[281] 29 U.S.C. 1144(d) (''Nothing in this subchapter shall be construed to alter, amend, modify, invalidate, impair, or supersede any law of the United States (except as provided in sections 1031 and 1137(b) of this title) or any rule or regulation issued under any such law.'').

[282] *See, e.g., C. P. by & through Pritchard* v. *Blue Cross Blue Shield of Ill.,* No. 3:20–CV–06145–RJB, 2022 WL 17788148, at *8, 10 (W.D. Wash. Dec. 19, 2022) (holding that ERISA's requirement at 29 U.S.C. 1104(a)(1)(D) to administer a plan's terms as written ''is subservient to Section 1557, outlawing discrimination, which is dominant''); *Tovar* v. *Essentia Health,* 342 F. Supp. 3d 947, 954 (D. Minn. 2018) (''The Court will not construe ERISA to impair Section 1557. Nothing in Section 1557, explicitly or implicitly, suggests that TPAs are exempt from the statute's nondiscrimination requirements.'').

rule when a pharmacy benefit manager was not responsible for designing the plan benefits that were adopted by the plan sponsor, similar to their arguments above against holding third party administrators liable under the rule.

Response: We discuss the rule's applicability to pharmacy benefit managers in the discussion under § 92.4 regarding the definition of ''health program or activity.'' Pharmacy benefit managers are health programs or activities and would be covered under the rule if they receive Federal financial assistance. A pharmacy benefit manager that does not directly receive Federal financial assistance would also be covered under the rule if it is part of the operations of a recipient that is principally engaged in the provision or administration of health-related services, health-related insurance coverage, or other health-related coverage, as set forth under the definition of ''health program or activity'' at § 92.4.[283]

If a pharmacy benefit manager is subject to section 1557 as part of the operations of a principally engaged recipient, we agree with commenters that the pharmacy benefit manager's liability under the rule would be similar to that of a covered third party administrator. Both entities contract with other parties, such as issuers or sponsors of self-insured group health plan coverage, to administer health benefits to plan enrollees. They may design plan benefits, formularies, payment structures, networks, and conduct utilization management. Therefore, if OCR receives a complaint about a covered pharmacy benefit manager, OCR will evaluate the liability of the pharmacy benefit manager consistent with the analysis set forth above for third party administrators. That is, OCR will determine whether responsibility for the challenged action lies with the covered pharmacy benefit manager or the plan sponsor.

Comment: One commenter requested that OCR clarify that administrative actions such as developing documents or preparing policy booklets for clients, alone, would not constitute third party administrator liability for discriminatory plan design features.

Response: We affirm that such administrative actions would not violate this rule to the extent the covered third party administrator is merely relaying information to enrollees consistent with the underlying plan terms that the third party administrator played no role in developing.

Comment: Some commenters requested that the rule clarify that an entity covered by section 1557 cannot outsource the implementation or design of discriminatory plans to entities that are not covered by the rule. Another commenter requested that OCR clarify that any third-party company may be liable under section 1557 when discriminatory plan terms originate with, or are managed by, the third-party company. For example, the commenter stated that third-party specialty benefits programs may promote or manage discriminatory specialty medication programs.

Response: A covered entity that outsources the implementation or benefit design of discriminatory plans remains liable under this rule for any discriminatory plan terms. Under the discussion of the definition of ''Federal financial assistance'' in § 92.4, we clarify that covered entities are responsible for the conduct of their subcontractors and cannot outsource or contract away their civil rights obligations by entering into contractual arrangements with subcontractors.

A third-party company that develops or manages discriminatory plans on behalf of a covered entity would only be liable under section 1557 to the extent the third-party company is a recipient or subrecipient of Federal financial assistance from the Department, including if the third party is part of a principally engaged recipient's operations.

Comment: Commenters requested that OCR clarify when liability under section 1557 extends across affiliated companies. Some commenters expressed concern that third party administrators and pharmacy benefit managers would automatically be deemed to be covered entities under the rule solely because they are related to an entity that received Federal financial assistance. These commenters requested that the final rule provide the same clarification that was in the 2016 Rule to clarify that a third party administrator (or pharmacy benefit manager[284]) is unlikely to be covered under the rule where they are ''a legal entity that is truly independent of an issuer's other, federally funded, activities.'' 81 FR 31433.

Other commenters expressed concern that third party administrators and pharmacy benefit managers could use complex corporate structures to distinguish separate lines of business to evade compliance with section 1557.[285] These commenters requested that OCR provide greater clarity on when liability under section 1557 extends across affiliated companies.

Response: As discussed in the 2016 Rule, 81 FR 31433, OCR will conduct a case-by-case analysis to determine whether a third party administrator or pharmacy benefit manager is appropriately subject to section 1557 as part of the operations of a recipient covered entity in situations where the third party administrator or pharmacy benefit manager is legally separate from an issuer or other covered entity that receives Federal financial assistance. This fact-specific analysis will rely on principles developed in longstanding civil rights case law, such as the degree of interrelatedness between or among entities, including the degree of common ownership and control between or among entities.[286] OCR will also examine whether the purpose of the legal separation was to avoid liability or avoid the application of civil rights law requirements—that is, whether it is intended to allow the entity to continue to administer discriminatory health insurance coverage or other health-related coverage.[287] As indicated in the 2016 Rule, a third party administrator or pharmacy benefit manager is unlikely to be covered by this final rule where it is a legal entity that is truly independent

[283] *See, e.g., Doe One* v. *CVS Pharmacy, Inc.,* No. 18–cv–01031–EMC, slip op. at 12–23 (N.D. Cal., Aug. 5, 2022) (relying on section 1557, the 2016 Rule, and the incorporated civil rights statutes to conclude that the complaint plausibly alleged that CVS Pharmacy, Inc. is principally engaged in the business of health care and all of its operations are covered by section 1557, including its pharmacy benefit managers Caremark, L.L.C. and Caremark PCS Health, L.L.C.).

[284] The 2016 Rule did not address pharmacy benefit managers.

[285] *Cf., Doe One* v. *CVS Pharmacy, Inc.,* No. 18–cv–01031–EMC, slip op. at 15 (N.D. Cal., Aug. 5, 2022) (''To ignore the overall interrelationship among the entities which, in the case at bar, design and implement the allegedly discriminatory program and permit the CVS interrelated entities to escape responsibility would exalt form over substance and impair the effectiveness of the anti-discrimination provision of the ACA.'').

Aug. 24, 1993) (section 504); *See also Doe One* v. *CVS Pharmacy, Inc.,* No. 18–cv–01031–EMC, slip op. at 12–23 (N.D. Cal., Aug. 5, 2022) (relying on section 1557, the 2016 Rule, and the incorporated civil rights statutes to conclude that the complaint plausibly alleged that CVS Pharmacy, Inc. is principally engaged in the business of health care and all of its operations are covered by section 1557, including its pharmacy benefit managers Caremark, L.L.C. and Caremark PCS Health, L.L.C.)

[287] *Papa* v. *Katy Indus., Inc.,* 166 F.3d 937, 941 (7th Cir. 1999), *cert. denied,* 528 U.S. 1019 (1999) (ADA, ADEA).

of an issuer's other, federally funded activities. We also address subsidiary liability under the discussion of § 92.4's definition of ''health program or activity.''

Comment: One commenter urged OCR to consider whether stop-loss coverage sold by a covered third party administrator to an employer results in discrimination on the basis of disability prohibited under section 1557. The commenter stated that stop-loss coverage uses techniques that target group members with high medical needs. The commenter asserted this could result in stop-loss coverage penalizing employers when a covered individual needs intensive treatment for a disabling condition.

Response: Stop-loss insurance provides coverage for the benefit of the employers, plan sponsors, or group health plans to cover financial liability for such entities to provide protection against catastrophic or unpredictable losses, and does not provide coverage for individuals. Stop-loss insurance that does not discriminate against individuals on the grounds protected under section 1557 does not implicate this final rule.

Comment: A few commenters expressed concern that the rule's application to covered third party administrators does not account for situations where the third party administrator is administering plans for religious employers. Commenters argued the rule could impose a burden on an employer's religious beliefs. Another commenter further argued that it could cause the employer to be exposed to liability for a claim of employment discrimination. The commenter explained that § 92.207 prohibits covered entities, such as a covered third party administrator, from providing a health-coverage related product that aligns with the beliefs and practices of religious employers. The commenter argued this results in a burden on the employer's religion because such religious employers cannot obtain a health coverage-related product that is illegal for covered entities to provide. If such an employer were to obtain a group health plan that was consistent with its faith, the commenter argued that the employer is at risk of liability due to OCR's position that it will transfer complaints alleging discrimination by an employer to the EEOC, which will review the employer's plan to determine if it is discriminatory under title VII of the Civil Rights Act.

Response: As discussed throughout this section, a health insurance issuer or third party administrator subject to section 1557 is prohibited from discriminating on the basis of race, color, national origin, sex, age, or disability in its provision or administration of health insurance coverage or other health-related coverage, and is also able to seek assurance of a religious exemption consistent with § 92.302(b). As specified in § 92.2(b), section 1557 does not apply to an employer or a plan sponsor with regard to its employment practices, including the provision of employee health benefits. A religious employer is able to obtain health insurance coverage or administration of its self-funded group health plan coverage from any entity not subject to section 1557, which would fall outside of the application of this rule.

Network Adequacy

The comments and our responses regarding network adequacy are set forth below.

Comment: Commenters appreciated OCR's attention to network adequacy and its acknowledgement that certain provider networks may constitute discriminatory benefit design under section 1557. Commenters stated that discriminatory provider networks profoundly affect the accessibility and quality of care for vulnerable populations. One commenter expressed concern that OCR has limited interest in complaints about access to care stemming from provider networks because the preamble in the Proposed Rule emphasized that health plans have discretion over benefit design and did not explicitly mention provider networks. A commenter recommended that OCR amend the proposed § 92.207(b)(2) to expressly reference provider networks as a type of design feature that falls within the scope of prohibited discriminatory activities.

Response: OCR acknowledges the importance of network adequacy in ensuring nondiscriminatory access to health care while also recognizing covered entities' autonomy in developing their provider networks as part of their benefit design packages, consistent with existing State and Federal network adequacy and other laws, including section 1557.[288] OCR will accept complaints related to provider networks and will investigate allegations of discrimination on a case-by-case basis. OCR declines to amend § 92.207(b)(2) because we believe the regulatory text is clear as written and does not require further clarification. As previously discussed, the term ''benefit design'' encompasses an array of features, including provider networks, and OCR intends to interpret it broadly.

Comment: Commenters urged OCR to include examples of discriminatory network design while articulating several practices that they believed to be violations of section 1557. Some network design practices commenters characterized as discriminatory included low reimbursement rates that lead to lower provider participation, arbitrary limits to in-network providers, limiting the participation of safety-net providers, insufficient providers with accessible medical equipment, narrow pharmacy networks, and performance requirements related to cost or other outcome and quality measures. Commenters argued that all of these practices prevent access and may be used by covered entities to dissuade enrollees with high health needs from enrolling in plans.

Response: OCR appreciates commenters providing examples of how network plan designs might have discriminatory impacts on vulnerable populations. While we agree that certain network plan designs and practices, such as excluding all or most providers that specialize in treating certain conditions, may be discriminatory under section 1557, we will not establish minimum network adequacy standards in this rulemaking. As discussed in the Proposed Rule, 87 FR 47877, covered entities employing network plan designs may be subject to network adequacy standards governed by State and Federal law. For example, CMS regulations establish network adequacy requirements for qualified health plans, Medicare Advantage plans, and Medicare Part D prescription drug plans, and require states to develop and enforce network adequacy standards for their contracted Medicaid managed care plans. *See* 87 FR 47877. Many of these regulations establish specific requirements that must be satisfied, such as inclusion of certain types of providers and time and distance standards. Recognizing that network adequacy is regulated by other Departmental regulations, as we noted in the 2016 Rule, and again note here, it is outside the scope of section 1557 to establish uniform or minimum network adequacy standards.

Comment: Commenters asserted that discriminatory network design practices lead to excessive, and often insurmountable, administrative burdens

[288] Network plans offer medical care through a defined set of providers under contract with the issuer. *See* 42 U.S.C. 300gg–91(d)(10); 45 CFR 144.103 (defining ''network plan'' as ''health insurance coverage of a health insurance issuer under which the financing and delivery of medical care (including items and services paid for as medical care) are provided, in whole or in part, through a defined set of providers under contract with the issuer'').

for enrollees. Commenters also stated that provider network appeals processes can be opaque, arbitrary, and ultimately a tool to deny access to necessary care that meet the definition of a disability under the ADA. Commenters expressed concern over the increase in ''phantom networks,'' plans that list providers as in-network when they are not actually accepting patients, particularly for mental health providers. For example, commenters cited a recent study that showed that 60 percent of the mental health providers in the Oregon Medicaid managed care network were not actually accepting patients.[289] Commenters expressed frustration in discovering that certain in-network providers are unable or unwilling to address multiple co-occurring disabilities or general medical care for people with disabilities.

Response: Plan designs that subject individuals protected by section 1557 to excessive administrative burdens to access coverage benefits that other enrollees do not have to navigate to access coverage may be discriminatory under section 1557. Section 92.207(b) prohibits covered entities from discrimination ''in providing *or administering*'' (emphasis added) health insurance coverage or other health-related coverage.

Comment: Commenters requested strict monitoring and enforcement of provider network compliance with section 1557. A commenter suggested that OCR include scrutiny of provider networks via regular compliance reviews in addition to investigating complaints. To determine whether a certain network design is discriminatory, a commenter urged OCR to consider access measures such as medication adherence, uptake of innovative therapies, and complaints and appeals regarding delayed or denied access to specialists and drugs. A commenter requested that OCR provide greater scrutiny to the impact of provider network consolidation, especially those involving religiously affiliated institutions, in creating discriminatory impacts on health care recipients.

Other commenters stated that OCR should not establish network adequacy standards, as they believe that discrimination through network adequacy is sufficiently addressed by other State and Federal agencies as well as the National Association of Insurance Commissioners, National Committee for Quality Assurance, and URAC (formerly Utilization Review Accreditation Commission). Commenters noted that as network requirements increase, providers and facilities demand increased reimbursement rates, additional contracts for other member or system facilities, and specific network tier placement. Commenters asked OCR to consider limiting provider contracting practices such as ''all-or-nothing'' contracting and anti-tiering clauses. They noted that such practices harm consumers by increasing provider leverage and driving up health care costs.

Response: While we will not establish minimum network adequacy standards in this rulemaking, we emphasize that to ensure compliance with section 1557, covered entities must develop their networks in a nondiscriminatory manner. When determining whether an entity has violated this section, OCR will conduct a fact-intensive investigation to determine whether the challenged network excludes individuals from participation in or denies them the benefits of the plan, or otherwise discriminates against them on the basis of race, color, national origin, sex, age, or disability. This analysis will include evaluating whether a covered entity utilized, in a nondiscriminatory manner, a neutral rule or principle when deciding to adopt its provider network. As noted in the Proposed Rule, OCR is cognizant that a variety of factors may affect a covered entity's provider network design.[290] If OCR determines that a network design is discriminatory, covered entities will be expected to provide a neutral, nondiscriminatory reason for the network design that is not a pretext for discrimination.

Concerns around provider consolidation are out of the scope of this regulation; however, OCR acknowledges that as providers consolidate, there may be increased or novel concerns around discriminatory provider network design and impact to access to care for protected classes.

Medical Diagnostic Equipment

In the Proposed Rule, 87 FR 47836, OCR noted that individuals with mobility disabilities experience challenges accessing preventative, primary, and specialty care due to inaccessible medical diagnostic equipment (MDE). OCR sought comment on the extent to which a lack of accessible MDE within a provider network limits or denies access to care for individuals with disabilities. OCR also requested comment on whether it should incorporate the U.S. Access Board's Medical Diagnostic Equipment Standards (MDE Standards) as enforceable standards and whether a lack of accessible MDE constitutes discriminatory benefit design or network inadequacy.

Comment: OCR received many comments urging OCR to adopt the MDE Standards, created pursuant to section 510 of the Rehabilitation Act, in the final rule. These commenters stated that inaccessible MDE leads to poor health outcomes for people with disabilities, mainly because inaccessible MDE results in individuals with disabilities receiving less preventative care, including mammograms and cervical screenings, compared to their counterparts without disabilities.[291] One commenter also noted that this lack of preventative care, and ensuing poor health outcomes, could also place people with disabilities at unnecessary risk for institutionalization. Finally, these commenters urged OCR to state that the denial of services to individuals with disabilities due to inaccessible MDE is discrimination under other Federal disability rights laws, including section 504 and the ADA.

One commenter recommended that OCR require covered entities to ensure that within 30 days of the publication of the final rule, all newly purchased or replaced MDE comply with the MDE Standards. The commenter also recommended that OCR require all covered entities that use MDE to ensure that within two (2) years of the publication of this rule, all of their MDE meets the MDE Standards. A different commenter recommended that OCR use a similar approach to that required by the 2010 ADA Standards for Accessible Design, 75 FR 56236 (Sep. 15, 2010), where accessible MDE would be purchased to replace older equipment as needed.

Response: OCR appreciates the numerous comments requesting that the final rule require covered entities to comply with the MDE Standards. OCR agrees that when individuals with disabilities are denied appropriate preventative health care due to the

[289] Jane M. Zhu et al., *Phantom Networks: Discrepancies Between Reported and Realized Mental Health Care Access in Oregon Medicaid,* 41 Health Affairs 7, 1016 (2022), *https://www.healthaffairs.org/doi/abs/10.1377/hlthaff.2022.00052.*

[290] Such factors include ''the geographic location of the service area, the number of available providers and specialists in the service area, reimbursement rates, the number of providers willing to contract with the payer, and the overall design of the plan as it relates to premiums.'' 87 FR 47877. We note that the importance of geographic limitations may be reduced due to the industry growth in virtual care and ease of medical travel, where clinically appropriate.

[291] *See* Nat'l Council on Disability, *Enforceable Accessible Medical Equipment Standards: A Necessary Means to Address the Health Care Needs of People with Mobility Disabilities* (2021), *https://www.ncd.gov/assets/uploads/reports/ncd_medical_equipment_report_508.pdf.*

inaccessibility of MDE, they are placed at increased risk of poor health outcomes and potentially institutionalization. As noted, section 504, the ADA, and section 1557 all prohibit covered entities from discriminating against people with disabilities by denying them appropriate health care services. Requiring covered entities to comply with the MDE Standards would be one method to ensure that people with certain disabilities receive appropriate health care services, while allowing for greater patient autonomy.

On September 14, 2023, OCR issued an NPRM proposing updates to the Department's section 504 regulations.[292] OCR proposed specific accessibility standards, scoping requirements, and time periods for compliance for MDE used by recipients of Federal financial assistance in that NPRM.[293] Accordingly, while OCR recognizes the importance of ensuring that all people, regardless of disability status, receive effective preventative care, we will not address the MDE Standards in the regulatory text of this rulemaking.

Comment: Many commenters noted that while the MDE Standards were published in 2017, many providers, including recipients of Federal financial assistance, have failed to abide by the standards and acquire accessible MDE. As evidence, some commenters point to the data collected by the State of California concerning the prevalence of accessible MDE among providers, which they state indicates that the majority of California providers do not have accessible MDE.[294] These commenters note that until a Federal regulation creates specific requirements, accessible MDE will not be used by the majority of providers. Finally, commenters noted that even if providers acquire accessible MDE, they still must ensure that their staff are able to use the MDE effectively in order for people with disabilities to benefit.

Response: OCR recognizes that in the absence of an enforceable standard that requires providers to acquire MDE with specific features, providers may not acquire accessible MDE. This may be due in part to the cost of accessible MDE exceeding the cost of non-accessible MDE and the durability of existing MDE. OCR also agrees that if a provider acquires accessible MDE, such as an adjustable exam table, but does not ensure that staff can effectively use the table and assist patients with transfers, patients with disabilities will not benefit. For the MDE Standards to be effective, providers must also know how to use accessible MDE. OCR will continue to enforce existing nondiscrimination obligations and, as noted above, is in the process of rulemaking to adopt enforceable standards for accessible MDE under section 504.

Comment: Numerous commenters requested that OCR consider expanding on the existing MDE Standards. Some commenters requested that OCR create new standards specific to individuals with visual impairments, sensory limitations, or cognitive disabilities. Some commenters also requested that OCR expand the MDE Standards to non-diagnostic medical equipment in addition to MDE, with others, requesting that OCR determine the scoping requirements that covered entities would have to follow under the MDE Standards.

Response: OCR appreciates commenters' suggestions. Because we are not requiring providers to abide by the MDE Standards in this rulemaking, we will not determine whether to expand the MDE Standards beyond diagnostic equipment, create new standards unique to individuals with other disabilities, or determine the scoping requirements of the MDE Standards. However, we will consider these recommendations and note that regardless of whether medical equipment is diagnostic, a covered entity must make its health programs and activities accessible to individuals with disabilities.

Comment: Numerous commenters stated that because of inaccessible MDE, many patients with disabilities have been asked to bring someone with them to appointments in order to help them transfer onto MDE. The commenters state that it is never appropriate to require this of a patient.

Response: Existing Federal civil rights laws, including section 504, title II of the ADA, and the existing section 1557 implementing regulation, forbid providers from requiring a patient with a disability to bring their own aide or support person to an appointment to assist them with transfers. Any person who has been required by a provider to bring another person to an appointment to assist with transfers is encouraged to file a complaint with OCR.

Comment: One commenter stated that the use of accessible MDE could be considered a reasonable modification for persons with disabilities as required by existing disability rights laws.

Response: Providing accessible MDE is one method that providers can use to ensure that a patient with a disability is able to access a provider's programs and activities. A provider would likely violate Federal disability discrimination laws like section 504, the ADA, and section 1557 if the health programs and activities they provide, including preventative and diagnostic care, are not accessible to people with disabilities.

Comment: One commenter stated that while requiring covered entities to obtain and use accessible MDE would be beneficial to people with disabilities, in certain circumstances it may be sufficient for a covered entity without accessible MDE to offer transportation to another covered entity with accessible MDE.

Response: While a provider acquiring and using accessible MDE so that its patients with disabilities are able to receive health care in its offices is preferrable, there may be specific situations where it is appropriate for the provider to offer transportation to another facility that has accessible MDE.

Comment: Many commenters stated that they consider accessible MDE to raise both network adequacy and benefit design implications. They believed that a lack of accessible MDE leads to a lack of in-network care and a lack of network adequacy, which they alleged to be discriminatory. They stated that benefit design could be used to embed accessible MDE requirements. They also stated that accessibility should also be considered in conjunction with time and distance standards to determine network adequacy.

Response: OCR appreciates commenters raising these important opinions concerning how the presence of accessible MDE affects network adequacy and benefit design. While OCR has decided not to explicitly address accessible MDE in this rulemaking, we refer commenters to the discussion of network adequacy and benefit design under this section.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, OCR is finalizing the nondiscrimination in health insurance coverage and other health-related coverage provision at § 92.207 as proposed, with modification. We have revised § 92.207(b)(6) to clarify that the integration requirement extends to practices that result in the serious risk of institutionalization or segregation. We have revised § 92.207(c) to strike the text following ''legitimate,

[292] 88 FR 63392 (Sept. 14, 2023).

[293] 88 FR 63392, 63511 (Sept. 14, 2023) (proposed subpart J).

[294] Nancy R. Mudrick et al., *Presence of Accessible Equipment and Interior Elements in Primary Care Offices,* 3.1 Health Equity 275 (2019), *https://dredf.org/wp-content/uploads/2019/10/Presence-of-Accessible-Equipment-and-Interior-Elements-in-Primary-Care-Offices.pdf.*

nondiscriminatory reason for'' and now the text prohibits ''denying or limiting coverage of the health service or determining that such health service fails to meet applicable coverage requirements including reasonable medical management techniques such as medical necessity requirements.'' This section also provides that ''such coverage denial or limitation must not be based on unlawful animus or bias, or constitute a pretext for discrimination. Nothing in this section is intended to preclude a covered entity from availing itself of protections described in §§ 92.3 and 92.302.'' We have also made conforming edits to include ''or any combination thereof'' to the list of prohibited bases of discrimination found § 92.207(a) and (b)(1) and (2).

Prohibition on Sex Discrimination Related to Marital, Parental, or Family Status (§ 92.208)

In § 92.208, OCR proposed to prohibit covered entities from discriminating on the basis of sex in their health programs and activities with respect to an individual's marital, parental, or family status. The 2016 and 2020 final rules did not include a similar provision. This is not a new concept, however, as it is similar to the Department's title IX implementing regulations. *See* 45 CFR 86.40(a). Section 92.208 provides that, in determining whether an individual satisfies any policy or criterion regarding access to its health programs or activities, a covered entity must not take an individual's sex into account in applying any rule concerning an individual's current, perceived, potential, or past marital, parental, or family status.[295]

The comments and our responses regarding § 92.208 are set forth below.

Comment: Many commenters supported the inclusion of § 92.208 because it provides clarity for patients and providers and brings OCR into alignment with other nondiscrimination practices set by section 1557, ensuring that all vulnerable groups receive the same level of civil rights protections. Several commenters mentioned that this change aligned with the title IX regulation, which has, since 1975, explicitly interpreted sex discrimination to encompass discrimination on the basis of current, potential, or past parental, family, or marital status that treats persons differently on the basis of sex. Commenters also raised other civil rights statutes, like the Civil Service Reform Act that is applicable to Federal employees, which explicitly includes protections based on marital status.[296]

Response: OCR agrees that including this provision brings regulations in line with other civil rights laws that recognize policies that treat people differently on the basis of sex in applying rules related to marital, parental, or family status,[297] as discrimination on the basis of sex, particularly, and as stated in the Proposed Rule's preamble, the Department's longstanding acknowledgment of this interpretation of title IX, at 45 CFR 86.40(a).

Comment: Numerous commenters supported proposed § 92.208. Some of these commenters explained that taking marital, parental, or family status into account has engendered arbitrary policies at medical facilities that create barriers to accessing health care, which can result in harmful and inequitable treatment of individuals. Many commenters stated that this provision will help alleviate the denial of care some women experience because they are single, unmarried, childless, or not in the presence of a male partner or husband when they are seeking, for instance, birth control.

Response: OCR agrees that absent the prohibition on taking sex into account in marital, parental, or family status, covered entities may adopt arbitrary policies that could create unnecessary inequities and result in harmful health outcomes. Section 92.208 prohibits discrimination that applies different policies and procedures based on sex in the context of marital, parental, or family status; it does not, however, prohibit discrimination on the basis of marital status alone (*i.e.,* single, divorced, widowed, etc.). As discussed in the 2022 NPRM, OCR encountered complaints, in the course of its enforcement work, where covered entities applied different policies for married men and married women. For example, OCR has settled cases against covered entities with policies of automatically assigning a male spouse as the guarantor when a female spouse received medical services, while not automatically assigning a female spouse as the guarantor when a male spouse received medical services. 87 FR 78878.

Comment: Many commenters supported the protections against discrimination on the basis of sex in the context of marital, parental, and family status contained in § 92.208 because of their impact on same-sex couples and the varying types of discrimination that this group experiences, including past experiences of discrimination on the basis of marital, parental, and family status alone. For example, some commenters said that these protections are critical because, although many same-sex couples live in committed relationships, they are less likely to be married, largely due to laws that until recently prohibited same-sex marriage. These protections, commenters argued, help to insulate LGBTQI+ individuals who have experienced discrimination in many health care settings, such as hospitals where they have been denied visitation rights and authority to make medical decisions impacting their loved ones' health conditions. Many commenters highlighted that these forms of discrimination were well documented during the AIDS crisis, when longtime partners were regularly denied hospital visitation rights and lacked adequate protections, even for discrimination based solely on marital status. For similar reasons, some commenters stated that this provision would protect families headed by same-sex couples, who may be denied the right to make medical decisions for their children. These commenters noted, that in the health care context, the involvement of family and external support systems can improve health outcomes, management of chronic illnesses, and continuity of care.

Response: OCR agrees that the prohibition on taking an individual's sex into account in applying any rule concerning an individual's current, perceived, potential, or past marital, parental, or family status can be critical in health care settings involving medical decision-making and visitation rights, particularly for same-sex couples. Section 92.208 prohibits a covered entity from implementing a policy related to marital, parental, or family status that treats individuals differently on the basis of sex (*e.g.,* male spouses of women can make medical decisions for their children but non-male spouses of women cannot, or allowing visitation rights for a married heterosexual couple but denying visitation rights to a married same-sex couple), but it does not prohibit covered entities from making distinctions based upon their marital status alone (*e.g.,* applying different rules to married and nonmarried individuals that do not distinguish based on an individual's sex).

Comment: Other commenters also discussed the impact that the protections contained in proposed

[295] This final rule does not preclude the application of Federal laws regarding eligibility criteria for certain Federal programs under CMS.

[296] *See* Public Law 95–454, sec. 101, 92 Stat. 1111, 1113–14 (Oct. 13, 1978), codified at 5 U.S.C. 2301(b).

[297] The term ''family status'' used in this rule is distinct from any defined terms in other rules, including ''familial status'' as defined in the Fair Housing Act, 42 U.S.C. 3601 *et seq.*

§ 92.208 have on same-sex couples seeking fertility treatments. They stated that these protections are needed because some health insurance coverage or other health-related coverage include in vitro fertilization (IVF) treatments as a covered benefit for heterosexual married couples, but not for same-sex married couples. Some commenters highlighted how, in their view, institutional policies' definition of ''infertility'' lead to such a discriminatory practice. This establishes what commenters describe as an impossible standard for same-sex couples to meet when seeking fertility treatment and coverage.

Response: OCR understands that not all covered health insurance issuers offer fertility coverage or treatments. However, those that do must offer such benefits in a nondiscriminatory manner. For example, a covered health insurance issuer that offers fertility coverage or treatments for married different-sex couples could not deny the same coverage or treatments to married same-sex couples. section 1557's prohibitions of discrimination apply across all covered health programs and activities.

Comment: Other commenters who supported the inclusion of § 92.208 stated that these protections are important because they help ensure nondiscrimination against a wide range of family structures.

Response: OCR reminds commenters that this section prohibits discrimination on the basis of sex when applying rules related to marital, parental, and family status, and is not to be conflated with prohibition against discrimination on the basis of these statuses alone. Thus, policies and procedures that include conditions or limitations tied to these statuses would not run afoul of this rule unless they applied differently based on the sex of the individuals.

Comment: Some commenters supported § 92.208 because in their view, a medical practice cannot refuse a female patient solely because she has a female spouse or partner, as this could constitute a denial on the basis of association.

Response: OCR agrees that a medical practice may not refuse to see a prospective female patient based solely on the fact that the patient has a female spouse if they otherwise accept married individuals into their practice. This is because the refusal would be based on the sex of the prospective patient and would therefore constitute sex discrimination related to marital status. And, as noted in the Proposed Rule, a denial based on a female patient having a female spouse or partner would also constitute discrimination on the basis of association, which is specifically addressed in § 92.209, as the refusal would be based on the sex of an individual with whom the patient is known to have a relationship or association. 87 FR 47880.

Comment: Many commenters opposed the inclusion of § 92.208, stating that if Congress meant to include ''marital, parental, or family status'' in section 1557 it would have done so, just as it did in part in the Equal Credit Opportunity Act (ECOA) (including ''marital status'') and the Fair Housing Act (FHA) (including ''familial status''). These commenters contended that adding these protections would make the addition of marital and familial status a mere surplusage to the text of the ECOA and FHA, and that it would include additional terms to their application despite neither statute explicitly including the additional terms. Some commenters who opposed the provision also stated that OCR needs to account for the additional costs of including these changes, especially as it may impact religious institutions that provide marital counseling services.

Response: OCR disagrees that clarifying these protections under section 1557 impacts either the ECOA or FHA.[298] While these statutes bar discrimination on the basis of an individual's marital or familial status *per se,* § 92.208 bars discrimination on the basis of sex as it relates to marital and family status. As discussed in the 2022 NPRM, 87 FR 47878, this final rule's interpretation is consistent with a parallel, longstanding prohibition included in the Department's title IX implementing regulations, 45 CFR 86.40(a). OCR has consistently interpreted the scope of section 1557's prohibition on the ground of sex consistently with the scope of title IX's prohibition of discrimination on the ground of sex, which includes discrimination within the context of marital, parental, or family status.[299] This provision will apply similar standards already enforced by OCR, and we do not anticipate additional costs for covered entities, including religious institutions beyond the costs already captured in the Regulatory Impact Analysis below for recipients to seek assurances of religious and conscience exemptions under § 92.302(b).

Discrimination on the Basis of Pregnancy-Related Conditions

In proposing § 92.208, OCR stated its view that it could be beneficial to include a provision that would specifically prohibit discrimination on the basis of pregnancy-related conditions as a form of sex-based discrimination, and sought comment on how to include such a provision in the final rule. 87 FR 47879. This proposal was specifically requesting comment on a stand-alone provision, separate from the inclusion of ''pregnancy or related conditions'' in § 92.101(a)(2)'s inclusion of the term. Including such a provision at § 92.208 would mirror its placement to those of the Department's title IX implementing regulations at 45 CFR 86.21(c), 86.40, 86.52(b), and 86.57. The 2016 Rule explicitly included ''pregnancy, false pregnancy, termination of pregnancy, or recovery therefrom, childbirth or related medical conditions'' in former § 92.4. While the 2020 Rule did not include any definition of ''sex discrimination,'' it indicated that section 1557 would be enforced consistent with title IX and its implementing regulations, which includes these terms. For the reasons explained below, we decline to add ''pregnancy or related conditions'' to § 92.208.

The comments and our responses regarding this request for comment are set forth below.

Comment: Many commenters supported the inclusion of a provision that includes pregnancy-related conditions as a prohibited form of discrimination on the basis of sex. Numerous commenters discussed that pregnancy-related conditions are inherently linked to sex because discrimination on that basis affects an individual's ability to make decisions about their reproductive health and life, and affects individuals' ability to be equal and participating members of society.

Response: OCR appreciates these comments and agrees that clarifying that discrimination on the basis of sex includes pregnancy-related conditions, as § 92.101(a)(2)(ii) (''discrimination on the basis of sex includes . . . pregnancy or related conditions'') does, is critical to ensuring that individuals are protected against this form of sex discrimination. OCR also agrees that discrimination on the basis of

[298] *Cf. Conn. Nat'l Bank* v. *Germain,* 503 U.S. 249, 253 (1992) (courts must give effect to statutes with overlapping coverage ''so long as there is no 'positive repugnancy' between the two'').

[299] As discussed in the 2022 NPRM, 87 FR 47878, OCR has resolved complaints against covered entities with policies of automatically assigning a male spouse as the guarantor when a female spouse received medical services, while not automatically assigning a female spouse as the guarantor when a male spouse received medical services. *See* U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Sex Case Summaries: Summary of Selected OCR Compliance Activities, https://www.hhs.gov/civil-rights/for-providers/compliance-enforcement/examples/sex-discrimination/index.html.*

pregnancy or related conditions can negatively affect an individual's ability to make decisions about their reproductive health and life, and their ability to be equal and participating members of society.

Comment: Many commenters who supported the inclusion of pregnancy-related conditions discussed the need for clarity in light of the Supreme Court's decision in *Dobbs.* Commenters contended that pregnancy-related conditions should be included in the definition of ''sex discrimination'' because it would reinforce covered entities' legal obligations under section 1557, and would allow OCR to address related discrimination more holistically and inclusively.

Commenters maintained that pregnancy protections are critical in light of total or near-total abortion bans in some States after the *Dobbs* decision. Commenters explained that this legal uncertainty warrants clarity and explicit protections for pregnancy-related conditions, including termination of pregnancy, because patients and providers have been left uncertain and fearful of their ability to provide care, are subjected to additional scrutiny, and face the possibility of criminal prosecution and civil litigation in States that have limited reproductive health care options.

Response: OCR affirms that under section 1557, covered entities may not discriminate against individuals for their pregnancy-related decisions, past, present, or future. OCR declines to add in additional protections outside of the scope of this rule. At the same time, the ACA itself provides that ''[n]othing in this Act shall be construed to have any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A).[300] HHS will comply with this provision.

Comment: Some commenters discussed privacy concerns involving HIPAA, as some providers have worried that medical privacy may be compromised when patients seek care or information, even if unrelated to abortion. Commenters argued for the need to include pregnancy-related protections under section 1557 so that patients are not discriminated against for their pregnancy-related decisions, past, present, or future.

Response: OCR appreciates the privacy concerns raised by these commenters. OCR affirms that under section 1557, covered entities may not discriminate against individuals for their pregnancy-related decisions, past, present, or future, including where the patient discloses the information or where such information is contained in medical records. Indeed, HIPAA was enacted to protect such sensitive patient health information from being disclosed without the patient's consent or knowledge. Separately, OCR is considering revisions to the HIPAA Privacy Rule to strengthen privacy protections for individuals' protected health information related to reproductive health care. *See HIPAA Privacy Rule To Support Reproductive Health Care Privacy,* notice of proposed rulemaking, 88 FR 23506 (Apr. 17, 2023).

Comment: Other commenters urged OCR to address pregnancy-related conditions but to do so elsewhere in the rule, either in the provisions on what constitutes discrimination on the basis of sex (§ 92.101(a)(2)), equal program access on the basis of sex (§ 92.206(b)), or nondiscrimination in health insurance coverage (§ 92.207(b)). These commenters explained that confining the discussion of the pregnancy-related conditions to § 92.208 (Prohibition on sex discrimination related to marital, parental, or family status) risked a narrow interpretation and application of the prohibition, and could lead providers to consider this prohibition to be limited in context and scope. Commenters emphasized that pregnancy-related protections are relevant to a wide range of conduct beyond the context of marital, parental, or familial status and should not exclude individuals who are single. Commenters also raised that pregnancy-related discrimination applies to a broad scope of protected services, such as the decision to access certain reproductive health care services (*e.g.,* contraception), as well as denials of reproductive services and insurance coverage. Many commenters suggested that OCR include pregnancy-related conditions in a standalone provision, because OCR could then further clarify the interplay between section 1557 and other Federal statutes or regulations related to termination of pregnancy that may apply to covered entities.

Response: OCR appreciates these comments. In the 2022 NPRM, OCR considered including additional details regarding discrimination on the basis of ''pregnancy or related conditions'' in § 92.208 to mirror its placement to the Department's title IX implementing regulations at 45 CFR 86.21(c), 86.40, 86.52(b), and 86.57. However, having considered the comments received, OCR concluded that the rule is better served by leaving ''pregnancy or related conditions'' in § 92.101(a)(2), which outlines the scope of discrimination on the basis of sex. The Department believes § 92.101(a)(2)—which addresses forms of sex discrimination generally—is a better location, so as to not suggest that discrimination based on pregnancy or its related conditions is limited to instances of discrimination involving only marital, parental, or family status.

Comment: Many commenters supported the inclusion of pregnancy-related conditions, but suggested additional changes to the rule, including explicit descriptions of what pregnancy or related conditions encompasses. Several commenters encouraged OCR to add language establishing that pregnancy-related conditions specifically include pregnancy termination, childbirth, false pregnancy, ectopic pregnancy, miscarriage, and recovery, including any refusal of service or procedure based on any other protected basis under the rule.

Response: OCR agrees that protections for ''pregnancy or related conditions'' are critical and affirms that covered entities may not discriminate against individuals based on pregnancy or related conditions under section 1557. However, additional language to identify what the term ''pregnancy or related conditions'' means is not necessary given that the regulatory language is not intended to be exhaustive as explained above. As noted in the NPRM, OCR understands the term as including childbirth, false pregnancy, termination of pregnancy, and recovery therefrom, which are the ''grounds'' prohibited under title IX.[301] 87 FR 47878.

Comment: Some commenters opposed the inclusion of pregnancy-related conditions. One commenter cautioned OCR to not rely on the *Dobbs* decision or its effects as a basis for prohibiting discrimination on pregnancy-related conditions, including pregnancy termination. Some commenters stated *Dobbs* held that the regulation of abortion was returned to the States, and thus, OCR cannot propose a provision that is inclusive of abortion, which would be contrary to Congressional and judicial prohibitions. Other commenters, despite acknowledging

[300] The application of this final rule to covered entities with conscience or religious freedom objections are discussed more fully below in §§ 92.3 (Relationship to other laws) and 92.302 (Notification of views regarding application of Federal religious freedom and conscience laws).

[301] 45 CFR 86.40(a).

that the title IX regulations have since 1975 included ''pregnancy and related conditions'' (which includes termination of pregnancy), argued that because the term ''termination of pregnancy'' is not defined in the title IX regulations, the term should not be adopted here. A commenter suggested that OCR either not include ''termination of pregnancy'' as a pregnancy-related condition or clarify that ''termination of pregnancy'' does not include abortion because abortion is not morally equivalent to pregnancy or childbirth and should not be treated as such. Some commenters who opposed including pregnancy-related conditions argued that if the final rule includes such a term, OCR must account for its impact.

Response: OCR appreciates comments regarding the inclusion of ''pregnancy or related conditions,'' including those concerns related to *Dobbs.* OCR is not promulgating this rule in response to *Dobbs,* which addressed the question of whether the Constitution provides a right to abortion. This rule does not purport to interpret the Constitution, nor does it address whether States may regulate or ban abortions. Indeed, we emphasize that section 1303 of the ACA specifically states that ''[n]othing in this Act shall be construed to preempt or otherwise have any effect on State laws regarding the prohibition of (or requirement of) coverage, funding, or procedural requirements on abortions, including parental notification or consent for the performance of an abortion on a minor.'' 42 U.S.C. 18023(c)(1). Pursuant to that provision, this rule should not be read to override any such State abortion laws. OCR reiterates that a covered provider does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the care, based on a professional or business judgement about the scope of services it wishes to offer, or for any other nondiscriminatory reason.

This rule implements section 1557 of the ACA, which prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities by incorporating the ''grounds prohibited under'' title VI, title IX, the Age Act, and section 504. Under title IX, discrimination based on pregnancy has been understood to constitute sex discrimination since 1975. Consistent with this long-standing interpretation, OCR will consider complaints of sex discrimination, including discrimination based on pregnancy or related conditions, on a case-by-case basis, and it will look to title IX and section 1557 case law to determine whether discrimination on the basis of sex has occurred. OCR is unaware of any instance in which a covered entity has been required to provide an abortion under title IX, title VI, the Age Act, or section 504.

Consistent with this understanding of the incorporated statutes, the relevant case law, and historical practice, OCR emphasizes that a covered provider's decision not to provide abortions is not itself sex discrimination, under section 1557. Section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities. As noted above, a covered provider that generally offered abortion care could violate that prohibition if, for example, it generally offers or provides abortions to patients but refused to offer or provide an abortion to a particular patient because of that patient's race or disability. But a covered provider does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure, based on a professional or business judgment about the scope of the services it wishes to offer, or for any other nondiscriminatory reason.

Comment: Many commenters stated that *Dobbs* prevents OCR from protecting access for abortion care through its proposed definition of sex, because the Supreme Court held there is no constitutional right to an abortion and returned the issue to the States. Other commenters also stated that, because *Dobbs* returned the issue of abortion to the States, OCR cannot create regulations that would create conflicts with State laws banning or restricting abortion. Additionally, these commenters raised section 1303 as another basis under which the ACA prohibits OCR from issuing regulations that preempt State laws regarding abortion.

Other commenters raised the view that *Dobbs* reaffirmed *Bray* v. *Alexandria Women's Health Clinic,* 506 U.S. 263 (1993), which held that opposition to abortion does not constitute animus against women. They contend that OCR cannot therefore define sex to include pregnancy termination. Commenters also stated that *Dobbs* established that there is no compelling government interest in promoting abortion, and therefore OCR has no authority to promulgate rules in support of abortion. A few commenters expressed that under the ''major questions'' doctrine, OCR cannot set an abortion policy such as prohibiting discrimination on the basis of pregnancy termination without explicit authorization from Congress.

Response: OCR appreciates the commenters' concerns and their interpretation of *Dobbs.* The *Dobbs* opinion did not address title IX or section 1557. *Dobbs* nowhere prohibits OCR from issuing regulations or promulgating rules under its statutory authorities. Indeed, under section 1557, HHS is charged by Congress with the elimination of discriminatory barriers in the administration and provision of a diverse range of health programs and activities.

As OCR has previously stated, this rule does not establish a Federal policy requiring or promoting abortion services. Although OCR has concluded that section 1557 does not require the Department to incorporate the language of title IX's abortion neutrality provision, see § 92.208 (Prohibition on sex discrimination related to marital, parental, or family status), as we note throughout this preamble, OCR emphasizes that a covered provider's decision not to provide abortions does not itself constitute discrimination in violation section 1557. Section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities.

It bears emphasis that nothing in the ACA, including section 1557, has ''any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). In addition, nothing in the ACA, including section 1557, preempts or has any effect on State laws regarding ''the prohibition of (or requirement of) coverage, funding, or procedural requirements on abortions'' as provided in section 1303 of the ACA, 42 U.S.C. 18023(c)(1).

OCR's interest is protecting individuals against prohibited forms of discrimination under section 1557 when accessing the range of health programs and activities covered under the statute. OCR also disagrees that the ''major questions'' doctrine is implicated by its promulgation of rules that protect individuals from discrimination on the basis of sex consistent with the manner in which the term has long been interpreted in the title IX context.

Comment: Many commenters stated that *Dobbs* had—and continues to have—a significant impact that warrants section 1557's protections against

discrimination on the basis of pregnancy or related conditions. Many commenters discussed that *Dobbs* limited access to abortion nationwide and created a complex web of State laws that ban or severely restrict access to care. These commenters stated that certain communities, including people of color, people with low incomes, immigrants, young people, people with disabilities, and LGBTQI+ individuals are most likely to face legal barriers to accessing abortion care, including an increased threat of arrest and prosecution in States hostile to abortion.

Many commenters also posited that States' efforts to restrict access to abortion have resulted in further challenges to accessing other reproductive health care, including contraception, fertility care and treatment, and miscarriage or early pregnancy loss management. Commenters cited examples from multiple States where women experiencing miscarriages have been denied care even as their pregnancy-related complications threaten their health and lives.

Response: OCR understands commenters' concerns regarding the negative health impacts stemming from the *Dobbs* decision, including on those with pregnancy-related conditions. We emphasize, as we have repeatedly throughout this preamble, that this rule is neither a response to *Dobbs* nor affected by that decision. This rule rests on the application of section 1557's nondiscrimination prohibition, and the longstanding interpretation of title IX's prohibition on sex discrimination to include discrimination on the basis of pregnancy and related conditions.

Comment: Many commenters raised concerns about access to prescriptions related to contraception, miscarriages or early pregnancy loss, and medication abortion. Commenters also raised concerns about access to drugs prescribed to treat conditions like chronic disease or illness that are unrelated to abortion, but may have the effect of terminating a pregnancy. Some commenters explained that pharmacists are fearful about dispensing medications that could terminate a pregnancy even when the medication is not prescribed for the purpose of abortion, and in some instances, pharmacists have refused to fill prescriptions in certain States that have banned abortion.

In States that have banned abortion, commenters noted that physicians, health care providers, and pharmacists fear they will be criminally prosecuted under State law, leading to denials or delays in lawful access to medications to treat conditions unrelated to abortion. For instance, many commenters explained that certain drugs prescribed to treat health conditions such as cancer, arthritis, ulcers, autoimmune diseases, or other chronic conditions are being denied or limited because they can result in termination of a pregnancy. Specifically, commenters relayed that some treatments for conditions such as breast cancer, brain cancer, prostate cancer, alcoholism, post-traumatic stress disorder, and depression involve drugs that are being denied because of an indirect potential relationship with pregnancy termination.

Similarly, many commenters requested clarification that section 1557's prohibitions on discrimination protect access to contraception in the retail pharmacy setting. They raised concerns and described instances where individuals are denied access to hormonal contraception at a pharmacy that provides other forms of contraceptives. Some commenters opined that a pharmacy's refusal to provide prescribed medication to enable IUD (intrauterine device) insertion, or to treat an incomplete miscarriage, should be considered a section 1557 violation.

Commenters were concerned that such discrimination is not only sex and disability discrimination, but also creates additional and unnecessary barriers to prescription drugs that people need to live and maintain their health. For example, many commenters discussed that people with disabilities are increasingly denied or subjected to barriers to obtaining methotrexate, which is a prescription drug used to treat cancer and autoimmune conditions, because of the drug's potential effects on pregnancy. Many commenters explained that a pharmacist's refusal to fill an individual's prescription or a pharmacist's decision to not stock a specific drug or class of drugs inevitably harms persons with disabilities and women, especially those experiencing miscarriages and early pregnancy loss. They stated that women are also more likely than men to have autoimmune diseases for which many of these drugs are prescribed.

Response: OCR appreciates comments relating to access to lawfully prescribed and medically necessary medications. To start, OCR notes that, on September 29, 2023, after the close of the comment period for this rule, OCR issued revised guidance to pharmacies that supersedes the guidance referred to by some commenters.[302] If a covered entity denies or delays lawful access to medications to support persons with disabilities, treat cancer, or treat an autoimmune condition, that refusal could violate section 1557 if, for example, the refusal is on the basis of a prohibited ground, such as the person's race, age, disability, or sex. But, as OCR clarified in its updated guidance to the nation's pharmacies, section 1557 does not require pharmacies to fill prescriptions for medication for the purpose of abortion, nor does the guidance suggest or imply an obligation of pharmacies to fill prescriptions for medication in violation of State laws, including those banning or restricting abortion.[303] OCR provided several examples in the guidance, in which denying lawfully prescribed medication to customers may violate civil rights laws.[304] For example, where a treating physician diagnoses a miscarriage complicated by a uterine infection and orders an antibiotic to treat a patient's chills, fever, and vaginal bleeding, a pharmacy that refuses to provide the antibiotic because of concern that subsequent care may include an abortion may be discriminating on the basis of sex. OCR will evaluate and apply all applicable statutory protections, including relevant religious freedom and conscience protections, on a case-by-case basis.

In addition, the ACA is hardly silent on the issue of abortion. It contains an elaborate set of rules for when and how a qualified health plan may refuse or be prohibited from providing or paying for certain abortions. See 42 U.S.C. 18023(a)–(b). It further specifies that State laws regarding abortion are not preempted and that ''nothing in this act shall be construed to have effect on federal laws regarding—(i) conscience protections; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of willingness or refusal to provide, pay

[302] *See* U.S. Dep't of Health & Hum. Servs., *Guidance to the Nation's Retail Pharmacies: Obligations Under Federal Civil Rights Laws to Ensure Nondiscriminatory Access to Health Care at Pharmacies,* (Sept. 29, 2023), *https://www.hhs.gov/civil-rights/for-individuals/special-topics/reproductive-healthcare/pharmacies-guidance/index.html.* On April 5, 2024, the court in *State of Texas* v. *Becerra et al.,* No. 7:23–cv–00022–DC, Order for S.J., ECF No. 69 (W.D. Tex.), held that the revised guidance mooted plaintiffs' legal challenge to the superseded guidance.

[304] *Id.*

for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' *Id.* at 18023(c).

Comment: OCR sought comment on the title IX abortion neutrality provision's inclusion and on other possible readings of that provision. Although OCR also sought comment on whether the Department should align its title IX regulation regarding the abortion neutrality provision of title IX with the 2000 ''Common Rule'' version of that regulatory provision that more than 20 agencies have long adopted,[305] no comments addressed this specifically. Many commenters supported OCR's proposal to not import the language of title IX's abortion neutrality provision into section 1557's final rule. Doing so, they contended, would undermine and be contrary to OCR's implementation of section 1557, which is to eliminate barriers and expand access to health care and coverage. These commenters discussed how abortion is a critical form of health care and patients seek or need to terminate a pregnancy for a wide variety of reasons.

Response: OCR's determination to not incorporate title IX's abortion neutrality provision is based on our conclusion that doing so is not required and unnecessary as the ACA itself speaks to this issue. The ACA provides that nothing in the statute, including section 1557, has ''any effect on Federal laws regarding (i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). By contrast, the ACA does not contain specific language directing the incorporation of title IX's abortion neutrality provision. That section 1557 does not require its incorporation is therefore the better reading of the statute with regard to title IX. We reiterate, moreover, that this rule does not—and indeed, cannot—create a right to abortion; it operates only to prohibit discrimination on specific prohibited grounds.

Comment: Several commenters highlighted the differences between section 1557's coverage of health care from title IX's coverage of education because the decision to receive health care from a particular provider is often driven by factors, including geographic location, cost, insurance coverage, the type of care being sought, and the urgency of that care. Many other commenters stated that importing title IX's abortion neutrality provision would allow denials of care that can directly harm patients, including putting at risk a patient's life or health.

Response: OCR agrees with commenters that health care is fundamentally different from education. And although section 1557 incorporates ''the ground prohibited under'' title IX and the ''enforcement mechanisms provided for and available under'' that statute, 42 U.S.C. 18116(a), it does not incorporate title IX's other provisions. Title IX's abortion neutrality provision does not purport to define what constitutes prohibited sex discrimination under title IX—the ''ground prohibited'' under that statute—and it is not an enforcement mechanism; it provides only that nothing in title IX shall be construed to require or prohibit any person or entity to provide or pay for abortion or related benefit or service.

Congress made clear that the ACA, including section 1557, would have no effect on several specific Federal laws protecting individuals and entities that refuse to provide abortions. *See* 42 U.S.C. 18023(c)(2)(A). The ACA itself restates provisions of longstanding Federal law by making clear in 18023(c)(2)(A) that ''nothing in this act shall be construed to have effect on federal laws regarding—(i) conscience protections; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' These provisions reiterate existing Federal restrictions on abortion. For example, the Weldon Amendment forbids funds appropriated to HHS from being ''made available to a Federal agency or program, or to a State or local government, if such agency, program, or government subjects any institutional or individual health care entity to discrimination on the basis that the health care entity does not provide, pay for, provide coverage of, or refer for abortions.'' [306] The Coats-Snowe Amendment forbids discriminating against an entity that refuses to undergo training in performance of or referrals for abortions.[307] The Church Amendment forbids requiring any individual ''to perform or assist in the performance of any part of a health service program . . . if his performance or assistance in the performance of such part of such program . . . would be contrary to his religious beliefs or moral convictions.'' [308] It also provides that an entity's receipt of any grant, contract, loan, or loan guarantee under the Public Health Service Act, the Community Mental Health Centers Act, or the Developmental Disabilities Services and Facilities Construction Act ''does not authorize any court or any public official or other public authority to require . . . such entity to . . . make its facilities available for the performance of any sterilization procedure or abortion if the performance of such procedure or abortion in such facilities is prohibited by the entity on the basis of religious beliefs or moral convictions.'' [309] The Church Amendments also prohibit discrimination against health care personnel related to their employment or staff privileges because they ''performed or assisted in the performance of a lawful sterilization procedure or abortion.'' [310] The same nondiscrimination protections also apply to health care personnel who refuse to perform or assist in the performance of sterilization procedures or abortion.[311] In addition, some of HHS's programs and services are specifically governed by abortion restrictions in the underlying statutory authority or program authorization.[312] The ACA also contains a variety of ''special rules'' that apply specifically to

abortion coverage and services.[313] Each of these laws continues to apply and is not affected by this rule. Accordingly, it is not necessary to incorporate title IX's abortion neutrality provision.

OCR emphasizes that a covered provider's decision not to provide abortions or abortion coverage does not itself constitute discrimination in violation section 1557. As described above, section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities. As such there may be nondiscriminatory reasons for a provider not to offer abortion care or coverage. A covered entity does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure, based on a professional or business judgment about the scope of the services it wishes to offer, or for any other nondiscriminatory reason.

Comment: Many commenters who supported OCR's proposal noted that section 1557 does not require incorporation of title IX's abortion neutrality provision because if Congress wanted to include such a provision, it would have done so either by explicitly referencing title IX's abortion neutrality provision or by including text matching 20 U.S.C. 1688. Commenters suggested that silence on the incorporation or importation of title IX's abortion neutrality provision is not an oversight on the part of Congress, but instead an intentional decision, as Congress legislates with knowledge of the basic rules of statutory construction.

Many commenters stated that the Congressional drafters of section 1557 did not pick and choose among the multiple title IX exceptions, including those specific to military training, admissions decisions, and membership practices of certain tax-exempt organizations, and that there is no justification for OCR to do so either. They maintained that the statute only references title IX for the prohibition of sex discrimination. Commenters also said there was no need to import title IX's abortion neutrality provision given the availability of existing Federal statutory protections for covered entities and individuals who object to the provision, payment, or referral of abortion services. Many commenters noted that OCR proposed a process in which a covered entity could seek an exemption based on conscience or religious conflicts. These commenters argued that, where permitted by relevant Federal laws, such analysis by OCR would also account for any potential harm to third parties.

Response: For the reasons we set forth above, OCR maintains that importing title IX's abortion neutrality provision in this rule is not legally required by the statute.

Comment: Other commenters who supported not importing the title IX abortion neutrality provision suggested that the final rule should include the Proposed Rule's discussion that EMTALA protects emergency care for pregnancy-related conditions, including termination of pregnancy. Some commenters expressed that the final rule should make clear that section 1557 incorporates section 1303(d) of the ACA, 42 U.S.C. 18023(d), which states that nothing in title I of the ACA relieves any health care provider from providing emergency services as required by EMTALA.

Response: OCR does not enforce EMTALA and directs commenters to the discussion of EMTALA under § 92.3. OCR notes that the 2022 NPRM's discussion of EMTALA does not alter any requirements under section 1557, EMTALA's existing obligations, or the Department's previous guidance regarding EMTALA. Nothing in this rule changes or otherwise affects any health care provider's obligations with respect to EMTALA, including with respect to the rights, remedies, procedures, or legal standards available to individuals and entities under section 1303(c) of the ACA.

Comment: Many commenters objected to OCR's proposal that it was not required to import title IX's abortion neutrality provision in this rule. These commenters argued that the provision must be included to explicitly address that section 1557 and its implementing regulations are abortion neutral. Some commenters maintained that the 2022 NPRM's request for comment on whether ''it could be beneficial to include a provision specifically prohibiting discrimination on the basis of pregnancy-related conditions as a form of sex-based discrimination,'' 87 FR 47879, constituted an ''abortion mandate'' that would discriminate against providers and covered entities who object to abortion. Some commenters stated that the inclusion of ''pregnancy or related conditions'' as a form of sex discrimination without importing title IX's abortion neutrality provision would strip providers of their ability to object to pregnancy terminations. Some commenters acknowledged that other Federal laws exist to protect religious freedom and conscience, but nevertheless expressed concerns that absent the provision's adoption of title IX's abortion neutrality provision, health care providers and entities with religious objections would be left without protections and would be forced to provide, cover, pay, or refer for abortion services.

Response: OCR appreciates commenters' concerns, but for the reasons stated above, we disagree. A covered entity does not engage in discrimination prohibited by section 1557 if it declines to provide, pay for, cover, or refer for abortions based on religious or conscience objections to performing the procedure. OCR also intends to enforce and comply with all applicable religious freedom and conscience protections, including section 1303 of the ACA, the Weldon, Church, and Coats-Snowe amendments, RFRA, and other applicable religious freedom and conscience laws. We have added a procedure for recipients whereby they may rely on such protections or seek assurance of those protections, if they wish. See § 92.302.

Comment: Other commenters who objected to the Department's position contended that, on the one hand, OCR was relying on title IX's regulations to prohibit discrimination on pregnancy-related conditions, while, on the other hand, ignoring title IX's statutory abortion neutrality provision and religious exception. These commenters argued that OCR is arbitrarily and capriciously picking and choosing which provisions of title IX to implement. They stated that, under title IX, declining to provide or pay for any service related to abortion is not treated as prohibited sex discrimination and therefore it cannot be that the same action, under section 1557, could constitute prohibited sex discrimination. Several commenters argued that the abortion neutrality provision, unlike title IX's exceptions, is a rule of construction that applies to all of title IX, including the statute's prohibition on sex discrimination, and thus OCR must incorporate the provision into any section 1557 implementing regulations.

Response: OCR appreciates commenters' concerns. As we explained above, however, section 1557 incorporates some, but not all, parts of title VI, title IX, the Age Act, and section 504. Specifically, section 1557 incorporates the ''ground'' of discrimination and the ''enforcement mechanisms'' under the referenced statutes, including title IX. Section 1557 is best read to incorporate existing interpretations of what constitutes sex discrimination under title IX, including regulatory interpretations and case law.

[313] *See* 42 U.S.C. 18023(b).

But section 1557 does not incorporate provisions of title IX or that statute's regulations that do not define or interpret what constitutes a ground of discrimination or an enforcement mechanism. Those provisions include the religious exception and the abortion neutrality provision. This reading gives meaning to every term in section 1557, while recognizing that although the statute incorporates parts of other civil rights statutes, each statute addresses distinct issues and contexts. Title IX's abortion neutrality provision is a rule of construction as to what acts can be required of recipients under title IX, but nothing in the provision states that it construes what constitutes a ground of prohibited discrimination. In section 1557, Congress was explicit in the limited incorporation of title IX when it listed only the ground to be prohibited by itle IX and the enforcement mechanisms that apply, and the title IX abortion neutrality provision is not an enforcement mechanism.

Comment: Many commenters stated that OCR's proposal to not import the title IX abortion neutrality provision is contrary to Congress's intent when it drafted section 1557 and explicitly adopted by reference the entire title IX scheme under 20 U.S.C. 1681 *et seq.* Commenters stated that enactment of title IX did not simply prohibit sex discrimination, because at least two categories of conduct are not, in Congress's view, what constitutes sex discrimination for purposes of title IX—religious decisions by an entity that conflict with the terms of title IX and the refusal to provide or pay for abortion. In their view, this means that OCR cannot prohibit discrimination based on termination of pregnancy or abortion as a form of sex discrimination.

Response: OCR appreciates commenters' concerns but disagrees that the manner in which Congress chose to cite title IX in section 1557 indicates an intent to limit what constitutes discrimination of the basis of sex for the reasons stated above. OCR specifically disagrees that the inclusion of ''*et seq.*'' indicates Congress's intent to incorporate the entire statute, thereby negating Congress's use of the terms ''ground prohibited'' and ''enforcement mechanisms'' when describing which portions of title IX shall be incorporated in section 1557. Moreover, as discussed in detail above (*see* Treatment of the Title IX Religious Exception), OCR's analysis considers the entire statute, including title IX's specific limitation to the context of educational programs and activities.

Comment: Commenters argued that title IX's adoption by reference supports Congress's longstanding position to legislate in a manner that remains neutral with respect to abortion. In support of this view, some commenters pointed to the Pregnancy Discrimination Act of 1978, where Congress prohibits discrimination on the basis of pregnancy, childbirth, or related medical conditions, but also explicitly included an exemption for health insurance benefits for abortion which, in their view, demonstrates Congress's intent to remain neutral on abortion.

Response: OCR will adhere to the specific terms Congress enacted in section 1557 as well as other applicable Federal laws, including section 1303 of the ACA, the Weldon, Church, and Coats-Snowe amendments, RFRA, and other applicable religious freedom and conscience laws.

Comment: Other commenters who objected to OCR's proposal not to import title IX's abortion neutrality provision in the rule expressed concern that OCR ignored section 1303 of the ACA, 42 U.S.C. 18023, which they opine requires abortion neutrality throughout the ACA. For example, commenters discuss that section 1303(a), which gives States the option to prohibit abortion coverage in health plans, would be rendered meaningless if the final rule requires such coverage by either prohibiting discrimination on the basis of pregnancy-related conditions or by failing to include a provision establishing section 1557's abortion neutrality. Commenters stated that section 1303 forecloses any construction of section 1557 that would require the provision or coverage of abortion.

Response: OCR appreciates commenters' concerns regarding section 1303's applicability to section 1557. Section 1303(a) provides that States and qualified health plans may, to the extent allowed by State law, opt to offer or prohibit abortion coverage; it does not require that section 1557 to import the language of title IX's abortion neutrality provision. Section 1303 primarily grants States flexibility to decide whether qualified health plans sold through their respective Exchanges can include coverage benefits for abortion services. *See* 42 U.S.C. 18023(a) (''State opt-out of abortion coverage''). And, unless otherwise prohibited by State law, participating issuers may elect to cover abortion services in qualified health plans. For qualified health plans that elect to offer as a coverage benefit abortion services for which Federal funding is prohibited, section 1303 establishes separate accounting requirements to ensure Federal funds are segregated and maintained separate from a policy holder's out-of-pocket funds, which may pay for abortion coverage. 42 U.S.C. 18023(b)(2)(B)–(C). OCR acknowledges that section 1303 allows qualified health plans the independence to choose whether to provide abortion coverage where consistent with State law, but it does not command that the final rule import title IX's abortion neutrality provision.

OCR reiterates, moreover, that a covered provider's decision not to provide abortions or abortion coverage does not itself constitute discrimination in violation of section 1557. A covered entity that generally offered abortion care could violate section 1557 if, for example, it refused to provide an abortion to a particular patient because of their race or disability. But a covered provider does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure, based on a professional or business judgment about the scope of the services it wishes to offer, or for any other nondiscriminatory reason. Further, OCR maintains that importing title IX's abortion neutrality provision is not required given the recognition of the ACA provisions on abortion and the inclusion of those provisions in regulatory text.

Comment: Several commenters pointed to the Weldon and Church Amendments to assert that OCR does not have the authority to prohibit discrimination on the basis of pregnancy termination and requested that OCR include title IX's abortion neutrality provision to avoid any uncertainty on the issue. Other commenters urged OCR to include affirmative language in the final rule that section 1557 does not require the provision of, referral for, or coverage of abortion to eliminate any uncertainty maintained by many religious providers.

Response: OCR remains committed to upholding the Federal laws, including the abortion and conscience provisions of the ACA itself, the Church, Coats-Snowe, and Weldon Amendments; the generally applicable requirements of RFRA; and other applicable Federal laws that provide protection to covered entities. It is not necessary to include title IX's abortion neutrality provision in the final rule to provide certainty as to the safeguards in place to protect religious freedom and conscience. As discussed, a covered entity does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure. Also, we refer again to the process described at § 92.302, whereby

providers may rely on the protections in Federal law for religious freedom and conscience or seek assurance of such protections from OCR, if they wish.

Comment: Many commenters who objected to OCR's proposal not to import title IX's abortion neutrality provision in this rule expressed concern regarding the Proposed Rule's discussion of EMTALA and emergency medical conditions that may necessitate abortion. Some commenters opined that the Proposed Rule's preamble was a potential regulatory change by HHS to designate an ''abortion mandate'' in EMTALA. Some commenters also noted that such an ''abortion mandate'' meant that HHS could preempt State laws that prohibit abortion or alter State licensing and health and safety laws. Other commenters raised the ''major questions'' legal doctrine to conclude that Congress would not have granted HHS the authority to promulgate such rules that would rewrite the text of EMTALA on any grounds, including on the issue of abortion.

Response: These comments fall outside the scope of the final rule. To be clear, EMTALA does not alter any of section 1557's requirements, and this rule does not alter existing obligations under EMTALA, or any of the Department's previous guidance regarding EMTALA. Thus, nothing about the final rule imposes any change to EMTALA's statutory scheme, let alone a ''radical or fundamental change'' such that the major questions doctrine is implicated.[314] Further, commenters' view that the ''major questions'' legal doctrine applies is also misplaced. The ''major questions'' doctrine applies in certain ''extraordinary cases'' in which courts will refuse to defer to agency action it considers having ''vast economic and political significance'' absent express authorization from Congress.[315] As described, the final rule does not alter any existing obligations or guidance as to EMTALA. The ''major questions'' doctrine is not relevant here.

Additionally, there is no basis for commenters' concerns about a potential regulatory change or preemption of State laws, including those involving licensing and health and safety. Per the ACA itself, this rule does not override State laws regarding ''the prohibition of (or requirement of) coverage, funding, or procedural requirements on abortions'' or alter preexisting obligations under Federal law. *See* 42 U.S.C. 18023(c)(1), (d).

Comment: Other commenters stated that the *Franciscan Alliance* opinion vacating provisions similarly related to pregnancy-related conditions in the 2016 Rule precludes OCR from issuing this final rule with similar provisions that do not import title IX's abortion neutrality provision. Some commenters maintained that if OCR promulgates this rule with similar provisions, OCR risks being held in contempt of court. Other commenters stated that to adequately issue this final rule, OCR must explain why the holdings of the *Franciscan Alliance* court are incorrect or inapplicable to this rulemaking.

Response: OCR appreciates commenters' concerns, but notes that they mischaracterize the impact of the relief ordered in *Franciscan Alliance* on this rulemaking. The *Franciscan Alliance* court vacated a portion of the 2016 Rule—namely its interpretation of sex discrimination to include gender identity and termination of pregnancy.[316] The court also enjoined the Federal Government from interpreting or enforcing section 1557 or any related implementing regulations against the plaintiffs in that particular case in a manner that would require those plaintiffs to perform or provide insurance coverage for gender-transition procedures or abortions.[317] The court's orders have no effect on, and do not apply to, OCR's authority to promulgate new regulations, including this final rule, and to enforce those regulations against covered entities that were not plaintiffs in *Franciscan Alliance.* The instant rulemaking is new and includes significant changes that address concerns raised against the 2016 Rule in *Franciscan Alliance.* Also notable is the fact that § 92.302 outlines new procedures whereby persons may rely on the protections of Federal conscience or religious freedom laws or choose to seek assurance of such protections, if they wish. And OCR has issued a separate final rule codifying safeguards for Federal conscience protections. *See* 89 FR 2078 (Jan. 11, 2024). In addition, OCR has considered the legal and factual developments since the issuance of the 2016 Rule, which help to inform its decisions in this final rule. Therefore, OCR's promulgation of its new regulation in no way contravenes the *Franciscan Alliance* court's orders, and OCR will comply with that court's orders, and all other applicable orders, in enforcing this final rule. OCR thus disagrees that issuing this rule puts the agency at risk of being held in contempt, merely for acting within the authority that has been lawfully delegated to HHS under section 1557.

Comment: Some commenters requested that OCR provide clarification, either in a final rule or via sub-regulatory guidance, as to how the proposed pregnancy discrimination protections relate to and may be different from those guaranteed by the Pregnancy Discrimination Act of 1978.

Response: OCR appreciates these commenters' request and is intent on providing clear guidance on the scope of the final rule and its application through educational outreach efforts, trainings, and individualized assistance. OCR clarifies that it does not enforce the Pregnancy Discrimination Act of 1978, Public Law 95–555, which amended title VII, and applies to discrimination on the basis of pregnancy, childbirth, or related medical conditions in employment settings, while section 1557 applies to health programs or activities that receive Federal financial assistance. We also note that section 1557, title IX, and title VII are read consistently to apply similar protections in the different contexts in which they apply.

Comment: Other commenters expressed concern that *Dobbs* created tension between health care providers and patients, increasing distrust in providers. Commenters also stated that *Dobbs* has created chaos in the health care system, increasing the risk that patients will experience discriminatory care and suffer delays in lifesaving treatment as a direct result of legal and medical uncertainty. These commenters said that discrimination in care propagates more distrust, which is a significant barrier for individuals seeking care and is precisely what section 1557 was designed to protect against.

Response: OCR appreciates the commenters' concerns. OCR understands that the provider-patient relationship is critical to the provision of quality, competent health care and critical for achieving optimal health. For example, in proposing the policies and procedures required under § 92.8, OCR confirmed that patients value the ability to have their concerns directly heard by

their provider,[318] and understands that not all communities in the United States feel the same level of trust in their health care provider, particularly among racially and ethnically diverse communities.[319] OCR further recognizes that in light of *Dobbs,* in certain States, a patient may fear sharing critical information relevant to their health status. OCR is separately considering revisions to the HIPAA Privacy Rule to strengthen privacy protections for individuals' protected health information related to reproductive health care, which will assist in generating more trusting patient-provider relationships. *See* HIPAA Privacy Rule To Support Reproductive Health Care Privacy, notice of proposed rulemaking, 88 FR 23506 (Apr. 17, 2023).

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.208, with modification. For clarity, we are finalizing by adding a cross-reference to § 92.101(a)(2)'s description of sex discrimination.

Nondiscrimination on the Basis of Association (§ 92.209)

In § 92.209, we proposed prohibiting discrimination against an individual on the basis of the race, color, national origin, sex, age, or disability of an individual with whom the individual is known to have a relationship or association.

The comments and our responses regarding proposed § 92.209 are set forth below.

Comment: Commenters on this provision overwhelmingly expressed support for the inclusion of an explicit prohibition on associational discrimination, which many stated will protect individuals, including children and elders, who associate with LGBTQI+ individuals. Other commenters said that a prohibition of associational discrimination will also protect individuals and families who associate with an individual who has a history of drug use or substance use disorder (SUD). Some commenters noted that the 2020 Rule repealed the 2016 Rule's associational discrimination protections at former 45 CFR 92.209, despite comments urging OCR to maintain the provision. Many commenters noted that courts have recognized an individual's right to be free from discrimination based on their association with another an individual protected on one or more bases under section 1557.[320]

Response: OCR agrees that it is important to include an explicit provision addressing associational discrimination, as both consistent with courts' interpretation of what constitutes discrimination as well as to protect those experiencing such forms of discrimination.[321] As commenters noted, this particularly impacts LGBTQI+ people because significant numbers of children and elders live with or are cared for by LGBTQI+ people,[322] and some providers have refused to provide health care to children, for example, because their parents are gay or lesbian.[323] This is

[323] Tresa Baldas, *Pediatrician Won't Treat Baby With 2 Moms,* USA Today (Feb. 18, 2015), *https://www.usatoday.com/story/news/nation/2015/02/18/doctor-discrimination-baby/23642091/.*

likely also to be particularly important for people, especially children, who cannot access health care without the support of a caregiver. Such conduct by a covered entity may violate this provision and other provisions of this part, including §§ 92.101 (Discrimination prohibited), 92.206 (Equal program access on the basis of sex), 92.207 (Nondiscrimination in health insurance coverage and other health-related coverage), and 92.208 (Prohibition on sex discrimination related to marital, parental, or family status). Additionally, associational or caregiver discrimination also frequently arises in the context of disability discrimination, as addressed above in the preamble discussion of § 92.202 (Effective communication for individuals with disabilities). Another potential example of discrimination based on association relates to individuals with a substance use disorder (SUD) [324] and related stigma.[325] The ADA, section 504, and section 1557 prohibit discrimination on the basis of disability, and individuals with an SUD or a history of having an SUD typically are protected under these authorities, unless they are engaged in the current illegal use of drugs.[326] Section 92.209 makes clear that discrimination against individuals (including friends, nonfamilial caregivers, and family members) based on their association with individuals in recovery from SUD or with a history of drug use is prohibited under section 1557.

Comment: One commenter accurately observed that, unlike the Proposed Rule, the 2016 Rule's associational nondiscrimination provision referenced protections for both individuals and *entities* that associate with others. Emphasizing that an entity can also be discriminated against by other covered entities based on the original entity's association with an individual due to the individual's race, color, national origin, sex, disability or age, this commenter described a scenario where a health plan might discriminate against an entity that largely serves patients with LEP, LGBTQI+ populations, or an entity that provides Medications for Opioid Use Disorder (MOUD) to individuals with opioid use disorder.

Response: OCR recognizes that there may be instances where covered entities may discriminate against other entities based on these other entities' associations with populations they serve (including LGBTQI+ individuals, individuals with disabilities, etc.). For example, § 92.209 prohibits a covered entity from discriminating against another entity because that entity serves individuals protected under this rule, *e.g.,* individuals with SUD,[327] people with intellectual and developmental disabilities, people of a particular race or national origin, or people of a particular age. In this case, § 92.209 is violated based on the discriminated-against entity's association with an individual or individuals based on their race, color, national origin, sex, age, or disability. OCR did not intend to suggest in the Proposed Rule that this was no longer considered a prohibited form of discrimination and therefore is including ''entity'' in the final rule text.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.209, with modification. We have revised the provision to clarify that covered entities are prohibited from discriminating against individuals and entities under this provision by adding ''or entity'' in the following locations: ''. . . against an individual *or entity . . .,*'' and ''. . . with whom the individual *or entity . . . .*''

Nondiscrimination in the Use of Patient Care Decision Support Tools (§ 92.210)

Proposed § 92.210, entitled ''Use of clinical algorithms in decision-making,'' provided that a covered entity must not discriminate against any individual on the basis of race, color, national origin, sex, age, or disability through the use of clinical algorithms in its decision-making. We invited extensive public comment on this proposed provision, including on whether to limit the provision to clinical algorithms or to include additional forms of automated or augmented decision-making tools or models, such as artificial intelligence (AI) and machine learning, and whether the provision should include more specificity, such as explaining actions covered entities must take to identify and mitigate potential discrimination from these tools. 87 FR 47884. The Proposed Rule preamble described clinical algorithms as ''tools used to guide health care decision-making that could range in form from flowcharts and clinical guidelines to complex computer algorithms, decision support interventions, and models.'' 87 FR 47880. The preamble also described clinical algorithms as tools used by ''hospitals, providers, and payers (*e.g.,* health insurance issuers) . . . to assist with health care decision-making for various purposes,'' including ''screening, risk prediction, diagnosis, prognosis, clinical decision-making, treatment planning, health care operations, and allocation of resources, all of which affect the care that individuals receive.'' 87 FR 47880. The comments and our responses regarding § 92.210 are set forth below.

Comment: Many commenters requested that OCR codify a definition for the term ''clinical algorithm.'' Some commenters requested a definition for ''clinical algorithm'' to include any form of automated decision systems and AI used in health programs or activities. Many commenters also recommended that § 92.210 apply to tools used in a covered entity's health programs and activities in addition to those used in a clinical setting. These commenters suggested that § 92.210 should apply to a covered entity's administrative health care operations because the use of these tools can impact individuals' access to a covered entity's health programs and activities and the quality of services provided.

Arguing that the term ''clinical algorithm'' is insufficient, some commenters cited examples of tools that covered entities use in their health programs and activities, such as those used for budgeting and billing processes, utilization management, benefit design, program eligibility and enrollment, provider contracting, and pricing by providers and insurers which are susceptible to discriminatory bias. Commenters also identified tools used in skilled nursing facilities, tools used to allocate home and community-based services, and Medicaid eligibility systems.

Response: In the Proposed Rule's preamble, we indicated that ''clinical algorithms'' include tools beyond actual algorithms, 87 FR 47880, and we solicited comment about whether ''clinical algorithms'' should ''include additional forms of automated or augmented decision-making tools or models such as artificial intelligence or

[324] *Substance Use Disorder Demographics,* American Addiction Centers, (Dec. 9, 2022), *https://sunrisehouse.com/addiction-demographics* (more than 40 million Americans aged 12 or older suffered from a substance use disorder in 2020).

[326] *See, e.g.,* U.S. Dep't of Justice, *The ADA and Opioid Use Disorder: Combatting Discrimination Against People in Treatment and Recovery* (Apr. 5, 2022), *https://www.ada.gov/resources/opioid-use-disorder/.*

[327] *See MX Grp., Inc.* v. *City of Covington,* 293 F.3d 326, 335 (6th Cir. 2002) (a public entity violated title II of the ADA when it discriminated against a drug and alcohol treatment center by denying it a zoning permit because the center provided services to individuals with disabilities).

machine learning,'' 87 FR 47884. The Proposed Rule described ''clinical algorithms'' as ''*tools* used to guide health care decision-making that can range in form from flowcharts and clinical guidelines to complex computer algorithms, decision support interventions, and models,'' which hospitals, providers and health insurance issuers use to ''assist with decision-making for various purposes,'' including ''screening, risk prediction, diagnosis, prognosis, clinical decision-making, treatment planning, *health care operations,* and *allocation of resources,* all of which affect the care that individuals receive.'' 87 FR 47880 (emphases added). Thus, the Proposed Rule described clinical algorithms broadly to include a variety of health care decision-making tools in a covered entity's health programs and activities related to patient care. We further solicited comment about ''what types of clinical algorithms are being used in covered health programs and activities; how such algorithms are being used by covered entities; [and] whether they are more prevalent in certain health settings . . . .'' 87 FR 47884.

As discussed in the preamble under § 92.4, we are adopting the more precise term ''patient care decision support tool'' to replace the term ''clinical algorithm.'' This new term more closely aligns with what we described as ''clinical algorithms'' in the preamble to the Proposed Rule, such as various tools used to guide health care decision-making that affect the care that patients receive. *See* 87 FR 47880. In § 92.4, we define ''patient care decision support tool'' to mean ''any automated or non-automated tool, mechanism, method, technology, or combination thereof used by a covered entity to support clinical decision-making in its health programs or activities.'' The definition applies to tools that are used by a covered entity in its clinical decision-making that affect the patient care that individuals receive. Given covered entities' widespread use of automated decision systems and AI, and the scale by which AI can influence covered entities' clinical decision-making,[328] we are confirming that the types of patient care decision support tools subject to § 92.210 include automated decision systems and AI used to support clinical decision-making.

Covered entities may use patient care decision support tools in their health care decision-making in a variety of ways. Covered entities typically use patient care decision support tools at the individual patient level, such as a provider using clinical guidance from an algorithm to assess a patient's risk of a severe cardiac event.[329] Other patient care decision support tools pertain to health care administration decisions, typically used with regard to a group of patients (or a population) based on shared characteristics. For example, there is evidence that hospital system treatment protocol varies by geographic area due to variations produced by risk adjustment modeling.[330] In addition to these examples, patient care decision support tools would also include tools used for prior authorization and medical necessity analysis,[331] which directly impacts clinical decision-making and affects the care received by patients as directed by their providers. For example, a medical necessity review tool used by Medicare Advantage plans has been shown to deny enrollees' medical claims for rehabilitative care without considering enrollees' individual circumstances.[332]

One subset of patient care decision support tools to which § 92.210 applies includes ''predictive decision support interventions'' as defined in the Office of the National Coordinator for Health Information Technology's (ONC) recently published final rule for ''Health Data, Technology, and Interoperability: Certification Program Updates, Algorithm Transparency, and Information Sharing.'' [333] In its rule, ONC defines the term ''predictive decision support intervention'' (Predictive DSI) to mean ''technology that supports decision-making based on algorithms or models that derive relationships from training data and then produce an output that results in prediction, classification, recommendation, evaluation, or analysis.'' 89 FR 1192 (codified at 45 CFR 170.102). As ONC discussed in the Proposed Rule, Predictive DSI are used to predict unknown values based on relationships learned in training data, and they pertain to automated tools used for clinical, financial, or administrative purposes. ''Health Data, Technology, and Interoperability: Certification Program Updates, Algorithm Transparency, and Information Sharing.'' 88 FR 23746, 23785 (April 18, 2023).

It is important to note that § 92.210 is not duplicative of ONC's rule regarding Predictive DSIs because ONC's rule applies to and includes requirements for health information technology (IT) *developers,* whereas § 92.210 applies to and includes requirements for section 1557 covered entity *users* of patient care decision support tools (including Predictive DSIs). A section 1557 covered entity may, of course, develop its own Predictive DSI, in which case that entity may be subject to ONC's Predictive DSI requirements as well as section 1557's nondiscrimination requirements under § 92.210. Refer to section V of ONC's January 2024 Final Rule, 89 FR 1242–54, for more detailed information regarding Predictive DSIs. OCR worked closely with ONC during the development of this final rule and ONC's rule to advance a coordinated Departmental response in regulating

[333] 45 CFR 170.102; U.S. Dep't of Health & Hum. Servs., Off. of the Nat'l Coordinator for Health Info. Tech., Health Data, *Technology, and Interoperability: Certification Program Updates, Algorithm Transparency, and Information Sharing,* Final Rule, 89 FR 1192 (January 9, 2024). Regarding the term ''intervention,'' ONC notes that the term ''intervention'' in ''prediction decision support intervention'' was not intended to mean an intervention (medicine, medical procedure, or medical treatment) as the term is used in the practice of medicine, but rather, an intervention occurring within a workstream, including but not limited to alerts, order sets, flowsheets, dashboards, patient lists, documentation forms, relevant data presentations, protocol or pathway support, reference information or guidance, and reminder messages. Their use of the term intervention was consistent with how the Program used the term in § 170.315(a)(9).

tools used to support health care decision-making.

Section 92.210's definition for ''patient care decision support tool'' also includes non-automated and evidence-based tools that rely on rules, assumptions, constraints, or thresholds, as these also have the potential to result in discrimination. This includes ''evidence-based decision support interventions'' identified in ONC regulations at 45 CFR 170.315(b)(11)(iii). An example of a non-automated patient care decision support tool is a Crisis Standards of Care [334] flowchart for triage guidance. Such a flowchart may result in discrimination if, for example, it screens out individuals with disabilities, prohibiting them from equally accessing a health care service, program, or activity that a covered entity offers by assessing an individual's potential response to life-saving care without making an individualized assessment of the individual's health and without providing modifications for how an individual's disability or age could affect the assessment factors used in the algorithm or the time needed for the individual to respond to treatment. Another example is the race-adjusted estimated glomerular filtration rate (eGFR) equation that relies not only on training data, but also discriminatory assumptions and thresholds such as by applying a race-adjusted coefficient to the eGFR equation to reflect that Black people have been associated with higher levels of blood creatinine as compared with that of non-Black people, which results in a higher significance threshold for Black patients, thereby requiring more advanced kidney failure for Black patients than non-Black patients before they can receive the same level of care. Other examples of patient care decision support tools include, but are not limited to: flowcharts; formulas; equations; calculators; algorithms; utilization management applications; software as medical devices (SaMDs); software in medical devices (SiMDs); screening, risk assessment, and eligibility tools; and diagnostic and treatment guidance tools.

Comment: Some commenters urged OCR to narrow the definition for ''clinical algorithm'' and to clarify that the scope of § 92.210 does not extend beyond flowcharts and clinical algorithms to any forms of automated decision systems or AI. These commenters contended that a narrow definition is necessary to limit covered entities' liability and burden, disruption to covered entities' decision-making, and patients' exposure to greater health risks.

Response: Section 92.210 does not apply to tools used to support decision-making unrelated to clinical decision-making affecting patient care or that are outside of a covered entity's health programs or activities. For example, § 92.210 does not apply to the following activities when such activities are unrelated to clinical decision-making affecting patient care: automated or non-automated tools that covered entities use for administrative and billing-related activities; automated medical coding; fraud, waste and abuse; patient scheduling; facilities management; inventory and materials management; supply chain management; financial market investment management; or employment and staffing-related activities.

The purpose of § 92.210 is to prohibit discrimination that occurs through covered entities' use of patient care decision support tools in their health programs or activities. The rule does not seek to disrupt covered entities' clinical decision-making, expose patients to greater health risks, or to prevent the use of these tools entirely. We encourage covered entities to continue procuring, developing, and using patient care decision support tools that will improve patient care and access to quality care. Section 92.210 will help covered entities use these tools in a nondiscriminatory manner. Under § 92.210, evidence-based researchers, whose findings inform many inputs to patient care decision support tools, will be incentivized to recalibrate data, assumptions, and methods used in earlier studies.

Comment: Many commenters expressed support for proposed § 92.210 and discussed the extent of discrimination in health care resulting from the use of algorithms. Commenters were particularly concerned about the prevalence of ethnic and racial bias in clinical algorithms that results in fewer health care services provided to Black, Hispanic/Latino, Asian, and American Indian/Alaska Native patients. Others discussed Crisis Standards of Care, stating they are too often biased against people with disabilities, people of color (who disproportionately have at least one disability), and older individuals because these tools assess an individual's potential response to life-saving care without making an individualized assessment of the individual's health and without providing modifications for how an individual's disability or age could affect the assessment factors used in the algorithm or the time needed for the individual to respond to treatment.

Response: OCR appreciates commenters' feedback regarding proposed § 92.210. We share commenters' concerns about the potential for discrimination caused by the use of algorithms in health care, which are receiving considerable attention from the Department and Administration,[335] other executive agencies, Congress, stakeholders, professional associations, medical journals, and the media. As OCR implements section 1557 and other civil rights laws, it will continue to consider additional actions to support covered entities in implementation and compliance consistent with Federal law, including guidance or provision of technical assistance.

We particularly note that, since publication of proposed § 92.210, the Administration has issued: (1) a *Blueprint for an AI Bill of Rights,* which includes a principle for protecting the public from algorithmic discrimination; [336] (2) E.O. 14091, *Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,* which includes a section requiring agencies to consider opportunities to ''prevent and remedy discrimination, including by protecting the public from algorithmic discrimination;'' [337] and (3) E.O. 14110, *Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence,* which sets forth

[334] Crisis Standards of Care inform decision-making designed to accomplish the best outcome for a group of patients rather than focusing on an individual patient.

[336] The White House, *Blueprint for an AI Bill of Rights* (Oct. 4, 2022), *https://www.whitehouse.gov/ostp/ai-bill-of-rights/.*

[337] E.O. 14091, sec. 8(f), 88 FR 10825, 10831 (Feb. 22, 2023), *https://www.federalregister.gov/documents/2023/02/22/2023-03779/further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal.*

numerous executive actions designed to ensure the equitable, safe, and secure use of AI.[338] E.O. 14110 addresses civil rights violations and discrimination related to AI and seeks to protect individuals' civil rights by preventing discrimination, including algorithmic discrimination, through the use of automated systems and AI.[339]

Executive Order 14110 directs the Department to take actions, ''possibly including regulatory action,'' to ''ensure the safe, responsible deployment and use of AI in the healthcare, public-health, and human-services sectors.'' [340] It also directs the Department to ''consider appropriate actions to advance the prompt understanding of, and compliance with, Federal nondiscrimination laws by health and human services providers that receive Federal financial assistance, as well as how those laws relate to AI.'' [341]

We also acknowledge the recent surge in academic research highlighting potential harms caused by use of patient care decision support tools that may create or contribute to discrimination prohibited by section 1557, as discussed in the Proposed Rule at 87 FR 47880–82.

We appreciate the comments addressing the potential bias in Crisis Standards of Care, which, as discussed at length in the Proposed Rule, 87 FR 47881–82, were the focus of OCR's enforcement efforts during the COVID–19 Public Health Emergency and resulted in six States revising their Crisis Standards of Care to prevent discriminatory prioritization of hospital resources.[342]

Comment: Some commenters opposed proposed § 92.210, in part, because existing laws and regulations already prohibit discrimination in algorithmic tools. Other commenters opposed to finalizing § 92.210 urged OCR to use the feedback we received during the public comment period to inform engagement with stakeholders, including the Food and Drug Administration (FDA), device manufacturers, algorithm developers, clinicians, patients, and others, through which OCR could develop a regulatory framework involving risk-based approaches.

Response: While several Federal departments and agencies are taking action to regulate AI and other decision-making tools,[343] OCR, consistent with its underlying authority, is in a unique position to provide additional specificity regarding the application of long-standing nondiscrimination requirements to the use of such tools to ensure that discrimination does not result from covered entities' use of patient care decision support tools in their health programs or activities. The Department has authority to enforce section 1557, which prohibits covered entities from discriminating in their health programs and activities, including through the use of AI and other tools. Section 92.210 provides additional clarity to covered entities regarding their obligations. We are finalizing § 92.210 with a delayed applicability date of no later than 300 days after the final rule's effective date to give covered entities a reasonable period of time to come into compliance with § 92.210(b) and (c).

We received significant input on this issue from stakeholders during the public comment period, and the breadth of stakeholders' input and available research has informed the revisions in the final version of § 92.210. As OCR implements section 1557 and other civil rights laws, it will continue to consider additional actions to support covered entities in implementation and compliance consistent with Federal law, including guidance or engaging in future rulemaking. As AI, clinical algorithms, and predictive analytics are more widely used, OCR will continue to engage with the FDA, ONC, and other Federal partners to ensure consistency and a coordinated governmental effort to regulate such tools in health care. We will also continue to solicit stakeholders' input and to assist covered entities with compliance.

Comment: Some commenters expressed concern that proposed § 92.210 would not apply to health care-related AI products that are autonomous or that augment a covered entity's decision-making in its health programs and activities.

Response: This final rule clarifies that § 92.210 applies to all patient care decision support tools used in a covered entity's health programs or activities to support clinical decision-making, including patient care decision support tools that are autonomous and those that assist or augment a covered entity's clinical decision-making.

Comment: Some commenters recommended that § 92.210 exclude tools designed to improve health equity because these tools serve to protect members of historically marginalized communities. Relatedly, one commenter asked how proposed § 92.210 would affect algorithms that are currently in use and specifically designed to identify certain groups of patients susceptible to a particular condition or that may benefit from a particular therapy.

Response: Section 92.210 does not prohibit covered entities from using patient care decision support tools that identify, evaluate, and address health disparities so long as their use does not constitute prohibited discrimination on

the basis of race, color, national origin, sex, age, or disability.

Comment: Many commenters requested that OCR revise § 92.210 to include transparency requirements for covered entities regarding their use of clinical algorithms in their health programs and activities, including a requirement that covered entities notify individuals about the training data, assumptions, constraints, thresholds, and other inputs used to design each clinical algorithm in use. Commenters noted that otherwise, individuals would not know whether there has been a violation of § 92.210.

Response: A covered entity may routinely change the patient care decision support tools it uses. While there may be benefits to providing such information to patients, we decline to revise § 92.210 to require covered entities to notify patients about the patient care decision support tools used in their health programs and activities given the possible frequent changes and the costs associated with notifying patients.

We similarly decline to revise § 92.210 to require covered entities to notify patients about the training data and other inputs used to design and develop the patient care decision support tools used by a covered entity because, in addition to the costs discussed above, currently, patient care decision support tool developers may not ordinarily share this information with covered entities. We note, however, that ONC's final rule requires decision support interventions, supplied by a developer of certified health IT as part of its Health IT Module certified to 45 CFR 170.315(b)(11) criterion, to support making this information (source attributes) available to users of the Health IT Module. In addition, developers of certified health IT certified to 45 CFR 170.315(b)(11)(iii)(B) are required to make summary information of intervention risk management practices publicly available for Predictive DSIs the developer supplies as part of its Health IT Module provided through 45 CFR 170.523(f)(1)(xxi). 89 FR 1192 (January 9, 2024). Covered entities using decision support interventions supplied by a developer of certified health IT should have this type of information available to them.

In addition, to the extent that covered entities subject to HIPAA document their use of a patient care decision support tool in an individual's medical record, individuals may obtain that information when they exercise their HIPAA right of access to their protected health information contained in their respective designated record sets. *See* 45 CFR 164.524. Other Departmental agencies may also issue transparency-related guidance and requirements for AI developers. OCR seeks to partner with other agencies and covered entities to address best practices and may release guidance in the future.

While we decline to impose transparency requirements under § 92.210 for the reasons stated above, we note that it would be a best practice for covered entities to disclose information to patients about the patient care decision support tools used in their health programs and activities.[344] We further note, however, that such voluntary disclosure does not ensure compliance with § 92.210.

Comment: Many commenters recommended that OCR revise § 92.210 to clarify the steps that a covered entity must take to comply with § 92.210 and to ensure nondiscriminatory use of clinical algorithms. Commenters explained that when providers use a patient care support tool, they often rely on a developer's intended uses for the tool. Commenters discussed that covered entities do not design or develop many of the clinical algorithms that they use and are therefore unlikely to be aware of how the tool operates. They also stated that it is infeasible to require a covered entity to audit all algorithms in its health programs or activities and that proposed § 92.210 would force covered entities to police their own supply chains for clinical algorithms, which they state is also impracticable. Commenters expressed concern that covered entities may incur liability when they are unaware that an algorithmic output may result in discrimination and opined that covered entities should not be liable in such cases. Another commenter specified that physician liability should be limited to when a reasonable physician knows or should have known that the algorithm in question utilizes inputs and logic that are likely to result in discrimination. Further, commenters asserted that the additional steps that covered entities would need to take to comply with proposed § 92.210 are very likely to contribute to providers' already strained workload and further contribute to burnout.

Response: We appreciate commenters' concerns and have revised § 92.210 to provide additional clarity. We have added additional clarification on covered entities' obligations under § 92.210. Section 92.210 sets forth the general prohibition on discrimination on the basis of race, color, national origin, sex, age, or disability by a covered entity in its health programs or activities through the use of patient care decision support tools. Section 92.210(b) requires a covered entity to make reasonable efforts to identify patient care decision support tools used in its health programs and activities that employ input variables or factors that measure race, color, national origin, sex, age, or disability. Section 92.210(c) requires that for each patient care decision support tool identified in paragraph (b), a covered entity must make reasonable efforts to mitigate the risk of discrimination resulting from the tool's use in its health programs or activities.

We appreciate comments regarding how a covered entity may learn that a patient care decision support tool used in its health programs or activities creates a risk of discrimination on a protected basis. In the Proposed Rule, we noted that use of clinical algorithms may result in discriminatory outcomes when variables are used as a proxy for a protected basis, and that discrimination may result from correlations between a variable and a protected basis. 87 FR 47881. As a threshold matter, we note that section 1557 prohibits proxy discrimination as a general civil rights principle that applies to the entire final rule.[345] However, given the many possible indirect measures of race, color, national origin, sex, age, and disability, covered entities are not required to identify all patient care decision support tools with input variables or factors that indirectly measure these protected bases. However, covered entities should exercise caution when using patient care decision support tools that are known to use indirect measures for race, color, national origin, sex, age, or disability, which could result in prohibited discrimination.

We understand that covered entities in some circumstances may be largely unaware of the datasets developers use to train the patient care decision support tools that covered entities use. Section 92.210 does not require covered entities to obtain datasets or other attribute information from developers when purchasing or using patient care decision support tools. However, if a covered entity does not know whether a developer's patient care decision support tool uses variables or factors that measure race, color, national origin,

[344] *See, e.g.,* Am. Med. Ass'n, *American Medical Association Principles for Augmented Intelligence Development, Deployment, and Use,* pp. 2–4 (2023), *https://www.ama-assn.org/system/files/ama-ai-principles.pdf.*

[345] *See* discussion of proxy discrimination at § 92.207.

sex, age, or disability but has reason to believe such variables or factors are being used, or the covered entity otherwise knows or should know that the tool could result in discrimination, the covered entity should consult publicly available sources or request this information from the developer.

Further, ONC's recently published final rule discussed above revises existing certification criteria for developers of certified health IT by requiring developers with Health IT Modules certified to § 170.315(b)(11) to disclose information about a decision support intervention's source attributes relevant to health equity with the decision support intervention users. 89 FR 1192. This disclosure requirement will work in tandem with § 92.210 by enabling a covered entity that uses Health IT Modules certified to § 170.315(b)(11) to learn from a developer whether a specific decision support intervention relies on attributes that measure race, color, national origin, sex, age, or disability.

We are aware that covered entities use patient care decision support tools based on their respective needs and in accordance with developers' intended uses. But covered entities must exercise due diligence when acquiring and using such tools to ensure compliance with § 92.210.

Covered entities may learn that use of patient care decision support tools risk resulting in discrimination when OCR included that information in the Proposed Rule. In the Proposed Rule, in addition to the use of the race-adjusted eGFR equation discussed above, we identified uses of other categories of tools that may result in discrimination based on race, including tools used in ''cardiology (to assess the risk of heart failure), cardiac surgery (to assess the risk of complications and death), obstetrics (to determine risks associated with vaginal birth after cesarean), urology (to assess the risk of kidney stones and urinary tract infections), oncology (to predict rectal cancer survival and breast cancer risk), endocrinology (to assess osteoporosis and fracture risks), and pulmonology (to measure lung function).'' 87 FR 47881. The Proposed Rule also identified that use of Crisis Standards of Care to allocate health care resources may also discriminate on the basis of disability and/or age. 87 FR 47880–82. OCR aims to continue providing additional guidance to the public and covered entities as such information on potential discrimination in the use of such tools becomes available.

The Department itself regularly publishes information and advisories to the public. For example, the Agency for Healthcare Research and Quality (AHRQ) recently issued a report on the ''Impact of Healthcare Algorithms on Racial and Ethnic Disparities in Health and Healthcare.'' [346] Additionally, addressing published medical journals' research studies and the subsequent media attention about racial bias resulting from the use of pulse oximeters, the FDA published a safety communication to announce that the FDA was reassessing the content of its pulse oximetry guidance document and would share additional updates with the public.[347]

Published articles of research studies in peer-reviewed medical journals are also a reliable source of information about evidence-based adverse outcomes based on patient care decision support tools that may result in discrimination. Such articles are increasing in prevalence given the growing use of AI and other patient care decision support tools in health care decision-making.[348] For example, peer-reviewed medical journals have recently published several articles related to racial discrepancies resulting from the use of pulse oximeters.[349] One such study found that pulse oximeters more commonly overestimated arterial oxygen saturation levels in patients from minority racial and ethnic groups and led to delayed recognition of need for COVID–19 therapy among Black patients compared with white patients.[350]

Covered entities also may gain knowledge that use of a patient care decision support tool creates a risk of discrimination based on a prohibited basis through media outlets that may report on reliable studies.[351]

Health care professional and hospital associations are also often dependable sources of information that notify health care providers about developments in the practice of various specialties and in the administration of medical care, which can include potential discrimination that may result from the use of certain patient care decision support tools.[352] Health insurance-related associations also provide information to their members and the public.[353] Relevant information is also

provided through various nonprofit organizations in the field of AI.

ONC's rule also provides an opportunity for covered entities to learn about the data used in decision support interventions. Developers of decision support interventions that develop certified health IT as part of its Health IT Module are required to support making specific information disclosures under ONC's rule regarding discriminatory bias in their tools, including disclosure of source attributes, and risk management and governance practices.[354]

OCR will assess each allegation that a covered entity is violating § 92.210 on a case-by-case basis. For example, when OCR investigated complaints related to State Crisis Standards of Care guidelines during the COVID–19 pandemic, the investigations involved a fact-specific analysis of each of the guidelines in question. They also included extensive technical assistance with States to revise their Crisis Standards of Care guidelines to remove the alleged discriminatory.[355]

In our analysis of whether a covered entity is in compliance with § 92.210(b)'s ''reasonable efforts to identify'' requirement, OCR may consider, among other factors: (1) the covered entity's size and resources (*e.g.,* a large hospital with an IT department and a health equity officer would likely be expected to make greater efforts to identify tools than a smaller provider without such resources); (2) whether the covered entity used the tool in the manner or under the conditions intended by the developer and approved by regulators, if applicable, or whether the covered entity has adapted or customized the tool; (3) whether the covered entity received product information from the developer of the tool regarding the potential for discrimination or identified that the tool's input variables include race, color, national origin, sex, age, or disability; and (4) whether the covered entity has a methodology or process in place for evaluating the patient care decision support tools it adopts or uses, which may include seeking information from the developer, reviewing relevant medical journals and literature, obtaining information from membership in relevant medical associations, or analyzing comments or complaints received about patient care decision support tools.

In summary, OCR recognizes the challenges in identifying the discriminatory potential of every use of each patient care decision support tool, and therefore § 92.210(b) requires covered entities to make reasonable efforts to identify tools that employ input variables based on a protected basis.

Comment: Many commenters referred to potential devastating consequences from the use of specific clinical algorithms [356] and recommended that § 92.210 be revised to include a requirement for covered entities to mitigate the risk of discrimination that results from the use of clinical algorithms. Some commenters suggested that OCR require specific mitigation efforts, such as requiring covered entities to: develop and implement policies specific to covered entities' use of clinical algorithms; require staff training; use clinical algorithms in accordance with FDA clearance and developer's intended uses; use peer-reviewed research to inform adjustments to clinical algorithms; notify patients of suspect clinical algorithms; request an assessment of discriminatory inputs from developers; neutralize any discriminatory inputs by using the predominant cohort in the tool's training data; and submit annual reports to OCR regarding their use of clinical algorithms and mitigation efforts.

Response: OCR agrees with commenters' concerns about the potential for harm resulting from discriminatory algorithms and the need to mitigate the risks of discrimination when possible. However, we acknowledge that it is not always possible to completely eliminate the risk of discriminatory bias in patient care decision support tools,[357] and these tools also serve important health care functions. Section 92.210(c) requires covered entities to make reasonable efforts to mitigate the risk of discrimination resulting from the covered entity's use of a patient care decision support tool identified in § 92.210(b). This standard allows a covered entity to adopt more robust safeguards to prevent discrimination, should it choose to do so.

For example, in order to comply with § 92.210(c)'s mitigation requirement, a covered entity that uses the race-adjusted eGFR equation could discontinue using that equation and instead use the revised eGFR equation that does not adjust for race.[358] The covered entity may also implement measures to ensure that staff members follow proper protocols when using the race-adjusted eGFR equation.[359] OCR will evaluate mitigation measures covered entities take on a case-by-case basis to determine compliance with § 92.210(c).

A covered entity's obligation to mitigate risk of discrimination under § 92.210(c) is consistent with the National Institutes of Standards and Technology's (NIST) Artificial Intelligence Risk Management Framework, which explains that AI bias mitigation helps minimize potential negative impacts of AI systems while providing opportunities to maximize positive impacts, without articulating express mitigation measures.[360] The same is true for patient care decision support tools that a covered entity uses

Intelligence (webinar), Am.'s Health Ins. Plans, *https://www.ahip.org/webinars/creating-better-health-outcomes-with-digital-tools-and-artificial-intelligence* (Dec. 8, 2023).

[360] Nat'l Inst. of Standards & Tech., *Artificial Intelligence Risk Management Framework* (AI RMF 1.0), NIST AI 100–1, p. 4 (2023), *https://doi.org/10.6028/NIST.AI.100-1*, (The NIST AI Framework provides: ''Where tradeoffs among the trustworthy characteristics arise, measurement provides a traceable basis to inform management decisions. Options may include recalibration, impact mitigation, or removal of the system from design, development, production, or use, as well as a range of compensating, detective, deterrent, directive, and recovery controls.'').

in its health programs and activities for clinical decision-making.

While we appreciate the breadth of mitigation techniques suggested by commenters—and agree that many of those efforts would be best practices to prevent algorithmic discrimination—we decline to require covered entities to take any specific mitigation efforts under § 92.210(c). We have determined that a reasonable efforts mitigation requirement strikes the right balance between the need for covered entities to mitigate the risk of discrimination resulting from their use of patient care decision support tools and the burden placed on covered entities. In the Proposed Rule, 87 FR 47883, we noted that covered entities may choose to mitigate discrimination by establishing written policies and procedures governing how clinical algorithms will be used in decision-making, including adopting governance measures; monitoring any potential impacts and developing ways to address complaints; and training staff on the proper use of such systems in decision-making. We encourage covered entities to take these and other additional mitigating efforts to comply with § 92.210.[361] We further note that this rule does not excuse a covered entity from complying with any other applicable Federal or State law that may apply, including but not limited to requirements for FDA approval where appropriate, such as the Food Drug and Cosmetic Act [362] and the Medical Device Amendments.[363]

In addition, once a covered entity identifies a particular use of patient care decision support tool under § 92.210(b), a covered entity's mitigation efforts under § 92.210(c) may vary based on the input variable or factor, as well as the purpose of the tool in question. OCR acknowledges that some input variables may generate greater scrutiny, such as race, which is highly suspect,[364] as compared to other variables, such as age, which is more likely to have a clinically and evidence-based purpose. Some bases protected by section 1557, such as age, are likely prevalent in patient care decision support tools and may not require extensive mitigation efforts under § 92.210(c) if use of the variable in the tool does not result in discrimination. For instance, where a tool employs an input variable for age, the covered entity's mitigation efforts under § 92.210(c) regarding that tool may include justifying the tool's use of age as an input variable by showing that age is clinically indicated as a measure in the particular tool and/or aligns with evidence-based clinical best practices that do not result in discrimination. We further note that the Age Act itself allows age distinctions under certain circumstances, including when related to age distinctions that reasonably take into account age as a factor necessary to the normal operation or the achievement of any statutory objective of a program or activity. 42 U.S.C. 6103(b)(1); 45 CFR 91.13 (adopting statutorily permissive age distinctions found at 42 U.S.C. 6103(b)(1)).

Comment: Some commenters indicated that clinicians trust the FDA's process for reviewing and approving clinical use of patient care decision support tools as well as published data illustrating a tool's efficacy in their use of these tools.

Response: The FDA regulates the sale of medical devices (including diagnostic tests) and monitors the ongoing safety and effectiveness of regulated marketed devices.[365] The FDA has released draft guidance on Predetermined Change Control Protocol (PCCP AI/ML) [366] and will be publishing draft guidance for Artificial Intelligence/Machine Learning (AI/ML)-enabled Device Software Functions: Lifecycle Management Considerations and Premarket Submission Recommendations. In addition, FDA is actively working through public-private partnerships to set uniform guidelines on addressing bias in AI across its lifecycle.

Section 92.210 is concerned with ensuring that covered entities' use of a patient care decision support tool does not result in prohibited discrimination, which includes medical devices as ''automated or non-automated tool[s] . . . used by a covered entity to support clinical decision-making.'' While FDA's premarket review processes strive to minimize discriminatory biases in patient care decision support tools before they are authorized to market, real world post-market deployment of FDA-approved devices can introduce discriminatory bias. Therefore, it is important to identify different points of bias and provide an action plan for remediation.[367]

Comment: Many commenters suggested that covered entities should share liability with algorithm creators for the consequences related to covered entities' use of these tools because clinicians may lack sufficient information to detect that an algorithm can result in discrimination. Another commenter suggested that § 92.210 should impose strict liability on manufacturers of algorithms, not the end users. Yet another commenter suggested that OCR create a safe harbor for covered entities that use clinical algorithms consistent with and within the scope of their intended purpose.

Response: Each covered entity is independently required to comply with all provisions in section 1557, including § 92.210. A covered provider's liability under section 1557 is not contingent on or related to a developer's potential liability under this rule or this provision. As discussed above, § 92.210(b) requires a covered entity to identify use of patient care decision support tools in its health programs and activities that employ input variables or factors that measure race, color, national origin, sex, age, or disability, and § 92.210(c) requires covered entities to make reasonable efforts to mitigate the risk of discrimination that results from the covered entity's use of a tool identified in § 92.210(b) in clinical decision-making.

If a developer is subject to section 1557, § 92.210 applies to it in the same manner it applies to all covered entities. Under § 92.210, covered entities must take requisite actions to ensure their use of a patient care decision support tool does not result in discrimination. We decline to impose strict liability on covered entities in their use of these tools, including covered developers.

Comment: Some commenters opined that proposed § 92.210 lacked sufficient specificity and that our reference in the Proposed Rule to covered entities' overreliance on clinical algorithms was confusing because there is no definition or criteria about what it means to ''rely'' on a clinical algorithm.

Response: We appreciate commenters' concerns. We note that § 92.210 relates to covered entities' *use* of patient care decision support tools rather than their reliance on them. In the Proposed Rule, we cautioned that a covered entity's overreliance on clinical algorithms in its decision-making can result in discrimination, and that covered entities should refrain from *over-relying* on patient care decision support tools by using them beyond their reasonably expected scope as a replacement or substitute for providers' clinical judgment. 87 FR 47880–82.

Comment: Some commenters characterized § 92.210 as a novel provision and argued that, in consequence, OCR investigative staff need to conduct fact-specific analyses of allegations of discrimination. Other commenters supported OCR's proposed approach to conduct a case-by-case factual inquiry into compliance with § 92.210. Many commenters pointed out that proactive oversight by OCR is also needed due to the non-transparent, systemic nature of this form of discrimination, which may limit complaints.

Response: OCR will investigate each complaint under § 92.210 on a case-by-case basis. OCR will review all applicable evidence to determine whether the covered entity took reasonable steps to identify whether the patient care decision support tool it is using is a tool that employs input variables that measure race, color, national origin, sex, age, or disability under § 92.210(b). When an investigation reveals that a covered entity has appropriately identified its use of a patient care decision support tool under § 92.210(b), OCR will determine whether the covered entity took reasonable efforts to mitigate the risk of discrimination resulting from the use of the patient care decision support tool at issue in accordance with § 92.210(c), as described above. As we have affirmed elsewhere with respect to other provisions of this final rule, OCR will employ all available means to investigate alleged violations of § 92.210, including through complaint investigations and compliance reviews based upon potential complaints in order to provide proactive oversight over the use of these tools.

Comment: A professional association commenter recommended that OCR's enforcement actions should consider whether covered entities have set up incentives to pressure health care professionals to follow the recommendations of clinical algorithms even if they conflict with the professional's clinical judgment.

Response: We appreciate this comment, and OCR will take such situations into account on a case-by-case basis when determining whether a covered entity violates this provision as OCR evaluates the facts in complaints brought under § 92.210.

Comment: Commenters recommended that OCR work with covered entities to achieve compliance by providing covered entities, specifically physician practices, with technical assistance and guidance, to help them integrate both clinical algorithms and improvements for these algorithms into existing clinical workflows to increase efficiency and minimize administrative burden.

Response: OCR seeks to provide covered entities with technical assistance regarding compliance with all civil rights requirements, including compliance with § 92.210. OCR is committed to partnering with covered entities to eliminate discrimination resulting from the use of patient care decision support tools in covered entities' health programs and activities.

Comment: Some commenters were concerned that complying with § 92.210 would be difficult for smaller covered entities with fewer resources.

Response: Section 92.210 applies to all covered entities regardless of size, including smaller entities. All covered entities must make reasonable efforts to mitigate the risk of discrimination resulting from their use of a patient care decision support tool identified in § 92.210(b), but the size and resources of the covered entity will factor into the reasonableness of their mitigation efforts and their compliance with § 92.210.

Comment: Some commenters encouraged OCR to require covered entities to comply with § 92.210 as quickly as possible, while one commenter suggested that covered entities should be required to evaluate their algorithms and mitigate bias within 12 months.

Response: We acknowledge that covered entities may need additional time to comply with the new requirements in § 92.210(b) and (c). Therefore, OCR is revising § 92.1 to reflect a delayed applicability date that specifies covered entities must comply with § 92.210(b) and (c) within 300 days following the effective date of the rule.

Request for Additional Comment

OCR seeks comment on whether we should engage in additional rulemaking to expand the scope of § 92.210, and if so, in what ways. Specifically, OCR seeks comment on other decision support tools that are being used in covered entities' health programs and activities that do not directly impact patient care and clinical decision-making, but may nevertheless result in unlawful discrimination in violation of section 1557, and whether § 92.210 should apply to such decision support tools. For example, we are aware of decision support tools that are used by health insurance issuers to determine amounts owed to them or by providers for services rendered. Other examples include tools used for automated coding for billing,[368] and fraud, waste, and abuse.[369] Additionally, covered entities may use decision support tools for administrative and operational activities, such as patient scheduling, and we are aware that there is research suggesting that these tools can result in rushed and inadequate care for lower socioeconomic patients.[370] Decision support tools may also be used to allocate resources, such as allocating spending geographically on diagnostic imaging that favors regions with historically more expensive, high-tech equipment and a lower presence of historically marginalized and underserved persons.[371] OCR seeks comment on these uses and others that may result in unlawful discrimination in violation of section 1557, and whether § 92.210 should be expanded to cover these tools as well.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing § 92.210 with modifications. First, we are adding a § 92.210(a), which reads

[368] *See, e.g.,* Jessica Miller, *How Is AI Quickly Taking Medical Coding to the Next Level?,* Medicodio (June 6, 2023) *https://medicodio.com/how-is-ai-quickly-taking-medical-coding-to-the-next-level/#:~:text=AI%20has%20transformed%20medical%20coding,codes%2C%20and%20assign%20them%20automatically.*

[370] *See, e.g.,* Howard Fine et al., *Health Care Embraces AI,* Los Angeles Business Journal (June 12, 2023), *https://labusinessjournal.com/special-reports/health-care-embraces-ai/.*

[371] *See, e.g.,* Brent Nelson et al., *Computerized Decision Support for Concurrent Utilization Review Using the HELP System,* 1 J. Am. Med. Informatics Ass'n. 339 (1994), *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC116216/pdf/0010339.pdf.*

the same as proposed § 92.210 except that we added ''General prohibition'' to the beginning of the provision and replaced the term ''clinical algorithm'' with the term ''patient care decision support tool.'' Second, we added § 92.210(b), which states, ''A covered entity has an ongoing duty to make reasonable efforts to identify uses of patient care decision support tools in its health programs or activities that employ input variables or factors that measure race, color, national origin, sex, age, or disability.'' Third, we have added § 92.210(c), which states, ''For each patient care decision support tool identified in paragraph (b) of this section, a covered entity must make reasonable efforts to mitigate the risk of discrimination resulting from the tool's use in the covered entity's health programs or activities.''

Nondiscrimination in the Delivery of Health Programs and Activities Through Telehealth Services (§ 92.211)

In § 92.211, we proposed that a covered entity must not, in delivery of its health programs and activities through telehealth services, discriminate on the basis of race, color, national origin, sex, age, or disability.

OCR sought comment on this approach and whether covered entities and others would benefit from a specific provision addressing accessibility in telehealth services for individuals with disabilities and individuals with LEP. We invited comment on what such a provision should include, and why the provisions at proposed §§ 92.201 (Meaningful access for individuals with LEP), 92.202 Effective communication for individuals with disabilities), and 92.204 (Accessibility of ICT for individuals with disabilities), would be insufficient. Further, we requested comment on challenges with accessibility specific to telehealth and recommendations for telehealth accessibility standards that would supplement the effective communication and ICT provisions of this part. We encouraged commenters to consider the range of technology available for accessing telehealth, including user-friendly design, as well as security and privacy requirements (for example, when using public Wi-Fi access).

The comments and our responses regarding § 92.211 are set forth below.

Comment: Most commenters on this issue were supportive, stating that a specific provision requiring nondiscrimination in delivery of health programs and activities through telehealth services is important for addressing health equity for underserved groups and areas, social determinants of health, and improving access to a wide range of health care. Some commenters added that the expansion of telehealth has been particularly important for access to care for those who are immunocompromised or otherwise at risk for COVID–19 and potential future pandemics, those who live in rural communities, and those in need of gender-affirming care. Many commenters called for increased investment and training to promote technological literacy as a vital complement to this effort.

Response: We agree that a standalone provision requiring nondiscrimination in delivery of health programs and activities through telehealth services is warranted and we appreciate the thoughtful comments. We welcome the opportunity to promote health literacy and provide technical assistance within our scope of authority.

Comment: A few commenters indicated that covered entities will require additional time, technical assistance, and/or safe harbors to come into compliance with this provision, particularly if specific language access and accessibility requirements regarding telehealth platforms are incorporated. Furthermore, one commenter contended that regulation is premature since telehealth technology and platforms are too new.

Response: While we appreciate the concerns expressed by covered entities, we respectfully disagree with the proposition that it is premature to regulate nondiscrimination in health programs and activities delivered via telehealth. As stated in the Proposed Rule and the Department's joint guidance with DOJ on nondiscrimination in telehealth (Telehealth Guidance),[372] covered entities that use telehealth are already prohibited from doing so in a discriminatory manner. The Telehealth Guidance explains covered entities' responsibilities to ensure effective communication and the provision of auxiliary aids and services (section 504 and § 92.202) and the provision of language assistance services for individuals with LEP (title VI and § 92.201). Telehealth platforms, in particular, are also covered by the ICT provision (§ 92.204). Given the dramatic expansion in the use of telehealth and continuing barriers in access to care experienced by individuals due to inaccessibility of telehealth services, we believe it is necessary and appropriate to regulate this medium of health care provision. OCR will provide further technical assistance and clarifying guidance as appropriate to help covered entities further understand their responsibilities.

Comment: Some commenters requested that OCR apply a broad definition of ''telehealth'' requesting inclusion of medical devices, tests, and equipment used as part of telehealth services. Other commenters requested OCR define telehealth as ''the use of digital technology to deliver health care, health information, and other health services, including diagnosis, treatment, assessment, monitoring, communications, and education.''

Some commenters also requested that audio-only and remote patient monitoring be required to comply with §§ 92.201 (Meaningful access for individuals with LEP), 92.202 (Effective communication for individuals with disabilities), and 92.204 (accessibility of ICT for individuals with disabilities).

Response: OCR has determined it is appropriate to codify the definition of the term ''telehealth'' as provided by the Health Resources and Services Administration [373] and the Office of the National Coordinator for Health Information Technology [374] referenced in the Proposed Rule at 87 FR 47884. As such, we are adding a definition for telehealth to the final rule under § 92.4. which will read ''use of electronic information and telecommunications technologies to support long-distance clinical health care, patient and professional health-related education, public health, and health administration. Technologies include videoconferencing, the internet, store-and-forward imaging, streaming media, and terrestrial and wireless communications.'' Audio-only and remote patient monitoring services are included in this definition. Additionally, medical devices, tests, and equipment that are used as part of a health program or activity delivered through telehealth services must also be accessible.

Comment: Some commenters requested OCR amplify and make clear

Div., *Guidance on Nondiscrimination in Telehealth: Federal Protections to Ensure Accessibility to People with Disabilities and Limited English Proficient Persons* (July 29, 2022), *https://www.hhs.gov/civil-rights/for-individuals/disability/guidance-on-nondiscrimination-in-telehealth/index.html.*

[373] U.S. Dep't of Health Hum. Servs., Health Rsch. Servs. Admin., *What Is Telehealth?, https://www.hrsa.gov/rural-health/telehealth/what-is-telehealth.*

[374] HealthIT.gov, *What Is Telehealth? How Is It Different from Telemedicine?, https://www.healthit.gov/faq/*what-telehealth-how-telehealth-different-telemedicine.

that the privacy provisions under HIPAA are a part of this section. Many commenters detailed privacy concerns specific to individuals with disabilities and individuals with LEP. For individuals with disabilities, concerns were expressed for those who lack privacy in the home and might need additional functionality to be able to use telehealth privately.[375] Other commenters described concerns individuals with LEP may have about their data being shared with immigration or law enforcement.[376]

Response: Comments related to HIPAA are outside of the scope of this rulemaking. However, we direct commenters to HIPAA guidance we have released related to HIPAA and reproductive health care,[377] protecting the security of health information,[378] and audio-only telehealth.[379] Given our responsibility for HIPAA, OCR is very sensitive to privacy concerns among both people with disabilities and individuals with LEP and we remain committed to protecting their privacy and confidentiality.[380]

Comment: One commenter requested that OCR clarify that proposed § 92.211 on nondiscrimination through telehealth services does not apply to prescribing medication abortion or referring for abortion.

Response: The specific content of the health services provided via telehealth is beyond the scope of this rulemaking. In the same way in which we have generally declined to revise the final rule to address how a particular provision applies in the context of the provision of a particular type of care, we decline to do so here as well.

Comment: Many commenters wrote that ensuring equitable payment for and access to telehealth across a range of modalities (including audio-only telehealth, audio-video telehealth, real-time text, and in-person services), as well as making payment rules for telehealth implemented during the COVID–19 Public Health Emergency permanent, is needed to ensure nondiscrimination in the administration of telehealth. Other commenters said that audio-only telehealth should be reimbursed for individuals without smartphones or reliable broadband service. One State commenter requested CMS provide additional guidance on how this rule would impact service delivery in rural areas in light of CMS' audio-only service delivery in Medicare.

Response: Although OCR is cognizant of and sensitive to health equity concerns involving coverage and payment policies for health care services delivered via telehealth, such policies are outside the scope of OCR authorities and the section 1557 rulemaking. However, in general, OCR does not expect the rule to affect audio-only delivery of Medicare services in rural areas.

Comment: Several commenters wrote that inadequate reimbursement of telehealth and disparate medical management requirements limiting access to telehealth are discriminatory and that such practices ought to be prohibited.

Response: OCR will consider complaints raising the issues of whether inadequate reimbursement of telehealth or disparate medical management requirements limiting access to telehealth is discriminatory under section 1557 on a case-by-case basis. To the extent a covered entity's telehealth policies or practices delay or deny an individual's access to a health program or activity delivered via telehealth, OCR will consider whether the delay or denial is based on prohibited grounds under section 1557 as set forth in this rule, including as a discriminatory benefit design prohibited under § 92.207(b)(2). Covered entities have flexibility in determining the reimbursement rates and medical management requirements in their plans, and this rule does not establish specific reimbursement requirements or medical management requirements. However, as noted elsewhere in this preamble, such practices must be implemented in a nondiscriminatory manner.

Comment: Some commenters requested the rule prohibit covered entities from requiring individuals to use telehealth for programs, services, and assessments for which telehealth is inappropriate or risks substandard services or findings. Some commenters also asked OCR to require covered entities to offer in-person alternatives to telehealth services.

Response: OCR recognizes that not all health programs and activities are appropriately delivered via telehealth, and OCR will review complaints related to payers or providers that require individuals to receive programs, services, or assessments via telehealth for potential discrimination concerns. However, we decline to issue a blanket prohibition on the use of telehealth in specific circumstances as requested by commenters, as the use in those situations may not be per se discriminatory or there may be a legitimate, non-discriminatory reason for the practice.

A covered entity may need to offer in-person alternatives to telehealth, as a reasonable modification for individuals with disabilities who cannot be properly provided with effective communication or as a reasonable step to provide meaningful access for individuals with LEP through telehealth services. However, we decline to implement a general requirement that covered entities providing telehealth offer an in-person alternative.

Comment: Many commenters urged that individuals with a disability be afforded the opportunity to choose between telehealth and in-person care based on the service delivery model that works better for their health and communications needs and urged the inclusion of an opt-out provision.

Response: Any individual with a disability who needs to opt-out from receiving care via telehealth should request a reasonable modification of policies and procedures from the covered entity. Unless the reasonable modification fundamentally alters the health program or activity, the covered entity should approve an in-person visit.

Comment: A number of commenters called on OCR to codify WCAG 2.0 (AA), WCAG 2.1 (AA),[381] section 508, or related standards for telehealth platforms. Some recommended requiring certifications of compliance

[381] Web Content Accessibility Guidelines 2.1 (AA), W3C World Wide Web Consortium Recommendation, *https://www.w3.org/TR/WCAG21/.*

from covered entities. One commenter recommended that covered entities be required to attest to making their best effort to accommodate patient needs. Another commenter suggested an elaborate alternative regulatory scheme that would treat telehealth platforms like public accommodations. Other commenters suggested that standards should be adopted in such a manner as to grant covered entities time to come into compliance, and others suggested safe harbors for compliance if a covered entity meets WCAG standards.

Response: OCR recognizes that this is a complex and evolving area, and given the rapid evolution of platforms and technologies, we have decided not to adopt specific accessibility standards at this time for telehealth platforms, particularly given other ongoing rulemakings in this field. Both OCR and DOJ recently issued NPRMs addressing the accessibility of web content and mobile apps used by recipients of Federal financial assistance and public entities, respectively.[382] Those rulemakings provide greater clarity on obligations to ensure that web content and mobile applications are accessible. This rulemaking requires covered entities to ensure telehealth platforms are accessible to individuals with disabilities, unless doing so would impose undue financial and administrative burdens or would result in a fundamental alteration in the nature of a covered entity's health programs or activities. Specifically, OCR notes that communications before, during, and after telehealth appointments must be accessible to individuals with disabilities and individuals with LEP, consistent with pre-existing section 504, title VI, and section 1557 requirements.

Comment: A number of commenters recommended expanding the nondiscrimination requirement of § 92.211 to designated companions or caregivers of people with disabilities, since shared involvement is often necessary to set and facilitate telehealth appointments.

Response: Yes, companions with disabilities are covered under the effective communications requirements of this rule at § 92.202, and therefore we do not believe this language needs to be added. Companions with LEP are similarly covered under the meaningful access requirements of this rule at § 92.201.

Comment: Many commenters stated that providers should assess individuals with disabilities seeking to use telehealth platforms for visual, cognitive, intellectual, mobility, and functional needs, and that platforms should be adapted to address the needs of a wide variety of people with diverse functional limitations who have difficulties communicating through traditional telehealth, including, but not limited to, people with visual, hearing, and speech disabilities.

Response: OCR agrees that such an assessment would be informative and is recommended as a best practice and as a means of connecting individuals with the most appropriate auxiliary aids and services to meet their needs. However, OCR has concluded it is important to allow covered entities flexibility in determining whether to assess individuals with disabilities seeking to use telehealth platforms. We therefore decline to adopt an assessment requirement at this time. However, OCR will continue to monitor developments in methodology for assessing individuals with disabilities.

Comment: Many commenters recommended that covered entities be required to provide individuals with a Notice of Availability (§ 92.11) when covered entities electronically communicate to individuals that they may make telehealth appointments with the covered entity.

Response: Such a scheduling communication is already covered by § 92.11(c)(5)(v), because it relates to services that ''require or request a response from a participant, beneficiary, enrollee, or applicant.''

Comment: A significant number of commenters recommended adopting detailed specifications and performance standards for accessibility features on telehealth platforms for individuals with specific disabilities. Several commenters also said OCR needed to provide specific requirements related to qualified interpreters on telehealth platforms with ''specific provisions addressing accessibility in telehealth services and particularly related to access for individuals with disabilities and LEP individuals.''

Response: While OCR appreciates commenters' request for detailed performance standards, we decline to adopt such provisions at this time given the rapid evolution of platforms and technologies. Requirements addressed elsewhere in the rule, including at §§ 92.201 (Meaningful access for individuals with LEP) and 92.202 (Effective communication for individuals with disabilities), provide a baseline from which covered entities can tailor their compliance. OCR will continue to consider issuing additional guidance on this topic.

Comment: One commenter wrote that audio-only visits are inherently inferior to audio-visual telehealth visits as they exclude information and meaning conveyed through visual cues, increasing chances for poor communications, misdiagnoses, flawed evaluations, and other subpar outcomes. This commenter advised requiring in-person care be available on the same terms as telehealth.

Response: Although OCR appreciates the comment and recognizes that audio-only telehealth communication may not be appropriate for all circumstances, we decline to disallow audio-only as an option for telehealth delivery. We believe this would erect an unnecessary and unjustified barrier to telehealth for individuals who lack the quality or consistent internet access necessary for audio-visual telehealth. As stated previously, a covered entity may need to offer in-person alternatives to telehealth to ensure effective communication for individuals with disabilities (section 504, the ADA, and section 1557), or meaningful access for individuals with LEP (title VI and section 1557), but we decline to implement a general requirement that in-person care be available on the same terms as telehealth. For further information, we once again direct commenters to the Telehealth Guidance.[383]

Comment: One commenter wrote that, given that telehealth is incorporated in ''information and communication technology for individuals with disabilities'' (§ 92.204), it would be helpful to explain the interaction between these two sections.

Response: This commenter is correct that telehealth is closely related to the ICT section. ICT is generally a means by which to facilitate access to information in a health program or activity, whereas telehealth is a medium through which a health program or activity is delivered and for which access is needed. Health programs and activities provided through ICT include telehealth, which we define as the use of electronic information and telecommunications technologies to support long-distance clinical health care, patient and professional health-related education, public health, and health administration. In contrast, ICT relates to the technology and other equipment,

[382] *See* 88 FR 63392 (Sept. 14, 2023) (HHS) and 88 FR 51948 (Aug. 4, 2023) (DOJ).

[383] U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., U.S. Dep't of Justice, Civil Rts. Div., *Guidance on Nondiscrimination in Telehealth: Federal Protections to Ensure Accessibility to People with Disabilities and Limited English Proficient Persons* (July 29, 2022), *https://www.hhs.gov/civil-rights/for-individuals/disability/guidance-on-nondiscrimination-in-telehealth/index.html.*

such as computers and peripheral equipment; information kiosks and transaction machines; telecommunications equipment; telehealth interfaces or applications; customer premises equipment; multifunction office machines; software; mobile applications; websites; videos; and electronic documents. Thus, while telehealth interfaces and applications are a form of ICT, the rapid expansion of its use by providers and broad impact on the health care landscape necessitate careful consideration independent of a broader ICT section. The telehealth section is designed to ensure that health programs and activities delivered via telehealth technologies are done so in a manner that does not discriminate.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.211 without modification.

Subpart D—Procedures

Enforcement Mechanisms (§ 92.301)

Proposed § 92.301 provides that the enforcement mechanisms available for and provided under title VI of the Civil Rights Act of 1964, title IX of the Education Amendments of 1972, section 504 of the Rehabilitation Act of 1973, and the Age Discrimination Act of 1975 shall apply for purposes of section 1557 as implemented by the part.

The comments and our responses regarding § 92.301 are set forth below.

Comment: Many commenters strongly supported OCR's clarification that section 1557 provides an independent basis for regulation of discrimination in covered health programs and activities. Supporters indicated that the rule as proposed would provide for robust enforcement of section 1557, consistent with existing law and the clear intent of Congress. One commenter expressed support for the different mechanisms of enforcement and emphasized the importance of enforcement that is level, targeted, and constant to ensure long-term adherence to section 1557's nondiscrimination provisions.

Response: OCR appreciates and acknowledges the need for strong enforcement mechanisms in order to adequately address discrimination in health programs and activities.

Comment: One commenter noted that making a clear procedure for claims of discrimination on multiple bases is important, not only for the complainant to fully understand their rights and remedies, but also for the covered entity to know how best to respond to a grievance. Commenters also suggested that OCR provide guidance on how covered entities should proceed with complaints that involve multiple bases of discrimination.

Response: OCR agrees that it is important to provide clarity to both complainants and covered entities regarding the procedures for raising a claim under section 1557. We currently offer resources on our website to provide the public and covered entities with information about the complaint process and how covered entities implement and maintain compliance. As discussed in § 92.303, in an effort to simplify the complaint process, OCR is revising the regulatory text to apply a single administrative enforcement procedure for discrimination complaints filed under section 1557, regardless of the alleged basis of discrimination. This will eliminate confusion for both covered entities and the public with regard to how OCR will evaluate and investigate allegations of discrimination brought under this part, including allegations involving multiple bases of discrimination. Covered entities should handle section 1557 grievances involving multiple bases of discrimination under one process. OCR will continue to provide guidance to covered entities on an ongoing basis to ensure compliance with the rule.

Comment: Several commenters stated that section 1557 creates a health-specific, nondiscrimination private cause of action. They opine that, because Congress expressly adopted one provision to prohibit discrimination on multiple grounds, the enforcement mechanisms available under each of the referenced statutes are not intended to be limited to the particular ground of alleged discrimination but rather would be available regardless of the ground of discrimination at issue.

Many commenters strongly recommended that OCR expressly state, as it did in the 2016 Rule preamble, that it will interpret section 1557 as authorizing a private right of action for claims of disparate impact for all grounds of prohibited discrimination. They stated that making the private right of action language explicit in the rule will provide for transparency and patient protection and enable more consistent enforcement of section 1557. Commenters stated that without a disparate-impact theory of liability, a private right of action will ring hollow for people of color and other systemically marginalized groups. Additionally, commenters noted that in an era where artificial intelligence and automated decision-making are increasingly responsible for resource allocation, recognition of disparate-impact liability is critical. Other commenters noted that a private right of action is essential to ensuring that individuals who experience discrimination on the basis of sex in health care are not solely reliant on OCR to enforce the law and may be entitled to seek compensation through a private right of action for the harm they experience.

Commenters further stated that the Supreme Court has affirmed the right of all private individuals to sue in Federal court to challenge violations of the protections of section 1557. Other commenters noted that a private right of action is essential to ensuring that individuals who experience discrimination on the basis of sex in health care are not solely reliant on OCR to enforce the law. Commenters also stated that by expressly including enforcement mechanisms ''available under'' the statutes, Congress authorized disparate-impact claims to be brought under section 1557.

Finally, commenters raised specific concerns regarding the Age Act's administrative exhaustion requirement, 42 U.S.C. 6104(f), and many commenters recommended that OCR include regulatory language in the final rule clarifying that administrative exhaustion is not required before a court action involving multiple bases of discrimination that includes age can be filed by the complainant. These commenters stated that because section 1557 is its own statute—enforceable by private right of action in the courts—an older adult who is discriminated against based on age and another basis should not be disadvantaged due to the Age Act's administrative-exhaustion requirement.

Response: Courts have long recognized that section 1557 authorizes a private right of action under any of the bases for discrimination. OCR declines to revise regulatory text to adopt a stance on the appropriate standards that apply to private litigants. This is an issue appropriately addressed by the Federal judicial branch and not via agency rulemaking.

Comment: One commenter requested that OCR clarify whether providers caring for individuals with disabilities and relatives of such individuals have the ability to bring a civil rights action in appropriate cases, such as where the provider or relative are themselves harmed by the plan's discriminatory conduct.

Response: OCR cannot provide legal advice as to whether an individual can appropriately bring a private claim under section 1557. If an individual—

including providers and relatives of a plan holder—believes they have experienced discrimination prohibited by section 1557, they are able to file a complaint with OCR. OCR will conduct a case-by-case analysis to determine its jurisdiction over the complaint allegations.

Comment: Some commenters urged OCR to increase enforcement capacity through coordination among agencies within the Department, and that the final rule should authorize OCR to empower other Department components, such as CMS, to investigate and enforce section 1557 claims.

Response: As a law enforcement agency with specialized knowledge and delegated authority over section 1557 enforcement, OCR is the agency within the Department that investigates and enforces section 1557 complaints. However, OCR continues to work with other agencies on many different initiatives and issues, including to promote compliance with Federal civil rights laws such as section 1557.

Comment: Some commenters suggested that OCR should pair enforcement with robust outreach and education. Several commenters requested that OCR postpone any enforcement action until after OCR provides education resources and technical assistance, to allow time for different practices to come into compliance without penalty.

Several commenters requested that OCR use enforcement discretion for particular groups of providers. For example, one commenter asked OCR to provide assurances that pharmacists can use reasonable clinical judgment to treat patients within their scope of practice, and not be subject to additional administrative burden and legal liability. Another commenter requested that OCR use enforcement discretion and not penalize physicians for failing to provide interpreter services as long as they make reasonable efforts to satisfy the final rule's requirements. This commenter also requested that OCR provide guidance and support for physicians in rural and other hard to reach areas for procuring and using the necessary technology to connect with remote interpreters. Specifically, this commenter pointed to concerns with physician practices in remote areas where interpreter availability is inconsistent and remote connectivity to interpreter services is either substandard or non-existent due to the lack of necessary broadband.

Response: We appreciate the commenters' concern, but section 1557 has been in effect since 2010 and OCR declines to postpone enforcement past the effective date of 60 days after publication of the final rule. We note, however, that we have provided delayed implementation dates for a number of provisions. Further, prior to taking an enforcement action (*i.e.,* terminating Federal financial assistance or referring a matter to DOJ for enforcement), OCR must attempt to achieve a covered entity's voluntary compliance with the law, such as through providing technical assistance and reviewing policies and procedures.[384]

Comment: Some commenters recommended adding a new provision requiring OCR to publish general information about the number and types of complaints received and resolved on a yearly basis and to publicly post information regarding resolution agreements within 14 days of resolving a complaint.

Response: Much of the information requested is already provided to Congress annually through OCR's Congressional Justifications and these annual justifications are also available on OCR's website.[385] In addition, OCR posts its resolution agreements to its website, available to anyone to review. We intend to continue with this practice as more cases are resolved.

Comment: Some commenters were also concerned with mandatory arbitration agreements and recommended that OCR include a specific provision prohibiting insurers from requiring binding arbitration as the exclusive means to resolve a complaint arising under section 1557. These commenters were concerned that binding arbitration greatly favors defendants, particularly large corporations.

Response: OCR appreciates concerns with regards to arbitration but notes that agreements between private parties is beyond the scope of this rulemaking.

Summary of Regulatory Changes

For the reasons set forth above and in the Proposed Rule and considering the comments received we are finalizing the provisions as proposed in § 92.301, without modification.

[384] *See, e.g.,* U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *HHS Office for Civil Rights Resolves Complaints with CVS and Walgreens to Ensure Timely Access to Medications for Women and Support Persons with Disabilities* (June 16, 2023), *https://www.hhs.gov/civil-rights/for-providers/compliance-enforcement/agreements/cvs-walgreens/index.html.*

Notification of Views Regarding Application of Federal Religious Freedom and Conscience Laws (§ 92.302)

In proposed § 92.302, OCR proposed an administrative process under which recipients can notify OCR of their views that they are exempt from certain provisions of section 1557 due to an applicable Federal conscience or religious freedom law. This proposed provision was not in either the 2016 or 2020 Rule.

Proposed § 92.302(a) provided that a recipient may notify OCR of its view that it is exempt from certain provisions of this part due to the application of a Federal conscience or religious freedom law. Proposed § 92.302(b) provided that once OCR receives such notification from a particular recipient, OCR shall promptly consider those views in responding to any complaints or otherwise determining whether to proceed with any investigation or enforcement activity regarding that recipient's compliance with the relevant provisions of this part. We further explained that any relevant ongoing investigation or enforcement activity regarding the recipient shall be held in abeyance until a determination has been made under § 92.302(c).

Proposed § 92.302(c) provided that based on the information provided in the notification under Proposed § 92.302(a), OCR may determine at any time whether a recipient is exempt from the application of certain provisions of this part, or whether modified application of the provision is required with respect to specific contexts, procedures, or health care services, based on an applicable Federal conscience or religious freedom law. In doing so, we further explained that OCR will assess whether there is a sufficiently concrete factual basis for making a determination and will apply the applicable legal standard of the relevant law. Proposed § 92.302(c) also provided that OCR will communicate its determination to the recipient. Proposed § 92.302(d) provided that if OCR determines that a recipient is exempt from the application of certain provisions of this part or modified application of the provision is required as to specific contexts, procedures, or health care services, based on a Federal conscience or religious freedom law, that determination does not otherwise limit the application of any other provision of this part to the recipient or to other contexts, procedures, or health care services.

The comments and our responses regarding § 92.302 are set forth below.

Comment: Many commenters expressed support for the proposed provision primarily because, in their view, § 92.302 would balance the need to protect both the religious and conscience views of recipients and the civil rights protections for patients, providers, and consumers. In commenting on the purpose of section 1557, one religious, organizational commenter stated that it ''strongly supports the principle of nondiscrimination in health programs and activities established by the ACA and the promulgation of regulations to ensure that principle is implemented robustly'' because ''[a]ccess to health care is essential to promote and protect the inherent and inalienable worth and dignity of every individual.'' Another religious, organizational commenter stated that ''[e]nsuring access to health coverage and health care, and removing barriers to these, is without question a laudable goal.''

Response: OCR appreciates these commenters' views and agrees that § 92.302 allows OCR to fully consider and uphold religious freedom and conscience laws as well as civil rights laws for patients, providers, and consumers, to ensure broad access to health care for all individuals.

Comment: Many other commenters opposed the addition of § 92.302. Commenters maintained that the process for notifying OCR of their exemption requests would burden religious entities and favor the interests of third parties. Some commenters raised concerns that claims of third-party harms can be used by opponents of religious liberty as a basis for denying any religious exemption. Additionally, a few commenters asserted that any investigation by OCR that excludes consultation with the Conscience and Religious Freedom Division will lead to religious and conscience objectors losing to claims of third-party harms. Commenters thus requested that OCR explain the types of harm that may overcome religious objections.

Response: OCR appreciates commenters' objections to § 92.302 and recognizes the request for guidance and clarification. In response to commenters who stated that the notification process itself burdens religious entities, OCR has added clarifications to the regulatory text stating that recipients may rely on the protections in religious freedom and conscience laws or seek further assurance of these protections from OCR, if they wish. OCR notes that under revised § 92.302, recipients are not required to seek assurance of an exemption in advance but may raise a claim under an applicable Federal religious freedom and conscience protection in the context of an OCR investigation or enforcement action. Also, we have revised § 92.302(a) to make clear that, insofar as the application of any requirement under this part would violate applicable Federal protections for religious freedom and conscience, such application shall not be required. This language is consistent with language added to § 92.3(c) and has been interpreted by courts to support the Department's position that it ''will abide by RFRA in any enforcement of Section 1557'' and that the Department ''has never enforced section 1557 to require a provider with a religious objection to perform gender transition services.'' *Am. Coll. of Pediatricians* v. *Becerra,* 2022 WL 17084365 (E.D. Tenn. 2022) (citing to this language from the 2016 Rule as support).

In making determinations under § 92.302, OCR will faithfully apply the legal standards set forth in the Federal religious freedom or conscience law at issue. For example, RFRA provides that the Federal Government may not substantially burden a person's exercise of religion unless ''it demonstrates that application of the burden to the person—(1) is in furtherance of a compelling governmental interest; and (2) is the least restrictive means of furthering that compelling governmental interest.'' 42 U.S.C. 2000bb–1(b). Further, while case law interpreting RFRA requires consideration of any potential third-party harms, such harms, where relevant, are one of several factors that will be considered. Other Federal religious freedom and conscience laws set forth different tests. For example, a provision of the Church Amendments, 42 U.S.C. 300a–7, states that the receipt of Federal financial assistance (under certain statutes implemented by HHS) ''by any individual or entity does not authorize any court or any public official or other public authority to require . . . such individual to perform or assist in the performance of any sterilization procedure or abortion if his performance or assistance in the performance of such procedure or abortion would be contrary to his religious beliefs or moral convictions,'' *id.* 300a–7(b)(1). When administering its exemption process, OCR will carefully apply the text of these statutes and judicial precedents interpreting them, including by being mindful of the ways in which the texts of these statutes differ from one another.

We continue to believe that this approach is most consistent with the Federal religious freedom and conscience protections. In addition, OCR has consulted with the appropriate Department staff regarding the application of religious freedom and conscience protections during this rulemaking and will continue to engage staff during OCR's enforcement of the final rule.

Comment: Many commenters said that by not allowing a categorical pre-enforcement exemption and instead making the exemption process case-by-case, OCR will increase doubt among providers, inviting constant reliance upon administrative adjudication and litigation that will cost unnecessary time and money. Some commenters asserted that OCR's consideration of claims on a case-by-case basis is problematic for large health care systems with multiple sites of care. These commenters raised concerns that hospital systems would be deprived of the clarity and certainty needed to adhere to their religious principles and to establish compliance with policies covering all member hospitals, such that the health system would ensure that claimed exemptions were being appropriately and narrowly applied. These commenters claimed that because a recipient would be left with significant uncertainty until OCR considered any enforcement action, the process of claiming a pre-enforcement exemption with OCR affords few assurances of future enforcement protections.

Still, many other commenters supported the § 92.302 process because, in their view, such a case-by-case inquiry allows OCR an opportunity to consider objections in the context-specific manner that Federal religious freedom laws like RFRA require. Many commenters emphasized that in the context of health care under section 1557, the government has a compelling interest in not only preventing discrimination but ensuring taxpayer dollars are not used to further discrimination. Other commenters, however, asserted that RFRA imposes an affirmative obligation on the government to respect and protect religious liberty and is not a defensive argument for individuals to raise on a case-by-case basis.

Response: OCR understands some commenters' concerns and opposition to the proposed provision requiring case-by-case determinations. OCR maintains an important civil rights interest in the proper application of Federal conscience or religious freedom protections, which requires taking a case-by-case approach to such determinations. Among other things, this allows OCR to determine whether the government has a compelling

interest in denying an exemption to a particular party; [386] to consider, when relevant under the applicable legal standard, any harm an exemption could have on third parties, including other recipients, providers, patients, and the public; and to evaluate whether imposing burdens on a covered entity is the least restrictive means of furthering a compelling government's interest.[387]

However, to address commenters' concerns, OCR has revised § 92.302(a) to state that a recipient may ''rely on applicable Federal protections for religious freedom and conscience, and consistent with § 92.3(c), application of a particular provision(s) of this part to specific contexts, procedures, or health care services, shall not be required where such protections apply.'' When a recipient acts based upon its good faith reliance that it is exempt from providing a particular medical service due to the application of relevant religious freedom and conscience protections (*e.g.,* RFRA), OCR will not seek backward-looking relief against that recipient even if the recipient had not affirmatively sought assurance of an exemption under § 92.302(b). But if OCR determines, after an investigation, that the recipient does not satisfy the legal requirements for an exception, it will seek forward-looking relief as appropriate under the facts.

If the recipient wishes to receive an assurance from OCR regarding an exemption under any applicable religious freedom and conscience laws, it may do so under § 92.302(b) either prior to, or during the course of, an investigation. We understand that there was some confusion regarding the ''case-by-case approach'' discussed in how OCR proposed to evaluate exemption requests under § 92.302(b). We clarify here that a recipient may seek assurance of an exemption applying to specific contexts, procedures, or health care services generally. When OCR makes a case-by-case determination, this refers to the evaluation of the exemption assurance request as a whole—which may be requesting assurance of an exemption from a category of procedures or health care services. Thus, when we indicate that exemption requests will be evaluated on a case-by-case basis, this does not mean that a recipient must seek assurance of an exemption each time such procedure or health care is sought if an exemption already applies. Rather, a recipient may demonstrate that it is entitled to an exemption due to a religious or conscience objection to a particular provision in this part, as applied to specific contexts, procedures, or health care services.

A recipient may obtain assurance of its exemption in multiple ways under § 92.302(b). For example, if a recipient is seeking assurance of an exemption while there is no investigation pending, the notification to the OCR Director under § 92.302(b) would include: (1) identification of the provision of care to which the covered entity objects, specifying whether the objection is to the service overall or to the provision of care in a specific circumstance (per item (1)); (2) an explanation of the legal basis supporting the claim (per item (2)); and (3) the factual basis supporting the claim (per item (3)). Thus, for example, if a Catholic hospital is seeking an assurance of an exemption from having to perform sterilization procedures that would conflict with the religious tenets of their institution, their notification under § 92.302(b) would potentially include: (1) the provision to which there is an objection and that the objection is to provision of a procedure overall, *i.e.,* sterilization procedures that are prohibited by their religious tenets; (2) that they should be exempt under a specified religious freedom or conscience law; and (3) evidence that it, for example, never provides sterilization in violation of a particular religious or conscience belief for any patient, no matter their sex.

Alternatively, if a covered entity is seeking assurance of an exemption during an OCR investigation, it may similarly submit a notification under § 92.302(b). This notification would include the same information, but the factual basis for the claim would also discuss the specific context of the investigation in question. Though raised in response to a specific complaint allegation, the recipient may use this same notification to seek assurance of an exemption for the same circumstances going forward.

To take an example drawn from enforcement experience, OCR investigated allegations that a Catholic hospital discriminated against the complainant when it refused to allow his physician to perform a hysterectomy as a form of gender affirming care at their facility. The hospital confirmed during the investigation: (1) it did not perform the particular type of care or procedure (hysterectomy) on any patient under the circumstances (as it performs ''direct sterilization'' only for ''the cure or alleviation of a present and serious pathology and a simpler treatment is not available''); (2) that it was raising a defense under RFRA, citing the relevant legal standard; and (3) the factual basis for not providing such medical care and how the hysterectomy request conflicted with the exercise of its religious beliefs. OCR evaluated the complaint and the hospital's response in light of its obligations under RFRA, and determined that to require the hospital to allow the procedure in question to take place at their facility would result in a substantial burden on their religious exercise. OCR further found that section 1557's prohibition on sex discrimination as applied to the facts of this case was not the least restrictive means of achieving the government's compelling interest in preventing discrimination and therefore closed the matter.

Comment: Some commenters who supported the provision expressed appreciation that the process outlined in § 92.302 would allow OCR to consider an exemption's potential harms to third parties, such as patients or the public. Many commenters believed that this type of exemption process is structured to promote equity and transparency, while ensuring compliance with relevant legal requirements. Multiple commenters shared stories about denials of care, including in medical situations in which patients were seeking emergency services. One commenter reported an instance in which a woman was forced to deal with serious health complications when her treatment was delayed after emergency room staff learned of her sexual orientation. In another example, a commenter recalled that a pediatrician's office refused to make an appointment for an infant because the patient's parents were lesbians. Other commenters said a hospital refused to allow doctors with admitting privileges to provide their patients with, for instance, medically necessary gender-affirming care inside their facilities. Many commenters stated that even where patients are able to obtain the services from another provider, the delay in receiving care may cause irreparable harm. Multiple commenters described that the stress of being denied medical care and the fear of facing similar denials in the future can have serious negative health outcomes.

Some commenters who supported proposed § 92.302 compared the provision to the title IX religious exception, explaining that they preferred an administrative process that

[386] *Fulton* v. *City of Phila.,* 593 U.S. 522, 541–42 U.S. (2021).

[387] *See Burwell* v. *Hobby Lobby Stores, Inc.,* 573 U.S. 682, 739 (2014) (Kennedy, J., concurring) (''Among the reasons the United States is so open, so tolerant, and so free is that no person may be restricted or demeaned by government in exercising his or her religion. Yet neither may that same exercise unduly restrict other persons, such as employees, in protecting their own interests, interests the law deems compelling.'').

protects religious liberty, such as that proposed in § 92.302, over an exception that might be too broad.

Response: OCR appreciates these comments and agrees that the § 92.302 exemption process is the better approach.

Although commenters compared the proposed § 92.302 process with the title IX religious exception when expressing their support, OCR makes clear that the process provided under § 92.302 is separate and apart from title IX and this new provision does not rely upon or effectuate title IX's religious exception. Rather, as explained above, this provision clarifies the applicability of religious freedom and conscience protections and provides a process for OCR to respect applicable Federal religious freedom and conscience laws for specific recipients, whether or not they are religious organizations, in its enforcement of section 1557.

Comment: Several commenters who opposed this provision requested that OCR provide recipients with a categorical exemption, similar to what, in their view, was captured by the 2020 Rule through the importation of the title IX religious exception. In these commenters' view, such importation would provide a categorical exemption from providing procedures that would violate their religious beliefs. Many commenters also argued for incorporation of the title IX religious exception to address their concerns over what they viewed as the complexities, inconsistencies, and unpredictable nature of the § 92.302 process.

Many other commenters also stated that the process at § 92.302 is too burdensome and unclear, and in their view, it would effectively prohibit a provider from abstaining from procedures that violate their religious convictions. Additionally, some commenters stated that these burdens were unfair to religious employers, especially small employers, who the commenters said will refrain from applying for Federal funding, further harming patients due to limited providers.

A few commenters stated that, as proposed, § 92.302 forces religious entities to expose themselves to potential sanctions by requesting an exemption. Requesting any exemption, commenters argued, makes the recipient a target for an agency that, in their view, is a ''bully'' to religious organizations. Several commenters expressed concerns that in requesting an exemption, the recipient will lose, in their views, its ''privacy and anonymity,'' which could have a chilling effect on its provision of health care services.

Response: OCR appreciates and respects commenters' concerns relating to their religious convictions. The § 92.302 process demonstrates OCR's concerted effort to enforce Federal antidiscrimination laws and apply Federal religious freedom and conscience laws. Section 92.302 provides an administrative process, not implemented in either the 2016 or 2020 Rule, which responds to the shortcomings of both rules. Through the § 92.302 process, OCR is committed to implementing a rule that clarifies legal obligations and maintains transparency about its enforcement mechanisms.

Moreover, as previously addressed, *supra,* at § 92.208, OCR complies with the protections in the ACA itself; the Church, Coats-Snowe, and Weldon Amendments; the generally applicable requirements of RFRA; and other applicable Federal laws that provide religious freedom and conscience protections—§ 92.302 provides an administrative process through which providers may rely upon and assert these protections.[388] This provision helps ensure that recipients have an opportunity to seek assurance from OCR about the application of religious freedom and conscience protections. OCR does not seek to deprive a recipient of their ''privacy or anonymity,'' and the information requested is only that which is necessary to provide assurance of the exemption or modification that the recipient is seeking.

To clarify further, recipients may seek an assurance of an exemption under these Federal religious freedom and conscience laws at various points in time, including prior to an investigation or during an ongoing OCR proceeding. To begin, as explained above, a recipient may avail itself of the general application of § 92.302(a) and ''rely on applicable Federal protections for religious freedom and conscience, and application of a particular provision(s) of this part to specific contexts, procedures, or health care services, shall not be required.'' Should the recipient seek an assurance, it may—prior to any administrative investigation and enforcement—do so by filing a notification with OCR under § 92.302(b). OCR will then acknowledge receipt of the notification within 30 days, and the recipient may rely on a temporary exemption, per § 92.302(c)(1), while OCR adjudicates the assurance of exemption request. In instances where OCR has already initiated an investigation, the recipient may, during the pendency of that investigation, similarly notify OCR of their belief they are entitled to an exemption under the process provided at § 92.302(b). The notification will serve as a defense to the relevant investigation or enforcement activity, and a temporary exemption will then be in place per § 92.302(c)(2), pending OCR's determination regarding the request for assurance of the exemption or the conclusion of the investigation.

Finally, OCR disagrees with and respectfully objects to the characterization that it seeks to ''bully'' religiously affiliated recipients or expose them to potential sanctions. Religiously affiliated hospitals and health care facilities play a large role in the health care system, and OCR recognizes the critical patient care needs they provide, particularly in reaching underserved communities. As previously stated, the 2022 NPRM provided factual findings with respect to health care accessibility in the United States based upon health care capacity by providers, population demands, and geographic limitations. 87 FR 47840. A detailed discussion about these considerations can be found in the Regulatory Impact Analysis. In addition, OCR seeks to ensure Federal civil rights protections are fulfilled and has consulted with the appropriate staff regarding the application of religious freedom and conscience protections during this rulemaking and will continue to engage such staff during OCR's enforcement of the final rule.

Comment: Many commenters inquired about OCR's timeline for reaching a determination on a recipient's request. Specifically, commenters objected to the language in proposed § 92.302(c) that provides that, ''OCR may determine at any time whether a recipient is exempt from the application of certain provisions of this part'' because, in their view, this leaves open-ended the start and end points of the process. Some commenters opined that this uncertainty could result in disruptions or inappropriate denials of care while a recipient awaits a determination. Other commenters suggested that OCR amend § 92.302(c) to clarify what is intended by the clause ''may determine at any time'' because it may conflict with the provision in § 92.302(b) that such determinations will be made ''promptly.''

Many commenters recommended that OCR publish the anticipated timeframe for OCR's review of exemption requests, notify the requesting individuals/organizations about when OCR anticipates their review will be

[388] *See also* U.S. Dep't of Health & Hum. Servs., *Safeguarding the Rights of Conscience as Protected by Federal Statutes,* Final Rule, 89 FR 2078 (Jan. 11, 2024).

complete, and instruct the requesting individual/organization to notify patients if they will not be offering the service or treatment under review during that period. Commenters expressed the need to set a reasonable timetable to ensure that requests for exemptions are processed quickly to not impede or delay patient care. Some commenters also proposed that OCR publicize de-identified data on conscience claims and their respective review timelines to ensure public and private entities can monitor any access issues, should they occur.

Many commenters who opposed the process described in § 92.302 explained that the provision lacks the guidance or clarity necessary for recipients to comply. For example, several commenters noted that in proposed § 92.302(a), OCR merely invites health care entities to express their views on whether their Federal religious freedom and conscience rights would be violated but provides no information about when a response should be expected. Some commenters explained that proposed § 92.302(b) appears to contemplate that recipients would wait until they are investigated or subject to an enforcement action before notifying OCR of their view that Federal religious freedom and conscience laws protect them. According to commenters, as proposed, § 92.302 provides no incentive for recipients to notify OCR any earlier than that, since the subsection appears to impose no obligation on OCR to weigh the notification or request until such an investigation or enforcement action is live.

Other commenters pointed to the purported lack of guidance regarding the types of records and facts that would assist OCR in reaching a determination on the exemption request. Some commenters asserted that § 92.302(c) also does not explain how OCR will make final determinations and omits discussion of a recipient's potential recourse for appeal in the event of an adverse decision from OCR.

Response: OCR appreciates commenters' suggestions and concerns and understands the desire for additional clarity and an established timeline under which OCR will process requests for assurances of exemptions and notify recipients of any determination. We agree that there is value in providing more detail regarding what obligations OCR and recipients have during this process, and so have revised § 92.302. These revisions provide, among other things: (1) a general application provision stating that a recipient may rely on applicable Federal protections for religious freedom and conscience; (2) clarity on what a notification for an assurance of a conscience or religious freedom exemption must contain; (3) a temporary exemption that will take effect upon the recipient's submission of the notification, regardless of whether the recipient is being investigated, and that will remain valid during the pendency of OCR's review of the request and any administrative appeal; (4) a general timetable under which OCR will acknowledge and begin to evaluate requests for assurances of exemptions; (5) additional clarity with regard to the scope of an exemption that has been assured under § 92.302(d); and (6) an administrative appeal process for recipients receiving adverse determinations.

First, § 92.302(a) now provides that a recipient may rely on applicable Federal protections for religious freedom and conscience, and application of a particular provision(s) of this part to specific contexts, procedures, or health care services, shall not be required, and does not violate section 1557 if it so relies.

Second, § 92.302(b) now provides that a recipient may notify OCR of its view that it is exempt from certain provisions of this part due to the application of Federal protections for religious freedom and conscience and seek assurance of that exemption. This notification must be in writing directed to the OCR Director and the notification must include (1) the particular provision(s) of this part to which the recipient objects; (2) the legal basis supporting the assurance of exemption request, including the standards governing the applicable conscience or religious freedom law; and (3) the factual basis supporting the recipient's view that it is exempt, including identification of the conflict between the recipient's conscience or religious beliefs and the application of a provision in this part, which may include the specific contexts, procedures, or health care services that the recipient asserts will violate their conscience or religious beliefs overall.

Third, § 92.302(c) now provides that a recipient's notification and request for an assurance of an exemption to OCR will trigger the extension of a temporary exemption to the recipient. This exemption will cover the period of time it takes OCR to reach a determination on the request. The temporary exemption shall apply only to the provision(s) as applied to specific contexts, procedures, or health care services identified in the recipient's notification to OCR and will exempt conduct that occurs during the pendency of OCR's review and determination regarding the assurance of exemption request. In the event that there is an investigation or enforcement activity regarding the recipient related to the specific provisions for which an assurance of exemption has been requested, the temporary exemption will serve as a defense through the investigation or until OCR has made a determination on the assurance of exemption request, or through the administrative process if the recipient seeks an appeal under § 92.302(e). During this time, a recipient's temporary exemption shall remain effective. OCR will work promptly to reach a determination regarding the request.

Fourth, with respect to OCR's expected timetable for review, § 92.302(c) now provides that for pre-enforcement requests for an assurance of an exemption, OCR shall provide the recipient with email confirmation within 30 days of a recipient's notification acknowledging receipt of their request and stating that OCR will work expeditiously to reach a determination. If the request for an assurance of religious freedom and conscience exemption is received during the pendency of an investigation, it shall serve as a defense to the relevant investigation or enforcement activity until the final determination of the recipient's request, the conclusion of the investigation, and any relevant appeal. The temporary exemption shall exempt the recipient from the provision of care at issue in the investigation until a final determination is made on recipient's notification request or investigation, or during the pendency of any appeal.

Fifth, OCR has revised § 92.302(d) to clarify the effect of an exemption. The assurance of an exemption would exempt the recipient from OCR's administrative investigation and enforcement with regard to the application of a particular provision, which may include the specific contexts, procedures, or health care services that the recipient asserts will violate their conscience or religious beliefs. The exemption assurance will not apply to all contexts, procedures, or health care services. A recipient must otherwise have a legitimate, nondiscriminatory reason for denying or limiting service outside the scope of the granted exemption assurance, and any such decision must not be based on unlawful animus or bias, or constitute a pretext for discrimination. For example, a hospital with a religious exemption to not provide sterilizations outside of those permitted under their religious tenets may not rely on the exemption to broadly decline all health care services,

e.g., cancer treatments, to any individual if the hospital otherwise provides that care.

Sixth, § 92.302(e) now clarifies that a recipient may appeal an OCR determination under this section. The relevant revisions provide that recipients subject to an adverse determination of their request for assurance of an exemption may appeal OCR's determination of that request. Recipients who have been denied an exemption assurance under § 92.302 may raise their request before an administrative hearing examiner from the Department with the same procedural protections outlined for such administrative hearings under 45 CFR part 81. The temporary exemption granted under § 92.302(c) would remain in effect until completion of the administrative appeal process.

Comment: Many commenters supportive of the outlined process also urged OCR to revise proposed § 92.302 to require OCR to make publicly available, or publish on its website, all determinations for any exemptions claimed or granted under § 92.302. A few commenters made specific suggestions for what the public postings should contain. These commenters proposed that postings should include the name(s) of the recipient requesting the exemption, the factual basis asserted by that recipient demonstrating its eligibility under Federal law, OCR's analysis of those facts, and the specific provision(s) of the rule to which an exemption is recognized. A handful of other commenters raised the possibility of requiring exemption determinations to be published, within 10 days of issuance, in the **Federal Register** and on the Department's website. Commenters also suggested that the notice should be accompanied by an electronic link to documents that specifically state the nature, scope, and duration of the exemption granted.

Many commenters discussed that, in addition to promoting transparency, providing notice to the public of religious and conscience exemptions granted would provide guidance both to providers and patients regarding their rights and responsibilities under section 1557, reducing confusion that can impede equitable access to care, particularly for the vulnerable populations the rule is designed to protect. Many commenters stated that it is important that individuals seeking care or coverage know whether the health providers or issuers they are considering do, in fact, provide the services they need—including whether they will be presented with all available care options—and whether they will feel accepted and welcomed by the provider they see.

Response: OCR appreciates commenters' suggestions for revisions to the rule to provide notice to the public regarding assurances of exemptions granted under this provision, including through having OCR post information regarding such assurances. Consistent with our title IX regulations and those of other agencies,[389] OCR declines to revise § 92.302 to require affirmative notice of exemptions sought by or granted to recipients under this provision. OCR notes that nothing in this final rule prevents a recipient from providing public notice of any such exemption assurances it has sought or received and we encourage recipients to do so. We recognize that individuals are not always aware that the health care entities from which they seek care may be limited in the care they provide, and remain committed to working with recipients and the public to improve transparency, clarity, and access to health care through implementation of this rule. As noted above, OCR is also subject to FOIA, and information may be released to a requestor or made available for public inspection consistent with the agency's obligations under that statute and its implementing regulations.

Comment: Some commenters also criticized the process laid out in § 92.302 for failing to identify who will evaluate the exemption requests. One commenter stated that most recipients will likely wait to raise their religious defenses in litigation, as they see courts as the only neutral decisionmakers. A handful of commenters also raised concerns that the 2022 NPRM did not mention OCR's 2019 final rule, *Safeguarding the Rights of Conscience as Protected by Federal Statutes,* 84 FR 23170 (May 21, 2019), or its applicability to numerous Federal statutes protecting religious freedom and conscience in health care. As a result of this omission, these commenters expressed skepticism about OCR's ability to apply the regulatory provisions contained in that rule.

Several commenters also questioned the interaction between the proposed exemption process and private rights of action. They stated that while the § 92.302 process would apply to OCR investigations and enforcement, the provision did not address situations where a lawsuit has been filed, as there is no across-the-board requirement that the administrative process be exhausted before going to court. Commenters assumed that faith-based hospitals likely will be forced to litigate claims in the courts without the ability to stay proceedings pending OCR's consideration of their exemption claim—another factor, they argued, which undermined the usefulness of the proposal.

Response: OCR appreciates commenters' concerns regarding the process for review. OCR refers commenters to the six specific steps outlined above detailing what obligations OCR has, and what options are available to recipients. And as stated previously, OCR is committed to enforcing all Federal civil rights laws under its purview. While OCR appreciates comments regarding the 2019 *Safeguarding the Rights of Conscience as Protected by Federal Statutes* final rule, as a result of challenges to its legality, that rule has been vacated.[390] OCR has published its final rule on enforcement of religious freedom and conscience laws. *See Safeguarding the Rights of Conscience as Protected by Federal Statutes,* 89 FR 2078 (Jan. 11, 2024). Finally, OCR would not open or continue an investigation under section 1557 against the recipient regarding compliance with a provision for which they have requested an exemption assurance while a temporary exemption under § 92.302(a) is in effect, or after a final determination is made that the recipient is entitled to an exemption. While such commenters are correct that a temporary or final assurance of an administrative exemption from OCR would not itself preclude any private lawsuit under section 1557, OCR notes that the recipient could still raise the relevant Federal conscience or religious freedom law as a possible defense in judicial proceedings in such private litigation. And in cases where OCR has assured the recipient an exemption under § 92.302, the recipient could argue that that assurance is evidence that a Federal religious freedom or conscience law likely applies to the recipient in any private litigation under this final rule.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the

[389] *See, e.g.,* 45 CFR 86.12 (no notice requirement); *see, e.g.,* 34 CFR 106.12 (Department of Education, same).

[390] *New York* v. *HHS,* 414 F. Supp. 3d 475, 580 (S.D.N.Y. 2019) (''Accordingly, as a remedy, the Court vacates the 2019 Rule in its entirety, pursuant to [the Administrative Procedure Act] § 706(2).''), *appeal dismissed without prejudice to reinstatement,* Nos. 19–4254 et al. (2d Cir.); *see also Washington* v. *Azar,* 426 F. Supp. 3d 704 (E.D. Wash. 2019), *appeal pending,* No. 20–35044 (9th Cir.); *City & Cnty. of San Francisco* v. *Azar,* 411 F. Supp. 3d 1001 (N.D. Cal. 2019), *appeal pending,* Nos. 20–15398 et al. (9th Cir.).

comments received, we are finalizing the provision as proposed in § 92.302, with modifications. First, we are adding a § 92.302(a), which provide that a recipient may rely on applicable Federal protections for religious freedom and conscience, and consistent with § 92.3, application of a particular provision(s) of the part to specific contexts, procedures, or health care services shall not be required where such protections apply.

Second, we are revising the process laid out in proposed § 92.302(b) through (d) as follows. We are revising § 92.302(b) to provide that a recipient that seeks assurance consistent with § 92.302(a) regarding the application of particular provision(s) of the part to specific contexts, procedures, or health care services may do so by submitting a notification in writing to the Director of OCR. Notification may be provided by the recipient at any time, including before an investigation is initiated or during the pendency of an investigation, and provides details on what must be submitted in writing to the OCR Director. We are revising § 92.302(c) to provide that a temporary exemption from administrative investigation and enforcement will take effect upon the recipient's submission of the notification—regardless of whether the notification is sought before or during an investigation, and then delineates the scope and application of the temporary exemption. We are revising § 92.302(d) to provide that if OCR makes a determination to provide assurance of the recipient's exemption from the application of certain provision(s) of the part or that modified application of certain provision(s) is required, the recipient will be considered exempt from OCR's administrative investigation and enforcement with regard to the application of that provision as applied to the specific contexts, procedures, or health care services provided in the written determination. The determination does not otherwise limit the application of any other provision of the part to the recipient or to other contexts, procedures, or health care services.

Third, we are adding § 92.302(e) to provide an administrative appeal process for recipients subject to an adverse determination of its request for an assurance of religious freedom and conscience exemption. Fourth, we are adding § 92.302(f) to provide that a determination under this section is not final for purposes of judicial review until after a final decision under 45 CFR part 81.

Procedures for Health Programs and Activities Conducted by Recipients and State Exchanges (§ 92.303)

Section 92.303 proposed the enforcement procedures related to health programs and activities conducted by recipients and State Exchanges.

In § 92.303(a), OCR proposed applying the procedural provisions in the title VI regulation with respect to administrative enforcement actions concerning discrimination on the basis of race, color, national origin, sex, and disability under section 1557.

Proposed § 92.303(b) applied Age Act procedures to enforce section 1557 with respect to age discrimination complaints against recipients and State Exchanges.

Proposed § 92.303(c) stated that when a recipient fails to provide OCR with requested information in a timely, complete, and accurate manner, OCR may, after attempting to reach a voluntary resolution, find noncompliance with section 1557 and initiate the appropriate enforcement procedure, found at 45 CFR 80.8.

The comments and our responses regarding § 92.303 are set forth below.

Comment: Many commenters recommended that § 92.303(a) explicitly recognize claims of discrimination involving multiple grounds, and suggested adding the language ''or a combination thereof.''

Response: As discussed in § 92.101, OCR agrees with this recommendation and we have added ''or any combination thereof'' throughout the regulatory text.

Comment: Commenters generally supported adoption of title VI procedural provisions with respect to administrative enforcement actions; however, they noted that OCR proposed to process complaints alleging discrimination on the basis of age differently given the adoption of Age Act regulation requirements under § 92.303(b). These commenters recommended that OCR clarify that for administrative enforcement, it will treat claims involving multiple bases, such as age and other protected identities, under the same procedural provisions as title VI.

Response: The Proposed Rule followed the 2016 Rule's approach to administrative enforcement procedures for complaints on the basis of race, color, national origin, sex, and disability, applying the procedures found in the title VI regulation. The Proposed Rule proposed to apply the Age Act regulatory procedures to age-based complaints. The Age Act procedures uniquely contain a requirement that the Department refer all sufficient complaints to mediation upon receipt; unresolved complaints will be returned to the Department. 45 CFR 91.43. The timeline for mediation is generally 60 days, unless a resolution is reached sooner, or the mediator has extended the time period for no more than 30 days. *Id.* at § 91.43(e). The 60-day period counts as part of the 180 days the Department has to resolve a complaint before a court action can be filed by the complainant. 47 FR 57850, 57856 (Dec. 28, 1982). The mediation requirement derives entirely from the HHS Age Act regulations. The Age Act statute does not itself mandate referral for mediation. It merely directs agencies to publish regulations that ''provide appropriate investigative, conciliation, and enforcement procedures.'' 42 U.S.C. 6104(a)(4).

In adopting the mediation requirement, the Department stated that the Age Act regulations offered ''a unique opportunity to try [the] innovative approach'' to resolution of complaints and committed to monitoring the effectiveness of the mediation process. 47 FR 57850, 57856 (Dec. 28, 1982). According to the Department's 2021 Age Act Report, the Department referred 32 complaints for mediation, and two were successfully mediated (6 percent).[391] Eight of 21 (38 percent) cases were successfully mediated in 2020, and eight of 48 (17 percent) were successfully mediated in 2019.[392] Thus, the average success rate of mediation for complaints alleging age discrimination is roughly 18 percent. When a complaint is returned to the Department, it follows the title VI procedural provisions for investigations and enforcement. 45 CFR 91.47.

We agree that individuals filing complaints with OCR under any of the bases for discrimination, including on the basis of age, should not be subject to unnecessary administrative hurdles. Given that the Age Act mediation requirement is not required by statute, but rather was an ''innovative'' approach adopted by the Department under its administrative authority to implement the Age Act, we have determined that OCR has the authority to not import such a requirement into the section 1557 procedures. While

[391] *Annual Report to Congress on Implementation of the Age Discrimination Act of 1975—Fiscal Year 2021,* p. 32, *https://www.hhs.gov/sites/default/files/age-act-2021-report.pdf.*

[392] *Annual Report to Congress on Implementation of the Age Discrimination Act of 1975—Fiscal Year 2019,* p. 30, *https://www.hhs.gov/sites/default/files/age-act-2019-report.pdf*; *Annual Report to Congress on Implementation of the Age Discrimination Act of 1975—Fiscal Year 2020,* p. 32, *https://www.hhs.gov/sites/default/files/age-act-2020-report.pdf.*

mediation may prove beneficial under certain circumstances, as reflected through the Department's reporting on Age Act enforcement, it is not successful in all cases.

Given concerns raised by commenters, the value OCR places on the efficient and timely resolution of complaints, and the potentially sensitive nature of complaints raised under section 1557, we revisited the proposal to require complainants to engage in mandatory mediation. After review, and in light of these considerations and a desire for consistency across section 1557 administrative enforcement, we are revising the regulatory text to strike proposed § 92.303(b), which would have applied the Age Act procedural provisions to administrative enforcement actions concerning age discrimination. We are also revising § 92.303(a) to apply the title VI procedures to all administrative enforcement actions brought under section 1557.

This means that a complaint filed under section 1557 alleging age discrimination would not require the complainant to engage in mediation before OCR can open an investigation and claims alleging multiple bases of discrimination would be subject to the same enforcement procedures under the final rule. We note that complainants that wish to engage in mediation to address a complaint against a recipient or State Exchange will be provided with the option to do so, as these complaints may also be addressed under the Age Act, consistent with 45 CFR 91.43.

Comment: Commenters suggested making the OCR complaint process more straightforward and accessible, especially since individual complaints remain the primary trigger for investigations and individuals often file without legal representation. Commenters suggested that the final rule offer clear, fully accessible complaint mechanisms, including directions written in plain language, for filing discrimination complaints. These commenters suggested that complainants should not be required to parse out how a covered entity perceived them or responded to differing aspects of their lives. Further, these commenters recommended that any complaint procedures include resource materials such as Frequently Asked Questions, process diagrams, and materials presented in alternative formats, including videos with instructions in ASL embedded into the website as well as a clear and simple complaint process for individuals with LEP. One commenter further suggested that OCR clarify in the final rule that citizenship status is not relevant to an enforcement process or complaint filing.

One commenter also recommended that the time allowed for filing a complaint without needing to show good cause be extended from 180 days to 6 years to account for the postpartum timeline. Another commenter urged OCR to consider putting the longest deadline on the complaint filing that it can, consistent with its statutory obligations. This commenter noted that it often takes people months to realize they have been discriminated against, decide to do something about that discrimination, and find out that there are laws against the discrimination and agencies like OCR where they can file complaints.

Response: OCR appreciates the comments regarding the complaint process. We understand the complaint filing process may be both perceived and experienced as challenging, and OCR welcomes suggestions on making the process more accessible. We currently offer resources on our website to provide the public with information about the process for submitting a complaint and what to expect once they have submitted a complaint to OCR.[393] In addition, OCR revises its own processes, as needed. The most recent updates to OCR's Civil Rights Discrimination Complaint Form and Portal, for example, include providing the form and portal in fifteen languages other than English, and inclusion of additional clarity regarding forms of discrimination to report, including sexual orientation, gender identity, pregnancy, and discrimination against individuals with LEP.[394] We consider changes to the OCR complaint process on an ongoing basis as we strive to simplify the process and make it more accessible to all.

OCR notes that the requirement that a complaint be filed no later than 180 days from the alleged discrimination is consistent with the enforcement mechanisms under title VI, which we adopt herein and have also been adopted under title IX, section 504, and the Age Act. OCR will continue to extend the 180-day filing deadline for good cause, as outlined in the title VI regulation at 45 CFR 80.7(b). Further, to make this information more widely available, we are reinstating a required Notice of Nondiscrimination (§ 92.10), which includes information on how to file a complaint with OCR should an individual believe they were discriminated against.

In response to the comments received, OCR also notes that citizenship status is not relevant to an enforcement process or complaint filing; an individual's citizenship or immigration status does not prevent or alter their ability to file a complaint or OCR's ability to enforce potential violations.

Comment: Some commenters indicated that OCR should initiate compliance reviews rather than wait on individual complaints and some noted that while a simple, accessible complaint system is helpful, it should not, and cannot be, the only means of enforcement. Commenters stated that robust enforcement must include agency-initiated oversight, monitoring, and investigations; and that OCR should proactively review medical providers' treatment of patients of color for patterns to help detect bias.

A few commenters stated that incorporating the title VI procedures in proposed § 92.303(a) means including requirements that covered entities submit compliance reports and data to OCR and authorizing OCR to conduct periodic compliance reviews of covered entities. These commenters argued that OCR is effectively declaring that its enforcement of these provisions will be based on the presumption that any business decision made by a covered entity is either intentionally discriminatory or has an impermissibly discriminatory effect, unless and until that entity can demonstrate otherwise to OCR's satisfaction. According to the commenters, this would have the effect of imposing an expansive, arbitrary, and capricious new regulatory regime.

Response: OCR appreciates the importance of compliance reviews and robust enforcement. While most OCR investigations are conducted based on complaints received, OCR also conducts compliance reviews, which may be based on, for example, news reports or other information received by OCR.[395]

[394] U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Complaint Portal, https://ocrportal.hhs.gov/ocr/cp/complaint_frontpage.jsf*; U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Get Help in Other Languages, https://www.hhs.gov/ocr/get-help-in-other-languages/index.html*; U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Office for Civil Rights, Civil Rights and Conscience Complaint form* (Expiration Date: Dec. 31, 2025), *https://www.hhs.gov/sites/default/files/ocr-cr-complaint-form-package.pdf.*

[395] For example, on March 7, 2023, OCR announced that it had reached a Voluntary Resolution Agreement with Hillsborough County Fire and Rescue in Florida to improve access to care for communities of color. OCR initiated a compliance review of Hillsborough County Right and Rescue in response to public press reports indicating that its paramedics refused to transport

OCR disagrees with commenters' position that adopting the longstanding enforcement procedures of title VI creates a presumption that a covered entity is discriminating. Nor does the adoption of these procedures represent a new ''regulatory regime,'' as these procedures appear in the Department's title VI regulations, which were originally published in 1964[396] and have since been adopted in the Department's title IX and section 504 regulations. Section 92.303, adopting 45 CFR 80.6 (Compliance information), includes standard requirements related to civil rights enforcement, including seeking cooperation from recipients and State Exchanges in obtaining compliance; providing assistance and guidance to assist recipients and State Exchanges reach voluntary compliance; requiring records maintenance by recipients and State Exchanges so that they may demonstrate compliance with the conditions of their receipt of Federal funds; requiring access to pertinent records as needed to determine compliance; and sharing information with the public regarding protections against discrimination. As with all of its investigations, including compliance reviews, OCR acts as a neutral factfinder and does not presume discrimination by the covered entity.

Comment: Some commenters recommended that OCR consider creating a searchable database of complaints and provide status updates that clearly indicate where in the process a complaint stands. Commenters also noted that OCR should shorten the time between filing a complaint and resolution. They noted that lengthy timelines for resolution have been detrimental, as advocates are reluctant to file knowing the duration of an investigation, and covered entities feel less urgency to comply. Some commenters noted that an ongoing deterrent to filing administrative complaints with OCR is the lack of a mandatory response deadline from OCR in title VI procedures. These commenters recommended implementing a 90-day deadline for OCR to resolve most section 1557 complaints, and a 120-day deadline for ''more involved'' section 1557 complaints.

Response: OCR appreciates commenters' recommendation to create a searchable database of complaints, and will take that under advisement, though we cannot commit to doing so at this time. OCR works with finite resources to address complaints as quickly and efficiently as possible and will continue to do so. Title VI procedures require a prompt investigation whenever information indicates possible noncompliance. OCR intends to follow these enforcement procedures and promptly address and resolve outstanding compliance failures. Because each potentially discriminatory action involves unique facts and circumstances that must be independently investigated on a case-by-case basis before OCR can determine whether a challenged action is considered discriminatory, we decline to add a mandatory response deadline as requested by commenters.

Comment: One commenter recommended that OCR create a separate portal for complaints related to obstetric violence and obstetric racism.

Response: OCR currently uses one portal for all civil rights complaints. The portal allows complainants to select the ground(s) under which they believe they were discriminated against to help ensure their complaints are fully reviewed and considered by OCR.

Comment: Some commenters suggested merging proposed §§ 92.303 and 92.304 to help reduce confusion among complainants.

Response: While we appreciate the need to have clarity when filing complaints, maintaining two separate sections is necessary given that there are different procedures for OCR to follow depending on whether the complaint is against the Department itself, or a recipient or State Exchange. However, for the sake of additional clarity, OCR will revise § 92.303(a) to parallel § 92.304,

Comment: Some commenters recommended OCR include a provision in § 92.303 expressly stating that if OCR does not have jurisdiction over a complaint, it will refer it to the appropriate office or agency.

Response: Section 92.304 adopts the compliance procedures found in OCR's federally conducted section 504 implementing regulation, which includes a provision requiring OCR to make reasonable efforts to refer a complaint over which it does not have jurisdiction to the appropriate Federal Government agency. 45 CFR 85.61(e). There is no corresponding provision in the title VI procedures, which are adopted at § 92.303 and are applicable to recipients and State Exchanges. However, OCR's practice is to refer such complaints, and we believe this is important to reflect this in regulatory text. We have included a new provision, replacing the former age-discrimination related provision at proposed § 92.303(b), that reads: ''If OCR receives a complaint over which it does not have jurisdiction, it shall promptly notify the complainant and shall make reasonable efforts to refer the complaint to the appropriate Federal Government entity.''

A *Comment:* Some commenters recommended that any enforcement mechanism include monitoring, reporting, and ''actual penalties'' or fines.

Response: We appreciate the need for strong enforcement mechanisms to ensure compliance with section 1557. The enforcement mechanisms incorporated into the rule allow for investigations based on both complaints and OCR-initiated compliance reviews. Voluntary Resolution Agreements and Settlement Agreements resulting from investigations generally include a monitoring period and reporting requirement to ensure ongoing compliance. If a recipient or State Exchange does not come into voluntary compliance and is found in violation of section 1557, OCR can take compliance action by either initiating fund termination proceedings under 45 CFR 80.8 or by any other means authorized by law, including referral to DOJ for enforcement proceedings.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.303, with modifications. We are revising § 92.303(a) to read ''. . . administrative enforcement actions concerning discrimination on the basis of race, color, national origin, sex, age, disability, or any combination thereof . . .'' This language applies the same procedural provisions to administrative enforcement actions under section 1557

[396] 29 FR 16298, 16301–03 (Dec. 4, 1964).

regardless of the basis of alleged discrimination, acknowledges that discrimination experienced by individuals may involve multiple bases, and corrects a scrivener's error (an unnecessary placement of the word ''discrimination'' after ''disability''). We are also revising § 92.303(a) to parallel § 92.304, to now provide that the procedural provisions applicable to title VI apply with respect to administrative enforcement actions against health programs and activities of recipients and State Exchanges concerning discrimination on the basis of race, color, national origin, sex, age, and disability discrimination under section 1557 or the part. These procedures are found at 45 CFR 80.6 through 80.11 and part 81 of the subchapter. Additionally, we are replacing the text at proposed § 92.303(b) with new language stating: ''If OCR receives a complaint over which it does not have jurisdiction, it shall promptly notify the complainant and shall make reasonable efforts to refer the complaint to the appropriate Federal Government entity.''

Procedures for Health Programs and Activities Administered by the Department (§ 92.304)

In § 92.304, OCR addressed procedures for all claims of discrimination against the Department under section 1557 or the part, as set forth in § 92.304(a).

Section 92.304(b) proposed making the existing procedures under the section 504 federally conducted regulation at 45 CFR 85.61 and 85.62 applicable to all such claims under Section 1557 for all protected bases (*i.e.,* race, color, national origin, sex, age, and disability).

Section 92.304(c) proposed requiring the Department to provide OCR access to information relevant to determining compliance with section 1557 or the part.

Section 92.304(d) proposed prohibiting the Department from retaliating against an individual or entity for the purpose of interfering with any right secured by section 1557 or the part, or because such individual or entity has participated in an investigation, proceeding, or hearing under section 1557 or the part.

The comments and our responses regarding § 92.304 are set forth below.

Comment: Some commenters recommended that this section explicitly recognize claims of discrimination involving multiple bases, and suggested amending § 92.304(a) to add ''or a combination thereof.'' Some commenters recommended providing clear procedures for the administrative enforcement of such intersectional claims.

Response: OCR agrees that including this language is consistent with the changes we have made throughout the text regarding claims of discrimination involving multiple bases and accepts this proposal with a minor modification, so that the rule reads ''of any combination thereof.'' Further, OCR appreciates the recommendation for providing clear procedures for the administrative enforcement of intersectional claims. As stated in § 92.301, administrative complaints under section 1557 alleging multiple grounds of discrimination are now subject to a single administrative process.

Comment: Commenters on § 92.304(d) supported its prohibition on retaliation by the Department, noting that this provision shows a commitment to preventing discrimination at all levels and ensuring a path to rectifying grievances.

Response: OCR appreciates the support for this provision and, as stated in the preamble, we think it is important to include because individuals should not face retaliation for asserting their civil rights or raising concerns regarding discrimination being experienced by others.

Comment: Some commenters encouraged OCR to be as proactive as possible in enforcing the regulations with respect to the Department's programs.

Response: OCR appreciates the need for proactive enforcement and proactive technical assistance. We will continue working with the Department components in providing technical assistance and assisting them in helping to resolve compliance issues with section 1557.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, OCR is finalizing the provisions as proposed in § 92.304, with modification. We are revising § 92.304(a) and (b) to read ''. . . discrimination on the basis of race, color, national origin, sex, age, disability, or any combination thereof . . . ,'' consistent with edits made at §§ 92.101(a)(1), 92.207(a) and (b)(1) and (2), and 92.303(a). In addition, as noted above, for clarity, we are revising § 92.304(b) to parallel § 92.303 to now provide that the procedural provisions applicable to section 504 at 45 CFR 85.61 and 85.62 shall apply with respect to administrative enforcement actions against the Department, including Federally-facilitated Exchanges, concerning discrimination on the basis of race, color, national origin, sex, age, or disability under section 1557 or the part. Also, where the section cross-references regulatory provisions that use the term ''handicap,'' the term ''race, color, national origin, sex, age, or disability'' shall apply in its place.

III. Change in Interpretation—Medicare Part B Funding Meets the Definition of Federal Financial Assistance; Responses to Public Comment

The Department's longstanding position has been that Medicare Part B (''Part B'') funding does not meet the definition of ''Federal financial assistance'' for the purpose of title VI, title IX, section 504, the Age Act, and section 1557. *See, e.g.,* 81 FR 31375, 31383 (May 18, 2016). In the 2022 NPRM, we proposed to change that position after evaluating the Part B program and the definition of ''Federal financial assistance'', such that Part B funds will be considered Federal financial assistance when received by providers and suppliers.

The Department sought comment on the impact that this change in position may have on recipients subsidized only by Part B funds that do not receive any other form of Federal financial assistance from the Department. We also invited comment on the amount of time that should be allowed for recipients of Part B funds to come into compliance with the applicable statutes and their implementing regulations. We also sought comment on what resources the Department can provide to assist newly covered entities in coming into compliance.

The comments and our responses regarding this change in interpretation are set forth below.

Comment: Some commenters objected to the proposal. These commenters claimed that interpreting Part B as meeting the definition of ''Federal financial assistance'' would reduce access to care because forcing these providers to implement new requirements will discourage them from participating in federally funded health care programs. Other commenters who opposed this interpretation stated that Part B does not meet the definition of ''Federal financial assistance'' because the program requires participants to pay monthly premiums based on income. In this way, commenters maintained, Part B is merely a private health insurance plan for individuals with low incomes, and is not equivalent to a Federal welfare program. A few commenters discussed that including Part B among the programs to which section 1557 applies is a radical change to what

qualifies as Federal financial assistance, and that such a change will affect other civil rights laws.

Response: The Department's change in interpretation regarding Part B does not alter, change, or expand the definition of ''Federal financial assistance.'' As stated in the 2022 NPRM, the Department is revising its position regarding whether Part B payments constitute Federal financial assistance under the longstanding definition of ''Federal financial assistance'' in regulations implementing section 1557 and the four statutes referenced in section 1557: title VI, title IX, section 504, and the Age Discrimination Act. 87 FR 47828. After evaluating the definition of ''Federal financial assistance,'' the Department has concluded that Part B funds meet that definition. While we disagree that this change in interpretation changes the definition of ''Federal financial assistance,'' we do note that this change means that Part B payments are considered Federal financial assistance with respect to title VI, title IX, section 504, and the Age Discrimination Act, in addition to section 1557.

Moreover, the Department disagrees that Part B is the equivalent of private health insurance and therefore is not Federal financial assistance. Part B confers a benefit or subsidy on the recipient—namely, financial assistance to the provider in exchange for providing health care services. As discussed in the 2022 NPRM, ''the government is assisting providers of services by making available to them a segment of the patient population that either (a) would not have been able to afford any medical services, or (b) would not have been able to afford these specific providers.'' 87 FR 47890. The Federal Government, through Part B, offers providers a reliable source of payment for services given to eligible patients who otherwise would go without care. Although Part B enrollees may pay premiums to receive coverage, the Federal Government covers half of the cost of Part B benefits. Thus, the fact that enrollees may pay for a portion of their coverage does not change the fact that providers receive Federal financial assistance through the program. In this way, Part B is no different than Medicare Part A, which also offers financial assistance to providers and which has long been considered Federal financial assistance. We note, however, that private health insurance may be subject to this rule when a health insurance issuer receives Federal financial assistance for such coverage. For instance, issuers may receive Federal financial assistance through receipt of advance payments of the premium tax credit or cost-sharing reductions for qualified health plans, which are private health insurance plans sold on the Exchanges. Further, when a recipient health insurance issuer is principally engaged in the provision or administration of health insurance coverage or other health-related coverage as set forth under the definition of ''health program or activity'' at § 92.4, all of the issuer's operations are covered, including its other private health insurance coverage, such as coverage sold off the Exchange.

OCR is also unpersuaded by the argument that the Department's change in interpretation will reduce access to care by leading to physician disenrollment from Medicare participation or decreased participation in other federally funded government programs. Indeed, we are unaware of any evidence that supports this concern and commenters did not provide any. As stated in the 2022 NPRM, many providers who receive payments through Part B are already subject to section 1557 and the four civil rights laws referenced in section 1557 through receipt of other Federal financial assistance. 87 FR 47890.

For the reasons provided in the NPRM and restated here, the Department respectfully disagrees with commenters and reiterates its position that funds provided via the current Part B program meet the longstanding definition of ''Federal financial assistance''.

Comment: An overwhelming number of commenters supported the change in interpretation, the result of which is that the Part B funds will be considered Federal financial assistance. Many groups commented that applying section 1557 to Part B will help address past discrimination. For example, commenters discussed that excluding Part B from a Federal financial assistance designation exempted individual providers from any obligation to comply with the Civil Rights Act of 1964. This exemption of the Part B program from title VI's nondiscrimination requirements allowed doctors in many states to continue providing segregated health care services. Commenters stated that failing to consider Part B payments as Federal financial assistance created confusion for patients about whether civil rights laws applied to their individual health providers—many of whom refused to serve individuals on the basis of their race or national origin because title VI did not apply to them. Therefore, commenters suggested that discriminatory history warrants the Department's reassessment of whether Part B payments meet the definition of ''Federal financial assistance''. They also note that this change will align Part B with other portions of the Medicare program and bring uniformity across all Medicare providers, increasing access to quality health care.

Other commenters explained that many of Part B providers already receive other forms of Federal financial assistance, such that this change in interpretation will not subject them to new obligations. Some commenters stated that all providers enrolled in the Part B program are recipients of Federal financial assistance—regardless of whether they are ''participating'' or ''non-participating'' providers—because even those designated as ''non-participating'' agree to provide Medicare-subsidized health services to Part B enrollees.

Many other supportive commenters noted that because funds received under Medicare Part A and Part B are fundamentally similar and Medicare Part A payments have long been considered Federal financial assistance, it is reasonable for the Department to similarly consider Part B payments as Federal financial assistance. Therefore, the commenters argue, considering Part B payments to be Federal financial assistance will allow individuals additional options for bringing discrimination claims against discriminatory conduct in all health care settings.

Response: OCR appreciates commenters' views on the Department's change in interpretation regarding whether Part B payments constitute Federal financial assistance as defined by our civil rights regulations. The Department agrees with commenters that because Part B payments, like those of Medicare Part A, are Federal funds directly or indirectly received by providers, they squarely meet the definition of ''Federal financial assistance''. This position provides uniformity across the Medicare programs and will not only help address patient confusion regarding the funding streams of their respective Medicare programs, but also ensures that the Department is applying the definition of ''Federal financial assistance'' consistently across all of our federally funded programs.

The Department agrees that because many recipients of Part B funds are already recipients of some other form of Federal financial assistance, this change will not impose excessive burdens on those covered entities. For those newly covered entities, however, we are providing a delayed applicability date as discussed below.

Comment: Many other commenters expressed the view that this change in position by the Department reflects the evolution of how the Part B program operates today. Commenters explained that while Part B once served as contracts of insurance for those who qualified, today, individual providers directly bill and receive payment from the Federal Government itself.

Response: The Department acknowledges commenters' point that the current manner in which the Part B program is administered is a factor in our changed view on whether Part B funds meet the definition of ''Federal financial assistance''. As the commenters noted, a majority (⅔) of providers enrolled in Part B bill and are paid directly by the Medicare program. 87 FR 47889. However, this is not solely determinative regarding the change in interpretation. As noted in the 2022 NPRM, under *Grove City College* v. *Bell,* 465 U.S. 555, 569 (1984), Federal funds are Federal financial assistance regardless of whether they are provided directly by the Federal Government to an entity or are provided initially to beneficiaries (*i.e.,* program participants) for the specified purpose of assisting with payment for services.

Comment: Several commenters stated that this change in position will increase equity in access to quality health care for individuals with LEP, immigrants, and communities of color, as these groups are more likely to participate in Part B. Other commenters expressed the view that this interpretation allows the Department to align Part B providers' nondiscrimination obligations to Medicare Part A, which will result in better care for individuals with disabilities and will eliminate confusion for older adults who cannot determine whether their Part B provider receives any other type of Federal financial assistance. Other commenters stated that this will offer significant relief for older patients, individuals with disabilities, and LGBTQI+ adults by providing the same protections and rights regardless of the nature of the Medicare provider or the service they are receiving. These patients will no longer have to determine whether they are eligible for both Medicare and Medicaid, or whether they have Medicare or Medicaid, in order to assess what nondiscrimination protections they are afforded. A few commenters expressed the view that this will be particularly helpful for enrollees who rely on small specialty providers for care, such as medical equipment suppliers, that receive only Part B and no other form of Federal financial assistance. Several other commenters also explained that because many Medicare providers also serve people with other forms of health coverage, including private insurance, this change will increase access to quality health care for underserved communities who face disproportionate discrimination and barriers.

Response: The Department appreciates these comments and generally agrees that bringing all Medicare programs in line with other Federal financial assistance programs will bring about better health outcomes and increase equity in access to care. This position is also supported by the similarities across the Medicare programs and eliminates an inconsistency in the application of the definition of ''Federal financial assistance'' that the Department has determined is no longer justifiable.

Comment: A few commenters suggested that the Department should have a delayed date for when the revised interpretation regarding Part B payments as Federal financial assistance becomes effective. Some suggested at least 180 days and up to 365 days for newly covered providers to reach compliance for those practices that have not been subject to these requirements in the past. Several commenters stated that newly covered entities will need sufficient time to implement appropriate procedures, such as having a one-year applicability date or a safe-harbor compliance window of at least 6 months. However, one commenter expressed that the Department should impose the same implementation timeline for all covered entities, given that, in their view, very few entities will be providers who are not already Federal financial assistance recipients. This commenter explained that additional time is not necessary because OCR is also providing entities with technical assistance to reach compliance.

Response: The Department appreciates commenters' concerns and has amended the applicability date to give newly covered recipients sufficient time to come into compliance with civil rights obligations, as described below in the ''Summary of Changes.'' As this new designation of Part B applies to all Federal financial assistance-based civil rights statutes enforced by the Department, to the extent covered entities require assistance, OCR will provide adequate support.

Notice of Interpretation and Dates

A. *Notice of interpretation.*

The Department is finalizing its interpretation that Medicare Part B (''Part B'') funding meets the definition of ''Federal financial assistance'' for the purpose of title VI, title IX, section 504, the Age Act, and section 1557.

B. *Effective date.*

This interpretation is effective upon its publication in the **Federal Register**.

C. *Applicability date.*

The Department recognizes that that there are some recipients that do not receive any Federal financial assistance other than Part B funds and that these recipients be newly required to comply with section 1557 and other Federal civil rights laws enforced by OCR. The Department acknowledges that these recipients will require time to come into compliance as a result of this change in position. Therefore, while this revised interpretation is effective upon publication in the **Federal Register**, it will have a one-year delayed applicability date. Thus, compliance by entities whose Federal program participation has been limited to Part B must be in compliance with title VI, title IX, section 504, the Age Act, and section 1557 no later than May 6, 2025. An Assurance of Compliance, as required by 45 CFR 92.5, must be filed with the Department by entities whose Federal program participation has been limited to Medicare Part B no later than May 6, 2025. This can be completed via OCR's Assurance of Compliance portal at *https://ocrportal.hhs.gov/ocr/aoc/instruction.jsf*. Similarly, if such a recipient accepts a form of Federal financial assistance other than Part B prior to May 6, 2025, they will be required to complete an Assurance of Compliance at that time, consistent with section 1557 and the other Federal civil rights laws enforced by OCR.

IV. CMS Amendments

In the 2022 NPRM, the Department proposed clarifying CMS provisions that govern Medicaid and CHIP; PACE; health insurance issuers, including issuers providing EHB and issuers of qualified health plans (QHPs), and their officials, employees, agents, and representatives; States and the Exchanges carrying out Exchange requirements; and agents, brokers, or web-brokers that assist with or facilitate enrollment of qualified individuals, qualified employers, or qualified employees into Exchange coverage so that they again identify and recognize discrimination on the basis of sexual orientation and gender identity as prohibited forms of discrimination based on sex. The Department sought comments on CMS' proposal to explicitly mention only gender identity and sexual orientation in its amendments, while understanding that

discrimination on the basis of sex stereotypes, sex characteristics, and pregnancy or related conditions is also prohibited sex discrimination.

We are clarifying and emphasizing our intent that if any provision of this final rule is held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, or stayed pending further action, it shall be severable from this final rule, and from rules and regulations currently in effect, and not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other, dissimilar circumstances. Through this rule, we adopt provisions that are intended to and will operate independently of each other, even if each serves the same general purpose or policy goal. Where a provision is necessarily dependent on another, the context generally makes that clear.

Comment: The majority of commenters on the proposed CMS amendments in the 2022 NPRM supported the proposal to explicitly identify and recognize discrimination on the basis of sexual orientation and gender identity as prohibited types of sex discrimination. However, many of the commenters noted that the language in the CMS amendments did not match the language explaining what constitutes sex discrimination in the proposed section 1557 implementing regulation (proposed 45 CFR 92.101(a)(2)). Commenters encouraged the agency to adopt the language in proposed § 92.101(a)(2). Specifically, those commenters suggested that the CMS amendments should revise the term ''sex'' to ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; transgender status; and sex stereotypes)'' rather than ''sex (including sexual orientation and gender identity)'' as proposed for the various CMS regulations. Commenters argued that adopting the language from § 92.101(a)(2) in the CMS amendments would avoid confusion and ensure consistency of implementation and enforcement among the nondiscrimination protections in the CMS amendments and section 1557. In many contexts, CMS program regulations are more visible to some providers, patients, patient advocates, and other stakeholders than section 1557 requirements and are more readily translated into institutional policy, training, and patient awareness. Commenters asserted that the Department having a consistent description of sex discrimination would improve consistency across Department regulations, further the health and safety of program beneficiaries, and protect them from discrimination in health care. One commenter emphasized that a statement in the 2022 NPRM that CMS understands that discrimination on the basis of sex stereotypes, sex characteristics, and pregnancy or related conditions is prohibited sex discrimination, without the inclusion of such language in the regulatory text, provides inadequate notice to entities required to comply with the CMS amendments.

Response: The Department is finalizing the proposed amendments to the CMS regulations, with a revision to the description of sex discrimination to conform to the language in 45 CFR 92.101(a)(2). We appreciate that so many commenters made this suggestion and raised important issues concerning avoiding confusion, ensuring consistent implementation, and providing greater clarity for compliance and enforcement. In the Proposed Rule, CMS noted in the preamble that it understands that sex discrimination includes discrimination based on sex stereotypes, sex characteristics, including intersex traits, and pregnancy or related conditions, but limited the explicit mention in the regulatory text to gender identity and sexual orientation, sought comments. 87 FR 47891. The Department agrees with commenters that the amendments in the regulation should reflect CMS' intended interpretation of sex discrimination to avoid confusion for regulated entities and to better address the barriers to obtaining health care, including those faced by LGBTQI+ people, that CMS noted in the Proposed Rule. As there are entities that must comply with both CMS nondiscrimination provisions and section 1557, adopting identical language will ensure consistency across the policies and requirements applicable to entities subject to all of the provisions. As finalized, these CMS regulations provide that discrimination based on ''sex'' includes discrimination based on sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. The list in the regulation text is not an exhaustive one that outlines all the ways (or the only ways) that discrimination can be based on sex but, rather, it only identifies examples; CMS interprets these regulations accordingly. However, nothing in this rule impedes regulated entities from taking nondiscriminatory actions based on current medical standards and evidence, such as individualized and nondiscriminatory decisions based on current medical standards and evidence about the timing or type of protocols appropriate for care. The rule does not (and cannot) require a specific standard of care or course of treatment for any individual, minor or adult.

Summaries of regulatory changes are outlined below, along with responses to comments. In the following sections, for brevity, all references to ''sex discrimination'' or ''discrimination on the basis of sex'' mean ''discrimination based on sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity, including transgender status; and sex stereotypes).''

A. Medicaid and Children's Health Insurance Program (CHIP)

In 42 CFR 438.3(d)(4) and 438.206(c)(2) (which apply to CHIP managed care through existing cross-references in §§ 457.1201(d) and 457.1230(a)), we proposed to restore regulatory text to prohibit Medicaid and CHIP managed care plans, which include managed care organizations, prepaid inpatient health plans, prepaid ambulatory health plans, primary care case managers, and primary care case management entities in managed care programs, from discriminating on the basis of sexual orientation and gender identity, and to require managed care plans to promote access and delivery of services in a culturally competent manner to all beneficiaries regardless of sexual orientation or gender identity. Such text was finalized as part of §§ 438.3(d) and 438.206(c)(2) in the Medicaid and CHIP managed care final rule published in the **Federal Register** on May 6, 2016 (2016 Medicaid and CHIP Rule), 81 FR 27498, but was removed as part of the Department's second section 1557 rulemaking (2020 Rule), 85 FR 37160, 37219–37220.

Similarly, in 42 CFR 440.262, for fee-for-service Medicaid programs, we proposed to restore regulatory text to require States to promote access and delivery of services in a culturally competent manner to all beneficiaries regardless of sex, including sexual orientation or gender identity. Again, the text was finalized as part of § 440.262 in the 2016 Medicaid and CHIP Rule but the references to sexual orientation and gender identity were removed by the 2020 Rule. We also proposed to change ''unique'' in 42 CFR 440.262 to ''individualized'' to more accurately reflect Medicaid's goal of providing person-centered care. Finally, we proposed to incorporate 42 CFR 440.262 into CHIP regulations through a cross-reference at 42 CFR 457.495(e),

ensuring alignment across fee-for-service Medicaid and CHIP programs.

The comments received on these proposals and our responses are set forth below.

Comment: We received many comments in support of the reinstatement of prohibitions against discrimination based on sexual orientation and gender identity in Medicaid and CHIP. Commenters stated that restoring the regulation text at 42 CFR 438.3(d)(4), 438.206(c)(2), and 440.262 (and therefore in §§ 457.1201(d) and 457.1230(a)) would promote access to care and the delivery of services in a culturally competent manner, strengthen the Department's commitment to increasing equity, and address discrimination in health programs and activities that can lead to disparate health outcomes.

Response: We appreciate the support for our proposals and believe finalizing revisions to these provisions will be an essential step in promoting culturally competent care that improves access, quality of care, and ultimately health outcomes.

Comment: One commenter that asked CMS to adopt the more detailed description of ''sex discrimination'' in proposed § 92.101(a)(2) pointed out that CMS program rules provide different compliance mechanisms—including prospective as well as complaint-based mechanisms—that complement section 1557's fundamental but essentially retrospective, complaint-based enforcement scheme.

Response: We appreciate the commenter raising this important perspective. There are prospective and retrospective compliance mechanisms reflected as State and managed care plan responsibilities in the Medicaid managed care regulations at 42 CFR part 438. Some provisions explicitly address requirements that must be included in managed care plan contracts and others stipulate State responsibilities. A provision that particularly reflects State responsibilities for proactively monitoring their managed care programs to ensure compliance with Federal regulations is 42 CFR 438.66, which requires States to have a monitoring system for all Medicaid managed care programs that addresses all aspects of the program including the performance of each managed care plan. This provision also requires States to use the data collected from their monitoring activities to improve their program's performance. This example of a prospective and retrospective activity requirement demonstrates how the Medicaid managed care regulations may help states and their managed care programs complement OCR's enforcement actions related to the prohibition of discrimination by providing for more timely monitoring and enforcement of discrimination prohibitions. Consistent regulation text about what sex discrimination means in this context—specifically, it includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes—will maximize the effect of these benefits.

In addition, we believe it is critical to ensure consistency in the application of nondiscrimination requirements between Medicaid managed care and fee-for-service programs. Under section 1902(a)(19) of the Social Security Act, states must provide for such safeguards as may be necessary to assure access to care and services in a manner consistent with simplicity of administration and the best interest of beneficiaries. A Medicaid fee-for-service regulation (at 42 CFR 440.262) clarifying the meaning of the term ''sex'' in this context, particularly when that regulation is consistent with 42 CFR 438.3(d)(4) and 438.206(c)(2) facilitates simplicity in administration of nondiscrimination requirements and ensures the best interests of the beneficiaries are met across Medicaid delivery systems for all Medicaid beneficiaries. As we noted in the NPRM, the best interest of beneficiaries is appropriately met when access to care and services are provided in a non-discriminatory manner. A consistent approach on this issue will help protect beneficiaries from discrimination, avoid confusion, and provide for simplicity in administration of State Medicaid programs. To this end, we believe the reference to ''sex'' at 42 CFR 440.262 should be consistent with 42 CFR 438.3(d)(4) and 438.206(c)(2).

For this reason and those stated above, we are finalizing the proposed amendments to 42 CFR 438.3(d)(4), 438.206(c)(2), and 440.262 with revisions to make the discussions of ''sex'' in them consistent with 45 CFR 92.101(a)(2). In 42 CFR 438.3(d)(4) (and therefore § 457.1201(d)), we also are finalizing revisions to improve the readability of the provision by replacing some of the commas with semicolons and moving ''disability'' after ''national origin.'' We have also removed unnecessary parentheses in 42 CFR 438.3(d)(4), 438.206(c)(2), and 440.262.

Comment: One commenter asserted that the Department based the Proposed Rule on general provisions of the Social Security Act requiring that health assistance be provided in the ''best interest of beneficiaries'' (for Medicaid programs) and that the statute cited by the Department does not indicate Congressional intent related to prohibiting discrimination.

Response: The Department undertook this rulemaking to better align the section 1557 regulation with the statutory text of 42 U.S.C. 18116, to reflect recent developments in civil rights case law, and to better address issues of discrimination that contribute to negative health interactions and outcomes. We believe aligning the Medicaid and CHIP regulations in 42 CFR parts 438, 440, and 457, subpart L, with the section 1557 regulations is critical to fulfilling the Department's mission of pursuing health equity and protecting public health. Access to health care that is free from discrimination benefits all communities and people, and is also vital to addressing public health emergencies, such as the COVID–19 pandemic.

CMS possesses statutory authority under section 1902(a)(4) of the SSA (codified at 42 U.S.C. 1396a(a)(4)), which authorizes the Secretary to adopt methods of administration necessary for the proper and efficient operation of the Medicaid State plan; section 1902(a)(19) of the SSA (codified at 42 U.S.C. 1396a(a)(19)), which requires the Medicaid State plan to provide safeguards as necessary to assure that covered services are provided in a manner consistent with the best interests of the recipients; and section 2101(a) of the SSA (codified at 42 U.S.C. 1397aa(a)), which permits provision of funds to States to enable them to initiate and expand the provision of child health assistance to uninsured, low income children in an effective and efficient manner. CMS interprets section 1902(a)(19) of the SSA as prohibiting discrimination in the delivery of services because such discrimination is inconsistent with the best interests of the Medicaid beneficiaries who are eligible for and receive services. CMS interprets sections 1902(a)(4) and 2101(a) of the SSA as authorizing CMS to adopt regulations prohibiting discrimination on the basis of sex because such prohibitions on discrimination are necessary for the proper and efficient operation of a State plan, are in the best interest of beneficiaries, and enable states to provide child health assistance in an effective and efficient manner. For these reasons, we disagree with the commenter and continue to assert that adopting protection against discrimination to address disparities and, ultimately, health outcomes is within the authority granted to CMS by the Act.

Comment: One commenter stated that the proposed regulation text would prohibit physicians or other health professionals from categorically declining to provide gender-affirming treatments due to their religious or moral beliefs guaranteed them under the First Amendment to the U.S. Constitution and could require them to provide services and treatment procedures related to gender-affirming care that they object to performing.

Response: These regulations do not require the provision of any specific services. These regulations are neutral, generally applicable, and do not violate the Free Exercise Clause of the First Amendment. These regulations do not target religiously motivated conduct, but rather, are intended to prohibit sex discrimination generally in order to improve health outcomes for the LGBTQI+ community and fulfill the statutory command of the ACA to prohibit discrimination and remove unreasonable barriers to care. As noted previously in this rule, conduct does not constitute a violation of this rule's prohibition on sex discrimination if there is a legitimate, nondiscriminatory reason for the action. Also, HHS will respect religious freedom and conscience protections in Federal law, particularly with regard to the provision of certain health-related services. For example, when enforcing its nondiscrimination regulations, HHS will comply with laws protecting the exercise of conscience and religion, including RFRA (42 U.S.C. 2000bb through 2000bb–4) and all other applicable legal requirements. Nothing in the nondiscrimination protections at 42 CFR 438.3(d)(4), 438.206(c)(2), and 440.262 (which apply to CHIP managed care through existing cross-references in §§ 457.1201(d) and 457.1230(a) and CHIP fee-for-service through a new cross-reference at § 457.495(e)), displaces those protections. In enforcing the nondiscrimination provisions in the corresponding CMS regulations, the Department will comply with laws protecting the exercise of conscience and religion, including the Religious Freedom Restoration Act (42 U.S.C. 2000bb through 2000bb–4) and all other applicable legal requirements. Finally, we note that physician licensing and discipline are outside the scope of this rulemaking.

Summary of Regulatory Changes

After consideration of the public comments, we are finalizing 42 CFR 438.3(d)(4), 438.206(c)(2), and 440.262 (which apply to CHIP managed care through existing cross-references in §§ 457.1201(d) and 457.1230(a)) with revisions to specify that discrimination based on ''sex'' includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. Similarly, where these regulations require actions to be taken regardless of sex, that includes actions regardless of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. We are also finalizing the change of ''unique'' to ''individualized'' in 42 CFR 440.262 as proposed.

B. Programs of All-Inclusive Care for the Elderly (PACE)

In 42 CFR 460.98(b)(3), CMS proposed to add sexual orientation and gender identity to the list of characteristics that may not serve as a basis for discrimination against a PACE participant. Additionally, in 42 CFR 460.112, we proposed to add gender identity to the list of characteristics that may not serve as a basis for discrimination against a PACE participant. This PACE provision is applicable one year after the effective date of this final rule.

Comment: CMS received numerous comments supporting our changes to both provisions.

Response: CMS thanks the commenters for supporting these important changes that will serve to protect CMS' beneficiaries.

Comment: Several commenters did not support CMS' proposal to add sexual orientation and gender identity to the list of characteristics that may not serve as a basis for discrimination against a PACE participant. Some commenters objected to the protections against discrimination on the basis of gender identity, in particular. Some commenters, believing that the proposal requires coverage of gender-affirming care, stated that the Department can adequately protect people from discrimination without mandating this coverage.

Response: This rule does not require entities to cover any particular procedure or treatment. We clarify that, in finalizing the prohibition against discrimination on the basis of sex, the Department is not mandating that PACE organizations include coverage for any particular item or service not already covered. Rather, amending these sections to clarify discrimination on the basis of sex as including sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes will better ensure that all individuals are treated fairly in their access to health care. Without protection from such sex discrimination, transgender individuals may face barriers or be denied medically necessary services that are classified as covered under PACE and made available to other enrolled individuals. These amendments will better clarify nondiscrimination protections for all individuals, while also addressing existing disparities for LGBTQI+ individuals seeking health care. For the reasons discussed here and in the preamble to the Proposed Rule, CMS believes it is important to ensure all PACE participants are protected against unlawful discrimination of any kind, including discrimination based on sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. Therefore, we are finalizing these revisions.

Summary of Regulatory Changes

We are finalizing the regulatory language with modifications based on comments received. Specifically, we are revising the reference to sex to include additional detail explaining that the reference to ''sex'' includes sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity, including transgender status; and sex stereotypes.

C. Insurance Exchanges and Group and Individual Health Insurance Markets

In the HHS Notice of Benefit and Payment Parameters for 2023 Proposed Rule (2023 Payment Notice NPRM),[397] the Department proposed amendments to the regulations applicable to Exchanges, QHPs, and certain issuers to prohibit discrimination based on sexual orientation and gender identity. The amendments were similar to those proposed in the 2022 NPRM. Those proposed amendments were not finalized in the Notice of Benefit and Payment Parameters for 2023 final rule published on May 6, 2022,[398] because the Department determined that it would be most prudent to address the nondiscrimination proposals related to sexual orientation and gender identity in the 2022 NPRM to ensure consistency across the policies and requirements applicable to entities subject to both

[397] U.S. Dep't of Health & Hum. Servs. Ctrs. for Medicare & Medicaid Servs., Patient Protection and Affordable Care Act; HHS Notice of Benefit and Payment Parameters for 2023, 87 FR 584 (January 5, 2022).

[398] U.S. Dep't of Health & Hum. Servs. Ctrs. for Medicare & Medicaid Servs., Patient Protection and Affordable Care Act; HHS Notice of Benefit and Payment Parameters for 2023, 87 FR 27208 (May 6, 2022).

those amendments and section 1557. 87 FR 27208. The clarifications finalized in this section of the rule will apply on or after the effective date of this final rule (60 days after publication).

In finalizing amendments to the CMS regulations in this final rule, the Department considered comments received in response to the 2022 NPRM, as well as comments received to similar proposals in the 2023 Payment Notice NPRM (collectively, the ''Proposed Rules''). The Department is also responding to comments we received in response to the Proposed Rules in this final rule. In section C.1. of this preamble, the Department responds to comments applicable to 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b). Section C.2. provides a summary of regulatory changes for 45 CFR 155.120(c), 155.220(j), 156.200(e), and 156.1230(b); there were no unique comments applicable to those sections. Comments that relate specifically to 45 CFR 147.104 are addressed in section C.3. of this preamble.

As stated in the 2022 NPRM, if any of the provisions at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) are held to be invalid or unenforceable by their terms, or as applied to any person or circumstance, such provision shall be considered severable from its respective section or such application shall be considered severable from any valid or enforceable applications of such provision (87 FR 47895). The determination that a provision is invalid or unenforceable shall not affect either the remainder of its section or any other sections, and the determination that a provision is invalid or unenforceable as applied to any particular person or circumstance shall not affect the application of the provision to other persons not similarly situated or to other dissimilar circumstances. In enforcing the nondiscrimination provisions in the corresponding CMS regulations, the Department will comply with laws protecting the exercise of conscience and religion, including, to the extent applicable, section 1303 of the ACA, the Weldon, Church, and Coats-Snowe amendments, the Religious Freedom Restoration Act (42 U.S.C. 2000bb through 2000bb-4) and all other applicable legal requirements.

1. Comments and Responses to 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b)

The Department proposed to amend 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) by removing the term ''sex'' and revising the term to read ''sex (including sexual orientation and gender identity).'' However, after considering all the public comments submitted in response to the Proposed Rules, the Department is finalizing a revision to the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).'' This revision is necessary to ensure consistency across the policies and requirements applicable to entities subject to both those amendments and section 1557.

Comment: The majority of commenters to the proposal in the 2023 Payment Notice NPRM expressed broad support for the proposal and agreed that amending the CMS regulations is warranted in light of the well-documented discrimination that LGBTQI+ individuals face in seeking health care and insurance coverage.

Commenters supporting the proposal asserted that all Americans deserve access to affordable, high-quality health care, and that Federal policies and nondiscrimination protections must reinforce equity of care for all patients regardless of socioeconomic and sociodemographic characteristics and insurance coverage. Commenters urged the Department to finalize the proposed nondiscrimination protections in light of persisting trends of pervasive discrimination in insurance coverage. Commenters said that it is well documented that LGBTQI+ individuals continue to face discrimination in seeking health care, and that the nondiscrimination protections will help address barriers to health equity for LGBTQI+ individuals and aid providers in providing effective care.

Many commenters supporting the proposal referred to copious bodies of research, including research identified in the 2022 NPRM, that demonstrate the many ways in which the LGBTQI+ community faces discrimination when seeking health care, resulting in poorer health outcomes. 87 FR 47833–47835 (2022). Commenters asserted that issuers have contributed to this discrimination by employing transgender-specific exclusions to deny coverage for medically necessary treatment and that this was exacerbated by the removal of protections on the basis of sexual orientation and gender identity in the 2020 Rule. Many of these commenters also highlighted how individuals who identify as part of the LGBTQI+ community disproportionately face health disparities and are at higher risk for many conditions.

Response: We firmly believe that clarifying the scope of sex discrimination can lead to improved health outcomes for LGBTQI+ individuals [399] and that these protections are consistent with our broader aim of improving health equity. Finalizing the amendments to the nondiscrimination protections to explicitly prohibit discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes is warranted to help remedy health care discrimination and to better address barriers to health equity for LGBTQI+ individuals.[400] The revisions to 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) will support the Department's objective of ensuring consistency against employing discriminatory marketing practices and benefit designs.

Comment: Many of the commenters that supported the proposal in the 2023 Payment Notice NPRM suggested ways in which the Department could further strengthen or clarify the breadth of the nondiscrimination protections, such as by expressly prohibiting discrimination on the basis of sex characteristics, including intersex traits.

Many commenters also recommended that the Department clarify that gender identity discrimination includes discrimination based on gender expression and transgender status. Such commenters stated that entities often perpetuate discrimination against transgender people because of their gender expression or belief that they are transgender rather than their gender identity itself, which is often private information. These commenters argued that the inclusion of ''gender identity'' alone in nondiscrimination protections leaves room for confusion or evasion of legal obligations.[401] Commenters

emphasized that expressly incorporating transgender status into Department regulations would provide additional clarity, and would conform the regulation to contemporary protections against discrimination.

Response: We agree with commenters that discrimination on the basis of sexual orientation and gender identity may present itself as discrimination on the basis of gender expression and transgender status, which are inextricably linked with one's gender identity. We believe that gender expression and transgender status are sufficiently addressed by the inclusion of gender identity in the description of discrimination based on sex that is being finalized.

Comment: Many commenters supported the proposal as consistent with the overarching intent of the ACA to improve access to health coverage and prohibit discrimination in health care, asserting that the removal of protections on the basis of sexual orientation and gender identity in the 2020 Rule frustrates this purpose by creating barriers to comprehensive care. Many commenters affirmed that the Department has broad authority to regulate in this area under various sections of the ACA independent of section 1557. Specifically, commenters acknowledged that section 1321(a) of the ACA [402] gives the Department broad rulemaking authority to regulate Exchanges and QHPs; section 1312(c) [403] gives the Department authority to establish procedures for States to allow agents or brokers to enroll individuals and businesses in QHPs; section 1302(b)(4) [404] directs the Department, in defining EHB, to ''take into account the health care needs of diverse segments of the population, including women, children, persons with disabilities, and other groups''; section 1311(c)(1)(A) [405] directs the Department to establish criteria for QHPs to ensure that they will ''not employ marketing practices or benefit designs that have the effect of discouraging the enrollment in such plan by individuals with significant health needs''; and section 2792 of the PHS Act [406] provides the Department with broad authority to promulgate regulations that may be necessary or appropriate to carry out the provisions of title XXVII of the PHS Act, including the guaranteed availability provisions in section 2702,[407] added to the PHS Act by the ACA.

Response: We agree with commenters that clarifying the scope of sex discrimination aligns with the ACA's goals of improving access to health insurance and removing unreasonable barriers to care. We reiterate that we are relying on authority from sections 1311(c)(1)(A), 1312(e), and 1321(a)(1)(A), (B), and (D) of the ACA, as well as sections 2702 and 2792 of the PHS Act, to support this change. 87 FR 584, 596.

Comment: Some commenters objected to the protections against discrimination on the basis of gender identity, in particular, or stated that the Proposed Rule arbitrarily requires coverage of interventions for individuals diagnosed with gender dysphoria, but not for individuals seeking such procedures for other clinically indicated mental health conditions. Some commenters asserted the proposal is arbitrary and capricious because it requires issuers to provide coverage for a ''one-size-fits-all'' treatment to gender dysphoria that is unsupported by evidence. Such commenters, believing that the proposal requires coverage of gender-affirming care, stated that the Department can adequately protect people from discrimination without mandating this coverage.

Response: One of the primary goals of the proposals to clarify the scope of sex discrimination is to address the pervasive health care discrimination faced by LGBTQI+ patients.[408] When medically necessary treatments are categorically excluded when sought by transgender enrollees for purposes of gender-affirming care, but the same such treatments are covered for cisgender enrollees, such exclusions may deny transgender individuals access to coverage based on their sex. These types of exclusions, and other types of sex discrimination, can have the effect of discouraging or preventing the enrollment of LGBTQI+ individuals in health insurance coverage.

Issuers generally have discretion in designing their benefits packages, and this rule does not require entities to cover any particular procedure or treatment. We clarify that, in finalizing the prohibition against discrimination on the basis of sex, the Department is not mandating that health insurance issuers include coverage for any particular item or service not already covered. However, to the extent a covered entity provides coverage for a particular health service, the covered entity must provide coverage for the health service to all individuals in a neutral, nondiscriminatory manner consistent with this rule.

Amending these sections to specify discrimination on the basis of sex includes sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes will help better ensure that all individuals are treated fairly in their access to health care. Without protection from such sex discrimination, transgender individuals may face barriers or be denied medically necessary services that are classified as covered under their plan and made available to other enrolled individuals. Regulations at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) already prohibit discrimination on a variety of bases, including on the basis of race, color, national origin, present or predicted disability, age, sex, expected length of life, degree of medical dependency, quality of life, or other health conditions. Amending these sections to describe sex discrimination will better clarify nondiscrimination protections for all individuals, while also addressing existing disparities for LGBTQI+ individuals seeking health care.

Comment: Many commenters that objected to the proposed clarification suggested that coverage of gender-affirming care and any corresponding treatments are unsupported by clinical evidence, harmful to patients, and incongruent with the belief that gender is immutably defined by one's biological sex. For example, many commenters asserted that due to the lack of clinical evidence, CMS decided in 2016 not to issue a National Coverage Determination

grandfathered group or individual health insurance coverage to provide coverage for certain recommended preventive health services without imposing any cost-sharing requirements. Under this requirement, the plan or issuer must provide coverage, without cost sharing, for a recommended preventive service that is medically appropriate for the individual, as determined by the individual's attending provider, regardless of the individual's sex assigned at birth, gender identity, or recorded gender.

(NCD) [409] for coverage of gender-affirming surgery for Medicare beneficiaries with gender dysphoria. Many objecting commenters also claimed that studies that reach different conclusions (for example, any studies showing efficacy or safety of gender-affirming care) are flawed.

Response: We believe that commenters citing the 2016 Medicare NCD decision are incorrectly interpreting the decision. In its final Decision Memorandum on the issue, CMS notes that it declined to issue an NCD specifically on gender-affirming surgery because the clinical evidence is inconclusive, specifically as it relates to the Medicare population (that is, generally individuals 65 or older). CMS clarifies that the result of the decision is not a national coverage prohibition, but rather a continuation of the current policy that coverage decisions for gender-affirming surgery will continue to be made by local Medicare Administrative Contractors (MACs) and Medicare Advantage (MA) plans on a case-by-case basis based on whether gender-affirming surgery is reasonable and necessary for the individual beneficiary after considering the individual's specific circumstances.

Furthermore, the Medicare program did not analyze clinical evidence for counseling or hormone therapy treatments for gender dysphoria and was not making an NCD determination related to counseling, hormone therapy treatments, or any other potential treatment for gender dysphoria. Therefore, not only is the population for which the NCD applies distinct, but so is the scope of the NCD decision itself.

Claims made by opposing commenters regarding assertions of patient harm resulting from gender-affirming care, purported lack of evidence demonstrating efficacy of such care, alleged differences between ''biological sex'' and gender, and hypothetical medical scenarios are not germane to the proposed regulatory text acknowledging that sex discrimination includes discrimination on the basis of sexual orientation or gender identity. While claims about medical evidence and specific treatments may be relevant in evaluating whether a particular action constitutes unlawful discrimination, or whether a particular item or service is medically necessary, such assertions do not speak to the decision to clarify the scope of sex discrimination in the first place. We also acknowledge that there is a robust consensus in the medical community that gender-affirming care is safe, effective, and medically necessary when clinically indicated for a particular individual.

The amendments made concurrent with the 2020 final rule to the nondiscrimination protections in 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) were based on an erroneous assertion that the plain statutory meaning of ''sex'' does not encompass sexual orientation and gender identity, which is unsupported by *Bostock.* In addition, the 2020 amendments were based on the incorrect assertion that the denial of basic health care on the basis of gender-identity is not a widespread problem in the United States.

Comment: One commenter asserted that the proposed change to the description of sex discrimination is arbitrary and capricious because the Department did not compute the costs of the impact of the rule against the purported benefits of the proposal.

Response: As we explained in the 2022 NPRM and based on our experience with States selecting a new EHB-benchmark plan pursuant to 45 CFR 156.111,[410] CMS believes there will be minimal costs incurred based on amending these sections to clarify sex discrimination. Because these sections previously prohibited discrimination on the basis of sexual orientation and gender identity, many entities already comply with the prohibition on discrimination, as amended under this final rule. 87 FR 47898. We do not anticipate amending these sections to describe sex discrimination would impose substantial administrative costs on any regulated entities that did not subsequently revise nondiscrimination policies based on the 2020 Rule.[411] On balance, we believe any costs are justified in light of the potentially significant benefits provided by protecting individuals from discrimination based on sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. We refer readers to our cost benefit analysis in the Regulatory Impact Analysis of this final rule for additional discussion on the minimal cost impacts to plans and issuers to include nondiscrimination protections. 87 FR 47898.

Comment: Some commenters objected to a perceived lack of clarity in the Proposed Rules. Such commenters noted that the Proposed Rules did not appropriately discuss the breadth of which markets would be covered by this proposal, questioning whether it would apply to large group plans, fully insured group health plans sponsored by employers, health insurance issuers and third party administrators of self-insured plans.

Response: The amendments we are finalizing to the nondiscrimination regulations at 45 CFR 147.104(e) apply to health insurance issuers offering non-grandfathered group or individual health insurance coverage, and their officials, employees, agents, and representatives. The nondiscrimination amendments we are finalizing at 45 CFR 155.120(c) apply to States and Exchanges carrying out Exchange requirements. The nondiscrimination amendments we are finalizing at 45 CFR 155.220(j) apply to agents, brokers, or web-brokers that assist with or facilitate enrollment of qualified individuals, qualified employers, or qualified employees, in coverage in a manner that constitutes enrollment through an FFE, or assists individuals in applying for advance payments of the premium tax credit and cost-sharing reductions for QHPs sold through an FFE. The nondiscrimination amendments we are finalizing at 45 CFR 156.200(e) apply to QHPs in the individual and small-group markets. Section 156.125(b) requires issuers providing EHB to comply with the requirements of 45 CFR 156.200(e), thereby extending the application to non-grandfathered health insurance coverage in the individual and small group markets that provide EHBs.

Lastly, the nondiscrimination protections we are finalizing at 45 CFR 156.1230(b) apply to issuers using direct enrollment on an FFE.

Comment: Some commenters noted concerns about how the nondiscrimination protections would apply to health care providers.

Response: The amendments we are finalizing at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) do not apply to health care providers.

Comment: One commenter asked the Department to provide clarity on the interaction between the section 1557 requirement and the 2023 Notice of Benefit and Payment Parameters final rule regarding non-discriminatory benefit design and EHB.

Response: While the requirements of section 1557 and the requirements imposed on EHB are separate requirements, we are finalizing regulatory language in this rule to make compliance easier for entities that are subject to both standards. As we stated in the 2023 Notice of Benefit and Payment Parameters final rule, CMS continues to make refinements to our EHB nondiscrimination policy and will address non-discriminatory benefit design as it relates to EHB in future rulemaking.

Comment: Commenters objecting to a more detailed understanding of sex discrimination raised several legal concerns. Commenters stated that the Department's reliance on *Bostock* v. *Clayton County,* 590 U.S. 644 (2020), is inappropriate, misinterprets *Bostock,* and misapplies the case to section 1557. One commenter asserted that the rule is arbitrary and capricious because it inappropriately applies the title VII framework to health care. Other commenters stated that the proposal is based on a faulty interpretation of title IX. Commenters also asserted that although reverting the nondiscrimination sections to pre-2020 language would allow LGBTQI+ individuals to receive ''medically necessary'' care, the 2020 rule enforces the plain text enacted by the ACA, which prohibited the discrimination on the basis of sex only.

Other commenters cautioned that absent clear congressional authorization, the Department is not justified in promoting the view that sex or gender can be different than the sex assigned to an individual at birth. Other commenters asserted that the rule is arbitrary and capricious because it ignores that a person's sex is determined by biology and does not sufficiently specify what it means by ''sex'' and how it relates to gender dysphoria treatments.

Response: We disagree that the proposal to include nondiscrimination protections is arbitrary and capricious. We are not relying on or applying the title VII framework to the nondiscrimination protections we are finalizing at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b), nor are we relying on other Federal civil rights laws for statutory authority. As stated in the Proposed Rule, 87 FR 596, we are relying on authority from sections 1311(c)(1)(A), 1312(e), and 1321(a)(1)(A), (B), and (D) of the ACA to support the amendments at 45 CFR 155.120, 155.220, 156.200, and 156.1230. We also rely on authority from sections 2702 and 2792 of the PHS Act to support the amendments to 45 CFR 147.104 and 156.125. Section 2792 of the PHS Act provides the HHS Secretary with broad rulemaking authority to issue regulations as may be necessary or appropriate to carry out the provisions of title XXVII of the PHS Act, including the guaranteed availability provision in section 2702 of the PHS Act, implemented at 45 CFR 147.104, and the EHB requirements in section 2707(a) of the PHS Act, implemented at 45 CFR 147.150 and 156.125. 87 FR 584, 596. We made these proposals and are finalizing these provisions due in large part to the pervasive health and health care disparities faced by people who identify as part of the LGBTQI+ community.[412]

The aim of this final rule is to address the reality of many consumers in the health care sector and how discrimination on the basis of sex by entities regulated under 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) impairs the ability of consumers to access or pay for quality care. We believe these changes are necessary to address the role of discrimination in perpetuating the pervasive health and health care disparities faced by people who identify as part of the LGBTQI+ community.

We also disagree with commenters contesting that these nondiscrimination proposals inappropriately align with *Bostock.* In *Bostock,* the Supreme Court held that discrimination on the basis of sex under title VII of the Civil Rights Act of 1964 includes discrimination on the basis of sexual orientation and gender identity. Under *Bostock's* reasoning, laws that prohibit sex discrimination also prohibit discrimination on the basis of gender identity and sexual orientation.[413]

Furthermore, the inclusion of ''sex stereotypes'' is consistent with the Supreme Court's holding in *Price Waterhouse* v. *Hopkins,* 490 U.S. 228, 250–51 (1989). The inclusion of ''pregnancy or related conditions'' is consistent with the Department's longstanding interpretation of sex discrimination under Title IX.[414] As noted earlier in this preamble, the Department is finalizing these amendments to ensure consistency across the policies and requirements applicable to entities subject to health insurance market and Exchange requirements and those subject to section 1557. Amending CMS nondiscrimination protections to better specify the meaning of sex discrimination is imperative to advancing health equity and ensuring individuals are able to receive health care that is free from discrimination as envisioned under the ACA.

Comment: Many commenters to the 2023 Payment Notice NPRM expressed concerns that the proposal infringed on the First Amendment and would lead to violations of the religious conscience of providers, issuers, brokers, agents, and religiously affiliated hospitals. Some of these commenters objected to the inclusion of sexual orientation or gender identity within nondiscrimination protections altogether. Other commenters asserted that it is unclear how CMS would implement RFRA protections in the context of the nondiscrimination protections, and that this lack of clarity would increase the chance of litigation. A few commenters asked for the final rule to include an exemption for any stakeholders with religious objections (including issuers,

[414] *See* 45 CFR 86.21(c)(2) and (3); 86.40(b)(1), (4), and (5); 86.51(b)(6); 86.57(b) through (d) (Title IX regulation); *see also Conley* v. *Northwest Fla. State Coll.,* 145 F. Supp. 3d 1073 (N.D. Fla. 2015).

plan sponsors, or individual purchasers) or to clarify whether there will be a process for such stakeholders to claim an exemption under RFRA outside of litigation. One commenter requested a process under which issuers or the insured can receive an up-front exemption when they have a religious or conscience-based objection to paying for plans that cover benefits to which they object as being experimental and harmful.

Other commenters believed that the proposal takes the right approach in relation to moral and religious objections.

Response: These regulations are neutral, generally applicable, and do not violate the Free Exercise Clause of the First Amendment. These regulations do not target religiously motivated conduct, but rather, are intended to prohibit sex discrimination generally in order to improve health outcomes and fulfill the statutory command of the ACA to prohibit discrimination and remove unreasonable barriers to care. Certain protections already exist in Federal law with respect to religious or moral beliefs, particularly regarding the provision of certain health-related services. For example, when enforcing its nondiscrimination regulations, HHS will comply with laws protecting the exercise of conscience and religion, including RFRA and all other applicable legal requirements. Nothing in the nondiscrimination protections at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) displaces those protections, and an application of this rule will not be required if it would violate Federal religious freedom and conscience laws.

Although some commenters urged CMS to incorporate a categorical religious exemption into this final rule, a blanket religious exemption is not supported by the underlying statutes. We will apply the protections in existing laws in resolving any conflicts between religious beliefs and these nondiscrimination protections. An entity that believes that compliance with any of these provisions would violate their rights under RFRA or the Free Exercise Clause of the First Amendment should contact CMS, which is responsible for evaluating RFRA-based requests for requirements in the programs it operates or oversees.[415] An entity that believes that compliance with any provision of this rule would violate their rights under the religious freedom and conscience laws enforced by HHS's Office for Civil Rights should file a complaint with OCR.

As with any HHS program, if an entity alleges that HHS's actions have substantially burdened its religious exercise, the Department will apply the test set out by RFRA.[416] The RFRA analysis evaluates whether the actions of the Federal Government have substantially burdened an entity's exercise of religion; if so, the question becomes whether the action furthers a compelling interest and is the least restrictive means to further that interest. RFRA provides that when application of a Federal Government rule or other law would substantially burden a person's exercise of religion, the government must afford that person an exemption to the rule unless it can demonstrate that applying the burden to that person furthers a compelling governmental interest and is the least restrictive means of doing so.[417] Accordingly, under RFRA, we would assess whether a particular application of these rules substantially burdened a stakeholder's exercise of religion and, if so, whether the government has a compelling interest in denying the stakeholder's exemption assurance request and whether there are less restrictive alternatives available.[418] The government's compelling interest in prohibiting discrimination on the basis of sex is to improve health outcomes, including for the LGBTQI+ community, and fulfill the statutory command of the ACA to prohibit discrimination. Whether this prohibition imposes a substantial burden on an entity's exercise of religion and whether it is the least restrictive means of advancing the government's interest will depend on specific facts and circumstances.

The amendments we are finalizing at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) prohibit discrimination on the basis of sex in the conduct of health insurance issuers and their officials, employees, agents, and representatives; States and the Exchanges; agents, brokers, or web-brokers that assist with or facilitate enrollment of qualified individuals, qualified employers, or qualified employees; issuers subject to EHB requirements; and QHP issuers.

Lastly, we again reiterate that the amendments we are finalizing at 45 CFR 147.104(e), 155.120(c), 155.220(j), 156.125(b), 156.200(e), and 156.1230(b) do not require regulated entities to cover any particular service not already covered.

2. Health Insurance Exchanges

a. Non-Interference With Federal Law and Nondiscrimination Standards (45 CFR 155.120)

In 45 CFR 155.120 we proposed to amend paragraph (c)(1)(ii) by removing the term ''sex'' and adding in its place the phrase ''sex (including sexual orientation and gender identity).'' We did not receive comments unique to this section.

Summary of Regulatory Changes

We amend 45 CFR 155.120 in paragraph (c)(1)(ii) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).''

b. Federally-Facilitated Exchange Standards of Conduct (45 CFR 155.220)

In 45 CFR 155.220 we proposed to amend paragraph (j)(2)(i) by removing the term ''sex'' and adding in its place the phrase ''sex (including sexual orientation and gender identity).'' We did not receive comments unique to this section.

Summary of Regulatory Changes

We amend 45 CFR 155.220 in paragraph (j)(2)(i) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).''

c. Essential Health Benefits Package: Prohibition on Discrimination (45 CFR 156.125)

In 45 CFR 156.200 we proposed to amend § 156.200 in paragraph (e) by removing the term ''sex'' and adding in its place the phrase ''sex (including sexual orientation and gender identity).'' Section 156.125(b) would accordingly require issuers providing EHB to comply with such nondiscrimination requirements as it requires that an issuer providing EHB must comply with the requirements of § 156.200(e). We did not receive comments unique to this section.

[415] U.S. Dep't of Health and Hum. Servs., Off. of the Sec'y, Delegation of Authority, 86 FR 67067 (Nov. 24, 2021).

[416] See 86 FR 67067 (Nov. 24, 2021) (delegation of authority under which all HHS components are to ensure full compliance with RFRA and other constitutional requirements).

[417] 42 U.S.C. 2000bb–1(b).

[418] *Fulton* v. *City of Phila.,* 593 U.S. (2021) (''The question, then, is not whether the City [of Philadelphia] has a compelling interest in enforcing its non-discrimination policies generally, but whether it has such an interest in denying an exception to [Catholic Social Services].'').

Summary of Regulatory Changes

Elsewhere in this rule, we amend 45 CFR 156.200 in paragraph (e) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).'' Paragraph (b) of 45 CFR 156.125 accordingly requires issuers providing EHB to comply with such nondiscrimination requirements as it states that an issuer providing EHB must comply with the requirements of § 156.200(e).

d. QHP Issuer Participation Standards (45 CFR 156.200)

In 45 CFR 156.200 we proposed to amend paragraph (e) by removing the term ''sex'' and adding in its place the phrase ''sex (including sexual orientation and gender identity).'' We did not receive comments unique to this section.

Summary of Regulatory Changes

We amend 45 CFR 156.200 in paragraph (e) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).''

e. Direct Enrollment With the QHP Issuer in a Manner Considered To Be Through the Exchange (45 CFR 156.1230)

In 45 CFR 156.1230 we proposed to amend § 156.1230 in paragraph (b)(2) by removing the term ''sex'' and adding in its place the phrase ''sex (including sexual orientation and gender identity).'' We did not receive comments unique to this section.

Summary of Regulatory Changes

We amend 45 CFR 156.1230 in paragraph (b)(2) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).''

3. Prohibition of Discrimination—Group and Individual Health Insurance Markets Guaranteed Availability of Coverage (45 CFR 147.104)

In 45 CFR 147.104 we proposed to amend paragraph (e) by revising ''sex'' to ''sex (including sexual orientation and gender identity).''

The comments and our responses regarding this proposal are set forth below.

Comment: Some commenters requested that CMS clarify that States, including State Attorneys General, may enforce section 1557 to the fullest extent granted by law. That request was in response to CMS' explanation in the Proposed Rule that it was not relying on section 1557 as authority to amend 45 CFR 147.104 because states would not have authority to enforce section 1557 and CMS is of the view that partial reliance on section 1557 could unnecessarily complicate enforcement efforts. 87 FR 47898.

Response: In the Proposed Rule, CMS explained that one of the primary reasons CMS did not propose to rely on section 1557 authority to amend 45 CFR 147.104 was the manner in which § 147.104 is enforced. As discussed in the Proposed Rule, under PHS Act section 2723, States have primary enforcement authority over issuers with respect to regulations that implement title XXVII of the PHS Act, which includes § 147.104. CMS has a responsibility to enforce such regulations if CMS determines that a State is not substantially enforcing or the State notifies CMS that it has not enacted legislation to enforce or is not otherwise enforcing such regulations; otherwise, the State retains primary enforcement authority. Because section 1557 is not codified in title XXVII of the PHS Act, PHS Act section 2723 does not provide States with the authority to enforce section 1557. Therefore, CMS continues to be of the view that partial reliance on section 1557 authority could unnecessarily complicate enforcement efforts of § 147.104.

For this reason and because § 147.104 applies to issuers that may not receive Federal financial assistance such that they would be subject to section 1557, CMS relies on its authorities under sections 2702 and 2792 of the PHS Act when amending § 147.104. Notwithstanding the foregoing, the Department clarifies that although States do not enforce the administrative procedures specified in the section 1557 regulation itself, States may utilize their independent enforcement authorities to pursue violations of law, including applicable Federal laws, by entities within their jurisdictions.

Summary of Regulatory Changes

We amend 45 CFR 147.104 in paragraph (e) by removing the term ''sex'' and adding in its place the phrase ''sex (including discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).''

V. Executive Order 12866 and Related Executive Orders on Regulatory Review

A. Regulatory Impact Analysis

We have examined the impacts of the final rule under E.O. 12866, E.O. 14094, E.O. 13563, the Regulatory Flexibility Act (5 U.S.C. 601–612), the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4), and E.O. 13132 on Federalism. E.O.s 12866 and 13563 direct us to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). Section 3(f) of E.O. 12866 (as amended by E.O. 14094) defines a ''significant regulatory action'' as any regulatory action that is likely to result in a rule that may: (1) have an annual effect on the economy of $200 million or more (adjusted every 3 years by the Administrator of the Office of Information and Regulatory Affairs (OIRA) for changes in gross domestic product); or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or Tribal governments or communities; (2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raise legal or policy issues for which centralized review would meaningfully further the President's priorities or the principles set forth in this Executive order, as specifically authorized in a timely manner by the Administrator of OIRA in each case. This final rule is a significant regulatory action, under sec. 3(f)(1) of E.O. 12866 (as amended by E.O. 14094).

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because the costs of the final rule are small relative to the revenue of covered entities, including covered small entities, and because even the smallest affected entities would be unlikely to face a significant impact, we are certifying that the final rule will not have a significant economic impact on a substantial number of small entities.

The Unfunded Mandates Reform Act of 1995 (section 202(a)) generally

requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any 1 year.'' The current threshold after adjustment for inflation is $177 million, using the most current (2022) Implicit Price Deflator for the Gross Domestic Product. This final rule is not subject to the Unfunded Mandates Reform Act because it falls under an exception for regulations that establish or enforce any statutory rights that prohibit discrimination on the basis of race, color, religion, sex, national origin, age, or disability.[419]

E.O. 13132 on Federalism establishes certain requirements that an agency must meet when it promulgates a Proposed Rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local governments, preempts State law, or otherwise has federalism implications. In considering the principles in and requirements of E.O. 13132, the Department has determined that the final rule would not significantly affect the rights, roles, and responsibilities of the States.

The Congressional Review Act (CRA) defines a ''major rule'' as any rule that the Administrator of OIRA of the Office of Management and Budget finds has resulted in or is likely to result in: (A) ''an annual effect on the economy of $100,000,000 or more''; (B) ''a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions''; or (C) ''significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets.'' 5 U.S.C. 804(2). Based on the analysis of this final rule under E.O. 12866, this rule is expected qualify under 5 U.S.C. 804(2)(A). The Department will comply with the CRA's requirements to inform Congress.

The Background and Reasons for the final rulemaking sections at the beginning of this preamble contains a summary of this final rule and describes the reasons it is needed.

1. Public Comments

Comment: OCR received some comments discussing the cost of notices and taglines [420] in addition to requests that OCR work with the health care industry to develop future regulations. One commenter explained how the cost of including taglines averages up to $8.91 per month per covered entity and upwards of $2 million a year for the health insurance industry. Another health insurer commenter stated that they have spent over $16 million on notices and taglines since 2016 and estimated that they have spent over $3 million in 2022 alone. However, neither commenter provided data explaining the source or more detail on the cost estimates. Another commenter noted that the Proposed Rule does not adequately answer complaints received in prior 1557 rulemakings on the frequency and volume of materials related to the notice and tagline sections of the rule but did not provide any data with their comment.

Response: Based on costs estimated in this analysis, OCR derives a monthly cost of notices ranging from $21.28 to $26.60 per entity depending on the prevalence of electronic delivery. These cost estimates include the total notices of nondiscrimination and notices of availability of language assistance services and auxiliary aids and services (''Notices of Availability''); OCR therefore finds the commenter's estimate of $8.91 per month for Notices of Availability as plausible and consistent with the estimates in section 2 of the Regulatory Impact Analysis. OCR also notes that the cost estimates that are given are averages, and it is expected that there will be some entities that would have costs that are well above or below average. Furthermore, it is expected that large entities would have higher than average costs due to the increased number of notices they would send to individuals.

Comment: A few commenters expressed general concerns on the potential for an increase in premiums and costs within the health care industry. Commenters suggested the final rule would create a moral hazard for individuals or made general statements without data that increasing coverage of goods and services would increase costs and resulting premiums. Other commenters focused on the harm to small business the rule would cause from raising the insurance costs for low-income individuals that small businesses employ. Commenters argued this would lead to layoffs of said employees and limit what services would be available.

Response: As discussed in section 2 of the RIA, OCR expects that there is a possibility of increased premiums and costs due to the rule, but the possible increase is expected to be a small percentage of the current costs due to the low utilization of gender-affirming care and supply of specialists capable of offering said services. OCR does not expect the final rule to have a significant economic impact on small entities based on the analysis in the Regulatory Flexibility Act (RFA).

Comment: A couple of commenters were concerned that the rule would make it more difficult for small entities to compete and remain compliant, which would give a competitive advantage to larger entities in the industry and lead to more consolidation of supplier and provider markets.

Response: OCR appreciates the concerns raised by these commenters; however, as discussed in the RFA, OCR does not expect a significant impact of costs on a substantial number of small entities.

Comment: A few commenters claimed that the final rule would lead to lower innovation within the health care industry due to an increased need to spend funds fighting discrimination instead of medical research.

Response: As discussed in section 2 of the RIA, OCR estimates that additional costs from the inclusion of nondiscrimination requirements will be a small percentage of the total cost due to the limited number of individuals that would seek gender-affirming care, thereby limiting any potential decrease in available funds for medical research.

Comment: A few commenters expressed concern that the final rule would limit rural health care because it would make it more difficult for rural entities to stay compliant and would worsen their financial positions, potentially resulting in closures.

Response: As discussed in section 2 of the RIA, OCR estimates that the costs associated with the final rule would be a small percentage increase in overall costs. Furthermore, OCR reviewed relevant literature and found no studies which suggested that rural hospitals would be particularly impacted by expanded health care services. Finally, as discussed in the small entity analysis section of this RIA, OCR does not estimate a significant economic impact on a substantial number of small entities.

Comment: Several commenters expressed concern that the final rule would lead to fewer health care professionals in the industry for a

[419] 2 U.S.C. 1503(2).

[420] Commenters referred to ''taglines,'' which were required in the 2016 Rule at former § 92.8(d). This final rule does not require ''taglines'' but instead requires a notice of availability of language assistance services and auxiliary aids and services (referred to as ''Notice of Availability'') at § 92.11.

variety of reasons. Some of the commenters stated that the final rule would lead to health care professionals leaving the industry from the lack of conscience or religious exemptions. A couple of commenters stated that future health care professionals would not enter the industry in the future as the final rule would require them to violate the Hippocratic Oath or their religious beliefs.

Response: As discussed in section 2 of the RIA and preamble of the rule, the final rule includes a variety of protections for religious freedom and conscience rights, including a process whereby entities may rely on these protections and seek assurance of them from HHS. See § 92.302.

Comment: Several commenters noted that portions of the data that were used in the RIA, such as the number of covered entities and number of small entities, are outdated and need to be updated for an accurate cost estimate to be made.

Response: OCR agrees with commenters that data sources could be updated from the Proposed Rule. In this final rule RIA, the data for the number of covered entities, number of entities with more than 15 employees, the number of small entities, and hourly wages have been updated to the most recent data available.

Comment: A few commenters expressed concern that the final rule would cause irreparable harm to individuals who regret transitions.

Response: Commenters do not provide supporting evidence or data on the frequency or cost of potential irreparable harm. OCR disagrees with the commenters and did not find studies providing evidence or data on the frequency or cost of what the commenters characterize as irreparable harm, and therefore makes no changes to the final rule.

Comment: One commenter expressed concern that long-term costs associated with gender-affirming care are not accounted for within the RIA and that the studies used may not be accurate. Due to this, the commenter stated that the supplementary information provided is at best speculative.

Response: The main source for costs related to gender-affirming care come from a peer reviewed article in the New England Journal of Medicine, a well-respected medical journal. The cost associated with gender-affirming care is based on actual cost data from the Defense Manpower Data Center, which is part of the Department of Defense (DOD). As noted, the final rule does not mandate the provision of or coverage of gender-affirming care, or any particular health service. However, to the extent a covered entity provides coverage for a particular health service, the covered entity must provide the health service to all individuals in a neutral, nondiscriminatory manner consistent with this rule.

Comment: One commenter stated that the costs of algorithmic discrimination have been quantified and asked OCR to include examples of the costs of such discrimination.

Response: OCR includes a specific provision on algorithmic discrimination in the final rule and qualitatively discusses the potential costs to individuals from discriminatory application of algorithms and other decision support tools in the benefits section.

2. Summary of Costs and Benefits

This analysis quantifies several categories of costs to covered entities and to the Department under the final rule. Specifically, we quantify costs associated with covered entities training employees, revising policies and procedures, and costs associated with notices, including the Notice of Nondiscrimination and Notice of Availability. We quantify costs associated with provisions of the final rule related to documenting training activities performed under the final rule. We also quantify incremental costs associated with coverage for gender-affirming care (which, as noted above, is not mandated by the rule). Our analysis also addresses uncertainty in costs associated with notices and gender-affirming care, which is discussed in greater detail in the notices section of subsection B of section 2 of the RIA. We separately report a full range of cost estimates of about $523 million to $1,302.3 million using a 7 percent discount rate, and a full range of cost estimates of about $511.4 million to $1,290.7 million using a 3 percent discount rate. All cost estimates are in 2022 dollars. We conclude that the final rule would result in annualized costs over a 5-year time horizon of $646.5 million or $637.1 million, corresponding to a 7 percent or a 3 percent discount rate respectively.

In addition to these quantified cost estimates, the main analysis includes a discussion of costs that we do not quantify, and a discussion of the potential benefits under the rule that we similarly do not quantify. In addition to the impacts that we quantify, this final rule could also result in increases in premiums, which would result in increases in Exchange user fees and Federal expenditures for advance payments of the premium tax credit. These increases would be minimal due to the low utilization of gender affirming care and the availability of the services.

TABLE 1—ANNUALIZED COSTS OF THE FINAL RULE

[$ millions/year (percent)]

Primary estimate	Low estimate	High estimate	Year dollars	Discount rate (percent)	Period covered
$646.5	$523	$1,302.3	2022	7	2024–2028
$637.1	511.1	1,290.7	2022	3	2024–2028

a. Baseline Conditions

Section 1557 prohibits an individual from being excluded from participation in, denied the benefits of, or otherwise subjected to discrimination on the basis of race, color, national origin, sex, age, or disability in certain health programs and activities. It applies to any health program or activity, any part of which is receiving Federal financial assistance, and to any program or activity that is administered by an executive agency or any entity established under title I of the ACA.[421] On May 18, 2016, the Department published a final rule to implement section 1557 under the statute5 U.S.C. 301. 81 FR 31375. On June 19, 2020, the Department published a final rule that revised the Department's approach to implementing section 1557. 85 FR 37160. As described in greater detail in the Background section of this preamble, neither final rule was fully implemented as published, and certain provisions of the 2020 Rule remain the subject of ongoing litigation.

[421] 42 U.S.C. 18116.

The baseline scenario of no further regulatory action is substantially informed by the RIAs published with the 2016 and 2020 Rules. The 2016 RIA identified five sources of monetized costs: training and familiarization, enforcement, notice publication, sex discrimination policy and procedure changes, and language access plans. The bulk of the monetary impacts identified in the 2016 RIA occur in the first two years under the 2016 rule, with costs continuing in future years only for enforcement and language access plans.

The 2020 RIA adopted many of the assumptions contained in the 2016 RIA. For example, it assumed that many of the initial activities anticipated under the 2016 Rule were performed, and that the first two years of costs attributable to the 2016 Rule were incurred.[422] The 2020 RIA identifies cost savings only ''from the repeal of (1) the provision on the incentive for covered entities to develop language access plans and (2) the provisions on notice and taglines.'' 85 FR 37224. The 2020 RIA also identifies costs in the first year ''on covered entities' voluntary actions to re-train their employees on, and adopt policies and procedures to implement, the legal requirements of this final rule.'' 85 FR 37224.

In establishing a baseline scenario, this analysis similarly maintains a number of assumptions and estimates contained in prior analyses. For example, the baseline scenario includes some ongoing costs that are attributable to the 2016 Rule, such as the costs of enforcement. The 2016 RIA estimated that the costs of enforcement would be $108.8 million (reported in 2022 dollars), which we adopt as the costs under both the baseline and final rule scenarios. Similarly, we adopt the assumption in the 2020 RIA that covered entities continue to provide ongoing training attributable to the 2016 Rule, which was not impacted by the 2020 Rule. We include these ongoing training activities, including annual refresher training for returning employees and training for new employees, in the baseline scenario of no regulatory action.

The final rule analysis updates baseline conditions on the number of covered entities. The 2016 Rule, 2020 Rule, and 2022 NPRM all used 275,002 covered entities, and 41,250 covered entities that have 15 or more employees. This final rule updates the covered entities to 266,297 and the number of covered entities with 15 or more employees to 63,950. Table 2 presents the updated data on covered entities. To update this data, we identified the source of the original data being the 2012 Statistics of U.S. Businesses (SUSB) Annual Data Tables by Establishment Industry and found the 2020 version of the same dataset. Using the same NAICS codes from the Proposed Rule we identify the number of entities under these NAICS codes in addition to the number of firms with 15 or more employees.

TABLE 2—COVERED ENTITIES

NAICS code	Business type	Firm count 2020	Firms with 15 or more employees
62142	Outpatient mental health and substance abuse centers.	7,649	2,911
621491	HMO medical centers	84	21
621492	Kidney dialysis centers	449	216
621493	Freestanding ambulatory surgical and emergency centers.	4,554	2,204
621498	All other outpatient care centers	6,307	2,766
6215	Medical and diagnostic laboratories	7,200	1,892
6216	Home health care services	25,718	10,901
6219	All other ambulatory health care services	7,091	2,589
62321	Residential intellectual and developmental disability facilities.	6,674	3,628
6221	General medical and surgical hospitals	2,445	2,344
6222	Psychiatric and substance abuse hospitals	434	414
6223	Specialty (except psychiatric and substance abuse) hospitals.	301	280
6231	Nursing care facilities (skilled nursing facilities).	9,824	7,513
45611	Pharmacies and drug stores	19,346	3,436
6211	Offices of physicians	167,294	22,494
524114	Insurance Issuers	869	341
	Navigator grantees	58	
	Total Entities	266,297	63,950

In the next section, we discuss the incremental costs of the final rule, which exclude ongoing costs attributable to prior rulemaking.

b. Costs of the Final Rule

This analysis anticipates that the final rule would result in one-time costs to covered entities to process assurance of exemption requests and revise policies and procedures. The final rule would result in costs associated with a revised approach to notices, including the Notice of Nondiscrimination and Notice of Availability, costs to review new decision support tool requirements, and costs to training employees. The final rule would also result in costs associated with provisions related to documenting training activities performed under the final rule.

The final rule might result in additional costs associated with coverage for gender-affirming care. We discuss the potential costs associated with gender-affirming care coverage and the potential that some or all of these costs would be offset by reductions in spending on other types of care. We

[422] *E.g.,* 85 FR 37235 (''The Department assumes sunk costs cannot be recovered by this rule, and therefore that initial language access plan development costs attributable to the 2016 Rule cannot be recovered.'').

reiterate that the final rule does not mandate the provision of or coverage of gender-affirming care, or any particular health service. However, to the extent a covered entity provides coverage for a particular health service, the covered entity must provide the health service to all individuals in a neutral, nondiscriminatory manner consistent with this rule.

The analysis also discusses other potential costs of the final rule that we do not quantify.

Training

The Department anticipates that some covered entities would incur costs to train or retrain employees under the final rule. To calculate the costs related to training, we followed an approach common to both the 2016 and 2020 RIAs. Both analyses estimate that covered entities would train their employees on the requirements. This final rule uses the updated estimate of covered entities (266,297) as the basis for calculating the total costs. The 2020 RIA adjusted the number of covered entities downward by 50 percent, anticipating that some covered entities would not modify their procedures in response to the 2020 final rule, and would therefore not need to offer new training. Both RIAs anticipated that employers would most likely train employees who interact with the public and recognized that the percentage of employees that interact with patients and the public vary by covered entity. To account for this, the analyses adopted a central estimate of 50 percent of staff at covered entities that received one-time training on the requirements of the regulation.

Both RIAs reported the number of employees at covered entities by occupation category. To monetize the total costs of training, the RIAs adopted a value of time based on the average fully loaded wage rate for each occupation, combined with an assumption about the duration of the training. The 2016 RIA assumed that 50 percent of total employees at covered entities would receive training, while the 2020 RIA assumed that 25 percent of employees would receive training. Both RIAs assumed the typical training would last one (1) hour. For this analysis, we assume that 75 percent of total employees at covered entities would receive training, and that this training would last one (1) hour. This estimate is consistent with an assumption that all covered entities would revise their policies and procedures under the final rule and that most employees at covered entities would receive training.

As a necessary first step in calculating the incremental total costs of training attributable to the final rule, we have collected the most recent available data on the number of employees that would likely undergo training under the final rule, and data on the average wage rate by occupation for these employees.

The first category of health care staff that may receive training comprises health diagnosing and treating practitioners. This category includes physicians, dentists, optometrists, physician assistants, occupational, physical, speech and other therapists, audiologists, pharmacists, registered nurses, and nurse practitioners. The U.S. Bureau of Labor Statistics (BLS) Occupational code for this grouping is 29–1000, and the 2022 reported employment count for this occupational group is approximately 5.96 million, with average loaded wages of $114.42 per hour at the national level.[423]

The second category of health care staff that the Department assumes will receive training comprises degreed technical staff (Occupation code 29–2000) and accounts for 2.95 million employed individuals with average loaded wages of $51.18 per hour at the national level.[424] Technicians work in almost every area of health care: x-ray, physical, speech, psychiatric, dietetic, laboratory, nursing, and records technicians, to name but a few areas.

The third category of health care staff that the Department assumes will receive training comprises non-degreed medical assistants (Occupation code 31–0000), which includes psychiatric and home health aides, orderlies, dental assistants, and phlebotomists. Health care support staff (non-degreed, medical assistants) operate in the same medical disciplines as technicians, but often lack professional degrees or certificates often required for degreed technical staff. There are approximately 6.79 million employed individuals in these occupations in the health care and social assistance sector, with average loaded wages of $34.20 per hour at the national level.[425]

The fourth category of health care staff that the Department assumes will receive training is health care managers (Occupation code 11–9111) and accounts for approximately 0.48 million employed individuals with average loaded wages of $123.06 per hour at the national level.[426]

The fifth category of health care staff that the Department assumes will receive training is office and administrative assistants (Occupation code 43–0000) and accounts for approximately 2.719 million employed individuals with average loaded wages of $41.16 per hour within the Health Care and Social Assistance sector.[427] These workers are often the first staff patients encounter in a health facility and, because of this, covered entities might find it important that staff, such as receptionists and assistants, receive training on the regulatory requirements. The Department assumes that outreach workers are included in the five categories listed above.

The Department estimates that there are a total 18.9 million employees at covered entities, of which we assume 14.2 million, 75 percent, would receive training attributable to the final rule. Across the five occupation categories, we estimate a weighted hourly wage rate of $32.70, or a weighted fully loaded hourly wage rate of $65.41. Assuming that the average training takes one (1) hour and adopting a value of time based on fully loaded wage rates, we estimate total first-year training costs for all covered entities to be approximately $927.3 million [428] As a sensitivity analysis, we considered the scenario of covered entities providing training to all employees, 18.9 million, not just employees who interact with the public, 14.2 million. Under this scenario, the total cost of training would increase to about $1.2 billion. These costs are likely overstated since this training may supplement or replace expected annual or other ongoing training activities at covered entities. To the extent that covered entities reduce time spent on other training activities, these costs would offset some of the total costs attributable to the final rule.

Lastly, the Department assumes that 91 investigators at OCR, who are equivalent to GS–12 Step 1 employees

[423] U.S. Bureau of Labor Statistics, *May 2022 National Occupational Employment and Wage Estimates, https://www.bls.gov/oes/current/oes_nat.htm.* The average loaded wage for Healthcare Diagnosing or Treating Practitioners is derived by multiplying the mean hourly rate by 200 percent to include the mean hourly wage, the cost of fringe benefits and overhead costs ($57.21 * 200% = $114.42).

[428] Numbers may not multiply due to rounding.

and whose average hourly loaded wage is $65.46, will receive a one-time training during the first year of the promulgation of this rule.[429] Each individual would receive 8 hours of training for a total of $47,655 (91 x 1 x $65.46) in training costs. This training would not occur in any subsequent years.

In addition to the first-year training costs, we anticipate that the final rule would result in additional costs associated with ongoing training, including annual refresher training for returning employees and training for new employees. As discussed in the Baseline Conditions section, we assume that many covered entities are routinely carrying out these activities, absent further regulatory action. However, we anticipate that the final rule would result in a larger share of employees at covered entities receiving such training. To quantify the change in training activities between the baseline scenario and the final rule scenario, we take the difference between the share of employees receiving training under the baseline scenario and the final rule scenario. We carry through an assumption from the 2016 RIA, which assumed that 50 percent of total employees at covered entities receive training and compare this to an assumption in this final RIA that 75 percent of total employees at covered entities would receive training. This yields an estimate of 25 percent of total employees at covered entities that would receive training in subsequent years under the final rule. We adopt the same weighted hourly wage estimate, number of employees, and estimate the total ongoing annual training costs as $309.1 million. This was calculated by multiplying the total number of employees at covered entities by .25 and multiplying by $65.41.

Finally, the Department assumes covered entities may require employees to undergo one (1) hour of training in response to in OCR investigation. As it is difficult to determine the type of employee that would be required go through additional training, we use the average loaded hourly wage of $65.41 to evaluate the opportunity cost of training time. To estimate the frequency with which covered entities may assume this cost, we reviewed OCR complaints from the 2023 calendar year and identified 60 cases investigated under section 1557 that were closed with a covered entity either engaging in voluntary corrective action in response to the investigation or entering into a Voluntary Resolution Agreement with the agency.[430] Using this as a baseline, the Department assumes that for every year of the observation period there would be 60 potential instances of this additional training, and that it would be conducted in each case. As a result, we estimate that covered entities would incur $3,924 in additional training costs for every year of the observation period.[431]

Revising Policies and Procedures

As discussed above in the previous section, the Department anticipates that all covered entities, or approximately 266,297 entities, would revise their policies and procedures under the final rule, with approximately half of these entities requiring less extensive revisions. For covered entities with more extensive revisions, we adopt the estimates contained in the 2020 RIA, with four (4) total hours spent on revisions per entity. Of these, three (3) would be spent by a mid-level manager equivalent to a first-line supervisor (Occupation code 43–1011), at a cost of $62.98 ($31.49 × 2) per hour after adjusting for the cost of fringe benefits and other indirect costs, while an average of one (1) hour would be spent by executive staff equivalent to a general and operations manager (Occupation code 11–1021), at a cost of $118.14 ($59.07 × 2) per hour at the national level, including the cost of fringe benefits and other indirect costs.[432] For covered entities with less extensive revisions, we assume two (2) total hours spent on revisions per entity. Of these, one (1) would be spent by a mid-level manager, and one (1) would be spent by executive staff.

We monetize the time spent on revising policies and procedures by estimating a total cost per entity of $307.08 or $181.12, depending on the extent of the revisions. For the 133,149 covered entities with more extensive revisions, we estimate a total cost of about $40.8 million. For the 133,149 covered entities with less extensive revisions, we estimate a total cost of about $24.1 million. We estimate the total cost associated with revisions to policies and procedures under the final rule of $65.0 million.

The above estimates of time and number of entities that would choose to revise their policies under the regulation are approximate estimates based on general BLS data. We are unable to precisely estimate the total number of covered entities that would choose to revise their policies and procedures under the new regulation or to what extent they would make these changes due to the wide range of types and sizes of covered entities, from complex multi-divisional hospitals to small neighborhood clinics and physician offices.

In addition to the initial revisions of policies and procedures, the Department assumes some covered entities may elect or be required to revise their policies and procedures following an investigation. We assume that such revisions would cost the same as the original revision that occurs in the first year of the observation period. As discussed above, the Department estimates that during every year of the observation period, there would be an average of 60 instances in which corrective actions may be taken due to a 1557 investigation. As revising policies and procedures is a more significant corrective action compared to corrective training, the Department assumes that it will occur in response to only half of the investigations. The Department continues to use the assumption that half of the entities revising their policies and procedures would be major firms while the other half would be minor firms. The estimated total annual cost for revisions of policies and procedures in response to an OCR investigation is $7,323 ($307.08 × 15 + 181.12 × 15) in each year of the observation period.

Notices

The final rule requires the 266,297 covered entities to provide a Notice of Nondiscrimination to participants, enrollees, and beneficiaries, hereafter referred to as beneficiaries of its health program or activity, and members of the public. It also requires covered entities to provide a Notice of Availability. These provisions resemble elements of the 2016 Rule that were repealed in the 2020 Rule; however, the approach under the final rule provides a narrower set of situations where covered entities would be required to provide these notices. Both types of notices are required (1) on an annual basis; (2) upon request; (3) at a conspicuous location on the covered entity's health program or activity website; and (4) in clear and prominent physical locations where the health program or activity interacts with the public.

The Notice of Availability is also required in the following electronic and written communications related to the covered entity's health programs and activities: (1) notice of nondiscrimination required by final § 92.10; (2) notice of privacy practices required by 45 CFR 164.520; (3) application and intake forms; (4) notices of denial or termination of benefits or services, including Explanations of Benefits (EOBs) and notices of appeal and grievance rights; (5) communications related to an individual's rights, eligibility benefits, or services that require or request a response from a beneficiary; (6) communications related to a public health emergency; (7) consent forms and instructions related to medical procedures or operations, medical power of attorney, or living will (with an option of providing only one notice for all documents bundled together); (8) discharge papers; (9) communications related to the cost and payment of care with respect to an individual, including good faith estimates and medical billing and collections materials; (10) complaint forms; and (11) patient and member handbooks.

For the purposes of the Notice of Availability analysis, we base our estimates of the number of communications containing these notices on a subset of the communications identified in the 2020 RIA. We include communications that are EOBs. The Department received feedback regarding the financial burden imposed by applying the Notice of Availability requirements to EOBs. EOBs are typically an individual's first, and often only, notice of a denial or termination of benefits or services, and as such, the Notice of Availability requirement is essential in this context to ensure timely and equitable access to appeals processes. The final rule at § 92.11(d) permits covered entities to provide individuals with the option to opt out of receiving the Notice of Availability on an annual basis, which will reduce the cost and burden associated with these requirements. In addition, as beneficiaries increasingly elect to receive EOBs and other types of communications electronically, we expect the cost of these requirements to decrease over time. We adopt the other estimates as a reasonable proxy for the number of communications that would be anticipated under the final rule. These estimates are intended to encompass all categories of Notices of Availability required under the final rule. We have increased the total number of communications containing notices by 10 percent to account for the additional communications related to the cost and payment of care with respect to an individual, including good faith estimates and medical billing and collections materials, which were not included in the Proposed Rule.[433]

Table 3 below reports the number of communications containing notices anticipated under the final rule and presents the costs of these communications. Our cost estimates reflect a wide range of uncertainty in the cost per communication. For our primary scenario, we adopt a central estimate of the average costs to print and fold paper forms containing prescribing information of $0.05 (calculated as the midpoint estimate of a range from $0.03 to $0.07), reported in 2010 dollars.[434] We explore the sensitivity of the overall cost estimates under a low-cost ($0.035 per unit) and high-cost ($0.32 per unit) scenario, reported in 2018 dollars, which matches the range contained in the 2020 RIA. We adjust these per-unit cost inputs for inflation to 2022 price levels using the Implicit Price Deflator, resulting in a primary per-unit cost estimate of about $0.067 and a full range of about $0.045 to $0.37.[435] Combining these per-unit cost estimates with the count of each notice results in a primary estimate of $93.2 million, with a range of estimates between $57.2 million and $522.8 million. Following the approach in the 2020 RIA, we adjust this figure downward by 50 percent to account for the lower cost of electronic communications. For this adjustment, we adopt a measure of the share of respondents reporting that they used a ''Digital (mobile app or website)'' method to contact or interact with their health insurance issuer or plan in the last year when viewing an online statement.[436] We anticipate that the share of communications occurring online will increase over time but have not accounted for a trend for the 5-year time horizon of this analysis. This adjustment results in a primary estimate of the adjusted annual total of $46.6 million, with a range of costs between $28.6 million and $261.4 million. These costs would occur in each year of the time horizon of the analysis.

TABLE 3—COST OF NOTICE PROVISIONS

[2022 Dollars]

Cost element	Count (millions)	Cost scenario ($ millions)		
		Low	Primary	High
Eligibility and enrollment communications	19.5	$0.8	$1.3	$7.2
Annual notice of benefits	135.3	5.5	8.9	49.9
Explanations of benefits—hospital admissions	105.6	4.3	6.9	39.0
Explanations of benefits—physician visits	1035.1	41.8	68.1	382.0
Medical bills—hospital admissions	12.1	0.5	0.8	4.5
Medical bills—physician visits	108.9	4.4	7.2	40.2
Total, Unadjusted	1416.5	57.2	93.2	522.8
Total, Adjusted for Electronic Delivery	1133.2	28.6	46.6	261.4

[433] This reflects the increase from 10 categories accounted for by communications and notices in the Proposed Rule RIA to 11 categories, or an increase of 10 percent.

Documentation Requirements

The final rule requires covered entities to contemporaneously document certain other activities performed under the final rule. This includes activities such as employees' completion of the training required by this section in written or electronic form. The final rule also requires covered entities to retain certain records. These and other requirements, and the associated cost estimates, are discussed in greater detail in the PRA section.

The costs associated with retaining records related to grievances filed with a covered entity is the time spent by the staff of covered entities to store the complaints for no less than three (3) years. We calculate the costs of labor as one (1) employee per covered entity with more than 15 employees (63,950) spending 10 hours to store complaints and the associated records required under final § 92.8(c)(2) each year.[437] We assume that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation is $19.02 per hour, which we double to account for overhead and other indirect costs. We estimate the costs of retaining records related to grievances filed at all covered entities would be $24.3 million annually ($19.02 × 2 × 10 × 63,950). This estimation approach will overstate the costs if many covered entities already retain complaint information.

The costs associated with documenting employee training is the time spent by the staff of covered entities to (a) create training attendance forms, and (b) store the training sign-up sheet. We calculate the costs of labor as one (1) employee spending 15 minutes (0.25 hours) to create the sign-up sheet during the first year and one (1) employee spending one (1) hour collecting and storing the attendance forms the first year and subsequent years. We assume that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation is $19.02 per hour, which we double to account for overhead and other indirect costs. We estimate the costs of documenting employee training would be $12.6 million in the first year ($19.02 × 2 × 1.25 × 266,297) and $10.1 million in subsequent years ($19.02 × 2 × 1 × 266,297).

Coverage for Gender-Affirming Care

In addition to the cost some covered health insurance issuers and plans may incur for revising policies and procedures to comply with the rule, there is a possibility that such issuers and plans may incur a de minimis cost related to the cost of coverage for gender-affirming care. Various studies, however, suggest that any such increased costs will likely be negligible, and that any increases may be offset by savings from decreased utilization of other services. The likelihood of significant costs is low both because transgender individuals make up a very small percentage of the population and because many transgender individuals do not seek gender-affirming surgeries or other types of care.[438]

In April 2012, the California Department of Insurance conducted an Economic Impact Assessment on Gender Nondiscrimination in Health Insurance that found that prohibiting discrimination on the basis of gender identity in health insurance plans would have an ''insignificant and immaterial'' impact on costs.[439] This conclusion was based on evidence of low utilization and the estimated number of transgender individuals in California. The transgender population of California was estimated to range between 0.0022 percent and 0.0173 percent.[440] The study revealed that, contrary to common assumptions, not all transgender individuals seek surgical intervention, and that gender-affirming health care differs according to the needs and pre-existing conditions of each individual.[441] Despite expecting a possible spike in demand for benefits due to former or current unmet demand, the California Insurance Department concluded that any increased utilization that might occur over time is likely to be so low that any resulting costs remain actuarially immaterial.[442] The Assessment notes the experience of one employer that initially established premium surcharges to cover the anticipated cost of gender-affirming care, reporting that the employer subsequently eliminated the surcharges because they found that the funds collected were nearly 15 times the amount expended on care.[443] While it did not analyze any original data, a 2018 analysis by the State of Wisconsin's Department of Employee Trust Funds cited numerous studies finding that the cost of coverage was minimal, and noted that ''[w]hile it is challenging to predict the costs of care averted for any condition, there is some evidence that the costs associated with providing transgender-inclusive plans is met with reduced costs related to comorbidities.'' [444] Other studies looking at both public and private sector plans have reached similar conclusions. One study published in the New England Journal of Medicine projected that the cost for providing gender-affirming care benefits to members of the military would result in an annual increase of 0.012 percent of health care costs, ''little more than a rounding error in the military's $47.8 billion annual health care budget.'' [445] A 2013 study of 34 public and private sector employers that provided nondiscriminatory health care coverage found that providing coverage of gender-affirming care had ''zero to very low costs.'' [446] An

[437] This estimate is consistent with the 2016 Rule's Regulatory Impact Analysis: ''Of the 275,002 covered entities, approximately 15 percent employ more than 15 employees, resulting in approximately only slightly more than 41,250 covered entities being required to have grievance procedures and designate a responsible official.'' 81 FR 31375, 31452 (May 18, 2016).

[446] Jody Herman, The Williams Inst., UCLA Sch. of Law, *Cost and Benefits of Providing Transition-Related Health Care Coverage in Employee Health Benefits Plans: Findings from a Survey of Employers,* p. 2 (Sept. 2013), *http://*

additional study comparing costs and potential savings associated with covering gender-transition-related care concluded that ''additional expenses hold good value for reducing the risk of negative endpoints—HIV, depression, suicidality, and drug abuse'' and noted that ''provider coverage was cost-effective in 85 percent of simulations.'' [447] More recently, a 2021 survey of employers conducted by the Human Rights Campaign noted that most employers who covered gender-affirming care reported only ''marginal increases'' in cost, on the order of ''a fraction of a decimal point of cost calculations.'' [448]

In recent years, some legal challenges to coverage exclusions have also considered issues of cost and concluded that covering gender-affirming care does not significantly increase costs for plans. In discussing the parties' experts on the issue of the cost, one court noted that, ''[f]rom an actuarial perspective, there appears to be no dispute that the cost of coverage is immaterial.'' [449] Another court reviewing expert testimony called any cost savings from excluding coverage for gender-affirming care ''both practically and actuarially immaterial.'' [450]

Based on the studies discussed above, we estimate that providing transgender individuals nondiscriminatory insurance coverage and treatment would have a small impact on the overall cost of care and on health insurance premiums in terms of the percentage of overall spending. We reiterate that the final rule does not mandate the provision or coverage of gender-affirming care, or any particular health service. However, to the extent a covered entity provides coverage for a particular health service, the covered entity must provide the health service to all individuals in a neutral, nondiscriminatory manner consistent with this rule. The utilization rate of covered services, whatever those services may be, is likely to be extremely low because transgender individuals represent a small minority in the general population and because not all transgender individuals will seek medical care in the course of their transition.[451]

As described in this section, the costs associated with gender-affirming care are likely to be small on a percentage basis of total health care costs; however, when these estimates are combined with measures of overall health care spending, they would likely result in incremental costs that could be substantial. As an initial estimate, we pair the Belkin (2015) estimate of 0.012 percent of incremental health care costs with $4,255.1 billion in total health expenditures in calendar year 2021.[452] When this is grown to 2022 dollars, total health care costs are $4,550.0 billion. Combining these yields our upper-bound estimate of $546 million in annual costs associated with additional coverage. As a lower-bound estimate, we adopt an assumption that these costs will be fully offset by reductions in spending on other medical care. This lower bound of $0 is broadly consistent with a cost-effectiveness analysis that includes the probability of negative incremental costs associated with coverage.[453] For our primary estimate, we start with the midpoint of the lower-bound and upper-bound cost estimate of about $273.24 million annually. We reduce this figure by half to account for several factors, such as some covered entities already covering gender-affirming care under the baseline scenario. The coverage from § 92.207(b)(1) through (5) and (6) have delayed applicability dates of the first day of the first plan year beginning on or after January 1, 2025. Therefore, there is no cost from coverage in year 1 (2024). This results in a primary estimate of about $138 million per year starting in year 2 in incremental annual costs associated with additional coverage under the final rule, with a full range of cost estimates including $0 million and $546 million.

In addition, health plans and issuers could incur overall costs if total health care utilization increases as a result of this final rule. Any potential increase in costs as a result of increased health care utilization as a result of decreased discrimination could be passed on to beneficiaries in the form of increased premiums. However, this cost would be minimal due to the low utilization of gender affirming care along with the availability of the services.

Assessing Decision Support Tools for Discrimination

Section 92.210 sets a minimum requirement for each covered entity to make reasonable efforts to mitigate the risk of discrimination resulting from the covered entity's use of a decision support tool. This will impose a cost on covered entities to review for potential discrimination in their decision support tools and to then make reasonable steps to mitigate the risk of discrimination. To estimate the cost of review, the Department assumes that all covered entities, or 266,297 entities, would on average take 1 hour to review decision support tools in year 1 and 0.5 hours in each year 2–5. The Department assumes the time burden is halved after year 1 because entities would only be reviewing new decision support tools or changes made to preexisting ones in the past year. Evidence suggests that larger entities, such as insurers, health systems and national labs, are more likely to use decision support tools while some types of entities may not use them at all.[454] It is therefore likely that entities will have a large variance in time burden in practice as some entities will need to spend more time reviewing and others much less. OCR assumes that the hour of review consists of a 1557 coordinator (SOC code 43–4071) spending 0.5 hours coordinating a request for information on the potential for discrimination in decision support tools used by the covered entity and a Management Analyst (13–1111) or equivalent employee with knowledge of the decision support tools spending 0.5 hours responding to that request. After adjusting for fringe benefits and other indirect costs, the hourly wages for the Management Analyst and Section 1557 Coordinator come to $100.64 and $38.04 respectively. We monetize the time spent on reviewing decision support tools by estimating a total cost per entity

of $69.34 ($100.64 × 0.5 + $38.04 × 0.5). The estimated total cost to review decision support tools for all covered entities is $18,465,034 ($69.34 × 266,297) in year 1. In years 2–5, OCR estimates that the time burden will be half of what it was in year 1. This will lead to a total cost per entity of $34.67 ($100.64 × 0.25 + $38.04 × 0.25) in years 2–5. The estimated total cost to review decision support tools for all covered entities is $9,232,517 ($34.67 × 266,297) in each year 2–5.

If an entity reviews their decision support tools and determines that there is no evidence that use of the tools may result in discriminatory outputs, then it is likely that no further action will be taken, and no additional cost will be incurred. If the entity determines that there is evidence that the decision support tools used by the covered entity could result in discriminatory outputs, then the entity will have to make reasonable mitigation steps to be in compliance with the final rule. OCR has determined that there are a large variety of actions that a covered entity can take to satisfy the requirements of the final rule and that these steps likely depend on the specific scenario. One aspect that will affect what a covered entity would do is if the decision support tool that is being used is a third-party product that the covered entity pays for or was developed and is owned by the covered entity itself. In the first scenario, the covered entity could notify the third party that the decision support tool may result in outputs that could be in violation of the rule, take mitigation steps in the use of the tool to ensure decisions made using that tool account for the potential for bias, or switch to a different product if the cost to do so is not prohibitive. If the covered entity maintains their own decision support tool, then they might take time to update the decision support tool, change policies and procedures about its use, or take other reasonable mitigation measures to ensure that it is not used in a discriminatory manner. The cost of all these actions may vary greatly, and OCR does not have data to assess what the costs may be. Generally, OCR assumes that larger entities, such as multihospital health systems and insurers will have a higher cost to resolve these issues since they are more likely to use decision support tools.[455] In addition, OCR does not have data on how likely any given decision support tool is to be discriminatory and therefore necessitate taking reasonable mitigation steps. Due to these data limitations, OCR does not quantify the cost of taking reasonable mitigation steps.

Exemption Requests

We also identify a cost related to covered entities submitting a request for assurance of an exemption based on Federal conscience or religious freedom laws. We model this potential cost associated with exemption assurance requests as the time spent by covered entities to (a) assess the need for an exemption; (b) write the exemption assurance request; and (c) submit such a request to OCR. As an initial calculation, we assume that this would involve two (2) employees spending two (2) hours each assessing the need for an exemption and one employee spending three (3) hours writing and submitting the exemption assurance request to OCR. We further assume that legal personnel, including lawyers and legal assistants, would perform these functions. The mean hourly wage for these occupations is $70.55 per hour for each employee, which we double to account for overhead and other indirect costs. We multiply these factors together and estimate the cost per exemption request of $987.70 ($141.10 × 7 = $70.55 × 2 × 7).

OCR has revised the estimate of the number of religious exemptions from the Proposed Rule RIA, which assumed 27 religious exemptions. OCR has increased this estimate to provide a more conservative estimate of the cost of religious exemptions, given significant uncertainty in the number of requests that will be submitted. OCR revises its assumptions to assume that 707 religious hospitals and 2 percent of all other covered entities will request assurance of religious exemptions. This results in a total of 6,019 of such requests (707 + ((266,297 − 707) × 0.02)) in the first year. OCR estimates the cost to covered entities for the 6,019 of such requests as $5,944,792 (6,019 × $987.73).

We estimate the cost to OCR comprising the time it would take to review the request and determine if the exemption assurance should be given. We estimate that it would take a single lawyer equivalent employee (Occupation code 23–1011), with a wage of $70.55 per hour, 3 hours to complete this review. We double the mean hourly wage to account for overhead and fringe benefits. OCR estimates the cost to review 6,019 assurance of exemption requests as $2,547,768 ($141.10 × 3 × 6,019). The total estimated cost of this process is $8,492,559.

c. Total Quantified Costs

Table 4 below presents the total annual costs anticipated under the final rule for which estimates have been developed. For the purposes of this analysis, we assume that the regulatory requirements begin to take effect in the middle of 2024. In the first year under the final rule, these estimated costs include $927.4 million in training, $8.5 million to process religious assurance of exemption requests, $18.5 million to review decision support tools, and $65.0 million to revise policies and procedures. For all years in the analysis, we estimate recurring costs of $46.6 million related to notices. We estimate a first-year cost of $37 million related to documentation, with ongoing costs in future years of $10.1 million. We also report a primary recurring cost estimate of $136.6 million associated with coverage of gender-affirming care starting in year 2 and $9.2 million in reviewing decision support tools starting in year 2. The total costs in year 1 amount to $1,102.9 million, with ongoing annual costs of $511.7 million in subsequent years.

TABLE 4—PRIMARY ESTIMATE OF TOTAL ANNUAL COSTS

[$ Millions, 2022 dollars]

Cost element	2024	2025	2026	2027	2028
Training	$927.4	$309.1	$309.1	$309.1	$309.1

[$ Millions, 2022 dollars]

Cost element	2024	2025	2026	2027	2028
Assurance of Exemption Requests	8.5	0.0	0.0	0.0	0.0
Decision Support Tool Review	18.5	9.2	9.2	9.2	9.2
Total Costs *	1,102.9	511.7	511.7	511.7	511.7

This rulemaking also revises the Department's interpretation of whether Medicare Part B payments constitute Federal financial assistance by answering that question in the affirmative. Thus, the requirements of section 1557 and other civil rights statutes apply to entities that receive payments through Medicare Part B. We are currently unable to quantify the number of covered entities that are enrolled in Medicare Part B but that receive no other forms of Federal financial assistance. The 2016 Rule discussed several of the challenges associated with estimating the number of these entities. For example, the 2016 Rule notes that, ''although we have data, by program, for the number of physicians receiving payment from each program, there is no single, unduplicated count of physicians across multiple programs.'' We adopt the finding of the 2016 Rule that almost all practicing physicians were likely covered by the rule because they accept Federal financial assistance from sources other than Medicare Part B.[456]

3. Discussion of Benefits

Quantifying benefits for this final rule presents significant challenges. One notable challenge relates to attribution: several sources of benefits discussed in the preambles of the 2016 and 2020 Rules overlap with and may be attributable to prior existing civil rights regulation, to the ACA rather than the 2016 and 2020 rulemakings that implement section 1557, or to nondiscrimination policies based on State law or institutional policies prohibiting discrimination generally.

A second challenge relates to identifying a quantitative relationship between nondiscrimination policies and important outcomes such as improvements in public health outcomes. For example, we anticipate that this regulation would reduce the incidence of providers refusing to treat patients based on the patient's gender identity. This would result in fewer instances of delayed or denied care, which in turn would lead to reductions in mortality and morbidity risks. However, we are not able to estimate the changes in the magnitude of these discriminatory events that would be attributable to the final rule, and thus are unable to quantify or monetize these health improvements. Similarly, we anticipate that the final rule will result in other sources of benefits that we are unable to quantify. These include a reduction in suicidal ideation and attempts, improvements to mental health, reductions in substance use, and generally align with a discussion of the economic impacts of a California regulation relating to gender nondiscrimination in health insurance.[457]

In addition to these health improvements, we anticipate benefits to covered entities from additional regulatory clarity on how OCR will enforce the ACA's nondiscrimination protections, particularly in light of ongoing litigation related to the 2020 Rule, interpretation of the Supreme Court's *Bostock* decision, and the Department's Bostock Notification. The training provisions represent one mechanism by which the final rule would reduce discriminatory events. This would, in turn, reduce the number of enforcement actions, representing a potential cost-saving benefit for covered entities. We also anticipate benefits to covered entities from the establishment of a grievance process, which would reduce the number of complaints filed with OCR, though this may be offset somewhat from covered entities with fewer than 15 employees referring complaints to OCR in lieu of adopting their own grievance procedure.

We also anticipate that beneficiaries could benefit from reduced obstacles to accessing health care, including fewer language barriers and a reduction in discriminatory behavior related to sexual orientation and gender identity, resulting in a potential increase in overall health care utilization. These benefits relate to individuals' ability to access care and the quality of care they receive. For example, the provisions related to language access for individuals with LEP and accessibility for individuals with disabilities could reduce instances of negative outcomes, including death, due to a lack of understanding between patient and doctor or between patient and pharmacist, as well as lack of access to services. We also anticipate that the process by which individuals and recipients may seek assurance of an exemption based on Federal conscience or religious freedom laws will result in benefits from reduced litigation, which we do not capture in the benefit analysis. In addition, the prohibition on discrimination through the use of decision support tools is also likely to have a direct benefit on the health of individuals who are suffering from delayed or denied medical care due to discriminatory application of decision support tools. An example of this would be an incorrect diagnosis for skin cancer for a Black patient, which could lead to greater medical costs in the future and negative health outcomes for the patient.[458] Furthermore, the positive effects of using decision support tools, such as identifying those at risk for cardiovascular disease at an earlier date, will be a benefit across populations experiencing discrimination.[459]

4. Analysis of Regulatory Alternatives to the Final Rule

The Department considered various alternatives while developing this regulation, including adopting the compliance timeline of the Proposed Rule. As discussed in the preamble, the final rule will allow additional time for covered entities to comply with certain procedural requirements, as compared to the timeline of the Proposed Rule. For example, covered entities must comply with the § 92.9 Training requirements by no later than 300 days of effective

date. This revised timeline will postpone certain costs incurred by covered entities; however, since this analysis reports annual impacts, the revised timeline does not affect the quantified cost estimates. This section discusses several other alternatives OCR considered.

The Department analyzed several regulatory alternatives to the final rule related to the notice requirements. The first alternative considered retaining the 2020 Rule's repeal of the notices and taglines provisions. The Department considered concerns raised in response to the 2016 Rule notice and tagline requirements, as well as concerns raised in response to the removal of those requirements in the 2020 Rule. Though the Department acknowledges the burden placed on covered entities through the 2016 Rule notice requirements, the Department believes the 2020 Rule did not adequately consider the confusion and uncertainty placed on individuals or the unnecessary ambiguity that covered entities face by the 2020 Rule's repeal of the notices and taglines provisions in their entirety. As described earlier, we estimate that these provisions under the final rule would cost covered entities, as an aggregate, $46.6 million for each year. While excluding the provisions relating to the notices would reduce the cost of the final rule by $46.6 million, the Department rejected this option because it believes that the final provisions strike an appropriate balance between providing greater access for beneficiaries, while maximizing efficiency and economies of scale for covered entities.

The second alternative considered by the Department would require covered entities to provide notices only at their first encounter with a beneficiary. For this alternative, we adopt the quantity and cost estimates associated with eligibility and enrollment communication included in Table 5 above. Under our primary cost scenario, this policy alternative would result in annual costs of notices of $0.7 million, which is about $45.9 million lower than the final rule. The Department rejected this option however, because this policy alternative, while posing a significantly reduced cost and burden on covered entities, would be too narrow and substantially reduce the information available to beneficiaries, likely resulting in beneficiaries not being aware of their civil rights, including whether they have experienced a prohibited discriminatory practice by a covered entity.

The third alternative considered by the Department would require a more expansive notice provision, extending the requirements to include pharmacy-related notices. For this alternative, we adopt the 2020 RIA estimate of 3.2 billion annual pharmacy-related notices. This would result in $169.7 million in costs per year, or an increase of $123.1 million compared to the final rule. While this alternative related to notices would increase the number of notices available to beneficiaries, and therefore increase beneficiaries' opportunity to receive information regarding nondiscrimination and civil rights protections, the Department believes this alternative would neither address nor remedy the burden placed on covered entities through the 2016 Rule notice requirements. For this reason, the Department rejected this alternative.

Finally, the Department also considered not including a process for covered entities to submit a request for assurance of a religious or conscience exemption. As described in the cost section, we estimate that this policy alternative would reduce the quantified costs by $8.5 million. The Department did not choose this alternative because of its obligations to enforce a range of statutory protections, including Federal religious freedom and conscience laws. OCR remains committed to educating patients, providers, and other covered entities about their rights and obligations under these statutes, to protecting patients' health and dignity, and to providing a clear administrative process that respects the right to raise objections to the provision of certain kinds of care.

We have not quantified the benefits associated with this information for the final rule or for these policy alternatives.

Table 5 reports the total costs of these policy alternatives in present value and annualized terms, adopting a 3 percent and 7 percent discount rate. Table 6 reports the difference between the total cost of the alternatives compared to the provisions of the final rule, using the same accounting methods and discount rates. All estimates are presented in millions of year-2022 dollars, using 2024 as the base year for discounting.

TABLE 5—TOTAL COST OF POLICY ALTERNATIVES CONSIDERED

[$ Millions, 2022 dollars]

Accounting method discount rate	Present value		Annualized	
	3%	7%	3%	7%
Final Rule	$2,917.6	$2,650.8	$637.1	$646.5
Alternative 1: No Notice Provision	2,704.1	2,459.7	590.5	599.9
Alternative 2: Single Notice Provision	2,707.4	2,462.6	591.2	600.6
Alternative 3: Pharmacy-Related Notices	3,481.3	3,155.4	760.1	769.6
Alternative 4: No Exemption Provision	2,909.4	2,642.8	635.3	644.6

TABLE 6—COMPARISON OF ALTERNATIVES TO FINAL RULE

[$ Millions, 2022 dollars]

Accounting method discount rate	Present value		Annualized	
	3%	7%	3%	7%
Alternative 1: No Notice Provision	−$213.5	−$191.1	−$46.6	−$46.6
Alternative 2: Single Notice Provision	−210.2	−188.2	−45.9	−45.9
Alternative 3: Pharmacy-related Notices	563.7	504.6	123.1	123.1
Alternative 4: No Exemption Provision	−8.2	−7.9	−1.8	−1.9

The Department also considered whether to require covered entities to collect the self-identified race, ethnicity, primary language (spoken and written), sex (consistent with the categories of sex discrimination described at § 92.101(a)(2)), age, and disability status data for beneficiaries in any health program or activity. The Department believes, however, that our current authorities under section 1557, title VI, section 504, title IX, and the Age Act already provide us the ability to collect these data to ensure compliance.[460]

B. Regulatory Flexibility Act—Final Small Entity Analysis

The RFA requires agencies issuing a regulation to analyze options for regulatory relief of small businesses if a rule will have a significant impact on a substantial number of small entities. The RFA generally defines a ''small entity'' as:

(1) A proprietary firm meeting the size standards of the Small Business Administration (SBA);

(2) A nonprofit organization that is not dominant in its field; or

(3) A small government jurisdiction with a population of less than 50,000 (States and individuals are not included in the definition of ''small entity'').

OCR uses as its measure of significant economic impact on a substantial number of small entities a change in revenues of more than 3 percent for 5 percent or more of affected small entities. In instances where OCR judged that the final rule would have a significant impact on a substantial number of small entities, we considered alternatives to reduce the burden. To accomplish our task, we first identified all the small entities that may be impacted, and then evaluated whether the economic burden we determined in the RIA represents a significant economic impact.

1. Entities That Will Be Affected

OCR has traditionally classified most providers as small entities even though some nonprofit providers would not meet the definition of ''small entity'' were they proprietary firms. Nonprofit entities are small if they are independently owned and operated and are not dominant in their fields. The CMS Provider of Service file has indicators for profit and nonprofit entities, but these have proven to be unreliable. The Census data identifies firms' tax status by profit and non-profit status but only reports revenues and does not report them by the profit and non-profit status of the entity.

a. Physicians

One class of providers we do not automatically classify as small businesses is physician practices. Physician practices are businesses and therefore are ''small'' if they meet the SBA's definition. The current size standard for physicians (excluding mental health specialists) (North American Industry Classification System code 62111) is annual receipts of less than $16 million.[461] Using the Census data showing the number of firms, employees and payroll, we selected physicians that reported fewer than 20 employees as the top end for small physician offices. This equaled 16,361 entities or 9.8 percent of all physician offices defined as ''large.'' This left 150,933 offices or 90.2 percent as ''small.''[462]

b. Pharmacies

Pharmacies also are businesses, and the size standard for them is annual receipts of less than $37.5 million. According to Census Statistics of U.S. Businesses, there are 19,346 pharmacy and drug store firms (North American Industry Classification System code 456110). Because of the lack of revenue or receipt data for pharmacies, we are unable to estimate the number of small pharmacies based on the SBA size standard. However, using the number of employees taken from the Statistics of U.S. Businesses as a proxy for revenues, the data is divided by number of employees per firm and shows the number of employers with fewer than 20 employees and those with more than 20 employees.[463] There are 17,160 pharmacy firms with fewer than 20 employees, representing 88.7 percent of the total number of pharmacy firms. It seemed reasonable to assume that firms with fewer than 20 employees satisfy the SBA size standard and thus we accepted that the number of small pharmacy firms equaled 17,160. As with the number of small physician offices, our method can only identify the minimum number of ''small'' pharmacies that meet the SBA size standard. We cannot determine the actual number of ''small'' pharmacies.

c. Health Insurance Issuers

Another class of covered entities that are business enterprises is health insurance issuers. The SBA size standard for health insurance issuers is annual receipts of $47 million. Based on the analysis below, we conclude that there are few small health insurance issuers.

In 2021, there were 483 issuers in the U.S. health insurance market.[464] Health insurance issuers are generally classified under the North American Industry Classification System (NAICS) code 524114 (Direct Health and Medical Insurance Carriers). According to SBA size standards,[465] entities with average annual receipts of $47 million or less are considered small entities for this NAICS code. The Departments expect that few, if any, insurance companies underwriting health insurance policies fall below these size thresholds. Due to the lack of recent Census data based on enterprise receipt size, HHS used the Census 2017 SUSB data as a proxy since it was the last year in which this data is available. Based on data from SUSB annual report submissions for the 2017 SUSB reporting year, approximately 443 out of 745 issuers of health insurance coverage nationwide, approximately 59.46%, had total premium revenue of $40.0 million or less.[466] OCR decided to use a value slightly higher than the 2017 SBA standard to account for slight changes in the industry in addition to inflation. We then apply this percentage to the current number of insurance Issuers to estimate the number of small entities for the business type, which is approximately 517 of 869 entities. However, this estimate may overstate the actual number of small health insurance issuers that may be affected due to changes in the health care industry since 2017. To produce a conservative estimate, for the purposes of this analysis, the Departments assumes 59.5 percent, or 517 issuers are considered small entities.

d. Local Government Entities

We also excluded local governmental entities from our count of small entities

[460] *See, e.g.,* 45 CFR 80.6, 86.71, 91.34, and 84.61.

[461] U.S. Small Business Admin., *Table of Small Business Size Standards Matched to North American Industry Classification System Codes, Small Business Administration* (March 2023), *https://www.sba.gov/document/support-table-size-standards.*

[462] Physician practices may earn more than $16 million per year and that would increase the number of ''large'' practices in the analysis. But as we will later show, large practices will have proportionally larger workforce staff that must be excluded from the analysis.

because we lack the data to classify them by populations of fewer than 50,000. The following table shows the number of small, covered entities we estimated could be affected by the final rule.

TABLE 8—SMALL ENTITIES

NAICS code	Business type	Small entities
62142	Outpatient mental health and substance abuse centers	7,649
621491	HMO medical centers	84
621492	Kidney dialysis centers	449
621493	Freestanding ambulatory surgical and emergency centers	4,554
621498	All other outpatient care centers	6,307
6215	Medical and diagnostic laboratories	7,200
6216	Home health care services	25,718
6219	All other ambulatory health care services	7,091
62321	Residential intellectual and developmental disability facilities	6,674
6221	General medical and surgical hospitals	2,445
6222	Psychiatric and substance abuse hospitals	434
6223	Specialty (except psychiatric and substance abuse) hospitals	301
6231	Nursing care facilities (skilled nursing facilities)	9,824
45611	Pharmacies and drug stores	17,160
6211	Offices of physicians	150,933
524114	Insurance Issuers	517
	Navigator grantees	58
	Total Entities	247,398

2. Whether the Rule Will Have a Significant Economic Impact on Covered Small Entities

The Department generally considers a rule to have a significant impact on a substantial number of small entities if it has at least a 3 percent impact on revenue on at least 5 percent of small entities. We performed a threshold analysis to determine whether the quantified impacts of the final rule will exceed these thresholds. As described earlier in this analysis, we estimate the total annualized costs of the final rule would be about $637.1 million. Dividing these total costs by the 247,398 small entities gives a cost per entity of $2,575. This cost estimate would only exceed the 3 percent ''significant impact'' threshold on revenue for any covered small businesses with revenue below $85,836. We conclude that very few small businesses covered by the final rule will have revenues below $85,836, and that this number is very likely to be smaller than the 5 percent ''substantial number'' threshold.

As an additional consideration, we note that the costs of the final rule are mostly proportional to the size of the covered entity. For example, the costs associated with training, which account for more than 70 percent of the total costs of the final rule, are mostly proportional to the number of employees receiving training. In the main analysis, we estimate an incremental impact of one (1) hour per employee trained. The opportunity cost of training each employee represents 0.05 percent of a full-time employee's annual labor productivity, assuming a full-time employee works 2,080 hours per year.[467] This finding, that the cost of training represents 0.05 percent of the share of employees receiving training, is constant across firm size.

Because the costs of the final rule are small relative to the revenue of covered entities, including covered small entities, and because even the smallest affected entities would be unlikely to face a significant impact, we certify that the final rule will not have a significant economic impact on a substantial number of small entities.

C. Executive Order 12250 on Leadership and Coordination of Nondiscrimination Laws

Pursuant to E.O. 12250, the Department of Justice has the responsibility to ''review . . . proposed rules . . . of the Executive agencies'' implementing nondiscrimination statutes such as section 1557 ''in order to identify those which are inadequate, unclear or unnecessarily inconsistent.''The Department of Justice has reviewed and approved this final rule.

D. Paperwork Reduction Act

Information Collection Requirements

This final rule contains information collection requirements (ICRs) that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act (PRA) of 1995.[468] In order to evaluate whether an information collection should be approved by OMB, the PRA requires that the Department solicits comment on the following issues:

1. Whether the information collection is necessary and useful to carry out the proper functions of the agency;

2. The accuracy of the agency's estimate of the information collection burden;

3. The quality, utility, and clarity of the information to be collected; and

4. Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.[469]

The PRA requires consideration of the time, effort, and financial resources necessary to meet the information collection requirements referenced in this section. The Department previously published a notice of a proposed data collection on August 4, 2022, at 87 FR 47907–08, as part of an NPRM entitled ''Nondiscrimination in Health Programs and Activities'' (RIN 0945–AA17), to invite public comment. OCR solicited comment on the issues listed above for the sections that contain ICRs. The following paragraphs describe these provisions, with an estimate of the annual burden, summarized in Table 1. OCR did not receive comments related to the previous notice but has adjusted the estimated respondent burden in this request to reflect revised assumptions based on updated information available at the time of the final rule's

[467] 40 hours per week × 52 weeks = 2,080 hours. 0.05% = 0.0005 = 1 hour ÷ 2080 hours.

[468] 44 U.S.C. 3501–3520.

[469] 44 U.S.C. 3506(c)(2)(A).

publication. This revision resulted in adjusted cost estimates that are consistent with the RIA presented in this final rule. The estimates covered the employees' time for reviewing and completing the collections required.

Consistent with the NPRM, the collections of information proposed by this final rule relate to §§ 92.5 (Assurances required); 92.7 (Designation and responsibilities of a Section 1557 Coordinator); 92.9 (Training); 92.10 (Notice of nondiscrimination); and 92.11 (Notice of availability of language assistance services and auxiliary aids and services). Respondents to this proposed information collection would include a variety of covered entities with a health program or activity including hospitals, ambulatory surgical centers, skilled nursing facilities, and physicians' offices. For a more detailed discussion concerning the potential costs' implications related to these collections of information, please see the Regulatory Impact Analysis.

1. ICRs Regarding Assurances (§ 92.5)

Section 92.5 retains the assurances obligations from the 2016 and 2020 Rules for covered entities to submit an assurance of compliance to the Department. As stated in the NPRM, OCR has previously obtained PRA approval (OMB control # 0945–0008) for this reporting requirement via an update to HHS Form 690 (Consolidated Civil Rights Assurance Form), separate from this rulemaking. The requirement to sign and submit an assurance of compliance currently exists under section 1557 and other civil rights regulations (title VI, section 504, title IX, and the Age Act). Since the Department provides an online portal through which covered entities submit attestation of Assurance of Compliance, the Department has determined that this requirement imposes no additional reporting or recordkeeping requirements under the PRA.

OCR did not receive any comments in response to the ICRs related to this policy. Please see the prior preamble discussion for our responses to the general comments related to this provision. OCR is finalizing this ICR as proposed.

2. ICRs Regarding Section 1557 Coordinator (§ 92.7) and Training (§ 92.9)

Section 92.7 requires covered entities with 15 or more employees designate a section 1557 Coordinator to coordinate their efforts to comply with and carry out their responsibilities under section 1557. The burden to coordinate efforts to comply with and carry out the responsibilities under section 1557 was estimated in the NPRM, at an annualized burden of 10 hours per covered entity to store complaints and the associated records required under § 92.8(c)(2) each year. We assumed that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation was $17.38 per hour, which we double to account for overhead and other indirect costs. In the 2022 NPRM, OCR estimated the number of covered entities with more than 15 employees to be approximately 15 percent or 41,250. Although in the 2022 NPRM, OCR estimated that the costs of retaining records related to grievances filed at all covered entities would be $14.3 million annually (($17.38 × 2) × 10 × 41,250), we noted that this estimation approach may overstate the costs if many covered entities already retain complaint information.

OCR has adjusted our estimated respondent burden in this request to reflect baseline conditions based on updated information available at the time of the final rule's publication. No changes were made to estimated personnel or staff time or to the assumption that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation, however, has increased to $19.02 per hour, which we double to account for overhead and other indirect costs. The Department estimates the number of covered entities with more than 15 employees to be approximately 15 percent or 63,950. Although we estimate the costs of retaining records related to grievances filed at all covered entities would be $24.3 million annually (($19.02 × 2) × 10 × 63,950)), this estimation approach will overstate the costs if many covered entities already retain complaint information.

The burden for documenting employee training as required under § 92.9(c) is the cost of covered entity staff time to (a) create training attendance forms; and (b) store the training sign-up sheet. The labor cost would include one (1) employee spending 15 minutes (0.25 hours) to create the sign-up sheet during the first year and one (1) employee spending one (1) hour collecting and storing the attendance forms the first year and in subsequent years. In the NPRM, we estimated that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation was $17.38 per hour. The labor cost was $6.0 million in the first year (($17.38 × 1.25) × 275,002 covered entities). In the 2022 NPRM, we estimated that the cost in subsequent years would be $4.8 million, which would represent an annual allotment of one (1) hour (($17.38 × 1) × 275,002 covered entities).

OCR has adjusted our estimated respondent burden in this request to reflect updated baseline conditions based on updated information not available at the time of the publication of the NPRM. No changes were made to the estimated personnel or staff time or to the estimate that administrative or clerical support personnel would perform these functions. The mean hourly wage for this occupation, however, increased to $19.02 per hour. The estimated labor cost of documenting employee training would be $12.6 million in the first year (($19.02 × 2) × 1.25 × 266,297 covered entities). We estimate that the cost in subsequent years would be $10.1 million, which would represent an annual allotment of one (1) hour ((($19.02 × 2) × 1) × 266,297 covered entities).

OCR did not receive any comments in response to the ICRs related to this policy. Please see the prior preamble discussion for our responses to the general comments related to this provision. OCR is finalizing these ICRs as proposed.

3. ICRs Regarding Notice of Nondiscrimination (§ 92.10) and Notice of Availability of Language Assistance Services and Auxiliary Aids and Services (§ 92.11)

Under §§ 92.10 and 92.11, OCR requires covered entities to notify the public of their nondiscrimination requirements, as well as the availability of language assistance services and auxiliary aids and services.

Section 92.10 requires covered entities to provide a Notice of Nondiscrimination relating to its heath programs or activities to beneficiaries of its health programs and activities and members of the public. To minimize the burden on covered entities, the provision proposes a covered entity may combine the content of the notice required by this section with the notice required by title VI, section 504, title IX, and the Age Act implementing regulations.

Section 92.11 requires covered entities to notify the public of their nondiscrimination requirements, as well as the availability of language assistance services and auxiliary aids and services. A covered entity must provide a Notice of Availability that, at minimum, states that the covered entity provides language assistance services and auxiliary aids and services free of charge

in its health programs and activities, in compliance with section 1557. This notice must be provided to beneficiaries of the covered entity's health program or activity and members of the public. The notice must be provided in English and at least the top 15 languages spoken by persons with LEP of the relevant State or States in which a covered entity operates (including territories) and must be provided in alternate formats for individuals who request auxiliary aids and services to ensure effective communication.

OCR also received comments on the cost of Notices of Nondiscrimination and Notices of Availability (referred to as ''taglines'' in the 2016 and 2020 Rules). One commenter explained how the cost of including taglines averages up to $8.91 per month per covered entity and upwards of $2 million a year for the health insurance industry. Another commenter stated that they have spent over $16 million on notices and taglines since 2016, and estimate that they have spent over $3 million in 2022 alone. As we noted in the RIA, neither commenter provided sources for their data nor additional detail on their cost estimates. Another commenter noted that previous complaints on the frequency and volume of materials related to the notice and tagline sections of the rule were not addressed, but no data were provided with their comment.

Based on costs estimated in the RIA, OCR derives a monthly cost of Notices of Nondiscrimination and Notices of Availability from $21.28 and $26.60 per entity depending on the prevalence of electronic delivery. These cost estimates include the total Notices of Nondiscrimination and Notices of Availability and therefore OCR finds the commenter's estimate of $8.91 per month for Notices of Availability as plausible and consistent with the estimates in the RIA. OCR also notes that these cost estimates are averages. It is expected that some entities, including larger entities, may have higher than average costs due to the increased number of notices they would send to individuals.

Both types of notices are required (1) on an annual basis; (2) upon request; (3) at a conspicuous location on the homepage of the covered entity's health program or activity website; and (4) at conspicuous physical locations where the health program or activity interacts with the public.

In the NPRM, OCR estimated the burden for responding to the proposed notice requirements would be 34 minutes and that administrative or clerical support personnel would perform these functions. Because it was difficult to determine the exact number of communications that would be required to contain the notices anticipated under the 2022 NPRM, our cost estimates reflected a wide range of uncertainty in the cost. In the 2022 NPRM, the Department estimated an adjusted annual primary cost total of $4.5 million, with a range of costs between $2.7 million and $25.0 million. These costs would occur in each year of the time horizon of the analysis.

OCR has adjusted our estimated respondent burden in this request to reflect updated baseline conditions based on updated information not available at the time of the publication of the NPRM. Because it is difficult to determine the exact number of communications that would be required to contain the notices anticipated under the 2022 NPRM, our cost estimates reflect a wide range of uncertainty in the cost. OCR notes that the majority of associated costs for these requirements are from the materials, such as paper and ink, used in the notices and these costs are assumed to vary with the length of notices. No changes were made to the estimate that administrative or clerical support personnel would perform these functions. The estimated personnel and staff time, however, increased to 1.34 hours per year to perform these functions. The mean hourly wage for this occupation increased to $19.02 per hour, which we double to account for overhead and other indirect costs. The estimated labor cost to notify the public of their nondiscrimination requirements, as well as availability of language assistance services and auxiliary aids and services, would be $13.5 million (($19.02 × 2) × 1.34) × 266,297 covered entities). The Department estimates the total associated costs for these requirements as an adjusted annual total of $53.2 million, with a range of costs between $35.5 million and $292.6 million. These costs would occur in each year of the time horizon of the analysis.

OCR did not receive any comments in response to the ICRs related to § 92.10, and received the comments discussed above in response to ICRs related to § 92.11. Please see the prior preamble discussion for our responses to the general comments related to this provision. OCR is finalizing the ICRs for §§ 92.10 and 92.11 as proposed.

We have submitted a copy of this final rule to OMB for its review of the rule's ICRs. These requirements are not effective until they have been approved by OMB.

TABLE 1—SUMMARY OF ESTIMATED ANNUALIZED BURDEN

Information collection	Number of respondents	Responses frequency (average)	Total responses	Burden hours per response (average)	Hourly rate	Burden cost [470]
§ 92.7 Coordination Efforts	[471] 63,950/ 266,297	1	330,247	[472] 10/1.25	[473] $38.04	$24,326,580/ 12,662,422
§§ 92.10 & 92.11 Notice	266,297	[474] 1	266,297	1.34	38.04	13,574,117
Total application collection	330,247	.....	596,544	12.59	.....	50,563,119

[470] The figures in this column are averages based on a range. Large entities with more than 15 employees may require more hours than those provided here due to their size and complexity, while small entities may require fewer hours to conduct certain compliance activities.

[471] Covered entities with 15 or more employees would be required to coordinate the retention of grievance complaints for no less than three years. We have estimated that this provision would apply to approximately 63,950 covered entities. All covered entities would be required to document employee training on section 1557. We estimated that this would apply to approximately 266,297 covered entities.

[472] We have estimated that covered entities with 15 or more employees would spend approximately 10 hours on efforts to coordinate their compliance efforts under section 1557 as required under § 92.7. We estimate that all covered entities would spend approximately 1.25 hours documenting employee training as required under § 92.9.

[473] The $38.04 wage, which includes $19.02 plus 100 percent for benefits, applies to the category ''Administrative or Clerical Support Personnel.''

[474] Because it is difficult to determine the exact number of communications which would be required to contain the notices anticipated under the Proposed Rule, our number of responses per respondent estimate reflects this uncertainty.

E. Assessment of Federal Regulation and Policies on Families

Section 654 of the Treasury and General Government Appropriations Act of 1999 requires Federal departments and agencies to determine whether a proposed policy or regulation could affect family well-being. If the determination is affirmative, then the Department or agency must prepare an impact assessment to address criteria specified in the law.

The final rule would not negatively affect family wellbeing and would strengthen the stability of the family by promoting the ability of all individuals and families to receive health care free from discrimination. As research demonstrates that experiencing discrimination can have a negative impact on health and wellbeing, this rule addresses the immediate and long-term effects of discriminatory actions and establishes a set of practices to remove barriers to accessing care among entities that receive Federal funds. Addressing and preventing discrimination in health care can also improve the financial stability of the family unit by increasing access to nondiscriminatory health insurance coverage and other health-related coverage, aiding parents in their ability to provide for and nurture their children. The rule may be carried out only by the Federal Government because it would implement Federal nondiscrimination law, ensuring that American families have access to health care information and services, regardless of the State where they are located.

Dated: April 18, 2024.

Xavier Becerra,

Secretary, Department of Health and Human Services.

For the reasons set forth in the preamble, the Department of Health and Human Services amends 42 CFR parts 438, 440, 457, and 460 and 45 CFR parts 80, 84, 92, 147, 155, and 156 as follows:

Title 42—Public Health

PART 438—MANAGED CARE

■ 1. The authority citation for part 438 continues to read as follows:

Authority: 42 U.S.C. 1302.

■ 2. Amend § 438.3 by revising paragraph (d)(4) to read as follows:

§ 438.3 Standard contract requirements.

* * * * *

(d) * * *

(4) The MCO, PIHP, PAHP, PCCM or PCCM entity will not discriminate against individuals eligible to enroll on the basis of race; color; national origin; disability; or sex which includes sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes; and will not use any policy or practice that has the effect of discriminating on the basis of race; color; national origin; disability; or sex which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes.

* * * * *

■ 3. Amend § 438.206 by revising paragraph (c)(2) to read as follows:

§ 438.206 Availability of services.

* * * * *

(c) * * *

(2) *Access and cultural considerations.* Each MCO, PIHP, and PAHP participates in the State's efforts to promote the delivery of services in a culturally competent manner to all enrollees, including those with limited English proficiency and diverse cultural and ethnic backgrounds, disabilities, and regardless of sex which includes sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity and sex stereotypes.

* * * * *

PART 440—SERVICES: GENERAL PROVISIONS

■ 4. The authority citation for part 440 continues to read as follows:

Authority: 42 U.S.C. 1302.

■ 5. Revise § 440.262 to read as follows:

§ 440.262 Access and cultural conditions.

The State must have methods to promote access and delivery of services in a culturally competent manner to all beneficiaries, including those with limited English proficiency, diverse cultural and ethnic backgrounds, disabilities, and regardless of sex which includes sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes. These methods must ensure that beneficiaries have access to covered services that are delivered in a manner that meets their individualized needs.

PART 457—ALLOTMENTS AND GRANTS TO STATES

■ 6. The authority citation for part 457 continues to read as follows:

Authority: 42 U.S.C. 1302.

■ 7. Amend § 457.495 by adding paragraph (e) to read as follows:

§ 457.495 State assurance of access to care and procedures to assure quality and appropriateness of care.

* * * * *

(e) Access to and delivery of services in a culturally competent manner to all beneficiaries, as described in 42 CFR 440.262.

PART 460—PROGRAMS OF ALL-INCLUSIVE CARE FOR THE ELDERLY (PACE)

■ 8. The authority citation for part 460 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395, 1395eee(f), and 1396u–4(f).

■ 9. Amend § 460.98 by revising paragraph (b)(3) to read as follows:

§ 460.98 Service delivery.

* * * * *

(b) * * *

(3) The PACE organization shall not discriminate against any participant in the delivery of required PACE services based on race, ethnicity, national origin, religion, sex (including sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes), age, mental or physical disability, or source of payment.

* * * * *

■ 10. Amend § 460.112 by revising paragraph (a) introductory text to read as follows:

§ 460.112 Specific rights to which a participant is entitled.

(a) *Respect and nondiscrimination.* Each participant has the right to considerate, respectful care from all PACE employees and contractors at all times and under all circumstances. Each participant has the right not to be discriminated against in the delivery of required PACE services based on race, ethnicity, national origin, religion, sex (including sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes), age, mental or physical disability, or source of payment. Specifically, each participant has the right to the following:

* * * * *

Title 45—Public Welfare

PART 80—NONDISCRIMINATION UNDER PROGRAMS RECEIVING FEDERAL ASSISTANCE THROUGH THE DEPARTMENT OF HEALTH AND HUMAN SERVICES EFFECTUATION OF TITLE VI OF THE CIVIL RIGHTS ACT OF 1964

■ 11. The authority citation for part 80 continues to read as follows:

Authority: Sec. 602, 78 Stat. 252; 42 U.S.C. 2000d–1.

■ 12. Amend appendix A to part 80 under part 1 by adding entry 155 in numerical order to read as follows:

Appendix A to Part 80—Federal Financial Assistance To Which These Regulations Apply Part 1. Assistance Other Than Continuing Assistance to States

* * * * *

155. Supplementary medical insurance benefits for the aged (Title XVIII, Part B, Social Security Act, 42 U.S.C. 1395j–1395w–6).

* * * * *

PART 84—NONDISCRIMINATION ON THE BASIS OF HANDICAP IN PROGRAMS OR ACTIVITIES RECEIVING FEDERAL FINANCIAL ASSISTANCE

■ 13. The authority citation for part 84 continues to read as follows:

Authority: 20 U.S.C. 1405; 29 U.S.C. 794; 42 U.S.C. 290dd–2; 21 U.S.C. 1174.

■ 14. Amend appendix A to part 84 in subpart a, under Definitions, by revising section 2 to read as follows:

Appendix A to Part 84—Analysis of Final Regulation

Subpart A—General Provisions

Definitions * * *

2. ''Federal financial assistance''. In § 84.3(h), defining Federal financial assistance, a clarifying change has been made: procurement contracts are specifically excluded. They are covered, however, by the Department of Labor's regulation under section 503. The Department has never considered such contracts to be contracts of assistance; the explicit exemption has been added only to avoid possible confusion.

The proposed regulation's exemption of contracts of insurance or guaranty has been retained. A number of comments argued for its deletion on the ground that section 504, unlike title VI and title IX, contains no statutory exemption for such contracts. There is no indication, however, in the legislative history of the Rehabilitation Act of 1973 or of the amendments to that Act in 1974, that Congress intended section 504 to have a broader application, in terms of Federal financial assistance, than other civil rights statutes. Indeed, Congress directed that section 504 be implemented in the same manner as titles VI and IX. In view of the long established exemption of contracts of insurance or guaranty under title VI, we think it unlikely that Congress intended section 504 to apply to such contracts.

* * * * *

■ 15. Revise part 92 to read as follows:

PART 92—NONDISCRIMINATION IN HEALTH PROGRAMS OR ACTIVITIES

Subpart A—General Provisions

Sec.

Subpart B—Nondiscrimination Provisions

Subpart C—Specific Applications to Health Programs and Activities

Authority: 42 U.S.C. 18116.

PART 92—NONDISCRIMINATION IN HEALTH PROGRAMS OR ACTIVITIES

Subpart A—General Provisions

§ 92.1 Purpose and effective date.

(a) *Purpose.* The purpose of this part is to implement section 1557 of the Patient Protection and Affordable Care Act (ACA) (42 U.S.C. 18116), which prohibits discrimination on the basis of race, color, national origin, sex, age, and disability in certain health programs and activities. Section 1557 provides that, except as otherwise provided in title I of the ACA, an individual shall not, on the grounds prohibited under title VI of the Civil Rights Act of 1964, title IX of the Education Amendments of 1972, the Age Discrimination Act of 1975, or section 504 of the Rehabilitation Act of 1973, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under, any health program or activity, any part of which is receiving Federal financial assistance, including credits, subsidies, or contracts of insurance, or under any program or activity that is administered by an executive agency or any entity established under title I of the ACA. This part applies to health programs or activities administered by recipients of Federal financial assistance from the Department, Department-administered health programs or activities, and title I entities that administer health programs or activities.

(b) *Effective date.* The regulations in this part are effective beginning July 5, 2024, unless otherwise provided in the following schedule:

TABLE 1 TO PARAGRAPH (b)

Section 1557 requirement and provision	Date by which covered entities must comply
§ 92.7	Within 120 days of July 5, 2024.
§ 92.8	Within one year of July 5, 2024.
§ 92.9	Following a covered entity's implementation of the policies and procedures required by § 92.8, and no later than one year of July 5, 2024.
§ 92.10	Within 120 days of July 5, 2024.
§ 92.11	Within one year of July 5, 2024.
§ 92.207(b)(1) through (5).	For health insurance coverage or other health-related coverage that was not subject to this part as of July 5, 2024, by the first day of the first plan year (in the individual market, policy year) beginning on or after January 1, 2025.
§ 92.207(b)(6)	By the first day of the first plan year (in the individual market, policy year) beginning on or after January 1, 2025.
§ 92.210(b) and (c)	Within 300 days of July 5, 2024.

§ 92.2 Application.

(a) Except as otherwise provided in this part, this part shall apply to:

(1) Every health program or activity, any part of which receives Federal financial assistance, directly or indirectly, from the Department;

(2) Every health program or activity administered by the Department; and

(3) Every health program or activity administered by a title I entity.

(b) The provisions of this part shall not apply to any employer or other plan sponsor of a group health plan, including but not limited to, a board of trustees (or similar body), association or other group, with regard to its employment practices, including the provision of employee health benefits.

(c) Any provision of this part held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, shall be severable from this part and shall not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other, dissimilar circumstances.

§ 92.3 Relationship to other laws.

(a) Neither section 1557 nor this part shall be construed to apply a lesser standard for the protection of individuals from discrimination than the standards applied under title VI of the Civil Rights Act of 1964, title IX of the Education Amendments of 1972, section 504 of the Rehabilitation Act of 1973, the Age Discrimination Act of 1975, or the regulations issued pursuant to those laws.

(b) Nothing in this part shall be construed to invalidate or limit the rights, remedies, procedures, or legal standards available under title VI of the Civil Rights Act of 1964, title VII of the Civil Rights Act of 1964, title IX of the Education Amendments of 1972, section 504 of the Rehabilitation Act of 1973, or the Age Discrimination Act of 1975.

(c) Insofar as the application of any requirement under this part would violate applicable Federal protections for religious freedom and conscience, such application shall not be required. For example, 42 U.S.C. 18023 provides (among other things) that nothing in section 1557 shall be construed to have any effect on Federal laws regarding conscience protection; willingness or refusal to provide abortion; and discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.

(d) Nothing in this part shall be construed to supersede State or local laws that provide additional protections against discrimination on any basis described in § 92.1.

§ 92.4 Definitions.

As used in this part, the term—

1991 Standards means the 1991 ADA Standards for Accessible Design, published at appendix A to 28 CFR part 36 on July 26, 1991, and republished as appendix D to 28 CFR part 36 on September 15, 2010.

2010 Standards means 36 CFR part 1191, appendices B and D (2009), in conjunction with 28 CFR 35.151.

ACA means the Patient Protection and Affordable Care Act (Pub. L. 111–148, 124 Stat. 119 (2010) as amended by the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152, 124 Stat. 1029) (codified in scattered sections of U.S.C.)).

ADA means the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 *et seq.*), as amended.

Age means how old a person is, or the number of elapsed years from the date of a person's birth.

Age Act means the Age Discrimination Act of 1975 (42 U.S.C. 6101 *et seq.*), as amended.

Applicant means a person who applies to participate in a health program or activity.

Auxiliary aids and services include, for example:

(1) Qualified interpreters on-site or through video remote interpreting (VRI) services, as defined in 28 CFR 35.104 and 36.104; note takers; real-time computer-aided transcription services; written materials; exchange of written notes; telephone handset amplifiers; assistive listening devices; assistive listening systems; telephones compatible with hearing aids; closed caption decoders; open and closed captioning, including real-time captioning; voice, text, and video-based telecommunications products and systems, including text telephones (TTYs), videophones, and captioned telephones, or equally effective telecommunications devices; videotext displays; accessible information and communication technology (ICT); or other effective methods of making aurally delivered information available to persons who are deaf or hard of hearing;

(2) Qualified readers; taped texts; audio recordings; Braille materials and displays; screen reader software; magnification software; optical readers; secondary auditory programs (SAP); large print materials; accessible information and communication technology; or other effective methods of making visually delivered materials available to persons who are blind or have low vision;

(3) Acquisition or modification of equipment and devices; and

(4) Other similar services and actions.

Companion means a family member, friend, or associate of an individual seeking access to a service, program, or activity of a covered entity, who along with such individual, is an appropriate person with whom a covered entity should communicate.

Covered entity means:

(1) A recipient of Federal financial assistance;

(2) The Department; and

(3) An entity established under title I of the ACA.

Department means the U.S. Department of Health and Human Services.

Director means the Director of the Office for Civil Rights (OCR) of the Department, or their designee(s).

Disability means, with respect to an individual, a physical or mental impairment that substantially limits one or more major life activities of such individual; a record of such an impairment; or being regarded as having such an impairment, as defined and construed in the Rehabilitation Act, 29 U.S.C. 705(9)(B), which incorporates the definition of ''disability'' in the ADA, 42 U.S.C. 12102, as amended and adopted at 28 CFR 35.108.

Exchange means the same as ''Exchange'' defined in 45 CFR 155.20.

Federal financial assistance, as used in this part:

(1) Federal financial assistance means any grant, loan, credit, subsidy, contract (other than a procurement contract but including a contract of insurance), or any other arrangement by which the Federal Government, directly or indirectly, provides assistance or otherwise makes assistance available in the form of:

(i) Funds;

(ii) Services of Federal personnel; or

(iii) Real or personal property or any interest in or use of such property, including:

(A) Transfers or leases of such property for less than fair market value or for reduced consideration; and

(B) Proceeds from a subsequent transfer or lease of such property if the Federal share of its fair market value is not returned to the Federal Government.

(2) Federal financial assistance the Department provides or otherwise makes available includes Federal financial assistance that the Department plays a role in providing or administering, including advance payments of the premium tax credit and cost-sharing reduction payments under title I of the ACA, as well as payments, subsidies, or other funds extended by the Department to any entity providing health insurance coverage for payment to or on behalf of a person obtaining health insurance coverage from that entity or extended by the Department directly to such person for payment to any entity providing health insurance coverage.

Federally-facilitated Exchange means the same as ''Federally-facilitated Exchange'' defined in 45 CFR 155.20.

Health program or activity means:

(1) Any project, enterprise, venture, or undertaking to:

(i) Provide or administer health-related services, health insurance coverage, or other health-related coverage;

(ii) Provide assistance to persons in obtaining health-related services, health insurance coverage, or other health-related coverage;

(iii) Provide clinical, pharmaceutical, or medical care;

(iv) Engage in health or clinical research; or

(v) Provide health education for health care professionals or others.

(2) All of the operations of any entity principally engaged in the provision or administration of any health projects, enterprises, ventures, or undertakings described in paragraph (1) of this definition, including, but not limited to, a State or local health agency, hospital, health clinic, health insurance issuer, physician's practice, pharmacy, community-based health care provider, nursing facility, residential or community-based treatment facility, or other similar entity or combination thereof. A health program or activity also includes all of the operations of a State Medicaid program, Children's Health Insurance Program, and Basic Health Program.

Individual with limited English proficiency means an individual whose primary language for communication is not English and who has a limited ability to read, write, speak, or understand English. An individual with limited English proficiency may be competent in English for certain types of communication (*e.g.,* speaking or understanding), but still be limited English proficient for other purposes (*e.g.,* reading or writing).

Information and communication technology (ICT) means information technology and other equipment, systems, technologies, or processes, for which the principal function is the creation, manipulation, storage, display, receipt, or transmission of electronic data and information, as well as any associated content. Examples of ICT include, but are not limited to: computers and peripheral equipment; information kiosks and transaction machines; telecommunications equipment; telehealth interfaces or applications; customer premises equipment; multifunction office machines; software; mobile applications; websites; videos; and electronic documents.

Language assistance services may include, but are not limited to:

(1) Oral language assistance, including interpretation in non-English languages provided in-person or remotely by a qualified interpreter for an individual with limited English proficiency, and the use of qualified bilingual or multilingual staff to communicate directly with individuals with limited English proficiency;

(2) Written translation, performed by a qualified translator, of written content in paper or electronic form into or from languages other than English; and

(3) Written notice of availability of language assistance services.

Machine translation means automated translation, without the assistance of or review by a qualified human translator, that is text-based and provides instant translations between various languages, sometimes with an option for audio input or output.

National origin includes, but is not limited to, a person's, or their ancestors', place of origin (such as country or world region) or a person's manifestation of the physical, cultural, or linguistic characteristics of a national origin group.

OCR means the Office for Civil Rights of the Department.

Patient care decision support tool means any automated or non-automated tool, mechanism, method, technology, or combination thereof used by a covered entity to support clinical decision-making in its health programs or activities.

Qualified bilingual/multilingual staff means a member of a covered entity's workforce who is designated by the covered entity to provide in-language oral language assistance as part of the person's current, assigned job responsibilities and who has demonstrated to the covered entity that they are:

(1) Proficient in speaking and understanding both spoken English and at least one other spoken language, including any necessary specialized vocabulary, terminology and phraseology; and

(2) Able to effectively, accurately, and impartially communicate directly with individuals with limited English proficiency in their primary languages.

Qualified individual with a disability means an individual with a disability who, with or without reasonable modifications to rules, policies, or practices, the removal of architectural, communication, or transportation barriers, or the provision of auxiliary aids and services, meets the essential eligibility requirements for the receipt of services or the participation in programs or activities provided by the covered entity.

Qualified interpreter for an individual with a disability means an interpreter who, via a video remote interpreting service (VRI) or an on-site appearance:

(1) Has demonstrated proficiency in communicating in, and understanding:

(i) Both English and a non-English language (including American Sign Language, other sign languages); or

(ii) Another communication modality (such as cued-language transliterators or oral transliteration);

(2) Is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original statement; and

(3) Adheres to generally accepted interpreter ethics principles including client confidentiality.

(4) Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.

Qualified interpreter for an individual with limited English proficiency means an interpreter who via a remote interpreting service or an on-site appearance:

(1) Has demonstrated proficiency in speaking and understanding both spoken English and at least one other spoken language (qualified interpreters for relay interpretation must demonstrate proficiency in two non-English spoken languages);

(2) Is able to interpret effectively, accurately, and impartially to and from such language(s) and English (or between two non-English languages for relay interpretation), using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original oral statement; and

(3) Adheres to generally accepted interpreter ethics principles, including client confidentiality.

Qualified reader means a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.

Qualified translator means a translator who:

(1) Has demonstrated proficiency in writing and understanding both written English and at least one other written non-English language;

(2) Is able to translate effectively, accurately, and impartially to and from such language(s) and English, using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original written statement; and

(3) Adheres to generally accepted translator ethics principles, including client confidentiality.

Recipient means any State or its political subdivision thereof; or any instrumentality of a State or political subdivision thereof; any public or private agency, institution, or organization; other entity; or any person, to whom Federal financial assistance is extended directly or indirectly, including any subunit, successor, assignee, or transferee of a recipient. Such term does not include any ultimate beneficiary.

Relay interpretation means interpreting from one language to another through an intermediate language. This mode of interpretation is often used for monolingual speakers of languages of limited diffusion, including select indigenous languages. In relay interpreting, the first interpreter listens to the speaker and renders the message into the intermediate language. The second interpreter receives the message in the intermediate language and interprets it into a third language for the speaker who speaks neither the first nor the second language.

Section 504 means section 504 of the Rehabilitation Act of 1973 (Pub. L. 93–112; 29 U.S.C. 794), as amended.

Section 1557 means section 1557 of the ACA (42 U.S.C. 18116).

State includes each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the United States Virgin Islands, and the Commonwealth of the Northern Mariana Islands.

State Exchange means an Exchange established by a State and approved by the Department pursuant to 45 CFR part 155, subpart B.

Telehealth means the use of electronic information and telecommunications technologies to support long-distance clinical health care, patient and professional health-related education, public health, and health administration. Technologies include videoconferencing, the internet, store-and-forward imaging, streaming media, and terrestrial and wireless communications.

Title I entity means any entity established under title I of the ACA, as amended, including State Exchanges and Federally-facilitated Exchanges.

Title VI means title VI of the Civil Rights Act of 1964 (Pub. L. 88–352; 42 U.S.C. 2000d *et seq.*), as amended.

Title VII means title VII of the Civil Rights Act of 1964 (Pub. L. 88–352; 42 U.S.C. 2000e *et seq.*), as amended.

Title IX means title IX of the Education Amendments of 1972 (Pub. L. 92–318; 20 U.S.C. 1681 *et seq.*), as amended.

UFAS means the Uniform Federal Accessibility Standards (Pub. L. 90–480; 42 U.S.C. 4151 *et seq.*), as amended.

§ 92.5 Assurances required.

(a) *Assurances.* An entity applying for Federal financial assistance to which this part applies must, as a condition of any application for Federal financial assistance, submit an assurance, on a form specified by the Director, that the entity's health programs and activities will be operated in compliance with section 1557 and this part. A health insurance issuer seeking certification to participate in an Exchange or a State seeking approval to operate a State Exchange to which section 1557 or this part applies must, as a condition of certification or approval, submit an assurance, on a form specified by the Director, that the health insurance issuer's or State's health program or activity will be operated in compliance with section 1557 and this part. An applicant or entity may incorporate this assurance by reference in subsequent applications to the Department for Federal financial assistance or requests for certification to participate in an Exchange or approval to operate a State Exchange.

(b) *Duration of obligation.* The duration of the assurances required by this section is the same as the duration of the assurances required in the Department's regulations implementing section 504, 45 CFR 84.5(b).

(c) *Covenants.* When Federal financial assistance is provided in the form of real property or interest, the same conditions apply as those contained in the Department's regulations implementing section 504, at 45 CFR 84.5(c), except that the nondiscrimination obligation applies to discrimination on all bases covered under section 1557 and this part.

§ 92.6 Remedial action and voluntary action.

(a) *Remedial action.* (1) If the Director finds that a recipient or State Exchange has discriminated against an individual on the basis of race, color, national origin, sex, age, or disability, in violation of section 1557 or this part, such recipient or State Exchange must take such remedial action as the Director may require to overcome the effects of the discrimination.

(2) Where a recipient is found to have discriminated against an individual on the basis of race, color, national origin, sex, age, or disability, in violation of section 1557 or this part, and where another recipient exercises control over the recipient that has discriminated, the Director, where appropriate, may require either or both entities to take remedial action.

(3) The Director may, where necessary to overcome the effects of discrimination in violation of section 1557 or this part, require a recipient, in its health programs and activities, or State Exchange to take remedial action with respect to:

(i) Persons who are no longer participants in the recipient's or State Exchange's health program or activity but who were participants in the health program or activity when such discrimination occurred; or

(ii) Persons who would have been participants in the health program or activity had the discrimination not occurred.

(b) *Voluntary action.* A covered entity may take nondiscriminatory steps, in addition to any action that is required by section 1557 or this part, to overcome the effects of conditions that result or resulted in limited participation in the covered entity's health programs or activities by persons on the basis of race, color, national origin, sex, age, or disability.

§ 92.7 Designation and responsibilities of a Section 1557 Coordinator.

(a) *Section 1557 Coordinator and designees.* A covered entity that employs fifteen or more persons must designate and authorize at least one employee, a ''Section 1557 Coordinator,'' to coordinate the covered entity's compliance with its responsibilities under section 1557 and this part in its health programs and activities, including the investigation of any grievance communicated to it alleging noncompliance with section 1557 or this part or alleging any action that would be prohibited by section 1557 or this part. As appropriate, a covered entity may assign one or more designees to carry out some of these responsibilities, but the Section 1557 Coordinator must retain ultimate oversight for ensuring coordination with the covered entity's compliance with this part.

(b) *Responsibilities of a Section 1557 Coordinator.* A covered entity must ensure that, at minimum, the Section 1557 Coordinator:

(1) Receives, reviews, and processes grievances, filed under the grievance procedure as set forth in § 92.8(c);

(2) Coordinates the covered entity's recordkeeping requirements as set forth in § 92.8(c);

(3) Coordinates effective implementation of the covered entity's language access procedures as set forth in § 92.8(d);

(4) Coordinates effective implementation of the covered entity's effective communication procedures as set forth in § 92.8(e);

(5) Coordinates effective implementation of the covered entity's reasonable modification procedures as set forth in § 92.8(f); and

(6) Coordinates training of relevant employees as set forth in § 92.9, including maintaining documentation required by such section.

§ 92.8 Policies and procedures.

(a) *General requirement.* A covered entity must implement written policies and procedures in its health programs and activities that are designed to comply with the requirements of this part. The policies and procedures must include an effective date and be reasonably designed, taking into account the size, complexity, and the type of health programs or activities undertaken by a covered entity, to ensure compliance with this part.

(b) *Nondiscrimination policy.* (1) A covered entity must implement a written policy in its health programs and activities that, at minimum, states the covered entity does not discriminate on the basis of race, color, national origin (including limited English proficiency and primary language), sex (consistent with the scope of sex discrimination described at § 92.101(a)(2)), age, or disability; that the covered entity provides language assistance services and appropriate auxiliary aids and services free of charge, when necessary for compliance with section 1557 or this part; that the covered entity will provide reasonable modifications for individuals with disabilities; and that provides the current contact information for the Section 1557 Coordinator required by § 92.7 (if applicable).

(2) OCR considers it a best practice toward achieving compliance for a covered entity to provide information that it has been granted a temporary exemption or granted an assurance of exemption under § 92.302(b) in the nondiscrimination policy required by paragraph (b)(1) of this section.

(c) *Grievance procedures.* (1) A covered entity that employs fifteen or more persons must implement written grievance procedures in its health programs and activities that provide for the prompt and equitable resolution of grievances alleging any action that would be prohibited by section 1557 or this part.

(2) A covered entity to which this paragraph applies must retain records related to grievances filed pursuant to the covered entity's grievance procedures required under paragraph (c)(1) of this section that allege discrimination on the basis of race, color, national origin, sex, age, or disability for no less than three (3) calendar years from the date the covered entity resolves the grievance. The records must include the grievance; the name and contact information of the complainant (if provided by complainant); the alleged discriminatory action and alleged basis (or bases) of discrimination; the date the grievance was filed; the date the grievance was resolved; grievance resolution; and any other pertinent information.

(3) A covered entity to which this paragraph (c) applies must keep confidential the identity of an individual who has filed a grievance under this part except as required by law or to the extent necessary to carry out the purposes of this part, including the conduct of any investigation.

(d) *Language access procedures.* A covered entity must implement written language access procedures in its health programs and activities describing the covered entity's process for providing language assistance services to individuals with limited English proficiency when required under § 92.201. At a minimum, the language access procedures must include current contact information for the section 1557 Coordinator (if applicable); how an employee identifies whether an individual has limited English proficiency; how an employee obtains the services of qualified interpreters and translators the covered entity uses to communicate with an individual with limited English proficiency; the names of any qualified bilingual staff members; and a list of any electronic and written translated materials the covered entity has, the languages they are translated into, date of issuance, and how to access electronic translations.

(e) *Effective communication procedures.* A covered entity must implement written effective communication procedures in its health programs and activities describing the covered entity's process for ensuring effective communication for individuals with disabilities when required under § 92.202. At a minimum, a covered entity's effective communication procedures must include current contact information for the Section 1557 Coordinator (if applicable); how an employee obtains the services of qualified interpreters the covered entity uses to communicate with individuals with disabilities, including the names of any qualified interpreter staff members; and how to access appropriate auxiliary aids and services.

(f) *Reasonable modification procedures.* A covered entity must implement written procedures in its health programs and activities describing the covered entity's process for making reasonable modifications to its policies, practices, or procedures when necessary to avoid discrimination on the basis of disability as required under § 92.205. At a minimum, the reasonable modification procedures must include current contact information for the covered entity's Section 1557 Coordinator (if applicable); a description of the covered entity's process for responding to requests from individuals with disabilities for changes, exceptions, or adjustments to a rule, policy, practice, or service of the covered entity; and a process for determining whether making the modification would fundamentally alter the nature of the health program or activity, including identifying an alternative modification that does not result in a fundamental alteration to ensure the individual with a disability receives the benefits or services in question.

(g) *Combined policies and procedures.* A covered entity may combine the content of the policies and procedures required by paragraphs (b) through (f) of this section with any policies and procedures pursuant to title VI, section 504, title IX, and the Age Act if section 1557 and the provisions in this part are clearly addressed therein.

(h) *Changes to policies and procedures.* (1) Covered entities must review and revise the policies and procedures required by paragraphs (b) through (g) of this section, as necessary, to ensure they are current and in compliance with section 1557 and this part; and

(2) A covered entity may change a policy or procedure required by paragraphs (b) through (g) of this section at any time, provided that such changes comply with section 1557 and this part.

§ 92.9 Training.

(a) A covered entity must train relevant employees of its health programs and activities on the civil rights policies and procedures required by § 92.8, as necessary and appropriate for the employees to carry out their functions within the covered entity consistent with the requirements of this part.

(b) A covered entity must provide training that meets the requirements of paragraph (a) of this section, as follows:

(1) To each relevant employee of the health program or activity as soon as possible, but no later than 30 days following a covered entity's implementation of the policies and procedures required by § 92.8, and no later than 300 days following July 5, 2024;

(2) Thereafter, to each new relevant employee of the health program or activity within a reasonable period of time after the employee joins the covered entity's workforce; and

(3) To each relevant employee of the health program or activity whose functions are affected by a material change in the policies or procedures required by § 92.8 and any other civil rights policies or procedures the covered entity has implemented within a reasonable period of time after the material change has been made.

(4) For purposes of this section, ''relevant employees'' includes permanent and temporary employees whose roles and responsibilities entail interacting with patients and members of the public; making decisions that directly or indirectly affect patients' health care, including the covered entity's executive leadership team and legal counsel; and performing tasks and making decisions that directly or indirectly affect patients' financial obligations, including billing and collections.

(c) A covered entity must contemporaneously document its employees' completion of the training required by paragraphs (a) and (b) of this section in written or electronic form and retain said documentation for no less than three (3) calendar years.

§ 92.10 Notice of nondiscrimination.

(a) A covered entity must provide a notice of nondiscrimination to participants, beneficiaries, enrollees, and applicants of its health programs and activities, and members of the public.

(1) The notice required under this paragraph (a) must include the following information relating to the covered entity's health programs and activities:

(i) The covered entity does not discriminate on the basis of race, color, national origin (including limited English proficiency and primary language), sex (consistent with the scope of sex discrimination described at § 92.101(a)(2)), age, or disability;

(ii) The covered entity provides reasonable modifications for individuals with disabilities, and appropriate

auxiliary aids and services, including qualified interpreters for individuals with disabilities and information in alternate formats, such as braille or large print, free of charge and in a timely manner, when such modifications, aids, and services are necessary to ensure accessibility and an equal opportunity to participate to individuals with disabilities;

(iii) The covered entity provides language assistance services, including electronic and written translated documents and oral interpretation, free of charge and in a timely manner, when such services are a reasonable step to provide meaningful access to an individual with limited English proficiency;

(iv) How to obtain from the covered entity the reasonable modifications, appropriate auxiliary aids and services, and language assistance services in paragraphs (a)(1)(ii) and (iii) of this section;

(v) The contact information for the covered entity's Section 1557 Coordinator designated pursuant to § 92.7 (if applicable);

(vi) The availability of the covered entity's grievance procedure pursuant to § 92.8(c) and how to file a grievance (if applicable);

(vii) Details on how to file a discrimination complaint with OCR in the Department; and

(viii) How to access the covered entity's website, if it has one, that provides the information required under this paragraph (a)(1).

(2) The notice required under this paragraph (a) must be provided in a covered entity's health program or activity, as follows:

(i) On an annual basis to participants, beneficiaries, enrollees (including late and special enrollees), and applicants of its health program or activity;

(ii) Upon request;

(iii) At a conspicuous location on the covered entity's health program or activity website, if it has one; and

(iv) In clear and prominent physical locations, in no smaller than 20-point sans serif font, where it is reasonable to expect individuals seeking service from the health program or activity to be able to read or hear the notice.

(b) A covered entity may combine the content of the notice required by paragraph (a) of this section with the notices required by 45 CFR 80.6(d), 84.8, 86.9, and 91.32 if the combined notice clearly informs individuals of their civil rights under section 1557 and this part, so long as it includes each of the elements required by paragraph (a)(1) of this section.

§ 92.11 Notice of availability of language assistance services and auxiliary aids and services.

(a) A covered entity must provide a notice of availability of language assistance services and auxiliary aids and services that, at minimum, states that the covered entity, in its health programs or activities, provides language assistance services and appropriate auxiliary aids and services free of charge, when necessary for compliance with section 1557 or this part, to participants, beneficiaries, enrollees, and applicants of its health program or activities, and members of the public.

(b) The notice required under paragraph (a) of this section must be provided in English and at least the 15 languages most commonly spoken by individuals with limited English proficiency of the relevant State or States in which a covered entity operates and must be provided in alternate formats for individuals with disabilities who require auxiliary aids and services to ensure effective communication.

(c) The notice required under paragraph (a) of this section must be provided in a covered entity's health program or activity, as follows:

(1) On an annual basis to participants, beneficiaries, enrollees (including late and special enrollees), and applicants of its health program or activity;

(2) Upon request;

(3) At a conspicuous location on the covered entity's health program or activity website, if it has one;

(4) In clear and prominent physical locations, in no smaller than 20-point sans serif font, where it is reasonable to expect individuals seeking service from the health program or activity to be able to read or hear the notice; and

(5) In the following electronic and written communications when these forms are provided by a covered entity:

(i) Notice of nondiscrimination required by § 92.10;

(ii) Notice of privacy practices required by 45 CFR 164.520;

(iii) Application and intake forms;

(iv) Notices of denial or termination of eligibility, benefits or services, including Explanations of Benefits, and notices of appeal and grievance rights;

(v) Communications related to an individual's rights, eligibility, benefits, or services that require or request a response from a participant, beneficiary, enrollee, or applicant;

(vi) Communications related to a public health emergency;

(vii) Consent forms and instructions related to medical procedures or operations, medical power of attorney, or living will (with an option of providing only one notice for all documents bundled together);

(viii) Discharge papers;

(ix) Communications related to the cost and payment of care with respect to an individual, including medical billing and collections materials, and good faith estimates required by section 2799B–6 of the Public Health Service Act;

(x) Complaint forms; and

(xi) Patient and member handbooks.

(d) A covered entity shall be deemed in compliance with this section with respect to an individual if it exercises the option to:

(1) On an annual basis, provide the individual with the option to opt out of receipt of the notice required by this section in their primary language and through any appropriate auxiliary aids and services, and:

(i) Does not condition the receipt of any aid or benefit on the individual's decision to opt out;

(ii) Informs the individual that they have a right to receive the notice upon request in their primary language and through the appropriate auxiliary aids and services;

(iii) Informs the individual that opting out of receiving the notice is not a waiver of their right to receive language assistance services and any appropriate auxiliary aids and services as required by this part;

(iv) Documents, on an annual basis, that the individual has opted out of receiving the notice required by this section for that year; and

(v) Does not treat a non-response from an individual as a decision to opt out; or

(2) Document the individual's primary language and any appropriate auxiliary aids and services and:

(i) Provides all materials and communications in that individual's primary language and through any appropriate auxiliary aids and services; or

(ii) Provides the notice required by paragraph (a) of this section in that individual's primary language and through any appropriate auxiliary aids and services in all communications that are identified in paragraph (c)(5) of this section.

Subpart B—Nondiscrimination Provisions

§ 92.101 Discrimination prohibited.

(a) *General.* (1) Except as provided in title I of the ACA, an individual must not, on the basis of race, color, national origin, sex, age, disability, or any combination thereof, be excluded from

participation in, be denied the benefits of, or otherwise be subjected to discrimination under any health program or activity operated by a covered entity.

(2) Discrimination on the basis of sex includes, but is not limited to, discrimination on the basis of:

(i) Sex characteristics, including intersex traits;

(ii) Pregnancy or related conditions;

(iii) Sexual orientation;

(iv) Gender identity; and

(v) Sex stereotypes.

(b) *Specific prohibitions on discrimination.* (1) In any health program or activity to which this part applies:

(i) A recipient and State Exchange must comply with the specific prohibitions on discrimination in the Department's implementing regulations for title VI, section 504, title IX, and the Age Act, found at 45 CFR parts 80, 84, 86 (subparts C and D), and 91 (subpart B), respectively. Where this paragraph (b) cross-references regulatory provisions that use the term ''recipient,'' the term ''recipient or State Exchange'' shall apply in its place. Where this paragraph (b) cross-references regulatory provisions that use the term ''student,'' ''employee,'' or ''applicant,'' these terms shall be replaced with ''individual.''

(ii) The Department, including Federally-facilitated Exchanges, must comply with specific prohibitions on discrimination in the Department's implementing regulations for title VI, section 504, title IX, and the Age Act, found at 45 CFR parts 80, 85, 86 (subparts C and D), and 91 (subpart B), respectively. Where this paragraph (b) cross-references regulatory provisions that use the term ''a recipient,'' the term ''the Department or a Federally-facilitated Exchange'' shall apply in its place. Where this paragraph (b) cross-references regulatory provisions that use the term ''student,'' ''employee,'' or ''applicant,'' these terms shall be replaced with ''individual.''

(2) The enumeration of specific prohibitions on discrimination in paragraph (b)(1) of this section does not limit the general applicability of the prohibition in paragraph (a) of this section.

Subpart C—Specific Applications to Health Programs and Activities

§ 92.201 Meaningful access for individuals with limited English proficiency.

(a) *General requirement.* A covered entity must take reasonable steps to provide meaningful access to each individual with limited English proficiency (including companions with limited English proficiency) eligible to be served or likely to be directly affected by its health programs and activities.

(b) *Language assistance services requirements.* Language assistance services required under paragraph (a) of this section must be provided free of charge, be accurate and timely, and protect the privacy and the independent decision-making ability of the individual with limited English proficiency.

(c) *Specific requirements for interpreter and translation services.* (1) When interpretation services are required under this part, a covered entity must offer a qualified interpreter in its health programs and activities.

(2) When translation services are required under this part, a covered entity must utilize the services of a qualified translator in its health programs and activities.

(3) If a covered entity uses machine translation when the underlying text is critical to the rights, benefits, or meaningful access of an individual with limited English proficiency, when accuracy is essential, or when the source documents or materials contain complex, non-literal or technical language, the translation must be reviewed by a qualified human translator.

(d) *Evaluation of compliance.* In evaluating whether a covered entity has met its obligation under paragraph (a) of this section, the Director shall:

(1) Evaluate, and give substantial weight to, the nature and importance of the health program or activity and the particular communication at issue, to the individual with limited English proficiency; and

(2) Take into account other relevant factors, including the effectiveness of the covered entity's written language access procedures for its health programs and activities, that the covered entity has implemented pursuant to § 92.8(d).

(e) *Restricted use of certain persons to interpret or facilitate communication.* A covered entity must not, in its health programs and activities:

(1) Require an individual with limited English proficiency to provide their own interpreter, or to pay the cost of their own interpreter;

(2) Rely on an adult, not qualified as an interpreter, to interpret or facilitate communication, except:

(i) As a temporary measure, while finding a qualified interpreter in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no qualified interpreter for the individual with limited English proficiency immediately available and the qualified interpreter that arrives confirms or supplements the initial communications with an initial adult interpreter; or

(ii) Where the individual with limited English proficiency specifically requests, in private with a qualified interpreter present and without an accompanying adult present, that the accompanying adult interpret or facilitate communication, the accompanying adult agrees to provide such assistance, the request and agreement by the accompanying adult is documented, and reliance on that adult for such assistance is appropriate under the circumstances;

(3) Rely on a minor child to interpret or facilitate communication, except as a temporary measure while finding a qualified interpreter in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no qualified interpreter for the individual with limited English proficiency immediately available and the qualified interpreter that arrives confirms or supplements the initial communications with the minor child; or

(4) Rely on staff other than qualified interpreters, qualified translators, or qualified bilingual/multilingual staff to communicate with individuals with limited English proficiency.

(f) *Video remote interpreting services.* A covered entity that provides a qualified interpreter for an individual with limited English proficiency through video remote interpreting services in the covered entity's health programs and activities must ensure the modality allows for meaningful access and must provide:

(1) Real-time, full-motion video and audio over a dedicated high-speed, wide-bandwidth video connection or wireless connection that delivers high quality video images that do not produce lags, choppy, blurry, or grainy images, or irregular pauses in communication;

(2) A sharply delineated image that is large enough to display the interpreter's face and the participating person's face regardless of the person's body position;

(3) A clear, audible transmission of voices; and

(4) Adequate training to users of the technology and other involved persons so that they may quickly and efficiently set up and operate the video remote interpreting.

(g) *Audio remote interpreting services.* A covered entity that provides a qualified interpreter for an individual with limited English proficiency through audio remote interpreting

services in the covered entity's health programs and activities must ensure the modality allows for meaningful access and must provide:

(1) Real-time audio over a dedicated high-speed, wide-bandwidth connection or wireless connection that delivers high-quality audio without lags or irregular pauses in communication;

(2) A clear, audible transmission of voices; and

(3) Adequate training to users of the technology and other involved persons so that they may quickly and efficiently set up and operate the remote interpreting services.

(h) *Acceptance of language assistance services is not required.* Nothing in this section shall be construed to require an individual with limited English proficiency to accept language assistance services.

§ 92.202 Effective communication for individuals with disabilities.

(a) A covered entity must take appropriate steps to ensure that communications with individuals with disabilities (including companions with disabilities), are as effective as communications with non-disabled individuals in its health programs and activities, in accordance with the standards found at 28 CFR 35.130 and 35.160 through 35.164. Where the regulatory provisions referenced in this section use the term ''public entity,'' the term ''covered entity'' shall apply in its place.

(b) A covered entity must provide appropriate auxiliary aids and services where necessary to afford individuals with disabilities an equal opportunity to participate in, and enjoy the benefits of, the health program or activity in question. Such auxiliary aids and services must be provided free of charge, in accessible formats, in a timely manner, and in such a way to protect the privacy and the independence of the individual with a disability.

§ 92.203 Accessibility for buildings and facilities.

(a) No qualified individual with a disability shall, because a covered entity's facilities are inaccessible to or unusable by individuals with disabilities, be denied the benefits of, be excluded from participation in, or otherwise be subjected to discrimination under any health program or activity to which this part applies.

(b) Each facility or part of a facility in which health programs or activities are conducted that is constructed or altered by or on behalf of, or for the use of, a recipient or State Exchange must comply with the 2010 Standards if the construction or alteration was commenced on or after July 18, 2016, except that if a facility or part of a facility in which health programs or activities are conducted that is constructed or altered by or on behalf of, or for the use of, a recipient or State Exchange, was not covered by the 2010 Standards prior to July 18, 2016, such facility or part of a facility must comply with the 2010 Standards if the construction or alteration was commenced after January 18, 2018. If construction or alteration was begun on or after July 18, 2016, and on or before January 18, 2018, in conformance with UFAS, and the facility or part of the facility was not covered by the 2010 Standards prior to July 18, 2016, then it shall be deemed to comply with the requirements of this section and with 45 CFR 84.23(a) and (b). Departures from particular technical and scoping requirements by the use of other methods are permitted where substantially equivalent or greater access to and usability of the facility is provided. All newly constructed or altered buildings or facilities subject to this section must comply with the requirements for a ''public building or facility'' as defined in section 106.5 of the 2010 Standards.

(c) Each facility or part of a facility in which health programs or activities under this part are conducted that is constructed or altered by or on behalf of, or for the use of, a recipient or State Exchange in conformance with the 1991 Standards at appendix D to 28 CFR part 36 or the 2010 Standards shall be deemed to comply with the requirements of this section and with 45 CFR 84.23(a) and (b) with respect to those facilities, if the construction or alteration was commenced before July 18, 2016. Each facility or part of a facility in which health programs or activities are conducted that is constructed or altered by or on behalf of, or for the use of, a recipient or State Exchange in conformance with UFAS shall be deemed to comply with the requirements of this section and with 45 CFR 84.23(a) and (b), if the construction or alteration was commenced before July 18, 2016, and such facility would not have been required to conform with a different accessibility standard under 28 CFR 35.151.

§ 92.204 Accessibility of information and communication technology for individuals with disabilities.

(a) A covered entity must ensure that its health programs and activities provided through information and communication technology are accessible to individuals with disabilities, unless doing so would result in undue financial and administrative burdens or a fundamental alteration in the nature of the health programs or activities. If an action required to comply with this section would result in such an alteration or such burdens, a covered entity shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that, to the maximum extent possible, individuals with disabilities receive the benefits or services of the health program or activity provided by the covered entity.

(b) A recipient or State Exchange shall ensure that its health programs and activities provided through websites and mobile applications comply with the requirements of section 504 of the Rehabilitation Act, as interpreted consistent with title II of the ADA (42 U.S.C. 12131 through 12165).

§ 92.205 Requirement to make reasonable modifications.

A covered entity must make reasonable modifications to policies, practices, or procedures in its health programs and activities when such modifications are necessary to avoid discrimination on the basis of disability, unless the covered entity can demonstrate that making the modifications would fundamentally alter the nature of the health program or activity. For the purposes of this section, the term ''reasonable modifications'' shall be interpreted in a manner consistent with the term as set forth in the ADA title II regulation at 28 CFR 35.130(b)(7).

§ 92.206 Equal program access on the basis of sex.

(a) A covered entity must provide individuals equal access to its health programs and activities without discriminating on the basis of sex.

(b) In providing access to health programs and activities, a covered entity must not:

(1) Deny or limit health services, including those that have been typically or exclusively provided to, or associated with, individuals of one sex, to an individual based upon the individual's sex assigned at birth, gender identity, or gender otherwise recorded;

(2) Deny or limit, on the basis of an individual's sex assigned at birth, gender identity, or gender otherwise recorded, a health care professional's ability to provide health services if such denial or limitation has the effect of excluding individuals from participation in, denying them the benefits of, or otherwise subjecting them

to discrimination on the basis of sex under a covered health program or activity;

(3) Adopt or apply any policy or practice of treating individuals differently or separating them on the basis of sex in a manner that subjects any individual to more than de minimis harm, including by adopting a policy or engaging in a practice that prevents an individual from participating in a health program or activity consistent with the individual's gender identity; or

(4) Deny or limit health services sought for purpose of gender transition or other gender-affirming care that the covered entity would provide to an individual for other purposes if the denial or limitation is based on an individual's sex assigned at birth, gender identity, or gender otherwise recorded.

(c) Nothing in this section requires the provision of any health service where the covered entity has a legitimate, nondiscriminatory reason for denying or limiting that service, including where the covered entity typically declines to provide the health service to any individual or where the covered entity reasonably determines that such health service is not clinically appropriate for a particular individual. A covered entity's determination must not be based on unlawful animus or bias, or constitute a pretext for discrimination. Nothing in this section is intended to preclude a covered entity from availing itself of protections described in §§ 92.3 and 92.302.

(d) The enumeration of specific forms of discrimination in paragraph (b) of this section does not limit the general applicability of the prohibition in paragraph (a) of this section.

§ 92.207 Nondiscrimination in health insurance coverage and other health-related coverage.

(a) A covered entity must not, in providing or administering health insurance coverage or other health-related coverage, discriminate on the basis of race, color, national origin, sex, age, disability, or any combination thereof.

(b) A covered entity must not, in providing or administering health insurance coverage or other health-related coverage:

(1) Deny, cancel, limit, or refuse to issue or renew health insurance coverage or other health-related coverage, or deny or limit coverage of a claim, or impose additional cost sharing or other limitations or restrictions on coverage, on the basis of race, color, national origin, sex, age, disability, or any combination thereof;

(2) Have or implement marketing practices or benefit designs that discriminate on the basis of race, color, national origin, sex, age, disability, or any combination thereof, in health insurance coverage or other health-related coverage;

(3) Deny or limit coverage, deny or limit coverage of a claim, or impose additional cost sharing or other limitations or restrictions on coverage, to an individual based upon the individual's sex assigned at birth, gender identity, or gender otherwise recorded;

(4) Have or implement a categorical coverage exclusion or limitation for all health services related to gender transition or other gender-affirming care;

(5) Otherwise deny or limit coverage, deny or limit coverage of a claim, or impose additional cost sharing or other limitations or restrictions on coverage, for specific health services related to gender transition or other gender-affirming care if such denial, limitation, or restriction results in discrimination on the basis of sex; or

(6) Have or implement benefit designs that do not provide or administer health insurance coverage or other health-related coverage in the most integrated setting appropriate to the needs of qualified individuals with disabilities, including practices that result in the serious risk of institutionalization or segregation.

(c) Nothing in this section requires coverage of any health service where the covered entity has a legitimate, nondiscriminatory reason for denying or limiting coverage of the health service or determining that such health service fails to meet applicable coverage requirements, including reasonable medical management techniques such as medical necessity requirements. Such coverage denial or limitation must not be based on unlawful animus or bias, or constitute a pretext for discrimination. Nothing in this section is intended to preclude a covered entity from availing itself of protections described in §§ 92.3 and 92.302.

(d) The enumeration of specific forms of discrimination in paragraph (b) of this section does not limit the general applicability of the prohibition in paragraph (a) of this section.

§ 92.208 Prohibition on sex discrimination related to marital, parental, or family status.

In determining whether an individual satisfies any policy or criterion regarding access to its health programs or activities, a covered entity must not take an individual's sex, as defined in § 92.101(a)(2), into account in applying any rule concerning an individual's current, perceived, potential, or past marital, parental, or family status.

§ 92.209 Nondiscrimination on the basis of association.

A covered entity must not exclude from participation in, deny the benefits of, or otherwise discriminate against an individual or entity in its health programs and activities on the basis of the respective race, color, national origin, sex, age, or disability of the individual and another person with whom the individual or entity has a relationship or association.

§ 92.210 Nondiscrimination in the use of patient care decision support tools.

(a) *General prohibition.* A covered entity must not discriminate on the basis of race, color, national origin, sex, age, or disability in its health programs or activities through the use of patient care decision support tools.

(b) *Identification of risk.* A covered entity has an ongoing duty to make reasonable efforts to identify uses of patient care decision support tools in its health programs or activities that employ input variables or factors that measure race, color, national origin, sex, age, or disability.

(c) *Mitigation of risk.* For each patient care decision support tool identified in paragraph (b) of this section, a covered entity must make reasonable efforts to mitigate the risk of discrimination resulting from the tool's use in its health programs or activities.

§ 92.211 Nondiscrimination in the delivery of health programs and activities through telehealth services.

A covered entity must not, in delivery of its health programs and activities through telehealth services, discriminate on the basis of race, color, national origin, sex, age, or disability.

Subpart D—Procedures

§ 92.301 Enforcement mechanisms.

The enforcement mechanisms available for and provided under title VI of the Civil Rights Act of 1964, title IX of the Education Amendments of 1972, section 504 of the Rehabilitation Act of 1973, and the Age Discrimination Act of 1975 shall apply for purposes of section 1557 as implemented by this part.

§ 92.302 Notification of views regarding application of Federal religious freedom and conscience laws.

(a) *General application.* A recipient may rely on applicable Federal protections for religious freedom and conscience, and consistent with § 92.3(c), application of a particular

provision(s) of this part to specific contexts, procedures, or health care services shall not be required where such protections apply.

(b) *Assurance of religious freedom and conscience exemption.* A recipient that seeks assurance consistent with paragraph (a) of this section regarding the application of particular provision(s) of this part to specific contexts, procedures, or health care services may do so by submitting a notification in writing to the Director of OCR. Notification may be provided by the recipient at any time, including before an investigation is initiated or during the pendency of an investigation. The notification must include:

(1) The particular provision(s) of this part from which the recipient asserts they are exempt under Federal religious freedom or conscience protections;

(2) The legal basis supporting the recipient's exemption should include the standards governing the applicable Federal religious freedom and conscience protections, such as the provisions in the ACA itself; the Church, Coats-Snowe, and Weldon Amendments; the generally applicable requirements of the Religious Freedom Restoration Act (RFRA); or any other applicable Federal laws; and

(3) The factual basis supporting the recipient's exemption, including identification of the conflict between the recipient's religious or conscience beliefs and the requirements of this part, which may include the specific contexts, procedures, or health care services that the recipient asserts will violate their religious or conscience beliefs overall or based on an individual patient matter.

(c) *Temporary exemption.* A temporary exemption from administrative investigation and enforcement will take effect upon the recipient's submission of the notification—regardless of whether the assurance is sought before or during an investigation. The temporary exemption is limited to the application of the particular provision(s) in this part as applied to the specific contexts, procedures, or health care services identified in the notification to OCR.

(1) If the notification is received before an investigation is initiated, within 30 days of receiving the notification, OCR must provide the recipient with email confirmation acknowledging receipt of the notification. OCR will then work expeditiously to reach a determination of recipient's notification request.

(2) If the notification is received during the pendency of an investigation, the temporary exemption will exempt conduct as applied to the specific contexts, procedures, or health care services identified in the notification during the pendency of OCR's review and determination regarding the notification request. The notification shall further serve as a defense to the relevant investigation or enforcement activity regarding the recipient until the final determination of recipient's exemption assurance request or the conclusion of the investigation.

(d) *Effect of determination.* If OCR makes a determination to provide assurance of the recipient's exemption from the application of certain provision(s) of this part or that modified application of certain provision(s) is required, OCR will provide the recipient its determination in writing, and if granted, the recipient will be considered exempt from OCR's administrative investigation and enforcement with regard to the application of that provision(s) as applied to the specific contexts, procedures, or health care services provided. The determination does not otherwise limit the application of any other provision of this part to the recipient or to other contexts, procedures, or health care services.

(e) *Appeal.* A recipient subject to an adverse determination of its request for an exemption assurance may appeal OCR's determination under the administrative procedures set forth at 45 CFR part 81. The temporary exemption provided for in paragraph (c) of this section will expire upon a final decision under 45 CFR part 81.

(f) *Final agency action.* A determination under this section is not final for purposes of judicial review until after a final decision under 45 CFR part 81.

§ 92.303 Procedures for health programs and activities conducted by recipients and State Exchanges.

(a) The procedural provisions applicable to title VI apply with respect to administrative enforcement actions against health programs and activities of recipients and State Exchanges concerning discrimination on the basis of race, color, national origin, sex, age, disability, or any combination thereof, under section 1557 or this part. These procedures are found at 45 CFR 80.6 through 80.11 and 45 CFR part 81.

(b) If OCR receives a complaint over which it does not have jurisdiction, it shall promptly notify the complainant and shall make reasonable efforts to refer the complaint to the appropriate Federal Government entity.

(c) When a recipient or State Exchange fails to provide OCR with requested information in a timely, complete, and accurate manner, OCR may, after attempting to reach voluntary resolution, find noncompliance with section 1557 or this part and initiate appropriate enforcement procedures, found at 45 CFR 80.8, including beginning the process for fund suspension or termination and taking other action authorized by law.

§ 92.304 Procedures for health programs and activities administered by the Department.

(a) The procedural provisions applicable to section 504 shall apply with respect to administrative enforcement actions against the Department, including Federally-facilitated Exchanges, concerning discrimination on the basis of race, color, national origin, sex, age, disability, or any combination thereof, under section 1557 or this part. These procedures are found at 45 CFR 85.61 and 85.62. Where this section cross-references regulatory provisions that use the term ''handicap,'' the term ''race, color, national origin, sex, age, or disability, or any combination thereof,'' shall apply in its place.

(b) The Department must permit access by OCR to its books, records, accounts, other sources of information, and facilities as may be pertinent to ascertain compliance with section 1557 or this part. Where any information required of the Department is in the exclusive possession of any other agency, institution or person, and the other agency, institution or person fails or refuses to furnish this information, the Department shall so certify and shall set forth what efforts it has made to obtain the information. Asserted considerations of privacy or confidentiality may not operate to bar OCR from evaluating or seeking to enforce compliance with section 1557 or this part. Information of a confidential nature obtained in connection with compliance evaluation or enforcement shall not be disclosed except where necessary under the law.

(c) The Department must not intimidate, threaten, coerce, retaliate, or otherwise discriminate against any individual or entity for the purpose of interfering with any right or privilege secured by section 1557 or this part, or because such individual or entity has made a complaint, testified, assisted, or participated in any manner in an investigation, proceeding or hearing under section 1557 or this part. The identity of complainants must be kept confidential by OCR in accordance with applicable Federal law.

PART 147—HEALTH INSURANCE REFORM REQUIREMENTS FOR THE GROUP AND INDIVIDUAL HEALTH INSURANCE MARKETS

■ 16. The authority citation for part 147 continues to read as follows:

Authority: 42 U.S.C. 300gg through 300gg–63, 300gg–91, 300gg–92, and 300gg–111 through 300gg–139, as amended, and section 3203, Pub. L. 116–136, 134 Stat. 281.

■ 17. Amend § 147.104 by revising paragraph (e) to read as follows:

§ 147.104 Guaranteed availability of coverage.

* * * * *

(e) *Marketing.* A health insurance issuer and its officials, employees, agents and representatives must comply with any applicable State laws and regulations regarding marketing by health insurance issuers and cannot employ marketing practices or benefit designs that will have the effect of discouraging the enrollment of individuals with significant health needs in health insurance coverage or discriminate based on an individual's race, color, national origin, present or predicted disability, age, sex (which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes), expected length of life, degree of medical dependency, quality of life, or other health conditions.

* * * * *

PART 155—EXCHANGE ESTABLISHMENT STANDARDS AND OTHER RELATED STANDARDS UNDER THE AFFORDABLE CARE ACT

■ 18. The authority citation for part 155 continues to read as follows:

Authority: 42 U.S.C. 18021–18024, 18031–18033, 18041–18042, 18051, 18054, 18071, and 18081–18083.

■ 19. Amend § 155.120 by revising paragraph (c)(1)(ii) to read as follows:

§ 155.120 Non-interference with Federal law and non-discrimination standards.

* * * * *

(c) * * *

(1) * * *

(ii) Not discriminate based on race, color, national origin, disability, age, or sex (which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).

* * * * *

■ 20. Amend § 155.220 by revising paragraph (j)(2)(i) to read as follows:

§ 155.220 Ability of States to permit agents and brokers and web-brokers to assist qualified individuals, qualified employers, or qualified employees enrolling in QHPs.

* * * * *

(j) * * *

(2) * * *

(i) Provide consumers with correct information, without omission of material fact, regarding the Federally-facilitated Exchanges, QHPs offered through the Federally-facilitated Exchanges, and insurance affordability programs, and refrain from marketing or conduct that is misleading (including by having a direct enrollment website that HHS determines could mislead a consumer into believing they are visiting *HealthCare.gov*), coercive, or discriminates based on race, color, national origin, disability, age, or sex (which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes);

* * * * *

PART 156—HEALTH INSURANCE ISSUER STANDARDS UNDER THE AFFORDABLE CARE ACT, INCLUDING STANDARDS RELATED TO EXCHANGES

■ 21. The authority citation for part 156 continues to read as follows:

Authority: 42 U.S.C. 18021–18024, 18031–18032, 18041–18042, 18044, 18054, 18061, 18063, 18071, 18082, and 26 U.S.C. 36B.

■ 22. Amend § 156.200 by revising paragraph (e) to read as follows:

§ 156.200 QHP issuer participation standards.

* * * * *

(e) *Non-discrimination.* A QHP issuer must not, with respect to its QHP, discriminate on the basis of race, color, national origin, disability, age, or sex (which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).

* * * * *

■ 23. Amend § 156.1230 by revising paragraph (b)(2) to read as follows:

§ 156.1230 Direct enrollment with the QHP issuer in a manner considered to be through the Exchange.

* * * * *

(b) * * *

(2) The QHP issuer must provide consumers with correct information, without omission of material fact, regarding the Federally-facilitated Exchanges, QHPs offered through the Federally-facilitated Exchanges, and insurance affordability programs, and refrain from marketing or conduct that is misleading (including by having a direct enrollment website that HHS determines could mislead a consumer into believing they are visiting *HealthCare.gov*), coercive, or discriminates based on race, color, national origin, disability, age, or sex (which includes discrimination on the basis of sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; gender identity; and sex stereotypes).

Clean Vehicle Credits Under Sections 25E and 30D; Transfer of Credits; Critical Minerals and Battery Components; Foreign Entities of Concern

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Final regulations.

SUMMARY: This document contains final regulations regarding Federal income tax credits under the Inflation Reduction Act of 2022 (IRA) for the purchase of qualifying new and previously-owned clean vehicles, including new and previously-owned plug-in electric vehicles powered by an electric battery meeting certain requirements and new qualified fuel cell motor vehicles. In addition, the final regulations provide guidance for taxpayers who purchase qualifying vehicles and intend to transfer the amount of any previously-owned clean vehicle credit or new clean vehicle credit to dealers that are entities eligible to receive advance payments of either credit. The final regulations also provide guidance for dealers to become eligible entities to receive advance payments of previously-owned clean vehicle credits or new clean vehicle credits, and rules regarding recapture of the credits. Finally, the final regulations provide guidance on the meaning of three new definitions added to the exclusive list of mathematical or clerical errors relating to certain assessments of tax without a notice of deficiency.

DATES:

Effective date: These regulations are effective on July 5, 2024.

Applicability dates: For dates of applicability, *see* §§ 1.25E–1(h), 1.25E–2(i), 1.25E–3(k), 1.30D–1(d), 1.30D–2(d), 1.30D–3(h), 1.30D–4(j), 1.30D–5(k), 1.30D–6(j), and 301.6213–2(c).

FOR FURTHER INFORMATION CONTACT: Rika Valdman or Maggie Stehn of the Office of Associate Chief Counsel (Passthroughs & Special Industries) at (202) 317–6853 (not a toll-free number).

SUPPLEMENTARY INFORMATION:

Background

This document contains amendments to the Income Tax Regulations (26 CFR part 1) under sections 25E and 30D of the Internal Revenue Code (Code), and to the Procedure and Administration Regulations (26 CFR part 301) under section 6213 of the Code.

I. Section 25E

Section 13402 of Public Law 117–169, 136 Stat. 1818 (August 16, 2022), commonly known as the IRA, added section 25E to the Code. The credit under section 25E (section 25E credit) is a personal credit allowable under subpart A of the Code.

Section 25E(a) provides that, in the case of a qualified buyer who during a taxable year places in service a previously-owned clean vehicle, an income tax credit is allowed for the taxable year equal to the lesser of: (1) $4,000, or (2) the amount equal to 30 percent of the sale price with respect to such vehicle.

Section 25E(b)(1) sets a limitation based on modified adjusted gross income (Modified AGI) and provides that no credit is allowed for any taxable year if (A) the lesser of (i) the Modified AGI of the taxpayer for such taxable year, or (ii) the Modified AGI of the taxpayer for the preceding taxable year, exceeds (B) the threshold amount. The threshold amount is set forth in section 25E(b)(2) and varies based on a taxpayer's filing status. In the case of a taxpayer filing a joint return or who is a surviving spouse (as defined in section 2(a) of the Code), the threshold amount is $150,000. In the case of a taxpayer who is a head of household (as defined in section 2(b)), the threshold amount is $112,500. In the case of any other taxpayer, the threshold amount is $75,000. Section 25E(b)(3) defines Modified AGI as adjusted gross income (AGI) increased by any amount excluded from gross income under section 911, 931, or 933 of the Code.

Section 25E(c) defines certain terms for purposes of the section 25E credit. Section 25E(c)(1) defines ''previously-owned clean vehicle'' as a motor vehicle:

(A) the model year of which is at least 2 years earlier than the calendar year in which the taxpayer acquires such vehicle;

(B) the original use of which commences with a person other than the taxpayer;

(C) that is acquired by the taxpayer in a qualified sale; and

(D) that (i) meets the requirements of section 30D(d)(1)(C), (D), (E), (F), and (H) (except for section 30D(d)(1)(H)(iv)), or (ii) is a motor vehicle that (I) satisfies the requirements under section 30B(b)(3)(A) and (B), and (II) has a gross vehicle weight rating (GVWR) of less than 14,000 pounds.

Section 25E(c)(2) defines a ''qualified sale'' as a sale of a motor vehicle (A) by a dealer (as defined in section 30D(g)(8)); (B) for a sale price that does not exceed $25,000; and (C) that is the first transfer since the date of enactment of the IRA to a qualified buyer other than the person with whom the original use of such vehicle commenced.

Under section 25E(c)(3), ''qualified buyer'' means, with respect to a sale of a motor vehicle, a taxpayer (A) who is an individual; (B) who purchases such vehicle for use and not for resale; (C) with respect to whom no deduction is allowable with respect to another taxpayer under section 151 of the Code; and (D) who has not been allowed a section 25E credit for any sale during the 3-year period ending on the date of the sale of such vehicle.

Section 25E(c)(4) defines ''motor vehicle'' and ''capacity'' to have the meaning given such terms in section 30D(d)(2) and (4), respectively.

Section 25E(d) provides that no credit is allowed under section 25E(a) with respect to any vehicle unless the taxpayer includes the vehicle identification number (VIN) of such vehicle on the return of tax for the taxable year.

Section 25E(e) and (f) provide, respectively, that rules similar to the rules of section 30D(f) (without regard to paragraph (10) or (11) thereof) and the rules of section 30D(g) apply for purposes of section 25E. Section 13402(e)(2) of the IRA provides that the ability of a taxpayer to elect to transfer a section 25E credit under section 25E(f) applies to vehicles placed in service by the taxpayer after December 31, 2023.

Section 25E(g) provides that no section 25E credit is allowed with respect to a vehicle acquired after December 31, 2032.

II. Section 30D

A. In General

Section 30D(a) provides a credit (section 30D credit) with respect to each new clean vehicle that a taxpayer purchases and places in service. The credit is determined and allowable with respect to the taxable year in which the taxpayer places the new clean vehicle in service.

Section 30D was originally enacted by section 205(a) of the Energy Improvement and Extension Act of 2008, Division B of Public Law 110–343, 122 Stat. 3765, 3835 (October 3, 2008), to provide a credit for the purchase and placing in service of new qualified plug-in electric drive motor vehicles. Section 30D has been amended several times

since its enactment, most recently by section 13401 of the IRA.

The amount of the section 30D credit is treated as a personal credit or a general business credit, depending on the character of the vehicle. In general, the section 30D credit is treated as a personal credit allowable under subpart A of the Code. Section 30D(c)(2). However, the amount of the section 30D credit that is attributable to property that is of a character subject to an allowance for depreciation is treated as a current year business credit under section 38(b) instead of being allowed under section 30D(a). Section 30D(c)(1). Section 38(b)(30) lists as a current year business credit the portion of the section 30D credit to which section 30D(c)(1) applies. The IRA did not amend section 30D(c)(1) or (2).

B. IRA Amendments to Section 30D

1. Credit Amount and Critical Minerals and Battery Components Requirements

The IRA amends the rules for determining the amount of the section 30D credit. Prior to the amendments to section 30D made by section 13401(a) and (e) of the IRA, the amount of the section 30D credit was calculated based on the vehicle's battery capacity. The base amount was $2,500, plus $417 for a battery with a capacity of at least 5 kilowatt hours, and an additional $417 for each kilowatt hour of capacity in excess of 5 kilowatt hours, up to a maximum credit of $7,500 per vehicle. Section 13401(a) of the IRA amends section 30D(b) to provide a maximum credit of $7,500 per vehicle, consisting of $3,750 in the case of a vehicle that meets certain requirements relating to critical minerals and $3,750 in the case of a vehicle that meets certain requirements relating to battery components. The amendments made by section 13401(a) of the IRA apply to vehicles placed in service after the date on which the Secretary of the Treasury or her delegate (Secretary) issues proposed guidance described in new section 30D(e)(3)(B) of the Code relating to the new critical minerals requirements described in new section 30D(e)(1)(A) (Critical Minerals Requirement) and the new battery components requirements described in new section 30D(e)(2)(A) (Battery Components Requirement). *See* section 13401(k)(3) of the IRA.

New section 30D(e)(1)(A) provides that the Critical Minerals Requirement with respect to the battery from which the electric motor of a vehicle draws electricity is satisfied if the percentage of the value of the applicable critical minerals (as defined in section 45X(c)(6) of the Code) contained in such battery that were (i) extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or (ii) recycled in North America, is equal to or greater than the applicable percentage (as certified by the qualified manufacturer, in such form or manner as prescribed by the Secretary). The applicable percentage for the Critical Minerals Requirement is set forth in section 30D(e)(1)(B)(i) through (v), and varies based on when the vehicle is placed in service. In the case of a vehicle placed in service after the date of issuance of the proposed guidance described in new section 30D(e)(3)(B) and before January 1, 2024, the applicable percentage is 40 percent. In the case of a vehicle placed in service during calendar year 2024, 2025, and 2026, the applicable percentage is 50 percent, 60 percent, and 70 percent, respectively. In the case of a vehicle placed in service after December 31, 2026, the applicable percentage is 80 percent.

New section 30D(e)(2)(A) provides that the Battery Components Requirement with respect to the battery from which the electric motor of a vehicle draws electricity is satisfied if the percentage of the value of the components contained in such battery that were manufactured or assembled in North America is equal to or greater than the applicable percentage (as certified by the qualified manufacturer, in such form or manner as prescribed by the Secretary). The applicable percentage for the Battery Components Requirement is set forth in section 30D(e)(2)(B)(i) through (vi) and varies based on when the vehicle is placed in service. In the case of a vehicle placed in service after the date of issuance of the proposed guidance described in new section 30D(e)(3)(B) of the Code and before January 1, 2024, the applicable percentage is 50 percent. In the case of a vehicle placed in service during calendar year 2024 or 2025, the applicable percentage is 60 percent. In the case of a vehicle placed in service during calendar year 2026, 2027, and 2028, the applicable percentage is 70 percent, 80 percent, and 90 percent, respectively. In the case of a vehicle placed in service after December 31, 2028, the applicable percentage is 100 percent.

2. New Clean Vehicle Definition

Section 13401(c) of the IRA amends section 30D(d) of the Code by making the credit applicable to ''new clean vehicles,'' instead of ''new qualified plug-in electric drive motor vehicles.'' This amendment is applicable to vehicles placed in service after December 31, 2022. As amended by section 13401(c) and (g)(2) of the IRA, section 30D(d)(1) of the Code defines a ''new clean vehicle'' as a motor vehicle that satisfies the eight requirements set forth in section 30D(d)(1)(A) through (H) of the Code: the original use of the motor vehicle must commence with the taxpayer; the motor vehicle must be acquired for use or lease by the taxpayer and not for resale; the motor vehicle must be made by a qualified manufacturer; the motor vehicle must be treated as a motor vehicle for purposes of title II of the Clean Air Act; the motor vehicle must have a gross vehicle weight rating of less than 14,000 pounds; the motor vehicle must be propelled to a significant extent by an electric motor that draws electricity from a battery that has a capacity of not less than 7 kilowatt hours, and is capable of being recharged from an external source of electricity; the final assembly of the motor vehicle must occur within North America; and the person who sells any vehicle to the taxpayer must furnish a report to the taxpayer and to the Secretary, at such time and in such manner as the Secretary provides, containing specifically enumerated items.

With respect to the requirement that the motor vehicle must be made by a qualified manufacturer, the IRA creates new requirements for manufacturers of vehicles eligible for the section 30D credit that are applicable to vehicles placed in service after December 31, 2022. As amended by section 13401(c) of the IRA, section 30D(d)(3) of the Code defines a ''qualified manufacturer'' as any manufacturer (within the meaning of the regulations prescribed by the Administrator of the Environmental Protection Agency (EPA) for purposes of the administration of title II of the Clean Air Act (42 U.S.C. 7521 *et seq.*)) that enters into a written agreement with the Secretary under which such manufacturer agrees to make periodic written reports to the Secretary (at such times and in such manner as the Secretary may provide) providing vehicle identification numbers and such other information related to each vehicle manufactured by such manufacturer as the Secretary may require.

The IRA requires new clean vehicles to undergo final assembly in North America to be eligible for the section 30D credit. This requirement is applicable to vehicles sold after August 16, 2022. *See* section 13401(k)(2) of the IRA. New section 30D(d)(5) defines ''final assembly'' as the process by which a manufacturer produces a new

clean vehicle at, or through the use of, a plant, factory, or other place from which the vehicle is delivered to a dealer or importer with all component parts necessary for the mechanical operation of the vehicle included with the vehicle, whether or not the component parts are permanently installed in or on the vehicle.

The IRA provides that certain fuel cell vehicles may qualify for the section 30D credit. Section 13401(c) of the IRA adds new section 30D(d)(6) to the Code, which includes in the definition of the term ''new clean vehicle'' applicable to vehicles placed in service after December 31, 2022, any ''new qualified fuel cell motor vehicle'' (as defined in section 30B(b)(3)) that meets the requirements under section 30D(d)(1)(G) and (H) (North American final assembly and seller reporting requirements).

The IRA disqualifies certain vehicles from the section 30D credit if the battery of the vehicle contains critical minerals or battery components from a foreign entity of concern (FEOC). As amended by section 13401(e) of the IRA, section 30D(d)(7) of the Code excludes, after certain specified dates, vehicles placed in service with batteries containing certain critical minerals or battery components from a FEOC from the definition of the term ''new clean vehicle.'' In particular, amended section 30D(d)(7) (FEOC Restriction) provides that the term ''new clean vehicle'' does not include (A) any vehicle placed in service after December 31, 2024, with respect to which any of the applicable critical minerals contained in the battery of such vehicle (as described in section 30D(e)(1)(A)) were extracted, processed, or recycled by a FEOC (as defined in section 40207(a)(5) of the Infrastructure Investment and Jobs Act (42 U.S.C. 18741(a)(5))), or (B) any vehicle placed in service after December 31, 2023, with respect to which any of the components contained in the battery of such vehicle (as described in section 30D(e)(2)(A)) were manufactured or assembled by a FEOC (as so defined).

3. Elimination of Phaseout

The IRA eliminates the phaseout of the section 30D credit for vehicles made by manufacturers that have sold at least 200,000 vehicles eligible for the credit for use in the United States after December 31, 2009. Pursuant to section 13401(d) of the IRA this limitation does not apply to vehicles sold after December 31, 2022. *See* section 13401(k)(5) of the IRA.

4. Special Rules

The IRA adds four new special rules under section 30D(f) applicable to vehicles placed in service after December 31, 2022. First, section 30D(f)(8) permits only one section 30D credit to be claimed for each VIN. Second, section 30D(f)(9) requires taxpayers to include on the taxpayer's return for the taxable year the VIN of the vehicle for which the section 30D credit is claimed.

Third, section 30D(f)(10) denies the section 30D credit to certain high-income taxpayers. More specifically, section 30D(f)(10)(A) provides that no credit is allowed for any taxable year if (i) the lesser of (I) the Modified AGI of the taxpayer for such taxable year, or (II) the Modified AGI of the taxpayer for the preceding taxable year, exceeds (ii) the threshold amount. New section 30D(f)(10)(B) provides that the threshold amount is: (i) in the case of a joint return or a surviving spouse (as defined in section 2(a) of the Code), $300,000, (ii) in the case of a head of household (as defined in section 2(b) of the Code), $225,000, and (iii) in the case of any other taxpayer, $150,000. New section 30D(f)(10)(C) defines Modified AGI as AGI increased by any amount excluded from gross income under sections 911, 931, or 933.

Fourth, section 30D(f)(11) excludes from the section 30D credit vehicles that exceed certain manufacturer's suggested retail price (MSRP) thresholds. New section 30D(f)(11)(A) provides that no credit is allowed for a vehicle if the MSRP of the vehicle exceeds the applicable limitation. New section 30D(f)(11)(B) provides that the applicable limitation for each vehicle classification is as follows: in the case of a van, $80,000; in the case of a sport utility vehicle, $80,000; in the case of a pickup truck, $80,000; and in the case of any other vehicle, $55,000. New section 30D(f)(11)(C) authorizes the Secretary to prescribe such regulations or other guidance as the Secretary determines necessary to determine vehicle classifications using criteria similar to that employed by the EPA and the Department of the Energy (DOE) to determine size and class of vehicles.

5. Transfer of Credit

The IRA added new section 30D(g) to the Code, which allows the taxpayer to elect to transfer the section 30D credit in certain situations for vehicles placed in service after December 31, 2023.

Section 30D(g)(1) provides that subject to such regulations or other guidance as the Secretary determines necessary, a taxpayer may elect to transfer a section 30D credit with respect to a new clean vehicle to an eligible entity (credit transfer election).[1] If the taxpayer who acquires a new clean vehicle makes a credit transfer election under section 30D(g) with respect to such vehicle, the section 30D credit that would otherwise be allowed to such taxpayer with respect to such vehicle is allowed to the eligible entity specified in such election (and not the taxpayer).

Section 30D(g)(2) defines an ''eligible entity'' with respect to the vehicle for which the section 30D credit is allowed as the dealer that sold such vehicle to the taxpayer and that satisfies the following four requirements set forth in section 30D(g)(2)(A) through (D): (i) the dealer, subject to section 30D(g)(4), must be registered with the Secretary for purposes of section 30D(g)(2), at such time, and in such form and manner, as the Secretary prescribes; (ii) the dealer, prior to the credit transfer election and not later than at the time of sale, must have disclosed to the taxpayer purchasing such vehicle the manufacturer's suggested retail price, the value of the section 30D credit allowed and any other incentive available for the purchase of such vehicle, and the amount provided by the dealer to such taxpayer as a condition of the credit transfer election; (iii) the dealer, not later than at the time of sale, must have paid the taxpayer (whether in cash or in the form of a partial payment or down payment for the purchase of such vehicle) an amount equal to the credit otherwise allowable to such taxpayer; and (iv) the dealer with respect to any incentive otherwise available for the purchase of a vehicle for which a section 30D credit is allowed, including any incentive in the form of a rebate or discount provided by the dealer or manufacturer, must have ensured that the availability or use of such incentive does not limit the ability of a taxpayer to make a credit transfer election, and such election does not limit the value or use of such incentive.

Section 30D(g)(3) addresses the timing of the transfer and provides that any credit transfer election cannot be made by the taxpayer any later than the date on which the vehicle for which the section 30D credit is allowed is purchased.

[1] As discussed in section VIII of this Background section, on October 10, 2023, the Treasury Department and the IRS published a notice of proposed rulemaking (REG–113064–23) in the **Federal Register** (88 FR 70310), that referred to this election as the ''vehicle transfer election.'' However, ''credit transfer election'' is a more descriptive and appropriate term, so these final regulations adopt the defined term ''credit transfer election'' to refer to the election by a taxpayer to transfer a section 25E or section 30D credit to an eligible entity.

Section 30D(g)(4) provides that upon determination by the Secretary that a dealer has failed to comply with the requirements described in section 30D(g)(2), the Secretary may revoke the dealer's registration.

Section 30D(g)(5) provides that with respect to any payment described in section 30D(g)(2)(C), such payment is not includible in the gross income of the taxpayer and is not deductible with respect to the dealer.

Section 30D(g)(6) addresses the application of certain other requirements to the transfer of credit and provides that in the case of any credit transfer election with respect to any vehicle: (i) the basis reduction and no double benefit requirements of section 30D(f)(1) and (2) apply to the taxpayer who acquired the vehicle in the same manner as if the section 30D credit determined with respect to such vehicle were allowed to such taxpayer; (ii) the election in section 30D(f)(6) to not take the section 30D credit does not apply; and (iii) the VIN requirement of section 30D(f)(9) is treated as satisfied if the eligible entity provides the VIN of such vehicle to the Secretary in such manner as the Secretary may provide.

Section 30D(g)(7)(A) provides for the establishment of a program to make advance payments to eligible entities in an amount equal to the cumulative amount of the credits allowed with respect to any vehicles sold by such entity for which a credit transfer election described in section 30D(g)(1) has been made. Section 30D(g)(7)(B) provides that rules similar to the rules of section 6417(d)(6) of the Code apply for purposes of the advance payment rules, and section 30D(g)(7)(C) provides that for purposes of 31 U.S.C. 1324, the payments under section 30D(g)(7)(A) are treated in the same manner as a refund due from a credit provision referred to in 31 U.S.C. 1324(b)(2).

Section 30D(g)(8) defines the term ''dealer'' as a person licensed by a State, the District of Columbia, the Commonwealth of Puerto Rico, any other territory or possession of the United States, an Indian tribal government, or any Alaska Native Corporation (as defined in section 3 of the Alaska Native Claims Settlement Act (43 U.S.C. 1602(m)) to engage in the sale of vehicles. Section 30D(g)(9) defines an ''Indian tribal government'' as the recognized governing body of any Indian or Alaska Native tribe, band, nation, pueblo, village, community, component band, or component reservation, individually identified (including parenthetically) in the list published most recently as of the date of enactment of section 30D(g) (that is, August 16, 2022) pursuant to section 104 of the Federally Recognized Indian Tribe List Act of 1994 (25 U.S.C. 5131).

Section 30D(g)(10) provides that in the case of any taxpayer who has made a credit transfer election with respect to a new clean vehicle and received a payment from an eligible entity, if the section 30D credit would otherwise (but for section 30D(g)) not be allowable to such taxpayer pursuant to the application of the Modified AGI limitation of section 30D(f)(10), the income tax imposed on such taxpayer under chapter 1 of the Code for the taxable year in which such vehicle was placed in service must be increased by the amount of the payment received by such taxpayer.

Section 13401(k)(4) of the IRA provides that the ability for a taxpayer to elect to transfer a section 30D credit under section 30D(g) applies to vehicles placed in service after December 31, 2023.

6. Termination

The IRA added new section 30D(h) to the Code, which provides that no credit is allowed with respect to any vehicle placed in service after December 31, 2032.

III. Section 45W

Section 13403(a) of the IRA added section 45W to the Code, which is effective for vehicles acquired after December 31, 2022, and before January 1, 2033. A taxpayer can claim a section 45W credit for purchasing and placing in service a qualified commercial clean vehicle, as defined in section 45W(c), during the taxable year. Section 45W(e) provides that no section 45W credit is allowed with respect to any vehicle unless the taxpayer includes the VIN of such vehicle on the tax return for the taxable year.

IV. Section 6213(g)(2)

Section 6213(b)(1) authorizes the IRS to make certain assessments of mathematical or clerical errors without first issuing a notice of deficiency under section 6213(a). Section 13401(i)(4) of the IRA amended section 6213(g)(2) to provide the IRS with math error authority for the omission of a correct VIN required under sections 25E(d), 30D(f)(9), and 45W(e) to be included on a return. *See* section 6213(g)(2)(T)-(V).

V. Notice 2022–46

On October 24, 2022, the Treasury Department and the IRS published Notice 2022–46, 2022–43 I.R.B. 306. The notice requested general comments on issues arising under sections 25E and 30D. Regarding section 30D, the notice requested specific comments concerning: (1) definitions; (2) critical minerals; (3) battery components; (4) applicable values; (5) FEOCs; (6) recordkeeping and reporting; (7) tax-exempt entities; (8) registered dealers and eligible entities; (9) the final assembly requirement; (10) vehicle classifications; (11) elections to transfer and advance payments; and (12) recapture. Regarding section 25E, the notice requested specific comments concerning: (1) qualification as a ''previously-owned clean vehicle''; (2) the rules of section 30D(f) that should be applied under section 25E(e); (3) the rules of section 30D(g) that should be applied under section 25E; and (4) terms that may require definitions or further guidance. Stakeholders submitted more than 800 comments in response to Notice 2022–46. Those comments informed the development of the notices of proposed rulemaking relating to sections 25E and 30D discussed in section VII of this Background section.

VI. Revenue Procedures

On December 27, 2022, the Treasury Department and the IRS published Revenue Procedure 2022–42, 2022–52 I.R.B. 565, which sets forth the procedures under section 30D(d)(3) for qualified manufacturers to enter into a written agreement with the Secretary under which such manufacturer agrees to make periodic written reports to the Secretary providing VINs and such other information related to each vehicle manufactured by such manufacturer as the Secretary may require. The revenue procedure also provides the procedures for persons selling vehicles to report the information required to be reported to the IRS in order for such vehicles to be eligible for the section 25E credit or the section 30D credit.

On October 23, 2023, the Treasury Department and the IRS published Revenue Procedure 2023–33, 2023–43 I.R.B. 1135. The revenue procedure sets forth the procedures under sections 25E(f) and 30D(g) for the transfer of the section 25E credit and the 30D credit from the taxpayer to an eligible entity. In addition, the revenue procedure supersedes certain provisions of Rev. Proc. 2022–42.

On December 18, 2023, the Treasury Department and the IRS published Revenue Procedure 2023–38, 2023–51 I.R.B. 1544. The revenue procedure provides procedural rules for qualified manufacturers of new clean vehicles to comply with the reporting, certification, and attestation requirements regarding the excluded entity restriction, under which the IRS, with analytical

assistance from the DOE, will review compliance with the excluded entity restrictions. In addition, Rev. Proc. 2023–38 updates and consolidates the procedural rules for qualified manufacturers with respect to the section 25E credit, the section 30D credit, and the qualified commercial clean vehicle credit under section 45W. The revenue procedure supersedes certain provisions of Rev. Proc. 2022–42 and Rev. Proc. 2023–33.

On February 26, 2024, the Treasury Department and the IRS published Revenue Procedure 2024–12, 2024–9 I.R.B. 677. The revenue procedure provides a temporary extension of time to submit seller reports to the IRS under the procedures set out in Rev. Proc. 2022–42 and Rev. Proc. 2023–33 for the transfer of section 25E credits and 30D credits.

VII. Notice 2023–1, Notice 2023–16, and 30D White Paper

On January 17, 2023, the Treasury Department and the IRS published Notice 2023–1, 2023–3 I.R.B. 373, which describes definitions for certain terms in section 30D that the Treasury Department and the IRS intended to include in proposed regulations.

The Treasury Department also released a white paper on the anticipated direction of the proposed guidance on the Critical Minerals Requirement and Battery Components Requirement and the process for determining whether vehicles qualify under these requirements, as of December 29, 2022. *See* ''Anticipated Direction of Forthcoming Proposed Guidance on Critical Mineral and Battery Component Value Calculations for the New Clean Vehicle Credit,'' Dec. 29, 2022, *https://home.treasury.gov/system/files/136/30DWhite-Paper.pdf* (last accessed March 16, 2024).

On February 21, 2023, the Treasury Department and the IRS published Notice 2023–16, 2023–8 I.R.B. 479, which modifies Notice 2023–1 by revising the vehicle classification standard that the Treasury Department and the IRS intended to provide in proposed regulations.

VIII. Notices of Proposed Rulemaking

On April 17, 2023, the Treasury Department and the IRS published a notice of proposed rulemaking (REG–120080–22) in the **Federal Register** (88 FR 23370), containing proposed regulations under section 30D (April Proposed Regulations). The April Proposed Regulations provided proposed definitions for certain terms related to section 30D; proposed rules regarding personal and business use of new clean vehicles and other special rules; and additional proposed rules related to the Critical Minerals and Battery Components Requirements of section 30D(e) in proposed § 1.30D–3.

On October 10, 2023, the Treasury Department and the IRS published a notice of proposed rulemaking (REG–113064–23) in the **Federal Register** (88 FR 70310), which provided proposed guidance for elections to transfer clean vehicle credits under sections 25E(f) and 30D(g) (October Proposed Regulations). The October Proposed Regulations provided proposed guidance for taxpayers intending to transfer the section 25E credit and the section 30D credit to dealers that are entities eligible to receive advance payments of such credits. The October Proposed Regulations also provided proposed guidance for how dealers become eligible entities to receive advance payments of the section 25E credit and the section 30D credit. In addition, the October Proposed Regulations provided proposed guidance regarding basic and definitional provisions in for section 25E, recapture of the section 25E and section 30D credits, and math error authority under section 6213.

On December 4, 2023, the Treasury Department and the IRS published a notice of proposed rulemaking (REG–118492–23) in the **Federal Register** (88 FR 84098), which provided guidance regarding the excluded entities limitation of section 30D(d)(7) (December Proposed Regulations). The December Proposed Regulations provided proposed definitions and proposed rules for qualified manufacturers of vehicles to determine eligibility for the section 30D clean vehicle credit regarding the excluded entity restrictions, under which vehicles placed in service beginning in 2024 are not eligible if the battery contains battery components manufactured or assembled by a FEOC, and vehicles placed in service beginning in 2025 are not eligible if the battery contains applicable critical minerals extracted, processed, or recycled by a FEOC.

IX. Department of Energy Guidance

Concurrently with the release of the December Proposed Regulations, the DOE released proposed guidance in the **Federal Register**, which provides proposed interpretations of certain terms used in the definition of FEOC set forth in section 40207(a)(5) of the Infrastructure Investment and Jobs Act (IIJA), and as cross-referenced in section 30D(d)(7). Concurrently with the release of these final regulations, the DOE is releasing final regulations under section 40207(a)(5) of the IIJA.

Section 40207(a)(5) of the IIJA defines FEOC to include foreign entities covered by specific designations, inclusions, and allegations by Federal agencies as described in section 40207(a)(5)(A), (B), and (D), as well as foreign entities ''owned by, controlled by, or subject to the jurisdiction or direction of a government'' of a covered nation under section 40207(a)(5)(C). Covered nations are defined in 10 U.S.C. 4872(d)(2) as the People's Republic of China, the Russian Federation, the Democratic People's Republic of Korea, and the Islamic Republic of Iran, as of the date of publication of the these final regulations and the DOE final guidance. Finally, section 40207(a)(5)(E) of the IIJA provides that a FEOC includes a foreign entity that the Secretary of Energy, in consultation with the Secretary of Defense and the Director of National Intelligence, determines is engaged in unauthorized conduct that is detrimental to the national security or foreign policy of the United States. The DOE final guidance provides an interpretation of section 40207(a)(5)(C) of the IIJA. In particular, the DOE final guidance provides definitions for the terms ''government of a foreign country,'' ''foreign entity,'' ''subject to the jurisdiction,'' and ''owned by, controlled by, or subject to the direction of.'' In general, an entity incorporated in, headquartered in, or performing the relevant activities in a covered nation would be classified as a FEOC. For purposes of these rules, an entity would be ''owned by, controlled by, or subject to the direction'' of another entity if 25 percent or more of the entity's board seats, voting rights, or equity interest are cumulatively held by such other entity. In addition, licensing agreements or other contractual agreements may also create control. Finally, ''government of a foreign country'' is defined to include subnational governments and certain current or former senior foreign political figures.

Summary of Comments and Explanation of Revisions

The Treasury Department and the IRS received over 180 written and electronic comments in response to the April Proposed Regulations, the October Proposed Regulations, and the December Proposed Regulations (collectively, the proposed regulations). A public hearing on the proposed regulations was held on January 31, 2024. Copies of written comments and the list of speakers at the public hearing are available at *https://www.regulations.gov* or upon request.

After full consideration of the comments received on the proposed regulations and the testimony presented at the public hearing, this Treasury Decision adopts the proposed regulations with clarifying changes and additional modifications in response to the comments and testimony as described in this Summary of Comments and Explanation of Revisions.

Unless otherwise indicated in this Summary of Comments and Explanation of Revisions, provisions of the proposed regulations for which no comments were received are adopted without substantive change. Comments that merely summarize the proposed regulations, recommend statutory revisions to section 25E, section 30D, or other statutes, address issues that are outside the scope of this rulemaking (such as proposed changes to other guidance), or recommend changes to IRS forms, are beyond the scope of these regulations and are not adopted. In addition, comments that relate to the revenue procedures or notices described in section VI and VII of this Background section are beyond the scope of these regulations and are not adopted. The final regulations include non-substantive modifications, including modifications that promote consistency across definitions, rules, and examples, rearrange provisions, and improve the overall clarity of the guidance. Such modifications are not addressed in the Summary of Comments and Explanation of Revisions.

Section I of this Summary of Comments and Explanation of Revisions addresses the comments and revisions applicable only to section 25E. Section II of this Summary of Comments and Explanation of Revisions addresses the comments and revisions applicable to both section 25E and section 30D. Section III of this Summary of Comments and Explanation of Revisions addresses the comments and revisions applicable only to section 30D. Section IV of this Summary of Comments and Explanation of Revisions addresses the comments and revisions applicable to section 6213. Section V of this Summary of Comments and Explanation of Revisions addresses the applicability dates of these final regulations.

I. Section 25E Credit

A. Definitions

1. Previously-Owned Clean Vehicle

Proposed § 1.25E–1(b)(5) defined the term ''previously-owned clean vehicle'' by reference to the statutory definition provided in section 25E(c)(1). A commenter noted that the proposed definition of ''previously-owned clean vehicle'' does not address whether a previously-owned vehicle purchased from a dealership would be eligible for the section 25E credit. Another commenter requested that the Treasury Department and the IRS provide a definition of ''vehicle.''

Section 25E(c)(1) provides a definition of ''previously-owned clean vehicle'' and criteria to be considered a ''motor vehicle.'' Section 25E(c)(4) defines ''motor vehicle'' by reference to section 30D(d)(2), which defines that term as any vehicle that is manufactured primarily for use on public streets, roads, and highways (not including a vehicle operated exclusively on a rail or rails) and that has at least four wheels. Further, section 25E(c)(2) defines ''qualified sale'' in part, as a sale of a motor vehicle by the dealer. Under the plain language of section 25E, a sale of a previously-owned clean vehicle by a dealer is eligible for the section 25E credit, provided the other requirements of section 25E are satisfied. Accordingly, the final regulations do not adopt these comments.

The final regulations clarify that vehicles that may qualify as previously-owned clean vehicles include battery electric vehicles, plug-in hybrid electric vehicles, fuel cell motor vehicles, and plug-in hybrid fuel cell motor vehicles.

2. Qualified Sale

i. Motor Vehicle Reference and Price Cap

Section 25E(c)(2) defines ''qualified sale'' as a sale of a motor vehicle by a dealer (as defined in section 30D(g)(8)), for a sale price that does not exceed $25,000, and that is the first transfer since August 16, 2022 (the date of enactment of section 25E), to a qualified buyer other than the person with whom the original use of such vehicle commenced. Proposed § 1.25E–1(b)(8)(i) tracked the statutory definition.

A commenter recommended that the final regulations substitute ''previously-owned clean vehicle'' for ''motor vehicle'' in the definition of ''qualified sale'' in proposed § 1.25E–1(b)(8)(i). In addition, multiple commenters requested changes to the $25,000 maximum sale price amount in the definition of ''qualified sale.''

Section 25E(c)(2) uses the term ''motor vehicle'' in the definition of ''qualified sale.'' In order to maintain consistency with the statutory definition of ''qualified sale,'' the final regulations do not adopt this comment. With regard to the comments suggesting a change to the sale price limitation, section 25E(c)(2)(B) provides that the sale price may not exceed $25,000. Because the $25,000 sale price limitation is statutory, the final regulations do not adopt this comment.

ii. First Transfer Rule

Proposed § 1.25E–1(b)(8)(ii) provided that to be a qualified sale, a transfer must be the first transfer since August 16, 2022, as shown by vehicle history, of a previously-owned clean vehicle after the sale to the person with whom the original use of such vehicle commenced. The proposed regulation further provided that the taxpayer may rely on the dealer's provision of the vehicle history in determining whether the first transfer rule is satisfied.

A commenter recommended that the final regulations change the term ''vehicle history'' to ''vehicle history report'' in proposed § 1.25E–1(b)(8)(ii) and define ''vehicle history report'' as a report ''issued by an approved provider at *www.vehiclehistory.bja/ojp.gov/nmvtis_vehiclehistory*.'' The website recommended by the commenter provides a list of National Motor Vehicle Title Information System (NMVTIS) approved data providers. This website is maintained by the Department of Justice. The commenter further suggested removing the dealer limitation from the last sentence of proposed § 1.25E–1(b)(8)(ii) and tying the vehicle history report to the time of sale.

Proposed § 1.25E–1(b)(8)(ii) identified ''vehicle history'' as the mechanism for verifying whether a transfer is the first transfer of the vehicle for purposes of the qualified sale definition. The Treasury Department and the IRS agree that substituting the term ''vehicle history report'' for ''vehicle history'' adds clarity to the rule. The Treasury Department and the IRS further agree that requiring the taxpayer to obtain the vehicle history report from the dealer is overly restrictive, and that the vehicle history report should be obtained at the time of sale or as part of the sale transaction in order to satisfy the first transfer rule. Accordingly, the final regulations adopt these comments. Further, the Treasury Department and the IRS have determined that vehicle history reports issued by NMVTIS-approved data providers may be used to verify whether a transfer is the first transfer of the vehicle. However, the Treasury Department and the IRS lack sufficient information to determine whether limiting vehicle history reports to those issued by NMVTIS-approved data providers would place an undue burden on taxpayers. As a result, the final regulations adopt the comment, in part, by adding a definition of ''vehicle

history report'' and clarifying that the term includes reports from NMVTIS-approved data providers.

Another commenter expressed concern that the proposed first transfer rule is more restrictive than the statutory language and could severely limit the applicability of the section 25E credit. The commenter suggested that the most straightforward way to determine if a car had previously been sold to a qualified buyer would be to exclude vehicles for which a credit under 25E had previously been claimed. The commenter recommended that the final regulations allow one section 25E credit per VIN (regardless of whether the credit is claimed with respect to the first transfer since August 16, 2022, or the first transfer to a qualified buyer) in place of the proposed first transfer rule.

One of the statutory requirements to be a qualified sale is that the sale be the first transfer to a qualified buyer since the enactment of section 25E, other than to the person with whom the original use of the vehicle commenced. The commenter's suggestion that the final regulations adopt a one section 25E credit per VIN rule is inconsistent with the statutory language and Congressional intent, because it would allow a transfer to a second qualified buyer to be eligible for the credit in situations where the first qualified buyer did not claim the section 25E credit or was not eligible to claim the credit (for example, if the first qualified buyer's MAGI exceeds the limitation). Further, the commenter's suggestion, if adopted, would be unadministrable because taxpayers have no way of verifying whether a section 25E credit has previously been claimed with respect to a prior sale of a particular vehicle. Such information is not part of a vehicle history report and is otherwise inaccessible to taxpayers. While the IRS has that information, it cannot share that information without violating the taxpayer confidentiality restrictions in section 6103. As a result, taxpayers making purchasing decisions would not know which previously sold vehicles were eligible for the section 25E credit in advance of their vehicle purchase, which would disincentivize the purchase of previously-owned clean vehicles. Accordingly, the final regulations do not adopt this comment.

As for the commenter's concern that the proposed first transfer rule is more restrictive than the statutory language, the first transfer rule is consistent with how Congress expected the statute to operate [2] and is necessary to protect confidential taxpayer information consistent with section 6103. Once there has been a sale of a previously-owned clean vehicle, there is no information source from which a subsequent buyer could ascertain or verify whether the prior sale was to a qualified buyer. For example, vehicle history reports do not include information as to whether a previous buyer was an individual, whether the previous buyer was a dependent, or whether the previous buyer had claimed the section 25E credit in the prior three years. As noted above, in cases where the previous buyer has claimed the section 25E credit, the IRS would have the information necessary to determine whether the prior transfer was to a qualified buyer, but such taxpayer information is protected from disclosure by statute, under section 6103. The first transfer rule, by allowing the section 25E credit to the first transfer after the date of enactment of 25E as determined by the vehicle's vehicle history report, provides certainty to buyers and dealers in a manner that is consistent with the taxpayer confidentiality mandates of section 6103. In addition, the proposed first transfer rule is consistent with Congressional intent to incentivize the deployment of clean vehicles.

The final regulations thus adopt the proposed first transfer rule without substantive change. As noted earlier, the first transfer rule is an element of the definition of ''qualified sale.'' The final regulations merge proposed § 1.25E–1(b)(8)(i) and (ii) and finalize the definition of ''qualified sale'' as § 1.25E–1(b)(14). Further, the final regulations move the language regarding taxpayer reliance on the vehicle history report from the definition of ''qualified sale'' to a standalone rule in § 1.25E–1(f), and clarify that reliance on a vehicle history report applies in the case where there has been a prior sale and return or resale described in § 1.25E–2(c). For additional clarity, the final regulations add an example that illustrates how the first transfer rule works in the context of dealer-to-dealer transfers.

3. Sale Price

Section 25E(a)(2) and (c)(2)(B) provide that the sale price of a previously-owned clean vehicle is taken into account for purposes of determining the amount of the section 25E credit and whether a particular sale is a qualified sale of the vehicle. Proposed § 1.25E–1(b)(9) defined the ''sale price'' of a previously-owned clean vehicle as the total sale price agreed upon by the buyer and dealer in a written contract at the time of sale, including any delivery charges and after the application of any incentives, but excluding separately-stated taxes and fees required by law. Under the proposed definition, the sale price of a previously-owned clean vehicle was determined before the application of any trade-in value. Proposed § 1.25E–1(b)(2) provided that for purposes of the definition of ''sale price,'' the term ''incentive'' means any reduction in total sale price offered to and accepted by a taxpayer from the dealer or manufacturer, other than a reduction, whether in the form of a partial payment or down payment for the purchase of a previously-owned clean vehicle or otherwise, pursuant to section 25E(f) and § 1.25E–3.

One commenter requested clarification regarding the term ''incentives,'' noting that manufacturer and distributor rebates and incentives are typically not available for previously-owned vehicles. The commenter did not reference the proposed definition of ''incentive'' in its comment letter. The proposed definition addresses the commenter's concern by broadly defining ''incentive'' to include reductions in price by manufacturers and dealers. In other words, the proposed definition does not limit incentives to price reductions provided by manufacturers and distributors. Therefore, no clarification is needed. However, because the term ''incentive'' is relevant to both sale price determinations for purposes the $25,000 sale price cap in section 25E(c)(2)(B) and the eligible entity definition in section 30D(g)(2)(B)(ii) and (D), the final regulations include separate definitions of ''incentive'' that apply to those provisions. In addition, with regard to the definition of ''incentive'' for purposes of sale price determinations, the final regulations clarify that an ''incentive'' means any reduction in price offered to and accepted by a taxpayer from the dealer or manufacturer. This clarification is necessary because the proposed definition only looked to incentives available to taxpayers from the dealer or manufacturer, which could disadvantage consumers by artificially lowering the $25,000 sale price cap in cases where the incentive was not accepted by the taxpayer.

Several commenters requested modifications to the proposed definition of ''sale price.'' Two commenters requested a narrower definition. Specifically, one commenter suggested that the proposed definition of sale

[2] See Joint Committee on Taxation, *General Explanation of Tax Legislation Enacted in the 117th Congress* (JCS–1–23), December 2023 at page 254.

price be amended so that fees and charges allowed by a state or locality, such as titling and registration charges for out-of-state buyers and charges associated with perfecting a lienholder's security interest, be excluded from the sale price because the amount of such fees is not easily knowable at the time of sale. Another commenter recommended modifying the proposed definition of ''sale price'' to exclude documentation fees because of long-standing practice in the automotive industry to charge such fees to cover a dealer's processing and administrative costs associated with a sale. The inclusion of dealer document fees and charges allowed by a state or locality in the sale price would allow dealers to allocate a portion of the sale price of the vehicle to such fees in order to avoid the $25,000 sale price cap in section 25E(c)(2)(B). Accordingly, the final regulations do not adopt these comments.

A commenter suggested the proposed definition of ''sale price'' be amended to include the total transaction amount, less any government-imposed taxes or fees, and including all add-ons and any non-government fees to prevent dealers from capturing a large portion of the credit as profit. The proposed definition already effectively does what the commenter suggests by excluding only separately-stated taxes and fees as required by law. Accordingly, the final regulations do not adopt this comment.

4. Other Definitions Applicable to Section 25E

The Treasury Department and the IRS received comments related to other definitions applicable to section 25E that are also applicable to section 30D. Section II of this Summary of Comments and Explanation of Revisions discusses comments received and modifications made to definitions applicable to both section 25E and section 30D.

B. Limitations Based on Modified AGI

The proposed regulations restated the Modified AGI limitation of section 25E(b) at proposed § 1.25E–1(b)(3) and (c)(1).

Several commenters suggested that the qualifying income threshold for the section 25E credit should be increased. Because these limitations are statutory, the final regulations do not adopt this comment.

C. Branded Title

Proposed § 1.25E–2(d) provided that a title to a previously-owned clean vehicle indicating that such vehicle has been damaged or is otherwise a branded title does not impact the vehicle's eligibility for a section 25E credit.

A commenter suggested that the section 25E credit program should not be used to incentivize consumers to purchase unsafe or unreliable vehicles, such as those that have been determined to be a total loss, salvage, or junk, and encouraged the Treasury Department and the IRS to consider making such vehicles ineligible for the section 25E credit. The commenter further suggested that title status reflected in the NMVTIS should be determinative because all states, insurance companies, and junk and salvage yards are required by law to regularly report information about vehicles that have been determined to be a total loss, salvage, or junk to NMVTIS.

Vehicle titles indicate whether the title is clean (meaning the vehicle has never been declared a total loss) or branded (indicating the vehicle has sustained serious damage, such as in the case of salvage title, or that there is some other significant problem with the vehicle, as in the case of a lemon title brand). State law generally governs the titling of vehicles. Each State and the District of Columbia has different standards for determining when a vehicle title must be branded. Further, although there are broad categories of title brands that are common across jurisdictions, such as salvage title, the thresholds for applying those title brands varies. These variations can lead to the practice of title washing, which is a method of removing a title brand by retitling the vehicle in a jurisdiction that does not recognize the title brand. The Treasury Department and the IRS do not want to incentivize the purchase of unsafe or unreliable vehicles. However, modifying proposed § 1.25E–2(d) to exclude certain title brands could lead to an increase in title washing, which, in turn, could lead to increased fraud regarding previously-owned vehicles. This would negatively impact consumers of previously-owned clean vehicles. Moreover, the statute does not exclude branded titles, and there is no indication that Congress intended to exclude such vehicles. Accordingly, the final regulations do not adopt these comments.

II. Crossover Provisions in Section 25E and Section 30D

A. Definitions

This section of the Summary of Comments and Explanation of Revisions addresses definitions that apply to both section 25E and section 30D. Unless otherwise specified, the final regulations move the definitions relating to section 30D from §§ 1.30D–2, 1.30D–3(c), 1.30D–5(a), and 1.30D–6(a) to § 1.30D–2(b).

1. Dealer

Section 25E(c)(2)(A) cross references section 30D(g)(8) with regard to the term ''dealer.'' Under section 30D(g)(8), the term ''dealer'' means a person licensed by a State, the District of Columbia, the Commonwealth of Puerto Rico, or any other territory or possession of the United States, an Indian tribal government, or any Alaska Native Corporation to engage in the sale of vehicles.

Proposed §§ 1.25E–1(b)(1) and 1.30D–5(a)(2) defined ''dealer'' as provided in section 30D(g)(8), except that the proposed term did not include persons licensed solely by a territory of the United States.[3] Under the proposed regulations, the term included a dealer licensed in any jurisdiction described in section 30D(g)(8) (other than one licensed solely by a territory of the United States) that makes sales at sites outside of the jurisdiction in which its licensed. The definition of dealer in the proposed regulations did not include persons licensed solely by a territory because clean vehicle credits generally are not allowed for vehicles used predominantly outside of the 50 States and the District of Columbia. *See* sections 30D(f)(4), 25E(e), 50(b)(1), and 7701(a)(9) of the Code.

A commenter suggested that the definition of ''dealer'' should include licensed dealers in territories or possessions of the United States, but only for purposes of vehicles sold for use and not for resale in the 50 states or the District of Columbia.

Such a rule would create verification issues for the IRS and place administrative burdens on certain dealers and purchasers of clean vehicles. At a minimum, buyers purchasing clean vehicles from dealers licensed in territories of the United States would be required to provide an attestation or certificate to the dealer indicating that the buyer intended to use the vehicle in the United States and not resell it. In addition, predominant use of the vehicle in a territory subsequent to such a statement of intent would make the vehicle ineligible for a clean vehicle credit. Pursuant to section 30D(g)(1), the Secretary has authority to prescribe necessary regulations with respect to that subsection. Accordingly, the final regulations do not adopt this comment.

[3] Section 30D(g)(8) uses the term ''territory or possession,'' but the proposed regulations and these final regulations use the term ''territory'' since both terms have the same meaning.

A separate comment requested guidance on the circumstances in which an original equipment manufacturer (OEM) is considered a ''dealer'' for purposes of section 30D(g)(8). In response to this comment, the Treasury Department and the IRS note that an OEM may be a dealer if licensed in any jurisdiction described in section 30D(g)(8) and §§ 1.25E–1(b) or 1.30D–2(b), as applicable.

2. Placed in Service

The year in which a vehicle is placed in service is relevant for a number of rules under section 25E and section 30D, including the applicable percentages for the Critical Minerals and Battery Components Requirements of section 30D(e) and the FEOC Restriction, which impose manufacturer sourcing requirements for the clean vehicle battery.

Proposed §§ 1.25E–1(b)(4) and 1.30D–2(e) provided that a vehicle is considered to be placed in service on the date the taxpayer takes possession of the vehicle. The proposed definition is consistent with the meaning of ''placed in service'' for purposes of other Code provisions. *See* § 1.46–3(d)(1)(ii) and (4)(i) and § 1.179–4(e) (property is considered placed in service when ''placed in a condition or state of readiness and availability for a specifically assigned function''); § 145.4051–1(c)(2) (''a vehicle shall be considered placed in service on the date on which the owner of the vehicle took actual possession of the vehicle''); *see also* § 1.1250–4(b)(2) (''property is placed in service on the date on which it is first used''); *Consumers Power Co.* v. *Commissioner,* 89 T.C. 710 (1987); *Noell* v. *Commissioner,* 66 T.C. 718, 728–729 (1976).

The proposed definition is also consistent with the IRS's and the Tax Court's interpretation of ''placed in service'' as used in section 30D(a), which was not amended by the IRA, and while not precedential or binding, reflects the prevailing view. *See e.g., Trout* v. *Comm'r of Internal Revenue,* T.C. Summ. Op. 2015–66, 2015 WL 7423818, at *4 (T.C. Nov. 19, 2015) (''[t]he Court will look at whether the vehicle was 'in a condition or state of readiness and availability' for the 'specifically assigned function' for which petitioners purchased it to determine when petitioners placed the [vehicle] in service.''); *Podraza* v. *Comm'r of Internal Revenue,* T.C. Summ. Op. 2015–67, 2015 WL 7423525 (T.C. Nov. 19, 2015) (same); IRS PLR 201312034 (Mar. 22, 2013) (''the taxable year in which the taxpayer may claim the credit on their return is defined as the year in which the vehicle is 'placed in service,' which requires that the taxpayer have actual possession of the vehicle. . .'').

The Treasury Department and the IRS received several comments regarding the definition of ''placed in service.'' One commenter suggested that for purposes of the section 30D credit, the definition of ''placed in service'' be modified to mean the date of vehicle manufacture. The commenter further noted that the proposed definition will cause significant confusion for consumers if the clean vehicle they want to buy is no longer credit-eligible because the vehicle was not placed in service at the correct time.

Several other commenters requested that ''placed in service'' be defined as the date of manufacture for purposes of the vehicle manufacturing requirements (specifically, the Critical Minerals and Battery Components Requirements and the FEOC Restriction) of section 30D. Another commenter raised concerns with the proposed definition of ''placed in service'' based on vehicle possession because some taxpayers: (1) may never take possession of the vehicle, such as cases involving leases and gifts, (2) may take possession before a vehicle is sold, (3) may take possession at the time a vehicle is sold, or (4) may take possession after a vehicle is sold, such as cases in which the taxpayer preorders a vehicle. The commenter recommended that the definition of ''placed in service'' be the date on which a vehicle is registered by a United States jurisdiction that administers on-road vehicle registration laws.

The final regulations adopt the definition in proposed §§ 1.25E–1(b)(4) and 1.30D–2(e), with minor clarifying changes, because the definition is consistent with existing guidance, as well as case law relating to when a vehicle is placed in service. Further, the Treasury Department and the IRS do not adopt a definition of ''placed in service'' for purposes of the Critical Minerals and Battery Components Requirements and the FEOC Restriction that differs from the definition for purposes of section 30D(a), because in cases in which the same term is used in a single section the term is presumed to have the same meaning throughout. *Mertens* v. *Hewitt Assocs.,* 508 U.S. 248, 260, 113 S.Ct. 2063, 124 L.Ed.2d 161 (1993). Accordingly, the final regulations do not adopt these comments.

3. Sale

The term ''sale'' is not defined in section 25E, section 30D, or the proposed regulations applicable to those sections. A commenter suggested that a definition of the term ''sale'' be added to the final regulations for purposes of sections 25E and 30D. The commenter recommended that the term ''sale'' be defined as ''an enforceable contract to transfer ownership of a vehicle from a dealer to a taxpayer.''

The term ''sale'' is relevant to the determination of whether there is a qualified sale for purposes of section 25E(c)(2) and the applicable recapture provisions under sections 25E and 30D. The commenter's proposed definition is overly broad and would not require that the transfer of ownership be made for consideration provided by the buyer. Further, section 25E(a) provides that the section 25E credit is only allowed for a qualified sale of a previously-owned clean vehicle. Section 25E(c)(2)(A) defines the term ''qualified sale,'' in part, as a sale by a dealer. Similarly, the credit transfer election framework incentivizes the purchase of previously-owned clean vehicles and new clean vehicles from dealers. Dealers have well-established practices with regard to vehicle sales and what constitutes a sale transaction. Based on the foregoing, the Treasury Department and the IRS have determined that a definition of ''sale'' is unnecessary. Accordingly, the final regulations do not adopt this comment.

B. Special Rules

1. Recapture

Section 25E(e) provides that, for purposes of section 25E, rules similar to the rules of section 30D(f) apply. Section 30D(f)(5) instructs the Secretary to provide regulations for recapturing the benefit of any section 30D credit with respect to any property that ceases to be eligible for the section 30D credit. Proposed §§ 1.25E–2(c) and 1.30D–4(d) provided corresponding rules under section 30D(f)(5) for cancelled sales, returns, and resales of the vehicle. The final regulations clarify that for purposes of section 30D(f)(5), and by extension, section 25E(e), the amount of the benefit recaptured due to such an event is considered an increase to tax imposed by chapter 1 of the Code.

i. Cancelled Sale

Proposed §§ 1.25E–2(c)(1)(i) and 1.30D–4(d)(1)(i) provided the Federal income tax consequences that apply if the sale of a vehicle between the taxpayer and seller is cancelled before the taxpayer places the vehicle in service (that is, before the taxpayer takes possession of the vehicle).

A commenter recommended that part of the definition of ''cancelled sale'' be changed from ''taxpayer places the

vehicle in service'' to ''the vehicle is placed in service.'' Section 25E(a) expressly requires the previously-owned clean vehicle to be placed in service by a qualified buyer. Similarly, section 30D(a) expressly requires the new clean vehicle to be placed in service by the taxpayer. Accordingly, the final regulations do not adopt this comment because a clean vehicle placed in service by someone other than the qualified buyer or taxpayer, as applicable, would not qualify for the credit.

ii. Vehicle Returns

Proposed §§ 1.25E–2(c)(1)(ii) and 1.30D–4(d)(1)(ii) addressed the Federal income tax consequences that apply if the taxpayer returns the vehicle to the seller within 30 days of placing the vehicle in service.

The Treasury Department and the IRS received multiple comments regarding the proposed vehicle return rules in proposed §§ 1.25E–2(c)(1)(ii) and 1.30D–4(d)(1)(ii). A commenter requested that the final regulations clarify that once a contract for the purchase of a clean vehicle is signed by the buyer and seller, the 30-day return period is for credit recapture purposes only and that state contract law governs whether the buyer can void the sale. One commenter agreed that 30 days is an appropriate length of time for qualified vehicle returns. Another commenter recommended deleting the 30-day limitation. That commenter also suggested changing ''of placing such vehicle in service'' to ''after it is placed in service'' and ''the vehicle history'' to ''a vehicle history report as of the date of such sale.'' In addition, a commenter recommended that, in general, the Treasury Department and the IRS regulate returns after the vehicle is registered.

Dealers generally have return policies that range from several days up to 30 days, so the proposed rules regarding returns within 30 days reflect industry practice. The final regulations maintain the 30-day return rule, with one modification. Specifically, the final regulations, for purposes of 25E, modify the reference to ''the vehicle history'' by changing it to ''a vehicle history report obtained on the date of such subsequent sale or as part of such subsequent sale transaction'' to conform with modifications to the definition of ''qualified sale'' described in section I.A.2 of this Summary of Comments and Explanation of Revisions. The final regulations also add a definition of ''vehicle history report'' and clarify that the term includes reports from NMVTIS-approved data providers. In addition, the Treasury Department and the IRS confirm that the vehicle return rules in the final regulations relate only to the section 25E and 30D credits and have no impact on the voidability of the sales contract for the clean vehicle, which is governed by state contract law. Otherwise, the final regulations do not adopt these comments.

2. Resales

Proposed §§ 1.25E–2(c)(1)(iii) and 1.30D–4(d)(1)(iii) treat the taxpayer as having purchased a clean vehicle with an intent to resell such vehicle if the resale occurs within 30 days of the taxpayer placing the vehicle in service.

A commenter noted that it largely agreed with the proposed resale rules, but suggested that for purposes of section 25E, the final regulations include an exception for subsequent sales by dealers that are unaware of prior resales as of the date of the subsequent sale. The commenter did not suggest an exception for purposes of section 30D resales given that a resale of a vehicle will render it used, thereby making the vehicle ineligible for the section 30D credit. The commenter also suggested changing ''placing the vehicle'' in service to ''it being placed'' in service. Another commenter stated that 30 days is an appropriate length of time for the resale rule.

The recapture rule in proposed § 1.25E–2(c)(1)(iii) did not address sales by dealers. Proposed § 1.25E–2(c)(1)(iii) addressed sales by individual buyers within 30 days and provided that recapture in the event of such resale is recaptured from the taxpayer, not the dealer. Accordingly, the final regulations retain the rules in proposed §§ 1.25E–2(c)(1)(iii) and 1.30D–4(d)(1)(iii) and do not adopt these comments.

3. Other Returns or Resales

Proposed §§ 1.25E–2(c)(1)(iv) and 1.30D–4(d)(iv) provided a rule for returns or resales occurring more than 30 days after the date on which the taxpayer places the vehicle in service. Generally, taxpayers returning or reselling a clean vehicle more than 30 days after the date the taxpayer places it in service will remain eligible for the section 25E or section 30D credit for the purchase of such vehicle. The proposed regulations provided that, in the case of a new clean vehicle that is returned or resold, the vehicle, once returned or resold, is not available for original use by another taxpayer and, therefore, is not eligible for a section 30D credit. Similarly, in the case of a previously-owned clean vehicle that is returned or resold, the vehicle, once returned or resold, is generally not eligible for the section 25E credit upon a subsequent sale pursuant to the first transfer rule described in proposed § 1.25E–1(b)(8)(ii). In the case of a return occurring more than 30 days after the date on which the taxpayer places the vehicle in service, the seller report is not required to be updated because the taxpayer generally will be eligible for the clean vehicle credit in this circumstance. In addition, in the case of a resale of such vehicle, the seller report is not required to be updated because the seller would not have knowledge of the subsequent resale. Finally, if the taxpayer made an election to transfer the clean vehicle credit, that credit transfer election remains in effect and the value of any transferred credit pursuant to the clean vehicle credit transfer rules generally is not subject to recapture and is not an excessive payment.

Although the proposed regulations did not provide an automatic clean vehicle credit recapture rule for returns or resales more than 30 days after a return or resale, the IRS may determine, based upon the facts and circumstances of a particular case, that a clean vehicle was purchased with the intent to return or resell and may disallow the clean vehicle credit in such case.

One commenter noted that dealers regularly place new clean vehicles in use for longer than 30 days as loaners, rentals, or company vehicles, and that the period of time the vehicle is in use varies but is normally longer than 30 days. The commenter suggested that the section 30D credit obtained by the dealer on its purchase of the vehicle should not be recaptured if, after a period of more than 30 days of use as a loaner, the dealer reclassifies the vehicle as used and subsequently sells it to a third party. The commenter requested the addition of an example to the final regulations addressing this scenario.

The final regulations adopt the comment and add an example to § 1.30D–4(e) that illustrates the application of the vehicle return rules to a scenario in which the dealer purchases a new clean vehicle, uses it as a demonstrator, and later sells the vehicle.

4. Recapture After Transfer Election

One commenter requested that an example be added to the final regulations that addresses who would be responsible for repaying a credit in the event the taxpayer made an election to transfer the credit and later learned that the sale of the previously-owned

clean vehicle to the taxpayer was not a qualified sale.

In general, whether the sale of a previously-owned clean vehicle is a qualified sale will be determined at the time of sale. For example, the taxpayer may rely on the vehicle history report obtained at the time of sale or as part of the sale transaction to determine whether the first transfer rule is satisfied. In the case of recapture, as described in §§ 1.25E–2(c) and 1.30D–4(e), responsibility for recapture of a clean vehicle credit depends upon the circumstances of recapture. In the case of a vehicle return within 30 days of placing a clean vehicle in service in which the taxpayer made a credit transfer election, the eligible entity must repay the amount of the credit as an excessive payment. In contrast, if the taxpayer resells the vehicle within 30 days of placing the clean vehicle in service rather than returning it to the eligible entity, the amount of the transferred credit is recaptured from the taxpayer.

Another commenter requested additional information about specific procedures regarding recapture, including clarification as to whether both parties would be notified, how such notification might occur, and when recapture would occur.

Generally, recapture is reported via self-assessment by the eligible entity or taxpayer. In the event of recapture from the eligible entity, the eligible entity must report the recapture via the dealer registration system as described in §§ 1.25E–3(c)(1) and 1.30D–5(c)(1), as finalized. In the event of recapture from the taxpayer, the taxpayer must report the recapture amount as an increase in tax imposed by chapter 1 of the Code on the taxpayer's Federal income tax return for the taxable year in which the recapture occurred.

A commenter requested that the final regulations clarify whether a taxpayer would be liable for repayment of the credit or a portion of the credit if a transfer election is made but the taxpayer's regular tax liability is less than the total amount of the credit transferred. With respect to the section 25E credit, this situation is addressed in proposed § 1.25E–3(e)(1)(i) and proposed § 1.25E–3(e)(5) Example 1. With respect to the section 30D credit, this situation is addressed in proposed § 1.30D–5(e)(1)(i) and § 1.30D–5(e)(5) Example 1. These provisions and examples are adopted in the final regulations at § 1.25E–3(e)(1)(i), § 1.25E–3(e)(5) Example 1, § 1.30D–5(e)(1)(i), and § 1.30D–5(e)(5) Example 1. Accordingly, no additional clarification is needed and the final regulations do not adopt this comment.

5. Requirement To File a Complete Income Tax Return

Proposed §§ 1.25E–2(f) and 1.30D–4(g) provided that taxpayers must file an income tax return, together with Schedule A (Form 8936), *Clean Vehicle Credit Amount,* or successor form, and any additional forms, schedules, or statements prescribed by the Commissioner for the purpose of making a return to report the tax under chapter 1 of the Code that includes all of the information required on the forms and in the instructions, for the taxable year in which the clean vehicle is placed in service to be entitled to the credit under section 25E or section 30D. The final regulations under section 30D clarify that this requirement also applies to information returns because a partnership or S corporation may claim a section 30D credit as a general business credit under section 38.

A commenter noted that some taxpayers may transfer a credit to a dealer and then fail to file a return or fail to attach Form 8936 to their return, and that dealers will have little incentive to inform taxpayers of their future filing obligations in order to qualify for the credit. The commenter recommended that the final regulations clarify that failing to file a return or failing to attach Form 8936 to a return will not alone subject the taxpayer to the credit recapture rules.

Proposed §§ 1.25E–3(h) and 1.30D–5(g) provide a reporting requirement for taxpayers who transfer a section 25E credit or section 30D credit to a dealer, but do not provide for recapture of the credit as a consequence of failing to fulfill these requirements. Although a taxpayer may not otherwise be required to file an income tax return for a particular taxable year, the taxpayer is required to file an income tax return and attach a Form 8936 and Schedule A (Form 8936) to ensure timely processing of their tax return and to demonstrate their eligibility for the credit. This reporting requirement assists the IRS in the collection of accurate information necessary to effectively administer the section 25E and section 30D credits. The statutory text provides the IRS with sufficient authority to impose this requirement to ensure program integrity, including the ability to recapture the credit where necessary. See sections 25E(f), 30D(g)(1) and 30D(g)(10); see also section 6011. Accordingly, a clarification has been made in the final regulations. The final regulations regarding credit transfer elections under section 30D also clarify that this includes information returns.

C. Transfer Rules

1. Disclosure and Assurance

Section 30D(g) generally establishes a set of rules under which a taxpayer may transfer a section 30D credit to certain dealers, referred to as eligible entities, in which case the eligible entity (and not the taxpayer) is allowed the section 30D credit. In exchange, the eligible entity must pay the taxpayer an amount equal to the transferred section 30D credit (with such payment being made either in cash or in the form of a partial payment or down payment for the purchase of the vehicle). Section 25E(f) provides that, for purposes of section 25E, rules similar to the rules of section 30D(g) apply.

Proposed §§ 1.25E–3 and 1.30D–5 provided transfer rules under section 30D(g) (and section 25E(f) by cross reference to section 30D(g)), including the establishment of an advance payment program for such transfers. The proposed regulations did not specifically address the requirements under section 30D(g)(2)(B)(ii) and (D) relating to the disclosure by the dealer of other incentives.

A commenter requested that the final regulations define the term ''incentive'' for purposes of the disclosure requirement and suggested a definition similar to the one in proposed § 1.25E–1(b)(2). The commenter also requested that the final regulations provide an attestation for dealers and taxpayers to use in conjunction with creditable sales to satisfy the assurance requirement.

The Treasury Department and the IRS agree that the final regulations should include a definition of ''incentive'' for purposes of section 30D(g)(2)(B)(ii) and (D). Because the section 30(g) credit transfer rules also apply to section 25E by reason of the cross reference in section 25E(f), the definition of ''incentive'' for the section 25E and 30D eligible entity requirements should align. Accordingly, the final regulations add a definition of ''incentive'' to §§ 1.25E–1(b) and 1.30D–5(b) that applies for purposes of the eligible entity requirements. Under that definition, ''incentive'' means any reduction in price available to the taxpayer from the dealer or manufacturer, including as in combination with other incentives, other than a reduction in the form of a partial payment or down payment for the purchase of a clean vehicle pursuant to section 30D(g)(2)(C).

2. Definitions

Proposed §§ 1.25E–3(b) and 1.30D–5(a) provided definitions that apply for purposes of the transfer of a clean vehicle credit.

i. Advance Payment Program

Proposed §§ 1.25E–3(b)(1) and 1.30D–5(a)(1) defined ''advance payment program'' as the program described in section 30D(g)(7) (and section 25E(f) by cross reference to section 30D(g)) and the proposed regulations under which an eligible entity may receive an advance payment from the IRS in the case of a credit transfer election made by an electing taxpayer. The advance payment program is the exclusive means by which an eligible entity may receive a transferred clean vehicle credit.

Several commenters requested that the section 25E and 30D credits be refundable regardless of tax liability. Other commenters requested that the credits be available for a taxpayer to use as a down payment at the time of the sale. In contrast, another commenter, requested that taxpayers without sufficient tax liability be required to repay the excess credit amount because, the commenter argued, Congress intended for the credit to be a non-refundable credit. One commenter requested clarification on how the credit will work in 2024 and beyond compared to previous years. Another commenter suggested that the proposed regulations allow 30D credits to be carried forward.

The section 25E and 30D credits are nonrefundable credits under the Code that cannot be carried forward; however, pursuant to sections 25E(f) and 30D(g), such credits may be transferred to an eligible entity beginning in 2024, regardless of the tax liability of the taxpayer or the eligible entity for the applicable tax year. Sections 25E(f) and 30D(g) do not provide for repayment in the event of insufficient tax liability. In exchange for the transferred credit, the eligible entity must pay the taxpayer an amount equal to the transferred clean vehicle credit, with such payment being made either in cash or in the form of a partial payment or down payment for the purchase of the vehicle. The proposed regulations described the transfer of the clean vehicle credits, including examples of cases in which a taxpayer may not have sufficient tax liability to claim the full amount of the credit (for example, Example 1 of proposed § 1.30D–5(d)(5)(i)). Accordingly, the final regulations do not adopt the comment to require repayment of an excess credit amount. Proposed §§ 1.25E–3 and 1.30D–5 already provided the other rules requested by commenters, and no additional clarification is needed. Accordingly, no changes are needed in the final regulations to address these comments.

ii. Electing Taxpayer

Under proposed §§ 1.25E–3(b)(3) and 1.30D–5(a)(4), ''electing taxpayer'' means the individual that purchases and places in service a clean vehicle and that elects to transfer a clean vehicle credit associated with that vehicle that would otherwise be allowable to that individual.

A commenter requested that businesses that purchase new clean vehicles be allowed to use the credit transfer option under section 30D(g). Because the election to transfer a credit under section 30D(g) is limited to the credit allowable under section 30D, the Treasury Department and the IRS have determined that a taxpayer may not elect to transfer a general business credit for a new clean vehicle allowable under section 38 pursuant to section 30D(c)(1). Proposed § 1.30D–1(b)(1) provided that in the event a depreciable vehicle's use is 50 percent or more business use in the taxable year the vehicle is placed in service, it will be creditable entirely under section 38 as a general business credit rather than under section 30D. Thus, the use of a new clean vehicle must be predominantly personal for a taxpayer to be able to make the election to transfer the credit under section 30D(g). Accordingly, the final regulations do not adopt this comment.

iii. Eligible Entity

Under proposed §§ 1.25E–3(b)(4) and 1.30D–5(a)(5), ''eligible entity'' means a registered dealer that meets certain requirements and, by reason of meeting those requirements, is eligible to receive advance payments from the IRS under the advance payment program.

A commenter suggested clarifying that an eligible entity is a registered dealer that is eligible to receive payments under the advance payment program by virtue of meeting the statutory and regulatory requirements. Proposed §§ 1.25E–3(b)(4) and 1.30D–5(a)(5) already provided the rule requested in this comment, and no additional clarification is needed. Accordingly, the final regulations do not adopt this comment.

iv. Time of Sale

Under proposed §§ 1.25E–3(b)(6) and 1.30D–5(a)(7), ''time of sale'' means the date the clean vehicle is placed in service. Under the proposed regulations, the date the clean vehicle is placed in service is the date the taxpayer takes possession of the vehicle.

A commenter suggested that ''time of sale'' be defined as the date of sale on the seller report, and noted that physical possession may occur before, after, or at the time of sale (or at no time) and is not relevant to when a sale has occurred. The date a taxpayer takes possession of the vehicle is a date certain that completes the transaction of purchasing a vehicle, whereas a date on the seller report does not guarantee the taxpayer will take possession of the vehicle and place it in service. As discussed in section II.A.2 of this Summary of Comments and Explanation of Revisions, defining ''placed in service'' as the date a taxpayer takes possession of the vehicle is consistent with other provisions of the Code and prior interpretations of section 30D(a). Accordingly, the final regulations do not adopt this comment.

3. Dealer Registration

Proposed §§ 1.25E–3(c)(2) and 1.30D–5(b)(2) provided rules regarding dealer tax compliance. Specifically, the proposed regulations provided that if the dealer is not in dealer tax compliance for any of the taxable periods during the most recent five taxable years, the dealer may register nonetheless to become a registered dealer. However, the proposed regulations provided that in such cases the dealer cannot receive advance payments under the advance payment program until the dealer's tax compliance issue is resolved. This is because the dealer, while registered, is not an eligible entity until it comes into dealer tax compliance.

One commenter suggested creating an exemption from the dealer tax compliance requirement to address the unique nature of its sales model in which all advance payments of transferred credits ultimately reside with the corporate parent and not with one of the subsidiaries in the organization structure that may be deemed out of tax compliance.

A commenter asserted that dealers play a purely ministerial role in the credit transfer process, and their tax compliance status does not impact the dealer's ability to facilitate a credit transfer. The commenter requested that to the extent the final regulations do not remove the dealer tax compliance provision, the compliance lookback period should be for a maximum of three years rather than the five provided in the proposed regulations. In addition, the commenter requested that the final regulations clarify that the dealer tax compliance requirement applies for

advance payment purposes only and has no impact on a registered dealer's sales or seller reporting.

Pursuant to section 30D(g)(1) and (g)(7), participation in the advance payment program is elective and is subject to the requirements and conditions that the Secretary determines necessary. An advance payment system for dealers presents unique tax administration challenges because it involves the IRS making payments to dealers regardless of their tax liability and doing so outside of the normal tax filing system, with its built-in compliance and enforcement mechanisms. The dealer tax compliance requirement ensures that the entities receiving advance payments have satisfied their own Federal tax obligations, which aids in fraud prevention and tax administration. For these reasons, the final regulations retain the dealer tax compliance requirement. Further, the final regulations retain the five-year lookback period because the longer period better facilitates the IRS's ability to determine whether there are enforcement concerns with regard to a particular dealer. The final regulations also add an express statement that dealer tax compliance is required before describing the consequences of noncompliance. No clarification is needed regarding the scope of the dealer tax compliance requirement because it is clear from the placement of the requirement in the provisions relating to the transfer of the section 25E and 30D credits that such requirement applies only for purposes of the advance payment program and not for other dealer activities, such as the issuance of seller reports.

4. Form of Payment From Eligible Entity to Electing Taxpayer

Proposed §§ 1.25E–3(e)(3) and 1.30D–5(d)(3) provided that the Federal income tax treatment of the payments associated with a credit transfer election are the same regardless of whether the payment is made in cash or in the form of a partial payment or down payment for the purchase of the clean vehicle.

A commenter noted that in some states, dealers are prohibited under state law to promise to pay or otherwise tender cash if a vehicle is financed. The commenter recommended that the credit transfer election be available only for a reduction in sale price without the payment of cash in states where cash payments from dealers for financed vehicles are prohibited under state law. Proposed §§ 1.25E–3(e)(3) and 1.30D–5(d)(3) included examples that illustrate the application of the payment rules referenced by the commenter. The examples in proposed §§ 1.25E–3(e)(5)(ii) and 1.30D–5(d)(5)(ii) address a scenario in which the eligible entity makes the payment to the electing taxpayer in the form of a reduction in sale price (rather than as cash) and concluded that the eligible entity is eligible to receive an advance payment. Although addressed in the examples, reductions in sale price are not explicitly addressed in proposed §§ 1.25E–3(e)(3) and 1.30D–5(d)(3), which articulate the rules illustrated in the examples. Accordingly, the final regulations adopt proposed §§ 1.25E–3(e)(3) and 1.30D–5(d)(3) with language clarifying that reductions in sale price are acceptable forms of payment by an eligible entity.

5. Vehicle Identification Number Requirement

Proposed §§ 1.25E–2(e)(4) and 1.30D–5(d)(4) impose certain additional requirements for credit transfer elections. Among those rules, the proposed regulations provided that the vehicle identification number requirements of section 30D(f)(9) and, by reason of section 25E(e), section 25E(d), would be treated as satisfied if the eligible entity provides the vehicle identification number of such vehicle to the IRS in the form and manner set forth in guidance published in the *Internal Revenue Bulletin*. The final regulations, consistent with the Secretary's general authority under section 30D(g)(1), provide that the electing taxpayer must provide its vehicle identification number with its Federal income tax return for the taxable year in which the vehicle is placed in service. Reporting of the vehicle identification number by both the electing taxpayer and the eligible entity is necessary to reconcile the advance payments under the credit transfer program with the eligibility of the electing taxpayer, which helps safeguard program integrity.

6. Increases in Tax

i. Recapture From Taxpayer

Section 30D(g)(10) provides that, in the case of any taxpayer who has made a credit transfer election and received a payment from an eligible entity, if the section 30D credit would otherwise (but for section 30D(g)) not be allowable to such taxpayer pursuant to the application of the Modified AGI limitation, the tax imposed on such taxpayer under chapter 1 of the Code for the taxable year in which such vehicle was placed in service will be increased by the amount of the payment received by such taxpayer. Because section 25E(f) cross references to section 30D(g), similar rules apply with respect to the section 25E credit.

Proposed §§ 1.25E–3(g)(1) and 1.30D–5(f)(1) provided that, in the case of a clean vehicle credit that would otherwise not be allowable to a taxpayer that made a credit transfer election because the taxpayer exceeds the limitation based on Modified AGI, the income tax imposed on the taxpayer under chapter 1 of the Code for the taxable year in which the vehicle was placed in service is increased by the amount of the payment received by the taxpayer pursuant to the credit transfer election. The taxpayer in such a case must report recapture of the additional amount on its income tax return for the taxable year during which the vehicle was placed in service.

A commenter suggested that §§ 1.25E–3(g)(1) and 1.30D–5(f)(1) should be revised to apply recapture to taxpayers purchasing clean vehicles for resale or for primarily nonpersonal use. Regarding the purchase for resale aspect of this comment, proposed §§ 1.25E–2(c)(1)(iii)(E) and 1.30D–4(f)(1)(iii)(E) provided that the value of any transferred credit will be collected from the taxpayer in the event the taxpayer resells the vehicle within 30 days of placing the vehicle in service. Therefore, the proposed regulations already addressed the purchase for resale aspect of this comment and further clarification is not necessary. Regarding the aspect of the comment related to recapture in the event of primary nonpersonal use of the vehicle, Revenue Procedure 2023–33 provides that a taxpayer must attest to the IRS under penalty of perjury that the taxpayer is an individual for purposes of section 25E, or that the taxpayer will use the vehicle predominantly for personal use for purposes of section 30D. Because nonpersonal use of vehicles is adequately addressed in sub-regulatory guidance, additional clarification is not necessary. Accordingly, the final regulations do not adopt this comment.

Another commenter requested that the final regulations clarify who is responsible for recapture and under what circumstances. The final regulations, as described in this section of the Summary of Comments and Explanation of Revisions, make clear who is subject to recapture. Accordingly, the final regulations do not adopt this comment.

Based on the foregoing, the final regulations adopt proposed §§ 1.25E–2(c)(1)(iii)(E) and 1.30D–4(f)(1)(iii)(E) without modification.

ii. Excessive Payment to an Eligible Entity

Section 30D(g)(7)(B) and section 25E(f) (by cross reference to section 30D(g)) provide that rules similar to the rules of section 6417(d)(6) apply for purposes of the advance payment program. Proposed §§ 1.25E–3(g)(2) and 1.30D–5(f)(2) provided that, in the case of any advance payment that the IRS determines constitutes an excessive payment, the tax imposed on the eligible entity by chapter 1 of the Code, for the taxable year in which such determination is made will be increased by the sum of the amount of the excessive payment, plus an amount equal to 20 percent of such excessive payment. The proposed regulations further provided that the rule applies regardless of whether such entity would otherwise be subject to chapter 1 tax. The additional amount of 20 percent, however, will not apply if the eligible entity demonstrates to the IRS that the excessive payment was due to reasonable cause, which is presumed to be the case for a clean vehicle returned within 30 days of placing such vehicle in service. *See* proposed §§ 1.25E–3(g)(2)(ii) and 1.30D–5(f)(2)(ii).

The proposed regulations provided that an excessive payment means, with respect to an advance payment to an eligible entity pursuant to a credit transfer election made by an electing taxpayer, an advance payment made to a registered dealer that fails to meet the requirements to be an eligible entity. Additionally, the proposed regulations define ''excessive payment'' as an advance payment to an eligible entity with respect to a clean vehicle to the extent the payment exceeds the amount of the clean vehicle credit that would be otherwise allowable to the electing taxpayer with respect to the vehicle. *See* proposed §§ 1.25E–3(g)(2)(iii) and 1.30D–5(f)(2)(iii). However, any excess payment attributable to a taxpayer exceeding the limitation based on Modified AGI is not treated as an excessive payment to an eligible entity.

A commenter requested clarification that ''reasonable cause'' includes an eligible entity's reliance on a manufacturer's calculations for purposes of the Critical Minerals and Battery Components Requirements, as shown on *https://fueleconomy.gov* or elsewhere. Specifically, the commenter requested that the final regulations clearly provide that eligible entities will not be liable for mistaken determinations with respect to those requirements.

Section 4.03 of Revenue Procedure 2022–42 provides that a taxpayer may rely on the information and certifications (which include certifications with respect to the Critical Minerals and Battery Components Requirements and the FEOC Restriction) contained in the qualified manufacturer's periodic written reports. Therefore, in the case of a mistaken calculation by the qualified manufacturer in a periodic written report, the taxpayer is not denied the section 30D credit. Accordingly, if that taxpayer transfers the credit under the advance payment program, the excess of the advance payment to the dealer over the credit otherwise allowable to the taxpayer would be zero, and there is no excessive payment under proposed § 1.30D–5(f)(2)(iii). Consequently, the eligible entity would have no liability and no need to demonstrate reasonable cause. For clarity, the final regulations incorporate the provisions of section 4.03 of Revenue Procedure 2022–42 regarding taxpayer reliance on manufacturer certifications regarding qualified manufacturer status, and certifications and information a qualified manufacturer provides to the IRS in periodic written reports. The final regulations also delineate what taxpayer reliance means in this context. In addition, the final regulations add an example to §§ 1.25E–2(g) and 1.30D–5(g)(3) that illustrate that an excessive payment does not arise in the situation described by the commenter.

7. Two Credit Transfer Elections per Year

Proposed §§ 1.25E–3(i) and 1.30D–5(h) provided that a taxpayer may make no more than two credit transfer elections per taxable year. The proposed regulations further provided that in the case of a joint income tax return, each spouse may make two transfer elections per taxable year, for a maximum of four credit transfer elections in a taxable year. These proposed rules were intended to ensure program integrity by limiting credit transfer elections to vehicle sales that appear to be for legitimate nonbusiness individual use.

A commenter recommended that the requirements of proposed §§ 1.25E–3(i) and 1.30D–5(h) be deleted because there is no basis in section 25E or section 30D for these restrictions. The commenter noted that an eligible entity working with a taxpayer on a credit transfer would have no ability to determine whether the taxpayer would have already made two transfer elections. Section 30D(g)(1) provides that the credit transfer election is ''[s]ubject to such regulations or other guidance as the Secretary determines necessary.'' Section 25E(f) adopts section 30D(g) by reference. Therefore, the Treasury Department and the IRS have the authority to regulate the credit transfer election to ensure program integrity and sound tax administration. Moreover, pursuant to Revenue Procedure 2023–33, the taxpayer will attest to the IRS directly that they have not made more than two transfer elections per year, and the dealer may rely on the taxpayer's attestation. Accordingly, the final regulations do not adopt this comment.

III. New Clean Vehicle Credit—Section 30D

A. Definitions

Section 1.30D–2 of the April Proposed Regulations provided general definitions related to the section 30D credit. Section 1.30D–3(c) of the April Proposed Regulations provided definitions applicable for purposes of the Critical Minerals and Battery Components Requirements. Section 1.30D–6(a) of the December Proposed Regulations provided definitions applicable for purposes of the FEOC Restriction. In the Explanation of Provisions to the December Proposed Regulations, the Treasury Department and the IRS noted that terms relevant to both the Critical Minerals and Battery Components Requirements described in proposed § 1.30D–3 and the FEOC Restriction of proposed § 1.30D–6 should be interpreted consistently between those provisions.

Consistent with this statement, the final regulations retain proposed § 1.30D–2, with certain modifications described in this section of the Summary of Comments and Explanation of Revisions, and generally move the definitions from proposed § 1.30D–3 and proposed § 1.30D–6 to § 1.30D–2(b). However, the final regulations, under § 1.30D–3, retain certain definitions that are directly relevant to the calculations under the Critical Minerals and Battery Components Requirements; those definitions are cross-referenced in § 1.30D–2(b). Section 1.30D–2(b) also cross-references definitions in proposed § 1.30D–5, which provides rules for the credit transfer election (described in section II.C of this Summary of Comments and Explanation of Revisions).

The discussion in this section of the Summary of Comments and Explanation of Revisions only addresses new definitions, definitions that have been modified, or definitions for which comments were received.

1. Applicable Critical Mineral

Proposed §§ 1.30D–3(c)(1) and 1.30D–6(a)(1), consistent with section

30D(e)(1), defined an ''applicable critical mineral'' as an applicable critical mineral defined in section 45X(c)(6).

In addition, proposed § 1.30D–6(c)(4)(ii)(A) provided that the determination of whether an applicable critical mineral is FEOC-compliant takes into account each step of extraction, processing, or recycling through the step in which such mineral is processed or recycled into a constituent material, even if the mineral is not in a form listed in section 45X(c)(6) at every step. Proposed § 1.30D–6(c)(4)(ii)(A) provided an exception to this general rule in the case of recycling (as discussed in this Summary of Comments and Explanation of Revisions at section III.A.25). Proposed § 1.30D–6(c)(4)(ii)(C) further provided that, for purposes of determining whether an applicable critical mineral is FEOC-compliant, an applicable critical mineral is disregarded if it is fully consumed in the production of the constituent material or battery component and no longer remains in any form in the battery.

Several commenters asked for clarification with respect to graphite. Specifically, the commenters requested clarification as to whether graphite that is of a purity of less than 99.9 percent graphitic carbon, but that is purified to a minimum purity of 99.9 percent carbon, is an applicable critical mineral under section 45X(c)(6) and thus section 30D. These comments were considered in the context of the section 45X proposed regulations. As explained in the Explanation of Provisions to the section 45X proposed regulations: ''Some stakeholders have questioned whether this definition could be interpreted to refer to a particular crystalline structure of carbon, that is, 99.9 percent carbon in a graphitic form. [. . .] Consistent with the general intent of section 45X, proposed § 1.45X–4(b)(14) would clarify that the term '99.9 percent graphitic carbon by mass' means graphite that is 99.9 percent carbon by mass.'' The Treasury Department and the IRS will continue to consider this issue as part of finalizing of the section 45X regulations. The form of graphite that is an applicable critical mineral for the purposes of section 30D will be the form that is determined to be an applicable critical mineral in the 45X final regulations.

Several commenters requested clarity as to whether synthetic graphite is an applicable critical mineral. Those commenters requested that the final regulations explicitly state that both graphite variations, synthetic and natural, qualify as an applicable critical mineral. A separate commenter suggested that, because natural and synthetic graphite have entirely different processing procedures, synthetic graphite should not be categorized as an applicable critical mineral. These comments were also considered in the context of the section 45X proposed regulations. Proposed § 1.45X–4(b)(14) would provide that ''[t]he term *graphite* means natural or synthetic graphite that is purified to a minimum purity of 99.9 percent graphitic carbon by mass.'' The Treasury Department and the IRS will continue to consider this issue as part of finalizing of the section 45X regulations. The form of graphite that is an applicable critical mineral for the purposes of section 30D will be the form that is determined to be an applicable critical mineral in the section 45X final regulations.

Several commenters requested clarification on whether other critical minerals are subject to the Critical Minerals Requirement and the FEOC Restriction. One commenter requested that the final regulations provide clarification with respect to hydrofluoric acid (HF). HF may be produced from fluorspar that is purified to a minimum purity of 97 percent calcium fluoride by mass. In these cases, the fluorspar is an applicable critical mineral (under section 45X(c)(6)(K)) and the HF would be an associated constituent material, both of which would be subject to the Critical Minerals Requirement and the FEOC Restriction. The commenter noted that in other cases, HF may be made with lower purity fluorspar or through phosphate mining (without fluorspar). The commenter requested clarification that such HF is still subject to the Critical Minerals Requirement and the FEOC Restriction. Similarly, another commenter requested clarity as to whether nickel, manganese, cobalt, and lithium that do not meet the purity requirements of section 45X(c)(6) are subject to the Critical Minerals Requirement and the FEOC Restriction. This commenter recommended that such lower-purity minerals not be subject to these rules.

One commenter recommended expanding the definition of ''applicable critical mineral'' to include other chemical forms of the critical minerals identified in section 45X(c)(6), such as nitrates, hydroxides, oxides, oxide hydroxides, carbonates, and chlorides. Another commenter stated that the critical minerals list excludes important minerals, such as iron and phosphorous, that are prevalent in FEOC-made batteries, and that this exclusion may introduce a loophole whereby FEOC-made batteries using non-listed critical minerals may be eligible for the critical mineral portion of the 30D credit. That commenter requested that the Treasury Department and the IRS issue additional rules to address non-U.S. critical minerals. Finally, one commenter noted that many minerals that enter battery supply chains prior to attaining the purity level listed in section 45X or becoming an associated constituent material come from FEOCs. That commenter expressed support for extending FEOC-compliance for critical minerals throughout production, even if the mineral is not in a final form listed in section 45X(c)(6) during each step.

In response to these comments, the Treasury Department and the IRS note that under the plain language of sections 30D(e)(1) and 45X(c)(6), minerals other than those specified in section 45X(c)(6) are not applicable critical minerals, and are therefore not subject to the Critical Minerals Requirement and the FEOC Restriction. In addition, the rules of proposed §§ 1.30D–6(c)(4)(ii)(A) and 1.30D–6(c)(4)(ii)(C) provided additional clarity regarding classification as an applicable critical mineral in cases in which the form of the mineral changes during the steps of extraction, processing, or recycling. The final regulations extend this clarification to the Critical Minerals Requirement by incorporating it into the definition of ''applicable critical mineral.''

The final regulations adopt the definition in proposed §§ 1.30D–3(a)(1), 1.30D–6(c)(1), 1.30D–6(c)(4)(ii)(A), and 1.30D–3(c)(4)(ii)(C), with the modification described above, consolidate it, and move it to § 1.30D–2(b) with the modification described previously. Specifically, the final regulations, like the proposed regulations, provide that ''applicable critical mineral'' means an applicable critical mineral defined in section 45X(c)(6). The final regulations clarify that the requirements under §§ 1.30D–3 and 1.30D–6 with respect to an applicable critical mineral take into account each step of extraction, processing, or recycling through the step in which such mineral is processed or recycled into an associated constituent material, even if the mineral is not in a form listed in section 45X(c)(6) at every step of production. The final regulations further clarify that an applicable critical mineral is disregarded for purposes of the Critical Minerals Requirement and the FEOC Restriction if it is fully consumed in the production of the constituent material or battery component and no longer remains in any form in the battery.

In addition, the final regulations incorporate the special rule for recycling in proposed § 1.30D–6(c)(4)(ii)(A) into the definition of ''recycling'' in § 1.30D–2(b). The final regulations also provide an example that illustrates when the determinations under the Critical Minerals Requirement and the FEOC Restriction take place with respect to an applicable critical mineral.

2. Assembly

Proposed §§ 1.30D–3(c)(2) and 1.30D–6(a)(2) defined ''assembly,'' with respect to battery components, as the process of combining battery components into battery cells and battery modules. The final regulations adopt the definition of ''assembly'' in proposed §§ 1.30D–3(c)(2) and 1.30D–6(a)(2), consolidate it into a single provision, and move it to § 1.30D–2(b).

One commenter stated that the definition of ''assembly'' could allow for abuse under the Battery Components Requirement by allowing a North American manufacturer, for example, to simply affix two Chinese batteries together, which would be considered assembly of a North American battery component. However, in this situation, the incremental value, for purposes of determining the total incremental value of North American battery components (that is, the numerator in the qualifying battery component content that is compared to the applicable percentages of section 30D(e)(2)(B)), would only be the value of the affixed batteries, less the value of the batteries prior to assembly. Because that incremental value would be minimal, the potential for abuse as described by the commenter would also be minimal. Accordingly, the final regulations do not adopt this comment.

3. Associated Constituent Materials

Proposed § 1.30D–6(c)(4)(ii)(B) provided that in determining whether an applicable critical mineral is FEOC-compliant, a constituent material is associated with an applicable critical mineral if the applicable critical mineral has been processed or recycled into a constituent material, even if that processing or recycling transformed the mineral into a form not listed in section 45X(c)(6).

The Critical Minerals Requirement under proposed § 1.30D–3 incorporated the same concept by providing that the portion of an applicable critical mineral that is a qualifying critical mineral must be determined separately for each procurement chain. Proposed § 1.30D–3(c)(14) defined ''procurement chain'' as a common sequence of extraction, processing, or recycling activities that occur in a common set of locations with respect to an applicable critical mineral, concluding in the production of constituent materials.

These determinations necessarily encompass steps in the procurement chain in which the applicable critical mineral is transformed into a form not listed in section 45X(c)(6). Accordingly, the final regulations add a definition of ''associated constituent material'' to § 1.30D–2(b), which provides that, with respect to an applicable critical mineral, an ''associated constituent material'' is a constituent material that has been processed or recycled from such mineral into the constituent material with which it is associated, even if that processing or recycling transformed such mineral into a form not listed in section 45X(c)(6).

4. Battery

Proposed §§ 1.30D–3(c)(3) and 1.30D–6(a)(3) defined ''battery,'' for purposes of a new clean vehicle, as a collection of one or more battery modules, each of which has two or more electrically configured battery cells in series or parallel, to create voltage or current. Under proposed §§ 1.30D–3(c)(3) and 1.30D–6(a)(3), the term ''battery'' did not include items such as thermal management systems or other parts of a battery cell or module that do not directly contribute to the electrochemical storage of energy within the battery, such as battery cell cases, cans, or pouches. The final regulations adopt the definition of ''battery'' in §§ 1.30D–3(c)(3) and 1.30D–6(a)(3), consolidate it into a single provision, and move the definition to § 1.30D–2(b).

The Treasury Department and the IRS received comments both in support of and in opposition to the proposed definition of ''battery.'' Several commenters requested a broader definition of ''battery,'' while other commenters criticized the definition of battery as too broad. Similarly, several commenters disagreed with the definition of ''battery'' and recommended that it be defined as a complete battery pack. The Explanation of Provisions to the April Proposed Regulations noted that the proposed definition of ''battery'' is consistent with the language and purpose of section 30D because battery modules and cells are the sources ''from which the electric motor of such vehicle draws electricity.'' *See* sections 30D(e)(1)(A) and (2)(A). Consistent with this, items that do not directly contribute to the electrochemical storage of energy within the battery are not the subject of the IRA's incentives to shift to more secure and resilient electric vehicle battery supply chains. Such items are generally low-value commodities that are specific to the end-use of the energy storage technology, rather than the process of storing energy. The proposed definition of ''battery'' is in keeping with the statutory purpose of incentivizing the resiliency and security of the highest-value and most specialized portions of the battery supply chain. In addition, the functional definition of ''battery'' in the proposed regulations allows for technological changes, as the definition will not be obsolete if battery pack structures change in the future, but is also consistent with current industry practice, as electrochemical batteries are currently standard. Accordingly, the final regulations do not adopt these comments.

In addition, one commenter requested that the definition of ''battery'' exclude thermal management systems and other components that do not directly contribute to energy storage. Because the definition of ''battery'' already excludes such systems and such other components, no modification to the definition of ''battery'' is required.

Finally, one commenter noted the necessity of future conversations about the definitions of ''battery'' and ''battery component'' to reflect technological advances. The Treasury Department and the IRS will continue to monitor technology in this area in coordination with the DOE. The Treasury Department and the IRS welcome additional comments in the future that discuss technological changes with respect to electric vehicle batteries.

5. Battery Cell

Proposed §§ 1.30D–3(c)(4) and 1.30D–6(a)(4) defined ''battery cell'' as a combination of battery components (other than battery cells) capable of electrochemically storing energy from which the electric motor of a new clean vehicle draws electricity. This proposed definition of battery cell encompassed the smallest combination of battery components necessary for the function of energy storage. The final regulations adopt the definition of ''battery cell'' in proposed §§ 1.30D–3(c)(4) and 1.30D–6(a)(4), consolidate it into a single provision, and move it to § 1.30D–2(b).

A commenter requested that the guidance align the definitions of ''battery cell'' and ''battery component'' with those in section 45X(c)(5). However, section 30D does not adopt those definitions by reference. As noted in section III.A.4 of this Summary of Comments and Explanation of Revisions, items that do not directly contribute to the electrochemical storage of energy within the battery, which are

generally low-value commodities, are not the subject of the IRA's incentives to shift to more secure and resilient electric vehicle battery supply chains. For this reason, the Treasury Department and the IRS have determined that the section 30D definitions should be limited to electrochemical energy storage batteries that that are used in electric vehicles, and do not need to encompass concepts that are pertinent to other forms of energy storage that are included in the definitions in section 45X(c)(5) (for example, thermal batteries). Accordingly, the final regulations do not adopt this comment.

6. Battery Component

Proposed §§ 1.30D–3(c)(5) and 1.30D–6(a)(6) defined ''battery component'' as a component that forms part of a battery and that is manufactured or assembled from one or more components or constituent materials that are combined through industrial, chemical, and physical assembly steps. Battery components include, but are not limited to, a cathode electrode, anode electrode, solid metal electrode, separator, liquid electrolyte, solid state electrolyte, battery cell, and battery module. Constituent materials are not considered a type of battery component, although constituent materials could be manufactured or assembled into battery components. Some battery components could be made entirely of inputs that do not contain constituent materials. Battery components include any piece of the assembled battery cell that contributes to electrochemical energy storage.

The Treasury Department and the IRS received a number of comments regarding the definition of ''battery component.'' Several commenters were supportive of the definition. The proposed definition of ''battery component'' included a non-exhaustive list of specific components, and many commenters proposed additions to the list. One commenter suggested that the list specifically include cathode and anode foil. Other commenters requested clarity with respect to lead tabs (for battery cells), metal components (for battery modules), and cap assemblies (for the manufacture of canister battery cells). Other items suggested for inclusion were separator coatings, binders, electrolyte solvents and electrolyte salts, current collectors, cell contacting layers, voltage sense harnessing, and battery management systems. Another commenter noted that the inclusion of ''but not be limited to'' language creates uncertainty for automakers and instead asked for a full list of components. In response, the final regulations add a new definition of ''battery materials'' (described in section III.A.7 of this Summary of Comments and Explanation of Revisions) to § 1.30D–2(b). In addition, the final regulations clarify that battery materials without applicable critical minerals are not battery components, as they are not manufactured or assembled. The final regulations do not provide a complete list of battery components because electric vehicle battery components may vary depending on the battery chemistry, especially as battery technology continues to evolve. The illustrative list of battery components in the final regulation allows for future innovation.

Several commenters raised concerns regarding the limitation of battery components to items that contribute to electrochemical energy storage. A commenter supported the limitation as important to both the workability of and intent behind the Battery Components Requirement. On the other hand, another commenter requested that the final regulations expand the definition of ''battery component'' to include additional enabling technologies, such as thermal management, cooling, and housing and enclosure components. The commenter, mentioned previously, that requested clarity with respect to lead tabs and metal components stated that ambiguity with respect to the phrase ''electrochemical storage components'' made it difficult to determine whether these items were battery components. Similarly, commenters suggested that, under the language of section 30D, battery components should include thermal barriers. As noted previously, the proposed definition of ''battery,'' which informs the definition of ''battery component,'' is consistent with the statute because battery modules and cells are the sources ''from which the electric motor of such vehicle draws electricity.'' Section 30D(e)(1)(A) and (2)(A). In addition, this definition is consistent with the purpose of section 30D to provide incentives to move toward more secure and resilient electric vehicle battery inputs. Inputs that do not directly contribute to the electrochemical processes necessary for energy storage (for example, thermal management systems, battery management systems, housing/enclosure components) are generally lower-value and specific to the end use of the battery, rather than the process of storing energy. The same reasoning applies to battery components. As noted by the Joint Committee on Taxation, the battery components requirement in section 30D(e)(2)(A) is ''intended to incentivize the manufacturing or assembly of high-value battery components, such as battery cells, in North America.'' [4] Accordingly, because the proposed definition is consistent with the statutory text and purpose, the final regulations do not adopt these comments.

Finally, multiple commenters raised questions and provided recommendations relating to separators, many of which relate to the determination under the Battery Components Requirement (discussed in section III.B.2 of this Summary of Comments and Explanation of Revisions). One commenter requested clarification as to the incremental value of a coated separator, and recommended that the incremental value be determined by subtracting the value of an uncoated separator (a lithium-ion battery separator) from the value of the coated separator (a ceramic coated separator). Another commenter, noting that ''substantially all'' in the definition of ''North American Battery Component'' was vague, requested that the final regulations state that a separator coated in North America is a North American Battery Component (regardless of where the pre-coated separator was manufactured). This commenter stated that up to 60 percent of the value added by the separator comes from the coating process. In contrast, another commenter requested that the final regulations clarify that coating a separator is not manufacturing or assembly, to ensure that a separator coated in North America is not considered a North American Battery Component if the pre-coated separator was manufactured outside of North America. A different commenter advocated against the inclusion of base film and coating materials used to make such separator in the definition of ''battery component'' for purposes of the Battery Components Requirement and the FEOC Restriction. In addition, one commenter requested that the bare film and binders incorporated into a ceramic-coated separator be classified as battery sub-components and noted that these items should qualify under either the Critical Minerals Requirement or the Battery Components Requirement if manufactured in North America or a country with which the United States has a free trade agreement in effect. This commenter also made suggestions with respect to various other government

[4] Joint Committee on Taxation, Joint Committee on Taxation, *General Explanation of Tax Legislation Enacted in the 117 Congress* (JCS 1–23), December 2023, at 252, n.1070.

rules that may apply to coated separators, which are outside the scope of these final regulations.

In response to these comments, the Treasury Department and the IRS note that a coated separator is a battery component. In general, the base film and coating are battery materials, not battery components, because they are processed rather than manufactured or assembled. If those battery materials contain applicable critical minerals, those battery materials are constituent materials. The final regulations clarify this in the definition of ''battery component'' and the new definition of ''battery materials.''

Finally, several commenters discussed the relationship between the Battery Components Requirement and the FEOC Restriction. One commenter encouraged the Treasury Department and the IRS to use the same definition of ''battery component'' for purposes of the Battery Components Requirement and the FEOC Restriction. In contrast, another commenter suggested that the final regulations adopt a broader definition of ''battery component'' for purposes of the FEOC Restriction that includes components otherwise included in the definition of ''constituent material'' for purposes of the Critical Minerals Requirements. As noted in the Explanation of Provisions to the December Proposed Regulations, the Treasury Department and the IRS intend that terms relevant to both the Critical Minerals and Battery Components Requirement and the FEOC Restriction be interpreted consistently. Consistent with that, the final regulations include one general definition of ''battery component'' for purposes of section 30D, and do not adopt the comment suggesting a broader definition for purposes of the FEOC Restriction.

The final regulations, in § 1.30D–2(b), adopt a definition of ''battery component'' that clarifies the treatment of separators and incorporates the new definition of ''battery materials.'' The definition is modified to improve clarity regarding the relationship between battery components, constituent materials, and battery materials.

7. Battery Materials

To further clarify the line between battery components and constituent materials, the final regulations add a definition of ''battery materials'' to § 1.30D–2(b). The final regulations define ''battery materials'' as direct and indirect inputs to battery components that are produced through processing, rather than manufacturing or assembly. Battery materials are not considered a type of battery component, although battery materials may be manufactured or assembled into battery components. The three categories of battery materials are applicable critical minerals, constituent materials, and battery materials without applicable critical minerals. Examples of battery materials that may or may not contain applicable critical minerals include a separator base film (if not manufactured or assembled) and separator coating. Examples of battery materials without applicable critical minerals include conductive additives, copper foils prior to graphite deposition, and electrolyte solvents.

8. Clean Vehicle Battery

The final regulations add a definition of ''clean vehicle battery'' to § 1.30D–2(b). Consistent with section 30D(d)(1)(F) and 30D(e), the final regulations define ''clean vehicle battery,'' with respect to a new clean vehicle, means the battery from which the electric motor of the vehicle draws electricity to propel such vehicle.

9. Compliant-Battery Ledger

Proposed § 1.30D–6(a)(7) defined ''compliant-battery ledger,'' for a qualified manufacturer for a calendar year, as a ledger that tracks the number of available FEOC-compliant batteries for such calendar year. Proposed § 1.30D–6(d) set forth rules applicable to compliant-battery ledgers. The Treasury Department and the IRS received several comments about the rules for establishing, updating, and reconciling the compliant-battery ledger. These comments are included as part of the discussion of proposed § 1.30D–6(d) in section III.D.3 of this Summary of Comments and Explanation of Revisions.

The final regulations adopt the proposed definition and move it to § 1.30D–2(b).

10. Constituent Materials

Proposed §§ 1.30D–3(c)(6) and 1.30D–6(a)(8) defined ''constituent materials'' as materials that contain applicable critical minerals and are employed directly in the manufacturing of battery components. Constituent materials could include, but are not limited to, powders of cathode active materials, powders of anode active materials, foils, metals for solid electrodes, binders, electrolyte salts, and electrolyte additives, as required for a battery cell. As explained in the Explanation of Provisions to the April Proposed Regulations, the definition of ''constituent materials'' describes the materials that distinguish the steps of extraction, processing, and recycling of critical minerals from the subsequent steps of manufacturing and assembly of battery components. Constituent materials are the final products relevant for calculating the value of the applicable critical minerals in the battery.

The Treasury Department and the IRS received multiple comments with respect to the definition of ''constituent materials.'' Several commenters expressed support for the proposed definition. However, other commenters criticized the definition as not supported by the statute; as at odds with section 45X, which includes ''electrode active materials'' as qualifying battery components; and as an inappropriate reclassification of items that should be battery components, and thus subject to the Battery Components Requirement. One commenter suggested that constituent materials be included within the definition of ''battery component'' or otherwise phased in to allow for additional time to relocate production facilities to North America. Another commenter indicated that the definition of ''constituent materials'' could be exploited to exclude critical minerals.

In response to these comments, the Treasury Department and the IRS note that although section 30D does not define ''battery component,'' it consistently refers to components as ''manufactured or assembled,'' and it consistently refers to ''applicable critical minerals'' as ''extracted, processed, or recycled.'' To avoid a gap in the supply chain between applicable critical minerals and battery components, the proposed regulations introduced the concept of constituent materials to make clear that materials downstream of applicable critical minerals, but still processed rather than manufactured or assembled, belong in the analysis of a battery's applicable critical minerals. Section 30D looks to a material's production steps to determine its status as an applicable critical mineral or a battery component. The constituent materials concept does not alter how the statute works; rather, it clarifies how the statute applies to certain materials.

One commenter suggested modifying the definition of ''constituent materials'' to include domestic alternatives that serve the same purpose as constituent materials but do not contain applicable critical minerals. The final regulations do not adopt this comment because the commenter's proposal would be at odds with the Critical Minerals Requirement and the FEOC Restriction (as applicable to applicable critical minerals).

Other commenters raised questions with respect to whether specific materials are constituent materials. One commenter asked for clarification as to whether foils, such as a copper foil that does not contain any applicable critical minerals, are constituent materials. Another commenter asked for clarity with respect to polyvinylidene fluoride (PVDF). Noting that PVDF made from fluorine (in the form of an applicable critical mineral) would be a constituent material, the commenter asked for clarification about the classification of PVDF that is not made from an applicable critical mineral, such as PVDF sourced from phosphate rock. The final regulations clarify that battery materials may not contain applicable critical minerals. Further, the Treasury Department and the IRS note that the materials referenced by these commenters (foils and PVDF) would both be considered battery materials without applicable critical minerals.

One commenter sought clarification of whether lithium hexafluorophosphate is considered an electrolyte salt for purposes of the definition of constituent materials. If an applicable critical mineral in a form specified in section 45X(c)(6) is used to produce lithium hexafluorophosphate, and this material is integrated into a battery component, the material would be considered a constituent material.

A separate commenter requested that the final regulations clarify that carboxymethylcellulose (CMC), made from wood pulp or linter pulp, is not a constituent material. The commenter notes that CMC does not contain applicable critical minerals. The Treasury Department and the IRS note that, while CMC is used in the manufacture of a battery component as a binder or coating for the production of anode electrodes by deposition of anode active material onto copper foil, CMC itself does not contain an applicable critical mineral, and therefore would not be considered a constituent material.

Finally, one commenter requested clarification with respect to powders of cathode active materials (CAM), which is listed as a constituent material. The commenter noted that the list does not expressly include precursor materials used for making CAM or other intermediate materials incorporating the critical minerals that are used to produce the CAM. The commenter specifically recommended adding these items to the list and including references to the relevant applicable critical minerals by revising the definition to include powders of precursor cathode active materials and any other intermediate products incorporating critical minerals such as manganese, nickel, or cobalt, powders of cathode active materials. The final regulations provide, in the definition of ''applicable critical mineral,'' that determinations under the Critical Minerals Requirement and the FEOC Restriction with respect to an applicable critical mineral take into account each step of extraction, processing, or recycling through the step in which such mineral is processed or recycled into a constituent material. Thus, the final regulations clarify that these precursor or other intermediate materials are relevant for both the Critical Minerals Requirement and the FEOC Restriction.

The final regulations adopt the definition of ''constituent materials'' in proposed §§ 1.30D–3(a)(8) and 1.30D–6(c)(6), consolidate it into a single provision, and move it to § 1.30D–2(b). In addition, the final regulations clarify that battery materials without applicable critical minerals are not constituent materials.

12. Country With Which the United States Has a Free Trade Agreement in Effect

Proposed § 1.30D–3(c)(7) defined the term ''country with which the United States has a free trade agreement in effect'' and listed the countries with which the United States has free trade agreements in effect. As noted in the Explanation of Provisions to the April Proposed Regulations, the term free trade agreement is not defined in the IRA or in the Code. Proposed § 1.30D–3(c)(7)(i) set forth criteria for the identification of a country with which the United States has a free trade agreement in effect, including whether an agreement between the United States and another country, as to the critical minerals contained in electric vehicle batteries or more generally, and in the context of the overall commercial and economic relationship between that country and the United States: (A) reduces or eliminates trade barriers on a preferential basis, (B) commits the parties to refrain from imposing new trade barriers, (C) establishes high-standard disciplines in key areas affecting trade (such as core labor and environmental protections), and/or (D) reduces or eliminates restrictions on exports or commits the parties to refrain from imposing such restrictions on exports.

Proposed § 1.30D–3(c)(7)(ii) identified twenty countries with which the United States has comprehensive free trade agreements (that is, agreements covering substantially all trade in goods and services between the parties, including trade in critical minerals). In addition, the Treasury Department and the IRS proposed to include additional countries identified by the Secretary, after consideration of the listed criteria, and identified Japan as an additional country. On March 28, 2023, the United States and Japan concluded a Critical Minerals Agreement (CMA), which contained robust obligations to help ensure free trade in critical minerals.[5]

Proposed § 1.30D–3(c)(7)(iii) provided that the list of identified countries in paragraph (c)(7)(ii) may be revised and updated through appropriate guidance published in the **Federal Register** or in the *Internal Revenue Bulletin* (see § 601.601 of the Statement of Procedural Rules (26 CFR part 601)).

The final regulations adopt this definition and move it to § 1.30D–2(b). At this time, the Treasury Department and the IRS have not identified any additions to the list of identified countries. The final regulations continue to include Japan on the list of countries with which the United States has free trade agreements in effect. After consulting with the United States Trade Representative in applying the relevant factors for identifying free trade agreements, the Treasury Department and the IRS have concluded that Japan is a country with which the United States has a free trade agreement in effect. The Treasury Department and the IRS specifically sought comments on the proposed criteria for identifying countries with which the United States has free trade agreements in effect, other potential approaches for identifying those countries, and the list of countries set forth in proposed § 1.30D–3(c)(7)(ii).

The Treasury Department and the IRS received several comments with respect to this definition. One comment requested guidance identifying at what stage a trade agreement is considered in effect, noting the signature date of an agreement is frequently different from the trade agreement's implementation date. The commenter requested that the completion date be considered the date that a trade agreement is in effect. As an initial matter, international agreements to which the United States is a party, including those referred to in the § 1.30D–2(b) definition of ''country with which the United States has a free trade agreement in effect,'' ordinarily identify the date on which they enter into force

[5] Agreement Between the Government of the United States of America and the Government of Japan on Strengthening Critical Minerals Supply Chains, concluded March 28, 2023, *https://ustr.gov/sites/default/files/2023-03/US%20Japan%20Critical%20Minerals%20Agreement%202023%2003%2028.pdf.*

and therefore are ''in effect,'' as that term is used in section 30D. Consistent with the approach described in the proposed rules and adopted in the final rules, the Treasury Department and the IRS will also ''make any necessary amendments to the list . . . including adding any additional countries as any new qualifying international agreements enter into force and the Secretary determines that the [applicable] factors have been met.'' The Treasury Department and the IRS have determined that the assessment of whether an agreement is in effect is something that the Secretary will evaluate in the context of individual agreements that may be considered in determining whether to add individual countries to the list of countries with which the United States has free trade agreements in effect.

One commenter requested defining ''country'' to include geographical areas that are of an international nature and do not belong to any one country, such as international waters. The ordinary meaning of ''country'' does not include areas beyond national jurisdiction. Therefore, the final regulations do not adopt this comment.

Several comments suggested that the proposed definition of ''free trade agreement'' expands the regulatory regime and undercuts Congressional intent. Relatedly, a comment specifically criticized the inclusion of Japan on the list on the basis of the CMA. Other commenters supported the inclusion of Japan on the basis of the CMA. Another commenter suggested that the proposed regulations impermissibly expand the Secretary's authority to define ''free trade agreement,'' and that the regulatory definition departs from its accepted meaning. Several commenters suggested defining free trade agreements to include arrangements, including plurilateral agreements, in which the United States and a foreign economy agree to at least some strategic and/or economic partnerships, including government procurement, even if the agreement was not labeled a free trade agreement.

As noted earlier in this discussion and in the Explanation of Provisions to the April Proposed Regulations, the term ''free trade agreement'' is not defined in the IRA or in the Code, and the definition in the proposed regulations is consistent with the statute and its purpose, as reflected in the term's ordinary meaning, use, and context in section 30D and in the broader IRA. As also noted in the Explanation of Provisions to the April Proposed Regulations, the purpose of the IRA's amendments to section 30D is to expand the incentives for taxpayers to purchase new clean vehicles and for vehicle manufacturers to increase their reliance on supply chains in the United States and in countries with which the United States has reliable and trusted economic relationships, which is essential for our national security, our economic security, and our technological leadership. The proposed definition of ''country with which the United States has a free trade agreement in effect'' is consistent with these statutory purposes. In particular, the criteria identified in the proposed definition that must be met for an instrument to be determined to be a free trade agreement include whether an agreement between the United States and another country includes commitments related to reducing or eliminating trade barriers on a preferential basis, refraining from imposing new trade barriers, establishing high-standard disciplines in trade-related areas, and reducing or eliminating restrictions on exports or committing the parties to refrain from imposing such restrictions, all in the context of the overall commercial and economic relationship between the country in question and the United States. Based on the criteria above, Japan was identified as a country with which the United States has a free trade agreement in effect. In particular, the United States-Japan CMA was identified as a free trade agreement under these criteria because it includes robust obligations, such as a commitment to refrain from imposing duties on exports of critical minerals that are currently essential to the electric vehicle battery supply chain, and a commitment for the United States and Japan to confer on best practices regarding review of investments in the critical minerals sector for purposes of assisting a determination of the effect of such investments on national security. The CMA also includes detailed terms related to the relationships of labor and environmental laws to trade in critical minerals and cooperation on non-market policies and practices of non-parties affecting trade in critical minerals. The CMA was concluded in the context of an earlier trade agreement the United States concluded with Japan in 2019, a related 2019 agreement on digital trade, and the U.S.-Japan Partnership on Trade announced in November 2021.

Several commenters addressed issues relating to labor standards, environmental standards, economic and national security, transparency, and enforceability. One commenter requested that the United States Geological Survey be consulted as to the environmental standards and compliance and enforcement histories of specified non-domestic sources. Another commenter encouraged the Treasury Department and the IRS to collaborate with the Department of State to leverage the Minerals Security Partnership (MSP) to secure supply chains needed to scale domestic battery production while establishing higher labor standards, greater transparency, improved environmental practices, and greater value-added benefits for communities located in countries with significant mineral endowments. The Treasury Department and the IRS appreciate these concerns and note that they are appropriately reflected in the criteria identified in the proposed regulations, specifically as high-standard disciplines in key areas affecting trade. The Treasury Department and the IRS will consult with appropriate agencies across the Federal government in applying the listed criteria in the future.

Relatedly, several commenters raised concerns about whether countries with which the United States does not have free trade agreements in effect could launder applicable critical minerals through procurement chains involving countries with which the United States has free trade agreements in effect. The Treasury Department and the IRS have determined that the upfront review process in § 1.30D–3(d) of the final regulations (described in section III.B.3 of this Summary of Comments and Explanation of Revisions), which involves due diligence and requires documentation of critical mineral supply chains, will promote accurate tracing of the full critical mineral supply chain.

Another commenter suggested including a broad set of critical minerals in any future critical minerals agreement. The commenter noted that limiting future critical mineral agreements to a limited subset of applicable critical minerals has the potential to limit innovation. In response to this comment, the Treasury Department and the IRS note that the determination under the Critical Minerals Requirement with respect to ''any country with which the United States has a free trade agreement in effect,'' would not be limited in the case of critical minerals agreements by the scope of minerals covered by such critical minerals agreement. Once the Secretary determines that a country qualifies as a country with which the United States has a free trade agreement

in effect, any applicable critical minerals within the meaning of section 45X(c)(6) extracted or processed in that country are eligible. Finally, several commenters requested that additional countries be added to the list, including Argentina, the Philippines, members of the European Union, and the United Kingdom. At this time, the Treasury Department and the IRS have not identified agreements in effect with the suggested countries within the meaning of section 30D. The Treasury Department and the IRS will continue to work with the United States Trade Representative and across the Federal government to apply the listed criteria to determine if it is appropriate to list additional countries.

13. Extraction

Proposed §§ 1.30D–3(c)(8) and 1.30D–6(a)(9) defined ''extraction'' as the activities performed to extract or harvest minerals or natural resources from the ground or a body of water, including, but not limited to, by operating equipment to extract minerals or natural resources from mines and wells, or to extract or harvest minerals or natural resources from the waste or residue of prior extraction. Under the proposed definition, extraction concludes when activities are performed to convert raw mined or harvested products or raw well effluent to substances that can be readily transported or stored for direct use in applicable critical mineral processing. Extraction includes the beneficiation or other physical processes that allow the extracted materials, including ores, clays, and brines, to become transportable. Extraction also includes the physical processes involved in refining, but not the chemical and thermal processes involved in refining.

Several commenters requested clarity on the line between extraction and processing. Section III.A.22 of the Summary of Comments and Explanation of Revisions addresses these comments.

One commenter suggested that the definition of ''extraction'' be expanded to include critical minerals not physically taken from the ground, citing innovations in producing graphite from biomass that no longer require physical ground extraction. The proposed definition of ''extraction'' includes the extraction of minerals or natural resources from the waste or residue of prior extraction. Therefore, it is unnecessary to modify the definition of ''extraction'' in the manner the commenter suggests. However, the final regulations clarify that extraction also includes crude oil extraction to the extent processes applied to that crude oil yield an applicable critical mineral as a byproduct. The final regulations also clarify that extraction does not include activities that begin with a recyclable commodity (as such activities themselves constitute recycling).

The final regulations adopt the definition of ''extraction'' in the proposed regulations, consolidate it into a single provision with the clarification described previously, and move it to § 1.30D–2(b).

14. Final Assembly

Proposed § 1.30D–2(b) provided that, consistent with section 30D(d)(5), ''final assembly'' means the process by which a manufacturer produces a new clean vehicle at, or through the use of, a plant, factory, or other place from which the vehicle is delivered to a dealer or importer with all component parts necessary for the mechanical operation of the vehicle included with the vehicle, whether or not the component parts are permanently installed in or on the vehicle. To establish where final assembly of a new clean vehicle occurred, the proposed regulations provided that a taxpayer could rely on the following information: (1) the vehicle's plant of manufacture as reported in the VIN pursuant to 49 CFR 565; or (2) the final assembly point reported on the label affixed to the vehicle as described in 49 CFR 583.5(a)(3). The final regulations adopt the proposed definition of ''final assembly'' without change.

The proposed regulations provided two different methods for determining whether a vehicle meets the North American final assembly requirement, either via the VIN or the vehicle label, to ensure that this information was available and accessible for taxpayers. For nearly all vehicles, both methods will provide the same final assembly location. The vehicle's plant of manufacture as reported in the VIN means the plant where the manufacturer affixes the VIN. *See* 49 CFR 565.12. The plant of manufacture is reported in the VIN pursuant to 49 CFR 565.15(d)(2). The DOE, Alternative Fuels Data Center (AFDC), and the Department of Transportation, National Highway Traffic Safety Administration (NHSTA), each provide a VIN decoder to the public, which can be used to identify a vehicle's plant of manufacture. AFDC, VIN Decoder, *https://afdc.energy.gov/laws/electric-vehicles-for-tax-credit;* NHTSA, VIN Decoder, *https://www.nhtsa.gov/vin-decoder.* Labeling requirements in 49 CFR 583.5 require the final assembly point to be reported on the label affixed to a passenger motor vehicle as defined in 49 U.S.C. 32304(11) (which limits such vehicles to those with GVWR of 8,500 pounds or less). Final assembly point means the plant, factory, or other place, which is a building or series of buildings in close proximity, where a new passenger motor vehicle is produced or assembled from passenger motor vehicle equipment and from which such vehicle is delivered to a dealer or importer in such a condition that all component parts necessary to the mechanical operation of such automobile are included with such vehicle, whether or not such component parts are permanently installed in or on such vehicle. For multi-stage vehicles, the labeling requirements provide that the final assembly point is the location where the first stage vehicle is assembled. 49 CFR 583.4(b)(5). Multi-stage vehicles are vehicles manufactured in two or more stages by which an incomplete vehicle becomes a completed vehicle and may involve multiple manufacturers. *See* 49 CFR 567.3 for definitions of ''incomplete vehicle'' and ''completed vehicle.''

A commenter stated that the proposed rule would allow taxpayers to use the vehicle's plant of manufacture reported on the VIN, rather than the final assembly point, for multi-stage vehicles. However, existing vehicle labeling requirements in 49 CFR part 583 apply to both single-stage and multi-stage vehicles with GVWR of 8,500 pounds or less. Therefore, such requirements provide a final assembly point for both types of vehicles. The proposed regulations provided flexibility to taxpayers in determining whether the section 30D credit final assembly requirement is met by allowing taxpayers to look to either the plant of manufacture identified in the VIN or the vehicle label final assembly point. In the limited situations in which the VIN and vehicle label may provide different final assembly locations, the proposed regulations allowed taxpayers to choose the standard that is more favorable to them. Moreover, the VIN and vehicle labels will diverge only in certain limited situations with respect to a multi-stage vehicle, and most multi-stage vehicles have a GVWR of more than 8,500 pounds, and are, therefore, not subject to the part 583 vehicle labeling requirements. Furthermore, it is important to leverage existing standards that provide accessible information to taxpayers, and such information is more accessible if taxpayers have multiple ways to obtain it. Accordingly, the final regulations do not adopt this comment.

Another commenter requested that the final regulations define ''final assembly'' more broadly, to include

assembly of body panels, painting, chassis assembly, trim installation, and other assembly and fabrication processes that are currently found in established final assembly plants, to maximize the incentive for production in the United States. Section 30D(d)(5) and the proposed definition of ''final assembly'' look to the plant, factory, or other place at which all component parts necessary for the mechanical operation of the vehicle are included with the vehicle. Consistent with the commenter's suggestion, this is generally the location where the chassis of the vehicle is assembled, because at that point the vehicle may be mechanically operable. In addition, the two reliance standards described in the proposed regulations, the vehicle's plant of manufacture as reported in the VIN, and the final assembly point reported on the vehicle label, generally also look to the location where the chassis of the vehicle is assembled. The other processes suggested by the commenter (body panel assembly, painting, and trim installation) do not affect mechanical operation of the vehicle and therefore are inconsistent with the definition of ''final assembly'' for purposes of 30D. Moreover, the VIN and labeling standards also would not consider such processes in determining the vehicle's plant of manufacture or final assembly point. To provide accessible information to taxpayers and to create an administrable rule, especially because the final assembly rule was immediately effective upon passage of the IRA,[6] the Treasury Department and the IRS determined it was necessary to leverage existing reporting of final assembly rather than create an alternative definition that relies on information that is not currently available to the public. The Treasury Department and the IRS consulted with the Department of Transportation in developing the proposed and final regulations regarding final assembly. Because the proposed definition of ''final assembly'' is consistent with the statutory definition and provides an administrable rule, the final regulations do not adopt this comment with respect to processes other than chassis assembly.

Another commenter stated that entities already in the process of constructing production facilities should not be held at a disadvantage given the economic opportunity of creating additional domestic jobs. The North American final assembly requirement in section 30D(d)(1)(G) is prescribed by statute, and the IRA provided an immediately applicable effective date for this provision (August 17, 2022). Accordingly, the final regulations do not adopt this comment.

15. Foreign Entity of Concern

Proposed § 1.30D–6(a)(10), consistent with section 30D(d)(7), defined ''foreign entity of concern'' to have the same meaning as in section 40207(a)(5) of the Infrastructure Investment and Jobs Act and guidance promulgated thereunder by the DOE. The final regulations adopt the proposed definition and move it to § 1.30D–2(b).

The definition of ''foreign entity of concern'' under section 40207(a)(5) of the Infrastructure Investment and Jobs Act is under the jurisdiction of the DOE. On December 1, 2023, contemporaneous with the issuance of the December Proposed Regulations, the DOE issued proposed interpretative guidance relating to the definition. 88 FR 84082 (published December 4, 2023). A number of commenters to the December Proposed Regulations made requests or suggestions with respect to the definition. These comments are outside of the scope of these regulations, and are not further addressed in this Summary of Comments and Explanation of Revisions.

Similarly, several commenters requested more detailed thresholds and processes for determining the involvement of FEOC entities based on entity ownership, control of, and/or acting jurisdiction. The determination of whether an entity is owned by, controlled by, or subject to the jurisdiction of a FEOC is within the jurisdiction of the DOE and its interpretive guidance. Accordingly, the comments are outside of the scope of these final regulations. One commenter also requested that the final regulations address the potential for arbitrage by artificially increasing the value of a critical mineral or battery component not based in or under the control of a FEOC. Because the FEOC Restriction is not based on value of materials, the final regulations do not adopt this comment.

16. FEOC-Compliant

Proposed § 1.30D–6(a)(11), adopted and moved to § 1.30D–2(b) of the final regulations, defined ''FEOC-compliant'' to mean in compliance with the applicable excluded entity requirement under section 30D(d)(7). The definition provided specific rules with respect to a clean vehicle battery, a battery component (other than a battery cell), a battery cell, and an applicable critical mineral. A number of commenters raised questions with respect to the due diligence required to determine if an item is FEOC-compliant or commented on the FEOC Restriction. These comments are addressed in section III.D of this Summary of Comments and Explanation of Revisions.

17. Manufacturer

Proposed § 1.30D–2(k) provided, consistent with section 30D(d)(3), that ''manufacturer'' means any manufacturer within the meaning of the regulations prescribed by the EPA for purposes of the administration of title II of the Clean Air Act (CAA) (42 U.S.C. 7521 *et seq.*) and as defined in 42 U.S.C. 7550(1).

Under 42 U.S.C. 7550(1) and 40 CFR 1068.30 under the CAA regulations, multiple parties may be a manufacturer with respect to a vehicle. To address this situation, the proposed definition also provided that, if multiple manufacturers are involved in the production of a vehicle, the requirements provided in section 30D(d)(3), which must be met for a vehicle to qualify for the section 30D, 45W and 25E credits, must be met by the manufacturer who satisfies the reporting requirements of the greenhouse gas emissions standards (CAA emissions reporting requirements) set by the EPA under the CAA for the subject vehicle. The purpose of the proposed multiple manufacturer rule was to provide a clear rule for OEMs and other parties that may be considered a manufacturer under the CAA regulations.

One commenter suggested that the final regulations modify the definition of ''manufacturer'' to include upstream members of the critical mineral supply chain, including cell manufacturers, cathode manufacturers, and anode manufacturers, in addition to the OEMs. Because the proposed regulations define a manufacturer by referring to the CAA regulations, if an upstream manufacturer is covered by the CAA regulations, that party will be a manufacturer under section 30D. However, if the upstream manufacturer is not covered by the CAA regulations, the statute would not include such manufacturers in the definition of ''manufacturer.'' Accordingly, the final regulations do not adopt this comment.

Another commenter requested that the multiple manufacturer rule be modified to include upfitters as manufacturers. Upfitters purchase new internal combustion engine (ICE) motor vehicles from manufacturers and then modify them into clean vehicles prior to the vehicle being placed in service by

[6] The final assembly requirement amendments made to section 30D in the IRA were applicable to vehicles sold after the date of enactment of the IRA. Public Law 117–169 § 13401(k)(2).

the ultimate purchaser. Because the ICE vehicle manufacturer is subject to the CAA emissions reporting requirements, neither the upfitter nor the ICE vehicle manufacturer would be able to meet the requirements of section 30D(d)(1)(C) and (3) under the multiple manufacturer rule in the proposed regulations. As a result, the vehicles modified by the upfitter would be ineligible for the section 25E, 30D, and 45W credits.

The Treasury Department and the IRS have concluded that including upfitters in the definition of ''manufacturer'' is consistent with the statutory language of section 30D and the CAA regulations, as well as Congressional intent to incentivize the development and purchase of non-ICE vehicles. Accordingly, the final regulations modify the multiple manufacturer rule to allow a manufacturer that modifies a new vehicle into either a new clean vehicle or a qualified commercial clean vehicle to enter into an agreement under section 30D(d)(3) if such modification occurs prior to the new motor vehicle being placed in service.

The same commenter requested that the final regulations allow this rule to apply retroactively for purposes of the section 45W credit for upfitters that modify new vehicles into qualified commercial clean vehicles. Section III.A.23 of this Summary of Comments and Explanation of Revisions concerning the definition of qualified manufacturer addresses this comment.

One commenter suggested that final regulations provide robust oversight of OEMs, including mandatory reporting of certain economic impacts including the collective bargaining status of final assembly plants, and repurposing the EPA's Clean School Bus Program's OEM Job Quality and Workforce Development questionnaire. This comment is beyond the scope of the final regulations and is not adopted.

The final regulations adopt the proposed definition of ''manufacturer'' with the modification regarding upfitters. In addition, the final regulations move the definition to § 1.30D–2(b).

18. Manufacturer's Suggested Retail Price (MSRP)

Proposed § 1.30D–2(c) provided that for purposes of the MSRP limitation in section 30D(f)(11)(A), ''manufacturer's suggested retail price'' means the sum of: (A) the retail price of the automobile suggested by the manufacturer as described in 15 U.S.C. 1232(f)(1); and (B) the retail delivered price suggested by the manufacturer for each accessory or item of optional equipment, physically attached to such automobile at the time of its delivery to the dealer, which is not included within the price of such automobile as stated pursuant to 15 U.S.C. 1232(f)(1), as described in 15 U.S.C. 1232(f)(2). This price information is reported on the label that is affixed to the windshield or side window of the vehicle, as described in 15 U.S.C. 1232.17.

One commenter stated that the determination of MSRP by manufacturers is not well-regulated, and that the final regulations should restrict manufacturers from setting an artificially low MSRP. The commenter suggested that the MSRP should be the actual out the door price paid, and should be limited so that the average cash price paid by consumers does not exceed the MSRP set by manufacturers. Another commenter suggested that the vehicle's base price (exclusive of accessories) be used to determine whether a vehicle's price is under the limitation to be eligible for the section 30D credit.

Section 30D(f)(11) restricts vehicle eligibility for the section 30D credit on the basis of MSRP, not on the basis of actual price paid. In addition, the Treasury Department and the IRS have determined that the MSRP should include not just the base MSRP described in 15 U.S.C. 1232(f)(1), but also the portion of the MSRP described in 15 U.S.C. 1232(f)(2) (each accessory or item of optional equipment, physically attached to the automobile at the time of its delivery to the dealer) because looking solely at base MSRP could encourage manufacturers to artificially lower the base MSRP and increase the amount of the MSRP allocated to accessories or items of optional equipment in an attempt to circumvent the MSRP limitations. Accordingly, the final regulations do not adopt the comments.

The final regulations adopt the proposed definition and move it to § 1.30D–2(b).

19. New Clean Vehicle

Proposed § 1.30D–2(m) defined ''new clean vehicle'' as a vehicle that meets the requirements described in section 30D(d). Under the proposed regulations, a new clean vehicle would not include any vehicle for which the qualified manufacturer: (1) fails to provide a periodic written report for such vehicle prior to the vehicle being placed in service, reporting the VIN of such vehicle and certifying compliance with the requirements of section 30D(d); (2) provides incorrect information with respect to the periodic written report for such vehicle; (3) fails to update its periodic written report in the event of a material change with respect to such vehicle; or (4) fails to meet the requirements of proposed § 1.30D–6(d) for new clean vehicles placed in service after December 31, 2024. For purposes of section 30D(d)(6), the term ''new clean vehicle'' includes any new qualified fuel cell motor vehicle (as defined in section 30B(b)(3)) that meets the requirements under section 30D(d)(1)(G) and (H).

Several commenters suggested that the Treasury Department and the IRS not allow leased vehicles to bypass the stringent domestic-sourcing requirements under section 30D by making the section 45W credit available for such vehicles. Another commenter asked whether the Modified AGI limitation would apply to the lessor or lessee if a clean vehicle is leased to individuals and, if used for business purposes, would fall within section 45W. Section 30D and section 45W each include a no double benefit rule. *See* section 30D(f)(2) and section 45W(d)(3). This demonstrates that under the statutory framework, certain vehicles may qualify for both the section 30D credit and the section 45W credit, and that in such instances, the taxpayer must choose which credit to claim. Further, as described in IRS Fact Sheet FS–2023–22, Topic G, Q5–7, a taxpayer that leases clean vehicles to its customers as its business may be eligible to claim the section 45W credit if the taxpayer is the owner of such vehicles for Federal income tax purposes. The owner of the vehicle is determined based on whether the lease is respected as a lease or is recharacterized as a sale for Federal income tax purposes. The Modified AGI limitation, if applicable, applies to the owner of the vehicle who places it in service for use or lease, and not to the lessee. Accordingly, the final regulations do not adopt these comments.

One commenter expressed concern that vehicles used in a courtesy transportation program would be ineligible for the section 30D credit upon a later sale due to the original use rule of section 30D(d)(1)(A). Because the original use rule is statutory, the final regulations do not adopt this comment. However, the owner of the vehicle that is used in a courtesy transportation program may itself be able to claim a section 30D credit.

Section 30D(d)(1)(F) requires the vehicle to be propelled to a significant extent by an electric motor that draws electricity from a battery that has a capacity of not less than 7 kilowatt hours, and is capable of being recharged from an external source of electricity.

One commenter requested that the final regulations define ''significant extent'' in the context of section 30D(d)(1)(F), but did not propose a definition. Given the purpose of this requirement to distinguish ICE vehicles from battery electric vehicles and plug-in hybrid electric vehicles, and the possibility for technical change in this area, it would be impracticable to precisely define the term. For these reasons, the final regulations do not adopt this comment.

Finally, one commenter suggested making the VINs of eligible vehicles available in an accessible, dealer-facing database, which would allow dealers to use a common source to readily identify which vehicles are eligible for the section 30D credit, reduce confusion, and improve deployment. This comment is outside of the scope of these final regulations. However, the Treasury Department and the IRS, together with the DOE, have provided public-facing information regarding vehicle eligibility via the IRS website and *https://fueleconomy.gov* and will continue to develop such information in a way that is accessible to dealers and taxpayers.

The final regulations adopt the proposed definition of ''new clean vehicle'' with clarifying language that new clean vehicles include battery electric vehicles, plug-in hybrid electric vehicles, fuel cell motor vehicles, and plug-in hybrid fuel cell motor vehicles.

20. New Qualified Fuel Cell Motor Vehicle

To provide additional clarity to taxpayers, the final regulations add a definition of a ''new qualified fuel cell motor vehicle'' to § 1.30D–2(b) that is consistent with section 30D(d)(6). Specifically, the final regulations define ''new qualified fuel cell motor vehicle'' to be any new qualified fuel cell motor vehicle (as defined in section 30B(b)(3)) that meets the requirements under section 30D(d)(1)(G) (that is, the final assembly in North America requirement) and (H) (that is, the seller report requirement), and that does not have a clean vehicle battery. This definition includes otherwise qualifying vehicles that have only a ''start-stop'' battery, because such a battery is not a clean vehicle battery.

21. Non-Traceable Battery Materials/ Impracticable-to-Trace Battery Materials

Proposed § 1.30D–6(a)(13)(i) defined ''non-traceable battery materials'' to mean specifically identified low-value battery materials that may originate from multiple sources and are often commingled during refining, processing, or other production processes by suppliers to such a degree that the qualified manufacturer cannot, due to current industry practice, feasibly determine and attest to the origin of such battery materials. Proposed § 1.30D–6(a)(13)(ii), which was reserved, would have provided the specific list of identified non-traceable battery materials. In the Explanation of Provisions to the December Proposed Regulations, the Treasury Department and the IRS, after extensive consultation with the DOE, stated that they would consider whether the following applicable critical minerals (and associated constituent materials) may be designated as identified non-traceable battery materials: applicable critical minerals contained in electrolyte salts, electrode binders, and electrolyte additives.

The Treasury Department and the IRS received a number of comments with respect to the definition of ''non-traceable battery materials'' as well as the related FEOC Restriction transition rule for non-traceable battery materials. Section III.D of this Summary of Comments and Explanation of Revisions discusses these comments.

Consistent with the expectation and requirement that OEMs will develop thorough tracing processes in the future, even while such processes do not now exist, the final regulations retain the list but change the name to ''impracticable-to-trace battery materials.'' The final regulations adopt the proposed definition and move it to § 1.30D–2(b). Specifically, the final regulations define ''identified impracticable-to-trace battery materials'' as applicable critical minerals in the following circumstances: graphite contained in anode materials (both synthetic and natural) and applicable critical minerals contained in electrolyte salts, electrode binders, and electrolyte additives.

22. Processing

Proposed §§ 1.30D–3(c)(13) and 1.30D–6(a)(14) defined ''processing'' as the non-physical processes involved in the refining of non-recycled substances or materials, including the treating, baking, and coating processes used to convert such substances and materials into constituent materials. The proposed regulations further provided that processing begins when chemical or thermal processes, or the combination of them, are used on extracted minerals or natural resources or manmade minerals or resources to create a new product that, through subsequent steps in the applicable critical minerals supply chain, will be processed into a final constituent material. Under the proposed regulations, processing included the chemical or thermal processes involved in refining, but did not include the physical processes involved in refining.

One commenter requested that the final regulations include high temperature heat treatment among the listed non-physical processes involved in refining that constitute processing to ensure that graphitization is included as processing. High temperature heat treatment is a thermal process, so it is already included in the definition of processing. Therefore, the commenter's requested modification is unnecessary.

Another commenter specifically requested that the final regulations address a fact pattern in which lithium carbonate is procured from an ally of the United States that is not a country with which the United States has a free trade agreement in effect, but is processed into both lithium hydroxide and cathode active material in the United States or a country with which the United States has a free trade agreement in effect. Lithium carbonate is a form of an applicable critical mineral specified in 45X(c)(6); therefore, it is subject to the Critical Minerals Requirement. Lithium carbonate that is procured from a region that is not in the United States or a country with which the United States has a free trade agreement in effect but is processed in the United States may be counted in the numerator of the qualifying critical mineral content calculation to the extent of the value added in the United States.

A number of commenters requested clarification on the line between extraction and processing. One commenter requested that the final regulations clarify that minor treatments necessary to render raw materials transportable are not processing (as chemical or thermal refining), but are instead extraction (as beneficiation). Another commenter noted that evolving technologies, such as glycine leaching technology, simplify value chains and may not uniquely fit into the proposed definitions of ''extraction'' or ''processing.'' One commenter recommended narrowing the definition of ''processing'' to exclude processes performed during battery manufacturing. Another commenter requested that the final regulations provide additional examples of different procurement chains that illustrate where the extraction and processing steps begin and end. Finally, another commenter proposed alternative definitions of ''extraction'' and ''processing'' that conform with the commenter's view of industry practice, rather than distinguish between physical and non-physical processes. That same commenter requested that the

final regulations clarify that smelting nickel is extraction rather than processing, again consistent with the commenter's view of industry practice. The Treasury Department and the IRS note that smelting nickel is a thermal process and is therefore already included in the proposed definition of ''processing.'' Further, the proposed regulations expressly list, in the definitions of ''extraction'' and ''processing,'' production steps that are generally high value add, and it is likely not possible to generate an exhaustive list given the variety of production steps that may apply to the various applicable critical minerals. Moreover, the proposed regulations are more administrable than a rule based on industry standards, which may change in the future. Accordingly, the final regulations do not adopt these comments.

The final regulations adopt the definition of ''processing'' in proposed §§ 1.30D–3(c)(13) and 1.30D–6(a)(14), consolidate it into a single provision, and move it to § 1.30D–2(b).

23. Qualified Manufacturer

Proposed § 1.30D–3(c)(15), applicable to the Critical Minerals and Battery Components Requirements, defined a ''qualified manufacturer'' as a manufacturer described in section 30D(d)(3). Proposed § 1.30D–2(l), applicable as a general definition for section 30D purposes, similarly defined a ''qualified manufacturer'' as a manufacturer that meets the requirements described in section 30D(d)(3). In addition, proposed § 1.30D–2(l) provided that the term ''qualified manufacturer'' does not include any manufacturer whose qualified manufacturer status has been terminated by the IRS for fraud, intentional disregard, or gross negligence with respect to any requirements of section 30D, including with respect to the periodic written reports described in section 30D(d)(3) and proposed § 1.30D–2(m), and any attestations, documentation, or certifications described in proposed §§ 1.30D–3(e) and 1.30D–6(d), at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

As in discussed in section III.A.17 of this Summary of Comments and Explanation of Revisions concerning the definition of ''manufacturer,'' a commenter requested that the proposed multiple manufacturer rule be modified to include upfitters as manufacturers. The same commenter requested that the final regulations allow upfitters to rely on any final regulations as of January 1, 2023, register as qualified manufacturers after the final regulations are published, and include in such upfitters' first periodic written report to the IRS information regarding all vehicles that the upfitter asserts are eligible for the section 45W credit. This comment is outside the scope of the final regulations because (i) it pertains to the section 45W credit, and (ii) the qualified manufacturer registration process is addressed in Revenue Procedure 2023–33 and other sub-regulatory guidance. Accordingly, the final regulations do not adopt this comment.

However, in considering the comment regarding upfitters, the Treasury Department and the IRS have determined that it is necessary to clarify when qualified manufacturer status is determined. Accordingly, the final regulations clarify that, for purposes of determining whether the qualified manufacturer requirement of section 30D(d)(1)(C) is met, a new clean vehicle is made by a qualified manufacturer if it is made by a manufacturer that is a qualified manufacturer at the time a written report is submitted to the IRS under a qualified manufacturer agreement, as described in section 30D(d)(3). This rule is consistent with section 30D, as well as its underlying purpose of incentivizing clean vehicle deployment. Further, under this rule, a vehicle made by a manufacturer that was not a qualified manufacturer at the time of production may still qualify as a new clean vehicle, provided the manufacturer becomes a qualified manufacturer and submits a written report to the IRS prior to the time the vehicle is sold. In addition, The Treasury Department and the IRS lack authority to provide retroactive relief with respect to vehicles that were sold prior to the time the qualified manufacturer submitted a periodic written report to the IRS under the qualified manufacturer agreement. Finally, the qualified manufacturer requirements of sections 30D(d)(1)(C) and 30D(d)(3), and therefore these final regulations, also apply for purposes of sections 25E and 45W. *See* sections 25E(c)(1)(D)(i) and 45W(c)(1). Therefore, a vehicle made by a manufacturer that was not a qualified manufacturer at the time of production—including a vehicle produced prior to enactment of the IRA, when there were no qualified manufacturer rules with respect to section 30D—may qualify as a previously-owned clean vehicle, provided the manufacturer becomes a qualified manufacturer and submits a written report to the IRS prior to the time the vehicle is sold. Consistent with this rule and with the statute, the final regulations provide that the IRS may terminate qualified manufacturer status for fraud, intentional disregard, or gross negligence with respect to any requirement of section 25E or section 45W or any regulations thereunder.

The final regulations adopt the proposed definition of ''qualified manufacturer'' with the modification described previously, and move it § 1.30D–2(b).

24. Recycling

Proposed §§ 1.30D–6(a)(15) and 1.30D–3(c)(19) defined ''recycling'' as the series of activities during which recyclable materials containing applicable critical minerals are transformed into specification-grade commodities and consumed in lieu of virgin materials to create new constituent materials; such activities result in new constituent materials contained in the battery from which the electric motor of a new clean vehicle draws electricity. Under the proposed regulations, all physical, chemical, and thermal treatments or modifications that convert recycled feedstocks to specification grade constituent materials are included in recycling. The Explanation of Provisions to the April Proposed Regulations noted that this definition aligns with the current methods of direct, hydrometallurgical, or pyrometallurgical recycling that are utilized commercially for reuse of materials for battery applications.

In addition, proposed § 1.30D–6(c)(4)(ii)(D), provided that, for purposes of the FEOC Restriction, an applicable critical mineral and associated constituent material that is recycled is subject to the FEOC-compliance determination if the recyclable material (1) contains an applicable critical mineral, (2) contains material that was transformed from an applicable critical mineral, or (3) is used to produce an applicable critical mineral at any point during the recycling process. Under the proposed regulations, the determination of whether an applicable critical mineral or associated constituent material that is incorporated into a battery via recycling is FEOC-compliant took into account only activities that occurred during the recycling process.

One commenter noted that the definition of ''recycling'' is vague and does not clearly define which recycling steps (for example, shredding, separating, producing black mass, and critical mineral refinement processing) can and cannot occur within a FEOC. The commenter requested that the final regulations clarify that all recycling

activities must occur in a non-FEOC facility for the recycled material to qualify as FEOC-compliant in a new clean vehicle battery. Under the proposed regulations, the determination of whether an applicable critical mineral or associated constituent material that is incorporated into a battery via recycling is FEOC-compliant already takes into account all recycling activities. Accordingly, the suggested clarification is unnecessary.

Another commenter recommended that the Treasury Department and the IRS work with the DOE and other agencies to develop safeguards to prevent batteries from being recycled before the end of their useful lives by entities seeking to convert non-FEOC-compliant batteries into FEOC-compliant batteries through recycling. Critical minerals and associated constituent materials are subject to both the Critical Minerals Requirement and the FEOC Restriction. The Critical Minerals Requirement generally looks to the value of the recycled materials. Due to this requirement, as well as market forces, it will generally be uneconomical to recycle batteries before the end of their useful lives for purposes of the FEOC Restriction. Accordingly, the final regulations do not adopt this comment.

The final regulations consolidate the definition of ''recycling'' in proposed §§ 1.30D–3(c)(19), 1.30D–6(a)(15), and 1.30D–6(c)(4)(ii)(D) into a single provision, and move it to § 1.30D–2(b). Specifically, the final regulations define ''recycling'' as the series of activities during which recyclable materials containing applicable critical minerals are transformed into specification-grade commodities and consumed in lieu of virgin materials to create new constituent materials; such activities result in new constituent materials contained in the clean vehicle battery. Under the final regulations, all physical, chemical, and thermal treatments or modifications that convert recycled feedstocks to specification-grade constituent materials are included in recycling. Further, recycled applicable critical minerals and associated constituent materials are only subject to the requirements under §§ 1.30D–3 and 1.30D–6 if the recyclable material contains an applicable critical mineral, contains material that was transformed from an applicable critical mineral, or if the recyclable material is used to produce an applicable critical mineral at any point during the recycling process. The requirements under §§ 1.30D–3 and 1.30D–6 only take into account activities that occurred during the recycling process.

The final regulations also add an example that illustrates which activities are taken into account with respect to recycling for purposes of the Critical Minerals Requirement and the FEOC Restriction.

25. Section 30D Regulations

Proposed § 1.30D–2(f) defined ''section 30D regulations'' to mean §§ 1.30D–1 through 1.30D–4. The final regulations modify the definition to mean §§ 1.30D–1 through 1.30D–6, and move it to § 1.30D–2(b).

26. Seller Report

Proposed § 1.30D–2(j) defined ''seller report'' as the report described in section 30D(d)(1)(H) and provided by the seller of a vehicle to the taxpayer and the IRS in the manner provided in, and containing the information described in, guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The proposed regulations further provided that the seller report must be provided to the IRS electronically. In addition, the proposed regulations provided that the term ''seller report'' does not include a report rejected by the IRS due to the information contained therein not matching IRS records. The final regulations adopt the proposed definition and move it to § 1.30D–2(b).

One commenter requested that the IRS issue a form, with related instructions, for making seller reports to taxpayer/purchasers as required by § 30(D)(d)(1)(H). The Treasury Department and the IRS have issued such a form, Form 15400, *Clean Vehicle Seller Report.*

27. Value

Proposed § 1.30D–3 defined ''value,'' with respect to property, as the arm's-length price that was paid or would be paid for the property by an unrelated purchaser determined in accordance with the principles of section 482 of the Code and regulations thereunder. The final regulations adopt the proposed definition and move it to § 1.30D–2(b).

One commenter recommended that the Treasury Department and the IRS consider how the term ''value'' might be defined in a manner that accommodates and incentivizes further technological innovation, increased performance and efficiency, and minimization of environmental impacts. The commenter, however, did not propose a specific modification to the definition. The final regulations, consistent with the proposed regulations, define ''value'' in accordance with longstanding tax law principles.

28. Vehicle Classifications

Proposed § 1.30D–2(g) provided that the vehicle classification of a new clean vehicle is to be determined consistent with the EPA's fuel economy labeling rules and definitions provided in 40 CFR 600.315–08 for vans, sport utility vehicles, pickup trucks, and other vehicles. Specifically, ''van'' means a vehicle classified as a van or minivan under 40 CFR 600.315–08(a)(2)(iii) and (iv), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a)(3)(ii); ''sport utility vehicle'' means a vehicle classified as a small sport utility vehicle or standard sport utility vehicle under 40 CFR 600.315–08(a)(2)(v) and (vi), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a)(3)(ii); ''pickup truck'' means a vehicle classified as a small pickup truck or standard pickup truck under 40 CFR 600.315–08(a)(2)(i) and (ii), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a)(3)(ii); and ''other vehicle'' means any vehicle classified in one of the classes of passenger automobiles listed in 40 CFR 600.315–08(a)(1), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a)(3)(ii).

One commenter commended the Treasury Department's and the IRS's decision to align the section 30D vehicle classification definitions with existing EPA regulations, which incorporate certain classification flexibility. For added clarity, the commenter recommended that the final regulations adopt by reference less specific pin cites in the EPA fuel economy labeling regulations to better reflect EPA's general classification authority. In particular, the commenter suggested that the final regulations define a sport utility vehicle by citing 40 CFR 600.315–08(a)(1), which states that the EPA Administrator may classify passenger automobiles by car line into one of the classes based on interior volume index or seating capacity except for those that the Administrator determines are most appropriately placed in a different classification. Additionally, the commenter suggested that the final regulations define pickup truck by citing 40 CFR 600.315–08(a)(2) or 40 CFR 600.315–08 generally rather than 40 CFR 600.315–08(a)(3)(ii). After consultation with the EPA, the Treasury Department and the IRS agree that a more general cross-reference to EPA's classification authority is warranted, given the authority not only in 40 CFR 600.315–08(a)(3)(ii) but also in 40 CFR 600.315–08(a)(1) and (2). The final

regulations adopt the comment and modify the definitions accordingly.

Another commenter requested that the MSRP limitation under section 30D(f)(11)(B) be expanded to apply to all crossover vehicles similar to the regime described in 40 CFR 600.315–08, which would further incentivize automakers to onshore electric vehicle supply chains by making additional vehicles eligible for the section 30D credit. The Treasury Department and the IRS note that crossover vehicles are included in the vehicle classifications subject to the appropriate MSRP limitation. Under the EPA fuel economy labeling regulations, crossover vehicles may be categorized as either a sport utility vehicle or other vehicle. The Treasury Department and the IRS adopted the EPA fuel economy labeling definitions in part because they are reported on the vehicle label and are accessible on *https://fueleconomy.gov*, making the classification accessible to both consumers and the IRS. In addition, the EPA fuel economy labeling definitions provide some discretion, which EPA may exercise to align its classifications with consumer expectations regarding vehicle type. Because the proposed regulations already adopt the regime suggested by commenters and because the MSRP limitation is prescribed by statute, the final regulations do not adopt this comment.

A different commenter requested that low-speed vehicles be included in the ''other vehicles'' classification under proposed § 1.30D–2(g)(5), noting that they are commercial, street-legal vehicles. However, as the commenter notes, a new clean vehicle must be treated as a motor vehicle for purpose of title II of the Clean Air Act as described in section 30D(d)(1)(D). Under section 216 of the title II of the Clean Air Act, a motor vehicle is defined as ''any self-propelled vehicle designed for transporting persons or property on a street or highway.'' 42 U.S.C. 7550(2). EPA regulations at 40 CFR 85.1703(e)(1) further define a motor vehicle under title II of the Clean Air Act to exclude vehicles with maximum speeds of 25 miles per hour, which excludes low-speed vehicles. Because section 30D requires new clean vehicles to meet Clean Air Act standards, which exclude low-speed vehicles, the final regulations do not adopt this comment.

Some commenters praised the proposed implementation of the fuel economy labeling regime, whereas others claimed there is a potential for misclassifying vehicles given the lessened emphasis on weight and other physical characteristics as major classification factors under EPA standards as compared to gas-powered vehicles. In particular, a commenter stated the proposed vehicle classification regime is arbitrary and unreliable, due to the EPA's subjective authority granted without explicit authorization found in title I of the IRA. The commenter requested that the final regulations use objective vehicle classification standards, such as those found in 40 CFR 600.002, rather than subjective EPA determinations. An additional commenter stated that light trucks and SUVs in particular may be misclassified as passenger cars if physical characteristics are overlooked for emissions.

The Treasury Department and the IRS previously considered adopting the vehicle classification definitions used by the CAFE standards in 40 CFR 600.002, as described in Notice 2023–1. After consultation with the DOE and the EPA, as provided for in section 30D(f)(11)(C), the Treasury Department and the IRS determined that the fuel economy labeling standards in 40 CFR 600.315–08 better reflect consumer expectations and marketing practices regarding vehicle classifications. In addition, the vehicle classification, as determined under the fuel economy labeling standards, is shown on the vehicle label and is otherwise accessible on *https://fueleconomy.gov,* making the classification accessible to both consumers and the IRS. In contrast, a particular vehicle's classification under the CAFE standard is not publicly available information under current practices. For these reasons, the final regulations do not adopt the comments.

The final regulations adopt the proposed definition, with more general cross-references to EPA's classification authority, and move it to § 1.30D–2(b).

B. Critical Minerals and Battery Components Requirements

Section 30D(e) provides requirements for critical minerals and battery components with respect to clean vehicle batteries. The Critical Minerals and Battery Components Requirements apply to applicable critical minerals and battery components, respectively, contained in a battery. The April Proposed Regulations set forth rules for the Critical Minerals and Battery Components Requirements in proposed § 1.30D–3. The final regulations reorganize the rules of the Critical Minerals and Battery Components Requirements.

First, the proposed regulations included, in proposed § 1.30D–3(c), definitions applicable for purposes of the Critical Minerals and Battery Components Requirements. As noted previously in section III.A of this Summary of Comments and Explanation of Revisions, the final regulations move many of these definitions to § 1.30D–2(b), as general definitions for purposes of section 30D and the section 30D regulations. The final regulations retain the definitions applicable to the calculations of the Critical Minerals Requirement in § 1.30D–3(c)(1), and the definitions applicable to and the Battery Components Requirement in § 1.30D–3(c)(2). Second, the final regulations include rules for the calculation of qualifying critical mineral content for purposes of the Critical Minerals Requirement in § 1.30D–3(a), and for the calculation of qualifying battery component content for purposes of the Battery Components Requirement in § 1.30D–3(b). Third, the final regulations finalize, as § 1.30D–3(d),[7] the rules for upfront review of the Critical Minerals and Battery Components Requirements. Fourth, the final regulations add a new rule for new qualified fuel cell motor vehicles as § 1.30D–3(e). Finally, in response requests from commenters, the final regulations add examples that illustrate the calculations under the Critical Minerals and Battery Components Requirements as § 1.30D–3(f).

1. Critical Minerals Requirement

Proposed § 1.30D–3(a)(1) provided that that Critical Minerals Requirement was met if the qualifying critical mineral content of the clean vehicle battery of the vehicle is equal to or exceeds the applicable critical minerals percentage provided in section 30D(e)(1)(B) and proposed § 1.30D–3(a)(2). Proposed § 1.30D–3(c)(18) defined ''qualifying critical mineral content'' as the percentage of the value of the applicable critical minerals contained in the clean vehicle battery that were extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or were recycled in North America.

The April Proposed Regulations provided a three-step process (50% Value Added Test) for determining the qualifying critical mineral content of a clean vehicle battery.

First, qualified manufacturer would determine the procurement chain or chains for each applicable critical

[7] The April Proposed Regulations reserved proposed § 1.30D–3(d) for excluded entities. The December Proposed Regulations modified proposed § 1.30D–3(d) to include a cross reference to the rules for excluded entities in proposed § 1.30D–6. These final regulations finalize those rules in § 1.30D–6; § 1.30D–3(d) is deleted as unnecessary.

mineral. Proposed § 1.30D–3(c)(14) defined a ''procurement chain'' as a common sequence of extraction, processing, or recycling activities that occur in a common set of locations, concluding in the production of constituent materials. In addition, proposed § 1.30D–3(c)(14) clarified that sources of a single applicable critical mineral may have multiple procurement chains if, for example, one source of the applicable critical mineral undergoes the same extraction, processing, or recycling process in different locations. Each applicable critical mineral procurement chain would be evaluated separately pursuant to proposed § 1.30D–3(a)(3)(ii).

Second, qualified manufacturers would evaluate each applicable critical mineral procurement chain in the clean vehicle battery to determine whether critical minerals procured from the chain have been (1) extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or (2) recycled in North America. Applicable critical minerals that satisfy this requirement are considered qualifying critical minerals. Proposed § 1.30D–3(c)(17) defined ''qualifying critical mineral'' as an applicable critical mineral that is extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or that is recycled in North America. Proposed § 1.30D–3(c)(17) used a 50 percent threshold to determine whether an applicable critical mineral is a ''qualifying critical mineral.'' Thus, under the proposed regulations, an applicable critical mineral was treated as extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, if: (1) 50 percent or more of the value added to the applicable critical mineral by extraction is derived from extraction that occurred in the United States or in any country with which the United States has a free trade agreement in effect; or (2) 50 percent or more of the value added to the applicable critical mineral by processing is derived from processing that occurred in the United States or in any country with which the United States has a free trade agreement in effect. An applicable critical mineral would be treated as recycled in North America if 50 percent or more of the value added to the applicable critical mineral by recycling is derived from recycling that occurred in North America. Proposed § 1.30D–3(c)(25) defined ''value added,'' with respect to recycling, extraction, or processing of an applicable critical mineral, as the increase in the value of the applicable critical mineral attributable to the relevant activity.

Third, qualified manufacturers would calculate qualifying critical mineral content. Under proposed § 1.30D–3(a)(3)(i), qualifying critical mineral content would be calculated as the percentage that results from dividing the total value of qualifying critical minerals by the total value of critical minerals. Proposed § 1.30D–3(c)(23) defined ''total value of qualifying critical minerals'' as the sum of the values of all the qualifying critical minerals contained in a battery described in proposed § 1.30D–3(a)(1). Proposed § 1.30D–3(c)(22) defined ''total value of critical minerals'' as the sum of the values of all applicable critical minerals contained in a battery described in proposed § 1.30D–3(a)(1).

Proposed § 1.30D–3(a)(3)(iii) required qualified manufacturers to select a date for determining the values associated with the total value of qualifying critical minerals (determined separately for each procurement chain) and the total value of critical minerals. Such date needs to be after the final processing or recycling step for the applicable critical minerals relevant to the certification described in section 30D(e)(1)(A) of the Code and should be uniformly applied for all applicable critical minerals contained in the battery.

Proposed § 1.30D–3(a)(3)(iv) provided that a qualified manufacturer may determine qualifying critical mineral content based on the value of the applicable critical minerals actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying critical mineral content for batteries in a group of vehicles, a qualified manufacturer could average the qualifying critical mineral content calculation over a limited period of time (for example, a year, quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof, with final assembly (as defined in section 30D(d)(5) of the Code and proposed § 1.30D–2(b)) within North America.

The Treasury Department and the IRS received numerous comments with respect to the Critical Minerals Requirement. To the extent comments relate to general definitions, such as ''constituent material,'' ''extraction,'' or ''processing,'' they are addressed in section III.A of this Summary of Comments and Explanation of Revisions.

Many commenters expressed criticism or concerns relating to the Critical Minerals Requirement. Several criticized the requirement as too strict. For example, one commenter stated that classifying the supply chains of the United States' allies as non-qualifying would damage the development of a North American supply chain. Section 30D(e)(1) requires an analysis of the location of supply chain activities (that is, extraction, processing, and recycling). Accordingly, the final regulations do not adopt these comments.

Similarly, one commenter requested that the Critical Minerals Requirement be restricted to nickel, cobalt, lithium, manganese, and graphite, as minerals. Because section 30D(e)(1)(A) defines ''applicable critical minerals'' by reference to section 45X(c)(6), which includes a broader list of minerals than the five noted by the commenter, the final regulations do not adopt this comment.

Many comments addressed the 50% Value Added Test. Multiple comments were supportive of the tests, while others recommended that the final regulations adopt a different rule. One commenter suggested that, for lithium and nickel, the final regulations replace the 50% Value Added Test with rules that specify which combinations of extraction and processing are necessary for qualification as qualifying critical mineral content. Two commenters recommended that the 50% Value Added Test be replaced with a determination based on change in tariff classifications. Several comments asserted that the 50% Value Added Test was not strict enough. One commenter stated that the 50% Value Added Test impermissibly stretches the statute by substantially diluting the applicable percentage requirement of section 30D(e)(1)(B). Similarly, another commenter states that the 50% Value Added Test improperly dilutes section 30D(e)(1)(B), and that it improperly bifurcates the Critical Minerals Requirement into separate tests for extraction and processing. Several commenters proposed that the 50% Value Added Test be increased to a higher percentage. Another commenter requested that the 50% Value Added Test be eliminated entirely after 2024. A different commenter requested that guidance describing a more stringent test under the Critical Minerals Requirement be provided as soon as possible, in order to provide clarity to taxpayers, OEMs, and battery suppliers. However, another commenter suggested that the IRS and the Treasury Department refrain from drafting a replacement to the 50% Value Add Test until supply chains are more mature.

An applicable critical mineral may undergo multiple steps of each of extraction, processing, or recycling that occur in multiple locations, and section 30D(e)(1)(A) does not specify how to determine whether an applicable critical mineral was extracted, processed, or recycled in a statutorily-required location. To account for this, the 50% Value Added Test was developed to determine whether an applicable critical mineral procurement chain was sufficiently produced in a statutory-required location to count toward meeting the Critical Minerals Requirement. The 50% Value Added Test allows qualified manufacturers to make an objective determination of when an applicable critical mineral was produced in a manner that would qualify under section 30D(e)(1)(A). While some commenters have criticized the 50 percent threshold as too low, this percentage, as noted in the Explanation of Provisions to the April Proposed Regulations, was intended as a transition rule while ensuring that a significant portion of the extraction, processing, or recycling activities was performed in a statutorily required location. The percentage was designed with the purposes of section 30D(e)(1) in mind and to allow qualified manufacturers time to transition supply chains in anticipation of a more stringent rule.

The final regulations adopt the Traced Qualifying Value Test, described more fully after the discussion of comments in this section of the Summary of Comments and Explanation of Revisions. This test is more precise than the 50% Value Added Test, as it requires an OEM to fully trace any value added in each procurement chain that it applies toward the Critical Minerals Requirement. It is also generally more stringent, because the OEM may treat as qualifying only a percentage of value of an applicable critical mineral, and not the full value. The Traced Qualifying Value Test credits the share of value added by extraction or processing in the United States or a country with which the United States has a free trade agreement in effect, or recycling in North America, in determining whether the Critical Minerals Requirement is met. By looking to the highest value-added percentage of the three specified activities (extraction, processing, or recycling) for each applicable critical mineral procurement chain, the Traced Qualifying Value Test appropriately implements the statutory language requiring only one of the three specified activities with respect to an applicable critical mineral to occur in a qualifying place in order to have the value of an applicable critical mineral count toward satisfying the Critical Minerals Requirement.

In response to comments suggesting alternative approaches to determining whether the Critical Minerals Requirement is satisfied, the Treasury Department and the IRS have determined that specifying combinations of extraction and processing steps would not be administrable given the potential number of permutations. Moreover, specifying combinations only for certain minerals would be at odds with the rules of section 30D(e)(1), which apply to all critical minerals. Similarly, the Treasury Department and the IRS have determined that determining qualifying mineral content based on a change in tariff classification would not be administrable or provide certainty to OEMs because changes in tariff classification may not provide the clear standards required for purposes of tax credit eligibility determinations.

The final regulations adopt the Traced Qualifying Value Test, which is described further below after the discussion of comments in this section of the Summary of Comments and Explanation of Revisions, for taxable years ending after May 6, 2024. In response to commenters who supported the 50% Value Added Test or who supported a longer transition period, the final regulations permit use of the 50% Value Added Test as an optional transition rule for vehicles for which a qualified manufacturer provides a periodic written report prior to January 1, 2027, and require the 50% Value Added Test for vehicles for which a qualified manufacturer provides a periodic written report prior to May 6, 2024.

Several commenters to the April Proposed Regulations raised questions about how the FEOC Restriction applied to applicable critical minerals. These questions were answered in the December Proposed Regulations, which are finalized herein.

Several commenters raised questions relating to the calculation under the 50% Value Added Test. These questions may be relevant under these final regulations for either the 50% Value Added Test (as it is retained as a transition rule) or for the Traced Qualifying Value Test, and so are addressed herein. For example, one commenter requested clarification on whether lithium carbonate or lithium ore corresponding to lithium carbonate should be used to calculate the total value of qualifying critical minerals. The final regulations clarify, in the definition of ''applicable critical mineral'' in § 1.30D–2(b), that the Critical Minerals Requirement and FEOC Restriction determinations with respect to an applicable critical mineral take into account each step of extraction, processing, or recycling through the step in which such mineral is processed or recycled into an associated constituent material, even if the mineral is not in a form listed in section 45X(c)(6) at every step of production. Thus, both the lithium carbonate and lithium ore should be taken into account. Several commenters raised specific questions about specific components of the calculation. Another commenter requested that the final regulations clarify that, under step three of the 50% Value Added Test calculation, the total value of qualifying critical minerals and total value of critical minerals means the value of the corresponding constituent materials. Because a constituent material may be composed of an applicable critical mineral that has multiple procurement chains, or of multiple critical minerals, their values may not necessarily correspond to the value of the associated constituent material. Accordingly, the final regulations do not adopt this comment. Another commenter asked whether a weighted average is used for purposes of the 50% Value Added Test if an applicable critical mineral has two or more procurement chains. The same commenter asked if the 50% Value Added Test can be satisfied by adding percentages across extraction and processing. Under both the proposed and final regulations, the 50% Value Added Test does not use a weighted average, and the percentages must be examined separately for each of extraction, processing, or recycling. Relatedly, two commenters noted that the proposed regulations did not provide a methodology for distributing the value-add across procurement chains. The proposed regulations required a separate analysis of each procurement chain and did not allow for analysis across procurement chains. Because allowing analysis across procurement chains would be at odds with the supply-chain tracing requirements of section 30D(e)(1), the final regulations do not adopt these comments.

One commenter asked for clarification on how to determine value added in cases in which multiple applicable critical minerals are processed together, and recommended that the final regulations provide that value added be allocated to each applicable critical

mineral based on weight. The proposed regulations defined ''value added'' with respect to recycling, extracting, or processing of an applicable critical mineral as the increase in the value of the applicable critical mineral attributable to the relevant activity; the proposed regulations did not provide a specific rule for a case in which multiple applicable critical minerals are processed together. In response to this comment, the final regulations clarify that, in the case in which multiple applicable critical mineral procurement chains are part of the same processing or recycling activity, value added should be allocated to each procurement chain based on relative mass.

The proposed regulations allowed qualified manufacturers to average qualifying critical mineral content over a limited period of time (for example, a year, quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof. The Treasury Department and the IRS received a number of comments on this rule. Several commenters were supportive of the proposed rule or sought a broader averaging rule. One commenter asked that the final regulations expressly allow for an 18-month averaging period. One commenter requested that the final regulations consider also allowing qualified manufacturers to average critical mineral content over batteries produced at a particular facility. Similarly, another commenter requested that the final regulations allow automakers to calculate, on a companywide basis, their volume or percentage of qualifying critical minerals and allocate such minerals to specific batteries or vehicles on a unit-by-unit or VIN-by-VIN basis. On the other hand, several commenters raised concerns that the averaging rule could allow for manipulation. One commenter suggested limitations on the averaging rule, and requested that the final regulations require automakers to offer a clear explanation of how they perform the calculation, and demonstrate to the IRS that the calculation will neither exclude any vehicles with a battery that the automaker brings to market, nor double count any vehicles. The commenter also suggested that the IRS limit an automaker's ability to switch between groupings of vehicles (for purpose of calculating the average) to minimize the opportunity to manipulate the calculation. The commenter further recommended that automakers be allowed to choose a test period (preferably as late as possible in the year) over which to calculate average values to take advantage of growing qualifying supply chains, but with sufficient time to ensure the automaker can determine vehicle eligibility for the tax credit before the beginning of a calendar year. Another commenter noted that averaging qualifying critical mineral content by alternative periods of time by model line, plant, class, or combination thereof with final assembly in North America may prove an administrative burden and result in an increased risk of manipulation, citing how anode and cathode critical minerals could move through the procurement supply chain to manipulate value calculations. A separate commenter expressed concern that the averaging rules could allow OEMs to source critical minerals from outside the United States and countries with which the United States has free trade agreements in effect, yet still satisfy the Critical Minerals Requirement. The Treasury Department and the IRS have determined that the proposed rules reflect a reasonable balancing of these considerations by allowing averaging, but limiting it to groups of vehicles that may share the same procurement chains (that is, vehicles from the same model line, plant, class, or some combination of thereof). In addition, the upfront review process, finalized as § 1.30D–3(d), provides a mechanism for review and verification of OEM calculations, which will prevent manipulation. Finally, the time periods of a year, quarter, or month are exemplary and do not prevent averaging over a different time period. However, the averaging period should be consistent with any rules and procedures established by the upfront review process. Accordingly, the final regulations do not adopt these comments.

Several commenters raised concerns with respect to the volatility of mineral pricing. One such commenter requested that qualified manufacturers be given the option to elect to average the most common critical mineral's value with the historical values of that material based on previous annual contracts. Others requested a historical lookback period of between eighteen months to five years. Another commenter requested that the Treasury Department and the IRS allow for multiple methods of calculation to address market fluctuations. Specifically, the commenter recommended that to address market fluctuations, the previous year's average mineral price could be used, or a five-year average. The commenter further noted that this would take into account the very large difference in the value of the different materials, but mitigate against market volatility. A commenter suggested the Treasury Department and the IRS provide the option to use widely-recognized and trusted market indices to serve as an acceptable estimation of the price of a particular step in the procurement chain for which actual prices for certain procurement chains or portions of the procurement chain cannot be determined by the manufacturer. The commenter noted that contracts with suppliers usually indicate what the ''controllable piece'' is, essentially what cost of that supplier's value-add is within the overall cost of the supplied product. However, contracts typically do not provide a set cost for inputs, as those inputs are price flexible based on the mineral markets, meaning that using an established mineral market index for cost estimation would more closely reflect the real-world prices paid for that material. The commenter indicated that these indices may include those commonly cited in U.S. Geological Survey reports. Finally, commenters proposed adopting a safe harbor provision due to the price volatility of critical minerals, which would enable producers of critical minerals to relocate sourcing operations to the United States or countries with which the United States has free trade agreements in effect. The Treasury Department and the IRS acknowledge these commenters' concerns relating to mineral valuation and volatility. The averaging rules of the proposed and final regulations are intended, in part, to address these concerns by allowing qualified manufacturers to determine qualifying critical mineral content based on an average value (rather than the value at a specific time that may be unusually high or low) and by allowing qualified manufacturer flexibility in determining the averaging period. Similarly, the proposed and final regulations allow qualified manufacturers to choose a date, after the final processing or recycling step, for the determination of value, which also provides flexibility. Accordingly, the final regulations do not adopt these comments.

Several commenters commented on sourcing and OEM due diligence. One commenter suggested that the final regulations require qualified manufacturers to engage in detailed tracing, and provide related documentation to the IRS. That commenter suggested that the processes of the EU Battery Regulation could provide a model. Another commenter encouraged the Treasury Department

and the IRS to work closely with the DOE, Environmental Protection Agency, and Department of Transportation to explore how a digital battery identifier could help facilitate material sourcing transparency and improve the efficiency of battery repurposing and recycling. Several commenters suggested adopting standards based on Organisation for Economic Co-operation and Development (OECD) standards. A commenter requested clarification on what due diligence is required with respect to battery supply chains, particularly in instances in which intermediate materials may not be sold on an open market. The upfront review process of § 1.30D–3(d) is intended to provide clear rules and a clear process for automakers to provide information regarding due diligence with respect to the Critical Minerals and Battery Components Requirements to the IRS. The Treasury Department and the IRS are considering future sub-regulatory guidance with respect to the upfront review process.

Finally, one commenter raised concerns that unexpected events could affect the supply of either applicable critical minerals or battery components, and suggested that the Treasury Department and the IRS allow for a temporary waiver request process in such cases, allowing the affected minerals or components to be excluded from the calculation under the Critical Minerals or Battery Components Requirements. The commenter set out a detailed scheme for the waiver process. Another commenter similarly requested a waiver process in cases in which certain production steps are affected by either market volatility or unexpected events. The Treasury Department and the IRS determined that the averaging rules under the Critical Minerals and Battery Components Requirements allow for flexibility in the case of both price fluctuations and unexpected events. In addition, allowing OEMs or their suppliers a waiver with respect to certain production steps could be subject to manipulation. Accordingly, these comments are not adopted.

As under the proposed regulations, the final regulations, under § 1.30D–3(a)(1), provide that the Critical Minerals Requirement is met if the qualifying critical mineral content of the clean vehicle battery of the vehicle is equal to or exceeds the applicable critical minerals percentage provided in section 30D(e)(1)(B) and § 1.30D–3(a)(2). The proposed regulations included the 50% Value Added Test for determination of the qualifying critical mineral content. In the Explanation of Provisions to the April Proposed Regulations, the Treasury Department and the IRS anticipated that the 50% Value Added Test would serve as a transition rule, which would provide manufacturers time to develop the necessary capability to certify compliance with the Critical Minerals Requirement throughout their supply chains, and the final regulations would move to a more stringent test. Certain commenters criticized the April NPRM rules as inconsistent with the statute, while others have been supportive. Several commenters asked for additional clarity as to how to make the calculations and for specific examples. Others asked that the calculation in the proposed rule be made permanent. Other than as described above, commenters generally did not identify alternative proposals for the Critical Minerals requirement. Consistent with this, and taking into account the comments received, the final regulations adopt the following rules for determining qualifying critical mineral content.

For vehicles for which a qualified manufacturer provides a periodic written report on or after May 6, 2024, § 1.30D–3(a)(3), as finalized, provides a three-step process (Traced Qualifying Value Test) for the calculation under the Critical Minerals Requirement.

First, the qualified manufacturer determines each procurement chain, as defined in § 1.30D–3(c)(1)(i), consistent with the April Proposed Regulations.

Second, the qualified manufacturer must determine the ''traced qualifying value'' of all applicable critical minerals'' and the ''total traced qualifying value.'' These definitions are introduced in the final regulations. ''Traced qualifying value'' is defined, in § 1.30D–3(c)(1)(vii) as, with respect to an applicable critical mineral that is extracted and processed into a constituent material, the value of the applicable critical mineral multiplied by the greater of (A) the value added to the applicable critical mineral by extraction that occurred in the United States or in any country with which the United States has a free trade agreement in effect, divided by the total value added from extraction of the applicable critical mineral; or (B) the value added to the applicable critical mineral by processing that occurred in the United States or in any country with which the United States has a free trade agreement in effect, divided by the total value added from processing of the applicable critical mineral. ''Traced qualifying value'' is defined as, with respect to an applicable critical mineral that is recycled into an associated constituent material, the value of the applicable critical mineral multiplied by the percentage obtained by dividing the value added to the applicable critical mineral by recycling that occurred in North America by the total value added from recycling of the applicable critical mineral. ''Valued added'' is defined in § 1.30D–3(c)(1)(viii), consistent with the April Proposed Regulations. Section 1.30D–3(a)(3)(ii) provides that the traced qualifying value of an applicable critical mineral, including the percentage or percentages necessary to determine the traced qualifying value, must be determined separately for each procurement chain. ''Total traced qualifying value,'' in § 1.30D–3(c)(1)(iv), is defined as the sum of the traced qualifying values of all applicable critical minerals contained in the clean vehicle battery.

Third, the qualified manufacturer determines the qualifying critical mineral content. Section 1.30D–3(a)(3)(i) provides that qualifying critical mineral content is determined by dividing the total traced qualifying value (calculated in step 2) by the total value of critical minerals. The final regulations, consistent with the proposed regulations, provide in § 1.30D–3(c)(1)(v) that the ''total value of critical minerals'' means the sum of the values of all applicable critical minerals contained in a clean vehicle battery.

Section 1.30D–3(a)(3)(iii) requires qualified manufacturers to select a date for determining the values associated with the total traced qualifying value (determined separately for each procurement chain) and the total value of critical minerals. Such date would need to be after the final processing or recycling step for the applicable critical minerals relevant to the certification described in section 30D(e)(1)(A) of the Code. This date would need to be uniformly applied for all applicable critical minerals contained in the battery.

Section 1.30D–3(a)(3)(iv) provides that a qualified manufacturer may determine qualifying critical mineral content based on the value of the applicable critical minerals actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying critical mineral content for batteries in a group of vehicles, a qualified manufacturer could average the qualifying critical mineral content calculation over a limited period of time (for example, a year, calendar quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof, with final assembly within North America.

As noted above, the Traced Qualifying Value Test is more precise than the 50% Value Added Test, as it requires an OEM to fully trace any value added in each procurement chain that it applies toward the Critical Minerals Requirement. It is also generally more stringent, because the OEM may treat as qualifying only a percentage of value of an applicable critical mineral, and not the full value. The Treasury Department and the IRS also considered adapting the 50% Value Added Test to require a higher threshold percentage than 50%, but such an approach results in a ''cliff effect'' whereby the value of applicable critical minerals just below the threshold percentages is not applied toward the Critical Minerals Requirement while the full value of applicable critical minerals just above the threshold percentage is treated as qualifying, which could lead to counter-intuitive results and increased potential for gaming. By contrast, the Traced Qualifying Value Test incentivizes each incremental increase in value-added activities in the United States and free trade agreement partner countries or in North America, as applicable. For these reasons, the Treasury Department and the IRS have determined that this test is the most effective of the potential alternatives considered in furthering the statutory purpose of transitioning to secure clean vehicle battery supply chains in the United States and allied countries.

In order to allow for a transition to the Traced Qualifying Value Test, the final regulations provide that, for vehicles for which a qualified manufacturer provides a periodic written report on or after May 6, 2024 and prior to January 1, 2027, a qualified manufacturer may calculate qualifying critical mineral content under the 50% Value Added Test. Finally, the regulations finalize the 50% Value Added Test for vehicles for which a qualified manufacturer provides a periodic written report prior to May 6, 2024.

2. Battery Components Requirement

The final regulations adopt the Battery Components Requirement of the April Proposed Regulations without change. Section § 1.30D–3(c)(2)(iii) defines ''qualifying battery component content'' as the percentage of the value of the battery components contained in the clean vehicle battery that were manufactured or assembled in North America. As finalized in § 1.30D–3(b)(1), the Battery Components Requirement is met if the qualifying battery component content of a clean vehicle battery is equal to or exceeds the applicable battery components percentage provided in section 30D(e)(2)(B) and § 1.30D–3(a)(2).

The final regulations provide a four-step process for determining the percentage of the value of the battery components in a battery that contribute toward meeting the Battery Components Requirement.

First, qualified manufacturers determine whether each battery component in a battery was a ''North American battery component,'' that is, a battery component substantially all of the manufacturing or assembly of which occurs in North America, without regard to the location of the manufacturing or assembly activities of any components that make up the particular battery component (as defined in § 1.30D–3(c)(2)(ii).

Second, qualified manufacturers determine the ''total incremental value of North American battery components,'' that is, the sum of the incremental values of each North American battery component contained in clean vehicle battery (as defined in § 1.30D–3(c)(2)(v)). ''Incremental value'' is defined as, with respect to the battery component, the value of that battery component minus the value of the manufactured or assembled battery components, if any, that are contained in that battery component (as defined in § 1.30D–3(c)(2)(i)).

Third, qualified manufacturers determine the ''total incremental value of battery components,'' that is, the sum of the incremental values of each battery component contained in a clean vehicle battery (as defined in § 1.30D–3(c)(2)(iv)).

Fourth, qualified manufacturers determine the qualifying battery component content, by dividing the total incremental value of North American battery components (determined in step 2) by the total incremental value of battery components (determined in step 3), as provided in § 1.30D–3(b)(3)(i).

Section 1.30D–3(b)(3)(ii) requires qualified manufacturers to select a date for determining the values associated with the total incremental value of North American battery components and the total incremental value of battery components. Such date needs to be after the last manufacturing or assembly step for the battery components relevant to the certification described in section 30D(e)(2)(A). This date must be uniformly applied for all battery components contained in the battery.

Section 1.30D–3(b)(3)(iii) provides that a qualified manufacturer may determine qualifying battery component content based on the incremental values of the battery components actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying battery component content for batteries in a group of vehicles, a qualified manufacturer could average the qualifying battery component content calculation over a limited period of time (for example, a year, a calendar quarter, or a month) with respect to vehicles from the same model line, plant, class, or some combination of thereof, with final assembly (as defined in section 30D(d)(5) of the Code and § 1.30D–2(b) of the final regulations) within North America.

Finally, the final regulations, in § 1.30D–3(c)(2)(iv), clarify that the battery module is the end point for the purpose of calculating the value of battery components. This clarification was noted in the Explanation of Provisions to the April Proposed Regulations. In addition, the final regulations clarify that, in the case of a cell-to-pack battery design with no modules, the battery cell is the end point for the purpose of calculating the value of battery components.

The Treasury Department and the IRS received a number of comments with respect to the Battery Components Requirement. Comments with respect to generally applicable definitions, such as ''assembly,'' ''battery,'' ''battery component,'' or ''manufacturing,'' are discussed in section III.A of this Summary of Comments and Explanation of Revisions. This section discusses comments with respect to the calculation required to determine compliance with the Battery Components Requirement.

One commenter criticized the Battery Components Requirement and noted that it may reduce efficiency, cost effectiveness, and innovation with respect to battery components. In response to this, the Treasury Department and the IRS note that the Battery Components Requirement is mandated by the statute. Similarly, another commenter recommended that battery components manufactured or assembled in Japan be considered as qualifying. However, this is prohibited by the statute because battery components must be manufactured or assembled in North America to meet the Battery Components Requirement.

A commenter asked for a more detailed components list along with calculation examples that include the components in the list. As discussed in section III.A.6 of this Summary of Comments and Explanation of Revisions, the Treasury Department and the IRS decline to amend the list of

battery components. However, the final regulations add a new definition for the term ''battery materials,'' and clarify that battery materials are not battery components. In addition, the Treasury Department and the IRS have included in the Summary of Comments and Explanation of Revisions to the final regulations an example calculation under the Battery Components Requirement that references specific components.

Proposed § 1.30D–3(b)(3)(iii) provided flexible rules that allow a qualified manufacturer to average the qualifying battery component content calculation over a limited period of time (for example, a year, quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof. One commenter raised a concern that these rules were too flexible and could create gaming opportunities. The commenter suggested that the final regulations clearly describe which vehicle characteristics may be averaged together and directly state that any combination of characteristics not identified in the final regulations may not be averaged together. Because the category of vehicle characteristics is open-ended, may vary by manufacturer, and is subject to change in the future, it is not practicable to specify certain vehicle characteristics that are necessary for grouping. In addition, a specified list of vehicle characteristics may not correspond to the vehicle procurement chains of particular manufacturers. For these reasons, the Treasury Department and the IRS appreciate the concerns raised by this comment, but have concluded that the flexibility of the proposed rule is necessary in order to provide an administrable rule to qualified manufacturers. In addition, the upfront review process described in proposed § 1.30D–3(e), discussed in section III.B.3 of this Summary of Comments and Explanation of Revisions, will also help prevent gaming of the Battery Components Requirement calculations. This commenter also suggested that the Treasury Department and the IRS maintain the right to update which characteristics may be averaged together in the future, should changes be necessary. In response to this, the Treasury Department and the IRS will continue to study this issue as the Treasury Department and the IRS gain experience with the upfront review process.

Finally, two commenters suggested that the final regulations consider allowing for a waiver of the Critical Minerals and Battery Components Requirements in certain cases. The statute does not provide for a waiver program; thus, the final regulations do not adopt these comments. Commenter proposals for a waiver process are discussed in more detail in section III.B.1 of this Summary of Comments and Explanation of Revisions.

3. Upfront Review

Proposed § 1.30D–3(e) provided for an upfront review to assess a qualified manufacturer's conformance with the Critical Minerals and Battery Components Requirements. Specifically, proposed § 1.30D–3(e) provided that for new clean vehicles placed in service after December 31, 2024, the qualified manufacturer must provide attestations, certifications, and documentation demonstrating compliance with the requirements of section 30D(e), at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The IRS, with analytical assistance from the DOE, will review the attestations, certifications, and documentation. This rule is finalized as § 1.30D–3(d).

One commenter stated that, if final regulations require qualified manufacturer submissions, the Treasury Department and the IRS should develop a system to protect confidential business secrets. In response to this, the Treasury Department and the IRS note that they intend to continue to engage with OEMs and other stakeholders to develop the rules under the upfront review process.

4. Rule for New Qualified Fuel Cell Motor Vehicles

The final regulations provide in § 1.30D–3(e) that the requirements of section 30D(e) and § 1.30D–3 (Critical Minerals and Battery Components Requirements) are deemed to be satisfied with respect to new qualified fuel cell motor vehicles. Thus, the amount of the credit with respect to these vehicles, under section 30D(b), is $7,500. However, a qualified fuel cell motor vehicle (as defined in section 30B(b)(3)) with a clean vehicle battery, such as a plug-in hybrid fuel cell electric vehicle, would be subject to the Critical Minerals and Battery Components Requirements because it draws electricity from the clean vehicle battery.

Because new qualified fuel cell motor vehicles do not have a clean vehicle battery, these vehicles do not have applicable critical minerals or battery components contained in such battery that would be subject to the Critical Minerals and Battery Components Requirements. The IRA's enactment of section 30D(d)(6), which provides that new qualified fuel cell motor vehicles are new clean vehicles if such vehicles meet the North American final assembly and seller reporting requirements (*see* section 30D(d)(1)(G) and (H)), indicates that Congress intended for these vehicles to be eligible for the section 30D credit. Therefore, the better reading of section 30D as a whole is that new qualified fuel cell motor vehicles are eligible for the full section 30D credit amount of $7,500.

C. Special Rules

Proposed § 1.30D–4 provided special rules with respect to the section 30D credit. Among those rules, proposed § 1.30D–4(b)(5)(i) provided that, except as provided in proposed § 1.30D–4(b)(5)(ii), in the case of a new clean vehicle that is placed in service by a corporation or other taxpayer that is not an individual for whom AGI is computed under section 62, the Modified AGI limitation does not apply. One commenter expressed concern about individuals circumventing the Modified AGI limitation by having a non-grantor trust place in service an otherwise qualifying vehicle, suggesting that an anti-abuse rule would prevent such occurrences. In response to this comment, the final regulations provide that the Modified AGI limitation applies to individuals, estates, and non-grantor trusts. For estates and non-grantor trusts, Modified AGI is AGI as determined under section 67(e) of the Code. The final regulations also provide that the $150,000 threshold amount applies to estates and non-grantor trusts for purposes of the Modified AGI limitation, and that an estate or non-grantor trust will be treated as having Modified AGI above the threshold amount for any year in which it is not in existence. The Treasury Department and the IRS will also continue to monitor this issue. In further response to this comment, the final regulations also clarify the applicability of this credit to grantor trusts, and provide that, to the extent that the grantor or another person is treated as owning all or part of a trust under sections 671 through 679 of the Code, the section 30D credit is allocated to such grantor or other person in accordance with § 1.671–3(a)(1). In addition, the Modified AGI limitation applies based on the Modified AGI of the grantor or other deemed owner, not the Modified AGI of the trust or any other beneficiary.

The final regulations also clarify that with regard to partnerships and S corporations, the Modified AGI limitation applies on a partner or shareholder level. Finally, consistent with the preceding, the final regulations provide that the Modified AGI

limitation does not apply to corporations and taxpayers other than individuals, estates, trusts, and partners or shareholders of passthrough entities.

D. FEOC Restriction

Section 30D(d)(7), the excluded entities provision or FEOC Restriction, excludes from the definition of ''new clean vehicle'' any vehicle placed in service after December 31, 2024, with respect to which any of the applicable critical minerals contained in the battery of such vehicle (as described in section 30D(e)(1)(A)) were extracted, processed, or recycled by a FEOC (as defined in section 40207(a)(5) of the Infrastructure Investment and Jobs Act), or any vehicle placed in service after December 31, 2023, with respect to which any of the components contained in the battery of such vehicle (as described in section 30D(e)(2)(A)) were manufactured or assembled by a FEOC (as so defined).

Several commenters either criticized the FEOC Restriction or requested that these applicability dates be delayed in order to give the industry time to reconfigure their supply chains. Similarly, commenters noted that the FEOC Restriction may be problematic for land-based sourcing of nickel, cobalt, and manganese in particular. As the FEOC Restriction and its applicability dates are statutory, the final regulations do not adopt these comments.

Proposed § 1.30D–6(a) provided definitions for terms relevant to the FEOC Restriction and proposed § 1.30D–6. The final regulation moves these definitions to § 1.30D–2(b), and include a new § 1.30D–6(a) that is a general statement of the FEOC Restriction rules. Otherwise, the final regulations adopt the structure and framework of proposed § 1.30D–6, with the modifications described herein.

1. Due Diligence and Transition Rule for Non-Traceable Battery Materials

Proposed § 1.30D–6(b) provided due diligence requirements for qualified manufacturers to determine compliance with the FEOC Restriction. Proposed § 1.30D–6(b)(2) provided a temporary exception to the due diligence requirements for identified non-traceable battery materials.

i. Due Diligence

Proposed § 1.30D–6(b)(1) provided that the qualified manufacturer must conduct due diligence with respect to all battery components and applicable critical minerals (and associated constituent materials) that are relevant to determining whether such components or minerals are FEOC-compliant. This due diligence must comply with standards of tracing for battery materials available in the industry at the time of the attestation or certification that enable the qualified manufacturer to know with reasonable certainty the provenance of applicable critical minerals, constituent materials, and battery components. As noted in the Explanation of Provisions to the December Proposed Regulations, such tracing standards may include international battery passport certifications and enhanced battery material and component tracking and labeling. Proposed § 1.30D–6(b)(1) specified that reasonable reliance on a supplier attestation or certification will be considered due diligence if the qualified manufacturer does not know or have reason to know after due diligence that such supplier attestation or certification is incorrect.

The due diligence must be conducted by the qualified manufacturer prior to its determination of any information to establish a compliant-battery ledger described in proposed § 1.30D–6(d), and on an ongoing basis. A battery is not considered FEOC-compliant unless the qualified manufacturer has conducted such due diligence with respect to all such components and applicable critical minerals of the battery and provided required attestations or certifications described in section III.D. of this Summary of Comments and Explanation of Revisions.

The Treasury Department and the IRS received a number of comments relating to the due diligence requirement.

As noted previously, proposed § 1.30D–6(b)(1) provided that due diligence must comply with standards of tracing for battery materials available in the industry at the time of the attestation or certification. The proposed regulations did not specify a tracing system. Several commenters requested that the final regulations create an industry standard for due diligence to avoid confusion and provide a standardized system. One such commenter suggested that the Catena-X battery passport, used in Europe, as a model while another commenter recommended against adopting such rules because the commenter considered them to be burdensome and largely untested. Another commenter suggested defining ''due diligence'' according to certain OECD standards. That same commenter suggested requiring use of digital battery identifiers (that is, battery passports). Another commenter suggested that until mineral supply chain tracing becomes standardized, voluntary standards using multi-stakeholder governance with independent, publicly available, third-party auditing (such as the Initiative for Responsible Mining Assurance's standard), can assist. Finally, one commenter expressed a desire to better understand expectations for supply chain tracing and offered to assist the Treasury Department and qualified manufacturers in implementing effective traceability mechanisms.

The Treasury Department and the IRS appreciate the number of comments about due diligence. However, the broad range of perspectives offered by the commenters counsels against mandating a universal standard at this time. The Treasury Department and the IRS will continue to monitor industry standards, battery passports, and other methodologies for tracing, and will consider this issue for future guidance.

The Treasury Department and the IRS also received comments with respect to the due diligence requirements and upstream suppliers of the OEMs. One commenter requested that the final regulations require battery manufacturers and suppliers of battery components and applicable critical minerals to cooperate and provide information to qualified manufacturers. Alternatively, the commenter requested that battery manufacturers be required to directly submit information to the IRS and provide qualified manufacturers with certification that any items are FEOC-compliant. Section 30D does not provide authority to require submissions by upstream suppliers, either to the qualified manufacturer or to the IRS. Section 30D(d)(3) authorizes information reporting to the Secretary regarding new clean vehicles only by qualified manufacturers. Qualified manufacturers may seek to incorporate reporting and assurances by their battery suppliers as part of their supply contracts, but such an arrangement would be outside the scope of these regulations. Accordingly, the final regulations do not adopt this comment.

Two commenters raised issues with respect to battery supplier reliance on further upstream suppliers. Proposed § 1.30D–6(b)(1) specified that reasonable reliance on a supplier attestation or certification will be considered due diligence if the qualified manufacturer does not know or have reason to know after due diligence that such supplier attestation or certification is incorrect. The two commenters requested that the reasonable reliance rule be extended to third-party manufacturers or suppliers who conduct due diligence under proposed § 1.30D–6(c)(5). The Treasury Department and the IRS agree with these commenters. Accordingly, the final regulations also specify that that

reasonable reliance on a supplier attestation or certification will also be considered due diligence if the third-party manufacturer or supplier (described in § 1.30D–6(c)(5)) does not know or have reason to know after due diligence that such supplier attestation or certification is incorrect.

One commenter stated that additional clarification is needed to identify the elements of reasonable reliance and due diligence beyond the attestation of the supplier. For instance, suppliers may, in certain circumstances, be reluctant to share certain sourcing information as proprietary and competitive in nature. The commenter asked whether a supplier statement based on undisclosed information could be reasonably relied upon. In addition, the commenter sought more information about implications of a qualified manufacturer's reasonable reliance on supplier attestations that prove later to be inaccurate, such as whether the qualified manufacturer's reasonable reliance would act as a shield against a penalty. Another commenter suggested that Treasury should consider establishing a process for certifying that suppliers are not FEOCs. The commenter posited that such a process could mirror existing U.S. government certification, accreditation, or registration processes, such as International Traffic in Arms Regulations (ITAR) registration or National Institute of Standards and Technologies (NIST) certification.

The Treasury Department and the IRS appreciate the commenters' desire for certainty regarding the procedures for establishing reasonable reliance and due diligence. As described in proposed § 1.30D–6(f), the IRS will consider a range of remedial options in the event of inaccurate attestations, certification, or documentation, and the IRS will exercise discretion in pursuing any of the specified options on the basis of the unique facts and circumstances of the inaccuracy, including reasonable reliance on supplier information. In addition, parties to supply contracts may include a provision for such attestations as part of their contracts.

ii. Transition Rule for Impracticable-to Trace-Battery Materials

Proposed § 1.30D–6(b)(2) provided that for any new clean vehicles for which the qualified manufacturer provides a periodic written report before January 1, 2027, the due diligence requirement may be satisfied by excluding identified non-traceable battery materials (and associated constituent materials). In addition, proposed § 1.30D–6(c)(2) provided that identified non-traceable battery materials (and associated constituent materials) may be excluded from the determination of whether a battery cell is FEOC-compliant. To use these transition rules, qualified manufacturers must submit a report during the up-front review process (described in section III.B.3 of this Summary of Comments and Explanation of Revisions) demonstrating how the qualified manufacturer will comply with the excluded entity restrictions once the transition rule is no longer in effect and once all materials must be fully traced through the entire electric vehicle battery supply chain.

Proposed § 1.30D–6(a)(13)(i) defined ''non-traceable battery materials'' to mean specifically identified low-value battery materials that may originate from multiple sources and are often commingled during refining, processing, or other production processes by suppliers to such a degree that the qualified manufacturer cannot, due to current industry practice, feasibly determine and attest to the origin of such battery materials. For this purpose, low-value battery materials are those that have low value compared to the total value of the battery. Proposed § 1.30D–6(a)(13)(ii) was reserved to contain the specific list of identified non-traceable battery materials. While proposed § 1.30D–6(a)(13)(ii) was reserved, the Explanation of Provisions to the December Proposed Regulations identified as exemplar materials, for potential inclusion on the list, applicable critical minerals contained in electrolyte salts, electrode binders, and electrolyte additives.

As noted in section III.A. of this Summary of Comments and Explanation of Revisions, consistent with the expectation and requirement that OEMs will develop tracing processes in the future, the final regulations retain the list but change the name to ''impracticable-to-trace battery materials,'' in order to better describe the rationale underlying the list.

The Treasury Department and the IRS received many comments with respect to the list of identified nontraceable battery materials as well as the proposed transition rules.

Several commenters requested changes to the meaning of ''low value.'' [8] One commenter requested that low value be determined by reference to the battery as a whole, and not just the total value of applicable critical minerals. Similarly, another commenter requested that ''low value'' be defined with respect to a specified percentage relative to the value of the battery. Several commenters requested that ''low value'' be defined as less than 5 percent or 10 percent of the value of the battery. However, another commenter proposed that ''low value'' be defined as less than 5 percent of the total value of the critical minerals in the batteries. Finally, one commenter objected to a definition based on value, noting that, apart from certain cathode materials, the economic value of every other component in lithium ion batteries is low relative to the total value of the battery. The final regulations do not adopt these comments, as the determination of low-value is not an operative rule with respect to the impracticable-to-trace battery materials list. Instead, the Explanation of Provisions to the December Proposed Regulations only noted the low-value of certain materials, relative to the value of the clean vehicle battery, for the purpose of identifying materials that qualified manufacturers could not feasibly trace. However, the as noted in this Summary of Comments and Explanation of Revisions, the term ''low-value'' is not defined as a specific percentage. Instead, a low-value battery material is one for which qualified manufacturers have not historically conducted due diligence or tracing, due to its relatively low value in relation to either the battery or the applicable critical minerals in the battery.

Several commenters supported the development of a specific list of nontraceable battery materials as this would provide the greatest clarity and certainty for the supply chain. Several commenters also requested a full enumerated list of materials. Many commenters requested certainty as soon as possible. Several commenters requested that the non-traceable battery materials rule be made permanent. On the other hand, several commenters supported the transition rule for non-traceable battery materials, agreed with the temporary nature of the rule, and were in favor of this approach over other alternatives, such as a de minimis rule or set of criteria for exclusion. Many commenters agreed with the exemplar materials identified in the Explanation of Provisions to the December Proposed Regulations (that is, applicable critical minerals contained in electrolyte salts, electrode binders, and

[8] The Explanation of Provisions to the December Proposed Regulations noted that, where battery materials make up only a very small percentage of the value of the battery as a whole, many industry participants had little reason to trace the source of these materials prior to the passage of the IRA. On the other hand, that Explanation of Provisions identified exemplar materials that accounted for less than two percent of the value of applicable critical minerals in the battery.

electrolyte additives). A few commenters suggested clarification regarding other materials. One commenter requested that the final rule exclude low value anode materials from the tracing requirements. Some commenters requested that applicable critical minerals contained in foils be added to the list. Other commenters recommended that low-value materials, comprising less than five or ten percent of the value of all critical minerals in a battery, be excluded from sourcing requirements under any final rule and specifically lists cobalt, zinc, tungsten, yttrium, titanium, graphite, and fluorspar as potential low-value materials. Finally, one commenter requested that constituent materials be added to the list. That commenter gave the specific example of the electrolyte, and noted that the battery manufacturer may have difficulty conducting due diligence with respect to electrolytes, due to the tiers of upstream suppliers as well as the need to request confidential commercial information.

Other commenters noted that certain minerals or materials should not be included in the definition of non-traceable battery materials. One commenter noted that consultation with industry is needed to develop a list, because many materials either can be traceable or will be traceable before 2027. Several commenters took issue with the exemplar materials identified in the Explanation of Provisions to the April Proposed Regulations. Some commenters disputed the idea that applicable critical minerals contained in electrolyte salts and electrode binders are non-traceable. One commenter noted that special electrolyte salts and additives (SESAs) are never commingled during transport or usage and may be traced to the source through a certification of origin. Other commenters specifically enumerated minerals that they asserted were traceable, including magnesium, magnesium sulfate, manganese sulphate monohydrate and related manganese materials and manganese oxides; fluorspar, fluorspar-based hydrofluoric acid, fluorine compounds, polyvinylidene fluoride (PVDF) and PVDF binder technology; rare earth elements; lithium and Lithium hexafluorophosphate (LiPF6); cobalt; and nickel. Finally, one commenter suggested that the list of non-traceable battery materials only include non-essential battery materials that have ready substitutes. The commenter contrasted those materials with essential battery materials (such as fluorinated salts and fluorinated binders) that are essential to making an EV battery and have no meaningful substitutes. The commenter recommended that such essential battery materials not be added to the nontraceable battery materials list.

Several comments raised questions relating to the justifications for the identified non-traceable battery materials list. One commenter, while generally supportive of the proposed rules, stated that all materials are in fact able to be traced.

Finally, several commenters suggested that the final regulations adopt a different approach for a transition rule. One commenter requested that the final regulations provide a detailed list of low-value and non-traceable battery materials that form part of constituent materials, so that battery manufacturers do not have to trace materials to specific upstream suppliers. Another commenter proposed establishing a dynamic list of non-traceable battery materials rather than a static list. Several commenters also suggested that the final regulations provide a list of criteria for manufacturers to apply to determine what materials are excludible. Similarly, several commenters recommended that the final regulations adopt a de minimis threshold, with some suggesting a five percent threshold and others a ten percent threshold. One commenter requested that the Treasury Department and the IRS remove the non-traceable battery materials transition rule and replace it with an exemption from due diligence for battery materials produced by DOE Office of Manufacturing Energy and Supply Chains battery grant awardees. Finally, one commenter requested a three- to four-year grace period for certain applicable critical minerals, such as graphite and powders of cathode active materials.

Balancing all of the varying and opposing considerations reflected in these comments, the final regulations do not adopt a de minimis percentage threshold. The statute does not provide guidance for determining a numerical de minimis percentage. Instead, the statute compels qualified manufacturers to conduct due diligence in order to determine that vehicles satisfy the FEOC Restriction. The final transition rule requires due diligence in light of existing tracing capabilities and the practicalities of mineral and battery component supply chains, such as the presence of commingling. Instead of adopting a numerical de minimis percentage, the final regulations retain the proposed list and the related transition rules from the proposed regulations, but generally include only the exemplar materials identified in the Explanation of Provisions to the April Proposed Regulations.

In addition, however, graphite contained in anode materials is added to the list of impracticable-to-trace battery materials. Several commenters raised issues relating to graphite. Many commenters that supported the transition rule also generally supported including graphite on the list. One commenter noted that graphite accounts for only 3 to 4 percent of EV battery value, and that it is especially difficult to trace because battery cell manufacturers frequently mix synthetic and natural graphite together. Another commenter requested clarification of whether the FEOC analysis for synthetic graphite (1) begins with the petroleum coke from which synthetic graphite is derived or, instead, (2) goes all the way upstream to the oil extraction. This commenter noted that, in the latter case, tracing would not be possible. However, a different commenter stated that the ''battery coke'' used by the EV industry to make synthetic graphite is not produced from a nontraceable supply chain, and that such battery coke (unlike commodity cokes) is not commingled prior to shipment to an end user. Taking these comments under consideration, the Treasury Department and the IRS have determined that, due to the commingling of natural and synthetic graphite, as well as the difficulty of tracing synthetic graphite fully upstream, graphite contained in anode materials is an impracticable-to-trace material. Consequently, the final regulations include graphite contained in anode materials on the list of identified impracticable-to-trace battery materials.

The final regulations add a definition of ''impracticable-to-trace battery materials'' to § 1.30D–2(b), and specify identified impracticable-to-trace battery materials as applicable critical minerals in the following circumstances: graphite contained in anode materials and applicable critical minerals contained in electrolyte salts, electrode binders, and electrolyte additives. Section 1.30D–6(b)(2) provides that for any new clean vehicles for which the qualified manufacturer provides a periodic written report before January 1, 2027, the due diligence requirement may be satisfied by excluding identified impracticable-to-trace battery materials (and associated constituent materials). Section § 1.30D–6(c)(3)(iii) provides that identified impracticable-to-trace battery materials (and associated constituent materials) may be excluded from the determination of whether a battery cell is FEOC-compliant.

In addition, the proposed regulations provided that, to use these transition rules, qualified manufacturers must submit a report during the up-front review process demonstrating how the qualified manufacturer will comply with the FEOC Restriction once the transition rules end. The final regulations keep this requirement and further clarify that this report must include information about efforts made to date to secure a FEOC-compliant battery supply once the transition rule is no longer in effect. Additional requirements related to this report will be described in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The Treasury Department and the IRS anticipate that such requirements will include robust documentation of efforts made to date to secure FEOC-compliant battery supply, such as potential suppliers engaged, offtake agreements, and contracts entered into with domestic or compliant suppliers. Finally, the Treasury Department and the IRS note that the inclusion of materials on the impracticable-to-trace battery materials list does not relieve any person from compliance obligations with respect to any other laws or requirements of other federal agencies or international organizations, including U.S. sanctions law administered by the Treasury Department's Office of Foreign Assets Control (OFAC) (31 CFR Chapter V).

2. FEOC Compliance

Proposed § 1.30D–6(c) provided the rules for determining whether battery components, battery cells, and applicable critical minerals (and associated constituent materials) are FEOC-compliant. These rules generally required the physical tracking of applicable critical minerals, battery cells, and battery components. However, proposed § 1.30D–6(c)(3)(ii)(A) provided that the determination that a battery cell is a FEOC-compliant battery cell may be made through an allocation of the available mass of applicable critical minerals and associated constituent materials to specific battery cells manufactured or assembled in a battery cell production facility, without the physical tracking of the mass of applicable critical minerals (and associated constituent materials) to specific battery cells. This allocation-based determination was an exception to the general rule, which required specific tracking. Proposed § 1.30D–6(c)(3)(ii)(F) provided that the allocation-based exception would be a temporary rule for any new clean vehicle for which the qualified manufacturer provides a periodic written report before January 1, 2027.

In the Explanation of Provisions to the December Proposed Regulations the Treasury Department and the IRS requested comments on whether industry practices are likely to develop that allow for physical tracking before December 31, 2032, and, if not, whether the allocation-based determination should be included as a permanent compliance approach rather than as a temporary transition rule.

In response, several commenters expressed appreciation for the allocation-based determination. Commenters also requested that the rule be made permanent, due to the inability to quickly modify supply chains and the impracticability or impossibility of physically tracing applicable critical minerals. One commenter appreciated the inclusion of the transition rule in allowing allocation-based determinations for critical minerals and constituent materials, as well as the transition rule regarding non-traceable materials. One commenter noted that the time frame for the temporary allocation-based approach (ending December 31, 2026) is very short and was not sure it would be sufficient for manufacturers to alter their supply chains, as needed. The commenter further recommended that the proposed transition rule for allocation-based accounting be made permanent for the duration of the section 30D tax credit. In response to these comments, these final regulations make the allocation-based determination a permanent rule. Informed by the consensus view from the comments and consultation with the DOE, the Treasury Department and the IRS recognize that it may be difficult to de-commingle supply chains by 2027. In addition, it would be difficult and impracticable to track individual masses of applicable critical minerals through the supply chain in order to determine which masses are FEOC-compliant and which are not. Moreover, allocation-based accounting is consistent with the purposes of the statute, because it encourages OEMs and their suppliers to ensure secure supply chains; under an allocation-based accounting rule, the number of new clean vehicles that OEMs are able to produce is limited by the supply of the lowest-quantity FEOC-compliant critical mineral.

In addition, several commenters requested changes to the calculation-based methodology under the allocation-based accounting rule. Two commenters requested that the allocation be of total aggregated mass of FEOC-compliant applicable critical minerals, rather than limiting the FEOC-compliant battery cells to the critical mineral that has the lowest percentage of FEOC-compliant supply. The Treasury Department and the IRS disagree with these comments. Under the total aggregated mass approach suggested by the commenters, a qualified manufacturer with 0 percent FEOC-compliant mass of a specific applicable critical mineral would still have FEOC-compliant batteries based on the total mass of FEOC-compliant applicable critical minerals. This result would be inconsistent with the purposes of section 30D(d)(7). Accordingly, the final regulations do not adopt these comments.

Two commenters recommended that the final regulations adopt a mass balance approach with respect to allocated accounting. A full mass balance approach would require full physical tracing across long procurement chains for arrays of materials into the battery materials production. Given concerns with the ability of manufacturers to implement a robust tracking process in the near term to this level of specificity, the final regulations do not adopt this approach.

Proposed § 1.30D–6(c)(3)(iii) provided that for new clean vehicles for which the qualified manufacturer provides a periodic written report before January 1, 2027, the determination of whether a battery cell is FEOC-compliant under proposed § 1.30D–6(c)(3) may be satisfied by excluding non-traceable battery materials, and their associated constituent materials. As described in section III.D.1.ii. of this Summary of Comments and Explanation of Revisions, this rule is finalized with respect to identified impracticable-to-trace battery materials.

3. Compliant-Battery Ledger

Proposed § 1.30D–6(d)(1) provided that for new clean vehicles placed in service after December 31, 2024, the qualified manufacturer must determine and provide information to the IRS to establish a compliant-battery ledger for each calendar year, as described in proposed § 1.30D–6(d)(2)(i) and (ii). One compliant-battery ledger may be established for all vehicles for a calendar year, or there may be separate ledgers for specific models or classes of vehicles.

The Treasury Department and the IRS received several comments with respect to the compliant-battery ledger.

Several commenters noted that the upfront review process is both novel and complicated, and will require continued conversation between OEMs and the Treasury Department and the IRS. One such commenter commended

the Treasury Department and the IRS's willingness to engage with manufacturers to support compliance and also asked for sufficient advance notice to qualified manufacturers regarding the upfront review process. Another noted that the process of establishing the mechanisms of the compliant-battery ledger will be an iterative process. In response to this, the Treasury Department and the IRS note that they intend to continue to engage with OEMs and other stakeholders to develop the rules under the upfront review process.

One commenter requested further clarification on the administrative procedures and necessary documentation requirements on areas such as FEOC-compliant certification and compliant-battery ledger. In response, the Treasury Department and the IRS generally note that initial guidance with respect to the upfront review process was issued in Revenue Procedure 2023–38.

Section 5.08 of Revenue Procedure 2023–38 requires qualified manufacturers to report any decrease to the ledger within 30-days of discovery. One commenter requested that this 30-day time period be extended. Although the comment is outside the scope of these final regulations, the Treasury Department and the IRS note that they will continue to study how best to administer the rules for establishing and updating compliant-battery ledgers.

One commenter raised a concern that the compliant-battery ledger may allow for noncompliance because batteries need not be tracked to specific vehicles. Proposed § 1.30D–6(c)(1) requires the physical tracking of batteries to specific new clean vehicles via serial number or other identification system. Therefore, the commenter's concern is already addressed.

Finally, two commenters requested additional mechanisms for the upfront review process. First, one commenter requested that the Treasury Department and the IRS create a safe harbor system through which sourcing plans and licensing agreements of a proposed transaction are submitted for review and clearance. This commenter suggested that the Treasury Department's Committee on Foreign Investment in the United States process could provide a model. Second, several commenters noted that OEMs may have difficulty verifying information due to confidentiality obligations as well as the lack of harmonization among suppliers, and proposed that the Treasury Department and the IRS create an online portal to allow OEMs and suppliers to match information. The Treasury Department and the IRS intend that the upfront review process will be an iterative process in which attestations, certifications, and documentation regarding the section 30D sourcing requirements are submitted for review to the IRS, with analytical assistance from the DOE. This process allows for additional information to be requested of and supplied by qualified manufacturers. In addition, qualified manufacturers may rely on determinations provided by third-party manufacturers or suppliers, provided the requirements in § 1.30D–6(c)(5) are met.

4. Rule for New Qualified Fuel Cell Motor Vehicles

The final regulations add § 1.30D–6(g) to clarify that the FEOC Restriction does not apply to new qualified fuel cell motor vehicles. However, a qualified fuel cell motor vehicle (as defined in section 30B(b)(3)) with a clean vehicle battery, such as a plug-in hybrid fuel cell electric vehicle, would be subject to the FEOC Restriction.

Because new qualified fuel cell motor vehicles do not contain clean vehicle batteries, these vehicles do not have applicable critical minerals or battery components contained in such battery that would subject the vehicles to the FEOC Restriction. Thus, the rule regarding new qualified fuel cell vehicles flows naturally from the statute.

IV. Section 6213(g)(2)

The IRA added three new definitions to the exclusive list of ''mathematical or clerical errors'' in section 6213(g)(2). These new definitions are set out in sections 6213(g)(2)(T), (U), and (V). Section 6213(g)(2)(T) provides that the term ''mathematical or clerical error'' means an omission of a correct VIN required under section 30D(f)(9) (relating to the credit for new clean vehicles) to be included on a return; section 6213(g)(2)(U) provides that the term ''mathematical or clerical error'' means an omission of a correct VIN required under section 25E(d) (relating to the credit for previously-owned clean vehicles) to be included on a return; and section 6213(g)(2)(V) provides that the term ''mathematical or clerical error'' means an omission of a correct VIN required under section 45W(e) (relating to the credit for qualified commercial clean vehicles) to be included on a return.

The flush language added in 1998 to the end of section 6213(g)(2) regarding whether a taxpayer is treated as having omitted a correct taxpayer identification number does not provide the clarification that is necessary to determine the meaning of ''an omission of a correct vehicle identification number'' under sections 6213(g)(2)(T) through (V). Accordingly, proposed § 301.6213–2 provided rules for determining whether the IRS is authorized to use math error authority to make a summary assessment if there has been an ''omission of a correct vehicle identification number'' on a taxpayer's return on which the taxpayer is claiming or electing to transfer the credits under sections 30D, 25E and 45W.

A comment recommended that the proposed regulation be modified to clarify how it applies to taxpayers who rely on a seller report containing mistakenly entered VINs, or taxpayers who rely on manufacturers' incorrect determinations that a vehicle is eligible for the section 25E or 30D credit if the vehicle is in fact ineligible for either credit.

Vehicle sellers can prevent the situation described by the commenter by submitting the seller report described in §§ 1.25E–1(b)(19) and § 1.30D–2(b)(48), which must be submitted electronically by the seller to the IRS at the time of sale. The reported VIN's eligibility is checked against qualified manufacturer reporting to the IRS at the time of submission of the seller report. The taxpayer then receives a copy of the seller report only after VIN eligibility is verified through the seller reporting process in real time. Accordingly, the seller report should not contain an incorrect VIN or VIN for a vehicle that was ineligible for a clean vehicle credit. Vehicle sellers are advised to ensure they accurately enter the VIN of the clean vehicle the taxpayer is purchasing when submitting the seller report and to be cautious in finalizing transactions in any case in which a VIN's eligibility has not been confirmed by the IRS through an electronically submitted seller report. Taxpayers should also ensure that the VIN listed on their seller report matches the VIN of the clean vehicle actually purchased. In addition, the taxpayer can rely on the information and certifications contained in the qualified manufacturer written reports for the sections 25E and 30D credits pursuant to §§ 1.25E–2(h) and 1.30D–4(h).

V. Applicability Dates

The final rules modify the applicability dates of the proposed rules for uniformity and administrability across the various rules included in the April, October, and December Proposed Regulations. Consistent with the authority in section 7805(b)(1), the applicability dates generally are

modified to apply to taxable years ending after the latest publication date of the proposed regulations to which the section relates. Accordingly, the section 25E final regulations generally apply to taxable years ending after October 10, 2023, and the section 30D final regulations generally apply to taxable years ending after December 4, 2023.

The regulatory applicability dates also align with certain statutory applicability dates. For example, the rules regarding transfer of the section 25E and 30D credits in §§ 1.25E–3 and 1.30D–5 apply to clean vehicles placed in service after December 31, 2023, in taxable years ending after December 31, 2023, to reflect the statutory applicability date of vehicles acquired (section 25E) or placed in service (section 30D) after December 31, 2023. Similarly, the rules related to the FEOC Restriction in § 1.30D–6 reflect the statutory applicability date of vehicles placed in service after December 31, 2023.

Special Analyses

I. Regulatory Planning and Review

Pursuant to the Memorandum of Agreement, Review of Treasury Regulations under Executive Order 12866 (June 9, 2023), tax regulatory actions issued by the IRS are not subject to the requirements of section 6 of Executive Order 12866, as amended. Therefore, a regulatory impact assessment is not required.

II. Paperwork Reduction Act

The Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520) (PRA) generally requires that a Federal agency obtain the approval of the Office of Management and Budget (OMB) before collecting information from the public, whether such collection of information is mandatory, voluntary, or required to obtain or retain a benefit.

Any collection burden associated with rules described in these final regulations is previously accounted for in OMB Control Number 1545–2137. These final regulations do not alter previously accounted for information collection requirements and do not create new collection requirements. OMB Control Number 1545–2137 covers Form 8936 and Form 8936–A regarding electric vehicle credits, including the new requirement in section 30D(f)(9) to include on the taxpayer's return for the taxable year the VIN of the vehicle for which the section 30D credit is claimed. Revenue Procedure 2022–42 describes the procedural requirements for qualified manufacturers to make periodic written reports to the Secretary to provide information related to each vehicle manufactured by such manufacturer that is eligible for the section 30D credit as required in section 30D(d)(3), including the critical mineral and battery component certification requirements in sections 30D(e)(1)(A) and (e)(2)(A). In addition, Revenue Procedure 2022–42 provides the procedures for sellers of new clean vehicles to report information required by section 30D(d)(1)(H) for vehicles to be eligible for the section 30D credit. The collections of information contained in Revenue Procedure 2022–42 are described in that document and were submitted to the Office of Management and Budget in accordance with the Paperwork Reduction Act under control number 1545–2137.

The requirement to determine the final assembly location as defined in § 1.30D–2(b) by relying on (1) the vehicle's plant of manufacture as reported in the VIN pursuant to 49 CFR 565 or (2) the final assembly point reported on the label affixed to the vehicle as described in 49 CFR 583.5(a)(3) is accounted for by the Department of Transportation in OMB Control Numbers 2127–0510 and 2127–0573.

For purposes of the PRA, the reporting burden associated with the collection of information in §§ 1.25E–3 and 1.30D–5 regarding credit transfer elections will be reflected in the PRA Submissions associated with Revenue Procedure 2023–33. The OMB control number for Revenue Procedure 2023–33 is 1545–2311.

A Federal agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid control number assigned by the Office of Management and Budget.

III. Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) (RFA) imposes certain requirements with respect to Federal rules that are subject to the notice and comment requirements of section 553(b) of the Administrative Procedure Act (5 U.S.C. 551 *et seq.*) and that are likely to have a significant economic impact on a substantial number of small entities. Unless an agency determines that a proposal will not have a significant economic impact on a substantial number of small entities, section 603 of the RFA requires the agency to present a final regulatory flexibility analysis (FRFA) of the proposed rule.

In connection with the April and December Proposed Regulations, the Secretary certified that these proposed regulations will not have a significant economic impact on a substantial number of small entities.

April Proposed Regulations: The regulations proposed in April affect two types of business entities: (1) qualified manufacturers that must trace and report on their critical minerals and battery components in order to certify that their new clean vehicles qualify for the section 30D credit, and (2) businesses that may earn the section 30D credit when purchasing and placing in service a new clean vehicle.

While the tracking and reporting of critical minerals and battery components is likely to involve significant administrative costs, according to public filings, all qualified manufacturers had total revenues above $1 billion in 2022. There are a total of 13 qualified manufacturers that have indicated that they manufacture vehicles currently eligible for the section 30D credit.

Qualified manufacturers also have to certify that their vehicles qualify under the Critical Minerals and Battery Components Requirements. The regulations provide definitions and general rules for the section 30D credit, including rules for qualified manufacturers to comply with the Critical Minerals and Battery Components Requirements. The Treasury Department and the IRS intend that the rules provide clarity for qualified manufacturers for consistent application of critical minerals and battery components calculations and for taxpayers purchasing new clean vehicles that qualify for the section 30D credit. The Treasury Department and the IRS have determined that qualified manufacturers do not meet the applicable definition of small entity.

Business purchasers of clean vehicles who take the section 30D credit must satisfy reporting requirements that are largely the same as those faced by individuals accessing the section 30D credit to purchase clean vehicles. Taxpayers will continue to file Form 8936, Clean Vehicle Credit, to claim the section 30D credit. As was the case for the section 30D credit prior to amendments made by the IRA, taxpayers can rely on qualified manufacturers to determine if the vehicle being purchased qualifies for the section 30D credit and the credit amount. The estimated burden for individual and business taxpayers filing this form is approved under OMB control number 1545–0074 and 1545–0123. To make it easier for a taxpayer to determine the potential section 30D credit available for a specific vehicle, the regulations provide business entities with tools and definitions to ascertain

whether any vehicles purchased would be eligible for the credit. The VIN reporting required by section 30D(f)(9) and described in the proposed regulations was included in prior section 30D reporting.

December Proposed Regulations: The regulations proposed in December affect qualified manufacturers that must determine their compliance with the FEOC Restriction in order to certify that their new clean vehicles placed in service after December 31, 2023, qualify for the section 30D credit.

While the tracking and reporting of compliance with the FEOC Restriction is likely to involve significant administrative costs, according to public filings, every qualified manufacturer had total revenues above $1 billion in 2022. There are a total of 13 qualified manufacturers that have indicated that they manufacture vehicles currently eligible for the section 30D credit. Qualified manufacturers also have to certify that their vehicles comply with the FEOC Restriction and contain batteries that are FEOC-compliant. The regulations provide definitions and general rules for this purposes. Accordingly, the Treasury Department and the IRS intend that the rules provide clarity for qualified manufacturers for consistent application of the FEOC Restriction. The Treasury Department and the IRS have determined that qualified manufacturers do not meet the applicable definition of small entity.

For these reasons, it is hereby certified that §§ 1.30D–1, 1.30D–3, 1.30D–4(a)–(e) and 1.30D–6, and the accompanying definitions in § 1.30D–2 that were proposed in the April and December Proposed Regulations, do not have a significant economic impact on a substantial number of small entities.

In connection with the October Proposed Regulations, the Treasury Department and the IRS presented an IRFA to invite comments on both the number of entities affected and the economic impact on small entities. No comments were received specific to these areas of inquiry. In the absence of comments in response to the October Proposed Regulations, this FRFA is presented with the final rule.

In addition, pursuant to section 7805(f) of the Code, the April, October, and December proposed regulations preceding this final rule were submitted to the Chief Counsel for the Office of Advocacy of the Small Business Administration for comment on its impact on small business, and no comments were received from the Chief Counsel for the Office of Advocacy of the Small Business Administration.

A. Need for and Objectives of the Rule

The final regulations provide the eligibility rules and key definitions regarding the section 25E and section 30D credits to allow taxpayers to know whether their purchase of a previously-owned clean vehicle or new clean vehicle is eligible for the section 25E and section 30D credits, respectively. In addition, the final regulations provide rules regarding the recapture authority under sections 25E(e) and 30D(f)(5), so that taxpayers and the IRS have clear rules regarding when a clean vehicle may cease being eligible for the section 25E and section 30D credits. Further, the final regulations provide rules regarding the omission of a correct VIN for purposes of math error authority as described in section 6213(g)(2). Clear rules regarding the exercise of math error authority will provide for efficient and fair tax administration.

The final regulations provide guidance for purposes of taxpayers electing to transfer vehicle credits under sections 25E(f) and 30D(g) to eligible entities, and for eligible entities participating in the advance payment program with respect to those transferred credits. The final regulations provide rules regarding the process for taxpayers to elect to transfer the credits and for eligible entities to register and receive advance payments from the IRS, and rules regarding the Federal income tax treatment of the credit transfer election, including recapture and excessive payments. The final rules regarding the credit transfer election ensure certainty regarding the consequences of the transfer election, decrease the risk of fraud, and expedite the process by which an eligible entity may receive an advance payment under section 25E(f) or 30D(g).

The final rules are expected to encourage taxpayers to increase the placing in service of new and previously-owned clean vehicles. Thus, the Treasury Department and the IRS intend and expect that the final rules will deliver benefits across the economy and environment that will beneficially impact various industries, including clean vehicle manufacturers and dealers.

B. Issues Raised by Public Comments in Response to the IRFA

As previously noted, there were no comments filed that specifically addressed the impact of the proposed rules and policies on small entities or the number of potentially impacted entities presented in the IRFA. Additionally, no comments were filed by the Chief Counsel of Advocacy of the Small Business Administration.

C. Affected Small Entities

The Small Business Administration estimates in its 2023 Small Business Profile that 99.9 percent of United States businesses meet its definition of a small business. The applicability of these final regulations does not depend on the size of the business, as defined by the Small Business Administration. As described more fully in the Summary of Comments and Explanation of Revisions to this final regulation and in this FRFA, these rules may affect a variety of different businesses across several different industries, but will primarily affect dealers of new and previously-owned clean vehicles that would like to be eligible entities to receive a transferred credit from the buyers of a clean vehicle. The Treasury Department and the IRS currently estimate the number of dealers of new clean vehicles to be approximately 16,000, and the number of dealers of previously-owned clean vehicles to be approximately 36,000.

Of the estimated 16,000 dealers of new clean vehicles, we estimate that 10,000 will have receipts in excess of $25 million; 3,000 will have receipts between $10-$25 million; 1,000 will have receipts between $5–10 million, and 2,000 will have receipts under $5 million. Of the estimated 36,000 dealers of previously-owned clean vehicles, we estimate that 500 will have receipts in excess of $25 million; 1,500 will have receipts between $10-$25 million; 2,000 will have receipts between $5–10 million, and 32,000 will have receipts under $5 million.

The Treasury Department and the IRS expect to receive more information on the impact on small businesses through comments on this final rule.

D. Impact of the Rules

The recordkeeping and reporting requirements would increase for taxpayers who elect to transfer the section 25E or 30D credit to an eligible entity. In addition, the recordkeeping and reporting requirements would increase for dealers who seek to qualify as eligible entities and participate in the advance payment program. Although the Treasury Department and the IRS do not have sufficient data to precisely determine the likely extent of the increased costs of compliance, the estimated burden of complying with the recordkeeping and reporting requirements are described in section II of the Special Analyses regarding the PRA. The Treasury Department and the IRS estimate that, based on the total of

52,000 dealers of new (16,000) and previously-owned (36,000) clean vehicles, it will take approximately one hour to register as entities eligible to receive advance payments of credits under sections 25E and 30D, for a total of 52,000 hours total. The Treasury Department and the IRS further estimate that there are approximately 950,000 taxpayers who will purchase new clean vehicles and 28,750 taxpayers who will purchase previously-owned clean vehicles who will elect to transfer their respective credits to the eligible entity, for a total of 978,750 elections annually. The Treasury Department and the IRS estimate each election will take approximately 15 minutes to complete, for a total burden of approximately 244,688 hours per year.

E. Steps Taken To Minimize Impacts on Small Entities and Alternatives Considered

The Treasury Department and the IRS considered various alternatives in promulgating these final regulations. Significant alternatives considered include: (1) the sale price definition in § 1.25E–1(b)(16); (2) the first transfer rule described in § 1.25E–1(b)(14)(ii); (3) the recapture rules provided in §§ 1.25E–2(c) and 1.30D–4(e), and (4) the dealer registration requirements provided in §§ 1.25E–3(c) and 1.30D–5(c).

Regarding the sale price definition in § 1.25E–1(b)(16), the Treasury Department and the IRS considered the appropriate scope of the definition and how the definition of sale price should be consistent with or diverge from the definition of manufacturer's suggested retail price for purposes of section 30D(f)(11). The definition of ''manufacturer's suggested retail price'' in § 1.30D–2(b) refers to a statutory definition in 15 U.S.C. 1232 that is used for purposes of vehicle labeling on the vehicle window sticker. That definition includes optional accessories or items included by the manufacturer at the time of delivery to the dealer but excludes delivery charges to the dealer. For previously-owned clean vehicles, however, there are not similar vehicle labeling standards that provide a standard for defining sale price. In addition, in a previously-owned clean vehicle sale, the dealer and buyer may negotiate to characterize a portion of the sale price as a separately stated fee or charge (other than those required by law) to avoid the section 25E sale price cap of $25,000. To prevent this type of recharacterization, § 1.25E–1(b)(16) defines sale price to mean the total sale price agreed upon by the buyer and the dealer, including any delivery charges. This definition specifically excludes separately-stated taxes and fees required by State or local law because such taxes and fees are not subject to negotiation or recharacterization by the dealer and buyer.

The Treasury Department and the IRS considered various alternatives to the first transfer rule described in § 1.25E–1(b)(14)(ii). This rule is necessary to determine whether a sale of a previously-owned clean vehicle is a qualified sale pursuant to section 25E(c)(2). One of the requirements to be a qualified sale is that the sale be the first transfer to a qualified buyer since the enactment of section 25E other than to the person with whom the original use of the vehicle commenced. However, some of the characteristics of being a qualified buyer are unknowable to the dealer and the buyer in a subsequent sale, including that a qualified buyer be an individual, not be a dependent, and not have claimed the section 25E credit in the prior three years. As a result, if a previously-owned clean vehicle is transferred more than once after the date of enactment of section 25E, there is no way for the parties after the first transfer to know if the first transfer was to a qualified buyer. Because the IRS may have access to some information necessary to determine whether a first transfer was to a qualified buyer, the Treasury Department and the IRS considered alternatives to the first transfer rule such as a look-up tool regarding prior claims of the section 25E credit for a particular vehicle or information regarding prior vehicle purchasers. However, disclosure of this information raises significant confidentiality issues. Accordingly, the Treasury Department and the IRS have provided the first transfer rule to provide certainty to buyers and dealers as to which transfer of a previously-owned clean vehicle is the first transfer and will qualify for the section 25E credit by relying on the vehicle history report.

The Treasury Department and the IRS considered alternatives to the recapture rules provided in §§ 1.25E–2(c) and 1.30D–4(e). Given the increased availability and benefits of the section 30D credit and the new section 25E credit arising because the credit can be transferred to an eligible entity and is not limited by the taxpayer's tax liability, the Treasury Department and the IRS determined it was necessary to provide rules regarding when the value of the clean vehicle credits can be recaptured. The Treasury Department and the IRS also considered the appropriate length of time within which a return or resale of a vehicle would make the taxpayer ineligible for the credit. Longer and shorter periods of time were considered. Based on industry standard return policies, including money-back guarantees, the Treasury Department and the IRS determined that it was appropriate to deny the benefit of the credit if the vehicle was returned within 30 days. In addition, the Treasury Department and the IRS determined it was reasonable to assume an intent to resell the vehicle, making the purchase of the vehicle ineligible, if the vehicle was resold within 30 days.

Finally, with respect to the dealer registration requirements provided in §§ 1.25E–3(c) and 1.30D–5(c), the Treasury Department and the IRS considered various processes by which a seller could become an eligible entity and participate in the advance payment program. The Treasury Department and the IRS considered a process that did not require submission of a significant amount of information prior to the dealer becoming an eligible entity, but such an approach could require more back-end compliance. To ensure efficient tax administration and reduce fraud, the Treasury Department and the IRS determined that an up-front, electronic registration process was necessary for the IRS to effectively review and validate eligible entity status. In addition, the Treasury Department and the IRS determined that dealers must submit identity information and attestations regarding their participation in the advance payment program to ensure program integrity. Finally, the Treasury Department and the IRS determined that dealer tax compliance was necessary to ensure that advance payments are being paid only to compliant dealers.

F. Duplicative, Overlapping, or Conflicting Federal Rules

The final rule does not duplicate, overlap, or conflict with any relevant Federal rules. As discussed in the Summary of Comments and the Explanation of Revisions, the final rules merely provide requirements, procedures, and definitions related to the credit transfer election for sections 25E and 30D. The Treasury Department and the IRS invite input from interested members of the public about identifying and avoiding overlapping, duplicative, or conflicting requirements.

IV. Unfunded Mandates Reform Act

Section 202 of the Unfunded Mandates Reform Act of 1995 requires that agencies assess anticipated costs and benefits and take certain other actions before issuing a final rule that

includes any Federal mandate that may result in expenditures in any one year by a State, local, or Tribal government, in the aggregate, or by the private sector, of $100 million in 1995 dollars, updated annually for inflation. In 2023, that threshold is approximately $198 million. This final rule does not include any Federal mandate that may result in expenditures by State, local, or Tribal governments, or by the private sector in excess of that threshold.

V. Executive Order 13132: Federalism

Executive Order 13132 (Federalism) prohibits an agency (to the extent practicable and permitted by law) from promulgating any regulation that has federalism implications, unless the agency meets the consultation and funding requirements of section 6 of the Executive order, if the rule either imposes substantial, direct compliance costs on State and local governments, and is not required by statute, or preempts State law. This final rule does not have federalism implications and does not impose substantial direct compliance costs on State and local governments or preempt State law within the meaning of the Executive order.

VI. Regulatory Planning and Review

Pursuant to the Memorandum of Agreement, Review of Treasury Regulations under Executive Order 12866 (June 9, 2023), tax regulatory actions issued by the IRS are not subject to the requirements of section 6 of Executive Order 12866, as amended. Therefore, a regulatory impact assessment is not required.

VII. Congressional Review Act

Pursuant to the Congressional Review Act (5 U.S.C. 801 *et seq.*), the Office of Information and Regulatory Affairs designated this rule as a major rule as defined by 5 U.S.C. 804(2).

Statement of Availability of IRS Documents

The IRS Revenue Procedures, Notices, and other guidance cited in this preamble is published in the *Internal Revenue Bulletin* and is available from the Superintendent of Documents, U.S. Government Publishing Office, Washington, DC, 20402, or by visiting the IRS website at *https://www.irs.gov*.

Drafting Information

The principal authors of the regulations are Rika Valdman, Maggie Stehn, Nicole Stenchever, Mark C. Frantz, Jr., James Williford, and Iris Chung of the Office of Associate Chief Counsel (Passthroughs & Special Industries). However, other personnel from the Treasury Department and the IRS participated in the development of the final regulations.

List of Subjects

26 CFR Part 1

Income taxes, Reporting and recordkeeping requirements.

26 CFR Part 301

Employment taxes, Estate taxes, Excise taxes, Gift taxes, Penalties, Reporting and recordkeeping requirements.

Amendments to the Regulations

Accordingly, the Treasury Department and the IRS amend 26 CFR parts 1 and 301 as follows:

PART 1—INCOME TAXES

■ **Paragraph 1.** The authority citation for part 1 is amended by adding entries in numerical order for §§ 1.25E–1 through 1.25E–3, and 1.30D–1 through 1.30D–6 to read in part as follows:

Authority: 26 U.S.C. 7805 * * *

* * * * *

Section 1.25E–1 also issued under 26 U.S.C. 25E.

Section 1.25E–2 also issued under 26 U.S.C. 25E.

Section 1.25E–3 also issued under 26 U.S.C. 25E, 26 U.S.C. 30D(g)(1) and (g)(10), and 26 U.S.C. 6011.

* * * * *

Section 1.30D–1 also issued under 26 U.S.C. 30D.

Section 1.30D–2 also issued under 26 U.S.C. 30D.

Section 1.30D–3 also issued under 26 U.S.C. 30D.

Section 1.30D–4 also issued under 26 U.S.C. 30D and 26 U.S.C. 45W(d)(3).

Section 1.30D–5 also issued under 26 U.S.C. 30D and 26 U.S.C. 6011.

Section 1.30D–6 also issued under 26 U.S.C. 30D.

* * * * *

■ **Par 2.** Sections 1.25E–0 through 1.25E–3 are added to read as follows:

Sec.

§ 1.25E–0 Table of contents.

This section lists the captions contained in §§ 1.25E–1 through 1.25E–3.

§ 1.25E–1 Credit for previously-owned clean vehicles.

(a) *In general.* Section 25E(a) of the Internal Revenue Code (Code) allows as a credit against the tax imposed by chapter 1 of the Code (chapter 1) for the taxable year of a taxpayer an amount equal to the lesser of $4,000, or the amount equal to 30 percent of the sale price of a previously-owned clean vehicle, if that previously-owned clean vehicle is placed in service during the taxable year by a taxpayer that acquired the previously-owned clean vehicle in a qualified sale in which that taxpayer is a qualified buyer. This section provides definitions and generally applicable rules that apply for purposes of determining the credit under section 25E and the section 25E regulations (section 25E credit). Section 1.25E–2 provides special rules under section 25E(e) and other special rules with respect to the section 25E credit. Section 1.25E–3 provides rules under section 25E(f).

(b) *Definitions.* The definitions in this paragraph (b) apply for purposes of section 25E and the section 25E regulations.

(1) *Advance payment program. Advance payment program* means advance payment program as defined in § 1.25E–3(b)(1).

(2) *Credit transfer election. Credit transfer election* means credit transfer election as defined in § 1.25E–3(b)(2).

(3) *Dealer. Dealer* has the meaning provided in section 25E(c)(2)(A) by reference to section 30D(g)(8) of the Code, except that the term does not include persons licensed solely by a territory of the United States, and includes a dealer licensed by any jurisdiction described in section 30D(g)(8) (other than one licensed solely by a territory of the United States) that makes sales at sites outside of the jurisdiction in which it is licensed.

(4) *Dealer tax compliance. Dealer tax compliance* means dealer tax compliance as defined in § 1.25E–3(b)(3).

(5) *Electing taxpayer. Electing taxpayer* means electing taxpayer as defined in § 1.25E–3(b)(4).

(6) *Eligible entity. Eligible entity* means eligible entity as defined in § 1.25E–3(b)(5).

(7) *Excessive payment. Excessive payment* means excessive payment as defined in § 1.25E–3(g)(2)(iii).

(8) *Incentive*—(i) *For purposes of sale price.* For purposes of the definition of *sale price* in § 1.25E–1(b)(16), *incentive* means any reduction in price offered to and accepted by a taxpayer from the dealer or manufacturer, other than a reduction in the form of a partial payment or down payment for the purchase of a previously-owned clean vehicle pursuant to section 25E(f) and § 1.25E–3.

(ii) *For purposes of eligible entity requirements.* For purposes of the eligible entity requirements for a credit transfer election pursuant to sections 25E(f) and 30D(g)(2)(B) and (D), *incentive* means any reduction in price offered to the taxpayer by the dealer or manufacturer of the previously-owned clean vehicle, including in combination with other incentives, other than a reduction in the form of a partial payment or down payment for the purchase of a previously-owned clean vehicle pursuant to section 25E(f) and § 1.25E–3.

(9) *Modified adjusted gross income. Modified adjusted gross income* means adjusted gross income (as defined in section 62 of the Code) increased by any amount excluded from gross income under section 911, 931, or 933 of the Code.

(10) *Placed in service.* A previously-owned clean vehicle is considered to be placed in service on the date the taxpayer takes possession of the vehicle.

(11) *Previously-owned clean vehicle. Previously-owned clean vehicle* has the meaning provided in section 25E(c)(1). Vehicles that may qualify as previously-owned clean vehicles include battery electric vehicles, plug-in hybrid electric vehicles, fuel cell motor vehicles, and plug-in hybrid fuel cell motor vehicles.

(12) *Qualified buyer. Qualified buyer* means, with respect to a sale of a motor vehicle, a taxpayer—

(i) Who is an individual;

(ii) Who purchases such vehicle for use and not for resale;

(iii) With respect to whom no deduction is allowable to another taxpayer under section 151 of the Code; and

(iv) Who has not been allowed a credit under section 25E and this section for any sale during the three-year period beginning three years before the date of the sale of such vehicle and ending on the date of the sale of such vehicle.

(13) *Qualified manufacturer. Qualified manufacturer* means qualified manufacturer as defined in § 1.30D–2(b)(42).

(14) *Qualified sale. Qualified sale* means a sale of a motor vehicle—

(i) By a dealer;

(ii) For a sale price that does not exceed $25,000; and

(iii) That is a sale to a qualified buyer (other than the person with whom the original use of such vehicle commenced), and that is the first transfer of the motor vehicle since August 16, 2022 (other than a transfer to a dealer).

(15) *Registered dealer. Registered dealer* means registered dealer as defined in § 1.25E–3(b)(6).

(16) *Sale price.* The *sale price* of a previously-owned clean vehicle means the total price agreed upon by the taxpayer and dealer in a written contract at the time of sale, including any delivery charges and after the

application of any incentives. The sale price of a previously-owned clean vehicle does not include separately stated taxes and fees required by State or local law. The sale price of a previously-owned clean vehicle is determined before the application of any trade-in value.

(17) *Section 25E regulations. Section 25E regulations* means this section and §§ 1.25E–2 and 1.25E–3.

(18) *Seller report. Seller report* means the report described in section 25E(c)(1)(D)(i) by reference to section 30D(d)(1)(H) that the seller of a previously-owned clean vehicle provides to the taxpayer and the IRS in the manner provided in, and containing the information described in, guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The seller report must be transmitted to the IRS electronically. The term *seller report* does not include a report rejected by the IRS due to the information contained therein not matching IRS records.

(19) *Time of sale. Time of sale* means time of sale as defined in § 1.25E–3(b)(7).

(20) *Vehicle history report. Vehicle history report* means a report that provides the ownership history of a motor vehicle. *Vehicle history report* includes a vehicle history report issued by a data provider approved by the National Motor Vehicle Title Information System.

(c) *Limitation based on modified adjusted gross income*—(1) *In general.* Under section 25E(b)(1), no section 25E credit is allowed for any taxable year if—

(i) The lesser of—

(A) The modified adjusted gross income of the taxpayer for such taxable year, or

(B) The modified adjusted gross income of the taxpayer for the preceding taxable year, exceeds

(ii) The threshold amount.

(2) *Threshold amount.* For purposes of section 25E(b)(1) and paragraph (c)(1) of this section, the threshold amount is determined based on the taxpayer's return filing status for the taxable year, as set forth in paragraphs (c)(2)(i) through (iii) of this section. *See* section 25E(b)(2).

(i) In the case of a joint return or a surviving spouse (as defined in section 2(a) of the Code), the threshold amount is $150,000.

(ii) In the case of a head of household (as defined in section 2(b)), the threshold amount is $112,500.

(iii) In the case of a taxpayer not described in paragraph (c)(2)(i) or (ii) of this section, the threshold amount is $75,000.

(3) *Special rule for change in filing status.* If the taxpayer's filing status for the taxable year differs from the taxpayer's filing status in the preceding taxable year, then the taxpayer satisfies the limitation in section 25E(b)(1) and paragraph (c)(1) of this section if the taxpayer's modified adjusted gross income does not exceed the threshold amount in either year based on the applicable filing status for that taxable year.

(d) *Credit may be claimed on only one tax return*—(1) *In general.* The amount of the section 25E credit attributable to a previously-owned clean vehicle may be claimed on only one Federal income tax return, including on a joint return for which one of the spouses is listed on the seller report. In the event a previously-owned clean vehicle is placed in service by multiple taxpayers who do not file a joint return, such as married individuals filing separate returns, no allocation or proration of the section 25E credit is available.

(2) *Seller reporting.* The name and taxpayer identification number of the taxpayer claiming the section 25E credit must be listed on the seller report pursuant to sections 25E(c)(1)(D)(i) and 30D(d)(1)(H). The credit will be allowed only on the Federal income tax return of the taxpayer listed in the seller report.

(e) *Examples.* The following examples illustrate the application of the rules in this section.

(1) *Example 1: First transfer since enactment of section 25E.* On August 1, 2022, a dealer sells a previously-owned vehicle that satisfies the requirements of section 25E(c)(1)(A), (B), and (D). On May 7, 2024, a dealer sells the vehicle to a qualified buyer, X, for a sale price of $24,000. X places the vehicle in service the same day. The May 7, 2024, sale to X is the first transfer of the vehicle since the enactment of section 25E.. The May 7, 2024, sale is a qualified sale pursuant to section 25E(c)(2) and paragraph (b)(14) of this section. As a result, the vehicle also satisfies the requirement of section 25E(c)(1)(C) and is a previously-owned clean vehicle as defined in section 25E(c)(1) and paragraph (b)(11) of this section.

(2) *Example 2: Multiple transfers since enactment of section 25E.* On July 1, 2023, a dealer sells a previously-owned vehicle that satisfies the requirements of section 25E(c)(1)(A), (B), and (D) to an individual, X, for a sale price of $30,000. X places the vehicle in service the same day. This is the first transfer of the vehicle since the enactment of section 25E. On May 7, 2024, a dealer sells the vehicle to an individual, Y, for a sale price of $24,500. The July 1, 2023, sale of the vehicle to X is not a qualified sale because the sale price exceeds the $25,000 limitation described in section 25E(c)(2)(B) and paragraph (b)(14) of this section. The May 7, 2024, sale to Y is not a qualified sale because it is not the first transfer since the enactment of section 25E.

(3) *Example 3: Multiple transfers; commercial purchaser.* The facts are the same as in paragraph (e)(2) of this section (*Example 2*), except that X is a partnership and the July 1, 2023, sale is for a sale price of $24,000. Although the vehicle is a previously-owned clean vehicle as defined in section 25E(c)(1) and paragraph (b)(11) of this section, no section 25E credit is allowed in relation to the sale because X is not a qualified buyer. The May 7, 2024, sale to Y is not a qualified sale because it is not the first transfer since enactment of section 25E.

(4) *Example 4: Multiple transfers; buyer exceeds modified adjusted gross income limitation.* The facts are the same as in paragraph (e)(2) of this section (*Example 2*), except the July 1, 2023, sale is for a sale price of $24,000 and X's modified adjusted gross income exceeds the limitation described in section 25E(b)(2) and paragraph (c) of this section. No section 25E credit is allowed in relation to the July 1, 2023, sale to X because X's modified adjusted gross income exceeds the limitation described in section 25E(b)(2) and paragraph (c) of this section. The May 7, 2024, sale to Y is not a qualified sale because it is not the first transfer since the enactment of section 25E.

(5) *Example 5: Multiple transfers; buyer elects to not take credit.* The facts are the same as in paragraph (e)(2) of this section (*Example 2*), except the July 1, 2023, sale is for a sale price of $24,000 and X elects to not claim the section 25E credit. The May 7, 2024, sale to Y is not a qualified sale because it is not the first transfer since the enactment of section 25E.

(6) *Example 6: Multiple transfers; sale between dealers.* On July 1, 2023, a dealer, D1, sells a previously-owned vehicle that satisfies the requirements of section 25E(c)(1)(A), (B), and (D) to another dealer, D2, for $18,000. D1 and D2 are not individuals. On August 1, 2024, D2 sells the vehicle to an individual, Y, for a sale price of $24,500. Y places the vehicle in service the same day. Y satisfies the modified adjusted gross income limitation in section 25E(b)(2) and paragraph (c) of this section. The July 1, 2023, sale to D2 is ignored because it is a transfer

between dealers. Further, with regard to the July 1, 2023, sale, D2 is not a qualified buyer because D2 is not an individual. The May 7, 2024, sale to Y is a qualified sale because it is the first transfer that is regarded since the enactment of section 25E.

(f) *Reliance on vehicle history report for purposes of determining whether sale is a qualified sale.* A taxpayer may rely on a vehicle history report obtained on the date of sale or as part of the sale transaction to determine whether the requirements of section 25E(c)(2)(C) and paragraph (b)(14) of this section are satisfied, including in the case where there has been a prior sale and return or resale described in § 1.25E–2(c).

(g) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(h) *Applicability date.* This section applies to previously-owned clean vehicles placed in service after December 31, 2022, in taxable years ending after October 10, 2023.

§ 1.25E–2 Special rules.

(a) *In general.* This section provides guidance under section 25E(e) of the Internal Revenue Code (Code), which incorporates rules similar to the rules of section 30D(f) of the Code, other than section 30D(f)(10) or 30D(f)(11). Unless otherwise provided in this section, the rules of section 30D(f) apply to section 25E and the section 25E regulations in the same manner by replacing, if applicable, any reference to section 30D or the section 30D credit with a reference to section 25E or the section 25E credit. This section also provides guidance regarding other special rules with respect to the section 25E credit.

(b) *No double benefit*—(1) *In general.* Under sections 25E(e) and 30D(f)(2), the amount of any deduction or other credit allowable under chapter 1 of the Code (chapter 1) for a vehicle for which a section 25E credit is allowable must be reduced by the amount of the section 25E credit allowed for such vehicle.

(2) *Interaction between section 25E and section 30D credits.* A section 30D credit that has been allowed with respect to a vehicle in a taxable year before the year in which a section 25E credit is allowable for that vehicle does not reduce the amount allowable under section 25E.

(c) *Recapture*—(1) *In general.* This paragraph (c) provides rules regarding the recapture of the section 25E credit.

(i) *Cancelled sale.* If the sale of a previously-owned clean vehicle between the taxpayer and dealer is cancelled before the taxpayer places the vehicle in service, then—

(A) The taxpayer may not claim the section 25E credit with respect to the vehicle;

(B) The sale will be treated as not having occurred (and no transfer of the vehicle is considered to have occurred by reason of the cancelled sale), and the vehicle will, therefore, still be eligible for the section 25E credit upon a subsequent sale meeting the requirements of section 25E and the section 25E regulations;

(C) The seller report must be rescinded by the seller in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter); and

(D) The taxpayer cannot make a credit transfer election under section 25E(f) and § 1.25E–3 with respect to the cancelled sale.

(ii) *Vehicle return.* If a taxpayer returns a previously-owned clean vehicle to the dealer within 30 days of placing such vehicle in service, then—

(A) The taxpayer cannot claim the section 25E credit with respect to the vehicle;

(B) The sale will be treated as having occurred (and a transfer of the vehicle is therefore considered to have occurred by reason of the sale), and the vehicle will not qualify for the section 25E credit upon a subsequent sale;

(C) The seller report must be updated by the seller; and

(D) A credit transfer election made pursuant to section 25E(f) and § 1.25E–3, if applicable, will be treated as nullified and any advance payment made pursuant to section 25E(f) and § 1.25E–3, if applicable, will be collected from the eligible entity as an excessive payment pursuant to § 1.25E–3(g)(2).

(iii) *Resale.* If a taxpayer resells a previously-owned clean vehicle within 30 days of placing the vehicle in service, then the taxpayer is treated as having purchased such vehicle with the intent to resell, and—

(A) The taxpayer cannot claim the section 25E credit with respect to the vehicle;

(B) The sale to the taxpayer will be treated as having occurred (and a transfer of the vehicle is therefore considered to have occurred by reason of the sale), and the vehicle will not qualify for the section 25E credit upon a subsequent sale;

(C) The seller report will not be updated;

(D) A credit transfer election made pursuant to section 25E(f) and § 1.25E–3, if applicable, will remain in effect and any advance payment made pursuant to section 25E(f) and § 1.25E–3 will not be collected from the eligible entity; and

(E) The amount of any transferred credit will be collected from the taxpayer as an increase in tax imposed by chapter 1 of the Code for the taxable year in which the vehicle was placed in service.

(iv) *Other returns and resales.* In the case of a vehicle return not described in paragraph (c)(1)(ii) of this section or a resale not described in paragraph (c)(1)(iii) of this section, the previously-owned clean vehicle will not be eligible for the section 25E credit upon a subsequent sale.

(2) *Recapture rules in the case of a credit transfer election.* For additional recapture rules that apply in the case of a credit transfer election, see § 1.25E–3(g)(1). For excessive payment rules that apply in the case of an advance payment made to an eligible entity, see § 1.25E–3(g)(2).

(3) *Example: Vehicle return.* On May 1, 2024, a dealer, D, sells a vehicle that satisfies the requirements of section 25E(c)(1) to a qualified buyer, X. X returns the vehicle to D within 30 days of placing the vehicle in service, and does not claim the section 25E credit. On July 9, 2024, D sells the vehicle to a qualified buyer, Y, for a sale price of $24,000. The vehicle history report obtained on July 9, 2024, reflects the May 1, 2024, sale and subsequent return of the vehicle. The July 9, 2024, sale of the vehicle is not a qualified sale because it is not the first transfer of the vehicle after the enactment of section 25E. Therefore, no section 25E credit is allowed in relation to that sale. It is irrelevant that X did not claim the section 25E credit with respect to the May 1, 2024, sale.

(d) *Branded title.* A title to a previously-owned clean vehicle indicating that such vehicle has been damaged, or is otherwise a branded title, does not impact the vehicle's eligibility for a section 25E credit.

(e) *Seller registration.* A seller must register with the IRS in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) for purposes of filing seller reports (as defined in § 1.25E–1(b)(18)).

(f) *Requirement to file income tax return.* No section 25E credit is allowed unless the taxpayer claiming such credit files a Federal income tax return for the taxable year in which the previously-owned clean vehicle is placed in service. The taxpayer must attach to such return a completed Form 8936, *Clean Vehicle Credits,* or successor

form, that includes all information required by the form and instructions. The taxpayer must also attach a completed Schedule A (Form 8936), *Clean Vehicle Credit Amount,* or successor form or schedule, that includes all information required by the schedule and instructions, such as the vehicle identification number of the previously-owned clean vehicle.

(g) *Taxpayer reliance on manufacturer certifications and periodic written reports to IRS.* A taxpayer who acquires a previously-owned clean vehicle in a qualified sale and places it in service may rely on the manufacturer's certification concerning the manufacturer's status as a qualified manufacturer. A taxpayer also may rely on the information and certifications contained in the qualified manufacturer's periodic written reports to the IRS for purposes of determining whether a vehicle is a previously-owned clean vehicle. The procedures for such written reports are established in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). To the extent a taxpayer relies on such certifications or information, the previously-owned clean vehicle the taxpayer acquires will be deemed to meet the requirements of section 25E(c)(1)(D) (except the section 30D(d)(1)(H) requirement cross-referenced in section 25E(c)(1)(D)(i), which must be satisfied separately), provided the certifications or information relied upon by the taxpayer support this result. *See* § 1.25E–3(g)(3)(ii) for an example that illustrates the interplay between the rule in this paragraph (g) and the excessive payment rule in § 1.25E–3(g)(2).

(h) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(i) *Applicability date.* This section applies to previously-owned clean vehicles placed in service after December 31, 2022, in taxable years ending after October 10, 2023.

§ 1.25E–3 Transfer of credit.

(a) *In general.* This section provides rules related to the transfer and advance payment of the section 25E credit pursuant to section 25E(f) of the Internal Revenue Code (Code) by cross reference to section 30D(g) of the Code. Under the rules of section 30D(g) and this section, a taxpayer may elect to transfer a section 25E credit to an eligible entity, and the eligible entity may receive an advance payment for such credit, provided certain requirements are met. *See* paragraph (d) of this section for rules applicable to credit transfer elections. *See* paragraph (f) of this section for rules applicable to advance payments of transferred section 25E credits. Section 30D(g)(2) sets forth certain requirements that a dealer must satisfy to be an eligible entity for credit transfer and advance payment purposes. Section 30D(g)(2)(A) requires registration with the IRS. *See* paragraph (c) of this section for rules related to dealer registration. Section 30D(g)(2)(B) through (D) and paragraph (f)(2) of this section impose additional requirements that a registered dealer must satisfy in order to be an eligible entity for credit transfer and advance payment purposes.

(b) *Definitions.* This paragraph (b) provides definitions that apply for purposes of section 25E(f) and this section. *See* § 1.25E–1(b) for definitions that are generally applicable to section 25E and the section 25E regulations.

(1) *Advance payment program. Advance payment program* means the program described in paragraph (f)(1) of this section.

(2) *Credit transfer election. Credit transfer election* has the meaning provided in sections 25E(f) and 30D(g), and paragraph (d) of this section.

(3) *Dealer tax compliance. Dealer tax compliance* means that the dealer has filed all required Federal information and tax returns, including for Federal income and employment tax purposes, and the dealer has paid all Federal tax, penalties, and interest due as of the time of sale. A dealer that has entered into an installment agreement with the IRS for which a dealer is current on its obligations (including required filings) is treated as being in dealer tax compliance.

(4) *Electing taxpayer. Electing taxpayer* means an individual who purchases and places in service a previously-owned clean vehicle and elects to transfer the section 25E credit that would otherwise be allowable to such individual to an eligible entity pursuant to section 25E(f) and paragraph (d) of this section. A taxpayer is an electing taxpayer only if the taxpayer makes certain attestations to the registered dealer, pursuant to procedures provided in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter), including that the taxpayer does not anticipate exceeding the modified adjusted gross income limitation of section 25E(b)(1) and § 1.25E–1(b).

(5) *Eligible entity. Eligible entity* has the meaning provided in section 30D(g)(2) and paragraph (f)(2) of this section.

(6) *Registered dealer. Registered dealer* means a dealer that has completed registration with the IRS as provided in paragraph (c) of this section.

(7) *Time of sale. Time of sale* means the date the previously-owned clean vehicle is placed in service, as defined in § 1.25E–1(b)(10).

(c) *Dealer registration*—(1) *In general.* A dealer must register with the IRS in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) for the dealer to receive credits transferred by an electing taxpayer pursuant to section 25E(f) and paragraph (d) of this section.

(2) *Dealer tax compliance required.* A dealer must be in dealer tax compliance to complete and maintain its registration with the IRS. If the dealer is not in dealer tax compliance for any of the taxable periods during the last five taxable years, then the dealer may complete its initial registration with the IRS, but the dealer will not be eligible for the advance payment program (and, therefore, the dealer will not be eligible to receive transferred section 25E credits) until the compliance issue is resolved. The IRS will notify the dealer in writing that the dealer is not in dealer tax compliance, and the dealer will have the opportunity to address any failure through regular procedures. If the failure is corrected, the IRS will complete the dealer's registration, and, provided all other requirements of section 25E(f) and this section are met, the dealer will then be allowed to receive transferred section 25E credits and participate in the advance payment program. Additional procedural guidance regarding this paragraph is set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(3) *Suspension of registration.* A registered dealer's registration may be suspended pursuant to the procedures described in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). Any decision made by the IRS relating to the suspension of a registered dealer's registration is not subject to administrative appeal to the IRS Independent Office of Appeals unless the IRS and the IRS Independent Office of Appeals agree that such review is available and the IRS provides the time and manner for such review.

(4) *Revocation of registration.* A registered dealer's registration may be revoked pursuant to the procedures described in guidance published in the *Internal Revenue Bulletin* (see § 601.601). Any decision made by the IRS relating to the revocation of a

dealer's registration is not subject to administrative appeal to the IRS Independent Office of Appeals unless the IRS and the IRS Independent Office of Appeals agree that such review is available and the IRS provides the time and manner for such review.

(d) *Credit transfer election by electing taxpayer.* For a previously-owned clean vehicle placed in service after December 31, 2023, an electing taxpayer may elect to apply the rules of section 25E(f) and this section to make a credit transfer election with respect to the vehicle so that the section 25E credit is allowed to the eligible entity specified in the credit transfer election (and not to the electing taxpayer) pursuant to the advance payment program described in paragraph (f) of this section. The electing taxpayer, as part of the credit transfer election, must transfer the entire amount of the credit that would otherwise be allowable to the electing taxpayer under section 25E with respect to the vehicle, and the eligible entity specified in the credit transfer election must pay the electing taxpayer an amount equal to the amount of the credit included in the credit transfer election. A credit transfer election must be made no later than the time of sale, and must be made in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). Once made, a credit transfer election is irrevocable.

(e) *Federal income tax consequences of credit transfer election*—(1) *Tax consequences for electing taxpayer.* In the case of a credit transfer election, the Federal income tax consequences for the electing taxpayer are as follows—

(i) The amount of the section 25E credit that the electing taxpayer elects to transfer to the eligible entity under section 30D(g) (by reason of section 25E(f)) and paragraph (d) of this section may exceed the electing taxpayer's regular tax liability (as defined in section 26(b)(1) of the Code) for the taxable year in which the sale occurs, and the excess, if any, is not subject to recapture on the basis that it exceeded the electing taxpayer's regular tax liability;

(ii) The payment made by an eligible entity to an electing taxpayer under section 30D(g)(2)(C) (by reason of 25E(f)) and paragraph (d) of this section to an electing taxpayer pursuant to a credit transfer election is not includible in the gross income of the electing taxpayer; and

(iii) The payment made by an eligible entity under section 30D(g)(2)(C) (by reason of section 25E(f)) and paragraph (d) of this section is treated as repaid by the electing taxpayer to the eligible entity as partial payment of the sale price of the previously-owned clean vehicle. Thus, the repayment by the electing taxpayer is included in the electing taxpayer's basis in the previously-owned clean vehicle prior to the application of the basis reduction rule of section 30D(f)(1) that applies by reason of section 25E(e) and § 1.25E–2(a).

(2) *Tax consequences for eligible entity.* In the case of a credit transfer election, the Federal income tax consequences for the eligible entity are as follows—

(i) The eligible entity is allowed the section 25E credit with respect to the previously-owned clean vehicle and may receive an advance payment pursuant to section 30D(g)(7) (by reason of section 25E(f)) and paragraph (f) of this section;

(ii) Advance payments received by the eligible entity are not treated as a tax credit in the hands of the eligible entity and may exceed the eligible entity's regular tax liability (as defined in section 26(b)(1)) for the taxable year in which the sale occurs;

(iii) An advance payment received by the eligible entity is not included in the gross income of the eligible entity;

(iv) The payment made by an eligible entity under section 30D(g)(2)(C) (by reason of section 25E(f)) and paragraph (d) of this section to an electing taxpayer is not deductible by the eligible entity;

(v) The payment made by an eligible entity to the electing taxpayer under section 30D(g)(2)(C) (by reason of section 25E(f)) and paragraph (d) of this section is treated as paid by the electing taxpayer to the eligible entity as partial payment of the sale price of the previously-owned clean vehicle. Thus, the repayment by the electing taxpayer is treated as an amount realized by the eligible entity under section 1001 of the Code and the regulations under section 1001; and

(vi) If the eligible entity is a partnership or an S corporation, then—

(A) The IRS will make the advance payment to such partnership or S corporation equal to the amount of the section 25E credit allowed that is transferred to the eligible entity;

(B) Such section 25E credit is reduced to zero and is, for any other purpose of the Code, deemed to have been allowed solely to such entity (and not allocated or otherwise allowed to its partners or shareholders) for such taxable year; and

(C) The amount of the advance payment is not treated as tax exempt income to the partnership or S corporation for purposes of the Code.

(3) *Form of payment from eligible entity to electing taxpayer.* The tax treatment of the payment made by the eligible entity to the electing taxpayer described in paragraphs (e)(1) and (2) of this section is the same regardless of whether the payment is made in cash, in the form of a partial payment or down payment for the purchase of the previously-owned clean vehicle, or as a reduction in sale price (without the payment of cash) of the previously-owned clean vehicle.

(4) *Additional requirements.* In the case of a credit transfer election, the following additional rules apply:

(i) The requirements of section 30D(f)(1) (regarding basis reduction) and 30D(f)(2) (regarding no double benefit), by reason of section 25E(e), apply to the electing taxpayer as if the credit transfer election were not made (so, for example, the electing taxpayer must reduce the electing taxpayer's basis in the vehicle by the amount of the section 25E credit, regardless of the credit transfer election).

(ii) Section 30D(f)(6) (regarding the election not to take the credit), by reason of section 25E(e), will not apply (in other words, by electing to transfer the credit, the electing taxpayer is electing to take the credit).

(iii) Section 30D(f)(9) (regarding the vehicle identification number requirement), by reason of section 25E(e), and section 25E(d) (regarding the vehicle identification number requirement) will be treated as satisfied if the eligible entity provides the vehicle identification number of such vehicle to the IRS in the form and manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The electing taxpayer must also provide the vehicle identification number with their Federal income tax return for the taxable year in which the vehicle is placed in service. *See* section 6213(g)(2)(U) of the Code and § 301.6213–2 of this chapter for rules relating to the omission of a correct vehicle identification number.

(5) *Examples.* The following examples illustrate the rules of paragraph (e) of this section.

(i) *Example 1: Electing taxpayer's regular tax liability less than amount of credit*—(A) *Facts.* T, an individual, purchases a previously-owned clean vehicle from a dealer, D, which is a C corporation. T satisfies the requirements to be an electing taxpayer and elects to transfer the section 25E credit to D. D is a registered dealer and satisfies the requirements to be an eligible entity. The sale price of the vehicle is $24,000. The section 25E credit otherwise allowable to T is $4,000. D makes the payment required to be made to T in the form of a cash payment of $4,000. T

uses the $4,000 as a partial payment for the vehicle. T pays D an additional $20,000 from other funds. T's regular tax liability for the year is less than $4,000.

(B) *Analysis.* Under paragraph (e)(1)(i) of this section, T may transfer the credit to D, even though T's regular tax liability is less than $4,000, and no amount of the credit will be recaptured from T on the basis that the allowable credit exceeded T's regular tax liability. D's $4,000 payment to T is not included in T's gross income, and the sale price of the vehicle is $24,000 (including both the $4,000 payment and the additional $20,000 paid by T from other funds), prior to the application of the basis reduction rule of section 30D(f)(1) (by reason of section 25E(e)). After application of the basis reduction rule, T's basis in the vehicle is $20,000. D is eligible to receive an advance payment of $4,000 for the transferred section 25E credit as provided in section 30D(g)(7) (by reason of section 25E(e)) and paragraph (f) of this section. Under paragraph (e)(2) of this section, D may receive the advance payment regardless of whether D's regular tax liability is less than $4,000. The advance payment is not treated as a credit toward D's tax liability (if any), nor is it included in D's gross income. Further, D's $4,000 payment to T is not deductible, and D's amount realized is $24,000 upon the sale of the vehicle (including both the $4,000 payment from D to T that T uses as a partial payment, and the additional $20,000 paid by T from other funds).

(ii) *Example 2: Non-cash payment by eligible entity to electing taxpayer*—(A) *Facts.* The facts are the same as in paragraph (e)(5)(i)(A) of this section (facts of *Example 1*), except that D makes the payment to T in the form of a reduction in the sale price of the vehicle (rather than as a cash payment).

(B) *Analysis.* Paragraph (e)(3) of this section provides that the application of paragraphs (e)(1) and (2) of this section is not dependent on the form of payment from an eligible entity to an electing taxpayer (for example, a payment in cash or a payment in the form of a reduction in sale price). Thus, the analysis is the same as in paragraph (e)(5)(i)(B) of this section (analysis of *Example 1*).

(iii) *Example 3: Eligible entity is a partnership*—(A) *Facts.* The facts are the same as in paragraph (e)(5)(i)(A) of this section (facts of *Example 1*), except that D is a partnership.

(B) *Analysis.* The analysis as to T is the same as in paragraph (e)(5)(i)(B) of this section (analysis of *Example 1*). Because D is a partnership, paragraph (e)(2)(vi) of this section applies. Thus, the advance payment is made to the partnership, the credit is reduced to zero and is, for any other purpose of the Code, deemed to have been allowed solely to the partnership (and not allocated or otherwise allowed to its partners) for such taxable year. The amount of the advance payment is not treated as tax exempt income to the partnership for purposes of the Code.

(f) *Advance payments received by eligible entities*—(1) *In general.* An eligible entity may receive advance payments from the IRS (corresponding to the amount of the section 25E credit for which a credit transfer election was made by an electing taxpayer to transfer the credit to the eligible entity pursuant to section 30D(g) (by reason of section 25E(f)) and paragraph (d) of this section) before the eligible entity files its Federal income tax return or information return, as appropriate, for the taxable year with respect to which the credit transfer election corresponds. This advance payment program is the exclusive mechanism for an eligible entity to receive the section 25E credit transferred pursuant to section 25E(f) and paragraph (d) of this section. An eligible entity receiving a transferred section 25E credit may not claim the credit on a tax return.

(2) *Requirements for a registered dealer to become an eligible entity.* A registered dealer qualifies as an eligible entity, and may therefore receive an advance payment in connection with a credit transfer election, if it meets the following requirements:

(i) The registered dealer submits all required registration information and is in dealer tax compliance;

(ii) The registered dealer retains information regarding the credit transfer election for three calendar years beginning with the year immediately after the year in which the vehicle is placed in service, as described in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter);

(iii) The registered dealer meets any other requirements set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) or in forms and instructions; and

(iv) The registered dealer meets any other requirements of section 25E(f) by reference to section 30D(g), including those in section 30D(g)(2)(B) through (E).

(g) *Increase in tax*—(1) *Recapture if electing taxpayer exceeds modified adjusted gross income limitation.* If an electing taxpayer has modified adjusted gross income that exceeds the limitation in section 25E(b) and § 1.25E–1(b), then the income tax imposed on such taxpayer under chapter 1 of the Code (chapter 1) for the taxable year in which the vehicle was placed in service is increased by the amount of the payment received by the taxpayer. The electing taxpayer must recapture such amounts on the Federal income tax return described in paragraph (h) of this section.

(2) *Excessive payments*—(i) *In general.* This paragraph provides rules under section 25E(f) by reference to section 30D(g)(7)(B), which provides that rules similar to the rules of section 6417(d)(6) of the Code apply to the advance payment program. In the case of any advance payment to an eligible entity that the IRS determines constitutes an excessive payment, the tax imposed on the eligible entity under chapter 1, regardless of whether such entity would otherwise be subject to tax under chapter 1, for the taxable year in which such determination is made will be increased by the sum of the following amounts—

(A) The amount of the excessive payment; plus

(B) An amount equal to 20 percent of such excessive payment.

(ii) *Reasonable cause.* The amount described in paragraph (g)(2)(i)(B) of this section will not apply to an eligible entity if the eligible entity demonstrates to the satisfaction of the IRS that the excessive payment resulted from reasonable cause. In the case of a previously-owned clean vehicle (with respect to which a credit transfer election was made by the electing taxpayer) that is returned to the eligible entity within 30 days of being placed in service, the eligible entity will be treated as having demonstrated that the excessive payment resulted from reasonable cause.

(iii) *Excessive payment defined.* Excessive payment means an advance payment made—

(A) To a registered dealer that fails to meet the requirements to be an eligible entity provided in paragraph (f)(2) of this section; or

(B) Except as provided in paragraph (g)(2)(iv) of this section, to an eligible entity with respect to a previously-owned clean vehicle to the extent the payment exceeds the amount of the credit that, without application of section 25E(f) and this section, would be otherwise allowable to the electing taxpayer with respect to the vehicle for such tax year.

(iv) *Special rule for cases in which electing taxpayer's modified adjusted gross income exceeds the limitation.* Any excess described in paragraph (g)(2)(iii)(B) of this section that arises due to the electing taxpayer exceeding

the limitation based on modified adjusted gross income in section 25E(b) and § 1.25E–1(b) is not an excessive payment. Instead, the amount of the advance payment is recaptured from the taxpayer under section 25E(e) and paragraph (g)(1) of this section.

(3) *Examples.* The following examples illustrate the excessive payment rules in paragraph (g)(2) of this section.

(i) *Example 1: Registered dealer is not an eligible entity*—(A) *Facts.* In 2024, D, a registered dealer, receives an advance payment of $4,000 with respect to a credit transferred pursuant to section 25E(f) and paragraph (d) of this section for a previously-owned clean vehicle, vehicle V. In 2025, the IRS determines that D was not an eligible entity with respect to vehicle V at the time it received the advance payment in 2024 because D failed to satisfy one of the requirements of section 30D(g)(2) (applicable by reason of section 25E(e)) and paragraph (f)(2) of this section. D is unable to show reasonable cause for the failure.

(B) *Analysis.* Under paragraph (g)(2)(i) of this section, the tax imposed on D is increased by the amount of the excessive payment if the advance payment received by D constitutes an excessive payment. Under paragraph (g)(2)(iii) of this section, the entire amount of the $4,000 advance payment received by D is an excessive payment because D did not meet the requirements to be an eligible entity under section 30D(g)(2) (applicable by reason of section 25E(f) and paragraph (f)(2) of this section). Additionally, because D cannot show reasonable cause for its failure to meet these requirements, the tax imposed under chapter 1 on D is increased by $4,800 in 2025 (the taxable year of the IRS determination). This is comprised of the $4,000 excessive payment plus the $800 penalty, calculated as 20% of the $4,000 excessive payment (20% × $4,000 = $800). This treatment applies regardless of whether D is otherwise subject to tax under chapter 1 (for example, if D is a partnership).

(ii) *Example 2: Incorrect manufacturer certifications*—(A) *Facts.* In 2024, T, a taxpayer, makes an election to transfer a $4,000 credit pursuant to section 25E(f) and paragraph (d) of this section to registered dealer, E, with respect to vehicle V. M, the manufacturer of vehicle V, certified to the IRS that vehicle V has a battery with a capacity of not less than 7 kilowatt hours (kwh). T and vehicle V otherwise meet the eligibility requirements for the section 25E credit. T, in reliance on the manufacturer's certification to the IRS regarding vehicle V's battery capacity, transfers the section 25E credit to E. Subsequent to T's purchase of vehicle V and election to transfer the $4,000 credit to E, M reports to the IRS that vehicle V has a battery capacity of less than 7 kwh.

(B) *Analysis.* Section 1.25E–2(g) provides that T may rely on the information and certifications provided in M's written report to the IRS for purposes of determining whether vehicle V is a previously-owned clean vehicle, as defined in section 25E(c)(1) and § 1.25E–1(b)(11). Because T relied on M's certification to the IRS regarding vehicle V's battery capacity and T and vehicle V otherwise meet the eligibility requirements for the section 25E credit, vehicle V is deemed to meet the requirements of section 30D(d)(1)(F) (as cross-referenced in section 25E(c)(1)(D)(i)). Under paragraph (g)(2)(iii)(B) of this section, an advance payment to an eligible entity with respect to a vehicle is an excessive payment to the extent the payment exceeds the amount of the credit that, without a credit transfer election, would be otherwise allowable to the electing taxpayer with respect to the vehicle for such taxable year. Because the amount of the credit that would be allowable to T for 2024 is $4,000, and T transferred the $4,000 credit to E, there is no excessive payment with respect to E.

(h) *Return requirement.* An electing taxpayer that makes a credit transfer election must file a Federal income tax return for the taxable year in which the credit transfer election is made and indicate such election on the return in accordance with the instructions to the form on which the return is made. The electing taxpayer must attach to such return a completed Form 8936, *Clean Vehicle Credits,* or successor form, that includes all information required by the form and instructions. The electing taxpayer must also attach a completed Schedule A (Form 8936), *Clean Vehicle Credit Amount,* or successor form or schedule, that includes all information required by the schedule and instructions, such as the vehicle identification number of the previously-owned clean vehicle.

(i) *Two credit transfer elections per year.* A taxpayer may make no more than two credit transfer elections per taxable year, consisting of either two elections to transfer section 30D credits, or one section 30D credit and one election to transfer a section 25E credit. In the case of taxpayers who file a joint return, each individual taxpayer may make no more than two credit transfer elections per taxable year.

(j) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions will continue in effect.

(k) *Applicability date.* This section applies to previously-owned vehicles placed in service after December 31, 2023, in taxable years ending after December 31, 2023.

■ **Par 3.** Sections 1.30D–0 through 1.30D–6 are added to read as follows:

§ 1.30D–0 Table of contents.

This section lists the captions contained in §§ 1.30D–1 through 1.30D–6.

§ 1.30D–1 Credit for new clean vehicles.

(a) *In general.* Section 30D(a) of the Internal Revenue Code (Code) allows as a credit against the tax imposed by chapter 1 of the Code (chapter 1) for the taxable year of a taxpayer an amount equal to the sum of the credit amounts determined under section 30D(b) with respect to each new clean vehicle purchased by the taxpayer that the taxpayer places in service during the taxable year. This section provides generally applicable rules that apply for purposes of determining the credit under section 30D and the section 30D regulations (section 30D credit). Section 1.30D–2 provides definitions that apply for purposes of section 30D and the section 30D regulations. Section 1.30D–3 provides rules regarding the critical minerals and battery components requirements of section 30D(e). Section 1.30D–4 provides guidance regarding the limitations and special rules in section 30D(f) as well as other special rules with respect to the section 30D credit. Section 1.30D–5 provides rules for the credit transfer election and advance payment program and for recapture. Section 1.30D–6 provides rules regarding the foreign entities of concern (FEOC) restriction of section 30D(d)(7).

(b) *Application with other credits*—(1) *Business credit treated as part of general business credit.* Section 30D(c)(1) requires that so much of the section 30D credit that would be allowed under section 30D(a) for any taxable year (determined without regard to section 30D(c) and this paragraph (b)) that is attributable to a depreciable vehicle must be treated as a general business credit under section 38 of the Code that is listed in section 38(b)(30) for such taxable year (and not allowed under section 30D(a)). In the case of a depreciable vehicle the use of which is 50 percent or more business use in the taxable year such vehicle is placed in service, the section 30D credit that would be allowed under section 30D(a) for that taxable year (determined without regard to section 30D(c) and this paragraph (b)) that is attributable to such depreciable vehicle must be treated as a general business credit under section 38(b)(30) for such taxable year (and not allowed under section 30D(a)). See paragraph (b)(2) of this section for rules applicable in the case of a depreciable vehicle the use of which is less than 50 percent business use in the taxable year such vehicle is placed in service. See paragraph (b)(3) of this section for rules applicable to a section 30D credit allowed under section 30D(a) pursuant to section 30D(c)(2) or paragraph (b)(2)(ii) or (b)(3) of this section.

(2) *Apportionment of section 30D credit.* Unless the taxpayer has elected to transfer the credit pursuant to section 30D(g) and § 1.30D–5(d), in the case of a depreciable vehicle the business use of which is less than 50 percent of a taxpayer's total use of the vehicle for the taxable year in which the vehicle is placed in service, the taxpayer's section 30D credit for that taxable year with respect to that vehicle must be apportioned as follows:

(i) The portion of the section 30D credit corresponding to the percentage

of the taxpayer's business use of the vehicle is treated as a general business credit under section 30D(c)(1) and paragraph (b)(1) of this section (and not allowed under section 30D(a) or paragraph (b)(3) of this section).

(ii) The portion of the section 30D credit corresponding to the percentage of the taxpayer's personal use of the vehicle is treated as a section 30D credit allowed under section 30D(a) pursuant to section 30D(c)(2) and paragraph (b)(3) of this section.

(3) *Personal credit limited based on tax liability.* Section 26 of the Code limits the aggregate amount of credits allowed to a taxpayer by subpart A of part IV of subchapter A of chapter 1 (subpart A) based on the taxpayer's tax liability. Under section 26(a), the aggregate amount of credits allowed to a taxpayer by subpart A cannot exceed the sum of the taxpayer's regular tax liability (as defined in section 26(b)) for the taxable year reduced by the foreign tax credit allowable under section 27 of the Code, and the alternative minimum tax imposed by section 55(a) of the Code for the taxable year. Section 30D(c)(2) provides that the section 30D credit allowed under section 30D(a) for any taxable year (determined after application of section 30D(c)(1) and paragraphs (b)(1) and (2) of this section) is treated as a credit allowable under subpart A for such taxable year, and the section 30D credit allowed under section 30D(a) is therefore subject to the limitation imposed by section 26.

(c) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(d) *Applicability date.* This section applies to taxable years ending after December 4, 2023.

§ 1.30D–2 Definitions for purposes of section 30D.

(a) *In general.* The definitions in this section apply for purposes of section 30D of the Internal Revenue Code (Code) and the section 30D regulations.

(b) *Definitions*—(1) *Advance payment program. Advance payment program* means advance payment program as defined in § 1.30D–5(b)(1).

(2) *Applicable critical mineral*—(i) *In general. Applicable critical mineral* means an applicable critical mineral as defined in section 45X(c)(6) of the Code. The requirements of §§ 1.30D–3(a) and 1.30D–6 with respect to an applicable critical mineral take into account each step of extraction, processing, or recycling through the step in which such mineral is processed or recycled into a constituent material, even if the mineral is not in a form listed in section 45X(c)(6) at every step of production. However, an applicable critical mineral is disregarded for purposes of the requirements of §§ 1.30D–3(a) and 1.30D–6 if it is fully consumed in the production of the constituent material or battery component and no longer remains in any form in the battery.

(ii) *Example: Form of applicable critical mineral.* Mineral Y is extracted and is intended to be incorporated into the battery of an electric vehicle. Mineral Y is not in a form listed in section 45X(c)(6) at the time of such extraction, but subsequently it is refined into an applicable critical mineral form listed in section 45X(c)(6). Both the extraction and processing are taken into account for purposes of the requirements of §§ 1.30D–3(a) and 1.30D–6.

(3) *Assembly.* Assembly, with respect to battery components, means the process of combining battery components into battery cells and battery modules.

(4) *Associated constituent material.* Associated constituent material, with respect to an applicable critical mineral, means a constituent material that has been processed or recycled from such mineral into the constituent material with which it is associated, even if that processing or recycling transformed such mineral into a form not listed in section 45X(c)(6).

(5) *Battery.* Battery, for purposes of a new clean vehicle, means a collection of one or more battery modules, each of which has two or more electrically configured battery cells in series or parallel, to create voltage or current. The term *battery* does not include items such as thermal management systems or other parts of a battery cell or module that do not directly contribute to the electrochemical storage of energy within the battery, such as battery cell cases, cans, or pouches.

(6) *Battery cell.* Battery cell means a combination of battery components (other than battery cells) capable of electrochemically storing energy from which the electric motor of a new clean vehicle draws electricity.

(7) *Battery cell production facility.* Battery cell production facility means a facility in which battery cells are manufactured or assembled.

(8) *Battery component.* Battery component means a component that forms part of a clean vehicle battery and that is manufactured or assembled from one or more components or battery materials that are combined through industrial, chemical, and physical assembly steps. Battery components may include, but are not limited to, a cathode electrode, anode electrode, solid metal electrode, coated separator, liquid electrolyte, solid state electrolyte, battery cell, and battery module.

(9) *Battery materials.* Battery materials means direct and indirect inputs to battery components that are produced through processing rather than through manufacturing or assembly. Battery materials are not considered a type of battery component, although battery materials may be manufactured or assembled into battery components. The three categories of battery materials are applicable critical minerals, constituent materials, and battery materials without applicable critical minerals. Examples of battery materials that may or may not contain applicable critical minerals include a separator base film (if not manufactured or assembled) and separator coating. Examples of battery materials without applicable critical minerals include conductive additives, copper foils prior to graphite deposition, and electrolyte solvents.

(10) *Clean vehicle battery.* Clean vehicle battery, with respect to a new clean vehicle, means the battery from which the electric motor of the vehicle draws electricity to propel such vehicle.

(11) *Compliant-battery ledger. A compliant-battery ledger,* for a qualified manufacturer for a calendar year, is a ledger established under the rules of § 1.30D–6(d) that tracks the number of available FEOC-compliant batteries for such calendar year.

(12) *Constituent materials.* Constituent materials means battery materials that contain applicable critical minerals. Constituent materials may include, but are not limited to, powders of cathode active materials, powders of anode active materials, foils, metals for solid electrodes, binders, electrolyte salts, and electrolyte additives, as required for a battery cell. Battery materials without applicable critical minerals are not constituent materials.

(13) *Country with which the United States has a free trade agreement in effect*—(i) *In general.* The term *country with which the United States has a free trade agreement in effect* means any of those countries identified in paragraph (b)(13)(ii) of this section or that the Secretary of the Treasury or her delegate (Secretary) may identify in the future. The criteria the Secretary will consider in determining whether to identify a country under this paragraph (b)(13) include whether an agreement between the United States and that country, as to the critical minerals contained in clean vehicle batteries or more generally, and in the context of the overall commercial

and economic relationship between that country and the United States:

(A) Reduces or eliminates trade barriers on a preferential basis;

(B) Commits the parties to refrain from imposing new trade barriers;

(C) Establishes high-standard disciplines in key areas affecting trade (such as core labor and environmental protections); and/or

(D) Reduces or eliminates restrictions on exports or commits the parties to refrain from imposing such restrictions.

(ii) *Free trade agreements in effect.* The countries with which the United States currently has free trade agreements in effect are: Australia, Bahrain, Canada, Chile, Colombia, Costa Rica, Dominican Republic, El Salvador, Guatemala, Honduras, Israel, Japan, Jordan, South Korea, Mexico, Morocco, Nicaragua, Oman, Panama, Peru, and Singapore.

(iii) *Updates.* The list of countries in paragraph (b)(13)(ii) of this section may be revised and updated through guidance published in the **Federal Register** or in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(14) *Credit transfer election.* Credit transfer election means credit transfer election as defined in § 1.30D–5(b)(2).

(15) *Dealer.* Dealer means dealer as defined in § 1.30D–5(b)(3).

(16) *Dealer tax compliance.* Dealer tax compliance means dealer tax compliance as defined in § 1.30D–5(b)(4).

(17) *Depreciable vehicle.* Depreciable vehicle means a vehicle of a character subject to an allowance for depreciation.

(18) *Electing taxpayer.* Electing taxpayer means electing taxpayer as defined in § 1.30D–5(b)(5).

(19) *Eligible entity.* Eligible entity means eligible entity as defined in § 1.30D–5(b)(6).

(20) *Excessive payment.* Excessive payment means excessive payment as defined in § 1.30D–5(g)(2)(iii).

(21) *Extraction.* Extraction means the activities performed to harvest minerals or natural resources from the ground or from a body of water. Extraction includes, but is not limited to, operating equipment to harvest minerals or natural resources from mines and wells and the physical processes involved in refining. Extraction also includes operating equipment to extract minerals or natural resources from the waste or residue of prior extraction, including crude oil extraction to the extent that processes applied to that crude oil yield an applicable critical mineral as a byproduct. Extraction concludes when activities are performed to convert raw mined or harvested products or raw well effluent to substances that can be readily transported or stored for direct use in critical mineral processing. Extraction does not include activities that begin with a recyclable commodity (as such activities are recycling). Extraction does not include the chemical and thermal processes involved in refining.

(22) *FEOC-compliant.* FEOC-compliant means in compliance with the applicable excluded entity requirement under section 30D(d)(7). In particular—

(i) A battery component (other than a battery cell), with respect to a new clean vehicle placed in service after December 31, 2023, is FEOC-compliant if it is not manufactured or assembled by a FEOC;

(ii) An applicable critical mineral, with respect to a new clean vehicle placed in service after December 31, 2024, is FEOC-compliant if it is not extracted, processed, or recycled by a FEOC;

(iii) A battery cell, with respect to a new clean vehicle placed in service after December 31, 2023, and before January 1, 2025, is FEOC-compliant if it is not manufactured or assembled by a FEOC and it contains only FEOC-compliant battery components;

(iv) A battery cell, with respect to a new clean vehicle placed in service after December 31, 2024, is FEOC-compliant if it is not manufactured or assembled by a FEOC and it contains only FEOC-compliant battery components and FEOC-compliant applicable critical minerals; and

(v) A clean vehicle battery, with respect to a new clean vehicle placed in service after December 31, 2023, is FEOC-compliant if it contains only FEOC-compliant battery components (other than battery cells) and FEOC-compliant battery cells (as described in paragraph (b)(22)(iii) or (iv) of this section, as applicable).

(23) *Final assembly.* Final assembly means the process by which a manufacturer produces a new clean vehicle at, or through the use of, a plant, factory, or other place from which the vehicle is delivered to a dealer or importer with all component parts necessary for the mechanical operation of the vehicle included with the vehicle, whether or not the component parts are permanently installed in or on the vehicle. To establish where final assembly of a new clean vehicle occurred for purposes of the requirement in section 30D(d)(1)(G) that final assembly of a new clean vehicle occur within North America, the taxpayer may rely on the following information:

(i) The vehicle's plant of manufacture as reported in the vehicle identification number pursuant to 49 CFR 565; or

(ii) The final assembly point reported on the label affixed to the vehicle as described in 49 CFR 583.5(a)(3).

(24) *Foreign entity of concern.* Foreign entity of concern (FEOC) has the meaning provided in section 40207(a)(5) of the Infrastructure Investment and Jobs Act (42 U.S.C. 18741(a)(5)) and guidance promulgated thereunder by the Department of Energy (DOE).

(25) *Impracticable-to-trace battery materials*—(i) *In general. Impracticable-to-trace battery materials* means specifically identified, low-value battery materials that originate from multiple sources and are commingled during refining, processing, or other production processes by suppliers to such a degree that the qualified manufacturer cannot, due to current industry practice, feasibly determine and attest to the origin of such battery materials. For this purpose, impracticable-to-trace battery materials are those that have low value compared to the total value of the clean vehicle battery.

(ii) *Identified impracticable-to-trace battery materials.* Identified impracticable-to-trace battery materials means applicable critical minerals in the following circumstances: graphite contained in anode materials, and applicable critical minerals contained in electrolyte salts, electrolyte binders, or electrolyte additives.

(26) *Incentive.* Incentive means incentive as defined in § 1.30D–5(b)(7).

(27) *Incremental value. Incremental value* means incremental value as defined in § 1.30D–3(c)(2)(i).

(28) *Manufacturer*—(i) *In general. A manufacturer* means any manufacturer within the meaning of the regulations prescribed by the Administrator of the Environmental Protection Agency (EPA) for purposes of the administration of title II of the Clean Air Act (42 U.S.C. 7521 *et seq.*) and as defined in 42 U.S.C. 7550(1). Except as provided in paragraph (b)(28)(ii) of this section, if multiple manufacturers are involved in the production of a vehicle, the requirements of section 30D(d)(3) must be met by the manufacturer that satisfies the reporting requirements of the greenhouse gas emissions standards set by the EPA under the Clean Air Act (42 U.S.C. 7521 *et seq.*) for the subject vehicle.

(ii) *Modification of a new motor vehicle*—(A) If a manufacturer modifies a new motor vehicle (as defined in 42 U.S.C. 7550(3)) that does not satisfy the requirements of section 30D(d)(1)(F) or (d)(6) so that the new motor vehicle, after modification, does satisfy such

requirements, then such manufacturer may satisfy the requirements of section 30D(d)(3) if the modification occurred prior to the new motor vehicle being placed in service.

(B) If a manufacturer modifies a new motor vehicle (as defined in 42 U.S.C. 7550(3)) that does not satisfy the requirements of 45W(c)(3) so that the new motor vehicle, after modification, does satisfy such requirements, then such manufacturer may satisfy the requirements of 30D(d)(3) if the modification occurred prior to the new motor vehicle being placed in service.

(29) *Manufacturer's suggested retail price*—(i) *In general.* Manufacturer's suggested retail price means the sum of the retail price and the retail delivered price (as defined in paragraphs (b)(29)(ii) and (iii) of this section) as reported on the label that is affixed to the windshield or side window of the vehicle, as described in 15 U.S.C. 1232.

(ii) *Retail price.* Retail price, for purposes of paragraph (b)(29)(i) of this section, means the retail price of the automobile suggested by the manufacturer as described in 15 U.S.C. 1232(f)(1).

(iii) *Retail delivered price.* Retail delivered price, for purposes of paragraph (b)(29)(i) of this section, means the retail delivered price suggested by the manufacturer for each accessory or item of optional equipment physically attached to such automobile at the time of its delivery to the dealer that is not included within the price of such automobile as stated pursuant to 15 U.S.C. 1232(f)(1), as described in 15 U.S.C. 1232(f)(2).

(30) *Manufacturing.* Manufacturing, with respect to a battery component, means the industrial and chemical steps taken to produce a battery component.

(31) *Modified adjusted gross income*—(i) *Individuals.* Modified adjusted gross income, in the case of an individual, means adjusted gross income (as defined in section 62 of the Code) increased by any amount excluded from gross income under section 911, 931, or 933 of the Code.

(ii) *Estates and trusts.* Modified adjusted gross income, in the case of an estate or non-grantor trust, means adjusted gross income (as defined in section 67(e) of the Code).

(32) *New clean vehicle.* New clean vehicle means a vehicle that meets the requirements described in section 30D(d). Vehicles that may qualify as new clean vehicles include battery electric vehicles, plug-in hybrid electric vehicles, fuel cell motor vehicles, and plug-in hybrid fuel cell motor vehicles. A vehicle does not meet the requirements of section 30D(d) if—

(i) The qualified manufacturer fails to provide a periodic written report for such vehicle prior to the vehicle being placed in service reporting the vehicle identification number of such vehicle and certifying compliance with the requirement of section 30D(d);

(ii) The qualified manufacturer provides incorrect information with respect to the periodic written report for such vehicle;

(iii) The qualified manufacturer fails to update its periodic written report in the event of a material change with respect to such vehicle; or

(iv) For new clean vehicles placed in service after December 31, 2024, the qualified manufacturer fails to meet the requirements of § 1.30D–6(d).

(33) *New qualified fuel cell motor vehicle.* New qualified fuel cell motor vehicle means any new qualified fuel cell motor vehicle (as defined in section 30B(b)(3)) that meets the requirements under section 30D(d)(1)(G) (that is, the final assembly in North America requirement) and (H) (that is, the seller report requirement), and that does not have a clean vehicle battery.

(34) *North America.* North America means the territory of the United States, Canada, and Mexico as defined in 19 CFR part 182, Appendix A, § 1(1).

(35) *North American battery component.* North American battery component means North American battery component as defined in § 1.30D–3(c)(2)(ii).

(36) *Placed in service.* A new clean vehicle is considered to be placed in service on the date the taxpayer takes possession of the vehicle.

(37) *Processing.* Processing means the non-physical processes involved in the refining of non-recycled substances or materials, including the treating, baking, and coating processes used to convert such substances and materials into constituent materials. Processing includes the chemical or thermal processes involved in refining. Processing does not include the physical processes involved in refining.

(38) *Procurement chain.* Procurement chain means procurement chain as defined in § 1.30D–3(c)(1)(i).

(39) *Qualifying battery component content.* Qualifying battery component content means qualifying battery component content as defined in § 1.30D–3(c)(2)(iii).

(40) *Qualifying critical mineral. Qualifying critical mineral* means qualifying critical mineral as defined in § 1.30D–3(c)(1)(ii).

(41) *Qualifying critical mineral content.* Qualifying critical mineral content means qualifying critical mineral content as defined in § 1.30D–3(c)(1)(iii).

(42) *Qualified manufacturer.* A qualified manufacturer means a manufacturer that meets the requirements described in section 30D(d)(3) at the time the manufacturer submits a periodic written report to the IRS under a written agreement described in section 30D(d)(3). The term qualified manufacturer does not include any manufacturer whose qualified manufacturer status has been terminated by the IRS. The IRS may terminate qualified manufacturer status for fraud, intentional disregard, or gross negligence with respect to any requirements of section 30D, the section 30D regulations, or any guidance under section 30D, including with respect to the periodic written reports described in section 30D(d)(3) and paragraph (b)(32) of this section and any attestations, documentation, or certifications described in §§ 1.30D–3(d) and 1.30D–6(d), at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). *See* § 1.30D–6(f) for additional rules regarding inaccurate determinations and documentation. The IRS may also terminate qualified manufacturer status for fraud, intentional disregard, or gross negligence with respect to any requirement of section 25E or section 45W or any regulations thereunder.

(43) *Recycling*—(i) *In general.* Recycling means the series of activities during which recyclable materials containing critical minerals are transformed into specification-grade commodities and consumed in lieu of virgin materials to create new constituent materials; such activities result in new constituent materials contained in the clean vehicle battery. All physical, chemical, and thermal treatments or modifications that convert recycled feedstocks to specification grade constituent materials are included in recycling. However, recycled applicable critical minerals and associated constituent materials are only subject to the requirements under §§ 1.30D–3(a) and 1.30D–6 if the recyclable material contains an applicable critical mineral, contains material that was transformed from an applicable critical mineral, or if the recyclable material is used to produce an applicable critical mineral at any point during the recycling process. The requirements under §§ 1.30D–3(a) and 1.30D–6 only take into account activities that occurred during the recycling process.

(ii) *Example: Recycling of applicable critical mineral.* Mineral Z, an applicable critical mineral in a form

listed in section 45X(c)(6), was processed by A in a prior production process. Mineral Z subsequently was derived from recyclable material in a form not listed in section 45X(c)(6). Mineral Z was recycled by B. The requirements under §§ 1.30D–3 and 1.30D–6 only take into account the activities conducted by B.

(44) *Registered dealer.* Registered dealer means registered dealer as defined in § 1.30D–5(b)(8).

(45) *Section 30D regulations.* Section 30D regulations means § 1.30D–1, this section, and §§ 1.30D–3 through 1.30D–6.

(46) *Seller report.* Seller report means the report described in section 30D(d)(1)(H) that the seller of a new clean vehicle provides to the taxpayer and the IRS in the manner provided in, and containing the information described in, guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The seller report must be transmitted to the IRS electronically. The term seller report does not include a report rejected by the IRS due to the information contained therein not matching IRS records.

(47) *Time of sale.* Time of sale means time of sale as defined in § 1.30D–5(b)(9).

(48) *Total incremental value of battery components.* Total incremental value of battery components means total incremental value of battery components as defined in § 1.30D–3(c)(2)(iv).

(49) *Total incremental value of North American battery components.* Total incremental value of North American battery components means total incremental value of North American battery components as defined in § 1.30D–3(c)(2)(v).

(50) *Total traced qualifying value.* Total traced qualifying value means total traced qualifying value as defined in § 1.30D–3(c)(1)(iv).

(51) *Total value of critical minerals.* Total value of critical minerals means total value of critical minerals as defined in § 1.30D–3(c)(1)(v).

(52) *Total value of qualifying critical minerals.* Total value of qualifying critical minerals means total value of qualifying critical minerals as defined in § 1.30D–3(c)(1)(vi).

(53) *Traced qualifying value.* Traced qualifying value means traced qualifying value as defined in § 1.30D–3(c)(1)(vii).

(54) *Value.* Value, with respect to property, means the arm's-length price that was paid or would be paid for the property by an unrelated purchaser determined in accordance with the principles of section 482 of the Code and regulations thereunder.

(55) *Value added.* Value added means value added as defined in § 1.30D–3(c)(1)(viii).

(56) *Vehicle classification*—(i) *In general.* Vehicle classification means the vehicle classification of a new clean vehicle determined consistent with the rules and definitions provided in 40 CFR 600.315–08 and this paragraph (b)(56) for vans, sport utility vehicles, pickup trucks, and other vehicles.

(ii) *Van.* Van means a vehicle classified as a van or minivan under 40 CFR 600.315–08(a)(2)(iii) and (iv), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a).

(iii) *Sport utility vehicle.* Sport utility vehicle means a vehicle classified as a small sport utility vehicle or standard sport utility vehicle under 40 CFR 600.315–08(a)(2)(v) and (vi), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a).

(iv) *Pickup truck.* Pickup truck means a vehicle classified as a small pickup truck or standard pickup truck under 40 CFR 600.315–08(a)(2)(i) and (ii), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a).

(v) *Other vehicle.* Other vehicle means any vehicle classified in one of the classes of passenger automobiles listed in 40 CFR 600.315–08(a)(1), or otherwise so classified by the Administrator of the EPA pursuant to 40 CFR 600.315–08(a).

(c) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(d) *Applicability date.* This section applies to taxable years ending after December 4, 2023.

§ 1.30D–3 Critical minerals and battery components requirements.

(a) *Critical minerals requirement*—(1) *In general.* The critical minerals requirement described in section 30D(e)(1)(A) of the Internal Revenue Code (Code), with respect to a clean vehicle battery, is met if the qualifying critical mineral content of such battery is equal to or greater than the applicable critical minerals percentage (as defined in paragraph (a)(2) of this section), as certified by the qualified manufacturer, in such form or manner as prescribed by the Secretary of the Treasury or her delegate (Secretary).

(2) *Applicable critical minerals percentage*—(i) *In general.* For purposes of paragraph (a)(1) of this section, the *applicable critical minerals percentage,* which is based on the year in which a vehicle is placed in service by the taxpayer, is set forth in paragraphs (a)(2)(ii) through (vi) of this section. *See* section 30D(e)(1)(B).

(ii) *Vehicles placed in service between April 18, 2023, and December 31, 2023.* In the case of a vehicle placed in service after April 17, 2023, and before January 1, 2024, the applicable critical minerals percentage is 40 percent.

(iii) *Vehicles placed in service during calendar year 2024.* In the case of a vehicle placed in service during calendar year 2024, the applicable critical minerals percentage is 50 percent.

(iv) *Vehicles placed in service during calendar year 2025.* In the case of a vehicle placed in service during calendar year 2025, the applicable critical minerals percentage is 60 percent.

(v) *Vehicles placed in service during calendar year 2026.* In the case of a vehicle placed in service during calendar year 2026, the applicable critical minerals percentage is 70 percent.

(vi) *Vehicles placed in service during calendar year 2027 and later.* In the case of a vehicle placed in service after December 31, 2026, the applicable critical minerals percentage is 80 percent.

(3) *Determining qualifying critical mineral content*—(i) *In general.* Qualifying critical mineral content with respect to a clean vehicle battery is calculated as the percentage that results from dividing:

(A) The total traced qualifying value, by

(B) The total value of critical minerals.

(ii) *Separate determinations required for each procurement chain.* The traced qualifying value of an applicable critical mineral, including the percentage or percentages necessary to determine the traced qualifying value, must be determined separately for each procurement chain.

(iii) *Time for determining value.* A qualified manufacturer must select a date for determining the values described in paragraphs (a)(3)(i)(A) and (B) of this section. Such date must be after the final processing or recycling step for the applicable critical minerals relevant to the certification described in section 30D(e)(1)(A).

(iv) *Application of qualifying critical mineral content to vehicles.* A qualified manufacturer may determine qualifying

critical mineral content based on the value of the applicable critical minerals actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying critical mineral content for clean vehicle batteries in a group of vehicles, a qualified manufacturer may average the qualifying critical mineral content under this paragraph (a)(3)(iv) over a period of time (for example, a year, a calendar quarter, or a month) with respect to vehicles from the same model line, plant, class, or some combination thereof, with final assembly (as defined in section 30D(d)(5) of the Code and § 1.30D–2(b)(23)) within North America.

(4) *Temporary safe harbor for determining qualifying critical mineral content for vehicles for which a qualified manufacturer submits a periodic written report on or after May 6, 2024 and before January 1, 2027*—(i) *In general.* For vehicles for which a qualified manufacturer submits a periodic written report on or after May 6, 2024 and before January 1, 2027, qualifying critical mineral content with respect to a clean vehicle battery may be calculated as the percentage that results from dividing:

(A) The total value of qualifying critical minerals, by

(B) The total value of critical minerals.

(ii) *Separate determinations required for each procurement chain.* The portion of an applicable critical mineral that is a qualifying critical mineral must be determined separately for each procurement chain.

(iii) *Time for determining value.* A qualified manufacturer must select a date for determining the values described in paragraphs (a)(4)(i)(A) and (B) of this section. Such date must be after the final processing or recycling step for the applicable critical minerals relevant to the certification described in section 30D(e)(1)(A).

(iv) *Application of qualifying critical mineral content to vehicles.* A qualified manufacturer may determine qualifying critical mineral content based on the value of the applicable critical minerals actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying critical mineral content for clean vehicle batteries in a group of vehicles, a qualified manufacturer may average the qualifying critical mineral content calculation over a period of time (for example, a year, quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof, with final assembly (as defined in section 30D(d)(5) of the Code and § 1.30D–2(b)(23)) within North America.

(v) *Consistent determination required for all procurement chains.* A qualified manufacturer that makes a determination under this paragraph (a)(4) must use the rules of this paragraph for all procurement chains of the clean vehicle battery. If a qualified manufacturer averages qualifying critical mineral content as described in paragraph (a)(4)(iv) of this section, the qualified manufacturer must use the rules of such paragraph for all procurement chains for all clean vehicle batteries in the group of vehicles. Therefore, the qualified manufacturer may not use the rules of paragraph (a)(3) for some procurement chains and the rules of paragraph (a)(4) for other procurement chains for the same clean vehicle battery or clean vehicle batteries in the group of vehicles, as applicable.

(5) *Rule for determining qualifying critical mineral content for vehicles for which a qualified manufacturer submitted a periodic written report before May 6, 2024.* For vehicles for which a qualified manufacturer submitted a periodic written report before May 6, 2024, qualifying critical mineral content with respect to a clean vehicle battery must be calculated using the method described in paragraph (a)(4) of this section.

(b) *Battery components requirement*—(1) *In general.* The battery components requirement described in section 30D(e)(2)(A), with respect to a clean vehicle battery, is met if the qualifying battery component content of such battery is equal to or greater than the applicable battery components percentage (as defined in paragraph (b)(2) of this section), as certified by the qualified manufacturer, in such form or manner as prescribed by the Secretary.

(2) *Applicable battery components percentage*—(i) *In general.* For purposes of paragraph (b)(1) of this section, section 30D(e)(2)(B) provides the *applicable battery components percentage,* which is based on the year in which a vehicle is placed in service by the taxpayer as set forth in paragraphs (b)(2)(ii) through (vii) of this section.

(ii) *Vehicles placed in service between April 18, 2023, and December 31, 2023.* In the case of a vehicle placed in service after April 17, 2023, and before January 1, 2024, the applicable battery components percentage is 50 percent.

(iii) *Vehicles placed in service during calendar year 2024 or 2025.* In the case of a vehicle placed in service during calendar year 2024 or 2025, the applicable battery components percentage is 60 percent.

(iv) *Vehicles placed in service during calendar year 2026.* In the case of a vehicle placed in service during calendar year 2026, the applicable battery components percentage is 70 percent.

(v) *Vehicles placed in service during calendar year 2027.* In the case of a vehicle placed in service during calendar year 2027, the applicable battery components percentage is 80 percent.

(vi) *Vehicles placed in service during calendar year 2028.* In the case of a vehicle placed in service during calendar year 2028, the applicable battery components percentage is 90 percent.

(vii) *Vehicles placed in service in calendar year 2029 and later.* In the case of a vehicle placed in service after December 31, 2028, the applicable battery components percentage is 100 percent.

(3) *Determining qualifying battery component content*—(i) *In general.* Qualifying battery component content with respect to a clean vehicle battery of the vehicle is calculated as the percentage that results from dividing—

(A) The total incremental value of North American battery components, by

(B) The total incremental value of battery components.

(ii) *Time for determining value.* A qualified manufacturer must select a date for determining the incremental values described in paragraphs (b)(3)(i)(A) and (B) of this section. Such date must be after the last manufacturing or assembly step for the battery components relevant to the certification described in section 30D(e)(2)(A).

(iii) *Application of qualifying battery component content to vehicles.* A qualified manufacturer may determine qualifying battery component content based on the incremental values of the battery components actually contained in the clean vehicle battery of a specific vehicle. Alternatively, for purposes of calculating the qualifying battery component content for clean vehicle batteries in a group of vehicles, a qualified manufacturer may average the qualifying battery component content calculation over a period of time (for example, a year, quarter, or month) with respect to vehicles from the same model line, plant, class, or some combination of thereof, with final assembly (as defined in section 30D(d)(5) of the Code and § 1.30D–2(b)(23)) within North America.

(iv) *End point for determination.* For a clean vehicle battery that contains a

battery module or modules containing battery cells, the calculation under this paragraph (b) takes into account the value of the module and battery components contained in the module. In the case of a clean vehicle battery that contains battery cells but no battery modules, the calculation under this paragraph (b) takes into account the value of the battery cells and battery components contained in the battery cells.

(c) *Definitions*—(1) *Certain terms relevant to the critical minerals requirement.* The following definitions apply for purposes of the rules of section 30D(e)(1) and paragraph (a) of this section:

(i) *Procurement chain.* Procurement chain means a common sequence of extraction, processing, or recycling activities that occur in a common set of locations with respect to an applicable critical mineral, concluding in the production of constituent materials. Sources of a single applicable critical mineral may have multiple procurement chains if, for example, one source of the applicable critical mineral undergoes the same extraction, processing, or recycling process in different locations.

(ii) *Qualifying critical mineral*—(A) *In general.* Qualifying critical mineral means an applicable critical mineral that is extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or that is recycled in North America.

(B) *Extracted or processed in the United States or in any country with which the United States has a free trade agreement in effect.* An applicable critical mineral is extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, if:

(*1*) Fifty percent or more of the value added to the applicable critical mineral by extraction is derived from extraction that occurred in the United States or in any country with which the United States has a free trade agreement in effect; or

(*2*) Fifty percent or more of the value added to the applicable critical mineral by processing is derived from processing that occurred in the United States or in any country with which the United States has a free trade agreement in effect.

(C) *Recycled in North America.* An applicable critical mineral is recycled in North America if 50 percent or more of the value added to the applicable critical mineral by recycling is derived from recycling that occurred in North America.

(iii) *Qualifying critical mineral content.* Qualifying critical mineral content means the percentage of the value of the applicable critical minerals contained in a clean vehicle battery that is extracted or processed in the United States, or in any country with which the United States has a free trade agreement in effect, or that is recycled in North America.

(iv) *Total traced qualifying value.* Total traced qualifying value means the sum of the traced qualifying values of all applicable critical minerals contained in a clean vehicle battery.

(v) *Total value of critical minerals.* Total value of critical minerals means the sum of the values of all applicable critical minerals contained in a clean vehicle battery.

(vi) *Total value of qualifying critical minerals.* Total value of qualifying critical minerals means the sum of the values of all the qualifying critical minerals contained in a clean vehicle battery.

(vii) *Traced qualifying value*—(A) *Extracted or processed in the United States or in any country with which the United States has a free trade agreement in effect.* Traced qualifying value means, with respect to an applicable critical mineral that is extracted and processed into a constituent material, the value of the applicable critical mineral multiplied by the greater of:

(*1*) The value added to the applicable critical mineral by extraction that occurred in the United States or in any country with which the United States has a free trade agreement in effect, divided by the total value added by from extraction of the applicable critical mineral; or

(*2*) The value added to the applicable critical mineral by processing that occurred in the United States or in any country with which the United States has a free trade agreement in effect, divided by the total value added by processing of the applicable critical mineral.

(B) *Recycled in North America.* Traced qualifying value means, with respect to an applicable critical mineral that is recycled into a constituent material, the value of the applicable critical mineral multiplied by the percentage obtained by dividing the value added to the applicable critical mineral by recycling that occurred in North America by the total value added by recycling of the applicable critical mineral.

(viii) *Value added.* Value added, with respect to recycling, extraction, or processing of an applicable critical mineral, means the increase in the value of the applicable critical mineral attributable to the relevant activity. In the case of multiple applicable critical mineral procurement chains that are part of the same processing or recycling activity, value added should be allocated to each procurement chain based on relative mass.

(2) *Certain terms relevant to the battery components requirement.* The following definitions apply for purposes of the rules of section 30D(e)(2) and paragraph (b) of this section:

(i) *Incremental value.* Incremental value, with respect to a battery component, means the value determined by subtracting from the value of that battery component the value of the manufactured or assembled battery components, if any, that are contained in that battery component.

(ii) *North American battery component.* North American battery component means a battery component substantially all of the manufacturing or assembly of which occurs in North America, without regard to the location of the manufacturing or assembly activities of any components that make up the particular battery component.

(iii) *Qualifying battery component content.* Qualifying battery component content means the percentage of the value of the battery components contained in a clean vehicle battery that were manufactured or assembled in North America.

(iv) *Total incremental value of battery components.* Total incremental value of battery components means the sum of the incremental values of each battery component contained in a clean vehicle battery.

(v) *Total incremental value of North American battery components.* Total incremental value of North American battery components means the sum of the incremental values of each North American battery component contained in a clean vehicle battery.

(d) *Upfront review of critical minerals and battery components requirements.* For new clean vehicles anticipated to be placed in service after December 31, 2024, the qualified manufacturer must provide attestations, certifications, and documentation demonstrating compliance with the requirements of section 30D(e), at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The IRS, with analytical assistance from the Department of Energy, will review the attestations, certifications, and documentation.

(e) *New qualified fuel cell motor vehicles.* The requirements of section 30D(e) and this section are deemed to be satisfied with respect to new qualified fuel cell motor vehicles. The amount of

the credit with respect to such vehicles, under section 30D(b), is $7,500.

(f) *Examples.* The following examples illustrate the rules of this section.

(1) *Example 1: Critical minerals requirement*—(i) *Facts.* In 2028, Company A uses a clean vehicle battery that contains three applicable critical minerals, which are used for the clean vehicle batteries of the same group of vehicles for the purposes of averaging qualifying critical mineral content under paragraph (a)(3)(iv) of this section.

(A) Applicable critical mineral 1 (ACM–1) has a value of $100. ACM–1 has one procurement chain; in this procurement chain, extraction accounts for 20% ($20) of the total value added of ACM–1 and processing accounts for 80% ($80) of the total value added of ACM–1. Of the value added by extraction, 100% ($20) is in the United States or in a country with which the United States has a free trade agreement in effect. Of the value added by processing, 100% ($80) is in the United States or in a country with which the United States has a free trade agreement in effect.

(B) Applicable critical mineral 2 (ACM–2) has a value of $200. ACM–2 has two procurement chains. The value of ACM–2 is $100 per procurement chain. In the first procurement chain for ACM–2, extraction accounts for 50% ($50) of the value added, while processing accounts for 50% ($50). Of the value added by extraction, 50% ($25) is in United States or in a country with which the United States has a free trade agreement in effect. Of the value added by processing, 25% ($12.50) is in the United States or in a country with which the United States has a free trade agreement in effect. In the second procurement chain for ACM–2, extraction accounts for 50% ($50) of the value added, and processing accounts for 50% ($50) of the value added. Of the value added by extraction, 75% ($37.50) is in the United States or in a country with which the United States has a free trade agreement in effect. Of the value added by processing, 100% ($50) is in the United States or in a country with which the United States has a free trade agreement in effect.

(C) Applicable critical mineral 3 (ACM–3) has a value of $100. ACM–3 has one procurement chain. Extraction accounts for 10% ($10) of the value added and processing accounts for 90% ($90) of the value added. Of the value added by extraction, 50% ($5) is in the United States or in a country with which the United States has a free trade agreement in effect. Of the value added by processing, 75% ($67.50) is in the United States or in a country with which the United States has a free trade agreement in effect.

(ii) *Analysis*—(A) First, Company A determines each procurement chain. ACM–1 has one procurement chain. ACM–2 has two procurement chains. ACM–3 has one procurement chain.

(B) Second, Company A determines, for each procurement chain, the traced qualifying value, and then determines the total traced qualifying value.

(*1*) With respect to ACM–1, Company A divides the value added by extraction that is in the United States or in any country with which the United States has a free trade agreement in effect by the total value added from extraction of the applicable critical mineral: $20/$20, which equals 100%. Company A divides the value added by processing that is in the United States or in any country with which the United States has a free trade agreement in effect by the total value added from processing of the applicable critical mineral: $80/$80, which equals 100%. Because the percentages for extraction and processing are equal, that percentage (100%) is used to determine traced qualifying value. Therefore, Company A multiplies 100% by the total value of the applicable critical mineral ($100) to obtain $100 as the traced qualifying value for the procurement chain of ACM–1.

(*2*) With respect to the first procurement chain of ACM–2, Company A divides the value added by extraction that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from extraction of the applicable critical mineral: $25/$50, which equals 50%. Company A divides the value added by processing that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from processing of the applicable critical mineral: $12.50/$50, which equals 25%. Of these percentages, the one for extraction is greater (50%). Therefore, Company A multiplies 50% by the total value of the applicable critical minerals ($100) to obtain $50 as the traced qualifying value for the first procurement chain of ACM–2.

(*3*) With respect to the second procurement chain of ACM–2, Company A divides the value added by extraction that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from extraction of the applicable critical mineral: $37.50/$50, which equals 75%. Company A divides the value added by processing that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from processing of the applicable critical mineral: $50/$50, which equals 100%. Of these percentages, the one for processing is greater (100%). Therefore, Company A multiplies 100% by the total value of the applicable critical mineral ($100) to obtain $100 as the traced qualifying value for the second procurement chain of ACM–2.

(*4*) With respect to ACM–3, Company A divides the value added by extraction that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from extraction of the applicable critical mineral: $5/$10, which equals 50%. Company A divides the value added by processing that is in the United States or a country with which the United States has a free trade agreement in effect by the total value added from processing of the applicable critical mineral: $67.50/$90, which equals 75%. Of these percentages, the one for processing is greater (75%). Company A therefore multiplies 75% by the total value of the applicable critical mineral ($100) to obtain $75 as the traced qualifying value for the procurement chain of ACM–3.

(*5*) The total traced qualifying value is the sum of the traced qualifying values of all applicable critical minerals contained in the clean vehicle battery of the vehicle, or $325 ($100 + $50 + $100 + $75).

(C) Third, Company A determines the qualifying critical mineral content by taking the total traced qualifying value ($325, determined in step 2) divided by the total value of the critical minerals in the battery ($400). The qualifying critical mineral content is therefore 81.25%. Company A uses this percentage to calculate the average qualifying critical mineral content for the clean vehicle batteries of a group of vehicles and compares that average percentage to the applicable critical minerals percentage of section 30D(e)(2) and § 1.30D–3(a)(2).

(2) *Example 2: Critical minerals requirement temporary safe harbor*—(i) *Facts.* The facts are the same as in paragraph (f)(1)(i) of this section (facts of *Example 1*). However, Company A is eligible to apply the temporary safe harbor of § 1.30D–3(a)(4) to determine its qualifying critical mineral content and chooses to do so. The applicable critical minerals are used for the clean vehicle batteries of the same group of vehicles for the purposes of averaging qualifying critical mineral content under paragraph (a)(4)(iv) of this section.

(ii) *Analysis*—(A) First, Company A determines each procurement chain, as in paragraph (f)(1) of this section (*Example 1*).

(B) Second, Company A determines whether ACM–1, ACM–2, and ACM–3 are qualifying critical minerals. ACM–1 is a qualifying critical mineral because, for both extraction and processing, 100% of the value added is derived from extraction and processing that occurs in the United States or in a country with which the United States has a free trade agreement in effect. With respect to its first procurement chain, ACM–2 is a qualifying critical mineral because 50% of the value added from extraction is derived from extraction that occurs in the United States or a country with which the United States has a free trade agreement in effect. With respect to its second procurement chain, ACM–2 is a qualifying critical mineral because 75% of the value added from extraction, and 100% of the value added from processing are derived from extraction and processing, respectively, that occur in the United States or in a country with which the United States has a free trade agreement in effect. ACM–3 is a qualifying critical mineral because 50% of the value added for extraction, and 75% of the value added for processing, are derived from extraction and processing, respectively, that occur in the United States or in a country with which the United States has a free trade agreement in effect. The total value of the qualifying critical minerals is the sum of the value of all of the qualifying critical minerals contained in the clean vehicle battery of the vehicle, or $400 ($100 + $100 + $100 + $100).

(C) Third, Company A determines qualifying critical mineral content by taking the total value of qualifying critical minerals ($400, determined in step 2) and dividing by the total value of critical minerals in the battery ($400). The qualifying critical mineral content of the battery is 100%. Company A uses this percentage to calculate average qualifying critical mineral content for the clean vehicle batteries of a group of vehicles and compares that average percentage to the applicable critical minerals percentage of section 30D(e)(2) and § 1.30D–3(a)(2).

(3) *Example 3: Battery components requirement*—(i) *Facts.* Company B uses a battery cell comprised of a cathode electrode, anode electrode, separator, and electrolyte. The cathode electrode has a value of $4,000 and is manufactured in North America. The anode electrode has a value of $1,000 and is manufactured outside of North America. The separator has a value of $1,000 and is manufactured in North America. The electrolyte has a value of $800 and is manufactured in North America. The battery cell has a value of $7,500 and is manufactured in North America. The battery components are used for the clean vehicle batteries of the same group of vehicles for the purposes of averaging qualifying critical mineral content under paragraph (b)(3)(iii) of this section.

(ii) *Analysis*—(A) First, Company B determines whether each battery component in a battery is a North American battery component. The cathode electrode, separator, and battery cell are North American battery components.

(B) Second, Company B determines the total incremental value of North American battery components. The incremental value of the battery cell ($700) is determined by subtracting from the value of the battery cell ($7,500) the total value of its battery components ($6,800). The incremental value of the cathode electrode is $4,000. The incremental value of the separator is $1,000. The incremental value of the electrolyte is $800. The total incremental value of North American battery components is $6,500 ($700 + $4,000 + $1,000 + $800).

(C) Third, Company B determines the total incremental value of battery components. The anode electrode is not a North American battery component because it is manufactured outside of North America. The incremental value of the anode electrode is $1,000. The total incremental value of battery components is $6,500 plus $1,000 or $7,500.

(D) Fourth, Company B determines the qualifying battery component content by taking the total incremental value of North American battery components ($6,500, determined in Step 2) divided by the total incremental value of battery components ($7,500, determined in Step 3). The qualifying battery component content is therefore 86.7%. Company B uses this percentage to calculate the average battery component content for the clean vehicle batteries of a group of vehicles and compares that average percentage to the applicable battery components percentage of section 30D(e)(2) and § 1.30D–3(b)(2).

(g) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(h) *Applicability date*—(1) *In general.* Except as provided in paragraph (h)(2) of this section, this section applies to new clean vehicles placed in service after April 17, 2023, in taxable years ending after April 17, 2023.

(2) *Upfront review and traced qualifying value.* Paragraphs (a)(3) and (4) (relating to traced qualifying value test) and (d) (relating to upfront review of critical minerals and battery components requirements) of this section apply to taxable years ending after May 6, 2024.

§ 1.30D–4 Special rules.

(a) *No double benefit*—(1) *In general.* Under section 30D(f)(2) of the Internal Revenue Code (Code), the amount of any deduction or other credit allowable under chapter 1 of the Code for a vehicle for which a credit is allowable under section 30D(a) must be reduced by the amount of the section 30D credit allowed for such vehicle (determined without regard to section 30D(c)).

(2) *Interaction between section 30D and section 25E credits.* A section 30D credit that has been allowed with respect to a vehicle in a taxable year before the year in which a credit under section 25E of the Code is allowable for that vehicle does not reduce the amount allowable under section 25E.

(3) *Interaction between section 30D and section 45W credits.* Pursuant to section 45W(d)(3) of the Code, no credit is allowed under section 45W with respect to any vehicle for which a credit was allowed under section 30D.

(b) *Limitation based on modified adjusted gross income*—(1) *In general.* Under section 30D(f)(10)(A), no credit is allowed under section 30D(a) for any taxable year if—

(i) The lesser of—

(A) The modified adjusted gross income of the taxpayer for such taxable year, or

(B) The modified adjusted gross income of the taxpayer for the preceding taxable year, exceeds

(ii) The threshold amount.

(2) *Threshold amount.* For purposes of section 30D(f)(10)(A) and paragraph (b)(1) of this section, the threshold amount applies to taxpayers based on the return filing status for the taxable year, as set forth in paragraphs (b)(2)(i) through (iii) of this section. *See* section 30D(f)(10)(B).

(i) In the case of a joint return or a surviving spouse (as defined in section 2(a) of the Code), the threshold amount is $300,000,

(ii) In the case of a head of household (as defined in section 2(b)), the threshold amount is $225,000.

(iii) In the case of a taxpayer not described in paragraph (b)(2)(i) or (ii) of this section, the threshold amount is $150,000.

(3) *Special rule for change in filing status.* If the taxpayer's filing status for the taxable year differs from the taxpayer's filing status in the preceding taxable year, then the taxpayer satisfies the limitation described in section 30D(f)(10) and paragraph (b)(1) of this section if the taxpayer's modified adjusted gross income does not exceed the threshold amount in either year based on the applicable filing status for that taxable year.

(4) *Application to estates and trusts*—(i) *Estates and non-grantor trusts.* In the case of a new clean vehicle placed in service by an estate or a non-grantor trust, the threshold amount of paragraph (b)(2)(iii) of this section applies for purposes of the modified adjusted gross income limitation of section 30D(f)(10) and this paragraph (b). For purposes of the modified adjusted gross income limitation, an estate or non-grantor trust is treated as having modified adjusted gross income above the threshold amount for any year in which the estate or non-grantor trust is not in existence.

(ii) *Grantor trusts.* In the case of a new clean vehicle placed in service by a grantor trust, the modified adjusted gross income limitation of section 30D(f)(10) and this paragraph (b) applies based on the modified adjusted gross income of the grantor or other deemed owner of the trust, and not the modified adjusted gross income of the trust or any beneficiary of the trust other than the grantor or other deemed owner.

(5) *Application to passthrough entities.* In the case of a new clean vehicle placed in service by a partnership or an S corporation, if the section 30D credit is claimed by individuals, non-grantor trusts, or estates who are direct or indirect partners of that partnership or shareholders of that S corporation, the modified gross income limitation of section 30D(f)(10) and this paragraph (b) applies at the partner or shareholder level in accordance with the rules of this paragraph (b).

(6) *Other taxpayers.* The modified adjusted gross income limitation of this paragraph (b) does not apply in the case of a new clean vehicle placed in service by a corporation or by a taxpayer that is not an individual, estate, trust, or entity as provided in paragraph (b)(4) or (b)(5) of this section.

(c) *Credit may generally be claimed on only one tax return*—(1) *In general.* Except as provided in paragraph (c)(2) of this section, the amount of the section 30D credit attributable to a new clean vehicle may be claimed on only one Federal income tax return, including on a joint return in which one of the spouses is listed on the seller report. In the event a new clean vehicle is placed in service by multiple taxpayers who do not file a joint tax return (for example, in the case of married individuals filing separate returns), no allocation or proration of the section 30D credit is available.

(2) *Exception for passthrough entities.* In the case of a new clean vehicle placed in service by a partnership or an S corporation, the section 30D credit is allocated among the partners of the partnership under § 1.704–1(b)(4)(ii), or among the shareholder(s) of the S corporation under sections 1366(a) and 1377(a) of the Code, and claimed on the Federal income tax returns of the individual partners or S corporation shareholder(s).

(3) *Seller reporting*—(i) *In general.* The name and taxpayer identification number of the taxpayer claiming the section 30D credit must be listed on the seller report pursuant to section 30D(d)(1)(H). The credit will be allowed only on the Federal income tax return of the taxpayer listed in the seller report.

(ii) *Passthrough entities.* In the case of a new clean vehicle placed in service by a partnership or S corporation, the name and tax identification number of the partnership or S corporation that placed the new clean vehicle in service must be listed on the seller report pursuant to section 30D(d)(1)(H).

(4) *Example.* A married couple jointly purchases and places in service a new clean vehicle that qualifies for the section 30D credit and puts both of their names on the title. The couple files separate Federal income tax returns by using the married filing separately filing status. Only one spouse may claim the section 30D credit with respect to the new clean vehicle on that spouse's respective return, and the other spouse may not claim any amount of the section 30D credit with respect to that new clean vehicle. The spouse that claims the section 30D credit must be the same spouse listed on the seller report.

(d) *Grantor trusts.* To the extent that the grantor or another person is treated as owning all or part of a trust under sections 671 through 679 of the Code, the section 30D credit is allocated to such grantor or other person in accordance with § 1.671–3(a)(1).

(e) *Recapture rules*—(1) *In general.* This paragraph (e) provides rules under section 30D(f)(5) regarding the recapture of the section 30D credit.

(i) *Cancelled sale.* If the sale of a vehicle between the taxpayer and seller is cancelled before the taxpayer places the vehicle in service, then—

(A) The taxpayer may not claim the section 30D credit with respect to the vehicle;

(B) The sale will be treated as not having occurred and the vehicle will be considered available for original use by another taxpayer (regardless of the cancelled sale), and the vehicle will, therefore, still be eligible for the section 30D credit upon a subsequent sale that meets the requirements of section 30D and the section 30D regulations;

(C) The seller report must be rescinded by the seller in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter); and

(D) The taxpayer cannot make a credit transfer election under section 30D(g) and § 1.30D–5(d) with respect to the cancelled sale.

(ii) *Vehicle return.* If a taxpayer returns to the seller a vehicle within 30 days of placing such vehicle in service, then—

(A) The taxpayer cannot claim the section 30D credit with respect to the vehicle;

(B) The vehicle will no longer be considered available for original use by another taxpayer, and, therefore, the vehicle will no longer be eligible for the section 30D credit;

(C) The seller report must be updated by the seller in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter); and

(D) A credit transfer election under 30D(g) and § 1.30D–5(d), if applicable, will be treated as nullified and any advance payment made pursuant to section 30D(g) and § 1.30D–5(f), if applicable, will be collected from the eligible entity as an excessive payment pursuant to § 1.30D–5(g)(2).

(iii) *Resale.* If a taxpayer resells a vehicle within 30 days of placing the vehicle in service, then the taxpayer is treated as having purchased such vehicle with the intent to resell, and—

(A) The taxpayer cannot claim the section 30D credit with respect to the vehicle;

(B) The vehicle will no longer be considered available for original use by another taxpayer, and, therefore, the vehicle will no longer be eligible for the section 30D credit;

(C) The seller report will not be updated;

(D) A credit transfer election under 30D(g) and § 1.30D–5(d), if applicable, will remain in effect and any advance payment made pursuant to section 30D(g) and § 1.30D–5(f) will not be collected from the eligible entity; and

(E) The value of any transferred credit will be collected from the taxpayer as an

increase in tax imposed by chapter 1 of the Code for the taxable year in which the vehicle is placed in service.

(iv) *Other vehicle returns and resales.* In the case of a return of a new clean vehicle not described in paragraph (e)(1)(ii) of this section or a resale not described in paragraph (e)(1)(iii) of this section, the vehicle will no longer be considered available for original use by another taxpayer, and, therefore, will no longer be eligible for the section 30D credit upon a subsequent sale.

(2) *Recapture rules in the case of a credit transfer election.* For additional recapture rules that apply in the case of a credit transfer election, see § 1.30D–5(g)(1). For excessive payment rules that apply in the case of an advance payment made to an eligible entity, see § 1.30D–5(g)(2).

(3) *Example: Demonstrator vehicle.* A dealer purchases, registers, and titles a vehicle in its name and uses it as a demonstrator vehicle for customers. The dealer resells the vehicle more than 30 days after placing the vehicle in service. The dealer claimed the section 30D credit on its Federal tax return for the tax year the vehicle is placed in service. The credit recapture provision in § 1.30D–4(e)(1)(iii) does not apply because the vehicle was resold more than 30 days after being placed in service.

(f) *Seller registration.* A seller must register with the IRS in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) for purposes of filing seller reports (as defined in § 1.30D–2(b)(46)).

(g) *Requirement to file return.* No section 30D credit is allowed unless the taxpayer claiming such credit files a Federal income tax return or information return, as appropriate, for the taxable year in which the new clean vehicle is placed in service. The taxpayer must attach to such return a completed Form 8936, *Clean Vehicle Credits,* or successor form that includes all information required by the form and instructions. The taxpayer must also attach a completed Schedule A (Form 8936), *Clean Vehicle Credit Amount,* or successor form or schedule that includes all information required by the schedule and instructions, such as the vehicle identification number of the previously-owned clean vehicle.

(h) *Taxpayer reliance on manufacturer certifications and periodic written reports to the IRS.* A taxpayer that acquires a new clean vehicle and places it in service may rely on the manufacturer's certification concerning the manufacturer's status as a qualified manufacturer. A taxpayer also may rely on the information and certifications contained in the qualified manufacturer's written reports to the IRS. The procedures for such periodic written reports are established in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). To the extent a taxpayer relies on certifications or attestations from the qualified manufacturer regarding certain section 30D requirements, the new clean vehicle the taxpayer acquires will be deemed to meet the requirements of section 30D(d)(1)(C) through (F), (d)(7), and (e). *See* § 1.30D–5(g)(3)(ii) for an example that illustrates the interplay between the rule in this paragraph (h) and the excessive payment rule in § 1.30D–3(g)(2).

(i) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions shall continue in effect.

(j) *Applicability date.* This section applies to taxable years ending after December 4, 2023.

§ 1.30D–5 Transfer of credit.

(a) *In general.* This section provides rules related to the transfer and advance payment of the section 30D credit pursuant to section 30D(g) of the Internal Revenue Code (Code). Under the rules of section 30D(g) and this section, a taxpayer may elect to transfer a section 30D credit to an eligible entity, and the eligible entity may receive an advance payment for such credit, provided certain requirements are met. *See* paragraph (d) of this section for rules applicable to credit transfer elections. *See* paragraph (f) of this section for rules applicable to advance payments of transferred section 30D credits. Section 30D(g)(2) sets forth certain requirements that a dealer must satisfy to be an eligible entity for credit transfer and advance payment purposes. Section 30D(g)(2)(A) requires registration with the IRS. *See* paragraph (c) of this section for rules related to dealer registration. Section 30D(g)(2)(B) through (D) and paragraph (f)(2) of this section impose additional requirements that a registered dealer must satisfy in order to be an eligible entity for credit transfer and advance payment purposes.

(b) *Definitions.* This paragraph (b) provides definitions that apply for purposes of section 30D(g) and this section. *See* § 1.30D–2(b) for definitions that are generally applicable to section 30D and the section 30D regulations.

(1) *Advance payment program.* Advance payment program means the program described in paragraph (f)(1) of this section.

(2) *Credit transfer election.* Credit transfer election has the meaning provided in section 30D(g) and paragraph (d) of this section.

(3) *Dealer.* Dealer has the meaning provided in section 30D(g)(8), except that, for purposes of this section, the term does not include persons licensed solely by a territory of the United States, and includes a dealer licensed by any jurisdiction (other than one licensed solely by a territory of the United States) that makes sales at sites outside of the jurisdiction in which it is licensed.

(4) *Dealer tax compliance.* Dealer tax compliance means the dealer has filed all required Federal information and tax returns, including for Federal income and employment tax purposes, and the dealer has paid all Federal tax, penalties, and interest due as of the time of sale. A dealer that has entered into an installment agreement with the IRS for which a dealer is current on its obligations (including filing obligations) is treated as in dealer tax compliance.

(5) *Electing taxpayer.* Electing taxpayer means an individual who purchases and places in service a new clean vehicle and elects to transfer the section 30D credit that would otherwise be allowable to such individual to an eligible entity pursuant to section 30D(g) and paragraph (d) of this section. A taxpayer is an electing taxpayer only if the taxpayer makes certain attestations to the registered dealer, pursuant to procedures provided in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter), including that the taxpayer does not anticipate exceeding the modified adjusted gross income limitation of section 30D(b)(1) and § 1.30D–4(b) and that the taxpayer will use the vehicle predominantly for personal use.

(6) *Eligible entity.* Eligible entity has the meaning provided in section 30D(g)(2) and paragraph (f)(2) of this section.

(7) *Incentive.* For purposes of the eligible entity requirements of section 30D(g)(2)(B)(ii) and (D), incentive means any reduction in price available to the taxpayer from the dealer or manufacturer, including in combination with other incentives, other than a reduction in the form of a partial payment or down payment for the purchase of a new clean vehicle pursuant to section 30D(g)(2)(C).

(8) *Registered dealer.* Registered dealer means a dealer that has completed registration with the IRS as provided in paragraph (c) of this section.

(9) *Sale price.* The sale price of a new clean vehicle means the total price agreed upon by the taxpayer and dealer in a written contract at the time of sale, including any delivery charges and after the application of any incentives. The sale price of a new clean vehicle does not include separately stated taxes and fees required by State or local law. The sale price of a new clean vehicle is determined before the application of any trade-in value.

(10) *Time of sale.* Time of sale means the date the new clean vehicle is placed in service, as defined in § 1.30D–2(b)(36).

(c) *Dealer registration*—(1) *In general.* A dealer must register with the IRS in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) for the dealer to receive credits transferred by an electing taxpayer pursuant to section 30D(g) and paragraph (d) of this section.

(2) *Dealer tax compliance required.* A dealer must be in dealer tax compliance to complete and maintain its registration with the IRS and paragraph (d) of this section. If the dealer is not in dealer tax compliance for any of the taxable periods during the last five taxable years, then the dealer may complete its initial registration with the IRS, but the dealer will not be eligible for the advance payment program (and, therefore, the dealer will not be eligible to receive transferred section 30D credits) until the compliance issue is resolved. The IRS will notify the dealer in writing that the dealer is not in dealer tax compliance, and the dealer will have the opportunity to address any failure through regular procedures. If the failure is corrected, the IRS will complete the dealer's registration, and, provided all other requirements of section 30D(g) and this section are met, the dealer will then be allowed to receive transferred section 30D credits and participate in the advance payment program. Additional procedural guidance regarding this paragraph is set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(3) *Suspension of registration.* A registered dealer's registration may be suspended pursuant to the procedures described in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). Any decision made by the IRS relating to the suspension of a registered dealer's registration is not subject to administrative appeal to the IRS Independent Office of Appeals unless the IRS and the IRS Independent Office of Appeals agree that such review is available and the IRS provides the time and manner for such review.

(4) *Revocation of registration.* A registered dealer's registration may be revoked pursuant to the procedures described in guidance published in the *Internal Revenue Bulletin* (see § 601.601). Any decision made by the IRS relating to the revocation of a dealer's registration is not subject to administrative appeal to the IRS Independent Office of Appeals unless the IRS and the IRS Independent Office of Appeals agree that such review is available and the IRS provides the time and manner for such review.

(d) *Credit transfer election by electing taxpayer.* For a new clean vehicle placed in service after December 31, 2023, an electing taxpayer may elect to apply the rules of section 30D(g) and this section to make a credit transfer election with respect to the vehicle so that the section 30D credit with respect to the vehicle is allowed to the eligible entity specified in the credit transfer election (and not to the electing taxpayer) pursuant to the advance payment program described in paragraph (f) of this section. The electing taxpayer, as part of the credit transfer election, must transfer the entire amount of the credit that would otherwise be allowable to the electing taxpayer under section 30D with respect to the vehicle, and the eligible entity specified in the credit transfer election must pay the electing taxpayer an amount equal to the amount of the credit included in the credit transfer election. A credit transfer election must be made no later than the time of sale, and must be made in the manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). Once made, a credit transfer election is irrevocable. No credit transfer election may be made to transfer an amount of credit that would otherwise be allowed to the electing taxpayer under section 38.

(e) *Federal income tax consequences of the credit transfer election*—(1) *Tax consequences for electing taxpayer.* In the case of a credit transfer election, the Federal income tax consequences for the electing taxpayer are as follows—

(i) The credit amount under section 30D that the electing taxpayer elects to transfer to the eligible entity under section 30D(g) and paragraph (d) of this section may exceed the electing taxpayer's regular tax liability (as defined in section 26(b)(1) of the Code) for the taxable year in which the sale occurs, and the excess, if any, is not subject to recapture on the basis that it exceeded the electing taxpayer's regular tax liability;

(ii) The payment made by an eligible entity to an electing taxpayer under section 30D(g)(2)(C) and paragraph (d) of this section to an electing taxpayer pursuant to the credit transfer election is not includible in the gross income of the electing taxpayer; and

(iii) The payment made by an eligible entity to an electing taxpayer under section 30D(g)(2)(C) and paragraph (d) of this section is treated as repaid by the electing taxpayer to the eligible entity as partial payment of the sale price of the new clean vehicle. Thus, the repayment by the electing taxpayer is included in the electing taxpayer's basis in the new clean vehicle prior to the application of the basis reduction rule in section 30D(f)(1).

(2) *Tax consequences for eligible entity.* In the case of a credit transfer election, the Federal income tax consequences for the eligible entity are as follows—

(i) The eligible entity is allowed the section 30D credit with respect to the new clean vehicle and may receive an advance payment pursuant to section 30D(g)(7) and paragraph (f) of this section;

(ii) Advance payments received by the eligible entity are not treated as a tax credit in the hands of the eligible entity and may exceed the eligible entity's regular tax liability (as defined in section 26(b)(1)) for the taxable year in which the sale occurs;

(iii) An advance payment received by the eligible entity is not included in the gross income of the eligible entity;

(iv) The payment made by an eligible entity under section 30D(g)(2)(C) and paragraph (d) of this section to an electing taxpayer is not deductible by the eligible entity;

(v) The payment made by an eligible entity to an electing taxpayer under section 30D(g)(2)(C) and paragraph (d) of this section is treated as repaid by the electing taxpayer to the eligible entity as partial payment of the sale price of the new clean vehicle. Thus, the repayment by the electing taxpayer is treated as an amount realized by the eligible entity under section 1001 of the Code and the regulations under section 1001; and

(vi) If the eligible entity is a partnership or an S corporation, then—

(A) The IRS will make the advance payment to such partnership or S corporation equal to the amount of the section 30D credit allowed that is transferred to the eligible entity;

(B) Such section 30D credit is reduced to zero and is, for any other purpose of the Code, deemed to have been allowed solely to such entity (and not allocated or otherwise allowed to its partners or shareholders) for such taxable year; and

(C) The amount of the advance payment is not treated as tax exempt income to the partnership or S corporation for purposes of the Code.

(3) *Form of payment from eligible entity to electing taxpayer.* The tax treatment of the payment made by the eligible entity to the electing taxpayer described in paragraphs (e)(1) and (2) of this section is the same regardless of whether the payment is made in cash, in the form of a partial payment or down payment for the purchase of the new clean vehicle, or as a reduction in sale price (without the payment of cash) of the new clean vehicle.

(4) *Additional requirements.* In the case of a credit transfer election, the following additional rules apply—

(i) The requirements of section 30D(f)(1) (regarding basis reduction) and 30D(f)(2) (regarding no double benefit) apply to the electing taxpayer as if the credit transfer election were not made (so, for example, the electing taxpayer must reduce the electing taxpayer's basis in the vehicle by the amount of the section 30D credit, regardless of the credit transfer election);

(ii) Section 30D(f)(6) (regarding the election not to take the credit) will not apply (in other words, by electing to transfer the credit, the electing taxpayer is electing to take the credit);

(iii) Section 30D(f)(9) (regarding the vehicle identification number requirement) will be treated as satisfied if the eligible entity provides the vehicle identification number of such vehicle to the IRS in the form and manner set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The electing taxpayer must also provide the vehicle identification number with their tax return for the taxable year in which the vehicle is placed in service. *See* section 6213(g)(2)(T) of the Code and § 301.6213–2 of this chapter for rules relating to the omission of a correct vehicle identification number.

(5) *Examples.* The following examples illustrate the rules of paragraph (e) of this section.

(i) *Example 1: Electing taxpayer's regular tax liability less than amount of credit*—(A) *Facts.* T, an individual, purchases a new clean sport utility vehicle from a dealer, D, which is a C corporation. T satisfies the requirements to be an electing taxpayer and elects to transfer the section 30D credit to D. D is a registered dealer and satisfies the requirements to be an eligible entity. The sale price of the vehicle is $57,500. The section 30D credit otherwise allowable to T is $7,500. D makes the payment required to be made to T in the form of a cash payment of $7,500. T uses the $7,500 as a partial payment for the vehicle. T pays D an additional $50,000 from other funds. T's regular tax liability for the year is less than $7,500.

(B) *Analysis.* Under paragraph (e)(1)(i) of this section, T may transfer the credit to D, even though T's regular tax liability is less than $7,500, and no amount of the credit will be recaptured from T on the basis that the allowable credit exceeds T's regular tax liability. D's $7,500 payment to T is not included in T's gross income, and the sale price of the vehicle is $57,500 (including both the $7,500 payment and the additional $50,000 paid by T from other funds), prior to the application of the basis reduction rule of section 30D(f)(1). After application of the basis reduction rule, T's basis in the vehicle is $50,000. D is eligible to receive an advance payment of $7,500 for the transferred section 30D credit as provided in section 30D(g)(7) and paragraph (f) of this section. Under paragraph (e)(2) of this section, D may receive the advance payment irrespective of the fact that D's regular tax liability is less than $7,500. The advance payment is not treated as a credit toward D's tax liability (if any), nor is it included in D's gross income. Further, D's $7,500 payment to T is not deductible, and D's amount realized is $57,500 upon the sale of the vehicle (including both the $7,500 payment from D to T that T uses as a partial payment, and the additional $50,000 paid by T from other funds).

(ii) *Example 2: Non-cash payment by eligible entity to electing taxpayer*—(A) *Facts.* The facts are the same as in paragraph (e)(5)(i)(A) of this section (facts of *Example 1*), except that D makes the payment to T in the form of a reduction in the sale price of the vehicle (rather than as a cash payment).

(B) *Analysis.* Paragraph (e)(3) of this section provides that the application of paragraphs (e)(1) and (2) of this section is not dependent on the form of payment from an eligible entity to an electing taxpayer (for example, a payment in cash or a payment in the form of a reduction in sale price). Thus, the analysis is the same as in paragraph (e)(5)(i)(B) of this section (analysis of *Example 1*).

(iii) *Example 3: Eligible entity is a partnership*—(A) *Facts.* The facts are the same as in paragraph (e)(5)(i)(A) of this section (facts of *Example 1*), except that D is a partnership.

(B) *Analysis.* The analysis as to T is the same as in paragraph (e)(5)(i)(B) of this section (analysis of *Example 1*). Because D is a partnership, paragraph (e)(2)(vi) of this section applies. Thus, the advance payment is made to the partnership, the credit is reduced to zero and is, for any other purpose of the Code, deemed to have been allowed solely to the partnership (and not allocated or otherwise allowed to its partners) for such taxable year. The amount of the advance payment is not treated as tax-exempt income to the partnership for purposes of the Code.

(f) *Advance payments received by eligible entities*—(1) *In general.* An eligible entity may receive advance payments from the IRS (corresponding to the amount of the section 30D credit for which a credit transfer election was made by an electing taxpayer to transfer the credit to the eligible entity pursuant to section 30D(g) and paragraph (d) of this section) before the eligible entity files its Federal income tax return or information return, as appropriate, for the taxable year with respect to which the credit transfer election corresponds. This advance payment program is the exclusive mechanism for an eligible entity to receive the section 30D credit transferred pursuant to section 30D(g) and paragraph (d) of this section. An eligible entity receiving a transferred section 30D credit may not claim the credit on a tax return.

(2) *Requirements for a registered dealer to become an eligible entity.* A registered dealer qualifies as an eligible entity, and may therefore receive an advance payment, in connection with a credit transfer election, if it meets the following requirements:

(i) The registered dealer submits required registration information and is in dealer tax compliance;

(ii) The registered dealer retains information regarding the credit transfer election for three calendar years beginning with the year immediately after the year in which the vehicle is placed in service, as described in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter);

(iii) The registered dealer meets any other requirements set forth in guidance published in the *Internal Revenue Bulletin* (see § 601.601 of this chapter) or in forms and instructions; and

(iv) The registered dealer meets any other requirements of section 30D(g), including those in section 30D(g)(2)(B) through (E).

(g) *Increase in tax*—(1) *Recapture if electing taxpayer exceeds modified adjusted gross income limitation.* If an electing taxpayer has modified adjusted gross income that exceeds the limitation in section 30D(f)(10) and § 1.30D–4(b), then the income tax imposed on such taxpayer under chapter 1 of the Code (chapter 1) for the taxable year in which such vehicle was placed in service is

increased by the amount of the payment received by the taxpayer. The electing taxpayer must recapture such amounts on the return described in paragraph (h) of this section.

(2) *Excessive payments*—(i) *In general.* This paragraph provides rules under section 30D(g)(7)(B), which provides that rules similar to the rules of section 6417(d)(6) of the Code apply to the advance payment program. In the case of any advance payment to an eligible entity that the IRS determines constitutes an excessive payment, the tax imposed on the eligible entity under chapter 1, regardless of whether such entity would otherwise be subject to tax under chapter 1, for the taxable year in which such determination is made will be increased by the sum of the following amounts—

(A) The amount of the excessive payment; plus

(B) An amount equal to 20 percent of such excessive payment.

(ii) *Reasonable cause.* The amount described in paragraph (g)(2)(i)(B) of this section will not apply to an eligible entity if the eligible entity demonstrates to the satisfaction of the IRS that the excessive payment resulted from reasonable cause. In the case of a new clean vehicle (with respect to which a credit transfer election was made by the electing taxpayer) that is returned to the eligible entity within 30 days of being placed in service, the eligible entity will be treated as having demonstrated that the excessive payment resulted from reasonable cause.

(iii) *Excessive payment defined.* Excessive payment means an advance payment made—

(A) To a registered dealer that fails to meet the requirements to be an eligible entity provided in section 30D(g)(2) and paragraph (f)(2) of this section, or

(B) Except as provided in paragraph (g)(2)(iv) of this section, to an eligible entity with respect to a new clean vehicle to the extent the payment exceeds the amount of the credit that, without application of section 30D(g) and this section, would be otherwise allowable to the electing taxpayer with respect to the vehicle for such tax year.

(iv) *Special rule for cases in which the electing taxpayer's modified adjusted gross income exceeds the limitation.* Any excess described in paragraph (g)(2)(iii)(B) of this section that arises due to the electing taxpayer exceeding the limitation based on modified adjusted gross income in section 30D(f)(10) and § 1.30D–4(b) is not an excessive payment. Instead, the amount of the advance payment is recaptured from the electing taxpayer under section 30D(g)(10) and paragraph (g)(1) of this section.

(3) *Examples.* The following examples illustrate the excessive payment rules in paragraph (g)(2) of this section.

(i) *Example 1: Registered dealer is not an eligible entity*—(A) *Facts.* In 2024, D, a registered dealer, receives an advance payment of $7,500 with respect to a credit transferred under section 30D(g)(1) and paragraph (d) of this section for a new clean vehicle V. In 2025, the IRS determines that D was not an eligible entity with respect to new clean vehicle V at the time of the receipt of the advance payment in 2024, because D failed to satisfy one of the requirements of section 30D(g)(2) and paragraph (f)(2) of this section. D is unable to show reasonable cause for the failure.

(B) *Analysis.* Under paragraph (g)(2)(i) of this section, the tax imposed on D is increased by the amount of the excessive payment if the advance payment received by D constitutes an excessive payment. Under paragraph (g)(2)(iii) of this section, the entire amount of the $7,500 advance payment received by D is an excessive payment because D did not meet the requirements to be an eligible entity under section 30D(g)(2) and paragraph (f)(2) of this section. Additionally, because D cannot show reasonable cause for its failure to meet these requirements, the tax imposed under chapter 1 on D is increased by $9,000 in 2025 (the taxable year of the IRS determination). This is comprised of the $7,500 value of the credit plus the $1,500 penalty, calculated as a 20% penalty on such $7,500 (20% × $7,500 = $1,500). This treatment applies regardless of whether D is otherwise subject to tax under chapter 1 (for example, if D is a partnership).

(ii) *Example 2: Incorrect manufacturer certifications*—(A) *Facts.* In 2024, T, a taxpayer, makes an election to transfer a credit under section 30D(g)(1) and paragraph (d) of this section to E, a registered dealer, for a new clean vehicle V. M, the manufacturer of such vehicle, certified to the IRS that vehicle V was eligible for a $7,500 credit because it met both the critical minerals and the battery components requirements. T transfers the $7,500 credit to E. Subsequent to T's purchase and election to transfer the $7,500 credit to E, M reports to the IRS that vehicle V was only eligible for a $3,750 credit because it did not meet the critical minerals requirement.

(B) *Analysis.* Under § 1.30D–4(h), T may rely on the information and certifications provided in M's written report to the IRS regarding vehicle V's eligibility for the section 30D credit. Under paragraph (g)(2)(iii)(B) of this section, an advance payment to an eligible entity with respect to a vehicle is an excessive payment to the extent the payment exceeds the amount of the credit that, without a credit transfer election, would be otherwise allowable to the electing taxpayer with respect to the vehicle for such taxable year. Because the amount of the credit that would be allowable to T for 2024 is $7,500, and T transferred the $7,500 credit to E, there is no excessive payment with respect to E.

(h) *Return requirement.* An electing taxpayer that makes a credit transfer election must file a Federal income tax return or information return, as appropriate, for the taxable year in which the credit transfer election is made and indicate such election on the return in accordance with the instructions to the form on which the return is made. The electing taxpayer must attach a completed Form 8936, *Clean Vehicle Credits,* or successor form, and a completed Schedule A (Form 8936), *Clean Vehicle Credit Amount,* or successor form or schedule, including the vehicle identification number of the new clean vehicle and such other information as provided in forms and instructions.

(i) *Two credit transfer elections per year.* A taxpayer may make no more than two credit transfer elections per taxable year, consisting of either two elections to transfer section 30D credits, or one election to transfer a section 30D credit and one election to transfer a section 25E credit. In the case of taxpayers who file a joint return, each individual taxpayer may make no more than two credit transfer elections per taxable year.

(j) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions will continue in effect.

(k) *Applicability date.* This section applies to new clean vehicles placed in service after December 31, 2023, in taxable years ending after December 31, 2023.

§ 1.30D–6 Foreign entity of concern restriction.

(a) *In general.* This section provides rules related to the excluded entities provision of section 30D(d)(7) of the Internal Revenue Code (Code), which imposes certain restrictions on the extraction, processing, or recycling of applicable critical minerals, and the manufacturing or assembly of battery

components contained in a clean vehicle battery by a foreign entity of concern (FEOC). Specifically, section 30D(d)(7) provides that the term *new clean vehicle* does not include any vehicle placed in service after December 31, 2023, with respect to which any of the battery components in the clean vehicle battery were manufactured or assembled by a FEOC, or any vehicle placed in service after December 31, 2024, with respect to which any of the applicable critical minerals contained in the clean vehicle battery were extracted, processed, or recycled by a FEOC (FEOC restriction). *See* § 1.30D–2(b) for definitions applicable to section 30D(d)(7) and this section.

(b) *Due diligence required*—(1) *In general.* The qualified manufacturer must conduct due diligence with respect to all battery components and applicable critical minerals (and associated constituent materials) that are relevant to determining whether such components or minerals are FEOC-compliant. Such due diligence must comply with standards of tracing for battery materials available in the industry at the time of the attestation or certification that enables the qualified manufacturer to know with reasonable certainty the provenance of applicable critical minerals, associated constituent materials, and battery components. Reasonable reliance on a supplier attestation or certification will be considered due diligence if the qualified manufacturer, or any third-party manufacturer or supplier, does not know or have reason to know that such supplier attestation or certification is incorrect. *See* paragraph (c)(5) of this section for rules related to third-party manufacturers and suppliers. The qualified manufacturer must conduct due diligence prior to the qualified manufacturer determining the information necessary to establish any compliant-battery ledger under paragraph (d) of this section, and the qualified manufacturer must continue to conduct due diligence on an ongoing basis.

(2) *Transition rule for impracticable-to-trace battery materials.* For any new clean vehicles for which the qualified manufacturer provides a periodic written report before January 1, 2027, the due diligence requirement of paragraph (b)(1) of this section may be satisfied by excluding identified impracticable-to-trace battery materials. To use this transition rule, a qualified manufacturer must submit a report during the up-front review process described in paragraph (d)(2)(ii) of this section demonstrating how the qualified manufacturer will comply with the FEOC restriction of section 30D(d)(7) and this section, including information about efforts made to date to secure a FEOC-compliant supply of these battery materials once the transition rule is no longer in effect.

(c) *FEOC compliance*—(1) *In general.* In the case of any new clean vehicle placed in service after December 31, 2023, the clean vehicle battery or batteries of the vehicle must be FEOC-compliant. A serial number or other identification system must be used to physically track FEOC-compliant batteries to specific new clean vehicles. The determination that a clean vehicle battery is FEOC-compliant is made as follows:

(i) *Step 1.* The qualified manufacturer determines whether battery components and applicable critical minerals (and associated constituent materials) are FEOC-compliant, in accordance with paragraph (c)(4) of this section.

(ii) *Step 2.* The FEOC-compliant battery components and FEOC-compliant applicable critical minerals (and associated constituent materials) are physically tracked to specific battery cells, in accordance with paragraph (c)(3)(i) of this section. Alternatively, FEOC-compliant applicable critical minerals and associated constituent materials (but not battery components) may be allocated to battery cells, without physical tracking, in accordance with paragraph (c)(3)(ii) of this section. In addition, the determination of whether a battery cell is FEOC-compliant may be made by applying the transition rule for impracticable-to-trace battery materials, in accordance with paragraph (c)(3)(iii) of this section.

(iii) *Step 3.* The battery components, including battery cells, are physically tracked to specific clean vehicle batteries, in accordance with paragraph (c)(2) of this section.

(2) *FEOC-compliant batteries.* The determination that a clean vehicle battery is FEOC-compliant must be made by physically tracking FEOC-compliant battery components (including battery cells) to such battery. With respect to battery cells, a serial number or other identification system must be used to physically track FEOC-compliant battery cells to such batteries.

(3) *FEOC-compliant battery cells*—(i) *In general.* Except as provided in paragraph (c)(3)(ii) of this section, the determination that a battery cell contains FEOC-compliant battery components and FEOC-compliant applicable critical minerals and their associated constituent materials must be made by physically tracking FEOC-compliant battery components to specific battery cells, and by physically tracking the mass of FEOC-compliant applicable critical minerals and their associated constituent materials to specific battery cells.

(ii) *Allocation-based determination for applicable critical minerals and associated constituent materials of a battery cell*—(A) *In general.* The determination that a battery cell is FEOC-compliant may be based on an allocation of available mass, procured or contracted for, of applicable critical minerals and their associated constituent materials to specific battery cells manufactured or assembled in a battery cell production facility, without the physical tracking of mass of applicable critical minerals and associated constituent materials to specific battery cells.

(B) *Allocation limited to applicable critical minerals in the battery cell.* The rules of this paragraph (c)(3)(ii) are limited to applicable critical minerals and their associated constituent materials that are incorporated into a battery cell or its battery components. Battery components must be physically tracked.

(C) *Separate allocation required for each type of associated constituent material*—(*1*) *In general.* Any allocation under this paragraph (c)(3)(ii) with respect to the mass of an applicable critical mineral must be made within the type of associated constituent material (such as powders of cathode active materials, powders of anode active materials, or foils) in which such applicable critical mineral is contained. Masses of an applicable critical mineral may not be aggregated across constituent materials with which such applicable critical mineral is not associated, and an allocation of a mass of an applicable critical mineral may not be made from one type of constituent material to another.

(*2*) *Example.* M, a qualified manufacturer, operates a battery cell production facility. M manufactures a line of battery cells that contains applicable critical mineral Z (ACM–Z) in constituent material 1 and in constituent material 2. With respect to constituent material 1, M procures 20,000,000 kilograms (kg) of ACM–Z for the battery cell production facility, of which 4,000,000 kg are FEOC-compliant and 16,000,000 kg are not FEOC-compliant. With respect to constituent material 2, M procures another 15,000,000 kg of ACM–Z for the battery cell production facility, of which 7,500,000 kg are FEOC-compliant and 7,500,000 kg are not FEOC-compliant. M determines which battery cells are FEOC-compliant through an allocation-

based determination with respect to battery cells manufactured or assembled in the battery cell production facility. Under this paragraph (c)(3)(ii)(C), any allocation with respect to the mass of ACM–Z must be made within the type of constituent material in which ACM–Z is contained. Thus, M may not aggregate the 4,000,000 kg of FEOC-compliant ACM–Z contained in constituent material 1 with the 7,500,000 kg of FEOC-compliant ACM–Z contained in constituent material 2, and allocations may not be made from constituent material 1 to constituent material 2. As a result, overall FEOC compliance is constrained by the 20% of constituent material 1 that is FEOC-compliant due to having 4,000,000 kg of ACM–Z, even though 33% (4,000,000 + 7,500,000)/(20,000,000 + 15,000,000) of the total mass of ACM–Z is FEOC-compliant.

(D) *Allocation within each product line of battery cells.* Any allocation under this paragraph (c)(3)(ii) with respect to applicable critical minerals and their associated constituent materials must be allocated within one or more specific battery cell product lines of the battery cell production facility.

(E) *Limitation on number of FEOC-compliant battery cells.* If a qualified manufacturer uses an allocation-based determination described in this paragraph (c)(3)(ii), the number of FEOC-compliant battery cells that can be produced from such allocation may not exceed the total number of battery cells for which there is enough of every FEOC-compliant applicable critical mineral. That number will necessarily be limited by the applicable critical mineral that has the lowest percentage of FEOC-compliant supply. For example, if a qualified manufacturer allocates applicable critical mineral A, which is 20 percent FEOC-compliant, and applicable critical mineral B, which is 60 percent FEOC-compliant, to a battery cell product line, no more than 20 percent of the battery cells in that battery cell product line will be treated as FEOC-compliant.

(iii) *Transition rule for impracticable-to-trace battery materials.* For any new clean vehicles for which the qualified manufacturer provides a periodic written report before January 1, 2027, the qualified manufacturer's determination of whether a battery cell is FEOC-compliant under this paragraph (c)(3) may be satisfied by excluding identified impracticable-to-trace battery materials (and associated constituent materials).

(4) *FEOC-compliant battery components and applicable critical minerals*—(i) *In general.* The determination of whether battery components and applicable critical minerals (and their associated constituent materials) are FEOC-compliant must be made prior to any determination under paragraphs (c)(2) and (3) of this section.

(ii) *Timing of determination of FEOC or FEOC-compliant status.* Whether an entity is a FEOC is determined at the time of the entity's performance of the relevant activity, which for applicable critical minerals is the time of extraction, processing, or recycling, and for battery components is the time of manufacturing or assembly. The determination of whether an applicable critical mineral is FEOC-compliant is determined at the end of processing or recycling the applicable critical mineral into a constituent material, taking into account all applicable steps through and including final processing or recycling.

(iii) *Example: Timing of FEOC compliance determination.* Mineral X, an applicable critical mineral, was not extracted by a FEOC but was later processed by a FEOC. Mineral X is not FEOC-compliant because one step of the extraction and processing was performed by a FEOC. Therefore, any battery containing Mineral X is not FEOC-compliant.

(5) *Third-party manufacturers or suppliers.* The determinations under paragraphs (c)(2) through (4) of this section, which are generally made by the qualified manufacturer, may be made by a third-party manufacturer or supplier that operates a battery cell production facility, provided the third-party manufacturer satisfies the requirements of paragraph (c)(5)(i) through (iii) of this section, and paragraph (c)(5)(iv) of this section, if applicable.

(i) *Due diligence required.* The third-party manufacturer or supplier must perform the due diligence described in paragraph (b) of this section.

(ii) *Provision of required information to qualified manufacturer.* The third-party manufacturer or supplier must provide the qualified manufacturer of the new clean vehicle information sufficient to establish a basis for the determinations under paragraphs (c)(2) through (4) of this section, including information related to the due diligence described in paragraph (c)(5)(i) of this section.

(iii) *Contractual obligations.* The third-party manufacturer or supplier must be contractually required to provide the information in paragraph (c)(5)(ii) of this section to the qualified manufacturer and must be contractually required to inform the qualified manufacturer of any change in the supply chain that affects the determinations of FEOC compliance under paragraph (c)(2) through (4) of this section.

(iv) *Additional requirements in case of multiple third-party manufacturers or suppliers.* If there are multiple third-party manufacturers or suppliers (such as a case in which a qualified manufacturer contracts with a battery manufacturer, that, in turn, contracts with a battery cell manufacturer or supplier that operates a battery cell production facility), the due diligence and information requirements of this paragraph (c) must be satisfied by each third-party manufacturer or supplier, either by providing all required information directly to the qualified manufacturer or indirectly through contractual relationships.

(d) *Compliant-battery ledger*—(1) *In general.* For new clean vehicles placed in service after December 31, 2024, the qualified manufacturer must determine and provide information to the IRS to establish a compliant-battery ledger for each calendar year, as described in paragraphs (d)(2)(i) and (ii) of this section. The qualified manufacturer may establish one compliant-battery ledger for all vehicles for a calendar year, or separate ledgers for specific models or classes of vehicles to account for different battery cell chemistries or differing quantities of cells in each clean vehicle battery.

(2) *Determination of number of batteries*—(i) *In general.* To establish a compliant-battery ledger for a calendar year, the qualified manufacturer must determine the number of clean vehicle batteries, with respect to new clean vehicles for which the qualified manufacturer anticipates providing a periodic written report during the calendar year, that it knows or reasonably anticipates will be FEOC-compliant, pursuant to the requirements of paragraphs (b) and (c) of this section. The determination is based on the battery components and applicable critical minerals (and associated constituent materials) that are procured or contracted for the calendar year and that are known or reasonably anticipated to be FEOC-compliant battery components or FEOC-compliant applicable critical minerals, as applicable.

(ii) *Upfront review.* The qualified manufacturer must attest to the number of FEOC-compliant clean vehicle batteries determined under paragraph (d)(2)(i) of this section and provide the basis for the determination, including attestations, certifications and documentation demonstrating

compliance with paragraphs (b) and (c) of this section, at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). The IRS, with analytical assistance from the Department of Energy (DOE), will review the attestations, certifications, and documentation. Once the IRS determines that the qualified manufacturer provided the required attestations, certifications, and documentation, the IRS will approve or reject the determined number of FEOC-compliant batteries. The IRS may approve the determined number in whole or part. The approved number is the initial balance in the compliant-battery ledger.

(iii) *Decrease or increase to compliant-battery ledger*—(A) Once the compliant-battery ledger is established with respect to a calendar year, the qualified manufacturer must determine and take into account any decrease in the number of FEOC-compliant batteries for such calendar year and any of the prior three calendar years for which the qualified manufacturer had a compliant-battery ledger, within 30 days of discovery. In addition, the qualified manufacturer may determine and take into account any increase in the number of FEOC-compliant batteries. Such determinations, and any supporting attestations, certifications, and documentation, must be provided on a periodic basis, in accordance with paragraph (d)(2)(ii) of this section and the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(B) The decrease described in paragraph (d)(2)(iii)(A) of this section may decrease the compliant-battery ledger below zero, creating a negative balance in the compliant-battery ledger.

(C) If any decrease described in paragraph (d)(2)(iii)(A) of this section is determined subsequent to the calendar year to which it relates, the decrease must be taken into account in the year in which the change is discovered.

(D) Any remaining balance in the compliant-battery ledger at the end of the calendar year, whether positive or negative, will be included in the compliant-battery ledger for the subsequent calendar year. If a qualified manufacturer has multiple negative compliant-battery accounts, any negative balance will first be included in the compliant-battery ledger for the same model or class of vehicles for the subsequent calendar year. However, if there is no ledger for the same model or class of vehicles in the subsequent calendar year, the IRS can account for such negative balance in the ledger of a different model or class of vehicles of the qualified manufacturer.

(3) *Tracking FEOC-compliant batteries.* The compliant-battery ledger for a calendar year must be updated to track the qualified manufacturer's available FEOC-compliant batteries, by reducing the balance in the ledger as the qualified manufacturer submits periodic written reports reporting the vehicle identification numbers of new clean vehicles as eligible for the credit under section 30D, at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). If the balance in the compliant-battery ledger of the qualified manufacturer for a calendar year is zero or less than zero, the qualified manufacturer may not submit additional periodic written reports with respect to section 30D until the number of available FEOC-compliant batteries is increased as described in paragraph (d)(2)(iii)(A) of this section.

(4) *Reconciliation of battery estimates.* After the end of any calendar year for which a compliant-battery ledger is established, the IRS may require a qualified manufacturer to provide attestations, certifications, and documentation to support the accuracy of the number of the qualified manufacturer's FEOC-compliant batteries for such calendar year, including with respect to any changes described in paragraph (d)(2)(iii) of this section, at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(e) *Rule for 2024*—(1) *In general.* For new clean vehicles that are placed in service after December 31, 2023, and prior to January 1, 2025, the qualified manufacturer must determine whether the battery components contained in the vehicles satisfy the requirements of section 30D(d)(7)(B), and whether batteries contained in the vehicles are FEOC-compliant under the rules of paragraphs (b) and (c) of this section. The qualified manufacturer must make an attestation with respect to such determinations at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter). However, for any new clean vehicles for which the qualified manufacturer provides a periodic written report before June 5, 2024, provided that the qualified manufacturer has determined that its supply chains for each battery component with respect such vehicles contain only FEOC-compliant battery components:

(i) For purposes of paragraphs (c)(2) and (3) of this section, the determination of which battery cells or clean vehicle batteries, as applicable, contain FEOC-compliant battery components may be made without physical tracking;

(ii) For purposes of paragraph (c)(2) of this section, the determination of which clean vehicle batteries contain FEOC-compliant battery cells may be made without physical tracking (and without the use of a serial number or other identification system); and

(iii) For purposes of paragraph (c)(1) of this section, the determination of which vehicles contain FEOC-compliant batteries may be made without physical tracking (and without the use of a serial number or other identification system).

(2) *Determination.* The determination that a qualified manufacturer's supply chains of each battery component contain only FEOC-compliant battery components may be made with respect to specific models or classes of vehicles.

(f) *Inaccurate attestations, certifications, or documentation*—(1) *In general.* If the IRS determines, with analytical assistance from the DOE and after review of the attestations, certification, and documentation described in paragraph (d) of this section, that a qualified manufacturer has provided attestations, certifications, or documentation that contain inaccurate information, the IRS may take appropriate action, as described in paragraphs (f)(2) and (3) of this section. Such action would affect vehicles and qualified manufacturers on a prospective basis.

(2) *Inadvertence*—(i) *Inaccurate information may be cured by qualified manufacturer.* If the IRS determines that the qualified manufacturer's attestations, certifications, or documentation for a specific new clean vehicle contain inaccurate information due to inadvertence, the qualified manufacturer may, within a reasonable period of time after discovery of the inaccurate information, cure the errors, including by a decrease in the compliant-battery ledger as described in paragraph (d)(2)(iii) of this section. If the qualified manufacturer has multiple compliant-battery ledgers, the IRS may determine which ledger is to be decreased.

(ii) *Consequences if errors not cured.* If the qualified manufacturer does not cure the errors, the IRS may take any of the following actions:

(A) In the case of a new clean vehicle that has not been placed in service but for which the qualified manufacturer has submitted a periodic written report certifying compliance with the requirements of section 30D(d), the IRS may determine that such vehicle is no

longer considered a new clean vehicle eligible for the section 30D credit.

(B) In the case of a new clean vehicle that has not been placed in service and for which the qualified manufacturer has not submitted a periodic written report certifying compliance with the requirements of section 30D(d), the qualified manufacturer may not submit such periodic written report.

(C) In the case of a new clean vehicle that has been placed in service, the IRS may require a decrease in the qualified manufacturer's compliant-battery ledger as described in paragraph (d)(2)(iii) of this section. If the qualified manufacturer has multiple compliant-battery ledgers, the IRS may determine which ledger is to be decreased.

(3) *Intentional disregard or fraud.* If the IRS determines that a qualified manufacturer intentionally disregarded attestation, certification, or documentation requirements, or reported information fraudulently or with intentional disregard, the IRS may take any of the actions described in paragraph (f)(3)(i) or (ii) of this section.

(i) *All vehicles ineligible for credit.* The IRS may determine that all vehicles manufactured by the qualified manufacturer that have not been placed in service are no longer considered new clean vehicles eligible for the section 30D credit.

(ii) *Termination of written agreement.* The IRS may terminate the written agreement between the IRS and the manufacturer, thereby terminating the manufacturer's status as a qualified manufacturer. In such instance, the manufacturer would be required to submit a new written agreement to reestablish qualified manufacturer status at the time and in the manner provided in the *Internal Revenue Bulletin* (see § 601.601 of this chapter).

(g) *Rules inapplicable to new qualified fuel cell motor vehicles.* The requirements of section 30D(d)(7) and this section do not apply to new qualified fuel cell motor vehicles.

(h) *Examples.* The following examples illustrate the rules under paragraphs (b) through (e) of this section:

(1) *Example 1: In general*—(i) *Facts.* M is a manufacturer of new clean vehicles and batteries. M also manufactures and assembles battery cells at its own battery cell production facility. M manufactures a line of new clean vehicles that it anticipates will be placed in service in calendar year 2025. Each vehicle contains one clean vehicle battery, and each clean vehicle battery contains 1,000 battery cells. All battery cells are produced at the same battery cell production facility. The battery cells are not manufactured or assembled by a FEOC. Each battery cell contains 10 units of battery component A. M has procured or is under contract to procure 10,000,000 units of battery component A for the battery cell production facility, of which 6,000,000 units are from supplier 1 and 4,000,000 units are from supplier 2.

(ii) *Analysis*—(A) Under paragraph (b) of this section, M must conduct due diligence on all battery components and applicable critical minerals (and associated constituent materials) that are contained in the clean vehicle batteries to determine whether such components or minerals are FEOC-compliant.

(B) Under paragraph (c)(4) of this section, M must first determine whether the battery components and applicable critical minerals (and associated constituent materials) are FEOC-compliant. From its due diligence, M determines that, of the 10,000,000 units of battery component A, the 6,000,000 units from supplier 1 are FEOC-compliant while the 4,000,000 units from supplier 2 are not FEOC-compliant. M determines that all other battery components and applicable critical minerals (and associated constituent materials) of the battery cells are FEOC-compliant, that the battery cell is not manufactured or assembled by a FEOC, and that all battery components (excluding components of the battery cell) of the clean vehicle batteries are FEOC-compliant.

(C) Under paragraph (c)(3) of this section, M must determine which battery cells are FEOC-compliant through the physical tracking of the 6,000,000 units of FEOC-compliant battery component A to determine which 600,000 (6,000,000/10) battery cells are FEOC-compliant. Under paragraph (c)(2) of this section, M must use a serial number or other identification system to track the 600,000 FEOC-compliant battery cells to 600 (600,000/1,000) specific clean vehicle batteries.

(D) Under paragraph (d)(1) of this section, a compliant-battery ledger must be established for calendar year 2025. For purposes of paragraph (d)(2)(i) of this section, M determines that it will manufacture 600 batteries for calendar year 2025 that are FEOC-compliant. Under paragraph (d)(2)(ii) of this section, M attests to the 600 FEOC-compliant batteries and provides the basis for the determination, including attestations, certifications, and documentation demonstrating compliance with paragraphs (b) and (c) of this section. Once the IRS, with analytical assistance from the DOE, approves the number, a compliant-battery ledger is established with a balance of 600 FEOC-compliant batteries.

(E) M manufactures 100 vehicles that it anticipates will be placed in service in 2025, for which it provides periodic written reports providing the vehicle identification numbers of the vehicles and indicating that such vehicles qualify for the section 30D credit. Under paragraph (d)(3) of this section, the compliant-battery ledger is updated to track the number of FEOC-compliant batteries. The number of FEOC-compliant batteries contained in the compliant-battery ledger is reduced from 600 to 500. Assuming all of the other requirements of section 30D and the regulations thereunder are met, the 100 vehicles are new clean vehicles for purposes of section 30D.

(2) *Example 2: Rules for third-party suppliers*—(i) *Facts.* The facts are the same as in paragraph (h)(1)(i) of this section (facts of *Example 1*), except that M contracts with a battery manufacturer, BM, for the provision of clean vehicle batteries, and BM contracts with a battery cell supplier, BCS, that operates a battery cell production facility, for the provision of battery cells.

(ii) *Analysis.* Under paragraph (c)(5) of this section, BCS may make the determination in paragraphs (c)(2) through (4) of this section, provided that M, BM, and BCS perform due diligence as described in paragraph (b) of this section. In addition, BM and BCS must provide M with information sufficient to establish a basis for the determinations under paragraphs (c)(2) through (4) of this section, including information related to due diligence. Finally, BM and BCS must be contractually required to provide the required information to M, and must also be required to inform the qualified manufacturer of any change in supply chains that affects the determinations of FEOC compliance under paragraphs (c)(2) and (4) of this section. The contractual requirement may be satisfied if BM and BCS each have the contractual obligation to M. Alternatively, it may be satisfied if BCS has a contractual obligation to BM and BM, in turn, has a contractual obligation to M.

(3) Example *3: Applicable critical minerals*—(i) *Facts.* The facts are the same as in paragraph (h)(1)(i) of this section (facts of *Example 1*). In addition, each battery cell contains 20 kilograms (kg) of applicable critical mineral Z (ACM–Z) contained in a constituent material. M has procured or is under contract to procure 20,000,000 kg of ACM–Z for the battery cell production

facility, of which 4,000,000 kg are from supplier 3 and 16,000,000 kg are from supplier 4.

(ii) *Analysis.* The analysis is the same as in paragraph (h)(1)(ii) of this section (analysis of *Example 1*). In addition, from its due diligence, M determines that of the 20,000,000 kg of ACM–Z, the 4,000,000 kg from supplier 3 is FEOC-compliant while the 16,000,000 kg from supplier 4 is not FEOC-compliant. Under paragraph (c)(3) of this section, M may determine which battery cells are FEOC-compliant through the physical tracking of the 4,000,000 kg of FEOC-compliant ACM–Z to 200,000 (4,000,000/20) of the battery cells that also contain battery component A, in order to determine which 200,000 battery cells are FEOC-compliant. Alternatively, M may determine which 200,000 battery cells are FEOC-compliant through an allocation of ACM–Z (but not battery component A) to battery cells, without physical tracking, under paragraph (c)(3)(ii) of this section. Under paragraph (c)(2) of this section, M must use a serial number or other identification system to track the 200,000 FEOC-compliant battery cells to 200 (200,000/1,000) specific clean vehicle batteries.

(4) *Example 4: Comprehensive example*—(i) *Facts.* M is a manufacturer of new clean vehicles and batteries. M also manufactures or assembles battery cells at its own battery cell production facility. M manufactures a line of new clean vehicles. Each vehicle contains one battery. All battery cells are produced at the same battery cell production facility. The battery cells are not manufactured or assembled by a FEOC. Each battery contains 1,000 NMC 811 battery cells. M anticipates manufacturing 1,000,000 such battery cells for a line of new clean vehicles that it anticipates will be placed in service in calendar year 2025.

(A) Each battery cell contains 1 cathode electrode, 1 anode electrode, 1 separator, and 1 liquid electrolyte. Thus, M procures 1,000,000 units of each battery component for the battery cell production facility.

(B) In addition, each NMC 811 cathode incorporates cathode active material (a constituent material) produced using 2.5 kg of applicable critical minerals, consisting of 0.5 kg of lithium hydroxide, 1.6 kg of nickel sulfate, 0.2 kg of cobalt sulfate, and 0.2 kg of manganese sulfate. Thus, M procures 2,500 metric tons (2.5 kg × 1,000,000/1,000) of applicable critical minerals for the battery cell production facility, resulting in purchase agreements for 500 metric tons of lithium, 1,600 metric tons of nickel, 200 metric tons of cobalt, and 200 metric tons of manganese.

(ii) *Analysis*—(A) Under paragraph (b) of this section, M must conduct due diligence on all battery components and applicable critical minerals (and associated constituent materials) that are contained in the clean vehicle batteries to determine whether such components or minerals are FEOC-compliant.

(B) Under paragraph (c)(4) of this section, M must first determine whether the battery components and applicable critical minerals (and associated constituent materials) are FEOC-compliant. From its due diligence M determines that, of the cathode electrodes, 600,000 are not manufactured by a FEOC and are therefore FEOC-compliant; 400,000 are manufactured by a FEOC and are therefore non-compliant. Because each battery cell contains 1 cathode electrode, a maximum of 600,000 battery cells would be FEOC-compliant. Of the critical minerals that M has procured, M determines that 250 metric tons of lithium hydroxide, 1,200 metric tons of nickel sulfate, and all of the cobalt sulfate and manganese sulfate are FEOC-compliant. M determines that all other battery components and applicable critical minerals of the battery cells are FEOC-compliant.

(C) Under paragraph (c)(3) of this section, M must determine which battery cells are FEOC-compliant through the physical tracking of battery components. M may determine which battery cells are FEOC-compliant through the physical tracking of applicable critical minerals. Alternatively, M may determine which battery cells are FEOC-compliant through an allocation of applicable critical minerals (and associated constituent materials) but not battery components.

(D) Under an allocation-based determination, M has procured 500 metric tons of lithium hydroxide incorporated into a constituent material for the battery cell production facility, of which 50% (250/500 metric tons) is FEOC-compliant. M has procured 1,600 metric tons of nickel sulfate incorporated into a constituent material for the battery cell production facility, of which 75% (1,200/1,600 metric tons) is FEOC-compliant. Because the lithium hydroxide is the least compliant applicable critical mineral or component, M allocates the FEOC-compliant lithium hydroxide mass to 50% or 500,000 (50% × 1,000,000) of the total battery cells, and to battery cells that contain FEOC-compliant cathode electrodes and have been allocated FEOC-compliant nickel sulfate. Under paragraph (c)(3)(ii)(E) of this section, the quantity of FEOC-compliant battery cells is limited by the applicable critical mineral (lithium hydroxide) that has the lowest percentage (50%) of FEOC-compliant supply.

(E) Under paragraph (c)(2) of this section, M must use a serial number or other identification system to track the 500,000 FEOC-compliant battery cells to 500 (500,000/1,000) specific clean vehicle batteries.

(F) Under paragraph (d)(1) of this section, a compliant-battery ledger must be established for calendar year 2025. For purposes of paragraph (d)(2)(i) of this section, M determines that it will manufacture 500 batteries for calendar year 2025 that are FEOC-compliant, allocating its FEOC-compliant applicable critical minerals to the cells containing FEOC-compliant battery components. Under paragraph (d)(2)(ii) of this section, M attests to the 500 FEOC-compliant batteries and provides the basis for the determination, including attestations, certifications, and documentation demonstrating compliance with paragraphs (b) and (c) of this section. Once the IRS, with analytical assistance from the DOE, has approved the number, a compliant-battery ledger is established with a balance of 500 FEOC-compliant batteries.

(i) *Severability.* The provisions of this section are separate and severable from one another. If any provision of this section is stayed or determined to be invalid, it is the agencies' intention that the remaining provisions will continue in effect.

(j) *Applicability date.* This section applies to new clean vehicles placed in service after December 31, 2023, in taxable years ending after December 31, 2023.

PART 301—PROCEDURE AND ADMINISTRATION

■ **Par 4.** The authority citation for part 301 is amended by adding an entry in numerical order for § 301.6213–2 to read, in part, as follows:

Authority: 26 U.S.C. 7805.

* * * * *

Section 301.6213–2 also issued under 26 U.S.C. 6213.

* * * * *

■ **Par 5.** Section 301.6213–2 is added to read as follows:

§ 301.6213–2 Omission of correct vehicle identification number.

(a) *In general.* The definition of the term *mathematical or clerical error* in

section 6213(g)(2) of the Internal Revenue Code (Code) includes:

(1) Under section 6213(g)(2)(T), an omission of a correct vehicle identification number required under section 30D(f)(9) of the Code (relating to credit for new clean vehicles) to be included on a return;

(2) Under section 6213(g)(2)(U), an omission of a correct vehicle identification number required under section 25E(d) of the Code (relating to credit for previously-owned clean vehicles) to be included on a return; and

(3) Under section 6213(g)(2)(V), an omission of a correct vehicle identification number required under section 45W(e) of the Code (relating to credit for qualified commercial clean vehicles) to be included on a return.

(b) *Omission of a correct vehicle identification number.* For purposes of paragraph (a) of this section, a taxpayer is treated as having omitted a correct vehicle identification number if:

(1) The vehicle identification number required to be reported under section 30D(f)(9), 25E(d), or 45W(e) is not included on the return of tax;

(2) The vehicle identification number included on the return of tax is not that of a vehicle eligible for a credit under section 30D, 25E, or 45W.

(3) The vehicle identification number included on the return of tax is not that of a vehicle eligible for a credit under section 30D, 25E, or 45W for the year in which it is claimed;

(4) The vehicle identification number included on the return of tax differs from the vehicle identification number reported to the IRS and the taxpayer under section 30D(d)(1)(H) for each new clean vehicle placed in service during the taxable year by the taxpayer who was issued the report; or

(5) The vehicle identification number included on the return of tax differs from the vehicle identification number reported to the IRS and the taxpayer under section 25E(c)(1)(D)(i) for each previously-owned clean vehicle placed in service during the taxable year by the taxpayer who was issued the report.

(c) *Applicability date.* This section applies to taxable years beginning after December 31, 2023.

Douglas W. O'Donnell,

Deputy Commissioner.

Approved: April 21, 2024.

Aviva Aron-Dine,

Acting Assistant Secretary of the Treasury (Tax Policy).

Part VI

Department of Energy

10 CFR Parts 429 and 430
Energy Conservation Program: Energy Conservation Standards for Consumer Water Heaters; Final Rule

DEPARTMENT OF ENERGY

10 CFR Parts 429 and 430

[EERE 2017–BT–STD–0019]

RIN 1904–AD91

Energy Conservation Program: Energy Conservation Standards for Consumer Water Heaters

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Final rule.

SUMMARY: The Energy Policy and Conservation Act, as amended (''EPCA''), prescribes energy conservation standards for various consumer products and certain commercial and industrial equipment, including consumer water heaters. EPCA also requires the U.S. Department of Energy (''DOE'' or ''the Department'') to periodically determine whether more stringent standards would be technologically feasible and economically justified, and would result in significant energy savings. In this final rule, DOE is adopting amended energy conservation standards for consumer water heaters. It has determined that the new and amended energy conservation standards for these products would result in significant conservation of energy, and are technologically feasible and economically justified.

DATES: The effective date of this rule is July 5, 2024. Compliance with the new and amended standards established for consumer water heaters in this final rule is required on and after May 6, 2029.

ADDRESSES: The docket for this rulemaking, which includes **Federal Register** notices, public meeting attendee lists and transcripts, comments, and other supporting documents/materials, is available for review at *www.regulations.gov*. All documents in the docket are listed in the *www.regulations.gov* index. However, not all documents listed in the index may be publicly available, such as information that is exempt from public disclosure.

The docket web page can be found at *www.regulations.gov/docket/EERE-2017-BT-STD-0019*. The docket web page contains instructions on how to access all documents, including public comments, in the docket.

I. Synopsis of the Final Rule

The Energy Policy and Conservation Act, Public Law 94–163, as amended (''EPCA''),[1] authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. (42 U.S.C. 6291–6317) Title III, Part B of EPCA [2] established the Energy Conservation Program for Consumer Products Other Than Automobiles. (42 U.S.C. 6291–6309) These products include consumer water heaters, the subject of this rulemaking. As discussed in section II.B.3 of this document, DOE is finalizing standards for all consumer water heaters, with the exception of gas-fired instantaneous water heaters, in this Final Rule.

Pursuant to EPCA, any new or amended energy conservation standard must be designed to achieve the maximum improvement in energy efficiency that DOE determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A)) Furthermore, the new or amended standard must result in significant conservation of energy. (42 U.S.C. 6295(o)(3)(B)) EPCA also provides that not later than 6 years after issuance of any final rule establishing or amending a standard, DOE must publish either a notice of determination that standards for the product do not need to be amended, or a notice of proposed rulemaking including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6295(m))

In accordance with these and other statutory provisions discussed in this document, DOE analyzed the benefits and burdens of six trial standard levels (''TSLs'') for consumer water heaters. The TSLs and their associated benefits and burdens are discussed in detail in sections V.A through V.C of this document. As discussed in section V.C of this document, DOE has determined that TSL 2 represents the maximum improvement in energy efficiency that is technologically feasible and economically justified. The adopted standards, which are expressed in terms of uniform energy factor (''UEF''), are shown in Table I.1. These standards apply to all products listed in Table I.1 and manufactured in, or imported into, the United States starting on May 6, 2029.

BILLING CODE 6450–01–P

[1] All references to EPCA in this document refer to the statute as amended through the Energy Act of 2020, Public Law 116–260 (Dec. 27, 2020), which reflect the last statutory amendments that impact Parts A and A–1 of EPCA.

[2] For editorial reasons, upon codification in the U.S. Code, Part B was redesignated Part A.

Table I.1 Energy Conservation Standards for Consumer Water Heaters (Compliance Starting May 6, 2029)

Product Class	Effective Storage Volume and Input Rating *(if applicable)*	Draw Pattern	Uniform Energy Factor*
Gas-fired Storage Water Heater	< 20 gal	Very Small	$0.2062 - (0.0020 \times V_{eff})$
		Low	$0.4893 - (0.0027 \times V_{eff})$
		Medium	$0.5758 - (0.0023 \times V_{eff})$
		High	$0.6586 - (0.0020 \times V_{eff})$
	≥ 20 gal and ≤ 55 gal	Very Small	$0.3925 - (0.0020 \times V_{eff})$
		Low	$0.6451 - (0.0019 \times V_{eff})$
		Medium	$0.7046 - (0.0017 \times V_{eff})$
		High	$0.7424 - (0.0013 \times V_{eff})$
	>55 gal and ≤ 100 gal	Very Small	$0.6470 - (0.0006 \times V_{eff})$
		Low	$0.7689 - (0.0005 \times V_{eff})$
		Medium	$0.7897 - (0.0004 \times V_{eff})$
		High	$0.8072 - (0.0003 \times V_{eff})$
	> 100 gal	Very Small	$0.1482 - (0.0007 \times V_{eff})$
		Low	$0.4342 - (0.0017 \times V_{eff})$
		Medium	$0.5596 - (0.0020 \times V_{eff})$
		High	$0.6658 - (0.0019 \times V_{eff})$
Oil-fired Storage Water Heater	≤ 50 gal	Very Small	$0.2909 - (0.0012 \times V_{eff})$
		Low	$0.5730 - (0.0016 \times V_{eff})$
		Medium	$0.6478 - (0.0016 \times V_{eff})$
		High	$0.7215 - (0.0014 \times V_{eff})$
	> 50 gal	Very Small	$0.1580 - (0.0009 \times V_{eff})$
		Low	$0.4390 - (0.0020 \times V_{eff})$
		Medium	$0.5389 - (0.0021 \times V_{eff})$
		High	$0.6172 - (0.0018 \times V_{eff})$
Very Small Electric Storage Water Heater	< 20 gal	Very Small	$0.5925 - (0.0059 \times V_{eff})$
		Low	$0.8642 - (0.0030 \times V_{eff})$
		Medium	$0.9096 - (0.0020 \times V_{eff})$
		High	$0.9430 - (0.0012 \times V_{eff})$
Small Electric Storage Water Heater	≥ 20 gal and ≤ 35 gal	Very Small	$0.8808 - (0.0008 \times V_{eff})$
		Low	$0.9254 - (0.0003 \times V_{eff})$
Electric Storage Water Heaters	> 20 and ≤ 55 gal (excluding small electric storage water heaters)	Very Small	2.30
		Low	2.30
		Medium	2.30
		High	2.30
	> 55 gal and ≤120 gal	Very Small	2.50
		Low	2.50
		Medium	2.50
		High	2.50
	> 120 gal	Very Small	$0.3574 - (0.0012 \times V_{eff})$
		Low	$0.7897 - (0.0019 \times V_{eff})$
		Medium	$0.8884 - (0.0017 \times V_{eff})$
		High	$0.9575 - (0.0013 \times V_{eff})$
Tabletop Water Heater	< 20 gal	Very Small	$0.5925 - (0.0059 \times V_{eff})$
		Low	$0.8642 - (0.0030 \times V_{eff})$
	≥ 20 gal	Very Small	$0.6323 - (0.0058 \times V_{eff})$
		Low	$0.9188 - (0.0031 \times V_{eff})$
Instantaneous Gas-fired Water Heater**	<2 gal and >50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Oil-fired Water Heater	< 2 gal and ≤ 210,000 Btu/h	Very Small	0.61
		Low	0.61

		Medium	0.61
		High	0.61
	≥ 2 gal and ≤ 210,000 Btu/h	Very Small	$0.2780 - (0.0022 \times V_{eff})$
		Low	$0.5151 - (0.0023 \times V_{eff})$
		Medium	$0.5687 - (0.0021 \times V_{eff})$
		High	$0.6147 - (0.0017 \times V_{eff})$
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92
	≥ 2 gal	Very Small	$0.8086 - (0.0050 \times V_{eff})$
		Low	$0.9123 - (0.0020 \times V_{eff})$
		Medium	$0.9252 - (0.0015 \times V_{eff})$
		High	$0.9350 - (0.0011 \times V_{eff})$
Grid-Enabled Water Heater	> 75 gal	Very Small	$1.0136 - (0.0028 \times V_{eff})$
		Low	$0.9984 - (0.0014 \times V_{eff})$
		Medium	$0.9853 - (0.0010 \times V_{eff})$
		High	$0.9720 - (0.0007 \times V_{eff})$

* V_{eff} is the Effective Storage Volume (in gallons), as determined pursuant to 10 CFR 429.17.
** As discussed in section II.B.3 of this document, DOE is still considering amended energy conservation standards for gas-fired instantaneous water heaters.

BILLING CODE 6450–01–C

A. Benefits and Costs to Consumers

Table I.2 summarizes DOE's evaluation of the economic impacts of the adopted standards on consumers of consumer water heaters, as measured by the average life-cycle cost (''LCC'') savings and the simple payback period (''PBP'').[3] The average LCC savings are positive for all product classes, and the PBP is less than the average lifetime of consumer water heaters, which is estimated to be about 15 years for storage water heaters (*see* section IV.F of this document).

Table I.2 Impacts of Adopted Energy Conservation Standards on Consumers of Consumer Water Heaters

Product Class	Effective Storage Volume and Input Rating *(if applicable)*	Average LCC Savings *2022$*	Simple Payback *years*
Gas-fired Storage Water Heater	≥20 gal and ≤55 gal	29	9.1
Oil-fired Storage Water Heater	≤50 gal	141	6.5
Electric Storage Water Heaters	Small Electric Storage Water Heaters ≥20 gal and ≤35 gal (<51 gal FHR)	N/A	N/A
	≥20 gal and ≤55 gal, Excluding Small Electric Storage Water Heaters	859	5.6
	>55 gal and ≤120 gal	458	0.2

DOE's analysis of the impacts of the adopted standards on consumers is described in section IV.F of this document.

B. Impact on Manufacturers

The industry net present value (''INPV'') is the sum of the discounted cash flows to the industry from the base year through the end of the analysis period (2023–2059). Using a real discount rate of 9.6 percent, DOE estimates that the INPV for manufacturers of consumer water heaters in the case without amended standards is $1,478.8 million in 2022$. Under the adopted standards, DOE estimates the change in INPV to range

[3] The average LCC savings refer to consumers that are affected by a standard and are measured relative to the efficiency distribution in the no-new-standards case, which depicts the market in the compliance year in the absence of new or amended standards (*see* section IV.F.9 of this document). The simple PBP, which is designed to compare specific efficiency levels, is measured relative to the baseline product (*see* section IV.C of this document).

from −18.6 percent to 1.9 percent, which is a loss of $275.3 million to a gain of $28.2 million. In order to bring products into compliance with amended standards, it is estimated that industry will incur total conversion costs of $239.8 million.

DOE's analysis of the impacts of the adopted standards on manufacturers is described in sections IV.J and V.B.2 of this document.

C. National Benefits and Costs [4]

DOE's analyses indicate that the adopted energy conservation standards for consumer water heaters would save a significant amount of energy. Relative to the case without amended standards, the lifetime energy savings for consumer water heaters purchased in the 30-year period that begins in the anticipated year of compliance with the amended standards (2030–2059), amount to 17.6 quadrillion British thermal units (''Btu''), or quads.[5] This represents a savings of 10 percent relative to the energy use of these products in the case without amended standards (referred to as the ''no-new-standards case'').

The cumulative net present value (''NPV'') of total consumer benefits of the standards for consumer water heaters ranges from $25 billion (at a 7-percent discount rate) to $82 billion (at a 3-percent discount rate). This NPV expresses the estimated total value of future operating-cost savings minus the estimated increased product and installation costs for consumer water heaters purchased during the period 2030–2059.

In addition, the adopted standards for consumer water heaters are projected to yield significant environmental benefits. DOE estimates that the standards will result in cumulative emission reductions (over the same period as for energy savings) of 332 million metric tons (''Mt'') [6] of carbon dioxide (''CO_2''), 90 thousand tons of sulfur dioxide (''SO_2''), 665 thousand tons of nitrogen oxides (''NO_X''), 3,058 thousand tons of methane (''CH_4''), 2.9 thousand tons of nitrous oxide (''N_2O''), and 0.6 tons of mercury (''Hg'').[7]

DOE estimates the value of climate benefits from a reduction in greenhouse gases (''GHG'') using four different estimates of the social cost of CO_2 (''SC–CO_2''), the social cost of methane (''SC–CH_4''), and the social cost of nitrous oxide (''SC–N_2O''). Together these represent the social cost of GHG (''SC–GHG''). DOE used interim SC–GHG values (in terms of benefit per ton of GHG avoided) developed by an Interagency Working Group on the Social Cost of Greenhouse Gases (''IWG'').[8] The derivation of these values is discussed in section IV.L of this document. For presentational purposes, the climate benefits associated with the average SC–GHG at a 3-percent discount rate are estimated to be $17 billion. DOE does not have a single central SC–GHG point estimate and it emphasizes the value of considering the benefits calculated using all four sets of SC–GHG estimates. DOE notes, however, that the adopted standards would be economically justified even without inclusion of monetized benefits of reduced GHG emissions.

DOE estimated the monetary health benefits of SO_2 and NO_X emissions reductions, using benefit per ton estimates from the Environmental Protection Agency,[9] as discussed in section IV.L of this document. DOE estimated the present value of the health benefits would be $12 billion using a 7-percent discount rate, and $33 billion using a 3-percent discount rate.[10] DOE is currently only monetizing health benefits from changes in ambient fine particulate matter ($PM_{2.5}$) concentrations from two precursors (SO_2 and NO_X), and from changes in ambient ozone from one precursor (for NO_X), but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions.

Table I.3 summarizes the monetized benefits and costs expected to result from the amended standards for consumer water heaters. There are other important unquantified effects, including certain unquantified climate benefits, unquantified public health benefits from the reduction of toxic air pollutants and other emissions, unquantified energy security benefits, and distributional effects, among others.

BILLING CODE 6450–01–P

[4] All monetary values in this document are expressed in 2022 dollars.

[5] The quantity refers to full-fuel-cycle (FFC) energy savings. FFC energy savings includes the energy consumed in extracting, processing, and transporting primary fuels (*i.e.,* coal, natural gas, petroleum fuels), and, thus, presents a more complete picture of the impacts of energy efficiency standards. For more information on the FFC metric, *see* section IV.H.1 of this document.

[6] A metric ton is equivalent to 1.1 short tons. Results for emissions other than CO_2 are presented in short tons.

[7] DOE calculated emissions reductions relative to the no-new-standards-case, which reflects key assumptions in the *Annual Energy Outlook 2023* (''*AEO2023*''). *AEO2023* reflects, to the extent possible, laws and regulations adopted through mid-November 2022, including the Inflation Reduction Act. *See* section IV.K of this document for further discussion of *AEO2023* assumptions that affect air pollutant emissions.

[8] To monetize the benefits of reducing GHG emissions this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Intereim Estimates Under Executive Order 13990* published in February 2021 by the IWG. (''February 2021 SC–GHG TSD''). *www.whitehouse.gov/wp-content/uploads/2021/02/Technical/SupportDocument_SocialCostof CarbonMethaneNitrousOxide.pdf.*

[9] U.S. EPA. Estimating the Benefit per Ton of Reducing Directly Emitted $PM_{2.5}$, $PM_{2.5}$ Precursors and Ozone Precursors from 21 Sectors. Available at *www.epa.gov/benmap/estimating-benefit-ton-reducing-pm25-precursors-21-sectors.*

[10] DOE estimates the economic value of these emissions reductions resulting from the considered TSLs for the purpose of complying with the requirements of Executive Order 12866.

Table I.3 Summary of Monetized Benefits and Costs of Adopted Energy Conservation Standards for Consumer Water Heaters

	Billion $2022
3% discount rate	
Consumer Operating Cost Savings	124
Climate Benefits*	17
Health Benefits**	33
Total Benefits†	175
Consumer Incremental Product Costs‡	42
Net Benefits	132
Change in Producer Cashflow (INPV)‡‡	(0.28) - 0.03
7% discount rate	
Consumer Operating Cost Savings	47
Climate Benefits* (3% discount rate)	17
Health Benefits**	12
Total Benefits†	76
Consumer Incremental Product Costs‡	22
Net Benefits	54
Change in Producer Cashflow (INPV)‡‡	(0.28) - 0.03

Note: This table presents the costs and benefits associated with consumer water heaters shipped during the period 2030–2059. These results include consumer, climate, and health benefits that accrue after 2059 from the products shipped during the period 2030–2059.

* Climate benefits are calculated using four different estimates of the social cost of carbon (SC-CO_2), methane (SC-CH_4), and nitrous oxide (SC-N_2O) (model average at 2.5 percent, 3 percent, and 5 percent discount rates; 95th percentile at 3 percent discount rate) (see section IV.L of this document). Together these represent the global SC-GHG. For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown; however, DOE emphasizes the value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits, but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. See section IV.L of this document for more details.

† Total and net benefits include those consumer, climate, and health benefits that can be quantified and monetized. For presentation purposes, total and net benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.

‡ Costs include incremental equipment costs as well as installation costs.

‡‡ Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. *See* sections IV.F and IV.H of this document. DOE's national impacts analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). *See* section IV.J of this document. In the

detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. Change in INPV is calculated using the industry weighted average cost of capital value of 9.6 percent that is estimated in the manufacturer impact analysis (*see* chapter 12 of the final rule technical support document ("TSD") for a complete description of the industry weighted average cost of capital). For consumer water heaters, the change in INPV ranges from -$275 million to $28 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. *See* section V.C of this document. DOE is presenting the range of impacts to the INPV under two scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the net benefit calculation for this final rule, the net benefits would range from $131.7 billion to $132.0 billion at 3-percent discount rate and would range from $53.7 billion to $54.0 billion at 7-percent discount rate.

BILLING CODE 6450–01–C

The benefits and costs of the proposed standards can also be expressed in terms of annualized values. The monetary values for the total annualized net benefits are (1) the reduced consumer operating costs, minus (2) the increase in product purchase prices and installation costs, plus (3) the value of climate and health benefits of emission reductions, all annualized.[11]

The national operating cost savings are domestic private U.S. consumer monetary savings that occur as a result of purchasing the covered products and are measured for the lifetime of consumer water heaters shipped during the period 2030–2059. The benefits associated with reduced emissions achieved as a result of the adopted standards are also calculated based on the lifetime of consumer water heaters shipped during the period 2030–2059. Total benefits for both the 3-percent and 7-percent cases are presented using the average GHG social costs with 3-percent discount rate. Estimates of total benefits are presented for all four SC–GHG value discount rates in section IV.L.1 of this document.

Table I.4 presents the total estimated monetized benefits and costs associated with the proposed standard, expressed in terms of annualized values. The results under the primary estimate are as follows.

Using a 7-percent discount rate for consumer benefits and costs and health benefits from reduced NO_X and SO_2 emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated cost of the standards adopted in this rule is $2,623 million per year in increased equipment costs, while the estimated annual benefits are $5,655 million in reduced equipment operating costs, $1,051 in monetized climate benefits, and 1,416 in monetized health benefits. In this case, the net benefit would amount to $5,499 per year.

Using a 3-percent discount rate for all benefits and costs, the estimated cost of the standards is $2,586 million per year in increased equipment costs, while the estimated annual benefits are $7,566 million in reduced operating costs, $1,051 million in monetized climate benefits, and $2,033 million in monetized health benefits. In this case, the net benefit would amount to $8,065 million per year.

BILLING CODE 6450–01–P

[11] To convert the time-series of costs and benefits into annualized values, DOE calculated a present value in 2022, the year used for discounting the NPV of total consumer costs and savings. For the benefits, DOE calculated a present value associated with each year's shipments in the year in which the shipments occur (*e.g.,* 2020 or 2030), and then discounted the present value from each year to 2022. Using the present value, DOE then calculated the fixed annual payment over a 30-year period, starting in the compliance year, that yields the same present value.

Table I.4 Annualized Benefits and Costs of Adopted Standards for Consumer Water Heaters

	Million 2022$/year		
	Primary Estimate	Low-Net-Benefits Estimate	High-Net-Benefits Estimate
3% discount rate			
Consumer Operating Cost Savings	7,566	7,078	8,065
Climate Benefits*	1,051	1,039	1,063
Health Benefits**	2,033	2,009	2,058
Total Benefits†	10,650	10,125	11,186
Consumer Incremental Product Costs‡	2,586	3,023	2,398
Net Benefits	8,065	7,102	8,788
Change in Producer Cashflow (INPV)‡‡	(28) - 3	(28) - 3	(28) - 3
7% discount rate			
Consumer Operating Cost Savings	5,655	5,294	6,024
Climate Benefits* (3% discount rate)	1,051	1,039	1,063
Health Benefits**	1,416	1,400	1,432
Total Benefits†	8,122	7,732	8,519
Consumer Incremental Product Costs‡	2,623	2,984	2,467
Net Benefits	5,499	4,748	6,052
Change in Producer Cashflow (INPV)‡‡	(28) - 3	(28) - 3	(28) - 3

Note: This table presents the costs and benefits associated with consumer water heaters shipped during the period 2030–2059. These results include consumer, climate, and health benefits that accrue after 2059 from the products shipped during the period 2030–2059. The Primary, Low Net Benefits, and High Net Benefits Estimates utilize projections of energy prices from the *AEO2023* Reference case, Low Economic Growth case, and High Economic Growth case, respectively. In addition, incremental equipment costs reflect a medium decline rate in the Primary Estimate, a low decline rate in the Low Net Benefits Estimate, and a high decline rate in the High Net Benefits Estimate. The methods used to derive projected price trends are explained in sections IV.F.1 and IV.F.4 of this document. Note that the Benefits and Costs may not sum to the Net Benefits due to rounding.

* Climate benefits are calculated using four different estimates of the global SC-GHG (see section IV.L of this document). For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown; however, DOE emphasizes the value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits, but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. *See* section IV.L of this document for more details.

† Total benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.

‡ Costs include incremental equipment costs as well as installation costs.

‡‡ Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. *See* sections IV.F and IV.H of this document. DOE's national impacts

analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). *See* section IV.J of this document. In the detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. The annualized change in INPV is calculated using the industry weighted average cost of capital value of 9.6 percent that is estimated in the manufacturer impact analysis (*see* chapter 12 of the final rule TSD for a complete description of the industry weighted average cost of capital). For consumer water heaters, the annualized change in INPV ranges from -$28 million to $3 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. *See* section V.C of this document. DOE is presenting the range of impacts to the INPV under two scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated annualized change in INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the annualized net benefit calculation for this final rule, the annualized net benefits would range from $8,037 million to $8,068 million at 3-percent discount rate and would range from $5,471 million to $5,502 million at 7-percent discount rate.

BILLING CODE 6450–01–C

DOE's analysis of the national impacts of the adopted standards is described in sections IV.H, IV.K, and IV.L of this document.

D. Conclusion

DOE concludes that the standards adopted in this final rule represent the maximum improvement in energy efficiency that is technologically feasible and economically justified, and would result in the significant conservation of energy. Specifically with regards to technological feasibility, products achieving these standard levels are already commercially available for all product classes covered by this rule. As for economic justification, DOE's analysis shows that the estimated benefits of the standards exceed, to a great extent, the estimated burdens of the standards.

Using a 7-percent discount rate for consumer benefits and costs and NO_X and SO_2 reduction benefits, and a 3-percent discount rate case for GHG social costs, the estimated cost of the standards for consumer water heaters is $2,623 million per year in increased product costs, while the estimated annual benefits are $5,655 million in reduced product operating costs, $1,051 million in climate benefits, and $1,416 million in health benefits. The net benefit amounts to $5,499 million per year.

The significance of energy savings offered by a new or amended energy conservation standard cannot be determined without knowledge of the specific circumstances surrounding a given rulemaking.[12] For example, some covered products and equipment have most of their energy consumption occur during periods of peak energy demand. The impacts of these products on the energy infrastructure can be more pronounced than products with relatively constant demand. Accordingly, DOE evaluates the significance of energy savings on a case-by-case basis.

As previously mentioned, the standards are projected to result in estimated cumulative national energy savings of 17.6 quads (full-fuel cycle (''FFC'')), the equivalent of the primary annual energy use of 116 million homes. In addition, they are projected to reduce CO_2 emissions by 332 Mt. Based on these findings, DOE has determined the energy savings from the standard levels adopted in this final rule are ''significant'' within the meaning of 42 U.S.C. 6295(o)(3)(B). A more detailed discussion of the basis for these conclusions is contained in the remainder of this document and the accompanying TSD.

[12] Procedures, Interpretations, and Policies for Consideration in New or Revised Energy Conservation Standards and Test Procedures for Consumer Products and Commercial/Industrial Equipment, 86 FR 70892, 70901 (Dec. 13, 2021).

II. Introduction

The following section briefly discusses the statutory authority underlying this final rule, as well as some of the relevant historical background related to the establishment of standards for consumer water heaters.

A. Authority

EPCA authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. Title III, Part B of EPCA established the Energy Conservation Program for Consumer Products Other Than Automobiles. These products include consumer water heaters, the subject of this document. (42 U.S.C. 6292(a)(4)) EPCA prescribed energy conservation standards for these products (42 U.S.C. 6295(e)(1)), and directs DOE to conduct future rulemakings to determine whether to amend these standards. (42 U.S.C. 6295(e)(4)) EPCA further provides that, not later than 6 years after the issuance of any final rule establishing or amending a standard, DOE must publish either a notice of determination that standards for the product do not need to be amended, or a NOPR including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6295(m)(1))

The energy conservation program under EPCA, consists essentially of four parts: (1) testing, (2) labeling, (3) the establishment of Federal energy conservation standards, and (4)

certification and enforcement procedures. Relevant provisions of the EPCA specifically include definitions (42 U.S.C. 6291), test procedures (42 U.S.C. 6293), labeling provisions (42 U.S.C. 6294), energy conservation standards (42 U.S.C. 6295), and the authority to require information and reports from manufacturers (42 U.S.C. 6296).

Federal energy efficiency requirements for covered products established under EPCA generally supersede State laws and regulations concerning energy conservation testing, labeling, and standards. (42 U.S.C. 6297(a)–(c)) DOE may, however, grant waivers of Federal preemption in limited instances for particular State laws or regulations, in accordance with the procedures and other provisions set forth under EPCA. (*See* 42 U.S.C. 6297(d))

Subject to certain statutory criteria and conditions, DOE is required to develop test procedures to measure the energy efficiency, energy use, or estimated annual operating cost of each covered product. (42 U.S.C. 6295(o)(3)(A) and 42 U.S.C. 6295(r)) Manufacturers of covered products must use the prescribed DOE test procedure as the basis for certifying to DOE that their products comply with the applicable energy conservation standards adopted under EPCA and when making representations to the public regarding the energy use or efficiency of those products. (42 U.S.C. 6293(c) and 6295(s)) Similarly, DOE must use these test procedures to determine whether the products comply with standards adopted pursuant to EPCA. (42 U.S.C. 6295(s)) The DOE test procedures for consumer water heaters appear at title 10 of the Code of Federal Regulations (''CFR'') part 430, subpart B, appendix E (''appendix E'').

DOE must follow specific statutory criteria for prescribing new or amended standards for covered products, including consumer water heaters. Any new or amended standard for a covered product must be designed to achieve the maximum improvement in energy efficiency that the Secretary of Energy determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A)) Furthermore, DOE may not adopt any standard that would not result in the significant conservation of energy. (42 U.S.C. 6295(o)(3))

Moreover, DOE may not prescribe a standard (1) for certain products, including consumer water heaters, if no test procedure has been established for the product, or (2) if DOE determines by rule that the standard is not technologically feasible or economically justified. (42 U.S.C. 6295(o)(3)(A)–(B)) In deciding whether a proposed standard is economically justified, DOE must determine whether the benefits of the standard exceed its burdens. (42 U.S.C. 6295(o)(2)(B)(i)) DOE must make this determination after receiving comments on the proposed standard, and by considering, to the greatest extent practicable, the following seven statutory factors:

(1) The economic impact of the standard on manufacturers and consumers of the products subject to the standard;

(2) The savings in operating costs throughout the estimated average life of the covered products in the type (or class) compared to any increase in the price, initial charges, or maintenance expenses for the covered products that are likely to result from the standard;

(3) The total projected amount of energy (or as applicable, water) savings likely to result directly from the standard;

(4) Any lessening of the utility or the performance of the covered products likely to result from the standard;

(5) The impact of any lessening of competition, as determined in writing by the Attorney General, that is likely to result from the standard;

(6) The need for national energy and water conservation; and

(7) Other factors the Secretary of Energy (''Secretary'') considers relevant.

(42 U.S.C. 6295(o)(2)(B)(i)(I)–(VII))

Further, EPCA, as codified, establishes a rebuttable presumption that a standard is economically justified if the Secretary finds that the additional cost to the consumer of purchasing a product complying with an energy conservation standard level will be less than three times the value of the energy savings during the first year that the consumer will receive as a result of the standard, as calculated under the applicable test procedure. (42 U.S.C. 6295(o)(2)(B)(iii))

EPCA, as codified, also contains what is known as an ''anti-backsliding'' provision, which prevents the Secretary from prescribing any amended standard that either increases the maximum allowable energy use or decreases the minimum required energy efficiency of a covered product. (42 U.S.C. 6295(o)(1)) Also, the Secretary may not prescribe an amended or new standard if interested persons have established by a preponderance of the evidence that the standard is likely to result in the unavailability in the United States in any covered product type (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the United States. (42 U.S.C. 6295(o)(4))

Additionally, EPCA specifies requirements when promulgating an energy conservation standard for a covered product that has two or more subcategories. DOE must specify a different standard level for a type or class of products that has the same function or intended use if DOE determines that products within such group (A) consume a different kind of energy from that consumed by other covered products within such type (or class); or (B) have a capacity or other performance-related feature which other products within such type (or class) do not have and such feature justifies a higher or lower standard. (42 U.S.C. 6295(q)(1)) In determining whether a performance-related feature justifies a different standard for a group of products, DOE must consider such factors as the utility to the consumer of such a feature and other factors DOE deems appropriate. *Id.* Any rule prescribing such a standard must include an explanation of the basis on which such higher or lower level was established. (42 U.S.C. 6295(q)(2))

Finally, pursuant to the amendments contained in the Energy Independence and Security Act of 2007 (EISA 2007), Public Law 110–140, any final rule for new or amended energy conservation standards promulgated after July 1, 2010, is required to address standby mode and off mode energy use. (42 U.S.C. 6295(gg)(3)) Specifically, when DOE adopts a standard for a covered product after that date, it must, if justified by the criteria for adoption of standards under EPCA (42 U.S.C. 6295(o)), incorporate standby mode and off mode energy use into a single standard, or, if that is not feasible, adopt a separate standard for such energy use for that product. (42 U.S.C. 6295(gg)(3)(A)–(B)) In this rulemaking, DOE is applying the UEF metric (which addresses standby mode and off mode energy use) to all product classes of consumer water heaters, including those product classes for which there are no currently applicable UEF-based standards.

B. Background

1. Current Standards

As directed by EPCA (42 U.S.C. 6295(e)(4)), DOE conducted two cycles of rulemakings to determine whether to amend the statutory standards for consumer water heaters found in 42 U.S.C. 6295(e)(1). The most recent rulemaking from April 2010 resulted in amended standards using the energy factor (''EF'') metric originally prescribed by EPCA with a requirement for compliance starting on April 16, 2015. 75 FR 20112 (the ''April 2010 Final Rule''). Later amendments to

EPCA directed DOE to establish a uniform efficiency metric for consumer water heaters (*see* 42 U.S.C. 6295(e)(5)(B)).[13] The Federal test procedure was revised to use a new metric, UEF, in a final rule published on July 11, 2014 (the ''July 2014 UEF TP Final Rule''). 79 FR 40542. In a final rule published in the **Federal Register** on December 29, 2016, the existing EF-based energy conservation standards were then translated from EF to UEF using a ''conversion factor'' method for water heater basic models that were in existence at the time. 81 FR 96204 (''December 2016 Conversion Factor Final Rule'').

These standards are set forth in DOE's regulations at 10 CFR 430.32(d) and are repeated in Table II.1.

BILLING CODE 6450–01–P

[13] The requirement for a consumer water heater test procedure using uniform energy factor as a metric, as well as the requirement for DOE to undertake a conversion factor rulemaking to translate existing consumer water heater standards denominated in terms of EF to ones denominated in terms of UEF, were part of the amendments to EPCA contained in the American Energy Manufacturing Technical Corrections Act (AEMTCA), Public Law 112–210 (Dec. 18, 2012).

Table II.1 Current UEF-Based Federal Energy Conservation Standards for Consumer Water Heaters

Product Class	Rated Storage Volume and Input Rating *(if applicable)*	Draw Pattern*	Uniform Energy Factor**
Gas-fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	$0.3456 - (0.0020 \times V_r)$
		Low	$0.5982 - (0.0019 \times V_r)$
		Medium	$0.6483 - (0.0017 \times V_r)$
		High	$0.6920 - (0.0013 \times V_r)$
	> 55 gal and ≤ 100 gal	Very Small	$0.6470 - (0.0006 \times V_r)$
		Low	$0.7689 - (0.0005 \times V_r)$
		Medium	$0.7897 - (0.0004 \times V_r)$
		High	$0.8072 - (0.0003 \times V_r)$
Oil-fired Storage Water Heater	≤ 50 gal	Very Small	$0.2509 - (0.0012 \times V_r)$
		Low	$0.5330 - (0.0016 \times V_r)$
		Medium	$0.6078 - (0.0016 \times V_r)$
		High	$0.6815 - (0.0014 \times V_r)$
Electric Storage Water Heaters	≥ 20 gal and ≤ 55 gal	Very Small	$0.8808 - (0.0008 \times V_r)$
		Low	$0.9254 - (0.0003 \times V_r)$
		Medium	$0.9307 - (0.0002 \times V_r)$
		High	$0.9349 - (0.0001 \times V_r)$
	> 55 gal and ≤ 120 gal	Very Small	$1.9236 - (0.0011 \times V_r)$
		Low	$2.0440 - (0.0011 \times V_r)$
		Medium	$2.1171 - (0.0011 \times V_r)$
		High	$2.2418 - (0.0011 \times V_r)$
Tabletop Water Heater	≥ 20 gal and ≤ 120 gal	Very Small	$0.6323 - (0.0058 \times V_r)$
		Low	$0.9188 - (0.0031 \times V_r)$
		Medium	$0.9577 - (0.0023 \times V_r)$
		High	$0.9884 - (0.0016 \times V_r)$
Instantaneous Gas-fired Water Heater	< 2 gal and >50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92
Grid-enabled Water Heater	> 75 gal	Very Small	$1.0136 - (0.0028 \times V_r)$
		Low	$0.9984 - (0.0014 \times V_r)$
		Medium	$0.9853 - (0.0010 \times V_r)$
		High	$0.9720 - (0.0007 \times V_r)$

* The draw pattern dictates the frequency and duration of hot water draws during the 24-hour simulated use test, and is an indicator of delivery capacity of the water heater. Draw patterns are assigned based on the first hour rating ("FHR"), for non-flow-activated water heaters, or maximum GPM rating ("Max GPM"), for flow-activated water heaters. For the specific FHR and Max GPM ranges which correspond to each draw pattern, see section 5.4.1 of appendix E to subpart B of 10 CFR part 430.

** V_r is the rated storage volume (in gallons), as determined pursuant to 10 CFR 429.17.

BILLING CODE 6450–01–C

In the December 2016 Conversion Factor Final Rule, DOE declined to develop conversion factors and UEF-based standards for consumer water heaters of certain sizes (by rated storage volume or input rating) and of certain types (*i.e.,* oil-fired instantaneous water heaters) where models did not exist on the market at the time to inform the analysis of the standards conversion. 81 FR 96204, 96210–96211. For consumer water heaters that did not receive converted UEF-based standards, DOE provided its interpretation that the original statutory standards—found at 42 U.S.C. 6295(e)(1) and expressed in terms of the EF metric—still applied; however, DOE would not enforce those statutorily-prescribed standards until such a time conversion factors are developed for these products and they can be converted to UEF. *Id.* Thus, the EF-based standards specified by EPCA apply to any consumer water heaters which do not have UEF-based standards found at 10 CFR 430.32(d). These EF-based standards are set forth at 42 U.S.C. 6295(e)(1) and are repeated in Table II.2.

Table II.2 EF-Based Federal Energy Conservation Standards for Consumer Water Heaters

Product Class	Energy Factor*
Gas water heaters	$0.62 - (0.0019 \times V_r)$
Oil water heaters	$0.59 - (0.0019 \times V_r)$
Electric water heaters	$0.95 - (0.00132 \times V_r)$

* V_r is the rated storage volume (in gallons), as determined pursuant to 10 CFR 429.17.

2. History of Standards Rulemaking for Consumer Water Heaters

On May 21, 2020, DOE initiated the current rulemaking by publishing in the **Federal Register** a request for information (''May 2020 RFI''), soliciting public comment on various aspects of DOE's planned analyses to help DOE determine whether to amend energy conservation standards for consumer water heaters. 85 FR 30853 (May 21, 2020). DOE subsequently published a notice requesting feedback on its preliminary analysis and technical support document (''preliminary TSD'') on March 1, 2022 (the ''March 2022 Preliminary Analysis'') with a 60-day comment period. 87 FR 11327 (Mar. 1, 2022). The comment period was extended by 14 days in a notice published on May 4, 2022. 87 FR 26303.

On October 21, 2022, DOE received a set of recommendations on amended energy conservation standards for consumer water heaters from a coalition of seven public- and private-sector organizations, including two water heater manufacturers, three energy efficiency organizations, one environmental group, and one consumer organization—collectively the Joint Stakeholders [14]—which addressed standards for electric storage water heaters, gas-fired storage water heaters, and gas-fired instantaneous water heaters. This coalition's submission is herein referred to as the ''Joint Stakeholder Recommendation.''

On July 28, 2023, DOE published in the **Federal Register** a notice of proposed rulemaking (''July 2023 NOPR'') and technical support document (''NOPR TSD'') with a 60-day comment period. 88 FR 49058 (Jul. 28, 2023). In the July 2023 NOPR, DOE proposed new and amended standards for consumer water heaters and addressed stakeholder feedback on the March 2022 Preliminary Analysis, including the Joint Stakeholder Recommendation. On September 13, 2023, DOE presented the proposed standards and accompanying analysis at a public meeting.

DOE received 2,950 comments in response to the July 2023 NOPR from interested parties, some of which were docketed together as multiple comments or commenters, resulting in a total of 1,140 docketed items. Note that of these total comments, 2,800 comments were ''form letter'' email submissions. In total, four distinct form letters were received. Additionally, several commenters submitted more than one comment to the docket. DOE directly references 54 of these written submissions in this final rule, which contain substantive comments regarding product classes within the scope of this final rule and are shown in Table II.3. The remainder of the comments were from individual commenters either expressing general opposition or support for the rulemaking. Total counts of both supportive and non-supportive comments received are included in section III.A of this document.

BILLING CODE 6450–01–P

[14] In this final rule, ''Joint Stakeholders'' refers to the group of stakeholders who submitted and continued to support the October 21, 2022, comment even though the makeup of this group has changed since the July 2023 NOPR. Specifically, BWC removed itself as a signatory after the July 2023 NOPR.

A parenthetical reference at the end of a comment quotation or paraphrase provides the location of the item in the public record.[15] To the extent that interested parties have provided written comments that are substantively consistent with any oral comments provided during the September 13, 2023, public meeting, DOE cites the written comments throughout this final rule. Any oral comments provided during the webinar that are not substantively addressed by written comments are summarized and cited separately throughout this final rule.

Additionally, DOE received comments from stakeholders in response to the July 2023 NOPR regarding the scope and classification of circulating water heaters as defined at 10 CFR 430.2 by the June 2023 TP Final

[15] The parenthetical reference provides a reference for information located in the docket of DOE's rulemaking to develop energy conservation standards for consumer water heaters. (Docket No. EERE–2017–BT–STD–0019, which is maintained at *www.regulations.gov*). The references are arranged as follows: (commenter name, comment docket ID number, page of that document).

Rule. DOE subsequently published a supplemental notice of proposed rulemaking on December 27, 2023 (''December 2023 SNOPR''), that discussed the comments received on this topic and proposed to amend the definition for ''circulating water heater'' to reclassify these products as storage-type water heaters. 88 FR 89330. DOE received 195 comments in response to the December 2023 SNOPR from interested parties. DOE directly references 14 of these written submissions which provided remarks about the rulemaking analysis pertinent to standards for circulating water heaters or comments relevant to the issues discussed in the December 2023 SNOPR, and these submissions are shown in Table II.4.

BILLING CODE 6450–01–C

3. Scope of This Final Rule

Following review of comments on the July 2023 NOPR and December 2023 SNOPR, DOE has decided to finalize at this time standards for all consumer water heaters with the exception of gas-fired instantaneous water heaters, as defined in 10 CFR 430.2 and replicated in section III.B of this final rule. DOE is not summarizing or responding to any comments specific to gas-fired instantaneous water heaters in this document, nor discussing any analytical methodologies or results for this product class as DOE continues to consider the comments submitted in response to the July 2023 NOPR and December 2023 SNOPR in informing DOE's decision on amended energy conservation standards for GIWHs.

III. General Discussion

DOE developed this final rule after considering oral and written comments, data, and information from interested parties that represent a variety of interests. The following discussion addresses issues raised by these commenters.

A. General Comments

This section summarizes general comments received from interested parties regarding rulemaking timing and process.

1. General Support

In response to the July 2023 NOPR, DOE received 966 [16] general comments (those which provided general remarks on the impact of the rulemaking) [17] related to product classes within the scope of this final rule, with 931, or 96 percent of, these comments expressing support of the proposed standards and a majority acknowledging the significant energy savings that would result from the adoption of the proposed standards.[18]

NYSERDA, GreenTECH, the CA IOUs, NCEL, Joint Regional Advocacy Groups, Joint Stakeholders, Joint Utilities, Joint Commenters, Joint Advocacy Groups, NYSPSC, Consumer Advocates, Health

[16] The number of comments reflects the number of individual party submissions. Specifically, form letters with multiple submissions count each submission individually.

[17] Commenters who are directly referenced in this final rule and appear in Table II.3 are not counted in these statistics because these submitters typically expressed detailed views that could not be generalized as either clear support or clear opposition for all aspects of the proposal.

[18] One comment in support of the proposed standards had 8,357 signatories.

Advocates, Joint Architects, PSR, NEEA and State Agencies all stated their support of the standards proposed in the July 2023 NOPR. These commenters highlighted the associated benefits of the proposal including utility bill savings, reduced GHG emissions, protection of human health, reduced energy consumption, and the ability to design more energy efficient buildings. (NYSERDA, No. 1192 at p. 1; GreenTECH, No. 71 at p. 1; CA IOUs, No. 1175 at pp. 1–2; NCEL, No. 1144 at p. 1; Joint Regional Advocacy Groups, No. 1154 at p. 1; Joint Stakeholders, No. 1156 at p. 1; Joint Utilities, No. 1158 at p. 1; Joint Commenters, No. 1159 at p. 1–2; Joint Advocacy Groups, No. 1165 at p. 1; NYSPSC, No. 1169 at p. 1; Consumer Advocates, No. 1172 at p. 1; Health Advocates, No. 1179 at p. 1; Joint Architects, No. 1188 at p. 1; PSR, No. 1196 at p. 1–2; NEEA, No. 1199 at p. 2; State Agencies, No. 1213 at p. 1–2)

NCEL noted that, according to a report by the Appliance Standards Awareness Project, water heaters represent the largest potential for emissions reductions among regulated consumer products, and the proposed standards would reduce CO_2 emissions by more than 500 Mt over 30 years of sales, helping the United States meet its climate goals. (NCEL, No. 1144 at p. 1) The Joint Regional Advocacy Groups supported, specifically, the proposed standards for electric storage water heaters at heat pump efficiency levels. (Joint Regional Advocacy Groups, No. 1154 at p. 1) The Joint State Attorneys General also commented in support of the proposed standards for consumer water heaters and recommended that DOE finalize the proposed rule as soon as possible. The Joint State Attorneys General further emphasized that the proposed standards would significantly improve the energy efficiency of both electric and gas water heaters while providing economic benefits to consumers. The Joint State Attorneys General stated that the proposed standards for consumer water heaters are projected to yield significant environmental benefits, climate benefits, and monetized health benefits. The Joint State Attorneys General also commented that the transition to more efficient consumer water heating will be increasingly cost effective and affordable as time progresses, particularly considering the Federal investment in weatherization, energy efficiency, and beneficial electrification programs that would help address cost concerns related to installing new or replacement products. (Joint State Attorneys General, No. 1035 at pp. 1–3) State Agencies claimed that while State regulations have the potential to reduce GHG emissions, individual States cannot adopt standards for products for which the Federal government has promulgated an existing standard (such as consumer water heaters) and that collaboration is required for impactful climate action. (State Agencies, No. 1213 at p. 1) DOE understands the commenter to be referring to provisions at 42 U.S.C. 6297, by which Federal energy standards supersede State regulations with exceptions for certain products that do not include consumer water heaters. State Agencies also indicated that the proposed standards would reduce the energy burden for low-income households, which spend larger portions of their income on energy bills. (State Agencies, No. 1213 at p. 2)

Rheem generally supported DOE's proposed amended standards and the analysis behind them but expressed concern regarding potential unintended consequences of the proposed standards for certain product classes caused in part by the application of the high-temperature test method and effective storage volume metric. Rheem suggested possible solutions to resolve these issues, which are discussed further in section V.D of this document. (Rheem, No. 1177 at p. 1) Rheem stated that, for electric storage water heaters between 20 and 120 gallons (except for small electric storage water heaters), heat pump-level standards are appropriate. Rheem recommended that DOE act to prevent a market shift away from heat pump technologies if standards are amended to require this for a larger fraction of the electric storage water heater market because not only would it result in reduction of energy savings, but it also would pose a risk to manufacturers' return on investment in heat pump water heater development in a timely manner. Rheem noted that there would be significant changes to product design and manufacturing facilities as a result of a heat pump standard in this rulemaking. (*Id.* at p. 7)

The Joint Stakeholders stated that the proposed standards for gas-fired water heaters are consistent with their recommendations and noted that the proposal follows the established rationale that separate standards be maintained for gas-fired storage water heaters and their instantaneous counterparts. (Joint Stakeholders, No. 1156 at p. 2) NEEA, the Joint Regional Advocacy Groups (citing the estimated FFC and monetary savings), and Bosch supported the proposed standards for gas-fired storage water heaters. (NEEA, No. 1199 at p. 9; Joint Regional Advocacy Groups, No. 1154 at p. 1; Bosch, No. 1204 at p. 2)

The CA IOUs encouraged DOE to set more stringent standards for gas-fired storage water heaters. According to the CA IOUs, more stringent standards for all gas-fired consumer water heater subclasses, specifically at condensing efficiencies, would result in significant savings of natural gas in California and across the United States. (CA IOUs, No. 1175 at p. 2) AWHI also encouraged DOE to set more stringent standards for gas-fired storage water heaters. (AWHI, No. 1036 at pp. 3–4)

NYSERDA stated that the proposals in the July 2023 NOPR substantially aligned with the Joint Stakeholder Recommendation, which was supported by NYSERDA. The commenter noted that, by allowing less stringent standards for small electric storage water heaters, DOE would ensure that there are replacement units available for lowboy water heaters, while still allowing innovation and expansion for heat pump water heaters. (NYSERDA, No. 1192 at p. 2)

Additionally, some commenters offered general support in response to the December 2023 SNOPR.

NYSERDA commented that the proposals in the December 2023 SNOPR fully address their concerns raised at the NOPR stage regarding the potential use of electric resistance circulating water heaters in place of heat pump electric storage water heaters. (NYSERDA, No. 1406 at p. 2) NEEA expressed support for the changes proposed in the December 2023 SNOPR and urged DOE to move forward with these proposals, as well as those made in the July 2023 NOPR. (NEEA, No. 1414 at p. 1) NEEA reiterated its support for effective storage volume-based standards and high temperature test methods to prevent small, overheated products from being used in place of products that meet the proposed standards. (NEEA, No. 1414 at p. 2) CEC reiterated its appreciation for DOE's efforts to address potential loopholes in the proposed regulatory language for circulating water heaters and high temperature test methods. (CEC, No. 1412 at p. 2)

2. General Opposition

Of the 966 general comments DOE received in response to the July 2023 NOPR related to product classes within the scope of this final rule, 29, or 3 percent, were in opposition of new standards, with the majority of opposition comments focused on the concerns of government overreach and interference with a free market, impacts on product cost, and overestimation of energy savings. Commenters also

expressed concerns about potential outsourcing to foreign companies due to the proposed standards, installation costs for gas-fired and heat pump water heaters, and the performance of heat pump water heaters. These topics are discussed in this section through section III.A.3 of this document.

Ravnitzky supported DOE's efforts to improve the energy efficiency of consumer water heaters and reduce greenhouse gas emissions but expressed concern for the impact of the proposed standards on consumers and manufacturers. Ravnitzky urged DOE to reconsider the proposed standards and account for the efficiency potential and resiliency benefits of non-heat pump water heaters. (Ravnitzky, No. 73 at p. 1)

Ravnitzky stated that the proposed standards do not account for the resiliency benefits of non-heat pump water heaters, which can operate without electricity. Ravnitzky stated that heat pump water heaters cannot function during a power outage, which could inconvenience consumers and result in health risks. Ravnitzky also stated that gas-fired water heaters are beneficial to consumers prone to natural disasters and extreme weather events that disrupt the power grid because they do not require electricity to operate. (Ravnitzky, No. 73 at p. 1)

Throughout this rulemaking, DOE has assessed the impacts of potential amended standards on consumers and manufacturers, specifically quantifying these impacts as national benefits and costs (*see* section I of this document). In response to the concerns raised by Ravnitzky, DOE notes that gas-fired water heaters will still be available as an option to consumers at the levels adopted in this final rule. Further, DOE notes that, while for certain classes of electric storage water heaters the adopted standards are currently only met through use of heat pump technology, electric storage water heaters that rely on electric resistance technology also require a continuous supply of electricity to operate. Therefore, without a backup supply of electricity a power outage would render both types of electric storage water heaters inoperable. DOE also notes that some gas-fired water heaters do require electricity to operate. However, as discussed in the July 2023 NOPR, DOE maintains its interpretation of EPCA at 42 U.S.C. 6295(q)(1) that gas-fired water heaters that do not require electricity should not be treated differently (*i.e.,* constitute a separate product class) from gas-fired water heaters that do. 88 FR 49058, 49079.

AEI stated its belief that the rule is based on the need to confront the global climate crisis, and therefore it is fatally flawed and should not be finalized due to the lack of evidence of a climate ''threat'' or ''crisis.'' (AEI, No. 817 at p. 2)

DOE is finalizing amendments to the test procedure and energy conservation standards for consumer water heaters based on its authority described in section II.A of this document, which requires the Department to consider seven (7) factors prior to finalizing such amendments. This final rule outlines DOE's analysis of all seven factors, with additional details provided in the TSD.

The Attorney General of TN commented that the proposed standards have significant federalism implications within the meaning of Executive Order 13132 for the following reasons: (1) DOE's standards have a preemptive effect on States' procurement standards; and (2) States own and purchase water heaters, and therefore the proposed standards' effect on water heater costs directly affect States as purchasers. (Attorney General of TN, No. 1149 at pp. 2–3) The Attorney General of TN commented that DOE must show that the intrastate activity covered by the proposed standards substantially affects the interstate market for water heaters and there is no such analysis in the July 2023 NOPR. The Attorney General of TN commented that the proposed standards will dominate the regulation of consumer goods—authority traditionally belonging to the States. (Attorney General of TN, No. 1149 at p. 3)

DOE responds that it believes the scope of both the standard proposed in the July 2023 NOPR and the amended standard adopted in this final rule properly includes all consumer water heaters distributed in commerce for personal use or consumption because intrastate state activity regulated by 42 U.S.C. 6291(17) and 6302 is inseparable from and substantially affects interstate commerce. DOE has clear authority under EPCA to regulate the energy use of a variety of consumer products and certain commercial and industrial equipment, including the subject consumer water heaters. *See* 42 U.S.C. 6295. Based on this statutory authority, DOE has a long-standing practice of issuing energy conservation standards with the same scope as the standard in this final rule. For example, DOE has maintained a similar scope of products in the April 2010 Final Rule and in the December 2016 Conversion Factor Final Rule. DOE disagrees with the Attorney General of TN's contention that the Commerce Clause, the Tenth Amendment, the Major Questions Doctrine, or any canons of statutory construction limit DOE's clear and long-standing authority under EPCA to adopt the standard, including its scope, in this final rule. A further discussion regarding the Attorney General of TN's Federalism concerns can be found at section VI.E of this document.

BWC, a former signatory to the Joint Stakeholder Recommendation, urged DOE to reconsider re-aligning certain aspects of its proposal to what was originally recommended by the Joint Stakeholder Recommendation. (BWC, No. 1164 at p. 1)

The July 2023 NOPR proposed product classes and efficiency levels incorporating the feedback from the Joint Stakeholder Recommendation; however, the Department did not align entirely with the Joint Stakeholder Recommendation. DOE provided its rationale for product class definitions, efficiency level selection, and effective storage volume throughout the July 2023 NOPR (*see* section IV of the July 2023 NOPR). These topics are discussed further in this final rule in sections IV.A.1.f, IV.C.1.a, and V.D.1 of this document, respectively.

BWC noted that the July 2023 NOPR was published only shortly after the June 2023 TP Final Rule, and that this period of time was too short for manufacturers to provide adequate feedback on new aspects of the test procedure, such as effective storage volume and high temperature testing. BWC expressed its concern over this and the 60-day comment period provided for the July 2023 NOPR, noting that these were both deviations from appendix A. The Gas Association Commenters and Rinnai also commented on this deviation, with ASA and the Gas Association Commenters stating that the 60-day comment period was insufficient to develop responses to the July 2023 NOPR and Rinnai stating that DOE did not have an adequate basis to depart from the standard 75-day comment period. ASA recommended extending the comment period to provide commenters additional time for research and feedback and the Gas Association Commenters stated this deviation placed undue burden on commenters to review and evaluate a proposal that could have significant ramifications on the water heater industry and consumers. Rinnai claimed that DOE has rushed the rulemaking process by relying on a preliminary TSD from 2022 and not producing a final TSD with the July 2023 NOPR and believed the compressed schedule between the September 2023 Webinar and the end of the comment period was

unjustified (BWC, No. 1164 at pp. 6–7; Gas Association Commenters, No. 1181, pp. 37–38; Rinnai, No. 1186 at p. 35; ASA, No. 1160 at p. 1) JEA, WMU, and Southeast Gas commented that as members of APGA, they supported APGA's submitted comments that offer more details on their concerns. (JEA, No. 865 at p. 2; WMU, No. 872 at p. 2; Southeast Gas, No. 887 at p. 1)

DOE has determined that the length of the comment period was appropriate and provided a meaningful opportunity to comment on the NOPR. In the July 2023 NOPR, DOE explained its deviation from section 6(f)(2) of 10 CFR part 430, subpart C, appendix A,[19] which specifies that the length of the public comment period for a NOPR be not less than 75 calendar days. However, with respect to NOPRs, EPCA requires at least a 60-day comment period. (42 U.S.C. 6295(p)(2)), and similarly, Executive Order (''E.O.'') 12866, ''Regulatory Planning and Review,'' 58 FR 51735 (Oct. 4, 1993) states that in most cases a comment period should not be less than 60 days. On April 8, 2024, DOE published in the **Federal Register** a final rule amending section 6 of appendix A to specify that comment periods for standards rulemaking documents will be determined on a case-by-case basis with a minimum 60-day comment period for NOPRs based on the requirements of EPCA and recommendations in E.O. 12866. 89 FR 24360 (April 8, 2024). As discussed in the July 2023 NOPR, DOE determined that a 60-day comment period provided sufficient time because the NOPR relied on many of the same analytical assumptions and approaches as used in the preliminary assessment, on which the public had an opportunity to comment. 88 FR 49058. In particular, a 60-day comment period (followed by 14-day extension) was provided for the March 2022 Preliminary Analysis, and a 45-day period for the May 2020 RFI. 87 FR 11327; 85 FR 30853.

In response to the December 2023 SNOPR, DOE received 176 comments, or 90 percent of comments, in opposition of new standards along similar concerns as those expressed in response to the July 2023 NOPR.

DOE also received feedback from some stakeholders that the comment period provided for the December 2023 SNOPR was too short. AHRI requested that DOE extend the comment period to provide stakeholders adequate time to properly respond. (AHRI, No. 1389 at p. 1) BWC stated that the opportunity to comment on the December 2023 SNOPR was severely limited due to its seasonal timing and comment period duration. (BWC, No. 1413 at p. 3) Rinnai stated that there was little meaningful time for a detailed assessment of the December 2023 SNOPR due to the timing of the comment period and that only a limited number of inputs were collected. (Rinnai, No. 1415 at p. 1)

The scope of the December 2023 SNOPR was limited to a definitional change for circulating water heaters, with only two requests for comment, and therefore DOE believes the comment period was sufficient. The CA IOUs, NEEA, CEC, and NYSERDA expressed support for the December 2023 SNOPR comment period being limited to 14 days because its scope is limited to circulating water heaters. (CA IOUs, No. 1409 at p. 1; NEEA, No. 1414 at p. 2; CEC, No. 1412 at p. 3; NYSERDA, No. 1406 at p. 1)

Additionally, DOE's proposal in the SNOPR was mainly responsive to more substantive stakeholder feedback received in response to the July 2023 NOPR, as discussed throughout that notice (*see* 88 FR 89330).

Many individual commenters also expressed concerns regarding the implementation of heat pump water heaters due to efficiency concerns in colder areas and weather, lack of expertise in maintaining a more complex product, reliability, potential for mold, and potentially high purchase and installation costs and requirements for a product with the same expected lifetime as a standard electric water heater. Individual commenters also stated that the proposed standards are counterproductive because heat pump water heaters eject cold air into the house which then has to be heated up by the household HVAC system. Individual commenters stated that consumers may face high costs and long wait times associated with retrofitting due to the proposed standards, and due to increased insulation, which results in larger products. These high costs will increase the cost of home ownership and may prevent first-time buyers from obtaining a home.

DOE accounts for differences between rated efficiency and on-site efficiency in its energy use analysis, which considers factors like climate and heating load. Heat pump water heaters can help with cooling demand in the summer but can work against the home heating system in the winter if they are not ducted separately. DOE's energy use analysis includes these impacts (*see* appendix 7B to the TSD). DOE quantifies these impacts in the energy use analysis to include them in the expected operating expenses for the LCC analysis.

One individual commenter requested that equipment and repair costs be factored into savings and that consumers should decide the return in savings when investing in new equipment. (Johnson, No. 1271 at p. 1) Great Plains Resource supported the proposed standard and stated that if a redesign of water heaters helps to control pollution, it should be passed. Great Plains Resource stated, however, that DOE should plan to mitigate costs for consumers associated with manufacturers increasing costs of water heaters. Other commenters suggested that DOE subsidize new water heater technologies or introduce a tax incentive rather than seeking energy efficiency through regulations. Great Plains Resource suggested that DOE should consider extending the time frame to help manufacturers create new equipment and create competition to control cost of equipment to consumers. (Great Plains Resource, No. 1267 at p. 1) An individual commented that condensing gas-fired water heaters use expensive vent pipes due to the corrosiveness of condensation. (Harley, No. 1341 at p. 1)

DOE notes that its analysis incorporates installation and equipment costs into its analysis, including the necessary venting, as well as repair and maintenance costs. Pickering expressed concern that the definitions proposed in the December 2023 SNOPR for circulating water heaters may not be compatible with solar photovoltaic direct water heating systems, which the commenter described as a low-cost system where DC electric output from the solar photovoltaic panel is wired (without grid connection) directly to the heating elements of an electric resistance storage water heater. (Pickering, No. 1399, at pp. 1–3)

DOE understands this comment to be opposing the proposed heat pump-level standards for most electric storage water heaters due to the fact that the direct solar photovoltaic water heating systems described by the commenter is dependent upon a DC-compatible electric storage water heater. DOE notes that electric resistance storage water heaters will still be available within the small electric storage water heater (and grid-enabled water heater product classes for cases where the home is still connected to a utility grid), however.

According to NPGA, APGA, AGA, and Rinnai, DOE is seeking to promote the market for electric heat pumps at the expense of gas-fired water heaters, diminishing competition and profoundly affecting consumer choice. They also stated that the proposed rule fails to meet EPCA's 3-year rebuttable

[19] In reference to appendix A as it appeared at the time of the publication of the July 2023 NOPR.

presumption of economic justification under pure economic terms and would be an enormous burden on manufacturing and on competition between gas and electric water heaters. (NPGA, APGA, AGA, and Rinnai, No. 441 at pp. 3–4) EEI noted that while the proposed standards for electric storage water heaters increase by 21 to 140 percent in efficiency, the July 2023 NOPR only proposed an increase of 0 to 9.7 percent for gas-fired and oil-fired storage water heaters, and this disparity would cause fuel-fired storage water heaters to gain a competitive advantage because buyers' decisions are strongly motivated by cost considerations. (EEI, No. 1198 at pp. 3–4) Sunrise Pittsburgh stated that the proposed standard would require electric and gas-fired water heaters to meet vastly different standards, which could potentially result in consumers switching to gas-fired water heaters given the lower upfront cost associated with gas-fired water heaters compared to heat pump water heaters. In turn, Sunrise Pittsburgh stated this may result in more carbon emissions. According to Sunrise Pittsburgh, revising the proposed standard to apply the same standard across all water heaters regardless of the technology or fuel source used would benefit consumers, especially it removes gas-fired water heaters from the market, as this would save consumers from asthma and carcinogens as well as dangerous gas-fired water heater explosions associated with gas fueled products. (Sunrise Pittsburgh, No. 905 at pp. 1–2)

In this rulemaking DOE has provided its analytical approach and results which have led to the selection of more stringent standards for some product classes compared to others. When determining whether the benefits of amended standards outweigh the burdens, DOE considers the trial standards levels, which are comprised of different efficiency levels for each product class. The construction of trial standards levels is discussed in section V.A of this document. In the shipments analysis, which is detailed in section IV.G of this document, DOE considers the impacts of product life-cycle costs on consumer purchasing decisions, which ultimately is used to assess the total energy savings, economic impacts to consumers, and impacts to health (summarized in section I.C of this document).

With respect to Sunrise Pittsburgh's suggestion to apply the same standard across all water heaters regardless of the technology or fuel source, DOE establishes separate standards for different product classes of consumer water heaters based on statutory requirements from EPCA, which includes a consideration for products that consume different types of energy (*e.g.,* electricity, oil, or gas). (42 U.S.C. 6295(q)(1)-(2)) The product classes established by this final rule are discussed in section IV.A.1 of this document.

3. Selection of Standards Levels

DOE received several comments regarding the selection of proposed efficiency levels.

CEC agreed with DOE's analysis recognizing that the majority of electric storage water heaters can meet heat pump-level standards but encouraged DOE to consider improving the minimum standard for electric storage water heaters >20 and ≤55 gal to a level closer to EL 2. CEC noted that while a UEF of 2.3 (as proposed) is sufficient to drive the core shift in technology, the least efficient heat pump water heaters on the market today have a UEF of 2.8 or greater. (CEC, No. 1173 at pp. 3–4)

As stated in the July 2023 NOPR, split-system and 120-volt heat pump water heaters may not be able to achieve the same efficiency levels as conventional 240-volt products, as suggested by less stringent ENERGY STAR Residential Water Heaters Specification Version 5.0 (''ENERGY STAR v5.0'') criteria at 2.20 UEF. DOE has observed products certified to both the ENERGY STAR database and DOE's Compliance Certification Database (''CCD'') capable of meeting these criteria and determined EL 2 such that novel 120-volt products would not be prevented from entering the market. 88 FR 49058, 49090. DOE continued to consider these factors when evaluating the standard levels for this final rule.

DOE received comments from BWC regarding the potential manufacturer impacts and capacity constraints related to transitioning all electric storage water heater products to heat pump designs. BWC stated appreciation that DOE recognized that a 5-year compliance window may be challenging for many manufacturers to redesign 100 percent of electric storage water heater products to incorporate heat pump designs. BWC noted that change of this scale would indeed require a commitment of significant time, resources, and capital to ensure these units can be produced at a rate that would satisfy sharply increased demand while meeting and exceeding consumers' needs and expectations. (BWC, No. 1164 at pp. 14–15)

NRECA recommended that DOE delay implementation of the proposed electric storage water heater standard for 40-gallon model sizes to allow more time for manufacturers to innovate and design heat pump water heaters that are more adaptable to a variety of installation scenarios. NRECA also recommended that DOE allow electric resistance options for storage tank sizes up to 50 gallons for space constrained installations, and that DOE apply the proposed standard for electric storage water heaters to new construction only, since new homes can be designed to accommodate heat pump water heaters. (NRECA, No. 1127 at p. 13)

In response, DOE notes that the timing of amended standards for consumer water heaters is mandated by EPCA. Furthermore, DOE finds that a 5-year lead time is sufficient for manufacturers to prepare given that heat pump water heaters available today can be installed in a variety of installation scenarios. For consumer water heaters DOE does not have the authority to regulate water heaters in new construction only. As discussed in section V.C of this document, DOE has fully weighed the burdens of its proposed standards for electric storage water heaters against its benefits in determining the appropriate standards level.

DOE acknowledges that requiring all electric storage water heater products to utilize heat pump designs would require notably higher levels of investment and development effort compared to only requiring a portion of the electric storage water heater market to transition to heat pump designs. In this final rule, DOE is adopting TSL 2, which, for electric storage water heaters, includes standards for larger products that are met through the use of heat pump technology while leaving standards for smaller products that can be met through the use of electric resistance heating. *See* section V.C.1 of this document for the benefits and burdens of the TSLs considered in this rulemaking.

In this rulemaking, DOE did not analyze more stringent standards for product classes for which there are currently no UEF-based standards. Several commenters raised the concern that establishing such standards for certain product classes and then raising standards for other product classes would create a market condition where manufacturers can shift their models to meet the requirements of the new product classes with less stringent standards, hence undermining the energy savings potential of this rulemaking. This issue is discussed in detail throughout this document. The creation of separate product classes for the models that do not have current

UEF-based standards is detailed in section IV.A.1 of this document. The selection of standards for these products is explained in section IV.C.1 of this document. Finally, the impact of market transition (*i.e.,* product class switching) is addressed in the shipments analysis in section IV.G of this document.

DOE received comments from some stakeholders regarding the impact of the proposed standards for electric storage water heaters (which correspond to efficiencies attainable by heat pump water heaters) on electric grids.

Armada claimed that the proposed standards would cause serious business harm to companies that provide technologies to convert traditional electric storage water heaters into demand-response products. (Armada, No. 1193 at p. 3) Armada emphasized the importance of American-made technologies for grid-reliability as critical to tackling the climate crisis and advancing environmental justice initiatives, but these technologies are at risk of being regulated out of existence by the proposed standards. (Armada, No. 1193 at p. 7) Armada commented that due to the long recovery cycle of heat pump water heaters, these products are limited in their demand response capabilities. Armada stated that while they can be used for scheduled time-of-use programs, they do not work well responding to grid congestion or to the intermittent availability of renewable energy sources (*e.g.,* wind or solar) because water heater energy use times do not line up with when renewable energy resources are available during the day. (Armada, No. 1193 at p. 3)

NRECA stated that heat pump water heaters may be beneficial to electrical grid demand peaks because they draw lower demand than electric resistance storage water heaters, however they expressed concern that heat pump water heaters may not yield enough savings for demand response programs to be cost-effective. NRECA also stated that most electric cooperatives use load control switches to manage electric water heater demand, but have found that this strategy is generally incompatible with heat pump water heaters, which take more time to reboot after a cut in power than an electric resistance storage water heater. NRECA added that heat pump water heater can be managed using more sophisticated strategies such as CTA 2045, AHRI 1430, or the manufacturer's API; however, NRECA commented that electric cooperatives are concerned about the time, expense, and security risks associated with implementing a new control strategy. (NRECA, No. 1127 at p. 11) NRECA stated many of their member electric cooperatives mitigate demand peaks by running demand response programs, using both grid-enabled water heaters and 50-gallon electric storage water heaters and added that few of the cooperatives they interviewed include or plan to include heat pump water heaters, due to incompatible load control strategies or reduced grid management benefits. (NRECA, No. 1127 at p. 11)

ECSC urged DOE to retain electric resistance options for electric storage water heater installations where heat pump water heaters impose a time-consuming, costly burden, and to consider restrictions on tankless electric water heaters instead. ECSC stated that if consumers cannot afford or install heat pump water heaters, the remaining options of a small electric storage water heater (''ESWH'') or a tankless electric water heater pose a significant threat to existing electric grid demand management programs, which rely on electric storage water heaters as a thermal resource. ECSC added that the proposed standards for electric storage water heaters will likely disproportionately harm low-to-moderate income consumers. (ECSC, No. 1185 at p. 2)

NEEA, however, noted that heat pump water heaters have been successfully deployed in demand response programs in the Pacific Northwest, and added that, similar to electric resistance storage water heaters, heat pump water heaters are capable of shifting load from on-peak to off-peak hours, and are also capable of handling load-up events since they have both electric resistance backup elements and a compressor. NEEA cited a pilot program conducted by Bonneville Power Administration and Portland General Electric which enrolled 175 heat pump water heaters and 90 electric resistance water heaters in a demand response program and controlled them through 600 events over the course of 220 days. NEEA noted the pilot found that electric resistance and heat pump water heaters alike were able to reduce load substantially. (NEEA, No. 1199 at pp. 8–9)

NRECA's comment indicates that utilities may employ more strategies for water heater load management than CTA–2045 or OpenADR communication protocols. DOE reviewed load control switch technology in more detail.[20] These load control switches appear to be capable of implementing schedule-based control. However, if utilities need to cut power to water heaters at unplanned times to manage electricity demand, heat pump water heaters are expected to still be able to return to operation in a reasonable amount of time. DOE's teardown analyses of heat pump water heaters on the market show that nearly all heat pump water heater designs today have backup electric resistance elements should the household require a faster recovery rate. DOE does not expect heat pump water heaters to remove these backup elements as a result of amended standards. Additionally, DOE finds that the studies conducted by NEEA provide evidence towards the compatibility of heat pump water heaters with present-day load control strategies.

In response to ECSC, there is an increasing number of heat pump water heaters available with demand-response capabilities. The ENERGY STAR v5.0 specification incentivizes the manufacture of heat pump water heaters that meet a list of criteria for connected product design, including the use of the standardized CTA–2045 or OpenADR communications protocols for utilities to send signals to enrolled water heaters. Load management strategies are expected to still be compatible with heat pump water heater designs. Additionally, DOE reiterates that electric resistance storage water heaters which elevate the storage tank temperature beyond 135 °F when responding to utility load management signals are exempt from having to test to the high temperature test method and will likely remain on the market. Beyond small electric storage water heaters and heat pump water heaters, grid-enabled water heaters (which are larger than 75 gallons of rated storage volume) are designed for this explicit purpose. DOE does not expect the availability of grid-enabled water heaters to decline as a result of this final rule (because no substantial amendments to the standards for these products are being adopted in this rulemaking), so there will remain electric resistance products available to consumers to connect to utility grid programs.

NPGA, APGA, AGA, and Rinnai stated that DOE should consider the effects the additional demand for electricity for water heaters may have on the energy grid as it has presently failed to consider such an impact its proposed standards may have on grid reliability. According to NPGA, APGA, AGA, and Rinnai, DOE should heed the guidance of the Government Accountability Office and analyze options for grid resilience to avoid enhanced strain

[20] See, for example, the Generac ARA Load Control Switch. Product literature can be found online at: *www.generacgs.com/wp-content/uploads/2023/04/ARA_LoadControlSwitch_SpecSheet_B-1.pdf* (Last accessed Oct. 11, 2023).

without a demand management or supply plan and would benefit by reviewing analysis of grid strain during extreme weather events. (NPGA, APGA, AGA, and Rinnai, No. 441 at p. 4) NMHC and NAA also advised that such an increase in electric product usage should be coupled with efforts to ensure the electric grid is prepared and suggested that DOE consider the costs and barriers in this rulemaking. (NMHC and NAA, No. 996 at p. 5)

DOE does not expect a significant fraction of consumers to switch from gas-fired or oil-fired water heaters to electric water heaters as a result of this rulemaking. *See* section IV.F.10 of this document. DOE does expect a significant fraction of consumers to switch from electric resistance storage water heaters to heat pump water heaters as a result of the more stringent standards for electric storage water heaters, however. Heat pump water heaters are significantly more efficient than electric resistance storage water heaters, and, as a result, consume significantly less electricity than electric resistance storage water heaters, which actually reduces strain on electrical grids.

The Attorney General of TN commented that the proposed rulemaking does not address the additional strain these standards would place on the national energy infrastructure and power grid. The Attorney General of TN stated that, by encouraging a 5 percent to 63 percent shift among consumers from gas-fired water heaters to those powered by electric pumps, the demand for additional electricity will place further stress on an already overworked energy grid. (Attorney General of TN, No. 1149 at p. 3)

DOE has carefully considered the potential impact of proposed standards on the national energy infrastructure and power grid. With reduced energy consumption and appropriate configuration, the proposed standards would actually benefit national energy infrastructure and power grid.

B. Scope of Coverage and Definitions

As discussed in section II.B.3 of this document, this final rule covers those consumer products that meet the definition of ''water heater,'' as codified at 10 CFR 430.2 and as described by EPCA at 42 U.S.C. 6291(27), with the exception of ''Gas-fired instantaneous water heater,'' as codified at 10 CFR 430.2.

Generally, DOE defines a ''water heater,'' consistent with EPCA's definition, as a product which utilizes oil, gas, or electricity to heat potable water for use outside the heater upon demand, including:

(a) Storage type units which heat and store water at a thermostatically controlled temperature, including gas storage water heaters with an input of 75,000 Btu per hour or less, oil storage water heaters with an input of 105,000 Btu per hour or less, and electric storage water heaters with an input of 12 kilowatts (kW) or less;

(b) Instantaneous type units which heat water but contain no more than one gallon of water per 4,000 Btu per hour of input, including gas instantaneous water heaters with an input of 200,000 Btu per hour or less, oil instantaneous water heaters with an input of 210,000 Btu per hour or less, and electric instantaneous water heaters with an input of 12 kilowatts or less; and

(c) Heat pump type units, with a maximum current rating of 24 amperes at a voltage no greater than 250 volts,[21] which are products designed to transfer thermal energy from one temperature level to a higher temperature level for the purpose of heating water, including all ancillary equipment such as fans, storage tanks, pumps, or controls necessary for the device to perform its function.

10 CFR 430.2; (42 U.S.C. 6291(27))

In addition, at 10 CFR 430.2, DOE further defines several specific categories of consumer water heaters as follows:

- ''Electric instantaneous water heater'' means a water heater that uses electricity as the energy source, has a nameplate input rating of 12 kW or less, and contains no more than one gallon of water per 4,000 Btu per hour of input.
- ''Electric storage water heater'' means a water heater that uses electricity as the energy source, has a nameplate input rating of 12 kW or less, and contains more than one gallon of water per 4,000 Btu per hour of input.
- ''Gas-fired instantaneous water heater'' means a water heater that uses gas as the main energy source, has a nameplate input rating less than 200,000 Btu per hour, and contains no more than one gallon of water per 4,000 Btu per hour of input.
- ''Gas-fired storage water heater'' means a water heater that uses gas as the main energy source, has a nameplate input rating of 75,000 Btu per hour or less, and contains more than one gallon of water per 4,000 Btu per hour of input.
- ''Grid-enabled water heater'' means an electric resistance water heater that—
  - Has a rated storage tank volume of more than 75 gallons;
  - Is manufactured on or after April 16, 2015;
  - Is equipped at the point of manufacture with an activation lock; and
  - Bears a permanent label applied by the manufacturer that—
    - Is made of material not adversely affected by water;
    - Is attached by means of non-water-soluble adhesive; and
    - Advises purchasers and end-users of the intended and appropriate use of the product with the following notice printed in 16.5 point Arial Narrow Bold font: ''IMPORTANT INFORMATION: This water heater is intended only for use as part of an electric thermal storage or demand response program. It will not provide adequate hot water unless enrolled in such a program and activated by your utility company or another program operator. Confirm the availability of a program in your local area before purchasing or installing this product.''
- ''Oil-fired instantaneous water heater'' means a water heater that uses oil as the main energy source, has a nameplate input rating of 210,000 Btu/h or less, and contains no more than one gallon of water per 4,000 Btu per hour of input.
- ''Oil-fired storage water heater'' means a water heater that uses oil as the main energy source, has a nameplate input rating of 105,000 Btu/h or less, and contains more than one gallon of water per 4,000 Btu per hour of input.

In the June 2023 Test Procedure Final Rule, DOE amended 10 CFR 430.2 (effective on July 21, 2023), adding the following definitions for circulating, low-temperature, and tabletop water heaters:

- ''Circulating water heater'' means an instantaneous or heat pump-type water heater that does not have an operational scheme in which the burner, heating element, or compressor initiates and/or terminates heating based on sensing flow; has a water temperature sensor located at the inlet or the outlet of the water heater or in a separate storage tank that is the primary means of initiating and terminating heating; and must be used in combination with a recirculating pump and either a separate storage tank or water circulation loop in order to achieve the water flow and temperature conditions recommended in the manufacturer's installation and operation instructions.
- ''Low-temperature water heater'' means an electric instantaneous water heater that is not a circulating water heater and cannot deliver water at a

[21] In the June 2023 TP Final Rule, DOE amended the definition of ''commercial heat pump water heater'' at 10 CFR 431.102 to align with the amperage and voltage requirements for consumer heat pump type units as specified in EPCA.

temperature greater than or equal to the set point temperature specified in section 2.5 of appendix E to subpart B of this part when supplied with water at the supply water temperature specified in section 2.3 of appendix E to subpart B of part 430 and the flow rate specified in section 5.2.2.1 of appendix E to subpart B of part 430.

• ''Tabletop water heater'' means a water heater in a rectangular box enclosure designed to slide into a kitchen countertop space with typical dimensions of 36 inches high, 25 inches deep, and 24 inches wide.

As stated in section I of this document, EPCA prescribed energy conservation standards for all consumer water heaters (*i.e.,* those that meet the definition of ''water heater'' above). For the purposes of this final rule, DOE is considering all consumer water heaters, as defined by EPCA, with the exception of ''gas-fired instantaneous water heaters.'' This rulemaking does include consumer water heaters for which there are no current UEF-based standards codified at 10 CFR 430.32(d).

In the July 2023 NOPR, DOE responded to inquiries concerning coverage of hot water dispensing products (not to be confused with low-temperature electric instantaneous water heaters or point-of-use electric storage water heaters), which operate at less than 2 kW of power and generally provide water at temperatures between 160 °F and 210 °F for food preparation purposes. DOE stated that while it has the authority to set standards for products that meet the definition of a consumer water heater (42 U.S.C. 6292(a)(4)), this rulemaking is not currently considering standards for hot water dispensing products. 88 FR 49058, 49070.

Additionally, DOE received comments from stakeholders in response to the July 2023 NOPR regarding the scope and classification of circulating water heater as defined at 10 CFR 430.2 by the June 2023 TP Final Rule. DOE subsequently published an SNOPR on December 27, 2023 (''December 2023 SNOPR''), that discussed the comments received on this topic and proposed to amend the definition for ''circulating water heater'' to reclassify these products as storage-type water heaters. 88 FR 89330. In the December 2023 SNOPR, DOE proposed amending the definition of ''circulating water heaters'' to re-classify these products as storage-type water heaters. *Id.* After considering the comments on the December 2023 SNOPR, DOE is adopting its proposal to amend the definition for ''circulating water heater'' as it appears at 10 CFR 430.2 to reclassify these products as storage-type water heaters. The SNOPR comments received from stakeholders and DOE's responses, along with the definition of a ''circulating water heater,'' are discussed in detail in section IV.A.1.a of this document. As a result of this reclassification, the scope of coverage for circulating water heaters is limited to those products which meet the statutory input rate limits for storage-type water heaters. Specifically, electric circulating water heaters must have a nameplate input rating of 12 kW or less, gas-fired circulating water heaters must have a nameplate input rating of 75,000 Btu/h or less, oil-fired circulating water heaters must have a nameplate input rating of 105,000 Btu/h or less, and heat pump circulating water heaters must have a maximum current rating of 24 amperes (''A'') at a voltage no greater than 250 volts (''V''). Circulating water heaters that have input rates greater than these specifications would be considered commercial water heaters.

In response to the December 2023 SNOPR, BWC indicated that commercial circulating water heaters are not separately defined at 10 CFR 431.102 and the recent final rule regarding energy conservation standards for commercial water heaters [22] did not establish separate standards for circulating water heaters. BWC requested that DOE clarify how the provisions in the December 2023 SNOPR will impact commercial circulating water heaters if adopted. (BWC, No. 1413 at p. 2) A.O. Smith agreed with DOE's determination that circulating water heaters with input rates surpassing those defined for consumer storage water heaters as outlined in 10 CFR 430.2, should be classified as commercial water heaters. A.O. Smith suggested that DOE formalize this categorization by establishing definitions for commercial gas-fired circulating water heaters with input rates between 75,000 Btu/h and 200,000 Btu/h at 10 CFR 431.102. (A.O. Smith, No. 1411 at p. 2)

Rheem concluded that gas-fired circulating water heaters with input rates greater than 75,000 but less than or equal to 105,000 Btu/h could be categorized as residential-duty commercial water heating equipment,[23] and therefore could be subject to the energy conservation standards recently established in the commercial water heater equipment final rule. Rheem requested DOE confirm its understanding that the proposed definitions circulating water heaters would extend to residential-duty commercial water heaters. (Rheem, No. 1408 at p. 3)

The scope of this rulemaking pertains specifically to consumer water heaters, and the amended standards and definitions addressed herein do not apply to residential-duty commercial water heaters (which are commercial water heating equipment defined at 10 CFR 431.102). The definition of circulating water heater DOE is establishing at 10 CFR 430.2 will be supplemented by additional definitions for electric, gas-fired, and oil-fired circulating water heaters that specify input rate limits consistent with consumer water heaters. Circulating water heaters that exceed these input rates will be commercial water heaters and therefore are outside the scope of standards established in this rulemaking. DOE may consider addressing standards and test procedures for commercial circulating water heaters in a future rulemaking for commercial water heaters.

In response to the July 2023 NOPR, the Joint Advocacy Groups urged DOE to clarify that electric water heaters that can operate at inputs both above and below 12 kW must meet both the relevant consumer and commercial water heater standards. (Joint Advocacy Groups, No. 1165 at p. 8)

DOE is aware of certain ''field-convertible'' electric storage water heaters which can be sold with elements rated above 12 kW (*e.g.,* 12.1 kW), but the product is designed in a way that allows the user to change the elements to a lower input rate (*e.g.,* 6 kW). Field-convertible electric storage water heaters are, therefore, sold as commercial water heaters but can be converted into consumer water heaters.[24]

[22] On October 6, 2023 the Department published a final rule amending standards for commercial water heating equipment, including commercial circulating water heaters. 88 FR 69686.

[23] DOE defines residential-duty commercial gas-fired storage water heaters as commercial gas-fired storage water heaters that are not designed to provide outlet hot water at temperatures greater than 180 °F, do not have a rated input greater than 105,000 Btu/h, and do not have a rated storage volume greater than 120 gallons. (10 CFR 431.102)

[24] For example, Rheem offers a commercial electric water heater that is marketed for light-duty commercial applications. In certain storage volumes (*i.e.,* 66, 80, and 119.9 gallon models) the input rating as shipped from the manufacturer is only available at 12.1 kW which qualifies the product as a commercial water heater. However, the product literature states that this product is factory shipped with two 6.05 kW elements that operate simultaneously, but can be easily converted in field for non-simultaneous element operation. When converted, the input rating would be effectively 6.05 kW. This causes the product to meet the definition of a consumer water heater. For more information see: *https://s3.amazonaws.com/WebPartners/ProductDocuments/9A53AD9F-75C2-*

Continued

Consistent with its determinations in other rulemakings, DOE has concluded that if a product can be configured to meet either the commercial water heater definition or the consumer water heater definition, then it must comply with the standards applicable to all types of product/equipment in which it can be configured. For example, in a recent final rule addressing convertible consumer refrigeration products, DOE specified that if a product is capable of operating with compartment temperatures as specified in multiple product category definitions (*i.e.,* a ''convertible product''), the model must be tested and certified to each applicable product category. 88 FR 7840, 7843 (Feb. 7, 2023). Also, in a recent final rule addressing the test procedure for consumer boilers (which are a space-heating appliance that can often also be configured to provide domestic water heating), DOE determined that if a combination appliance meets the definition of a consumer boiler, the product must be tested per the boiler test procedure and demonstrate compliance with those standards. 88 FR 15510, 15515 (Mar. 13, 2023). Similarly, field-convertible electric storage water heaters are subject to the appendix E test procedure and the standards adopted by this final rule to the extent that they can be configured to meet the consumer water heater definition.

Uponor stated that other countries have generated domestic hot water via a heat exchanger connected to a hydronic mechanical system to improve water quality and energy efficiencies for decades. Uponor provided product literature from its technology offerings and requested clarification about how such products would be covered under DOE's standards. (Uponor, No. 606 at p. 1)

DOE reviewed the product literature cited by the commenter and found that the technology being referenced is an unfired heat exchange device which can couple hydronic piping to domestic hot water piping far downstream of the point of heat generation so that the heat exchange can occur in commercial high-rise buildings to produce domestic hot water using heat from the building's hydronic heating system. While DOE does not disagree that these technologies could improve high-rise building system efficiencies, the heat exchangers referenced by Uponor may be better characterized as heat recovery devices that function based on diverting excess heat to the domestic hot water supply and work in conjunction with the appliance providing the heat.

In response to the July 2023 NOPR, DOE received questions from BWC asking whether space-heating products that are capable of heating domestic hot water by means of an indirect water heater tank would be considered circulating water heaters. In response to the December 2023 SNOPR, Pickering provided comments raising concerns about the potential for evaluating efficiency gains if there is overlap between these types of systems and circulating water heaters.

Pickering commented that definitions that do not account for the array of equipment that is on the market or coming on the market, and that do not recognize the efficiency gains to be had with multiple pieces of equipment operating as a system, may limit choice and stifle innovation. Specifically, Pickering commented that the proposed definitions for circulating water heaters may be incompatible with or otherwise create regulatory impediments to air-to-water heat pumps that provide domestic hot water as an ancillary function to space conditioning. Pickering added that these combined systems can increase overall system efficiency over a more typical separated system, but that the proposed definitions mean that it may be difficult to quantity the efficiency of the domestic hot water function of a combined system specifically, and that they may not account for or accommodate the combinations of equipment (assembled on site) that produce domestic hot water in such a combined system. (Pickering, No. 1399 at pp. 1–3)

Pickering recommended DOE consider removing indirect tanks from the definition of conventional electric storage water heaters, refrain from setting water heater efficiency standards for heat pumps that produce domestic hot water as an ancillary function, clarify that gas-fueled heat pumps are not considered to be electric storage water heaters, and take a systems approach to energy efficiency for domestic hot water. (Pickering, No. 1399 at p. 3)

BWC requested that DOE provide answers to the following questions: (1) Are split-system heat pump products that provide space heating, as well as domestic hot water through an indirect unfired hot water storage tank (''UFHWST'') classified as a circulating heat pump water heater, or instead as an air-to-water heat pump? (2) Would such a product need to be tested under the residential water heater test procedure, the air-to-water heat pump test procedure once such a procedure is created, or both? (3) Will such a product need to represent its efficiency using UEF or annualized fuel utilization efficiency, or both? (BWC, No. 1164 at pp. 11–12) While these questions pertain specifically to air-to-water heat pump appliances, DOE understands the need for general clarification regardless of the fuel type or technology.

Circulating water heaters circulate potable water through a heat exchanger: warm water from the stored volume of water enters the circulating water heater and exits after being heated to the setpoint temperature. By contrast, an indirect water heater uses the main furnace or boiler of a home to heat a fluid that is circulated through a heat exchanger in the storage tank.[25] An indirect water heater does not circulate the potable domestic hot water supply to and from the boiler (it is a separate heating fluid which circulates through the tank and boiler), therefore, DOE has determined that a boiler paired with an indirect water heater is not a circulating water heater.

Pickering also commented that the proposed definitions for circulating water heaters may be incompatible with or otherwise create regulatory impediments to solar thermal water heating systems. (Pickering, No. 1399 at p. 2)

DOE understands the commenter to be referring to solar water heating systems that circulate a hot heat transfer fluid between a solar heat collector and a heat exchanger inside a domestic hot water storage tank. Such a setup is parallel to an indirect-fired water heater: it is not the potable hot water that circulates between the heat source and the tank, it is an intermediate heat transfer fluid instead. As such, solar thermal water heating systems designed in this way do not constitute circulating water heaters.

This is in contrast to a boiler with a tankless coil (or a combination boiler-water heater). A tankless coil water heater provides hot water on demand without a tank, much like an instantaneous water heater. When a hot water faucet is turned on, water is heated as it flows through a heating coil or heat exchanger installed in a main furnace or boiler. In the tankless coil configuration, the domestic hot water supply does circulate through the boiler. However, these systems are typically flow-activated, and thus most do not meet the definition of a ''circulating water heater,'' either.

4E66-8967-1BAE91B17CAC.pdf (Last accessed on Dec. 20, 2023)

[25] A diagram of an indirect water heater and further description of this design configuration is provided on DOE's website at: *www.energy.gov/energysaver/tankless-coil-and-indirect-water-heaters* (Last accessed: Oct. 30, 2023).

BWC requested clarification on whether air-to-water heat pumps would be covered as both circulating water heaters and as hydronic heating system boilers, which are being discussed by the U.S. Environmental Protection Agency (''EPA'') with regards to amendments to the consumer boiler specification. Specifically, BWC called attention to the potential overlap between the definition of circulating water heater and what the EPA is considering regulating as air-to-water (hydronic) heat pumps for space-heating in a potential revision or new specification for consumer boilers. BWC stated that both heat pump circulating water heaters and hydronic heat pumps are air-to-water heat pumps, and there would be an issue if multiple product definitions overlapped, thereby encompassing the same covered product within scope and subjecting it to two separate test procedures and efficiency standards. (BWC, No. 1164 at pp. 11–12)

There is currently no codified definition for an air-to-water hydronic heat pump used for space heating purposes. However, in a March 2023 final rule amending the test procedure for consumer boilers (the ''March 2023 Boilers TP Final Rule''), DOE determined that hydronic heat pump appliances which meet the consumer boiler definition would be classified as consumer boilers. 88 FR 15510, 15516 (Mar. 13, 2023). However, the March 2023 Boilers TP Final Rule did not establish a test method for these hydronic heat pump boilers. *Id.* At this time, there is no Federal test procedure to determine the Annual Fuel Utilization Efficiency (''AFUE'') of such a product, hence, there are also no AFUE requirements for these heat pumps. In the March 2023 Boilers TP Final Rule, DOE also stated that, to the extent that a combination space and water heating product meets the definition of electric boiler or low pressure steam or hot water boiler, it is subject to the boilers test procedure and energy conservation standards for consumer boilers at 10 CFR 430.32(e)(2), and must be tested and rated accordingly. *Id.* at 15515. Therefore, per DOE's test procedure requirements, if an air-to-water heat pump meets both the definition of a consumer boiler and a consumer water heater, then it must be tested to both test procedures, should the boilers test procedure be amended at a future date to include an applicable method of test. On June 5, 2023, EPA released a Discussion Guide [26] requesting information from stakeholders about a method of test for hydronic heat pump boiler systems. DOE will monitor the development of this method of test but notes that it is a draft specification that has not been released as of this final rule.

RVIA commented that based on the plain language of the consumer product statute, appliances designed specifically for use in a recreational vehicle (''RV'') are exempted from new standards. RVIA urged DOE to continue to recognize the uniqueness of RVs and the importance of excluding specific component parts designed for RVs from new appliance standards. (RVIA, No. 1168 at p. 4)

The scope of this rulemaking excludes water heaters designed exclusively for RV applications because the definition of ''consumer product'' in EPCA excludes consumer products designed solely for use in recreational vehicles and other mobile equipment. (*See* 42 U.S.C. 6292(a)) In the market and technology assessment, DOE evaluated certification data to ensure that the model information used throughout this rulemaking analysis aligned with the scope of coverage.

Section IV.A.1 of this document contains detailed discussion of the product classes analyzed in this final rule.

C. Test Procedure

EPCA sets forth generally applicable criteria and procedures for DOE's adoption and amendment of test procedures. (42 U.S.C. 6293) Manufacturers of covered products must use these test procedures to certify to DOE that their product complies with energy conservation standards and to quantify the efficiency of their product. DOE's current energy conservation standards for consumer water heaters are expressed in terms of UEF. (*See* 10 CFR 430.32(d).)

DOE most recently amended the test procedure for these products at appendix E in the consumer and residential-duty commercial water heater test procedure final rule published on June 21, 2023 (''June 2023 TP Final Rule'') pursuant to the 7-year review requirement as specified by EPCA. (42 U.S.C. 6293(b)(1)(A) and 42 U.S.C. 6314(a)(1)(A)) In the June 2023 TP Final Rule, DOE added definitions and, where necessary, additional test procedure provisions for circulating water heaters, low-temperature water heaters, and tabletop water heaters, as well as provisions for high-temperature testing. However, DOE deferred the implementation of high-temperature testing provisions to this energy conservation standards rulemaking. 88 FR 40406, 40448. DOE also established effective storage volume as a metric and provided additional optional ambient test conditions for heat pump water heaters. *Id.* The test procedure for consumer water heaters incorporates by reference current versions of industry standards ASHRAE 41.1, ASHRAE 41.6, ASHRAE 118.2, ASTM D2156, and ASTM E97 and harmonizes various aspects of the test procedure with industry test procedures ASHRAE 118.2–2022 and NEEA Advanced Water Heating Specification v8.0. The amended test procedure established by the June 2023 TP Final Rule is mandatory for consumer water heater testing starting December 18, 2023, 180 days after publication, with the exception of certain provisions (*i.e.,* the new high temperature test method and the circulating water heater test method). For these specific provisions, compliance is mandatory on and after the compliance date of this final rule. (*See* Note at the beginning of appendix E).

D. Technological Feasibility

1. General

In each energy conservation standards rulemaking, DOE conducts a screening analysis based on information gathered on all current technology options and prototype designs that could improve the efficiency of the products or equipment that are the subject of the rulemaking. As the first step in such an analysis, DOE develops a list of technology options for consideration in consultation with manufacturers, design engineers, and other interested parties. DOE then determines which of those means for improving efficiency are technologically feasible. DOE considers technologies incorporated in commercially available products or in working prototypes to be technologically feasible. Sections 6(b)(3)(i) and 7(b)(1) of appendix A to 10 CFR part 430 subpart C (''appendix A'').

After DOE has determined that particular technology options are technologically feasible, it further evaluates each technology option in light of the following additional screening criteria: (1) practicability to manufacture, install, and service; (2) adverse impacts on product utility or availability; (3) adverse impacts on health or safety and (4) unique-pathway proprietary technologies. Section 7(b)(2)–(5) of the Appendix A. Section IV.B of this document discusses the results of the screening analysis for consumer water heaters, particularly the designs DOE considered, those it screened out, and those that are the

[26] The Boilers Discussion Guide can be found online at: *www.energystar.gov/products/residential_boilers_specification* (Last accessed: Nov. 3, 2023).

basis for the standards considered in this rulemaking. For further details on the screening analysis for this rulemaking, *see* chapter 4 of the final rule TSD.

2. Maximum Technologically Feasible Levels

When DOE proposes to adopt a new or amended standard for a type or class of covered product, it must determine the maximum improvement in energy efficiency or maximum reduction in energy use that is technologically feasible for such product. (42 U.S.C. 6295(p)(1)) Accordingly, in the engineering analysis, DOE determined the maximum technologically feasible (''max-tech'') improvements in energy efficiency for consumer water heaters, using the design parameters for the most efficient products available on the market or in working prototypes. The max-tech levels that DOE determined for this rulemaking are described in section IV.C of this final rule and in chapter 5 of the final rule TSD.

E. Energy Savings

1. Determination of Savings

For each trial standard level (''TSL''), DOE projected energy savings from application of the TSL to consumer water heaters purchased in the 30-year period that begins in the first full year of compliance with the amended standards (2030–2059).[27] The savings are measured over the entire lifetime of consumer water heaters purchased in the 30-year analysis period. DOE quantified the energy savings attributable to each TSL as the difference in energy consumption between each standards case and the no-new-standards case. The no-new-standards case represents a projection of energy consumption that reflects how the market for a product would likely evolve in the absence of amended energy conservation standards.

DOE used its national impact analysis (''NIA'') spreadsheet models to estimate national energy savings (''NES'') from potential amended standards for consumer water heaters. The NIA spreadsheet model (described in section IV.H of this document) calculates energy savings in terms of site energy, which is the energy directly consumed by products at the locations where they are used. For electricity, DOE reports national energy savings in terms of primary energy savings, which is the savings in the energy that is used to generate and transmit the site electricity. For natural gas, the primary energy savings are considered to be equal to the site energy savings. DOE also calculates NES in terms of full-fuel-cycle (''FFC'') energy savings. The FFC metric includes the energy consumed in extracting, processing, and transporting primary fuels (*i.e.,* coal, natural gas, petroleum fuels), and thus presents a more complete picture of the impacts of energy conservation standards.[28] DOE's approach is based on the calculation of an FFC multiplier for each of the energy types used by covered products or equipment. For more information on FFC energy savings, see section IV.H.2 of this document.

2. Significance of Savings

To adopt any new or amended standards for a covered product, DOE must determine that such action would result in significant energy savings. (42 U.S.C. 6295(o)(3)(B))

The significance of energy savings offered by a new or amended energy conservation standard cannot be determined without knowledge of the specific circumstances surrounding a given rulemaking.[29] For example, some covered products and equipment have most of their energy consumption occur during periods of peak energy demand. The impacts of these products on the energy infrastructure can be more pronounced than products with relatively constant demand. Accordingly, DOE evaluates the significance of energy savings on a case-by-case basis, taking into account the significance of cumulative FFC national energy savings, the cumulative FFC emissions reductions, and the need to confront the global climate crisis, among other factors.

As stated, the standard levels adopted in this final rule are projected to result in national energy savings of 17.6 quads, the equivalent of the primary annual energy use of 116 million homes. Based on the amount of FFC savings, the corresponding reduction in emissions, and the need to confront the global climate crisis, DOE has determined the energy savings from the standard levels adopted in this final rule are ''significant'' within the meaning of 42 U.S.C. 6295(o)(3)(B).

F. Economic Justification

1. Specific Criteria

As noted previously, EPCA provides seven factors to be evaluated in determining whether a potential energy conservation standard is economically justified. (42 U.S.C. 6295(o)(2)(B)(i)(I)(VII)) The following sections discuss how DOE has addressed each of those seven factors in this rulemaking.

a. Economic Impact on Manufacturers and Consumers

In determining the impacts of potential new or amended standards on manufacturers, DOE conducts an MIA, as discussed in section IV.J of this document. DOE first uses an annual cash-flow approach to determine the quantitative impacts. This step includes both a short-term assessment—based on the cost and capital requirements during the period between when a regulation is issued and when entities must comply with the regulation—and a long-term assessment over a 30-year period. The industry-wide impacts analyzed include (1) INPV, which values the industry on the basis of expected future cash flows; (2) cash flows by year; (3) changes in revenue and income; and (4) other measures of impact, as appropriate. Second, DOE analyzes and reports the impacts on different types of manufacturers, including impacts on small manufacturers. Third, DOE considers the impact of standards on domestic manufacturer employment and manufacturing capacity, as well as the potential for standards to result in plant closures and loss of capital investment. Finally, DOE takes into account cumulative impacts of various DOE regulations and other regulatory requirements on manufacturers.

For individual consumers, measures of economic impact include the changes in LCC and PBP associated with new or amended standards. These measures are discussed further in the following section. For consumers in the aggregate, DOE also calculates the national net present value of the consumer costs and benefits expected to result from particular standards. DOE also evaluates the impacts of potential standards on identifiable subgroups of consumers that may be affected disproportionately by a standard.

b. Savings in Operating Costs Compared To Increase in Price (LCC and PBP)

EPCA requires DOE to consider the savings in operating costs throughout the estimated average life of the covered product in the type (or class) compared to any increase in the price of, or in the

[27] DOE also presents a sensitivity analysis that considers impacts for products shipped in a 9-year period.

[28] The FFC metric is discussed in DOE's statement of policy and notice of policy amendment. 76 FR 51282 (Aug. 18, 2011), as amended at 77 FR 49701 (Aug. 17, 2012).

[29] The numeric threshold for determining the significance of energy savings established in a final rule published on Feb. 14, 2020 (85 FR 8626, 8670) was subsequently eliminated in a final rule published on Dec. 13, 2021 (86 FR 70892).

initial charges for, or maintenance expenses of, the covered product that are likely to result from a standard. (42 U.S.C. 6295(o)(2)(B)(i)(II)) DOE conducts this comparison in its LCC and PBP analysis.

The LCC is the sum of the purchase price of a product (including its installation) and the operating cost (including energy, maintenance, and repair expenditures) discounted over the lifetime of the product. The LCC analysis requires a variety of inputs, such as product prices, product energy consumption, energy prices, maintenance and repair costs, product lifetime, and discount rates appropriate for consumers. To account for uncertainty and variability in specific inputs, such as product lifetime and discount rate, DOE uses a distribution of values, with probabilities attached to each value.

The PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of a more-efficient product through lower operating costs. DOE calculates the PBP by dividing the change in purchase cost due to a more stringent standard by the change in annual operating cost for the year that standards are assumed to take effect.

For its LCC and PBP analysis, DOE assumes that consumers will purchase the covered products in the first year of compliance with new or amended standards. The LCC savings for the considered efficiency levels are calculated relative to the case that reflects projected market trends in the absence of new or amended standards. DOE's LCC and PBP analysis is discussed in further detail in section IV.F of this document.

c. Energy Savings

Although significant conservation of energy is a separate statutory requirement for adopting an energy conservation standard, EPCA requires DOE, in determining the economic justification of a standard, to consider the total projected energy savings that are expected to result directly from the standard. (42 U.S.C. 6295(o)(2)(B)(i)(III)) As discussed in section IV.H of this document, DOE uses the NIA spreadsheet models to project national energy savings.

d. Lessening of Utility or Performance of Products

In establishing product classes, and in evaluating design options and the impact of potential standard levels, DOE evaluates potential standards that would not lessen the utility or performance of the considered products. (42 U.S.C. 6295(o)(2)(B)(i)(IV)) Based on data available to DOE, the standards adopted in this document would not reduce the utility or performance of the products under consideration in this rulemaking.

e. Impact of Any Lessening of Competition

EPCA directs DOE to consider the impact of any lessening of competition, as determined in writing by the Attorney General, that is likely to result from a standard. (42 U.S.C. 6295(o)(2)(B)(i)(V)) It also directs the Attorney General to determine the impact, if any, of any lessening of competition likely to result from a standard and to transmit such determination to the Secretary within 60 days of the publication of a proposed rule, together with an analysis of the nature and extent of the impact. (42 U.S.C. 6295(o)(2)(B)(ii)) To assist the Department of Justice (''DOJ'') in making such a determination, DOE transmitted copies of its proposed rule and the NOPR TSD to the Attorney General for review, with a request that the DOJ provide its determination on this issue. In its assessment letter responding to DOE, DOJ concluded that the proposed energy conservation standards for consumer water heaters are unlikely to substantially lessen competition. DOE is publishing the Attorney General's assessment at the end of this final rule.

In response to the July 2023 NOPR, NPGA, APGA, AGA, and Rinnai asserted that the standards proposed in the July 2023 NOPR would have a significant market effect, with manufacturers likely choosing to leave the market rather than expend the millions of dollars it would take to redesign their products and production especially in requiring condensing technology in order to be in compliance with the standards proposed. (NPGA, APGA, AGA, and Rinnai, No. 441 at p. 3)

Although commenters focus primarily on condensing technologies as it relates to GIWHs, which are not amended in this final rule, DOE continued to look at the impact of competition as it relates to the other product classes for which DOE is adopting standards in this final rule. DOE does not expect that the adopted standard would significantly alter the level of concentration in the consumer water heater market. Additionally, DOJ stated, in a letter to DOE written in response to the July 2023 NOPR, that ''we do not have an evidentiary basis to conclude that the proposed energy conservation standards for consumer water heaters are likely to substantially lessen competition.'' (*See* Attorney General's assessment at the end of this final rule). For this final rule, DOE reviewed up-to-date information on the consumer water heater models available on the U.S. market to ensure a comprehensive analysis of the current manufacturer landscape. In response to stakeholders' comments, DOE carefully reviewed product offerings of original equipment manufacturers (''OEMs'') of gas-fired storage water heaters. DOE identified five OEMs of gas-fired storage water heaters that would be subject to more stringent standards under this rulemaking. Of the five OEMs identified, four OEMs currently manufacture gas-fired storage water heaters that meet the adopted TSL (EL 2 for gas-fired storage water heaters). Collectively, the four OEMs that already offer gas-fired storage water heaters that meet EL 2 account for approximately 95 percent of gas-fired storage water heater shipments.

f. Need for National Energy Conservation

DOE also considers the need for national energy and water conservation in determining whether a new or amended standard is economically justified. (42 U.S.C. 6295(o)(2)(B)(i)(VI)) The energy savings from the adopted standards are likely to provide improvements to the security and reliability of the Nation's energy system. Reductions in the demand for electricity also may result in reduced costs for maintaining the reliability of the Nation's electricity system. DOE conducts a utility impact analysis to estimate how standards may affect the Nation's needed power generation capacity, as discussed in section IV.M of this document.

DOE maintains that environmental and public health benefits associated with the more efficient use of energy are important to take into account when considering the need for national energy conservation. The adopted standards are likely to result in environmental benefits in the form of reduced emissions of air pollutants and greenhouse gases (''GHGs'') associated with energy production and use. DOE conducts an emissions analysis to estimate how potential standards may affect these emissions, as discussed in section IV.K of this document; the estimated emissions impacts are reported in section V.B.6 of this document. DOE also estimates the economic value of emissions reductions resulting from the considered TSLs, as discussed in section IV.L of this document.

g. Other Factors

In determining whether an energy conservation standard is economically justified, DOE may consider any other factors that the Secretary deems to be relevant. (42 U.S.C. 6295(o)(2)(B)(i)(VII)) To the extent DOE identifies any relevant information regarding economic justification that does not fit into the other categories described previously, DOE could consider such information under ''other factors.''

2. Rebuttable Presumption

As set forth in 42 U.S.C. 6295(o)(2)(B)(iii), EPCA creates a rebuttable presumption that an energy conservation standard is economically justified if the additional cost to the consumer of a product that meets the standard is less than three times the value of the first year's energy savings resulting from the standard, as calculated under the applicable DOE test procedure. DOE's LCC and PBP analyses generate values used to calculate the effect potential amended energy conservation standards would have on the payback period for consumers. These analyses include, but are not limited to, the 3-year payback period contemplated under the rebuttable-presumption test. In addition, DOE routinely conducts an economic analysis that considers the full range of impacts to consumers, manufacturers, the Nation, and the environment, as required under 42 U.S.C. 6295(o)(2)(B)(i). The results of this analysis serve as the basis for DOE's evaluation of the economic justification for a potential standard level (thereby supporting or rebutting the results of any preliminary determination of economic justification). The rebuttable presumption payback calculation is discussed in section IV.F of this document.

IV. Methodology and Discussion of Related Comments

This section addresses the analyses DOE has performed for this rulemaking with regard to consumer water heaters. Separate subsections address each component of DOE's analyses.

DOE used several analytical tools to estimate the impact of the standards considered in this document. The first tool is a spreadsheet that calculates the LCC savings and PBP of potential amended or new energy conservation standards. The national impacts analysis uses a second spreadsheet set that provides shipments projections and calculates national energy savings and net present value of total consumer costs and savings expected to result from potential energy conservation standards. DOE uses the third spreadsheet tool, the Government Regulatory Impact Model (''GRIM''), to assess manufacturer impacts of potential standards. These three spreadsheet tools are available on the DOE website for this rulemaking: *www.regulations.gov/docket/EERE-2017-BT-STD-0019*. Additionally, DOE used output from the latest version of the Energy Information Administration's (''EIA's'') *Annual Energy Outlook* (''*AEO*'') for the emissions and utility impact analyses.

A. Market and Technology Assessment

DOE develops information in the market and technology assessment that provides an overall picture of the market for the products concerned, including the purpose of the products, the industry structure, manufacturers, market characteristics, and technologies used in the products. This activity includes both quantitative and qualitative assessments, based primarily on publicly available information. The subjects addressed in the market and technology assessment for this rulemaking include (1) a determination of the scope of the rulemaking and product classes, (2) manufacturers and industry structure, (3) existing efficiency programs, (4) shipments information, (5) market and industry trends, and (6) technologies or design options that could improve the energy efficiency of consumer water heaters. The key findings of DOE's market assessment are summarized in the following sections. *See* chapter 3 of the final rule TSD for further discussion of the market and technology assessment.

1. Product Classes

When evaluating and establishing energy conservation standards for a type (or class) of covered products, DOE divides covered products into product classes by the type of energy used, or by capacity or other performance-related features which other products within such type (or class) do not have and that justify differing standards. (42 U.S.C. 6295(q)) In making a determination whether a performance-related feature justifies a different standard, DOE must consider such factors as the utility of the feature to the consumer and other factors DOE determines are appropriate. *Id.*

EPCA, as amended by the National Appliance Energy Act (NAECA; Pub. L. 100–12), established initial energy conservation standards, expressed as EF, that were based on three product classes differentiated by fuel type: (1) gas-fired, (2) oil-fired, and (3) electric. (42 U.S.C. 6295(e)(1)) These standards applied to consumer water heaters manufactured on or after January 1, 1990.

DOE subsequently amended these EF standards twice, most recently in the April 2010 Final Rule, with which compliance was required starting on April 16, 2015. 75 FR 20112. In the April 2010 Final Rule, DOE further divided consumer water heaters into product classes based on fuel type (gas-fired, oil-fired, or electric), product type (storage, instantaneous, tabletop), storage volume, and input rate.

The Energy Efficiency Improvement Act of 2015 (''EEIA 2015'') (Pub. L. 114–11), enacted on April 30, 2015, added a definition of ''grid-enabled water heater'' and a standard in terms of EF for such products to EPCA's energy conservation standards. (42 U.S.C. 6295(e)(6)(A)(ii)) DOE codified the definition for grid-enabled water heater and the associated energy conservation standards in a final rule published and effective on August 11, 2015. 80 FR 48004.

Most recently, the December 2016 Conversion Factor Final Rule, published and effective on December 29, 2016, translated the EF-based standards to UEF-based standards for certain classes of consumer water heaters, which are shown in Table IV.1. Although the classes of consumer water heaters with UEF-based standards have limitations on the stored volume, as discussed in that final rule, the standards established in EPCA do not place any limitation on the storage volume of consumer water heaters. Therefore, the original standards established by EPCA in terms of EF remain applicable to all products without UEF-based standards. 81 FR 96204, 96209–96211.

The 32 product classes covered in this final rule for which DOE has currently established UEF-based standards are summarized in Table IV.1. The product classes without UEF-based standards, for which EF-based standards from EPCA apply, are shown in Table IV.2.

BILLING CODE 6450–01–P

Table IV.1 Consumer Water Heater Product Classes with Current UEF-Based Standards

Product Type Covered in this Final Rule	Rated Storage Volume and Input Rating (if applicable)	Draw Patterns
Gas-Fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small Low Medium High
Gas-Fired Storage Water Heater	> 55 gal and ≤ 100 gal	Very Small Low Medium High
Oil-Fired Storage Water Heater	≤ 50 gal	Very Small Low Medium High
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small Low Medium High
Electric Storage Water Heater	> 55 gal and ≤ 120 gal	Very Small Low Medium High
Tabletop Water Heater	≥ 20 gal and ≤ 120 gal	Very Small Low Medium High
Instantaneous Electric Water Heater	< 2 gal	Very Small Low Medium High
Grid-Enabled Water Heater	> 75 gal	Very Small Low Medium High

Table IV.2 Consumer Water Heater Product Classes without Current UEF-Based Standards

Product Class Covered in this Final Rule	Rated storage volume and input rating (if applicable)
Gas-fired Storage	< 20 gal
	> 100 gal
Oil-fired Storage	> 50 gal
Electric Storage	< 20 gal
	> 120 gal
Tabletop	< 20 gal
	> 120 gal*
Oil-fired Instantaneous	< 2gal
	≥ 2 gal
Electric Instantaneous	≥ 2 gal

* Note: products larger than 120 gallons are not possible to fit into the design description of a tabletop water heater, as discussed in section IV.A.1.f.iv.

The CA IOUs suggested that DOE reconsider its approach to setting minimum UEF standards for the water heaters formerly subject to EF standards. Citing the provisions in EPCA (42 U.S.C. 6295(q)(1)(B)), the CA IOUs stated that DOE must consider capacity, consumer utility, and other performance-related features when establishing separate product classes for different types of water heaters. The CA IOUs questioned whether converting an EF standard to a

UEF standard should result in a new product class. The commenter urged DOE to immediately initiate a new rulemaking to address appropriate standards levels or the new product classes, if established. (CA IOUs, No. 1175 at p. 5)

In response to the CA IOUs, DOE originally established these product classes in the 2016 Conversion Factor Final Rule. 81 FR 96204, 96210. At this time, DOE does not have sufficient data to perform an analysis of costs versus benefits of subjecting these products to standards of the same stringency as the amended standards proposed in the July 2023 NOPR. While these products may not have performance-related ''features'' distinguishing them from currently covered products, these models come in different capacities than the products for which DOE has already established UEF-based standards. As has been observed in DOE's teardown analyses and has been indicated by comments from manufacturers, the applicability of efficiency-improving design options is often predicated upon the size or capacity of the water heater; therefore, at this time, the capacities of these products do appear to justify separate standards. However, should future product designs demonstrate that the same efficiency-improving design options are equally as applicable for these capacities, DOE would consider the need for distinguishing these product classes by evaluating whether separate standards are justified for these capacities in a future standards rulemaking (*see* 42 U.S.C. 6295(q)(1)(B)).

a. Circulating Water Heaters

In the June 2023 TP Final Rule, DOE established a definition for ''circulating water heater'' in 10 CFR 430.2, and also established test procedures to determine the UEF of these types of water heaters. 88 FR 40406. In the July 2023 NOPR, DOE identified three potential classes of circulating water heater based on fuel type and input ratings derived from instantaneous water heater definitions in EPCA at 42 U.S.C. 6291(27), which are shown in 88 FR 49058, 49077.

Table IV.3, and proposed their addition to the definitions found at 10 CFR 430.2. 88 FR 49058, 49077.

Table IV.3 Proposed Classes of Circulating Water Heaters from July 2023 NOPR

Product Class	Characteristics
Gas-fired Circulating Water Heater	A circulating water heater with a nominal input of 200,000 Btu/h or less; contains no more than one gallon of water per 4,000 Btu/h of input
Oil-fired Circulating Water Heater	A circulating water heater with a nominal input of 210,000 Btu/h or less; contains no more than one gallon of water per 4,000 Btu/h of input
Electric Circulating Water Heater	A circulating water heater with an input of 12 kW or less; contains no more than one gallon of water per 4,000 Btu/h of input (including heat pump-only units with power inputs of no more than 24 A at 250 V)

BILLING CODE 6450–01–C

As discussed in the June 2023 TP Final Rule, DOE had at that time determined that circulating water heaters with input ratings below 200,000 Btu/h (for gas-fired), 210,000 Btu/h (for oil-fired), or 12 kW (for electric) met the definitional criteria for instantaneous consumer water heaters. As such, these products were to be subject to the applicable energy conservation standards; however, DOE previously provided an enforcement policy for circulating water heaters.[30] Because an amended test procedure that includes new provisions for testing circulating water heaters was recently finalized in the June 2023 TP Final Rule, DOE proposed in the July 2023 NOPR to establish updated UEF standards that reflect the new test method and requested feedback on the proposed standards. In response to the July 2023 NOPR, DOE received comments that largely suggested that circulating water heaters are storage-type water heaters. As noted in section III.B, on December 27, 2023, therefore, DOE published the December 2023 SNOPR that proposed to reclassify these products as configurations of storage-type water heaters, thus proposed that separate product classes for circulating water heaters are not required. 88 FR 89330.

A ''circulating water heater'' is currently defined at 10 CFR 430.2 as an ''instantaneous or heat pump-type water heater that does not have an operational scheme in which the burner, heating element, or compressor initiates and/or terminates heating based on sensing flow; has a water temperature sensor located at the inlet or the outlet of the water heater or in a separate storage tank that is the primary means of initiating and terminating heating; and must be used in combination with a recirculating pump and either a separate storage tank or water circulation loop in order to achieve the water flow and temperature conditions recommended in the manufacturer's installation and operation instructions.''

As described in the December 2023 SNOPR, circulating water heaters contain very little to no water on their own (*i.e.,* are ''tankless''), but, as was determined in the June 2023 TP Final Rule, require a separate volume of water in order to function properly when installed in the field. In that rulemaking, circulating water heaters were designated as instantaneous-type water heaters because of the minimal storage volume contained within the product. However, comments received in response to the July 2023 NOPR led DOE to reevaluate circulating water heaters and propose in the December 2023 SNOPR to classify them as storage-type water heaters because they necessarily operate in tandem with a stored volume of water; hence, the circulating water heater and its separate tank or recirculation loop must be

[30] Prior to the June 2023 TP Final Rule, DOE became aware of gas-fired instantaneous water heaters meeting the definition of consumer water heaters which operated differently than those DOE had previously considered in test procedure rulemakings. On September 5, 2019, DOE issued an enforcement policy for consumer water heaters meeting the definition of gas-fired ''circulating water heater'' as described in said enforcement policy in which DOE stated that it would not seek civil penalties for failing to certify these products, or if these products failed to comply with applicable standards, on or before December 31, 2021. The June 2023 TP Final Rule has since addressed this issue by establishing test procedures to determine UEF ratings for circulating water heaters.

treated as one system. When considering the entire system—the circulating water heater plus the stored water volume required for its operation in the field—these water heaters are operationally very similar to storage-type water heaters and, as a result, DOE had tentatively determined that it is appropriate to classify them as such under its regulations. 88 FR 89330, 89333. The December 2023 SNOPR proposed the following revised definition for circulating water heaters:

''Circulating water heater means a water heater that does not have an operational scheme in which the burner, heating element, or compressor initiates and/or terminates heating based on sensing flow; has a water temperature sensor located at the inlet or the outlet of the water heater or in a separate storage tank that is the primary means of initiating and terminating heating; and must be used in combination with a recirculating pump to circulate water and either a separate storage tank or water circulation loop in order to achieve the water flow and temperature conditions recommended in the manufacturer's installation and operation instructions. Paired with a separate storage tank, a circulating water heater constitutes a storage-type water heater.''

88 FR 89330, 89339.

CEC, BWC, NEEA, NYSERDA, ASAP et al., and A.O. Smith expressed support for DOE's tentative determination that circulating water heaters be considered storage-type water heaters and subject to the appropriate standards. (CEC, No. 1412 at pp. 1–2; BWC, No. 1413 at p. 1; NEEA, No. 1414 at p. 2; NYSERDA, No. 1406 at p. 2; ASAP et al., No. 1407 at pp. 1–2; A.O. Smith, No. 1411 at p. 2) NEEA and ASAP et al. noted that, compared to other storage-type water heaters, circulating water heaters do not provide any additional utility or performance-related features that would warrant a separate product class. (NEEA, No. 1414 at p. 2; ASAP et al., No. 1407 at pp. 1–2) NEEA and A.O. Smith commented that defining circulating water heaters as storage-type will address concerns regarding these products potentially being used as a circumvention pathway for more stringent storage-type standards. (NEEA, No. 1414 at p. 2; A.O. Smith, No. 1411 at p. 2) A.O. Smith added that this will provide more business certainty. (A.O. Smith, No. 1411 at p. 2)

DOE specifically requested comment and information on whether gas-fired circulating water heaters could offer the same utility as gas-fired instantaneous water heaters. 88 FR 89330, 89334. DOE sought to understand whether gas-fired circulating water heaters could be a potential loophole to gas-fired instantaneous water heater standards enforcement after receiving comments in response to the NOPR identifying such a possibility.

BWC agreed with DOE that gas-fired circulating water heaters would not be direct substitutes for gas-fired instantaneous water heaters, indicating that gas-fired circulating water heaters as defined in the December 2023 SNOPR are better suited towards providing large volumes of hot water in short periods of time and gas-fired instantaneous water heaters for lengthier periods of time. (BWC, No. 1413 at p. 3) Rheem supported DOE's tentative determination that circulating water heaters do not provide the same consumer utility as gas-fired instantaneous water heaters. Rheem added that though they do not currently exist on the market, the combination of the non-flow-activated operational scheme, storage tank or recirculation loop requirement, and input rate limits consistent with other storage-type water heaters present in DOE's definition ensures that any future gas-fired circulating water heaters would not serve as direct replacements for gas-fired instantaneous water heaters. (Rheem, No. 1408 at p. 2) A.O. Smith agreed with DOE's tentative determination that gas-fired circulating water heaters do not provide the same consumer utility as gas-fired instantaneous water heaters. (A.O. Smith, No. 1411 at p. 6) CEC noted that circulating water heaters provide different utilities from instantaneous water heaters and experience thermal standby losses more than a typical non-circulating storage water heater due to plumbing acting as a storage volume for a significant volume of hot water. (CEC, No. 1412 at p. 3) ASAP et al. agreed with DOE's tentative determination that gas-fired circulating water heaters do not provide the same consumer utility as gas-fired instantaneous water heaters due to the fact that gas-fired instantaneous water heaters utilize flow-activated control schemes and larger burners (compared to gas-fired circulating water heaters) in order to meet demand on a continuous basis, whereas gas-fired circulating water heaters must operate with a separate stored volume of hot water. (ASAP et al., No. 1407 at p. 2)

Rinnai agreed with DOE that gas-fired circulating water heaters do not provide the same utility as gas-fired instantaneous water heaters. Rinnai also stated that gas-fired circulating water heaters do not provide consumers with the same features, energy efficiency and reduced emissions benefits as gas-fired instantaneous water heaters at the proposed UEF levels. Rinnai reiterated its comments made in response to the July 2023 NOPR that UEFs of 0.80 to 0.81 result in increased energy savings and reduction of CO_2 emissions in comparison with the levels gas-fired circulating water heaters would be subject to as gas-fired storage water heaters. Thus, Rinnai arrived at a different conclusion from DOE and claimed that there is not a sufficient basis for allowing gas-fired circulating water heaters to be held to a lower UEF standard than other consumer products and requested that DOE instead establish the more stringent standards proposed in the July 2023 NOPR. (Rinnai, No. 1415 at pp. 1–2)

As discussed in section IV.A.1.c of this document, DOE has found sufficient justification in accordance with the provisions of EPCA to establish separate standards for storage-type and instantaneous-type water heaters.

Rheem, however, noted an additional concern that circulating water heaters can be paired with any size storage tank in the field, and that there is still a concern that circulating water heaters certified to a lower capacity energy conservation standard would be installed with higher capacity storage tanks where higher energy conservation standards would be required. Because of this, Rheem recommended DOE establish separate energy conservation standards for circulating water heaters, but at levels consistent with the higher capacity energy conservation standards. In its recommendation, Rheem showed that the standards equations for larger storage-type product classes (*i.e.,* gas-fired storage water heaters 55–100 gallons, and electric storage water heaters 55–120 gallons) would apply to both circulating water heaters and their analogous traditional storage-type water heaters. (Rheem, No. 1408 at pp. 2–3)

DOE understands Rheem to be suggesting that, in the case that a circulating water heater is designed and marketed to be paired with multiple volumes of storage tanks in the field, it is useful for the rating to reflect larger storage volumes. However, DOE notes that the size of the separate storage tank that the product is tested with (in accordance with section 4.10 of the test procedure) results in the effective storage volume of the circulating water heater, which, for most types of circulating water heaters will be 80 to 120 gallons. This already results in circulating water heaters being held to the same standards as larger storage water heaters. The only exception to this is electric heat pump circulating

water heaters, which are paired with smaller tanks. Separate storage tank pairings are discussed further in section V.D.2 of this document. Additionally, the commenter does not provide evidence as to how different standards for circulating water heaters would be justified under the provisions of EPCA.

After reviewing these comments DOE has concluded that circulating water heaters do not have any characteristics which justify separate standards under the provisions of EPCA at 42 U.S.C. 6295(q)(1). DOE has determined not to create separate product classes for circulating water heaters.

To accomplish this, in the December 2023 SNOPR DOE had proposed an addition to the definition that stated, ''Paired with a separate storage tank, a circulating water heater constitutes a storage-type water heater.'' 88 FR 89330, 89335.

Multiple stakeholders raised concern that DOE's proposed revised definition for ''circulating water heater'' seemingly implies that circulating water heaters are only storage-type water heaters if they are paired with a separate storage tank. These commenters—NEEA, ASAP et al., the CA IOUs, CEC, A.O. Smith and NYSERDA—all indicated that circulating water heaters paired with a circulating loop also constitute storage-type water heaters. (NEEA, No. 1414 at p. 3; ASAP et al., No. 1407 at p. 2; CA IOUs, No. 1409 at pp. 1–2; CEC, No. 1412 at p. 2; A.O. Smith, No. 1411 at pp. 4–5; NYSERDA, No. 1406 at p. 2)

NEEA requested that DOE define circulating water heaters as constituting storage-type water heaters regardless of the configuration in which they are sold or installed. (NEEA, No. 1414 at p. 3) ASAP et al. encouraged DOE to clarify the proposed definition for circulating water heaters so that it is clear all circulating water heaters, whether paired with a separate storage tank or recirculation loop, would be considered storage-type water heaters. (ASAP et al., No. 1407 at p. 2)

The CA IOUs also stated that excluding mention of circulation loops would be inconsistent with the earlier definitional requirements indicating that they must be paired with either a separate storage tank or a water circulation loop and recommend that DOE modify the definition as ''Paired with a separate storage tank or circulation loop, a circulating water heater constitutes a storage-type water heater.'' (CA IOUs, No. 1409 at pp. 1–2)

CEC provided similar statements, adding that the exclusion of pairings with water circulation loops may become a loophole exploited by manufacturers. CEC recommended that DOE modify the definition to simply state that ''a circulating water heater constitutes a storage-type water heater'' to avoid potential misreading. (CEC, No. 1412 at p. 2)

A.O. Smith recommended DOE remove the phrase ''paired with'' from the statement ''paired with a separate storage tank a circulating water heater constitutes a storage-type water heater'' in the definition for circulating water heater to avoid implying that only circulating water heaters that come with a manufacturer-specified or supplied tank would be considered circulating water heaters. In place of this phrasing, A.O. Smith suggested DOE incorporate the definition for a ''water heater requiring a storage tank'' currently outlined in section 1.9 of appendix E to subpart B into § 430.2 and reference this definition in the circulating water heater definition to ensure clarity. A.O. Smith commented that, given the input capacity limits placed on circulating water heaters in their respective definitions, a recirculation loop without the use of a storage tank is unlikely to be an applicable configuration in the residential context. Therefore, A.O. Smith recommended DOE remove the term ''either'' and the phrase ''or water recirculation loop'' from the circulating water heater definition proposed in the December 2023 SNOPR. (A.O. Smith, No. 1411 at pp. 4–5)

NYSERDA recommended that DOE update the definition for circulating water heater to read as follows: ''When paired with a separate storage tank or as part of a water circulation loop, a circulating water heater constitutes a storage-type water heater''. (NYSERDA, No. 1406 at p. 2)

In response to these requests for further clarification, DOE agrees with most commenters that circulating water heaters would constitute storage water heaters whether they are paired with a tank or a recirculation loop. The loop serves to store hot water in pipes instead of in a tank. In both cases, the product does not function properly unless the hot water can be maintained outside of the water heater prior to delivery at a fixture.

While A.O. Smith suggested that a circulating water heater be defined as a ''water heater requiring a storage tank,'' this is not necessarily reflective of field usage to the extent that it can be used to define the product at 10 CFR 430.2. Numerous other comments indicate that a circulating water heater can also function with a recirculation loop. DOE has found examples of gas-fired instantaneous water heaters with input rates that modulate as low as 15,000 Btu/h and can be outfitted with recirculation loops in residential homes. While these specific products are *not* circulating water heaters because they have flow-activated control schemes and do not explicitly require a separate volume of stored hot water to function, they do demonstrate that it is possible for gas-fired products with input rates lower than 75,000 Btu/h to be used in conjunction with a recirculation loop and no tank.

Circulating water heaters are treated as ''water heaters requiring a storage tank'' in appendix E for the purpose of conducting the test procedure because they are not sold with a tank. The appendix E test procedure refers to ''water heaters requiring a storage tank'' in section 1.19 order to provide instruction on how to set up such a water heater with a representative volume of stored water. Therefore, DOE is not amending 10 CFR 430.2 to define a ''water heater requiring a storage tank'' because this terminology has limited application to the test setup instructions in appendix E only. DOE is also not incorporating this terminology in the definition of ''circulating water heater'' so as not to contradict how these products can be designed, marketed, and used in the field.

After considering the suggestions provided by interested parties, DOE is amending the definition of ''circulating water heater'' at 10 CFR 430.2 to read as:

Circulating water heater means a water heater that does not have an operational scheme in which the burner, heating element, or compressor initiates and/or terminates heating based on sensing flow; has a water temperature sensor located at the inlet or the outlet of the water heater or in a separate storage tank that is the primary means of initiating and terminating heating; and must be used in combination with a recirculating pump to circulate water and either a separate storage tank or water circulation loop in order to achieve the water flow and temperature conditions recommended in the manufacturer's installation and operation instructions. A circulating water heater constitutes a storage-type water heater.

The December 2023 SNOPR had also proposed to amend the definitions of the three different fuel types of circulating water heater to align with the re-classification of these products as storage water heaters. 88 FR 89330, 89339.

CA IOUs stated that specifying the volume of stored water per 4,000 Btu/h of input in these definitions is unnecessary because circulating water

heaters are already defined as storage-type water heaters and recommended that DOE remove this requirement from the definitions of electric, gas-fired and oil-fired circulating water heaters as proposed in the December 2023 SNOPR. (CA IOUs, No. 1409 at p. 2)

DOE also agrees with the CA IOUs' suggestion to revise the definitions for the different types of circulating water heaters. As discussed in section III.B, these additional definitions serve mainly to clarify the input rate cutoffs to distinguish these products from commercial water heaters. DOE is amending these definitions to read as:

Electric circulating water heater means a circulating water heater with an input of 12 kW or less (including heat pump-only units with power inputs of no more than 24 A at 250 V).

Gas-fired circulating water heater means a circulating water heater with a nominal input of 75,000 Btu/h or less.

Oil-fired circulating water heater means a circulating water heater with a nominal input of 105,000 Btu/h or less.

In the December 2023 SNOPR DOE requested comment on what the implications to industry might be if circulating water heaters were to be treated as storage water heaters. 88 FR 89330, 89335. In response, several commenters agreed that DOE's analysis for amended standards of storage-type water heaters is still representative if circulating water heaters are included in these product classes.

CEC agreed with DOE that the definition of circulating water heater as proposed in the December 2023 SNOPR would not change the results of the life-cycle cost, national impact, and other downstream analyses, stating that the proposed changes would not cause DOE's analysis to become unrepresentative and agreeing that no additional analysis is necessary. (CEC, No. 1412 at p. 2) The CA IOUs stated that there are few to no shipments of consumer water heaters meeting the definition of ''circulating water heater'' as proposed in the December 2023 SNOPR. CA IOUs stated that DOE may therefore maintain its July 2023 NOPR analyses with respect to storage-type water heaters and apply the associated proposed standards to circulating water heaters. (CA IOUs, No. 1409 at p. 1) NYSERDA and ASAP et al. stated their agreement with DOE's assessment that, because DOE has not identified consumer water heaters on the U.S. market that qualify as circulating water heaters, analytical results from the July 2023 NOPR remain representative and do not need to be updated due to changes proposed in the December 2023 SNOPR. (NYSERDA, No. 1406 at p. 2; ASAP et al., No. 1407 at p. 3) ASAP et al. added that, if introduced, circulating water heaters would likely have similar cost and usage characteristics to existing storage-type consumer water heaters. (ASAP et al., No. 1407 at p. 3)

Rinnai, however, requested that DOE clarify the justification for amending the definition of products that do not currently exist on the market. (Rinnai, No. 1415 at p. 1) BWC agreed with DOE that circulating water heaters as defined in the June 2023 TP Final Rule are not deployed in residential applications. (BWC, No. 1413 at p. 1) BWC agreed with DOE that there are no consumer products that meet the definition of ''circulating water heater'' as proposed in the December 2023 SNOPR and requested that DOE clarify how it determined that these products would have similar cost and use profiles as storage-type water heaters. (BWC, No. 1413 at p. 2)

In the December 2023 SNOPR the Department had erroneously stated that there are no longer heat pump circulating water heaters available on the market (*see* 88 FR 89330, 89333) due to changes in a manufacturer's website. Product literature for these models exists and has been added to the docket for this rulemaking. In addition to stakeholder comments, this literature demonstrates the use of these products in a manner similar to storage-type water heaters. Shipments of these products, though they are fewer than those of traditional storage-type water heaters, are not zero. These products are included in historical data on heat pump water heater shipments as they would meet efficiency level 1 for small electric storage water heaters. Hence DOE's analysis does include circulating heat pump water heaters as storage-type water heaters.

b. Low-Temperature Water Heaters

As stated previously in section III.B of this document, in the June 2023 TP Final Rule, DOE established the following definition for ''low-temperature water heater'' in 10 CFR 430.2:

''Low-temperature water heater'' means an electric instantaneous water heater that is not a circulating water heater and cannot deliver water at a temperature greater than or equal to the set point temperature specified in section 2.5 of appendix E to subpart B of this part when supplied with water at the supply water temperature specified in section 2.3 of appendix E to subpart B of part 430 and the flow rate specified in section 5.2.2.1 of appendix E to subpart B of part 430.

DOE also established test procedures to determine the UEF of these types of water heaters. 88 FR 40406. Regarding low-temperature water heaters, DOE notes that they are covered as electric instantaneous water heaters. As discussed in section IV.C of this document, DOE is not considering updated standards for electric instantaneous water heaters in this rulemaking because it was unable to determine technologies associated with increased efficiencies in these products. Therefore, although low-temperature water heaters are tested in a slightly different manner from other electric instantaneous water heaters, DOE is maintaining low-temperature water heaters within the broader electric instantaneous water heater product class as proposed in the July 2023 NOPR and is not establishing a separate class for them.

c. Storage-Type and Instantaneous-Type Product Classes

In the March 2022 Preliminary Analysis, DOE addressed comments received in response to the May 2020 RFI that suggested that DOE should consider eliminating the separate product classes for instantaneous water heaters. For the preliminary analysis, DOE analyzed separate classes for instantaneous water heaters, but sought feedback from stakeholders on whether storage-type and instantaneous-type water heater product classes should be combined. (See section 2.3 of the preliminary TSD.)

In response to the March 2022 Preliminary Analysis, DOE received comments indicating that storage and instantaneous product classes should not be combined because each type of product provides unique utility to consumers and combining their product classes would lead to UEF standards that are not technologically feasible. DOE tentatively agreed with these comments, which were addressed in the July 2023 NOPR, and maintained separate product classes for storage and instantaneous water heaters for its analyses and proposed standards. 88 FR 49058, 49078.

In response to the July 2023 NOPR, BWC agreed with DOE's tentative determination to maintain separate product classes for instantaneous-type and storage-type water heaters because they offer distinct utilities to consumers in both their designs and capabilities. (BWC, No. 1164 at p. 14) Rheem also agreed with DOE's tentative determination to maintain separate product classes for storage-type and instantaneous-type water heaters given that these water heaters have different

utilities and operational characteristics which necessitate separate consideration. (Rheem, No. 1177 at p. 11) However, Rheem noted that the proposed standards for electric instantaneous water heaters with 2 or more gallons of rated storage volume are significantly higher than the standards proposed for very small electric storage water heaters despite these products all having similar under-sink or commercial applications. (Rheem, No. 1177 at pp. 13–14) Rheem also requested clarification on whether rated or effective storage volume should be used when determining the storage-type and instantaneous-type water heater classification. (Rheem, No. 1177 at p. 2)

NEEA stated that, while it does not disagree with DOE's conclusion to create separate standards for gas-fired storage and gas-fired instantaneous water heaters, standby energy losses should not be considered in a determination of product class as they do not constitute a performance-related feature. NEEA noted that in DOE's decision to set separate product classes for storage and tankless water heaters, DOE stated that ''storage water heaters have associated standby energy losses that instantaneous water heaters do not.'' (NEEA, No. 1199 at p. 10)

AWHI, however, urged DOE to investigate combining gas-fired instantaneous and gas-fired storage water heater categories in a future rulemaking such that the same minimum UEF requirements would apply to both product classes. (AWHI, No. 1036 at pp. 3–4)

After reviewing the comments received on the July 2023 NOPR, DOE has determined that different product classes and standards for storage and instantaneous water heaters remain necessary at this time, and DOE is not combining them in this rulemaking. As stated in the July 2023 NOPR, storage and instantaneous water heaters offer distinct utilities to a consumer. For example, instantaneous water heaters provide a continuous supply of hot water, up to the maximum flow rate, while storage water heaters are often better suited to handle large initial demands for hot water as opposed to continuous draws. 88 FR 49058, 49078. These products are, therefore, designed differently to suit these different needs. As a result of the design differences (*i.e.,* the storage of hot water in storage-type water heaters), storage-type water heaters incur standby losses to the surrounding ambient air.

In response to Rheem, DOE notes that although electric instantaneous water heaters with 2 or more gallons of rated storage volume and very small electric storage water heaters may be used for many of the same under-sink-type applications, each still offers distinct utility to the consumer. Per their definitions at 10 CFR 430.2, electric instantaneous water heaters will necessarily have a higher input rate to volume ratio, and thus will be capable of operating on a more continuous basis than very small electric storage water heaters within the flow rate expectations of these applications. DOE expects these products to have design differences because the scope of coverage is limited to products with electric input rates no greater than 12 kW (*see* section III.B of this document); therefore, electric instantaneous water heaters cannot contain more than approximately 10 gallons of hot water,[31] whereas very small electric storage water heaters can contain up to 20 gallons.

In response to NEEA, DOE does not consider standby losses to be a performance-related feature; rather, the performance-related features are as previously described and the standby losses create the difference in energy consumption between storage-type and instantaneous-type water heaters that justifies different standard levels for the two types of products. In accordance with 42 U.S.C. 6295(q), DOE has concluded that separate standards for storage-type and instantaneous-type water heaters are justified not only because these types offer distinct utilities to the consumer, but also because the design necessary to provide this utility (*i.e.,* a stored volume of water for storage-type water heaters) affects the UEF rating.

EPCA defines instantaneous-type water heaters as units which heat water but contain no more than one gallon of water per 4,000 Btu per hour of input. (42 U.S.C. 6291(27)(B)) Based on the specific use of the term ''contain,'' the rated storage volume, which reflects the amount of water that can be contained, should be used when determining the storage-type and instantaneous-type water heater classification. For circulating water heaters, which operate in a system that contains a stored volume of hot water, this is the rated storage volume of the separate storage tank (*see* section IV.A.1.a of this document).

[31] 12 kW is approximately 41,000 Btu/h. Instantaneous-type water heaters contain no more than one gallon of water per 4,000 Btu/h of input, resulting in a maximum of about 10 gallons for an electric instantaneous water heater with 12 kW of input.

d. Gas-Fired Water Heaters

Gas-fired water heaters operate by burning fuel to generate heat, which is then transferred from the products of combustion (*i.e.,* flue gases) to the water using a heat exchanger before the flue gases are expelled through venting to the outside. Regardless of efficiency, gas-fired water heaters operate in the same manner, by transferring heat to potable water for use within residences. Any combustion heat not transferred to the water is lost to the environment as waste heat, primarily through the exhaust venting. The difference between high-efficiency water heaters and low-efficiency water heaters is the amount of heat that is lost to the environment. Condensing gas-fired water heaters are able to transfer more heat from the flue gases to the water, which results in less heat being lost to the environment. As a result, flue gases exhausted from a condensing gas-fired water heater are typically less than 130 °F, while flue gases exhausted to the environment from a non-condensing gas-fired storage water heater may be in the 300–400 °F range or even higher. Condensing gas-fired water heaters are able to extract more heat due to improved heat exchanger designs.

For example, A.O. Smith notes that their high-efficiency condensing gas storage water heaters ''are built similarly to standard [non-condensing] gas tank water heaters with some modifications for higher efficiency and performance.'' [32] More specifically, A.O. Smith notes that their condensing models ''are built with [a] helical internal heat exchanger that keeps combustion gasses in the tank longer to transfer more heat into the water, increasing efficiency and reducing operating cost.'' [33]

On December 29, 2021, DOE published a final interpretive rule (''December 2021 Venting Interpretive Final Rule'') reinstating its long-standing interpretation that the heat exchanger technology and associated venting used to supply heated air or hot water is not a performance-related ''feature'' that provides a distinct consumer utility under EPCA. 86 FR 73947. Throughout this rulemaking, some commenters have urged DOE to reconsider the conclusions reached in the December 2021 Venting Interpretive Final Rule, and in the July 2023 NOPR, DOE considered these comments but

[32] *See* A.O. Smith's Info Center on Gas Tank High Efficiency Water Heaters, available at *www.hotwater.com/info-center/gas-water-heaters/gas-tank-high-efficiency.html* (last accessed Apr. 3, 2024).

[33] *Id.*

again concluded that heat exchanger technology and venting do not constitute any of the characteristics upon which DOE has the authority to establish separate product classes under EPCA. 88 FR 49058, 49079.

i. General Comments

Earthjustice supported DOE's tentative determination in the NOPR that separate product classes for condensing and non-condensing products are not warranted, and stated that this is consistent with DOE's determinations in the December 2021 Venting Interpretive Rule. (Earthjustice, No. 1189 at pp. 2–3)

In response to comments that DOE should establish separate product classes for condensing and non-condensing gas-fired water heaters, DOE notes that when evaluating and establishing energy conservation standards, DOE is required to establish product classes based on: (1) the type of energy used; and (2) capacity or other performance-related feature which other products within such type (or class) do not have and that DOE determines justify a different standard. In making a determination of whether a performance-related feature justifies a different standard, DOE must consider factors such as the utility to the consumer of the feature and other factors DOE determines are appropriate. (42 U.S.C. 6295(q))

ii. Performance-Related Feature Under 42 U.S.C. 6295(q)(1)(B)

DOE received several comments on whether non-condensing technology should be considered a performance-related feature for the purpose of establishing a separate product class under 42 U.S.C. 6295(q). For example, Rinnai stated that, pursuant to section 6295(q) of EPCA, DOE is required to issue higher or lower energy conservation standards for non-condensing and condensing gas-fired instantaneous water heaters because the products have distinct capacities and performance-related features that provide consumer utility and justify separate standards. (Rinnai, No. 1186 at p. 15) Rinnai asserted that DOE's finding in the July 2023 NOPR that non-condensing technology does not constitute a performance-related feature as prescribed by EPCA at 42 U.S.C. 6295(q)(1) exceeds DOE's authority because it errs in limiting the analysis to non-condensing technology, ignoring features associated with non-condensing technology such as ease of installation and reduced installation cost, and because it interprets ''utility'' too narrowly by only considering the impact the technology has on consumer's operation of or interaction with the appliance. (Rinnai, No. 1186 at pp. 12–14) Similarly, TPPF commented that DOE should set a separate standard for condensing water heaters because, according to TPPF, a non-condensing water heater serves a separate consumer utility because it is more compact, easier to install, and requires less maintenance. TPPF asserted that the consumer utility of a design is not limited to that which is accessible to the layperson or based upon the consumer's operation of or interaction with the product, even the ease of installation of a non-condensing gas-fired instantaneous water heater should be considered a consumer utility. (TPPF, No. 1153 at pp. 3–4)

ONE Gas asserted that minimizing installed cost is a distinct product utility. (ONE Gas, No. 1200 at p. 5) ONE Gas asserted that the availability of products that can serve as a ''drop-in'' replacement for consumers who already have non-condensing products without modifications to the installation space is a consumer utility. ONE Gas also asserted that the ability of ''drop-in'' replacements to restore water heating ability without delays associated with switching to other products is a consumer utility. (ONE Gas, No. 1200 at p. 5) ONE Gas stated that the December 2021 Venting Interpretive Final Rule did not consider the technical and economic burdens of installation when it concluded that product classes based on combustion system types (*i.e.,* non-condensing and condensing) did not provide distinct customer utility among combustion appliances. (ONE Gas, No. 1200 at p. 6) ONE Gas reiterated its comments that DOE's determination that condensing/non-condensing combustion and power/atmospheric venting do not provide unique customer utility is unreasonable and that DOE is required to separately consider minimum energy standards for ''covered products that [have] two or more subcategories'' under EPCA at 42 U.S.C. 6295(q)(1). (ONE Gas, No. 1200 at p. 8)

With respect to commenters' statements that venting associated with non-condensing technology itself is a performance-related feature that justifies a separate product class, DOE first notes that venting, like a gas burner or heat exchanger, is one of the basic components found in every gas-fired water heater (whether condensing or noncondensing). As such, assuming venting is a performance-related feature, it is a feature that all gas-fired water heaters possess. As a result, it cannot be the basis for a product class. *See* 42 U.S.C. 6295(q)(1)(B). Thus, in order to meet the product class requirements in 42 U.S.C. 6295(q)(1)(B), these commenters are requesting DOE determine that a specific type of venting is a capacity or other performance-related feature.

A specific venting technology—including non-condensing venting—is not a ''capacity or other performance related feature'' under 42 U.S.C. 6295(q)((1)(B). As discussed in the December 2021 final interpretive rule, DOE has concluded that performance-related features are those that a consumer would be aware of and would recognize as providing additional benefits during operation of the covered product or equipment. 86 FR 73947, 73955.

DOE also notes that almost every component of a covered product could be broken down further by any of a number of factors. For example, heat exchangers, which are used in a variety of covered products, could be divided further by geometry or material; refrigerator compressors could be further divided by single-speed or variable-speed; and air-conditioning refrigerants could be further divided by global warming potential. As a general matter, energy conservation standards save energy by removing the least-efficient technologies and designs from the market. For example, DOE set energy conservation standards for furnace fans at a level that effectively eliminated permanent split capacitor (PSC) motors from several product classes, but which could be met by brushless permanent magnet (BPM) motors, which are more efficient. 79 FR 38130 (July 3, 2014). As another example, DOE set energy conservation standards for microwave oven standby mode and off mode at a level that effectively eliminated the use of linear power supplies, but which could be met by switch-mode power supplies, which exhibit significantly lower standby mode and off mode power consumption. 78 FR 36316 (June 17, 2013). The energy-saving purposes of EPCA would be completely frustrated if DOE were required to set standards that maintain less-energy-efficient covered products and equipment in the market based simply on the fact that they use a specific type of less efficient heat exchanger, motor, power supply, *etc.*

In this rule and many others, DOE has considered whether the purported ''feature'' provides additional performance benefits to the consumer during operation. Using the previous example of furnace fan motors, if an interested person had wanted to preserve furnace fans with PSC motors in the market, they would have had to

show that furnace fans with PSC motors offered some additional performance benefit during operation as compared to furnace fans with BPM motors. Refrigerator-freezers, on the other hand, are an example of where DOE determined that a specific type of performance-related feature offered additional performance benefit during operation. Some refrigerator-freezers have automatic icemakers. Additionally, some automatic icemakers offer through-the-door ice service, which provides consumers with an additional benefit during operation. As such, DOE further divided refrigerator-freezers into product classes based on the specific type of automatic icemaker (*i.e.,* whether the automatic icemaker offers through-the-door ice service). *See* 10 CFR 430.32(a).

After reviewing comments from stakeholders provided in this rulemaking, DOE has concluded that commenters have not pointed to any additional performance benefits during operation offered by non-condensing water heaters that use non-condensing venting as compared to water heaters that use other types of venting. Instead, these commenters generally cite compatibility with existing venting (*i.e.,* convenience of installation) and other economic considerations as reasons why non-condensing venting should be considered a performance-related feature for the purposes of EPCA's unavailability provision. To be sure, DOE considers installation costs in determining whether a standard is economically justified. The costs of installing condensing venting may, in certain installations, be substantial, and DOE accounts for such costs in its analysis. See section IV.F.2 of this document. But such installation costs are not a ''capacity or other performance-related feature'' for purposes of section 6295(q).

DOE has determined, based on its own research as well as information presented in stakeholder comments, that differences in cost or complexity of installation between different methods of venting (*e.g.,* a condensing water heater versus a non-condensing water heater) do not make specific methods of venting a performance-related feature under 42 U.S.C. 6295(o)(4), so as to justify separating the products/equipment into different product/equipment classes under 42 U.S.C. 6295(q)(1). 86 FR 73947, 73951 (Dec. 29, 2021).

iii. Whether Stakeholders Have Shown by a Preponderance of Evidence That Standards Would Result in Unavailability

DOE received public comments in reference to the ''unavailability provision'' found in EPCA, 42 U.S.C. 6295(o)(4), contending that if the proposed amended standard for GIWH were adopted, it would eliminate non-condensing GIWH from the market. DOE is not summarizing or responding to these comments in this notice, as DOE continues to consider these comments in informing DOE's decision on amended energy conservation standards for GIWH.

iv. Proper Treatment of Economic Considerations

According to NPGA, APGA, AGA, and Rinnai, the proposed UEF requirements for gas-fired storage water heaters would require new venting requirements and other additional equipment even if the adopted standards did not require condensing gas-fired storage water heaters. Based on these proposed UEF requirements, NPGA, APGA, AGA, and Rinnai asserted that DOE failed to understand the market for water heaters and what differentiates consumer decisions, apparent in its discussion of product classes in the July 2023 NOPR. NPGA, APGA, AGA, and Rinnai further asserted that DOE's failure to separate product classes based on relevant features preferred by consumers shows a fundamental market misunderstanding, questioning DOE's capacity to regulate the market. According to NPGA, APGA, and Rinnai, DOE continues to strain to show that the consumer gains no utility from features associated with condensing and non-condensing products, insisting that the design and operation of the unit ''does not provide any utility to the consumer that is accessible to the layperson, which is based upon the consumer's operation of or interaction with the appliance;'' however, these commenters stated, these design and installation issues are certainly accessible to the consumer when choosing the appliance. (NPGA, APGA, AGA, and Rinnai, No. 441 at pp. 2–3)

NPGA, APGA, AGA, Rinnai, and TPPF commented that DOE does not capture what differentiates consumer decisions to purchase non-condensing over condensing water heaters. DOE recognizes, however, that purchase price, installation cost, and maintenance cost—factors which some commenters suggested could be ''features'' of non-condensing models that lead some consumer to pick these models over condensing models—are relevant to consumer decision-making. Accordingly, DOE has treated those variables as inputs to evaluate the costs and benefits to consumers of standards requiring differing technologies. But as stated previously, those factors, while relevant to consumer decision-making and DOE's standard setting, are not ''features'' for purpose of sections 6295(o)(4) or (q)(1)(B). As stated in the December 2021 Venting Interpretive Final Rule, the ''features'' DOE considers separately pertain to those aspects of the appliance with which the consumer interacts during the operation of the product (*i.e.,* when the product is providing its ''useful output'') and the utility derived from those features during normal operation. 86 FR 73947, 73955. The installation and purchase decision factors mentioned by commenters do not affect the performance of the water heater and how a consumer uses it, but instead impact the cost of owning and operating one.

Because DOE views the issues discussed here to be matters of cost, the Department finds it appropriate under the statute to address these issues through the rulemaking's economic analysis. 86 FR 73947, 73951 (Dec. 29, 2021). This interpretation is consistent with EPCA's requirement for a separate analysis of economic justification for the adoption of any new or amended energy conservation standard (*see* 42 U.S.C. 6295(o)(2)–(3); 42 U.S.C. 6313(a)(6)(A)–(C); 42 U.S.C. 6316(a)). These costs are addressed in the LCC in section IV.F of this document.

v. Comparison to Ventless Clothes Dryers

Rinnai noted that, in the case of ventless clothes dryers, DOE recognized consumer costs associated with venting as a basis for establishing separate product classes. (Rinnai, No. 1186 at p. 11)

In response to Rinnai's discussion of ventless clothes dryers, DOE notes that venting in the case of clothes dryers is different from venting of gas-fired appliances, where combustion gases must be exhausted outside of the home, and these differences are outlined in the December 2021 Venting Interpretative Final Rule.

Venting for clothes dryers refers to the method of removal of evaporated moisture from the cabinet space. Vented clothes dryers exhaust this evaporated moisture from the cabinet outside of the home whereas ventless clothes dryers instead use a closed-loop system with an internal condenser to remove the evaporated moisture from the heated air.

In the TSD accompanying a 2011 direct final rule pertaining to residential clothes dryers, DOE explained that ventless clothes dryers can be installed where vented dryers would be precluded due to restrictions preventing any sort of vent from being installed, and thus the Department noted that how a clothes dryer is vented is not simply an issue of initial costs or a consumer choosing one product over another.[34] As discussed in the December 2021 Venting Interpretive Final Rule, unlike consumers of ventless dryers, consumers facing the prospect of replacing a non-condensing water heater with a condensing water heater do have options available to either modify existing venting or install a new venting system to accommodate a condensing product, or to install a feasible alternative to have heated air or water provided (*i.e.,* an electric appliance); but in all cases, the consumer would not be precluded from having access to heated water, a result which is distinctly different from the one at issue in the ventless clothes dryers example. 86 FR 73947, 73957. Condensing gas-fired water heaters can still be installed in buildings where non-condensing gas-fired water heaters currently are. This is because, unlike the case of clothes dryers, both non-condensing and condensing gas-fired water heaters use a vent—the difference in installation is in the type of venting material and its cost.

vi. Conclusion

For the reasons discussed in this section and in the December 2021 Final Interpretive Rule, DOE continues to find that there is no basis for altering the Department's approach regarding the establishment of product classes for gas-fired water heaters for this rulemaking.

e. Very Large Gas-Fired Storage Water Heaters

A.O. Smith identified that a product class for > 100 gallon gas-fired storage water heaters with a non-condensing efficiency level is likely to incentivize the circumvention of current condensing standards for 55–100 gallon gas-fired storage water heaters and residential-duty commercial gas-fired storage water heaters. (A.O. Smith, No. 1182 at p. 14) NYSERDA commented that a non-condensing-level standard for gas-fired storage water heaters > 100 gallons would result in market confusion and the possibility of circumventing residential-duty commercial water heater standards, because residential-duty commercial gas-fired storage water heaters may typically only be just over the 75,000 Btu/h input rate limit and could easily be converted to consumer water heaters. (NYSERDA, No. 1192 at p. 6)

DOE notes that the non-condensing level for >100 gallon gas-fired storage water heaters is simply a crosswalk of existing standards, and, as discussed in section IV.C.2 of this document, DOE did not evaluate more stringent standards for this product class in this rulemaking.

However, DOE understands the concerns from these stakeholders and may consider evaluating amended standards for these product classes in a future rulemaking.

f. Electric Storage Water Heaters

In response to the March 2022 Preliminary Analysis, DOE received comments requesting that DOE establish separate product classes for heat pump electric storage water heaters and electric resistance storage water heaters, citing concern with expanding heat pump-level standards for electric storage water heaters. DOE responded to these comments in the July 2023 NOPR, tentatively determining that the conclusions reached in the April 2010 Final Rule that separate classes are not justified (*see* 75 FR 20112, 20135) remain valid and that heat pump electric storage water heaters and electric resistance storage water heaters do not warrant separate product classes as they do not exhibit any unique performance-related features. 88 FR 49058, 49079–49080.

In response to the July 2023 NOPR, DOE received additional comments regarding the creation of separate product classes for heat pump electric storage water heaters and electric resistance storage water heaters. EEI asserted that DOE should create separate product classes or require lower efficiency levels for electric resistance storage water heaters rather than maintaining these technologies in the same classes with heat pump water heaters, as this would allow newer technologies at more economic price points a chance to meaningfully compete in the marketplace and would, in turn, support the Administration's climate and clean energy goals. EEI stated that the proposed standards would cause a significant increase in efficiency for existing electric resistance storage water heaters. (EEI, No. 1198 at pp. 2–3) Earthjustice, however, stated that separate product classes for heat pump and electric resistance storage water heaters are not warranted, as the NOPR correctly determines. Earthjustice added, specifically, that separate product classes would not be justifiable under EPCA because heat pump and electric resistance water heaters provide equivalent service to the end-user. (Earthjustice, No. 1189 at pp. 1–2)

DOE agrees with EarthJustice and maintains its longstanding position, outlined most recently in the July 2023 NOPR, that separate product classes for heat pump and electric resistance water heaters are not warranted under EPCA. DOE establishes separate product classes based on two criteria: (1) fuel source; and (2) whether a type of product offers a unique capacity or other performance-related feature that justifies a different standard. (*See* 42 U.S.C. 6295(q)(1))

Heat pump electric storage water heaters and electric resistance water heaters both use electricity as the fuel source. 88 FR 49058, 49079–49080. They both offer similar delivery capacities, and DOE has not identified any unique performance-related features offered by either heat pump electric storage water heaters or electric resistance storage water heaters. *Id.* DOE considers performance-related features to be those aspects of the appliance with which the consumer interacts during operation of the product. The technology used to heat the water, heat pump or electric resistance, is not something a consumer would interact with during operation of the water heater. Therefore, DOE has maintained both heat pump and electric resistance technologies within the electric storage water heater classes in this rulemaking analysis, consistent with its approach in the April 2010 Final Rule.

i. Configurations of Electric Water Heaters

In response to the December 2023 SNOPR, A.O. Smith requested clarification as to what test procedure provisions apply to electric resistance booster water heaters that meet the definition of a ''water heater requiring a storage tank'' but not of a ''circulating water heater''. A.O. Smith added that the June 2023 TP Final Rule preamble seems to indicate that electric resistance booster water heaters are to be tested to section 4.10 of appendix E, but that the heading for section 4.10 indicates the section is intended for circulating water heaters and does not include provisions for electric resistance booster water heaters. A.O. Smith commented that electric resistance booster water heaters and circulating water heaters both should be considered as ''water heater requiring a storage tank'' and

[34] Technical Support Document: Energy Efficiency Program for Consumer Products and Commercial and Industrial Equipment: Residential Clothes Dryers and Room Air Conditioners, pp. 3–6 (Available at: *www.regulations.gov/document?D=EERE-2007-BT-STD-0010-0053*).

recommended that the same test procedure apply to both. A.O. Smith recommended DOE implement this approach by establishing a definition for electric resistance booster water heaters and updating section 4.10 of appendix E to include provisions for testing electric resistance booster water heaters. (A.O. Smith, No. 1411 at p. 6)

In response to A.O. Smith, DOE notes that this section provides a description of electric water heater design examples and how they should be tested and classified for the applicable standards. An electric instantaneous water heater product that is designed to operate in tandem with a storage tank but not circulate the water between itself and the tank is not a circulating water heater because it does not meet the definitional criteria ''must be used in combination with a recirculating pump to circulate water.'' A.O. Smith suggested that this type of add-on product might qualify as a ''water heater requiring a storage tank'' per section 1.19 of appendix E; however, DOE does not find this to necessarily be true. Appendix E defines a ''Water Heater Requiring a Storage Tank'' in part as a water heater without a storage tank that cannot meet the requirements of sections 2 and 5 of this appendix without the use of a storage water heater or unfired hot water storage tank. However, section 5.2.2.1 specifies that, for flow-activated water heaters, if the water heater is not capable of providing the discharge temperature specified in section 2.5 of appendix E when the flow rate is 1.7 gallons ± 0.25 gallons per minute, then adjust the flow rate as necessary to achieve the specified discharge water temperature. Based on these requirements, electric resistance booster water heaters would indeed be able to be tested in accordance with appendix E without the use of a storage water heater or separate storage tank.

A.O. Smith said that it agreed with DOE's clarifications in the December 2023 SNOPR which classify all split-system heat pump water heaters, regardless of whether or not they include a tank, as electric storage water heaters. (A.O. Smith, No. 1411 at p. 3–4)

To offer additional clarity on how different electric water heaters would be regulated as a result of this final rule, Table IV.4 shows the distinguishing characteristics of circulating water heaters, split-system heat pump water heaters, and other water heaters that operate in tandem with a separate tank but are instantaneous-type.

A split-system heat pump water heater is defined in section 1.13 of appendix E and reads, ''Split-system heat pump water heater means a heat pump-type water heater in which at least the compressor, which may be installed outdoors, is separate from the storage tank'' (therefore, a split-system heat pump water heater is supplied with a storage tank). These designs are discussed more in the following subsection of this document. The definition of a circulating water heater is provided in section IV.A.1.a of this document, and the key distinction between a heat pump circulating water heater and a split-system heat pump water heater is that a circulating water heater is not sold with a tank (but must be paired with a tank or other stored volume of water in the field to operate), whereas a split system heat pump water heater is sold with a tank. Although heat pump circulating water heaters and split system heat pump water heaters are functionally very similar when installed in the field, they are differentiated in DOE's regulations due to differences in the test methods, which are outlined in Table IV.4. The definition of a low-temperature water heater is provided in section IV.A.1.b of this document, and these units are instantaneous-type (they do not include circulating water heaters).

BILLING CODE 6450–01–P

Table IV.4 Electric Water Heater Design Examples and Classifications

No.	Design Example	Product Category	Test Method	Determining Applicable Standard
1	A heat pump module that is not sold with a hot water storage tank or auxiliary electric storage water heater, but must be paired with one in the field to operate. The heat pump intakes water and outputs it at an elevated temperature using a recirculation pump. The heat pump only activates when a temperature sensor indicates that a separately stored quantity of water cools below an activation temperature.	*Electric storage water heater.* This design meets the definition of a *circulating water heater*, which is a storage-type water heater. It heats a remotely-stored quantity of water and returns the hot water to that stored water, but is sold without a storage tank.	Test with a separate storage tank per section 4.10 of appendix E. Because this is a heat pump, the tank pairing would be a 30 ± 5 gallon small electric storage water heater. Test conditions for the tank and heat pump are to be in accordance with section 2.2.2 of appendix E.	Per section 6.3.1.1 of appendix E, the effective storage volume is the volume of the tank (30 ± 5 gallons). If the first-hour rating is below 51 gallons, the product is a small electric storage water heater.
2	A heat pump module sold with a storage tank (which may or may not include backup heating elements). The system is designed to circulate water between the heat pump and the tank and could contain the temperature sensors for the heat pump in the stored water in the tank.	*Electric storage water heater.* This design meets the definition of a *split-system heat pump water heater*, which is a storage-type water heater because it contains more than one gallon of water per 4,000 Btu per hour of input.	Test with the tank that is sold with the heat pump. Test conditions for the tank and heat pump are to be in accordance with section 2.2.2 of appendix E.	The effective storage volume is determined based on the provisions of section 6.3.1.1 of appendix E.
3	A heat pump module sold with a storage tank (which may or may not include backup heating elements) having a specific design to accommodate the temperature sensor for the heat pump and the refrigerant lines. The system is designed with refrigerant lines connecting the heat pump to the tank and provide the heat transfer (rather than circulating water between the heat pump and tank as in design example #2 in this table).	*Electric storage water heater.* This design meets the definition of *a split-system heat pump water heater*, which is a storage-type water heater because it contains more than one gallon of water per 4,000 Btu per hour of input.	Test with the tank that is sold with the heat pump. Test conditions for the tank and heat pump are to be in accordance with section 2.2.2 of appendix E.	The effective storage volume is determined based on the provisions of section 6.3.1.1 of appendix E.
4	An electric resistance heating module that is not sold with a hot water storage tank, but must be paired with one in the field to operate. The electric resistance module intakes	*Electric storage water heater.* This design meets the definition of a *circulating water heater*, which is a	Test with a separate storage tank per section 4.10 of appendix E. Because this is an electric resistance heater, the tank pairing	Per section 6.3.1.1 of appendix E, the effective storage volume is the volume of the tank (80-120 gallons).*

	water and outputs it at an elevated temperature using a recirculation pump. The electric resistance element(s) only activate when a temperature sensor indicates that a separately stored quantity of water cools below an activation temperature.	storage-type water heater. It heats a remotely-stored quantity of water and returns the hot water to that stored water, but is sold without a storage tank.	would be an 80-120 gallon unfired hot water storage tank.	
5	An electric resistance heating module that identical to design example # 4 in this table, but is sold with a storage tank.	*Electric storage water heater.* This design contains more than one gallon of water per 4,000 Btu per hour of input.	Test with the tank that is sold with the heater.	The effective storage volume is determined based on the provisions of section 6.3.1.1 of appendix E.
6	An electric resistance heater that operates in tandem with a separate storage tank, but is not sold with a tank. It activates during draws if the temperature of the water delivered by the tank falls below an activation temperature. The heater intakes water from the tank and outputs it at an elevated temperature directly to the distribution system and not back to the tank.	*Electric instantaneous water heater.* This design contains less than one gallon of water per 4,000 Btu per hour of input. While it is typically installed with a separate tank that it is not sold with, it does not circulate hot water with the tank and does not need to a recirculation pump to operate. The design is flow-activated by the draw and not thermostatically activated by the temperature inside the tank to replenish the hot water storage.	Test as a stand-alone water heater (*i.e.*, without a storage tank). If it cannot raise water from the required supply temperature to a nominal delivery temperature of 125 °F (*i.e.*, meets the definition of a *low-temperature water heater*), test per the instructions in section 5.2.2.1 of appendix E.	The draw pattern is determined based on maximum GPM determined by testing the design per section 5.2.2.1 of appendix E.

* Note that, because the standards for 55 to 120 gallon electric storage water heaters correspond to heat pump efficiencies, such a product would not be compliant with current or amended standards.

BILLING CODE 6450–01–C

The same concepts would apply for any other fuel type (*e.g.,* gas or oil).

ii. Plug-In and Split-System Heat Pump Electric Storage Water Heaters

DOE received comments in response to the March 2022 Preliminary Analysis recommending that DOE create a separate product class for split-system and plug-in (120-volt) heat pump water heaters. Commenters cited their utility in installation scenarios unable to be met by other heat pump water heaters. DOE responded to these comments in the July 2023 NOPR stating that, while plug-in heat pump water heaters were not considered in the March 2022 Preliminary Analysis because they were not commercially available in the United States at the time, DOE did not have enough information to determine whether a higher or lower efficiency standard would be justified. DOE also stated that it had not identified any unique performance-related features that would warrant a separate product class for split-system heat pump water heaters or plug-in heat pump water heaters. 88 FR 49058, 49080.

Responding to the July 2023 NOPR, Rheem supported DOE's tentative determination not to assign separate product classes to 120-volt heat pump water heaters, noting that its 120-volt design configurations are able to meet the proposed standards. Rheem also stated that there is no need to amend the test procedure for 120-volt heat pump water heaters at this time. (Rheem, No. 1177 at p. 8) A.O. Smith, however, recommended that DOE separate 120-volt heat pump water heaters into their own product class and align the efficiency levels for this product class to ENERGY STAR® Version 5.0. A.O. Smith added that 120-volt heat pump water heaters are relatively new designs and are limited in capacity due to the absence of backup electric resistance elements (because the product must operate at a lower voltage of 120 volts as opposed to conventional 240-volt products). To ensure consumer satisfaction, A.O. Smith stated, these products will tend to favor maintaining higher FHRs at the detriment of UEF. (A.O. Smith, No. 1182, pp. 15–16)

BWC also supported DOE's tentative determination not to create a separate product class for 120-volt heat pump water heaters. BWC stated it does not believe that otherwise identical electric products differentiated only by their operating voltage meet the criteria for establishing separate product classes; the commenter asserted that the voltage

of the product does not cause the consumer to interact with the product differently; not does it enhance the utility being provided directly to the consumer by the product. (BWC, No. 1164 at p. 14)

Based on its review of the few models of 120-volt heat pump water heaters that have been released at the time of this final rule, DOE agrees with BWC in that it has not identified any unique consumer utility provided by the 120-volt plug-in configuration. As discussed in the assessment of benefits and burdens of each TSL (section V.C.1 of this document), DOE has determined that the amended standards adopted in this final rule will not significantly inhibit the future development of 120-volt heat pump water heaters. Further details of 120-volt heat pump water heaters are provided in DOE's market and technology assessment in chapter 3 of the final rule TSD.

In addition to 120-volt plug-in heat pump water heaters, split-system heat pump water heaters are another possible configuration of electric storage water heater.

A.O. Smith stated that commercially available split-system heat pump water heaters fall under two main categories: refrigerant-split systems (for electric storage water heaters) and water-split or ''monoblock'' systems (for electric circulating water heaters). (A.O. Smith, No. 1182 at p. 16)

As discussed in section IV.A.1.a of this document, DOE has determined that circulating water heaters are a configuration of storage-type water heater. Therefore, refrigerant-split systems and water-split systems must meet the same the standards adopted under this final rule. As was tentatively determined in the July 2023 NOPR, DOE has determined not to create a separate product class for split-system heat pump water heaters. Split-system heat pump water heaters use the same fuel source—electricity—as other electric storage water heaters. DOE also has not identified any unique performance-related features offered by split-system heat pump water heaters that would warrant a separate product class consideration at this time. And, as DOE stated previously, the type of technology used to heat the water, in this case a split-system heat pump, is not something a consumer would interact with during operation of the water heater.

In the December 2023 SNOPR DOE explained that treating circulating water heaters as storage water heaters was parallel to how split-system heat pump water heaters are treated: a heat pump module and a separate storage tank, which, altogether, are treated as a storage-type water heater. 88 FR 89330, 89333. Specifically, DOE wrote that these products ''have long been considered to be electric storage water heaters.'' *Id.*

Pickering noted that while most air-to-water heat pumps are electric, systems using natural gas or propane as the fuel source are emerging. Pickering added that the emergence of such technologies is not in agreement with DOE's statement that heat pump water heaters ''have long been considered to be electric storage water heaters''. (Pickering, No. 1399 at p. 2)

DOE agrees with Pickering that the statement in the December 2023 SNOPR implicitly was only referring to electric heat pumps. Split-system heat pump water heaters that do not rely on electricity as the main fuel source would not be electric storage water heaters. For example, split-system heat pump water heaters that are gas-fired would be considered gas-fired storage water heaters. Gas-fired heat pump water heaters are addressed in section IV.B.1 of this document.

iii. Grid-Enabled Water Heaters

Grid-enabled water heaters are a specific type of electric storage water heater with separate standards established by EPCA. (*See* 42 U.S.C. 6295I(6)(A)(ii), also discussed in section III.B of this document). The statutory definition of a grid-enabled water heater describes its characteristics as a product which must be activated when enrolled with a utility, but it does not specifically define what connected features the product must have once enrolled. In the July 2023 NOPR, DOE did not propose to define the connected features because DOE had not found it necessary at the time to further define connectivity.

SkyCentrics and TVA requested that DOE include a requirement for an open standard communication port such as EcoPort (CTA–2045) or equivalent to be added to the product requirements for all electric storage water heaters with a storage volume larger than or equal to 32 gallons. (TVA, No. 978 at pp. 1–2; SkyCentrics, No. 1191 at p. 1) TVA added that there are many water heater models with the port currently on or soon to be on the market, and stated that DOE can help promote this port as a national standard, helping OEMs benefit from volume production and reducing the cost of production by reducing SKUs with models that can be sold nationally. (TVA, No. 978 at pp. 1–2) AWHI also urged DOE to require CTA–2045 EcoPort in new electric storage water heaters, stating that industry partners would be ready for compliance with CTA 2045–B Level 2 as of July 1, 2025. (AWHI, No. 1036 at pp. 4–6)

DOE is maintaining its determination from the July 2023 NOPR not to adopt any specific requirements to define connectivity in this rulemaking. With respect to grid-enabled water heaters, the scope of this product class is defined by EPCA, which does not posit any specific design requirements for the demand-response communication protocol. While DOE recognizes that industry may benefit from standardization of the communication protocols, demand-response technology is not known to be a design option to improve efficiency of the product over an average use cycle (*see* chapter 3 of the final rule TSD, which discusses DOE's technology assessment); hence, it was not considered in the design pathway for compliance with more stringent standards. While EPCA establishes the authority for DOE to amend energy conservation standards for consumer water heaters, it does not directly grant DOE the authority to establish prescriptive design requirements for consumer water heaters, particularly as it relates to a requirement that would not directly impact the measured energy efficiency as measured by the DOE test procedure. Instead, the ongoing work by the EPA's ENERGY STAR program is expected to promote the standardization of demand-response technology. Specifically, ENERGY STAR's version 5.0 specification contains criteria for meeting the connected product designation, which references the CTA–2045 and OpenADR protocols.

Additionally, in the July 2023 NOPR, DOE did not propose to amend standards for grid-enabled water heaters because there remains uncertainty as to whether these products can achieve higher UEF values with added insulation (reduced standby losses being the main pathway towards higher efficiency because grid-enabled water heaters are statutorily defined as having electric resistance heating). 88 FR 49058, 49086.

NRECA and ECSC supported DOE's proposed retention of existing standards for grid-enabled water heaters, adding that these larger water heaters remain an important load-control tool for their member electric cooperatives. (NRECA, No. 1127 at pp. 2, 10; ECSC, No. 1185 at p. 2) NYSERDA also supported DOE's proposals regarding grid-enabled water heaters and stated that there is additional opportunity to address demand-response functionality in a future rulemaking. (NYSERDA, No. 1192 at p. 4)

CEC, however, urged DOE to reevaluate its conclusion that heat pump technology is not applicable as a technology option for grid-enabled water heaters, adding that although they are statutorily defined as ''electric resistance water heaters'' (*see* 42 U.S.C. 6295(e)(6)(A)(ii)), this definition does not preclude additional technologies, such as heat pumps. Therefore, CEC stated, the vast majority of hybrid grid-enabled water heaters employing both heat pump and electric resistance technologies would meet the statutory definition of grid-enabled water heater. (CEC, No. 1173 at pp. 11–12) The CA IOUs recommended that DOE amend standards for grid-enabled water heaters to be equivalent in stringency to those of other electric storage water heaters in a future rulemaking because these products directly compete with heat pump water heaters between 55 and 120 gallons. The CA IOUs also requested that DOE comply with the terms of the 2015 legislation creating the grid-enabled water heater product type and release the two market data reports described in 42 U.S.C. 6295(e)(6)(D)(i). (CA IOUs, No. 1175 at p. 5)

At this time, DOE is not aware of any commercially available heat pump water heaters that also meet the statutory definition of a grid-enabled water heater. Grid-enabled water heaters constitute an entirely separate product class, defined at 42 U.S.C. 6295(e)(6)(A)(ii) and must have a rated storage volume of more than 75 gallons. Not all demand-response water heaters meet the definition of a grid-enabled water heater. While DOE agrees that it is technologically feasible for grid-enabled water heaters to employ heat pumps to increase efficiency, such a product does not exist on the market. Manufacturers of certain models of heat pump water heaters in the electric storage water heater category, however, have certified these units' demand-response capabilities (which can be incorporated in water heaters outside of the grid-enabled product class) to ENERGY STAR, which indicates that heat pump innovation for grid-connected products can continue to occur in the absence of heat pump-level standards for grid-enabled water heaters; thus, it is unclear whether heat pump-level standards for grid-enabled water heaters would result in significant energy savings considering that shipments of electric storage water heaters dwarf those of grid-enabled water heaters today.[35] In other words, consumers seeking demand-response capabilities with heat pump technology could be more likely to seek an electric storage water heater with a communication module than a grid-enabled water heater. DOE may further evaluate the potential for more stringent standards for grid-enabled water heaters in a future rulemaking addressing energy conservation standards for consumer water heaters.

Rheem noted that EPCA (42 U.S.C. 6295(e)(6)(A)(ii)(I)) specifically defines grid-enabled water heaters on the basis that such a product ''has a rated storage tank volume of more than 75 gallons,'' and that DOE would be misaligning the scope of coverage of the grid-enabled water heater product classes if it were to define these classes as being greater than 75 gallons of effective storage volume. (Rheem, No. 1177 at p. 3)

DOE agrees with Rheem and will maintain the current product class definition for grid-enabled water heaters, which is based on rated storage volume rather than effective storage volume. However, as discussed in section V.D.1.f of this document, DOE is adopting amendments to the appendix E test procedure that will effectively exempt grid-enabled water heaters from the high temperature test method such that there is not likely to be any appreciable difference between the two volume metrics as they pertain to standards for grid-enabled water heaters. Therefore, the standards for grid-enabled water heaters will apply to products with rated storage volume greater than 75 gallons instead of an effective storage volume greater than 75 gallons, and this change from the July 2023 NOPR proposal is not expected to have any impact on the results of DOE's analysis or the scope of applicability of standards.

AHRI indicated that there is an additional backsliding concern for grid-enabled water heaters but did not elaborate on details of the concern. The commenter claimed that grid-enabled water heaters will not work correctly unless they are enrolled in a utility program and noted that DOE is collecting information to determine if these products are used properly in the field. (AHRI, No. 1167 at p. 5)

DOE has not identified any backsliding concerns for grid-enabled water heaters. Furthermore, maintaining the definition of this product class in terms of rated storage volume will mean no change to the standards for grid-enabled water heaters and therefore, no backsliding will occur. Regarding the functionality of grid-enabled water heaters, DOE agrees that grid-enabled water heaters will not function correctly unless enrolled in a utility program. Specifically, per 42 U.S.C. 6295(e)(6)(A)(i), grid-enabled water heaters must possess an activation lock that requires a key to enable the product to operate at its designed specifications and capabilities and without which activation the product will provide not greater than 50 percent of the rated first hour delivery of hot water certified by the manufacturer. This requirement sets these products apart from other large electric storage water heaters with grid connectivity.

iv. Small Electric Storage Water Heaters and Tabletop Water Heaters

Current product classes for electric storage water heaters are based on rated storage volume (capacity) and draw pattern. *See* 10 CFR 430.32(d). There are product classes for electric storage water heaters with storage volumes greater than 20 gallons and less than or equal to 55 gallons, and product classes for electric storage water heaters with storage volumes greater than 55 gallons and less than or equal to 120 gallons. As discussed in section II.B.2 of this document, DOE received a Joint Stakeholder Recommendation for amended water heater standards that included recommended standard levels for electric storage water heaters. In particular, the Joint Stakeholder Recommendation suggested setting different standards for smaller electric storage water heaters. In the July 2023 NOPR, DOE tentatively concluded that separate product classes for smaller electric storage water heaters are warranted. 88 FR 49058, 49080–49081. Specifically, DOE noted that market data for electric storage water heaters suggest there is a certain category of electric storage water heaters that are limited in their physical size due to the places they are typically installed, which are commonly referred to as ''lowboy'' water heaters. The physical size limitation of these water heaters restricts the amount of hot water that can be provided to the household. *Id.*

In reviewing the market for these water heaters, DOE found that most ''small electric storage water heaters'' offer an effective storage volume greater than or equal to 20 gallons and less than or equal to 35 gallons and deliver FHRs less than 51 gallons. Due to their low capacities, ''small electric storage water

[35] DOE included an assessment of grid-enabled water heaters in the March 2022 Preliminary Analysis. In shipments estimates, it was approximated that there were about 15 thousand shipments of grid-enabled water heaters in 2021, compared to 3.8 million shipments of other electric storage water heaters. See the NIA spreadsheet to the March 2022 Preliminary Analysis, docketed as Document No. EERE–2017–BT–STD–0019–0024 and available online at *www.regulations.gov/document/EERE-2017-BT-STD-0019-0024.*

heaters'' fall into the very small or low usage draw patterns. Thus, DOE tentatively concluded that this physical limitation is a performance-related feature affecting energy efficiency that would warrant a separate product class. DOE also explained that the physical size limitation constrains the technology options that can be considered to increase the efficiency of these water heaters. DOE, therefore, analyzed splitting the existing 20–55-gallon product classes for electric storage water heaters by establishing new ''small electric storage water heater'' product classes. *Id.*

In the July 2023 NOPR, DOE identified the following proposed product classes for electric storage water heaters: (1) electric storage water heaters with an effective storage volume greater than or equal to 20 gallons and less than or equal to 35 gallons, with FHRs less than 51 gallons (*i.e.,* very small and low draw patterns) (''small electric storage water heaters''); and (2) electric storage water heaters with an effective storage volume greater than or equal to 20 gallons and less than or equal to 55 gallons (excluding small electric storage water heaters).

Responding to the July 2023 NOPR, NEEA supported DOE's proposed creation of the small electric storage water heater product class, and noted that heat pump water heaters are sometimes too large to physically fit in the spaces currently occupied by these types of water heaters. (NEEA, No. 1199 at p. 8) The CA IOUs also supported DOE's proposal to create a new product class and separate electric resistance-level standards for small electric storage water heaters with effective storage volumes of ≥ 20 and ≤ 35 gallons limited to very small and low draw patterns. The CA IOUs agreed with DOE that there is a specific practicality provided by small electric resistance water heaters (also referred to as ''lowboys''), and that it is impractical to install currently available heat pump water heater in some spaces where lowboy water heaters are commonly installed. (CA IOUs, No. 1175 at p. 3)

Rheem asserted that a large portion of 35–40-gallon heat pump water heater sales would be at risk with the structure of the product classes proposed in the July 2023 NOPR. Rheem stated that either the threshold for small electric storage water heaters should be lowered to 30 gallons or the small electric storage water heater category be additionally restricted to products less than 36 inches in height (*i.e.,* lowboys). (Rheem, No. 1177 at p. 7)

PHCC stated that if DOE wished to limit certain products based on effective storage volume, the height is not a significant factor. The commenter asked DOE about the relevance of establishing the small electric storage water heater class based on a 36-inch height limitation while asserting that removing a height consideration would take pressure off the industry and streamline available models. PHCC also suggested DOE adjust the current heat pump-level standard for >55-gal electric storage water heaters to apply to those >40 gallons as well. (PHCC, No. 1151 at p. 2)

DOE is aware that certain 20–55-gallon heat pump water heaters may be interchangeable for some of the larger electric resistance water heaters in the small electric storage water heater product class and agrees with Rheem that some small electric storage water heaters may be substituted for larger products that would be subject to more stringent standards. As discussed in section IV.G.1 of this document, DOE has accounted for this in its analysis. Although the current limitation could lead to more substitution than if the volume threshold were lowered, DOE believes the small electric storage water heater product class, as proposed in the July 2023 NOPR, strikes the balance between preserving consumer utility at smaller storage volumes and ensuring heat pump water heaters are utilized where practicable to install. As such, DOE is adopting the small electric storage water heater product class, as proposed in the July 2023 NOPR. In response to PHCC, DOE notes that although a height restriction was included in the Joint Stakeholder Recommendation, DOE did not propose a height restriction on the small electric storage water heater product class in the July 2023 NOPR. As shown in Table IV.4 of the July 2023 NOPR, small electric storage water heaters are defined by volume and delivery capacity only. 88 FR 49058,49081. Additionally, DOE notes that PHCC's suggestion for expanding the applicability of heat pump-level standards is essentially what was proposed and is being adopted in this final rule. DOE is using a 35-gallon effective storage volume cutoff combined with a draw pattern requirement for small electric storage water heaters to be in the very small or low draw patterns. In its market assessment, DOE found that many products with nominal volumes of 40 gallons have rated storage volumes from 35 to 36 gallons because manufacturers may nominally report volumes that are within 10 percent of the actual storage volume. With respect to Rheem's suggestion that a height requirement be implemented, DOE notes that although most products on the market that fit into this category are ''lowboy'' products with limited overhead space, there are also products on the market that are physically constrained by their width or diameter. These tall, small-diameter water heaters also have smaller storage capacities and delivery capacities. They also have the same energy consumption characteristics as lowboy water heaters based on certification data. In the April 2010 Final Rule, when DOE had first declined to establish a separate product class for lowboy water heaters, DOE stated that it does not believe each different combination of physical dimensions currently available on the market warrants a separate product class. 75 FR 20112, 20131–20132. Consistent with the approach taken in the previous rulemaking, DOE has determined that separate standards for lowboy water heaters and these other shapes of small electric storage water heaters are not justified and, as a result, the product class definition should not specify a height restriction.

Tabletop water heaters, which typically have rated storage volumes of around 35 gallons, also have very particular dimensions in order to be used in a kitchen workspace. DOE is not amending the standards for tabletop water heaters in this final rule based on the market assessment for these products (*see* section IV.C.2 of this document for details). There are only two basic models of tabletop water heaters on the market currently. Because of the similarities between tabletop water heaters and small electric storage water heaters, DOE proposed, in the July 2023 NOPR, to create alignment between the standards for these types of products. Specifically, DOE proposed to amend the definition of ''tabletop water heater'' to specify that the tabletop designation of electric storage water heaters is only applicable to products in the very small or low draw pattern, and any tabletop water heaters in the medium and high draw patterns would henceforth be considered in the broader electric storage water heater product classes. 88 FR 49058, 49081. In the July 2023 NOPR, DOE requested comment on its proposal to limit the tabletop water heater designation to products in the very small and low draw patterns.

In response, AHRI supported the proposal to limit the tabletop water heater designation to the products in the very small and low draw patterns as it will prevent the use of tabletop water heaters as an avenue to bypass the current limitations on small electric storage water heaters. (AHRI, No. 1167

at p. 10) The Joint Advocacy Groups also supported DOE's proposal to limit the tabletop water heater designation to products in the very small and low draw patterns, as it would align the standards for tabletop water heaters with those for small electric storage water heaters and help ensure tabletop water heaters are not used as a less efficient substitute for conventional electric storage water heaters. (Joint Advocacy Groups, No. 1165 at pp. 6–7) Rheem supported DOE's proposed amendments to the tabletop water heater definition, indicating that this otherwise low-sales-volume product has the potential to be installed in place of heat pump water heaters. (Rheem, No. 1177 at p. 8) A.O. Smith supported the changes proposed to the tabletop water heater standards even though it asserted that this may cause some issues for existing products. (A.O. Smith, No. 1182 at p. 15)

BWC stated that re-defining tabletop water heaters as products that only meet either the very small or low draw pattern would remove half of the products from the market, even though this is a very small number of models. As a result, BWC stated, there would be a drastic reduction in model availability for consumers who rely on tabletop water heaters, many of which may be in densely populated, low-income households that have higher household occupancies and therefore require products with delivery capacities in the medium draw pattern. (BWC, No. 1164 at pp. 15–16)

In response to BWC, DOE notes that, in its market assessment of tabletop water heaters, there are only two basic models found to be certified and commercially available. One is in the low draw pattern, and the other has an FHR of 55 gallons, putting it into the medium draw pattern. Water heaters with FHRs less than 51 gallons can remain categorized as tabletop water heaters. Because the medium draw pattern tabletop water heater on the market today is very close to this FHR cutoff, in the July 2023 NOPR, DOE surmised that, with minimal design changes, a modified version of this model may remain on the market and be certified in the tabletop water heater category (*see* 88 FR 49058, 49081). This would avoid limitations to consumer choice. In written comments in response to the NOPR, the two manufacturers that produce tabletop water heaters both supported the proposed updates to the tabletop water heater definition. Additionally, DOE is not aware of, nor did BWC provide, information to support BWC's assertion that many tabletop water heaters are used in households with higher occupancies that require the medium draw pattern. Therefore, DOE is finalizing the definition for tabletop water heaters as proposed.

Additionally, given these insights regarding the market for tabletop water heaters, DOE is amending the product classes for tabletop water heaters to remove the storage volume-based product class boundary at 120 gallons. Comments indicate that the market for these products is limited and requires the specific use of the rectangular casing configuration with typical dimensions of 36 inches high, 25 inches deep, and 24 inches wide. The maximum possible volume contained in these dimensions is approximately 94 gallons, hence DOE does not expect there to exist a market for tabletop water heaters larger than 120 gallons. The amended product class structure for tabletop water heaters results in two volume-based categories: products less than 20 gallons, and products greater than or equal to 20 gallons.

v. Very Large Electric Storage Water Heaters

Responding to the July 2023 NOPR, Bosch, the Joint Advocacy Groups, the CA IOUs, Rheem, A.O. Smith, and AHRI all expressed concern that defining the >120-gallon electric storage water heater product class in terms of effective storage volume (rather than rated storage volume) could pose backsliding concerns given that it would be possible for electric resistance storage water heaters between 55 and 120 gallons to increase their effective storage volume to over 120 gallons by elevating tank temperatures, such that these products could circumvent the existing heat pump-level standards for electric storage water heaters which apply to rated storage volumes between 55 and 120 gallons. (Bosch, No. 1204 at pp. 2–3; Joint Advocacy Groups, No. 1165 at p. 8; CA IOUs, No. 1175 at pp. 3–4; Rheem, No. 1177 at p. 3; A.O. Smith, No. 1182 at p. 14; AHRI, No. 1167, pp. 5–6) Bosch and the CA IOUs also suggested that defining the greater than 120-gallon electric storage water heater product class in terms of effective storage volume could encourage a market shift towards larger electric resistance storage water heaters in place of smaller, <55-gallon heat pump water heaters. (Bosch, No. 1204 at pp. 2–3; CA IOUs, No. 1175 at pp. 3–4) Rheem noted that a product with a rated storage volume of 75 gallons could achieve an effective storage volume of 120 gallons at a storage tank temperature of 160 °F. (Rheem, No. 1177 at p. 3)

Multiple stakeholders suggested remedies to this potential problem. Bosch recommended that all electric storage water heaters (apart from very small electric storage water heaters) be required to utilize heat pump technology. (Bosch, No. 1204 at pp. 2–3) The CA IOUs suggested that DOE amend the calculations for effective storage volume such that products with rated storage volumes less than or equal to 120 gallons would be capped at an effective storage volume of 120 gallons. (CA IOUs, No. 1175 at pp. 3–4) Rheem suggested that DOE exempt products with rated storage volumes greater than 120 gallons from the high temperature test method because a >120-gallon product can already provide the same or more hot water than a heat pump water heater and thus does not rely on increasing its temperature to have a large effective storage volume. (Rheem, No. 1177 at p. 3) NYSERDA suggested that, rather than creating a separate product class for electric storage water heaters >120 gallons, DOE could instead remove the 120-gallon cap and apply the same standards for electric storage water heaters >55 gallons to those >120 gallons. (NYSERDA, No. 1192 at p. 5)

DOE agrees with stakeholders that defining the >120-gallon electric storage water heater product class in terms of effective storage volume, rather than rated storage volume, would pose a backsliding risk. However, as discussed in V.D.1 of this document, the high-temperature test method does not apply to water heaters that are larger than 55 gallons in rated storage volume. Therefore, the scenarios described above of an electric resistance water heater having a rated volume less than 120 gallons and an effective storage volume greater than 120 gallons is not likely to occur without the use of the high temperature test method. As a result, there would be no risk of backsliding for these standards.

2. Technology Options

DOE conducts a technology assessment to identify a complete list of technologies for consumer water heaters (''technology options'') with the potential to improve the UEF ratings of products. Section IV.B of this document describes the process by which technology options are screened in a separate screening analysis that aims to determine which technology options could feasibly be adopted based on five screening criteria. In the engineering analysis (section IV.C of this document), DOE selects the technology options that are most likely to constitute the design pathway to higher efficiency levels in a standards-case scenario (thereafter referred to as ''design options''). Thus, after DOE identifies a comprehensive

list of technologies for the technology assessment, the subsequent analysis focuses only on those technologies that are the most likely to be implemented in response to amended standards. In the July 2023 NOPR, DOE presented a list of technologies that it identified for initial consideration in the NOPR analysis. 88 FR 49058, 49082–49083.

In the technology assessment for the July 2023 NOPR, DOE examined 120-volt heat pump water heater technology and noted that there were very few models of 120-volt heat pump water heater available on the market at the time. DOE therefore requested comment on the outlook for the emergence of 120-volt heat pump water heaters, information regarding how their design and operation could differ from 240-volt heat pump water heaters, and data on performance characteristics and efficiencies. 88 FR 49058, 49082.

In response, AWHI commented that NEEA's Advanced Water Heating Specification version 8.01 contains a technical specification for a load shifting-capable 120-volt heat pump water heater, and that there are now three manufacturers that offer commercially available 120-volt heat pump water heaters ranging from 50 to 80 gallons. AWHI cited a preliminary market assessment conducted by New Buildings Institute stating that 22 to 30 percent of existing California homes could transition from fossil fuel-based water heaters to 120-volt heat pump water heaters without substantial site upgrades, and that the installation cost of 120-volt heat pump water heaters is significantly less that for 240-volt units due to minimal electrical interventions. AWHI stated that 120-volt heat pump water heaters do not need a dedicated circuit to be installed and can instead share a circuit with other appliances, reducing the impact of installation on the existing electrical infrastructure of the home. AWHI also stated that 120-volt heat pump water heaters do not have electric resistance elements, which results in slower recovery than 240-volt heat pump water heaters and are therefore more sensitive to environmental factors that impact compressor performance, such as input water temperature and ambient air temperature. AWHI stated that 120-volt heat pump water heaters incorporate integrated mixing valves and store water at temperatures above the delivery temperature to increase hot water capacity, which allows for easier participation in load shifting and demand-response programs. Lastly, AWHI stated that a 120-volt heat pump water heater performed at an overall average UEF of 2.90 and varied by season and use characteristics in a field study conducted in California by New Buildings Institute. (AWHI, No. 1036 at pp. 1–3)

BWC supported DOE's tentative determination not to include 120-volt heat pump water heaters in its analysis because these products are relatively new and do not have significant market share at the present time. BWC stated a belief that it is appropriate for DOE, and the industry, to take more time to better understand these products before establishing regulations. (BWC, No. 1164 at p. 14)

DOE appreciates the insight into 120-volt heat pump water heaters and continues to evaluate this technology. While DOE considers 120-volt heat pump water heaters to be a technology for improving the efficiency of electric water heaters, due to the nascent status of 120-volt heat pump water heaters, DOE did not consider 120-volt designs to constitute the main pathway towards higher efficiency for electric storage water heaters. However, as discussed in section V.C.1 of this document, the Department assessed TSLs with consideration of these designs. Specifically, when evaluating TSLs, DOE considered whether the potential standards levels would likely prevent new 120-volt designs from emerging onto the market.

Responding to the July 2023 NOPR, NEEA supported DOE's inclusion of the gas pressure-actuated non-powered damper as a technology option, stating that it is likely the lowest cost pathway to achieving EL 2. (NEEA, No. 1199 at p. 9) DOE has maintained non-powered dampers as a technology option for the final rule.

Additionally, while DOE identified modulating burners as a technology option for all gas-fired water heaters in the July 2023 NOPR technology analysis, DOE tentatively determined that modulating burners were used to increase UEF only in instantaneous gas-fired water heaters. 88 FR 49058, 49082. DOE did not receive any comments on that tentative determination. As discussed in section II.B.3 of this document, gas-fired instantaneous water heaters are no longer within the scope of this rulemaking. However, modulating burners could still be used in circulating gas-fired water heaters, which are a type of gas-fired storage water heater. Hence, in light of the classification of circulating water heaters as storage-type water heaters (*see* section IV.A.1.a of this document), DOE is retaining modulating burners in its list of technology options investigated for this final rule; however, as shown in chapter 5 of the TSD, modulating burners are not expected to be part of the representative, cost-effective design pathway to increasing efficiency for gas-fired storage water heaters. The technology options for Improving UEF in consumer water heaters are listed in Table IV.5 and described in chapter 3 of the final rule TSD.

BILLING CODE 6450–01–P

Table IV.5 Potential Technologies for Increasing Consumer Water Heater Efficiency

Technology Option		
Heat traps		
Improved insulation	Increased thickness	
	Insulation on tank bottom	
	Less conductive tank materials (*e.g.*, plastic)	
	Foam insulation	
	Pipe and fitting insulation	
	Advanced insulation types	Aerogel
		Vacuum panels
		Inert gas-filled panels
Electronic ignition systems	Direct spark ignition	
	Intermittent pilot ignition	
	Hot surface ignition	
Improved burners	Pulse combustion	
	Pressurized combustion	
	Side-arm heating	
	Two-phase thermosiphon technology	
	Modulating burners	Step Modulating Burners
		Fully Modulating Burners
	Reduced burner size (slow recovery)	
Heat exchanger improvements	Increased heat exchanger surface area	
	Enhanced flue baffle	
	Submerged combustion chamber	
	Multiple flues	
	Alternative flue geometry (Helical)	
	U-Tube	
	Condensing technology	
	Induced-draft (negative vent pressure) heat exchanger	
	Direct-fired heat exchange	
Improved venting	Flue damper	Externally-powered
		Thermopile-operated (non-powered)
		Gas-actuated (non-powered)
		Buoyancy-operated (non-powered)
	Concentric direct venting	
	Power vent	
Improved heat pump water heater	Compressor improvements	Increased capacity

Technology Option		
components		Increased efficiency
		Variable-speed drive
	Fan improvements	High-efficiency fan motors
		High-efficiency fan blades
	Expansion device improvements	
	Increased evaporator surface area	
	Increased condenser surface area	
Gas-fired absorption heat pump water heaters		
Gas-fired adsorption heat pump water heaters		
Carbon dioxide heat pump water heaters		
Thermophotovoltaic and thermoelectric generators		
Improved controls	Modulating controls

B. Screening Analysis

DOE uses the following five screening criteria to determine which technology options are suitable for further consideration in an energy conservation standards rulemaking:

(1) *Technological feasibility.* Technologies that are not incorporated in commercial products or in commercially viable, existing prototypes will not be considered further.

(2) *Practicability to manufacture, install, and service.* If it is determined that mass production of a technology in commercial products and reliable installation and servicing of the technology could not be achieved on the scale necessary to serve the relevant market at the time of the projected compliance date of the standard, then that technology will not be considered further.

(3) *Impacts on product utility.* If a technology is determined to have a significant adverse impact on the utility of the product to subgroups of consumers, or result in the unavailability of any covered product type with performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as products generally available in the United States at the time, it will not be considered further.

(4) *Safety of technologies.* If it is determined that a technology would have significant adverse impacts on health or safety, it will not be considered further.

(5)*Unique-pathway proprietary technologies.* If a technology has proprietary protection and represents a unique pathway to achieving a given efficiency level, it will not be considered further, due to the potential for monopolistic concerns.

10 CFR part 430, subpart C, appendix A, sections 6(b)(3) and 7(b).

In sum, if DOE determines that a technology, or a combination of technologies, fails to meet one or more of the listed five criteria, it will be excluded from further consideration in the engineering analysis. The reasons for eliminating any technology are discussed in the following sections.

The subsequent sections include comments from interested parties pertinent to the screening criteria, DOE's evaluation of each technology option against the screening analysis criteria, and whether DOE determined that a technology option should be excluded (''screened out'') based on the screening criteria.

1. Screened-Out Technologies

The following subsections describe the technologies that DOE eliminated for failure to meet one of the following five factors: (1) technological feasibility; (2) practicability to manufacture, install, and service; (3) impacts on equipment utility or equipment availability; (4) adverse impacts on health or safety; and (5) unique-pathway proprietary technologies.

In the July 2023 NOPR, DOE screened out the following technology options based on the above criteria: absorption and adsorption heat pump water heaters, advanced insulation types, condensing pulse combustion, direct-fired heat exchange, dual-fuel heat pumps, buoyancy-operated flue dampers, thermopile-operated flue dampers, reduced burner size (slow recovery), side-arm heating, two-phase thermosiphon technology, and U-tube flues. 88 FR 49058, 49083. Each of these technology options and the reasons for which they were screened out are discussed in detail in chapter 4 of the final rule TSD.

BWC stated that it is aware of exclusive intellectual property protections that it asserted may inhibit manufacturers from utilizing certain technologies that are assumed by DOE to be available in the market to increase energy efficiency on certain consumer water heater products, and that BWC would be able to provide information in a confidential interview with DOE's consultants. (BWC, No. 1164 at p. 16)

In selecting design options to improve efficiency in the engineering analysis, DOE performed teardowns of models manufactured by multiple companies to ensure that each efficiency level is achievable using non-proprietary designs.

BWC supported DOE's tentative determination not to consider thermopile-powered flue dampers for gas-fired storage water heaters. (BWC, No. 1164 at p. 16)

BWC stated that direct-vent and power-direct-vent gas-fired water heaters are not necessarily unsafe, but that their construction imposes limits on how these products can vent and operate; a major consideration for these products would be restrictions on the maximum allowable vent length that safety standards would permit. BWC requested that DOE consider these venting factors for gas-fired water heaters to avoid unintentionally encouraging installations that conflict with the requirements of safety standards such as ANSI Z21.10.1 and ANSI Z21.10.3. (BWC, No. 1164 at p. 16)

DOE agrees with BWC that direct-vent and power-direct-vent gas-fired water

heaters are safe to use when installed and operated in accordance with manufacturer recommendations and/or applicable safety standards. Therefore, DOE has not screened these technologies out of its analysis. In evaluating these technologies, DOE accounts for the necessary differences in venting systems installations (*see* section IV.F.2.b of this document).

2. Remaining Technologies

Through a review of each technology, DOE concludes that all of the other identified technologies listed in section IV.A.2 of this document meet all five screening criteria to be examined further as design options in DOE's final rule analysis. In summary, DOE did not screen out the following technology options listed in Table IV.6. These technology options are shown from left to right from broader categories to specific design options.

BILLING CODE 6450–01–P

Table IV.6 Remaining Technology Options

Technology Option			
Improved insulation		Increased thickness	
		Insulation on tank bottom	
		Less conductive tank materials (*e.g.*, plastic)	
		Foam insulation	
		Pipe and fitting insulation	
Electronic ignition systems		Direct spark ignition	
		Intermittent pilot ignition	
		Hot surface ignition	
Burner improvements		Pressurized combustion	
		Modulating burners	Step modulating burners
			Fully modulating burners
Gas-fired and Oil-fired Heat exchanger improvements		Increased heat exchanger surface area	
		Enhanced flue baffle	
		Submerged combustion chamber	
		Multiple flues	
		Alternative flue geometry (Helical)	
		Condensing technology	
		Induced-draft (negative vent pressure) heat exchanger	
Improved venting		Flue damper	Externally-powered
			Gas-actuated (non-powered)
		Power vent	
		Concentric direct venting	
Improved heat pump water heater components	Compressor improvements	Increased capacity	
		Increased efficiency	
		Variable-speed drive	
	Fan Improvements	High-efficiency fan motors	
		High-efficiency fan blades	
	Expansion device improvements		
	Increased evaporator surface area		
	Increased condenser surface area		
	Carbon dioxide (alternative refrigerant) heat pump water heaters		
Improved controls		Modulating controls	
Heat traps (all types)			

BILLING CODE 6450–01–C

DOE determined that these technology options are technologically feasible because they are being used or have previously been used in commercially available products or working prototypes. DOE also finds that all of the remaining technology options meet the other screening criteria (*i.e.,* practicable to manufacture, install, and service and do not result in adverse impacts on consumer utility, product availability, health, or safety). For additional details, *see* chapter 4 of the final rule TSD.

C. Engineering Analysis

The purpose of the engineering analysis is to establish the relationship between the efficiency and cost of consumer water heaters. There are two elements to consider in the engineering analysis; the selection of efficiency

levels to analyze (*i.e.,* the ''efficiency analysis'') and the determination of product cost at each efficiency level (*i.e.,* the ''cost analysis''). In determining the performance of higher-efficiency products, DOE considers technologies and design option combinations not eliminated by the screening analysis. For each product class, DOE estimates the baseline cost, as well as the incremental cost for the product at efficiency levels above the baseline. The output of the engineering analysis is a set of cost-efficiency ''curves'' that are used in downstream analyses (*i.e.,* the LCC and PBP analyses, the MIA, and the NIA).

As discussed in section IV.A.1 of this document, certain classes of consumer water heaters currently have UEF-based standards, while for others EPCA's EF-based standards apply. For this rulemaking, DOE analyzed amended UEF standards for the product classes that currently have standards in terms of UEF. For the product classes with EF-based standards, DOE developed translated standards in terms of UEF for use in the analysis.

In this final rule, DOE has analyzed standards with respect to the effective storage volume metric (as proposed in the July 2023 NOPR). Compared to rated storage volume and FHR, effective storage volume is a superior descriptor of the thermal energy stored in the hot water of the water heater which can be made immediately available for consumer use. As outlined in the July 2023 NOPR, there are two types of water heaters that can cause the system to store more energy than would be otherwise determined by the rated storage volume: (1) water heaters capable of operating with an elevated tank temperature, and (2) circulating water heaters. 88 FR 49058, 49086. In the June 2023 TP Final Rule, DOE established that compliance with the effective storage volume provisions (and, relatedly, the high temperature testing method and testing with separate storage tanks for circulating water heaters) would not be required until compliance with amended standards is required. For circulating water heaters, the effective storage volume of the water heater is determined by the measured storage volume of the separate storage tank used in testing because these types of water heaters are designed to operate with a volume of stored water in the field. 88 FR 40406, 40461–40462. Certain provisions for circulating water heater testing are discussed further in detail in section V.D.2 of this document. Section V.D.1 of this document discusses the proposed approach to consider efficiency determinations for water heaters tested using the high temperature testing method.

In the July 2023 NOPR, DOE tentatively determined not to propose amended standards for gas-fired storage water heaters (55 gal < V_{eff} ≤ 100 gal), tabletop water heaters (20 gal ≤ V_{eff} ≤ 120 gal), electric instantaneous water heaters (V_{eff} < 2 gal), and grid-enabled water heaters at that time based on the results of the market and technology assessment, screening analysis, interviews with manufacturers, and comments from interested parties. These assessments were discussed further in chapters 3 and 5 of the NOPR TSD. 88 FR 49058, 49086.

In this final rule, DOE has maintained the analytical approaches proposed in the July 2023 NOPR. For circulating water heaters, as discussed in section IV.A.1.a of this document, based on information from the December 2023 SNOPR, DOE has determined that these products offer the same consumer utility as storage-type water heaters, so the storage-type water heater standards would apply. In summary, Table IV.7 presents the consumer water heater product classes along with the approach to analyzing them for this final rule.

BILLING CODE 6450–01–P

Table IV.7 Analysis Approach by Product Class

Product Category Analyzed in this Final Rule	Distinguishing Characteristics (Effective Storage Volume and Input Rating)	Analysis
Gas-fired Storage Water Heater	< 20 gal	Converting EF-based standards to UEF-based standards
	≥ 20 gal and ≤ 55 gal	Amending UEF-based standards
	> 55 gal and ≤ 100 gal	No amendments
	> 100 gal	Converting EF-based standards to UEF-based standards
Oil-fired Storage Water Heater	≤ 50 gal	Amending UEF-based standards
	> 50 gal	Converting EF-based standards to UEF-based standards
Electric Storage Water Heater	< 20 gal	Converting EF-based standards to UEF-based standards
	≥ 20 gal and ≤ 35 gal, FHR < 51 gal (Small electric storage water heaters)	Amending UEF-based standards
	≥ 20 gal and ≤ 55 gal, excluding small electric storage water heaters	Amending UEF-based standards
	> 55 gal and ≤ 120 gal	Amending UEF-based standards
	> 120 gal	Converting EF-based standards to UEF-based standards
Tabletop Water Heater	< 20 gal	Converting EF-based standards to UEF-based standards
	≥ 20 gal and ≤ 120 gal	Remove boundary at 120 gal due to these sizes not being feasible within the description of a tabletop water heater
Electric Instantaneous Water Heater (including Low-Temperature Water Heaters)	< 2 gal	No amendments
	≥ 2 gal	Converting EF-based standards to UEF-based standards
Grid-enabled Water Heater	> 75 gal	No amendments
Circulating Water Heater	All Sizes	Included as storage-type water heaters

BILLING CODE 6450–01–C

Several commenters provided feedback about transitioning the energy conservation standards from a rated storage volume basis to an effective storage volume basis.

AHRI provided comments emphasizing the possibility of market confusion resulting from amended standards being prescribed in terms of effective storage volume instead of rated storage volume, noting that the previous conversion from the EF to the UEF metric itself was not without issue, leading to market disruption given that utility programs across the United States and in Canada have still not fully adopted the UEF metric. AHRI stated that the effective storage volume metric needs to be further scrutinized to evaluate the representativeness and repeatability of the metric, and that manufacturers require additional time to analyze the effective storage volume calculation to determine its accuracy, representativeness, and repeatability, as well as to conduct laboratory testing to this end. AHRI asserted that the 60-day comment period for the July 2023 NOPR was insufficient to conduct this review.

AHRI recommended using only effective storage volume in the energy conservation standards equations for products for which the metric applies to limit confusion. (AHRI, No. 1167 at p. 5) AHRI requested clarification on whether the effective storage volume metric would apply to grid-enabled water heaters, tabletop water heaters, and electric instantaneous water heaters larger than 2 gallons in rated storage volume, recommending that the effective storage volume metric not apply to grid-enabled water heaters. AHRI proposed two possible options to mitigate potential market confusion from the new effective storage volume metric: use rated storage volume for all product categories not subject to high temperature testing; or (the option AHRI stated was less preferable), include a footnote with the standards to indicate those product categories for which effective storage volume is identical to rated storage volume. (AHRI, No. 1167 at p. 6)

BWC commented that the replacement of the rated storage volume metric with effective storage volume deviates from the Joint Stakeholder Recommendation and could create situations where products may not be capable of supplying adequate hot water to the home. (BWC, No. 1164 at p. 1) BWC requested DOE not change the standards for all product classes to be in terms of effective storage volume, but instead to use the new metric only for product classes for which the rated storage volume and effective storage volume are expected to be different in order to avoid confusion. (BWC, No. 1164 at p. 9)

CEC identified a drafting error in the proposed regulatory language in the heading at 10 CFR 430.32(d)(1) and (2), where ''rated storage volume'' is used rather than ''effective storage volume.'' (CEC, No. 1173 at pp. 12–13) This was a publication error printed at 88 FR 49058, 49176. Stakeholders were notified of this typographical error in the September 13 Public Meeting. (Public Meeting Transcript, No. 1190 at p. 101).

In response, DOE maintains that effective storage volume is appropriate for use for all classes. In light of the reclassification of circulating water heaters as storage-type water heaters, defining all classes in terms of effective storage volume (rather than just electric storage classes, as was suggested by stakeholders) and delineating the standards as a function of effective storage volume is necessary to ensure the appropriate classification of these products. More specifically, because circulating water heaters will be considered part of the storage-type product classes, the same standards will apply to circulating water heaters. Where the standards for storage-type product classes are linear functions of volume, the purpose of this is to account for the additional standby loss that comes with more hot water being contained in the system. The effective storage volume of a circulating water heater is what captures the amount of hot water contained in this type of system, and therefore is most appropriate to base the standards equations on. Stakeholders correctly noted that the use of the high temperature test method (described in section V.D.1 of this document), which will apply to certain types of electric storage water heaters, is one way by which a model can have an effective storage volume different from its rated storage volume. Further, per section 6.3.1.1 of appendix E test procedure, the effective storage volume can be higher than the rated storage volume for any storage-type water heater if the mean tank temperature is more than 5 °F higher than the delivery temperature (*see* section V.D.1 of this document for details). Therefore, DOE adopts use of effective storage volume rather than storage volume in this final rule.

1. Product Classes With Current UEF-Based Standards

DOE typically uses one of two approaches to develop energy efficiency levels for the engineering analysis: (1) relying on observed efficiency levels in the market (*i.e.,* the efficiency-level approach), or (2) determining the incremental efficiency improvements associated with incorporating specific design options to a baseline model (*i.e.,* the design-option approach). Using the efficiency-level approach, the efficiency levels established for the analysis are determined based on the market distribution of existing products (in other words, based on the range of efficiencies and efficiency-level ''clusters'' that already exist on the market). Using the design option approach, the efficiency levels established for the analysis are determined through detailed engineering calculations and/or computer simulations of the efficiency improvements from implementing specific design options that have been identified in the technology assessment. DOE may also rely on a combination of these two approaches. For example, the efficiency-level approach (based on actual products on the market) may be extended using the design-option approach to ''gap fill'' levels (to bridge large gaps between other identified efficiency levels) and/or to extrapolate to the max-tech level (particularly in cases where the max-tech level exceeds the maximum efficiency level currently available on the market).

In the July 2023 NOPR, DOE developed efficiency levels with a combination of the efficiency-level and design-option approaches. DOE conducted a market analysis of currently available models listed in DOE's CCD to determine which efficiency levels were most representative of the current distribution of consumer water heaters available on the market. DOE also completed physical teardowns of commercially available units to determine which design options manufacturers may use to achieve certain efficiency levels for each water heater category analyzed. DOE requested comments from stakeholders and conducted interviews with manufacturers concerning these initial efficiency levels, which have been updated based on the feedback DOE received.

a. Efficiency Levels

In this final rule, as noted previously, DOE has analyzed efficiency levels for UEF that are a function of effective storage volume (with the exception of certain levels which were analyzed when DOE incorporated feedback from the Joint Stakeholder Recommendation). For products with substantial storage volumes, the UEF is expected to decrease with higher volumes because standby losses (*i.e.,* energy lost from the stored water to the surroundings when the water heater is not actively heating water) are related to the temperature of the water stored and the size of the tank.[36] The efficiency levels analyzed in this rulemaking assume that the relationships between standby losses and storage volume for baseline products (*i.e.,* the slopes of the current standards equations) would remain consistent for higher efficiency levels. In other words, the higher efficiency levels are linear equations that are parallel to the current standards. The exception to this is for DOE's analysis of the Joint Stakeholder Recommendation, which included certain efficiency levels that were not specified as a function of storage volume.

In this final rule, DOE has analyzed the same efficiency levels as were considered in the July 2023 NOPR. The details of the efficiency level analysis

[36] As discussed in section III.C of this document, the effective storage volume metric accounts for both temperature and tank size, whereas rated storage volume alone only accounts for tank size.

are presented in chapter 5 of the final rule TSD, and a summary of the efficiency levels is presented in the following sections.

i. Baseline Efficiency

For each product class, DOE generally selects a baseline model as a reference point for each class and measures changes resulting from potential energy conservation standards against the baseline. The baseline model in each product class represents the characteristics of a product/equipment typical of that class (*e.g.,* capacity, physical size). Generally, a baseline model is one that just meets current energy conservation standards, or, if no standards are in place, the baseline is typically the most common or least efficient unit on the market. For this final rule, the baseline efficiency levels for product classes with current UEF-based standards are equal to the current energy conservation standards (*see* Table II.1).

ii. Higher Efficiency Levels

As part of DOE's analysis, the maximum available efficiency level is the highest efficiency unit currently available on the market. DOE also defines a ''max-tech'' efficiency level to represent the maximum possible efficiency for a given product.

In July 2023 NOPR, the max-tech efficiency levels generally corresponded to the maximum available efficiency level on the market. DOE also analyzed multiple intermediate efficiency levels between the baseline and max-tech in order to develop the cost-efficiency relationship for each product class. Intermediate efficiency levels were chosen based on the market assessment where there were clear groupings in the market's efficiency distribution. In some cases, efficiency levels were observed for one draw pattern but not the others.

DOE has constructed cost versus efficiency curves for the representative capacities and representative draw patterns which exist on the market today, as opposed to directly analyzing every possible draw pattern. However, DOE is increasing the stringency of standards for draw patterns where products do not currently exist in order to match the stringency of standards for draw patterns where products in the same category do exist, in the event that products become available with draw patterns not currently on the market.

For these cases, DOE estimated these max-tech levels using existing relationships between efficiency levels observed in other draw patterns where products do exist. Products in different draw patterns are typically differentiated by rated storage volume and heating capacity (burner input rate, compressor capacity, or element wattage), and the design options used to improve UEF in one draw pattern can generally also be applied to water heaters of the same type in a different draw pattern. For the cases where products at additional intermediate efficiency levels were observed in the market at one draw pattern but not the others, DOE estimated efficiency levels in the other draw patterns based on what was observed for the one available draw pattern. The approach took into account how each product type's efficiency correlates to its delivery capacity (*i.e.,* either FHR or maximum GPM, the delivery capacity metrics assigned for non-flow-activated water heaters and flow-activated water heaters, respectively), recovery efficiency, and technological feasibility of design-option implementation. A detailed discussion of efficiency level selection on a product-class by product-class basis is provided in chapter 5 of the final rule TSD.

In the NOPR engineering analysis, DOE considered split-system heat pump water heaters as a representative design strategy for small electric storage water heaters because small electric storage water heaters are typically configured for applications with limited vertical clearance. Whereas integrated heat pump water heaters are typically designed with the heat pump components affixed to the top of the storage tank (significantly increasing the height of the water heater), split-system heat pump water heaters have the advantage of being able to install the heat pump in a remote location so that the storage tank height does not change. However, there are currently no models of split-system heat pumps for small electric storage water heaters on the market today, so DOE estimated the performance of a hypothetical design based on circulating heat pump water heaters and lowboy water heaters that were available at the time of the July 2023 NOPR. *See* chapter 5 of the NOPR TSD for further details. To ensure that the analysis is representative, in the July 2023 NOPR, DOE requested information about the potential design specifications, manufacturing processes, and efficiencies of split-system heat pump water heaters. 88 FR 49058, 49091.

In response to DOE's request for information regarding split-system heat pump water heaters, Rheem noted that it had identified a dual-fuel combination heat pump water heater and boiler product manufactured by its sister company in the Netherlands. (Rheem, No. 1177 at p. 8)

DOE reviewed product literature for the dual-fuel split-system heat pump water heater mentioned by Rheem, marketed in the Netherlands as the Intergas Xtend model. While dual-fuel heating is being screened out from this rulemaking analysis (*see* section IV.B.1 of this document), details about this design provide valuable information about the performance potentials for split-system heat pump water heaters (operating in heat pump-only mode). The Xtend split-system heat pump water heater has a reported coefficient of performance (''COP'') of 4.68, uses R–32 refrigerant, has a total heating capacity of 5 kW (over 17,000 Btu/h), and is designed for combination space and domestic hot water heating.[37] Based on the COP rating, DOE understands that this product identified by Rheem would likely have a UEF rating higher than the max-tech efficiency analyzed for small electric storage water heaters. However, after reviewing this design, DOE determined two main factors which lead to uncertainty as to whether this design is viable for small electric storage water heaters. First, the use of R–32 refrigerant (which has not been demonstrated in water heaters in the United States market) and the resulting total capacity of over 17,000 Btu/h is more akin to the designs of single-split space-constrained air-source heat pump air conditioners, which range between 15,200 and 23,800 Btu/h in DOE's CCD. In contrast, teardown analyses of heat pump water heaters show that these systems typically have much smaller compressors than do central (*i.e.,* whole-home) air conditioners, and therefore the Xtend water heater model as well. In addition, due to the higher capacity of the Xtend model, this product is more likely to function in the medium or high draw patterns, meaning that it does not serve the same consumer utility as a small electric storage water heater. This is because a much larger compressor would have very low run time (causing technical difficulties for refrigerant circulation), be noisier, and significantly increase the footprint of the heat pump module. As a result, it remains unclear whether split-system heat pump small electric storage water heaters are able to employ the same design options to achieve the higher efficiency of the Xtend model. DOE will continue to evaluate technologies for split-system heat pump water heaters in future

[37] Product information can be found online at: *www.intergas-verwarming.nl/consument/producten/xtend/* (Last accessed: Nov. 17, 2023).

rulemakings addressing consumer water heater standards.

In the July 2023 NOPR, DOE presented its efficiency levels for analysis and specifically requested further information on the technologies employed in 45-gallon medium draw pattern electric storage products at a UEF of 3.50 (which would potentially help with re-evaluating EL 2). 88 FR 49058, 49090. DOE did not, however, receive any comments on this particular topic.

Commenting more specifically on the electric storage water heater efficiency levels analyzed in the July 2023 NOPR, BWC noted that the Joint Stakeholder Recommendation originally suggested a minimum UEF of 2.0 for some of the smallest volumes of electric storage water heaters, and the NOPR proposes a level of 2.3 UEF. BWC asserted that a minimum UEF of 2.0 would be necessary in some products to allow manufacturers more flexibility to innovate new designs and reduce the cost of heat pump water heaters, which it stated will be critical for consumers to purchase these products because key rebates and tax incentives will expire in the early 2030s. However, BWC stated that it still supported electric resistance-level standards for small and very small electric storage water heaters, and that, generally, redesigns for these products would not be necessary to meet the proposed minimum efficiency standards. (BWC, No. 1164 at pp. 1–2)

In response to BWC, DOE notes that products exceeding 2.3 UEF are widely available across a range of capacities, indicating that this level is readily achievable, and thus analyzing an additional efficiency level at a UEF of 2.0 would be unlikely to provide additional benefit. As discussed in chapter 5 of the final rule TSD, a UEF of 2.0 is expected to correspond to split-system heat pump water heaters in the small electric storage water heater product category, which, as a result of the heat pump design, have certain limitations to achieving higher efficiencies. Electric storage water heaters that are not ''small electric storage water heaters'' do not have the same design limitations and can achieve higher efficiencies with integrated heat pump water heater designs (where the heat pump is adjoined at the top of the tank). Additionally, split-system designs are typically more expensive to manufacture compared to integrated designs, meaning that the most cost-effective pathway to achieving higher efficiencies would most likely be through integrated designs. (*See* section IV.C.1.e of this document and chapter 5 of the final rule TSD for estimated manufacturer production costs of both styles of heat pump designs.) In the selection of efficiency levels for these larger water heaters, DOE considered the certified UEF ratings of integrated heat pump water heaters on the market, the ENERGY STAR v5.0 specification, the Joint Stakeholder Recommendation, and its own test data. Based on these sources, a UEF of 2.3 was determined to be most representative of a low-cost heat pump water heater design for non-small electric storage water heaters.

Earlier in this rulemaking DOE received comments from some stakeholders who suggested that DOE consider establishing a ''heat pump-only'' level, which would exclude the use of electric resistance elements, as max tech for heat pump water heaters. In the July 2023 NOPR, DOE noted that its own test data indicate that heat pump water heaters with backup electric resistance elements typically do not use the elements during DOE's 24-hour simulated use test. Therefore, adding an efficiency level that corresponds to a ''heat-pump only'' design option as max tech would not be expected to change the UEF. 88 FR 49058, 49090.

BWC agreed with not including an efficiency level for electric storage water heaters that specifically pertained to a heat pump design that did not have backup electric resistance elements on the basis that not only would a higher efficiency standard pose significant challenges for the industry transition to heat pump water heaters, but also that the efficiency benefits of not having a backup electric resistance element would not be demonstrated by the current appendix E test procedure and UEF metric. (BWC, No. 1164 at pp. 16–17)

Essency stated it has achieved an FHR of 80 gallons and a UEF of 0.93 with electric resistance technology and suggested that max tech for electric resistance water heaters has not yet been reached. (Essency, No. 1194 at p. 1) GreenTECH stated that it is currently developing a fully electric consumer heat pump water heater with projected energy savings of 50 percent compared to current models and that utilizes peak amperage of less than 10 amps at 220 volts for a 50-gallon comparable model. (GreenTECH, No. 71 at p.1)

In response to Essency, DOE previously considered an efficiency level that corresponded to increased insulation for electric resistance storage water heaters (see the March 2022 Preliminary Analysis). However, DOE received many comments from manufacturers indicating that it may not be practical to incorporate more insulation in the manufacturing process, after which DOE had revised EL 1 to reflect a baseline heat pump efficiency instead. 88 FR 49058, 49089. In response to GreenTECH, based on its review of the components that are used in conventional 240-volt heat pump water heaters, DOE expects that there would not be any appreciable difference in technology or design between conventional 240-volt heat pump water heaters and a 220-volt heat pump water heater as described by GreenTECH. However, because GreenTECH did not provide further details regarding their design, which is currently commercially unavailable, DOE was unable to evaluate GreenTECH's suggestions as a max-tech efficiency level.

NEEA urged DOE to consider gas absorption or adsorption heat pump water heaters as max-tech, adding that statutorily, DOE is not limited to commercially available technologies. NEEA noted that multiple technology developers and manufacturers are advancing gas heat pump water heaters for the residential market, many of which are expected to be commercialized by 2025. (NEEA, No. 1199 at pp. 9–10)

In response to comments from NEEA, DOE did not consider gas-fired absorption or adsorption heat pumps for the max-tech levels because, as discussed in section IV.B of this document, these technologies were screened out for not being practicable to manufacture, install, or service on the scale necessary to serve the consumer water heater market upon the compliance date of the amended standards. For more details on the screening analysis, *see* chapter 4 of the final rule TSD.

AWHI encouraged DOE to consider efficiency levels for gas-fired storage water heaters that couple 120-volt electric-readiness with gas-fired water heater installations to minimize the burden of future electrification requirements. AWHI cited a comment from Rheem made in response to the March 2022 Preliminary Analysis recommending that DOE add a higher efficiency level for gas-fired storage water heaters that would require electricity but is achievable with a Category-I venting solution. AHWI stated that adopting such a standard level would, upon the second replacement of an existing gas-fired water heater after the compliance date of this rule, give consumers the option to install drop-in replacement 120-volt heat pump water heaters because the 120-volt electricity connection would already exist (being necessary to meet

such a standard). (AWHI, No. 1036 at p. 4)

In response to AWHI, DOE notes that it does consider an efficiency level for gas-fired storage water heaters that requires electricity and is achievable with category I venting, which is identified as EL 2B (see section IV.C.1.b of this document) and includes an electric flue damper but uses category I venting. Beyond that level, based on review of the market and technologies currently being used, DOE has concluded the most likely design pathway to improved UEF would be to increase flue baffling, which would require use of category III venting (*i.e.,* ''power venting'').

CEC requested DOE establish more stringent standards for gas-fired storage water heaters and, if necessary, proceed with a separate rule for gas-fired storage water heaters to avoid delaying the finalization of other settled portions of the proposed rule. CEC added that primary innovation needed make substantial efficiency improvements to gas-fired storage water heaters is to implement a spiral flue, which will exchange more heat from the combusted gas to the water. (CEC, No. 1173 at p. 4)

In response to CEC, DOE agrees that a ''spiral'' (helical) flue is one of the main technological improvements that allows gas-fired storage water heaters to have condensing-level efficiencies. DOE notes that the manufacture and design of these flues is a complicated and expensive process, and spiraling flues have added material costs due to the significantly longer flue length. Additionally, manufacturers must adjust designs to account for the tank volume that the flue takes up: the more space the flue takes up in the tank, the less tank volume there is left to store the hot water. These costs are reflected in the manufacturer production costs (''MPCs'') and conversion cost estimates for ELs 4 and 5 for gas-fired storage water heaters, and they eventually result in higher-priced products for consumers. DOE evaluated whether standards at condensing efficiency levels were economically justified taking into account these costs (*see* section V.C.1 of this document.)

After considering these comments, DOE has maintained the efficiency levels from the July 2023 NOPR.

iii. Efficiency Levels by Product Class

DOE's analysis for efficiency levels above baseline is discussed in more detail in chapter 5 of the final rule TSD. Efficiency levels, including baseline and higher efficiencies, across all product classes are listed in the tables that follow. The efficiency levels which correspond closely to the Joint Stakeholder Recommendation are indicated with ''JSR''.

BILLING CODE 6450–01–P

Table IV.8 Gas-fired Storage: 20 gal ≤ V_{eff} ≤ 55 gal, Standard, Low, and Ultra Low NO_X

Efficiency Level	UEF

BILLING CODE 6450–01–C

b. Design Options

Based on its teardown analyses and feedback provided by manufacturers in confidential interviews, DOE determined the technology options that are most likely to constitute the pathway to achieving the efficiency levels assessed. These technology options are referred to as ''design options.'' While manufacturers may achieve a given efficiency level using more than one design strategy, the selected design options reflect what DOE expects to be the most likely approach for the market in general in a standards-case scenario. Further details are provided in chapter 5 of the final rule TSD.

Ravnitzky indicated that DOE acknowledges that increased tank insulation can improve the efficiency of storage-type water heaters and questioned DOE's decision not to consider increased insulation thickness as a feasible technology option for electric storage water heaters. Ravnitzky claimed that, with sufficient insulation, non-heat pump water heaters can be nearly as efficient as heat pump water heaters. (Ravnitzky, No. 73 at p. 1)

DOE agrees that increased insulation thickness can improve the efficiency of storage-type water heaters and notes that increased insulation thickness is considered as a design option for increasing the efficiency of gas-fired and oil-fired storage water heaters. In addition, as discussed in the July 2023 NOPR, DOE initially considered an efficiency level for electric storage water heaters based on increased insulation thickness in the March 2022 Preliminary Analysis. However, in the July 2023 NOPR, DOE explained that in response to stakeholder feedback [38] on the March 2022 Preliminary Analysis,

[38] Specifically, DOE explained that feedback from multiple sources indicated that increasing the thickness may not be practical in the manufacturing process because the R-value of polyurethane diminishes when the compound is blown into larger cavities, and the increase in thickness does not offset the increase in water heater surface area (which will increase standby losses).

the first efficiency level design option for electric storage water heaters was changed to include heat pump technology, which DOE noted was more representative of the next level up from baseline. 88 FR 49058, 49089. Given the insulation thicknesses DOE has observed in models currently on the market, DOE maintains its position that the most likely design path for improving heat pump water heater efficiency above the baseline level would be through use of heat pump technology. Increasing insulation thicknesses to the point required to substantially increase the UEF of electric storage water heaters beyond what is required by the current standard may not be feasible. Therefore, for this final rule DOE has maintained the efficiency levels (and associated design options) for electric storage waters from the July 2023 NOPR.

In addition, DOE disagrees with the notion that non-heat pump water heaters could be made to be as efficient as heat pump water heaters through insulation thickness increases. Even if standby losses were to be completely eliminated, the electric resistance elements used for heating non-heat pump electric storage water heaters have a maximum theoretical efficiency of 100 percent, resulting in a maximum UEF of 1.00. Heat pump water heaters achieve efficiencies greater than 1.00 by extracting more heat energy from their surroundings than is required for them to operate, which non-heat pump water heaters are incapable of.

BWC generally supported the design options DOE selected at the NOPR stage. (BWC, No. 1164 at p. 16) However, BWC reiterated its comments indicating that gas-fired storage water heaters can only use 1 inch of insulation in certain circumstances, and that it should not be considered as the baseline design option. BWC stated that 1 inch of insulation would not be capable of meeting the current standards, and only certain models designed to accommodate space constraints may come with 1 inch of insulation. The decreased insulation from 2 inches, BWC stated, has a drawback in lowering the FHR and recovery rate of the model. (BWC, No. 1164 at p. 17)

DOE believes that BWC may have misunderstood the design options that were modeled for the baseline efficiency level for gas-fired storage water heaters in the engineering analysis. Based on teardown analyses, DOE did determine that products with 1 inch of insulation can meet the existing standards, but only for the low draw pattern and the medium draw pattern.[39] At the NOPR stage, DOE took into account BWC's feedback about decreased FHRs and slower recovery rates. 88 FR 49058, 49094. These factors lead to gas-fired storage water heaters with only 1 inch of insulation also having smaller burners with lower input ratings. Products in the high draw pattern require larger burners. In the NOPR engineering analysis, DOE increased the insulation thickness for the high draw pattern designs of gas-fired storage water heaters. A thickness of 1.5 inches was used based on teardown samples of high draw pattern gas-fired storage water heaters at the representative size. *Id.* (*See* chapter 5 of the NOPR TSD.) However, this specifically pertained to side insulation. After reviewing BWC's comments and its own teardown samples, DOE has again updated the design option for high draw pattern gas-fired storage water heaters to use 1.5 inches of side insulation and 2 inches of top insulation to reflect the minimum amount of insulation necessary to meet the current standards.

Table IV.13 through Table IV.17 show the design options at each UEF level analyzed for this final rule. DOE maintained the design options as they were discussed in the July 2023 NOPR.

BILLING CODE 6450–01–C

c. Cost Analysis

The cost analysis portion of the engineering analysis is conducted using one or a combination of cost approaches. The selection of cost approach depends on a suite of factors, including the availability and reliability of public information, characteristics of the regulated product, the availability and timeliness of purchasing the product on the market. The cost approaches are summarized as follows:

□ *Physical teardowns:* Under this approach, DOE physically dismantles a commercially available product, component-by-component, to develop a detailed bill of materials for the product.

□ *Catalog teardowns:* In lieu of physically deconstructing a product, DOE identifies each component using parts diagrams (available from manufacturer websites or appliance repair websites, for example) to develop the bill of materials for the product.

□ *Price surveys:* If neither a physical nor catalog teardown is feasible (for example, for tightly integrated products such as fluorescent lamps, which are infeasible to disassemble and for which parts diagrams are unavailable) or cost-prohibitive and otherwise impractical (*e.g.,* large commercial boilers), DOE conducts price surveys using publicly available pricing data published on major online retailer websites and/or by soliciting prices from distributors and other commercial channels.

In this rulemaking, DOE utilizes a combination of the physical and catalog teardown approaches to develop estimates of the MPC at each UEF efficiency level analyzed. Data from the teardowns were used to create bills of materials (''BOMs'') that capture all of the materials, components, and manufacturing processes necessary to manufacture products that achieve each UEF level. DOE used the BOMs along with publicly available material and component cost data as the basis for estimating the MPCs. DOE refined its cost estimates and its material and component cost data based on feedback received during confidential manufacturer interviews.

To perform this analysis, DOE selects representative capacities for each product class. These capacities reflect the most common or average size of a water heater in that product class, and this step is important because the MPC is dependent upon the size of the water heater—larger water heaters cost more to manufacture. The representative capacities analyzed in this rulemaking are detailed in chapter 5 of the final rule TSD. With the exception of one case, DOE has determined that the representative capacities analyzed in the July 2023 NOPR remain representative at this final rule stage. In this final rule analysis, DOE determined that a capacity of 75 gallons is more representative of units within the high draw pattern for electric storage water heaters in the 55–120-gallon range than 80 gallons, based on the distribution of units currently on the market (*see* appendix 3A to the final rule TSD). DOE therefore updated its analysis accordingly for this product class to use 75 gallons as the representative capacity.

In this rulemaking, DOE selected representative capacities for storage-type water heaters based on rated storage volume.

A.O. Smith agreed that heat pump water heaters are technologically feasible alternatives to electric resistance storage water heaters; however, A.O. Smith stated that 50-gallon heat pump water heaters are not always feasible replacements for 50-gallon electric resistance storage water heaters because, even for units with the same FHR, the heat pump offers a slower recovery that may not keep up with household demand. Additionally, A.O. Smith commented, homeowners must consider factors like ambient air temperature conditions when switching to a heat pump water heater, and it is often recommended to ''upsize'' when transitioning to a heat pump water heater so that performance expectations are not diluted. (A.O. Smith, No. 1182 at pp. 7–8)

DOE understands the commenter to be suggesting that, when evaluating the cost to improve efficiency, it may be more appropriate to consider representative capacities using a metric other than rated storage volume (*e.g.,* the FHR delivery capacity metric). The FHR determines which draw pattern a water heater falls into, and the engineering analysis selects representative characteristics for each draw pattern to determine cost and efficiency. While some consumers may opt to upsize when transitioning to heat pump water heaters, because the efficiency levels analyzed do not preclude designs with backup resistance heating elements, such ''hybrid'' heat pump water heaters can still achieve faster recoveries when the backup elements are used (the recovery rate of a backup element is independent of the ambient air conditions). Hence it would

not be mandatory to upsize if installing a typical hybrid heat pump water heater. Thus, in this engineering analysis, DOE has maintained analysis points based on rated storage volume as opposed to other capacity metrics such as input rate or FHR. A separate consideration for maintaining the FHR is not necessary given the analysis is performed for each draw pattern separately. DOE did, however, perform a separate analysis to address the impact of ambient air conditions on heat pump water heater energy usage (*see* section IV.E of this document).

The results of DOE's cost-efficiency analysis for this final rule are shown in section IV.C.1.e of this document.

In response to the July 2023 NOPR, Rinnai pointed to a peer review report by the National Academy of Science, Engineering and Medicine (''NAS'')[40] and stated that DOE's teardown analyses and cost reconstructions for existing products and newer high-efficiency designs is flawed and produces systematically underestimated costs (Rinnai suggested these costs were underestimated by roughly 30–50 percent). Rinnai stated that these underestimates to MPC lead to overstated LCC savings, and that DOE should instead look to market pricing to determine product cost or use market prices to validate other estimates. (Rinnai, No. 1186 at p. 33)

The rulemaking process for standards of covered products and equipment are outlined at appendix A to subpart C of 10 CFR part 430, and DOE periodically examines and revises these provisions in separate rulemaking proceedings. The recommendations in the NASEM report, which pertain to the processes by which DOE analyzes energy conservation standards, will be considered in a separate rulemaking considering all product categories.

As described in section IV.D of this document, under a more stringent standard, the mark-ups incorporated into the sales price may also change relative to current mark-ups. Therefore, DOE has concluded that basing the engineering analysis on prices of water heaters as currently seen in the marketplace would be a less accurate method of estimating future water heater prices following an amended standard than DOE's approach of conducting an engineering analysis and mark-ups analysis. (However, as noted earlier, price surveys are sometimes required when other methods are infeasible.) When relying on retail market data, the prices will include ''premium'' (*i.e.,* non-efficiency-related) features and do not account for the likely changes in designs, market, and pricing that would occur under an amended standard. Differences between online vendors with respect to mark-up and pricing practices could lead to online prices being unrepresentative for the overall market.

In response to the July 2023 NOPR, Rheem generally agreed with DOE's manufacturer production cost estimates, stating that they appeared reasonable for electric storage water heaters when the removal of non-efficiency related features and economies of scale are accounted for. (Rheem, No. 1177 at p. 8) BWC generally agreed with the gas-fired storage water heater manufacturer production cost estimates provided in the July 2023 NOPR, but noted that the MPC estimates for electric storage water heaters were inconsistent with its experience. BWC stated that it would welcome further opportunities to discuss this specific matter confidentially with DOE for this rulemaking. (BWC No. 1164 at p. 17)

As discussed in the July 2023 NOPR, DOE's consultants routinely conduct confidential manufacturer interviews to gather feedback on various analytical inputs, which are then aggregated for use in the analysis. Cost analyses are updated based on feedback where appropriate. 88 FR 49058, 49095. In addition, due to the volatility of metal prices, DOE uses 5-year average metal prices to minimize the impact of large fluctuations in metal prices. *Id.* DOE's 5-year average metal cost data have been updated to reflect prices for the most recent 5-year period ending August 2023. For all other material and component prices, DOE used the most recent prices available at the time of the analysis (*i.e.,* August 2023). As discussed, the MPC estimates used in this rulemaking reflect what would be the market-average product cost to manufacture a model that meets the efficiency level, excluding the cost of optional features that do not affect the efficiency of the product, and these estimates take into account what the designs and component costs would be in a standards-case-scenario. Because the metal prices used may deviate from the most recent year's and because the designs modeled reflect market averages in a standards-case-scenario without optional non-efficiency-related components, the MPC estimates resulting from this analysis may not exactly reflect the designs of any one specific manufacturer today.

d. Shipping Costs

Shipping costs for storage-type consumer water heater product classes were determined based on the area of floor space occupied by the unit, including packaging, and the weight. Most consumer water heaters cannot be shipped in any orientation other than vertical and are too tall to be double-stacked in a vertical fashion, though some units analyzed by DOE can be double-stacked. For small units that can be double-stacked, including lowboy electric storage water heaters and non-lowboy electric storage water heaters less than or equal to 35 gallons in storage volume, the floor area available effectively doubles, reducing the overall shipping cost compared to taller products. DOE also accounted for electric storage water heaters sold as split-system heat pumps stacking the heat pump assembly atop the tank assembly. DOE research suggests that consumer water heaters are usually shipped together in nearly fully loaded trailers, rather than in less than truckload (''LTL'') configurations, where the consumer water heaters only occupy a portion of the trailer volume. Therefore, shipping costs have been calculated assuming fully loaded trailers; however, DOE applied an assumption that each truckload would only consist of one type of water heater, which may result in a conservative estimate of shipping costs.

To calculate the shipping costs, DOE estimated the cost per trailer based on standard trailer sizes, shipping the products between the middle of the country to the coast, using the most recent reference year for prices (*i.e.,* 2022 for the July 2023 NOPR and 2023 for this final rule). Next, DOE estimated the shipped size (including packaging) of products in each product class at each efficiency level and, for each product class and efficiency level, determined the number of units that would fit in a trailer. DOE then calculated the average shipping cost per unit by dividing the cost per trailer load by the number of units that would fit per trailer (based on a calculation of whether the quantity is limited by space or by weight), for each product class and efficiency level.

In the July 2023 NOPR, DOE requested feedback on the analysis assumptions used to estimate shipping costs for consumer water heaters.

BWC stated that the shipping cost estimates provided in the July 2023 NOPR were generally consistent with its expectations, and that it is correct to assume that water heaters typically do not ship in less-than-truckload

[40] National Academy of Science, Engineering and Medicine, ''Review of Methods Used by the U.S. Department of Energy in Setting Appliance and Equipment Standards'' (2021), ISBN 978–0–309–68545–0/DOI 10.17226/25992.

configurations; however, real-world circumstances (such as one truck delivering orders to multiple wholesalers) prevent truckloads from consisting of solely one type of water heater. (BWC, No. 1164 at p. 18) However, BWC did not agree with the Department's assumption that each truckload would only consist of one type of water heater. In their experience this rarely occurs since truckloads are scheduled to fulfill multiple orders from multiple customers who are rarely ordering identical products. (BWC No. 1164 at p. 18)

DOE agrees with BWC that manufacturers do not always ship trucks completely full of one type of water heater. The shipping costs in the real world vary with a multitude of factors that are difficult to model and predict. For storage-type water heaters that are shipped with tankless water heaters, DOE expects the shipping costs it assumed to be conservatively high, because the estimate is based on a truck full of only storage-type water heaters (which would, as a result, not be able to carry as many products due to the size of the storage-type water heaters).

After considering the feedback received on shipping costs, DOE maintained the methodology from the July 2023 NOPR for this final rule but updated the cost per trailer using the most recent data available. The shipping costs are shown in section IV.C.1.e of this document.

e. Cost-Efficiency Results

The results of the engineering analysis are reported as cost-efficiency data in the form of MPCs and shipping costs calculated for each efficiency level of each product class for which DOE is proposing amended UEF-based standards. As discussed previously, DOE determined these costs by developing BOMs based on a combination of physical and catalog teardowns and using information in the BOMs along with component and material price data to estimate MPCs.

For heat pump water heaters specifically, BWC urged the Department to consider price impacts related to the Federal American Innovation and Manufacturing (''AIM'') Act of 2020, codified at 42 U.S.C. 7675. BWC noted that this legislation calls for a gradual phasedown of refrigerant products that are currently predominant in heat pump water heater designs, and stated that the provisions in the AIM Act will compel manufacturers to pivot to more costly refrigerants when producing heat pump water heater products. (BWC No. 1164 at p. 18)

In response, DOE notes that the AIM Act authorizes EPA to address hydrofluorocarbons (''HFCs'') in three main ways: phasing down HFC production and consumption through an allowance allocation program; promulgating certain regulations for purposes of maximizing reclamation and minimizing releases of HFCs from equipment; and facilitating sector-based transitions to next-generation technologies. (*See* 42 U.S.C. 7675) Regarding the gradual phasedown of HFC refrigerants with high global warming potential (''GWP''), the AIM Act mandates the phasedown of HFCs by 85 percent over a period ending in 2036, following the schedule outlined in the AIM Act. (42 U.S.C. 7675(e)(2)(C)) DOE notes that the engineering analysis incorporates up-to-date cost estimates (including the cost of refrigerants currently used in heat pump water heaters).

For this final rule, DOE reviewed EPA rulemakings pertaining to the phasedown of HFC production and consumption and sector-based transitions to next-generation technologies. Regarding the sector-based transitions under subsection (i) of the AIM Act, EPA published a final rule restricting the use of HFCs in specific sectors or subsectors on October 24, 2023 (''October 2023 EPA Final Rule''). 88 FR 73098. In the October 2023 EPA Final Rule, EPA does not adopt provisions to restrict the use of high-GWP refrigerants in heat pump water heaters. DOE understands that manufacturers may voluntarily invest in low-GWP systems for future heat pump water heater designs, however, such systems would not be mandatory as a result of Federal regulation at this time. However, the October 2023 EPA Final Rule does restrict the use of HFCs and blends containing HFCs with a GWP of 150 or greater beginning January 1, 2025 for all foam subsectors, including rigid polyurethane for use in water heaters. 88 FR 73098, 73183–73184. As discussed in chapter 3 of the final rule TSD, DOE has found that water heater manufacturers have already begun transitioning to alternative blowing agents for insulation foam, therefore this regulation is not expected to impact manufacturer production costs for consumer water heaters.

DOE maintained the same methodology as the July 2023 NOPR to develop the cost-efficiency results for this final rule, as detailed in section IV.C.1.c of this document. The results of DOE's analysis are listed in Table IV.18 through Table IV.23.

See chapter 5 of the final rule TSD for more details concerning these results.

2. Product Classes Without Current UEF-Based Standards

In the December 2016 Conversion Factor Final Rule, DOE established that EF-based standards as established by EPCA are applicable to consumer water heaters but would not be enforced until conversion factors and converted standards are adopted. 81 FR 96204, 96209–96211. To convert these EF-based standards to UEF-based standards, DOE first developed conversion factors that convert tested values measured under the DOE test procedure in effect prior to the July 2014 TP Final Rule (which produces the EF metric) to values found under the current DOE test procedure (which produces the UEF metric). DOE then applied these conversion factors to representative baseline models and derived the UEF-based energy conservation standards from the resulting UEF values.

For the July 2023 NOPR, DOE applied a similar methodology to translate from minimum efficiency levels denominated in EF to those in UEF for classes of covered consumer water heaters that do not yet have UEF-based standards. The translated standards are shown in Table IV.24.

Table IV.24 Translated UEF-based Energy Conservation Standards for Product Classes without established UEF-based Standards

Product Class	Nominal Input	Effective Storage Volume	Draw Pattern	Uniform Energy Factor
Gas-fired Storage Water Heater	≤ 75,000 Btu/h	< 20 gal	Very Small	0.2062 - (0.0020 x V_{eff})
			Low	0.4893 - (0.0027 x V_{eff})

a. Crosswalk to Equivalent-Stringency UEF-Based Standards

In the July 2023 NOPR, DOE requested feedback regarding the appropriateness of the proposed converted UEF-based standards and whether products on the market can meet or exceed the proposed levels. 88 FR 49058, 49100.

A.O. Smith noted that DOE initially proposed UEF levels for several of these classes in the supplemental notice of proposed rulemaking published on August 30, 2016 (''August 2016 Conversion Factor SNOPR''). 81 FR 59736. DOE, however, decided to forgo adopting the proposed levels for these classes in the December 2016 Conversion Factor Final Rule. A.O. Smith stated that DOE wrote it ''Received voluminous comments regarding the technical merits of the conversion factors and the converted standards expressed in UEF for the water heaters listed in Table III.1 for which DOE is going to defer finalizing and implementing these statutory standards and further consider the comments.''[41] A.O. Smith reiterated its comments submitted in response to the August 2016 SNOPR.[42] Throughout the July 2023 NOPR TSD, DOE notes that for most of the product classes being converted, there are currently no models on the market, and therefore it did not use test data to adjust its analytical model. However, there are products on the market that comport to several of the product classes for which DOE has proposed UEF energy conservation standard levels. (A.O. Smith, No. 1182 at p. 11)

In the August 2016 Conversion Factor SNOPR, DOE explained that it had considered the applicability of standards to the products which eventually did not receive UEF-based standards because these products were not considered in DOE's rulemakings that culminated in the April 16, 2010 and January 17, 2001 final rules (75 FR 20112 and 66 FR 4474, respectively), and accordingly, the standards adopted in those final rules are not applicable to these products. 81 FR 59736, 59742. Hence, the statutory EF-based standards were deemed most applicable to these product classes. *Id.* A.O. Smith generally raised the concern of needing test data to validate the converted standards when responding to the August 2016 Conversion Factor SNOPR, but did not explicitly indicate that the conversion equations were incorrect for the products which did not get converted. Rather, A.O. Smith had iterated that it was inappropriate at the time to establish standards without the basis of a test procedure that covered the sizes of water heaters in question. (A.O. Smith, EERE–2015–BT–TP–0007–0028 at pp. 2–3) As of the June 2023 TP Final Rule, the appendix E test procedure does cover all of the

[41] *See* 81 FR 96204, 96211.

[42] Found online at: *www.regulations.gov/comment/EERE-2015-BT-TP–0007-0028.*

consumer water heaters being addressed in this analysis, and it is clearly established which EF-based standards do apply to these products.

Rheem supported DOE's methodology to conduct the EF to UEF crosswalk for electric storage water heaters and gas-fired storage water heaters that currently do not have UEF-based standards. (Rheem, No. 1177 at p. 9–11) Other commenters requested that DOE publish data to demonstrate that the crosswalk results in appropriate standards compared to how these products would be rated if tested to the UEF test procedure.

A.O. Smith emphasized that DOE must have test data to demonstrate that the crosswalked UEF standards are achievable by products on the market today, especially for very small electric storage water heaters, where there are several models on the market. A.O. Smith noted that previous experience with test procedure changeovers has shown that new test methods and test metrics impact water heaters differently and often unpredictably depending upon their specific attributes. The commenter indicated that it conducted its own testing and provided a limit set of results showing that very small electric storage water heaters could pass the crosswalked standards at a normal temperature setpoint. (A.O. Smith, No. 1182 at pp. 11–12)

NYSERDA noted that the crosswalked product classes begin with the statutory EF standards, which result in the converted standards being significantly lower than those proposed for products with current UEF standards. (NYSERDA, No. 1192 at pp. 4–5) NYSERDA commented that, when the conversion factors were developed, these equations did not apply to the products that DOE is crosswalking to UEF standards in this rulemaking. (NYSERDA, No. 1192 at p. 5) Additionally, NYSERDA stated that the conversion factors were developed using rated storage volume; therefore the converted standards should be in rated storage volume also (instead of effective storage volume). (NYSERDA, No. 1192 at p. 5) NYSERDA recommended two approaches for setting standards for the product classes where there are no current models: a first option would be to test similarly sized products that do exist on the market; otherwise, the volume thresholds can be removed. NYSERDA commented that if DOE determines that these converted standards require additional analysis, it could simply clarify in the final rule that these products are still subject to the statutory EF standards and continue to rely on the waiver process to accommodate any products introduced within these categories; however, the commenter still encouraged DOE to further examine the converted EF standards. (NYSERDA, No. 1192 at p. 5)

Bosch stated there is insufficient information to fully justify the proposed converted UEF values for the very small electric storage water heater product class, adding that the 2016 Conversion Factor Final Rule was not originally intended for this product group. Bosch requested DOE release its analysis of the efficiency testing conducted on the 17 models in this product class, as there are significant differences between tanks and element types within this product class. (Bosch, No. 1204 at pp. 3–4)

BWC expressed concerns regarding the EF-to-UEF crosswalk DOE has analyzed in this rulemaking. BWC stated that using the December 2016 Conversion Factor Final Rule equations to establish UEF-based standards for these products is not appropriate because these products were never subjected to the EF test procedure, and that DOE's approach in the March 2022 Preliminary Analysis and July 2023 NOPR could set an improper baseline. (BWC, No. 1164 at p. 10)

As discussed in the July 2023 NOPR TSD, DOE conducted its own testing to verify that products on the market, when tested to the appendix E test procedure, would comply with the crosswalked standards. In response to the numerous requests for additional test data, DOE has published the results of the testing in chapter 5 of the final rule TSD. Additionally, DOE notes that A.O. Smith's test data also indicates that the standards are achievable (so long as the high temperature test is not used, which results in lower ratings). As discussed in section V.D.1 of this document, DOE has determined not to subject very small electric storage water heaters to high temperature testing; therefore, this would not be expected to reduce their UEF to a level below the adopted standards.

DOE notes that during the 2016 Conversion Factor rulemaking, it conducted testing of 55 consumer storage water heaters and 22 consumer instantaneous water heaters to validate the conversion factors used to determine the UEF-based standards DOE is establishing in this rulemaking. In addition, AHRI provided data for 130 consumer storage water heaters and 36 consumer instantaneous water heaters using both EF and UEF test procedures.[43] 81 FR 96204, 96214–96216. DOE concluded that these conversion factors resulted in UEF-based standards that were neither more nor less stringent than the equivalent EF-based standards. 81 FR 96204, 96207.

Rheem supported the translated UEF standards for very small electric storage water heaters, but recommended that DOE remove the high draw and medium draw pattern standards for very small electric storage water heaters because these levels are generally not achievable or necessary. (Rheem, No. 1177 at p. 9)

Removing the high and medium draw pattern standards for very small electric storage water heaters would result in a gap in coverage of standards, however, should products meeting this description become available in the future. Therefore, DOE is maintaining its approach to adopt standards for each draw pattern for very small electric storage water heaters. Should more data become available after this rulemaking, DOE may consider consolidating standards for different draw patterns if it can be determined conclusively that the medium and high draw pattern standards are not justified.

Rheem added further that reducing the crosswalked electric instantaneous water heater standards to align with those for very small electric storage water heaters would reduce manufacturer burden and design costs. (Rheem, No. 1177 at pp. 13–14)

While DOE acknowledges that electric instantaneous water heaters and very small electric storage water heaters may be installed in similar applications, as discussed in section IV.A.1.c of this document, storage-type and instantaneous-type water heaters generally have differences in operation that can lead to different utilities. Hence, DOE is maintaining its approach to treat these as separate product classes and evaluate standards separately.

BWC provided that it did not believe an approach that relied on a market analysis of currently listed models, along with an efficiency level and design option (teardown) analysis, was appropriate for these product classes that did not previously have a minimum efficiency standard. BWC stated that accounting for the stored water temperature and rated storage volume largely influence a product's efficiency rating, but there are other factors that can strongly influence the UEF, such as insulation thickness (for electric-type storage water heaters) and modulating controls (for instantaneous water

[43] Data for consumer water heaters tested during the development of the 2016 Conversion Factor Final Rule were reported in an SNOPR published in the **Federal Register** on August 30, 2016. 81 FR 59736.

heaters). BWC thus requested DOE to docket the analysis conducted to establish the new minimum UEF levels for these product classes. (BWC, No. 1164 at p. 10)

For this final rule DOE maintains its approach for converting standards from EF to UEF. EPCA directed DOE to establish a uniform efficiency descriptor to be used to regulate all covered water heaters, with certain exceptions for water heaters used only in commercial applications. (42 U.S.C. 6295I(5)) Therefore, DOE has conducted this analysis in satisfaction of its statutory obligation to delineate standards for all consumer water heaters in terms of UEF. The statute provides that, in the case of a test procedure or metric change, DOE must determine what equivalent standards are on the basis of the new test procedure or metric. (42 U.S.C. 6293(e)(2)) The conversion factor calculations serve to accomplish this purpose. Because the UEF-based standards for these product classes reflect the same stringency as the statutory EF-based standards that are currently applicable—*i.e.,* these are not standards that would require higher efficiency to comply— it is not necessary for DOE to conduct an assessment of energy savings or economic justification prior to proposing such standards. The Department believes that BWC may have misinterpreted the analysis for product classes with current UEF-based standards as also applying to these product classes which have EF-based standards. To reiterate, these standards are not being established pursuant to EPCA provisions at 42 U.S.C. 6295(o)(A), but instead in accordance with those at 42 U.S.C. 6293(e)(2). Additionally, the statutory EF-based standards are provided within EPCA and do not require separate justification to adopt these stringencies.

b. Consideration of More Stringent Standards

DOE also requested information and data regarding the UEF of products within these product classes if they are found to generally exceed the proposed levels. 88 FR 49058, 49100.

BWC supported DOE's tentative determination not to propose more stringent standards for product classes that are currently covered by the statutory EF-based standards because these product classes have low market share and would present limited opportunity for energy savings. (BWC, No. 1164 at p. 3)

Rheem commented that there may be no or very few water heaters on the market in the volume ranges for which crosswalked standards were proposed for gas-fired storage water heaters and therefore did not support more stringent standards for these sizes of gas-fired storage water heaters. (Rheem, No. 1177 at p. 11)

Rheem recommended against increasing the >120-gallon standards for electric storage water heaters to a level that would require heat pump technology because ASME tank construction is required for water heaters with a measured volume >120 gallons, significantly increasing the cost of the water heater to the point where it is not a low-cost replacement for a heat pump water heater. (Rheem, No. 1177 at p. 10) However, Rheem recommended increasing the energy conservation standards for <20-gallon tabletop water heaters to the levels proposed for ≥20-gallon tabletop water heaters and simplifying the energy conservation standards table. (Rheem, No. 1177 at p. 10)

In general, while there are few (or sometimes no) models on the market that fall within these product classes, comments received in response to the July 2023 NOPR suggested that, within the 5-year compliance period of this final rule, manufacturers would be incentivized to develop new models in these product classes in lieu of developing designs for product classes with current UEF-based standards that have to comply with more stringent standards. Based on the comments, which are summarized in the following paragraphs, DOE understands that this is possible if the design changes required to transfer an existing model to a product class without current UEF-based standards are less expensive than the design changes required to increase the efficiency of that model to meet the amended standard for the product class with a current UEF-based standard. Commenters provided feedback on whether or not more stringent standards were justified based on whether or not the product class could be used to ''circumvent'' other standards for similar product classes that have higher standards.

A.O. Smith indicated that simultaneous establishment of baseline UEF levels for converted product classes while increasing the efficiency levels for existing product classes creates a scenario where new products may emerge, and shipments may shift from product classes with more stringent standards to very similar products in new product classes with less stringent standards. (A.O. Smith, No. 1182 at p. 14)

DOE does not currently possess data supporting more stringent standards than those being established as part of this rulemaking. However, DOE may conduct a separate rulemaking to determine the benefits and burdens of higher standards for these products at a later time. For example, after the compliance date of this final rule, the availability of certifications of UEF may enable DOE to consider more stringent standards in a future rulemaking.

A.O. Smith provided some test data for very small electric storage water heaters showing that these products would not pass the proposed standards when tested to the high temperature test method, and thus recommended that very small electric storage water heaters be exempt from the high temperature test method. A.O. Smith stated that this test method would not be representative of an average use cycle for very small electric storage water heaters, and the company would rather dedicate its engineering resources toward the development of future heat pump offerings rather than redesigning existing product lines for modest efficiency gains resulting from overlapping test procedure changeovers. A.O. Smith recommended DOE test baseline very small and small electric storage water heaters according to the proposed test procedure to ensure that crosswalked standards do not result in a stringency increase. (A.O. Smith, No. 1182 at pp. 11–12)

Rheem recommended against setting a standard for very small electric storage water heaters at any higher stringency because a forced redesign for these products may not be necessary and would divert manufacturers' resources away from the heat pump water heater innovation. (Rheem, No. 1177 at p. 9)

DOE understands that, if the high temperature test method were to apply to very small electric storage water heaters, then that test method would result in lower efficiency ratings for these products, and these lower ratings would not comply with the crosswalked standards. Therefore, manufacturers would have to redesign very small electric storage water heaters to be more efficient in order to comply with the standards that resulted from the EF-to-UEF crosswalk, and this would effectively constitute an increase in stringency of standards for these products. In section V.D.1.c of this document, DOE explains its determination to exempt very small electric storage water heaters from the high temperature test. As a result, there would be no increase to stringency for these products.

c. Circulating Water Heaters

Prior to the publication of the June 2023 TP Final Rule, the test procedure did not provide sufficient clarity regarding how circulating water heaters should be tested, and the June 2023 TP Final Rule established a new method of testing circulating water heaters with separate storage tanks (*see* section 4.10 of appendix E) to represent how these products are used in the field. As a result of this method of testing, the efficiency ratings for circulating water heaters will reflect the standby losses incurred by the separate storage tank. As discussed previously in section IV.A.1.a of this document, DOE is classifying circulating water heaters as storage-type water heaters subject to the storage water heaters standards. In the July 2023 NOPR, however, DOE considered circulating water heaters as instantaneous water heaters and developed proposed standards using the instantaneous water heater efficiency levels as a starting point.

In response to the levels proposed in the July 2023 NOPR, NYSERDA suggested that DOE could address more stringent, heat pump-level standards for electric circulating water heaters in a separate rulemaking to ensure that the energy savings from this rulemaking are realized. (NYSERDA, No. 1192 at p. 7)

BWC requested clarification on how DOE derived the minimum efficiency levels for electric circulating water heaters in the NOPR, noting that the efficiencies corresponded to electric resistance technology, not heat pump circulating water heaters. (BWC, No. 1164 at pp. 2–3)

As discussed in section IV.A.1.a of this document, circulating water heaters will be subject to the applicable standards for storage-type water heaters. As such, there is no separate analysis to address UEF-based standards for circulating water heaters in this final rule.

In response to the December 2023 SNOPR proposing to treat circulating water heaters as part of the storage-type water heater product classes, BWC claimed that establishing heat pump-level standards for electric circulating water heaters would be inappropriate because they would favor one design option over another, as heat pump water heaters are not considered a separate product class from electric storage water heaters, stating that EPCA requires DOE to determine standards without regards to the technologies utilized by manufacturers or preferred by consumers. BWC requested that DOE clarify its understanding of its authority under EPCA with respect to these standards. (BWC, No. 1413 at pp. 2–3)

DOE notes that the analysis conducted in this rulemaking has determined that the amended standards for electric storage water heaters (which include electric circulating water heaters) are both technologically feasible and economically justified, and result in significant savings. These conclusions are discussed in detail in section V.C.1 of this document. DOE uses the screening criteria found in sections 6(b)(3) and 7(b) of appendix A to 10 CFR part 430, subpart C to determine which technology options are suitable for further consideration in an energy conservation standards rulemaking. Under the criteria for technological feasibility, DOE considers technologies incorporated in commercially-available products or in working prototypes to be technologically feasible. As such, EPCA does not prohibit DOE from establishing a standard that can only be met through the use of a certain technology. Heat pump technology is the only technology available to allow electric circulating water heaters to achieve higher efficiency levels. DOE is not establishing a prescriptive design requirement that electric circulating water heaters must implement heat pump technology.

3. Manufacturer Selling Price

To account for manufacturers' non-production costs and profit margin, DOE applies a multiplier (the manufacturer markup) to the MPC. The resulting manufacturer selling price (''MSP'') is the price at which the manufacturer distributes a unit into commerce. DOE developed an average manufacturer markup by examining the annual Securities and Exchange Commission (''SEC'') 10–K [44] reports filed by publicly traded manufacturers that produce consumer water heaters, the manufacturer markups from the April 2010 Final Rule, and feedback from confidential manufacturer interviews. 75 FR 20112. *See* chapter 12 of the final rule TSD for additional detail on the manufacturer markup.

D. Markups Analysis

The markups analysis develops appropriate markups (*e.g.,* retailer markups, distributor markups, contractor markups) in the distribution chain and sales taxes to convert the MSP estimates derived in the engineering analysis to consumer prices, which are then used in the LCC and PBP analysis. At each step in the distribution channel, companies mark up the price of the product to cover business costs and profit margin.

For consumer water heaters, the main parties in the distribution chain are (1) manufacturers, (2) wholesalers or distributors, (3) retailers, (4) plumbing contractors, (5) builders, (6) manufactured home manufacturers, and (7) manufactured home dealers/retailers. *See* chapter 6 and appendix 6A of the final rule TSD for a more detailed discussion about parties in the distribution chain.

For this final rule, DOE characterized how consumer water heater products pass from the manufacturer to residential and commercial consumers [45] by gathering data from several sources, including consultant reports (available in appendix 6A of the final rule TSD), the 2023 BRG report,[46] and the 2022 Clear Seas Research Water Heater contractor survey [47] to determine the distribution channels and fraction of shipments going through each distribution channel. The distribution channels for replacement or new owners of consumer water heaters in residential applications (not including mobile homes) are characterized as follows: [48]

Manufacturer → Wholesaler → Plumbing Contractor → Consumer
Manufacturer → Retailer → Consumer
Manufacturer → Retailer → Plumbing Contractor → Consumer

For mobile home replacement or new owner applications, there is one additional distribution channel where manufacturers sell to mobile home dealers/retail outlets that then sell to the customer.[49]

[44] U.S. Securities and Exchange Commission. Company Filings. Available at*www.sec.gov/edgar/searchedgar/companysearch.html* (last accessed December 1, 2023).

[45] DOE estimates that 2 percent of gas-fired storage heaters (''GSWHs''), 29 percent of oil-fired storage water heaters (''OSWHs''), and 9 percent of electric storage water heaters (''ESWHs'') will be shipped to commercial applications in 2030.

[46] BRG Building Solutions, The North American Heating & Cooling Product Markets (2023 Edition). Available at *www.brgbuildingsolutions.com/reports-insights* (last accessed December 1, 2023).

[47] Clear Seas Research, 2022 Mechanical System—Water Heater. Available at *clearseasresearch.com/reports/industries/mechanical-systems/* (last accessed December 1, 2023).

[48] Based on available data, DOE assumed that the consumer water heater goes through the: wholesaler/contractor 50 percent of the time for GSWHs, 90 percent of the time for OSWHs, and 45 percent of the time for ESWHs; directly form the retailer 45 percent of the time for GSWHs, 5 percent of the time for OSWHs, and 50 percent of the time for ESWHs, and retailer/contractor 5 percent of the time for GSWHs, OSWHs, and ESWHs.

[49] Based on available data, DOE assumed that the consumer water heater in mobile homes goes through the: wholesaler/contractor 5 percent of the time for GSWHs, 90 percent of the time for OSWHs, and 5 percent of the time for ESWHs; directly form

Mainly for consumer water heaters in commercial applications, DOE considers an additional distribution channel for which the manufacturer sells the equipment to the wholesaler and then to the consumer through a national account in both replacement and new construction markets.

The new construction distribution channel includes an additional link in the chain—the builder. The distribution channels for consumer water heaters in new construction [50] in residential applications (not including mobile homes) are characterized as follows: [51]

Manufacturer → Wholesaler → Plumbing Contractor → Builder → Consumer

Manufacturer → Wholesaler → Builder → Consumer

Manufacturer → Wholesaler (National Account) → Consumer

For new construction, all mobile home GSWHs and ESWHs are sold as part of mobile homes in a specific distribution chain characterized as follows:

Manufacturer → Mobile Home Manufacturer → Mobile Home Dealer → Consumer

DOE developed baseline and incremental markups for each actor in the distribution chain. Baseline markups are applied to the price of products with baseline efficiency, while incremental markups are applied to the difference in price between baseline and higher-efficiency models (the incremental cost increase). The incremental markup is typically less than the baseline markup and is designed to maintain similar per-unit operating profit before and after new or amended standards.[52]

To estimate average baseline and incremental markups, DOE relied on several sources, including: (1) form 10–K [53] from U.S. Securities and Exchange Commission (''SEC'') for Home Depot, Lowe's, Wal-Mart, and Costco (for retailers); (2) U.S. Census Bureau 2017 Annual Retail Trade Report for miscellaneous store retailers (NAICS 453) (for online retailers); [54] (3) U.S. Census Bureau 2017 Economic Census data [55] on the residential and commercial building construction industry (for builder, plumbing contractor, mobile home manufacturer, mobile home retailer/dealer); and (4) the U.S. Census Bureau 2017 Annual Wholesale Trade Report data [56] (for wholesalers). DOE assumes that the markups for national accounts is half of the value of wholesaler markups. In addition, DOE used the 2005 Air Conditioning Contractors of America's (''ACCA'') Financial Analysis on the Heating, Ventilation, Air-Conditioning, and Refrigeration (''HVACR'') contracting industry [57] to disaggregate the mechanical contractor markups into replacement and new construction markets for consumer water heaters used in commercial applications.

PHCC commented that DOE's approach of incremental markups is not representative of how contractors set markups. PHCC commented that contractors know the required profit margin and set markups accordingly, rather than determining a markup for a baseline product and deciding a lower appropriate markup based on additional costs due to increased standards. (PHCC, No. 1151 at pp. 5–6) Rheem agreed that DOE's estimates of manufacturers' production costs for electric resistance and heat pump water heaters appear reasonable and that the retail price for electric resistance water heaters is accurate but the retail price of heat pump water heaters is a little low. Rheem recommended reviewing incremental markups for heat pump water heaters. Rheem also requested clarification on whether incremental markups are current markups or estimated for the compliance date of the rulemaking. (Rheem, No. 1177 at pp. 8–9)

In response, the development of all markup values is based on the most current data available, representing current markups applied to the products. The markups analysis is intended to represent products sold and installed at higher volume, since such products become the new baseline efficiency in the standards cases. Comparisons to current retail prices are therefore not necessarily applicable if such products are not common, high-volume products. For example, heat pump water heaters currently have a small market share and have higher profit margins. In a standards case with heat pump water heaters as the new baseline efficiency, their markups will be more representative of high-volume products. DOE also acknowledges that the contractor and customer relationship is of value and hence assigns contractors as an active market participant for a major portion of its distribution channels. For contractor markups, DOE utilized the 2017 Economic Census data, the latest data source consisting of the detailed operating costs needed to derive incremental markups. DOE believes that while contractors are unlikely to directly estimate an incremental markup in response to the cost change due to efficiency standards, contractor behavior is consistent with the characterization of DOE's markup approach which results in lower overall markup than baseline markup. DOE does not mean to suggest that contractors will directly adjust their markups on equipment if the price they pay goes up as a result of appliance standards. Rather, the approach assumes that such adjustment will occur over a (relatively short) period of time as part of a business management process. In summary, DOE acknowledges that its approach to estimating distributor and contractor markup practices after amended standards take effect is an approximation of real-world practices that are both complex and varying with business conditions. However, it

---

the retailer 10 percent of the time for GSWHs, 5 percent of the time for OSWHs, and 25 percent of the time for ESWHs; retailer/contractor 5 percent of the time for GSWHs, OSWHs, and ESWHs; and directly through mobile home retailer 80 percent of the time for GSWHs, 0 percent of the time for OSWHs, and 65 percent of the time for ESWHs.

[50] DOE estimates that in the residential market 10 percent of GSWHs, 2 percent of OSWHs, and 15 percent of ESWHs will be shipped to new construction applications in 2030.

[51] DOE believes that many builders are large enough to have a master plumber and not hire a separate contractor, and assigned about half of water heater shipments to new construction to this channel. DOE estimated that in the new construction market, 90 percent of the residential (not including mobile homes) and 80 percent in commercial applications goes through a wholesalers to builders channel and the rest go through national account distribution channel.

[52] Because the projected price of standards-compliant products is typically higher than the price of baseline products, using the same markup for the incremental cost and the baseline cost would result in higher per-unit operating profit. While such an outcome is possible, DOE maintains that in markets that are reasonably competitive it is unlikely that standards would lead to a sustainable increase in profitability in the long run.

continues to believe that its assumption that standards do not facilitate a sustainable increase in profitability is reasonable.

In addition to the markups, DOE obtained State and local taxes from data provided by the Sales Tax Clearinghouse.[58] These data represent weighted average taxes that include county and city rates. DOE derived shipment-weighted average tax values for each State considered in the analysis.

In response to the July 2023 NOPR, AHRI advised that DOE's process should include industry participation by surveying manufacturers, distributors, and consumers and DOE should conduct another round of confidential interviews with manufacturers and reevaluate based on those interviews. (AHRI, No. 1167 at p. 11)

In support of the July 2023 NOPR, DOE conducted confidential interviews with OEMs representing approximately 80 percent of domestic industry consumer water heater shipments. In those interviews, DOE requested information about a range of topics including distribution channels. *See* appendix 12–A of the final rule TSD for a copy of the manufacturer interview guide. DOE also conducted confidential interviews with consumer water heater OEMs in support of the March 2022 Preliminary Analysis. Data collected through this process was recent and sufficient to conduct the analysis given that market conditions have remained largely the same since those confidential interviews. Chapter 6 of the final rule TSD provides details on DOE's development of markups for consumer water heaters.

E. Energy Use Analysis

The purpose of the energy use analysis is to determine the annual energy consumption of consumer water heaters at different efficiencies in representative U.S. single-family homes, mobile homes, multi-family residences, and commercial buildings, and to assess the energy savings potential of increased consumer water heater efficiency. The energy use analysis estimates the range of energy use of consumer water heaters in the field (*i.e.,* as they are actually used by consumers). The energy use analysis provides the basis for other analyses DOE performed, particularly assessments of the energy savings and the savings in consumer operating costs that could result from adoption of amended or new standards.

DOE estimated the annual energy consumption of consumer water heaters at specific energy efficiency levels across a range of climate zones, building characteristics, and water heating applications. The annual energy consumption includes the natural gas, liquid petroleum gas (''LPG''), and electricity used by the consumer water heater.

1. Building Sample

To determine the field energy use of consumer water heaters used in homes, DOE established a sample of households using consumer water heaters from EIA's 2015 Residential Energy Consumption Survey (''RECS 2015'') in the July 2023 NOPR, which was the most recent such survey that was then fully available.[59] The RECS data provide information on the vintage of the home, as well as water heating energy use in each household. DOE used the household samples not only to determine water heater annual energy consumption, but also as the basis for conducting the LCC and PBP analyses. DOE projected household weights and household characteristics in 2030, the first year of compliance with any amended or new energy conservation standards for consumer water heaters. To characterize future new homes, DOE used a subset of homes in RECS that were built after 2000.

In response to the July 2023 NOPR, Gas Association Commenters, Essency, Rinnai, and Atmos Energy commented that RECS 2015 should not have been used for the analysis and therefore the entire analysis is flawed. Gas Association Commenters stated that DOE had plenty of time to use RECS 2020 data and chose not to make their results look better. (Gas Association Commenters, No. 1181 at p. 32; Essency, No. 1194 at p. 3; Atmos Energy, No. 1183 at pp. 5–6; Rinnai, No. 1186 at p. 33) NYSERDA supported DOE's analysis, including RECS data and the consumer choice model analysis methodology. (NYSERDA, No. 1192 at pp. 3–4)

In response, DOE notes that RECS 2020 published finalized microdata in June 2023, with further updates published in July and September 2023. When conducting the analysis for the NOPR, the full set of microdata was not available. For this final rule, however, DOE incorporated RECS 2020 as the basis of the building sample development and updated the analyses accordingly.[60] DOE agrees that incorporating RECS 2020 improves the representativeness of the residential building sample as RECS 2020 brings a threefold increase in sample size compared to RECS 2015.[61] A larger sample size generally results in smaller standard errors, especially for estimates of smaller subpopulations. In this final rule, DOE maintains a similar methodology in sample development for the analyzed product classes. The details of selection criteria and the resulting sample size for each product class are presented in the final rule TSD (*see* chapter 7 and appendix 7A).

To determine the field energy use of consumer water heaters used in commercial buildings, DOE established a sample of buildings using consumer water heaters from EIA's 2018 Commercial Building Energy Consumption Survey (''CBECS 2018''), which is the most recent such survey that is currently fully available.[62] DOE has maintained its sample development methodology used in July 2023 NOPR for consumer water heaters used in commercial applications.

2. Hot Water Use Determination

Calculating hot water use for each sample household requires assigning the water heater a specific tank size (referred to as rated volume). For each household, RECS reports the size bin of the water heater (30 gallons and less, 31 to 49 gallons, and 50 gallons and more); for each commercial building, DOE assumes that the water heater generally falls under the biggest size option applicable for each product class. For each size bin, DOE derived the fraction of models falling under each draw patterns and assigns the sampled water heater to an appropriate one (*i.e.,* low, medium, and high). A specific tank size is then assigned based on the size bin and the draw pattern from the typical water heater sizes. Typical water heater sizes are the most common sizes for each product class and have the minimum energy factor allowed by current energy conservation standards.

[61] According to published data and EIA website, RECS 2020 is based upon responses collected from in total 18,496 households which is three times greater than 5,686 respondents in RECS 2015.

[62] U.S. Department of Energy: Energy Information Administration, Commercial Buildings Energy Consumption Survey (2018). Available at: *www.eia.gov/consumption/commercial/data/2018/index.php?view=microdata* (last accessed Dec. 1, 2023).

They are 30, 40, and 50 gallon for gas and electric storage water heaters, 30 and 50 gallon for oil, and 60 and 75 gallon for electric storage water heaters larger than 55 gallons. For the product class of ESWHs smaller than 35 gallons, DOE also assigned a fraction the tank size of 35 gallons. These sizes are referred to as ''standard'' sizes. Finally, DOE calculated the hot water use for each household and building based on the characteristics of the water heater and the reported water heating energy use.

In order to disaggregate the selected sampled water heaters into draw patterns and standard sizes, DOE used a variety of sources including RECS historical data on reported tank sizes, input from an expert consultant, and model data from DOE's public CCD [63] and AHRI certification directory [64] together with other publicly available data from manufacturers' catalogs of consumer water heaters. For all product classes, DOE used disaggregated shipments data by rated volume from BRG Building Solutions 2023 report from 2007 to 2022 [65] and data from U.S. Census Bureau data (2003–2008).[66] Finally to determine the appropriate product type and size for different applications, DOE used manufacturer-produced consumer water heater sizing guidelines and calculators.

AHRI recommended DOE explain its inputs in the energy use calculations. AHRI commented that DOE's use of nesting of various assumptions for residential water heaters leads to unlikely results that DOE does not, or cannot, explain. (AHRI, No. 1167 at p. 19) AHRI also asked why DOE has not accepted the suggestion by AHRI and others to use median, not the mean values for consumption and LCC savings to avoid the effects of these outliers and to alleviate, at least in part, the deficiencies of its base case random assignment issue. (AHRI, No. 1167 at p. 20)

In response, DOE notes that RECS data provides the information on the household size and water heating energy use. RECS is the most comprehensive, nationally-representative, and robust data source on household energy consumption available to DOE. In general, DOE has found that the weighted average energy use for water heating correlates with the size of the household, *i.e.,* the reported number of people in that household. Greater energy expenditure on water heating largely falls into the bins of households of larger sizes (4 people and above). The hot water use derived based on the water heating energy use follows similar pattern (see chapter 7 of the final rule TSD for the calculation of hot water use). When reporting the distribution of the derived hot water use, DOE takes into account both consumer water heaters in residential as well as consumer water heaters used in commercial applications and close to 40 percent of the top 5 percent of water consuming sample buildings/households are commercial applications which generally have higher upper bound of hot water use. These outlier data points therefore represent either data directly reported from RECS for larger households or commercial applications using consumer water heaters, both of which represent real-world usage. In addition, DOE evaluates each sampled building/household individually by calculating its hot water use and the corresponding cost efficiency thereafter and that DOE believes the average LCC savings as reported is a good representation of the aggregated national values. Nevertheless, the LCC spreadsheet includes a calculation of median LCC savings, as well as LCC savings at various percentiles. Even if DOE were to rely on the median LCC savings instead of the mean LCC savings, DOE's conclusion of economic justification would remain the same.

Gas Association Commenters argued that water consumption should be based on household size and that there are problems with water consumption calculations. Gas Association Commenters argue the model results in unrealistic outliers for smaller households reaching consumption levels equivalent to space heating. Gas Association Commenters argue that a potential reason for this failure is how the model calculates daily water usage. For example, Gas Association Commenters argued that in DOE's model, some single person households use 200–350 gallons a day which is far from reasonable (4–7 baths of water a day every day of the year). Gas Association Commenters argued that Draw Pattern ID is based on randomly assigned distribution. Gas Association Commenters argue that for small storage units, there is a 5 percent chance of a large draw pattern Gas Association Commenters argues that a better solution would be to use the test procedure for water heaters as a basis for modeling energy usage rather than assuming draw rates based on the size of the original equipment in RECS. (Gas Association Commenters, No. 1181 at pp. 25–31) Rinnai argued that hot water usage should be determined through less opaque methods than the current method. Rinnai stated that rather than using RECS data to determine water usage, DOE should use test procedure defined hot water usage rates for comparisons of ELs. Rinnai stated that they believe that doing so would provide clearer consistency in comparison of residential water heater technologies generally and for EL comparison for proposed efficiency thresholds. Rinnai also stated that this would make DOE's analysis more consistent with other federal rating programs such as the FTC energy guide labeling program. (Rinnai, No. 1186 at p. 26 and p. 33) Furthermore, Rinnai commented that if RECS is to be used, RECS 2015 is outdated and RECS 2020 should be used for this analysis. (Rinnai, No. 1186 at p. 33) On the contrary, NEEA supported DOE's overall method of analysis using Monte Carlo simulations informed by RECS data. NEEA commented that the Monte Carlo approach can successfully represent the true distribution of water product classes, hot water use, energy use and costs and that NEEA uses a similar approach when conducting similar analysis. NEEA commented that RECS serves as a reliable national dataset that helps account for the diversity found in the water heater market. (NEEA, No. 1199 at p. 5)

In response, for this final rule, DOE incorporated the latest RECS 2020 data for its analyses. With the increased sample size and the most recent timeline of the fielding of the survey, DOE believes that it provides a sample pool of more up to date national representation of housing characteristics and energy consumption of the home appliances. As discussed previously, the weighted average of the energy use on water heating and the derived hot water use generally correlates with the size of the household with deviations that represent the real world complexities of the use of hot water heater in households of different types. DOE continues to rely on RECS as the basis of its analyses for its incomparable scope of coverage on housing

characteristics and energy consumption and believes that it is an objective reflection of the landscape in the national water heater market. In terms of the assignment of draw pattern, DOE derived the distribution of different draw patterns based on market research of the number of models in each bin that are available on the market. The breakdown can be found in chapter 7 of the final rule TSD.

Ecotemp commented that the DOE consumer usage assumptions do not match the water use patterns of cabins, vacation homes, rental properties, or any other intermittent use dwelling. (Ecotemp, No. 1092 at p. 2) In response, RECS does not include in the survey house types like vacant, seasonal, vacation homes and group quarters and thus DOE build its analysis around regular households. However, in both residential households (sample by RECS) and commercial buildings (CBECS) DOE has observed samples with lower than usual water heating energy use. As stated previously, DOE believes that RECS and CBECS provide a nationally representative sample pool that includes a variety of housing types.

3. Energy Use Determination

To calculate the energy use of consumer water heaters, DOE determined the energy consumption associated with water heating and any auxiliary electrical use. In addition, for heat pump water heaters, DOE also accounted for the indirect effects of heat pump water heaters on heating, cooling, and dehumidification systems to compensate for the effects of the heat pump operation.[67] DOE calculated the energy use of water heaters using a simplified energy equation, the water heater analysis model (''WHAM''). WHAM accounts for a range of operating conditions and energy efficiency characteristics of water heaters. Water heater operating conditions are indicated by the daily hot water draw volume, inlet water temperature, thermostat setting, and air temperature around the water heater (ambient air temperature). To describe energy efficiency characteristics of water heaters, WHAM uses three parameters that also are used in the DOE test procedure: recovery efficiency (''*RE*''), standby heat-loss coefficient (''*UA*''), and rated input power (''P_{ON}'').

The current version of WHAM is appropriate for calculating the energy use of electric resistance storage water heaters. To account for the characteristics of other types of water heaters, energy use must be calculated using modified versions of the WHAM equation. These modified versions are further discussed in chapter 7 and appendix 7B of the final rule TSD.

The daily hot water draw volume is estimated based on the water heater energy use estimated from RECS 2020 and CBECS 2018. The inlet water temperature is based on weather station temperature data and RECS 2020 ground water temperature data for each household. The consumer water heater thermostat setting is based on multiple sources including contractor survey data and field data. To estimate the air temperature around the water heater (ambient air temperature), DOE assigned the sampled water heaters a water heater installation location including indoors (in the living space, such as an indoor closet), basement, garages, crawlspaces, outdoor closets, attics, etc. These fractions vary significantly by region and type of home, and match available survey data. Once the water heater is assigned an installation location, DOE then uses a methodology to determine the surrounding water heater ambient temperature. For example, in indoor locations the temperatures are assumed to be equal to the thermostat temperature. Other locations such as unconditioned attics or unconditioned basements/crawlspaces, outdoor closets, garages could have temperatures that are either lower than 32 deg. or above 100 deg. for a fraction of the year. *See* chapter 7 and appendix 8D (installation costs) of the final rule TSD for more details about the installation location methodology and ambient temperature methodology.

ONE Gas commented that DOE responded that it uses test procedure energy descriptor performance to determine energy use that is then ''convert[ed] . . . to field energy use using modified WHAM equations,'' but ONE Gas's review of these procedures as found in appendix 7B of the Preliminary Analysis TSD suggests that the energy consumption estimates modeled do not meet the intent of the NASEM peer review, and DOE's response is effectively incomplete. ONE Gas recommended that DOE (1) use the test procedure assumptions of hot water consumption (based on the UEF draw patterns for residential water heating products) as the basis for comparing efficiency levels and alternatives for minimum efficiency standards, and (2) use WHAM calculations or other methods for scaling up efficiency level savings for the forecasted market under the ELs analyzed. (ONE Gas, No. 1200 at p. 9) In response, the appendix 7B in Preliminary Analysis TSD was merged in chapter 7 in NOPR TSD. Cross-reference pointing to appendix 7B for the energy use methodology in the TSD in the July 2023 NOPR was a typo DOE now has corrected. Description of the use of WHAM can be found in chapter 7 of the final rule TSD. As discussed in section IV.E.2 of this document, DOE determines that calculating the hot water use based on RECS reports presents a representative distribution of real world energy consumption and the use of WHAM equation is essential for translating energy consumption into hot water use. DOE maintains its methodology in this final rule to use RECS-reported water heating energy use and WHAM equation to calculate the corresponding energy use for each efficiency level of each product classed for sampled households/buildings.

For heat pump water heaters, energy efficiency and consumption are dependent on ambient temperature. To account for this factor, DOE expanded the WHAM to include a heat pump performance adjustment factor. The equation for determining the energy consumption of heat pump water heaters is similar to the WHAM equation, but a performance adjustment factor that is a function of the average ambient temperature is applied to adjust RE. In response to the July 2023 NOPR, Essency noted that the energy consumption model used in the analysis utilizes a recovery efficiency model that is too simplified and overestimated. They stated that the recovery efficiency model is a quadratic function with a minimum temperature of roughly 45 °F–50 °F which gives it a recovery efficiency at 37 °F, which Essency commented is a temperature where most of the current heat pump water heaters are working with electric resistance only. Essency also commented that the energy removed from the air is deducted in warmer months but this energy is not considered for cold months where the energy is removed from a heated space, which Essency asserted creates a bias in the published efficiency of heat pump water heaters. Essency also commented that the surrounding air temperature was used to calculate the efficiency of the heat pump even in the ducted configuration. (Essency, No. 1194 at p. 2) Armada argued that the energy savings are only realized under specific space and climate conditions, and

[67] If the heat pump water heater is installed in a conditioned space and is un-ducted, the cooling byproduct of the heat pump operation could produce a cooling effect that could increase space heating energy use in the heating season and decrease space cooling energy use in the cooling season. In addition, heat pump operation could also produce a dehumidifying effect that could reduce dehumidifier equipment energy use.

deviations from these ideal conditions diminish the efficiency of a heat pump water heater. Armada noted that many heat pump water heaters have back up electric resistance heating, and when these space and climate conditions are not met, the water heater will utilize resistance heating—all of the cost of a heat pump with none of the anticipated benefits. (Armada, No. 1193 at pp. 5–6) NRECA commented that stakeholders in cold climates are concerned about the effectiveness of heat pump water heaters during extreme cold events. In cold climates, and particularly during extreme cold events, heat pump water heater in garages or other unconditioned spaces would operate electric resistive heating elements for a large portion of the day, resulting in high energy use and reducing LCC savings. NRECA commented that cooperatives such as Agralite Electric Cooperative in Minnesota and Iowa Lakes Electric Cooperative in Iowa expressed concerns related to the energy the heat pump water heater removes from the home if installed in the conditioned space. Because the heat pump water heater draws its energy from the air in the home, the space heating system must resupply heat taken up by the heat pump water heater. (NRECA, No. 1127 at p. 12)

In response, DOE notes that the analyses account for the energy consumption when the heat pump water heater is operating on electric resistance mode. DOE estimated that the electric resistance mode of operation is used 100 percent of the time when the monthly ambient temperature is less than 32 °F or more than 100 °F. As Essency noted, DOE adjusts the recovery efficiency in a quadratic function to account for the changes in performance of the heat pump under different conditions. DOE slightly updated the adjustment function for this final rule so that when below 32 °F and above 100 °F the electric resistance mode is considered. DOE also modified the methodology to take into account the outdoor temperature in ducted setting per Essency's comment. A heat pump water heater also operates in the electric resistance mode for part of the time even when the monthly ambient temperature (where the equipment is installed) is between 32 °F and 100 °F because this product has a slower recovery rate than an electric resistance water heater. DOE determined that, depending on household hot water consumption patterns, the electric resistance mode of operation varies significantly from household to household; on average DOE estimated that electric resistance mode accounts for 10 percent of the heat pump water heater unit's operating time. Lastly, because of the cooling effect heat pump water heater can have during heating season, DOE also estimated that two-thirds of heat extracted from the air by the heat pump water heater is replaced by the space conditioning system, which was taken in account for the heating season.

Gas Association Commenters commented that there is a bug in the LCC tool that causes it to use only a single year of weather data rather than 10-year average. (Gas Association Commenters, No. 1181 at p. 34) In response, DOE notes that the analysis uses the NOAA's 30 year average weather data for the outside air temperature for all product classes.

Chapter 7 of the final rule TSD provides details on DOE's energy use analysis for consumer water heaters.

F. Life-Cycle Cost and Payback Period Analysis

DOE conducted LCC and PBP analyses to evaluate the economic impacts on individual consumers of potential energy conservation standards for consumer water heaters. The effect of new or amended energy conservation standards on individual consumers usually involves a reduction in operating cost and an increase in purchase cost. DOE used the following two metrics to measure consumer impacts:

- The LCC is the total consumer expense of an appliance or product over the life of that product, consisting of total installed cost (manufacturer selling price, distribution chain markups, sales tax, and installation costs) plus operating costs (expenses for energy use, maintenance, and repair). To compute the operating costs, DOE discounts future operating costs to the time of purchase and sums them over the lifetime of the product.
- The PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of a more-efficient product through lower operating costs. DOE calculates the PBP by dividing the change in purchase cost at higher efficiency levels by the change in annual operating cost for the year that amended or new standards are assumed to take effect.

For any given efficiency level, DOE measures the change in LCC relative to the LCC in the no-new-standards case, which reflects the estimated efficiency distribution of consumer water heaters in the absence of new or amended energy conservation standards. In contrast, the PBP for a given efficiency level is measured relative to the baseline product.

For each considered efficiency level in each product class, DOE calculated the LCC and PBP for a nationally representative set of housing units and commercial buildings. As stated previously, DOE developed household samples from the RECS 2020 and CBECS 2018. For each sample household and commercial building, DOE determined the energy consumption for the consumer water heaters and the appropriate energy price. By developing a representative sample of households and commercial buildings, the analysis captured the variability in energy consumption and energy prices associated with the use of consumer water heaters.

Inputs to the calculation of total installed cost include the cost of the product—which includes MPCs, manufacturer markups, retailer and distributor markups, shipping costs, and sales taxes—and installation costs. Inputs to the calculation of operating expenses include annual energy consumption, energy prices and price projections, repair and maintenance costs, product lifetimes, and discount rates. DOE created distributions of values for product lifetime, discount rates, and sales taxes, with probabilities attached to each value, to account for their uncertainty and variability.

The computer model DOE uses to calculate the LCC relies on a Monte Carlo simulation to incorporate uncertainty and variability into the analysis. The Monte Carlo simulations randomly sample input values from the probability distributions and consumer water heater user samples. For this rulemaking, the Monte Carlo approach is implemented in MS Excel together with the Crystal Ball™ add-on.[68] The model calculated the LCC for products at each efficiency level for 10,000 water heater installations in housing and commercial building units per simulation run. The analytical results include a distribution of 10,000 data points showing the range of LCC savings for a given efficiency level relative to the no-new-standards case efficiency distribution (as shown in chapter 8 of the final rule TSD). In performing an iteration of the Monte Carlo simulation for a given consumer, product efficiency is chosen based on its probability. At

[68] Crystal Ball™ is commercially-available software tool to facilitate the creation of these types of models by generating probability distributions and summarizing results within Excel, available at *www.oracle.com/technetwork/middleware/crystalball/overview/index.html* (last accessed December 1, 2023).

the high end of the range, if the chosen product efficiency is greater than or equal to the efficiency of the standard level under consideration, the LCC calculation reveals that the hypothetical consumer represented by that data point is not impacted by the standard level because that consumer is already purchasing a more-efficient product. At the low end of the range, if the chosen product efficiency is less than the efficiency of the standard level under consideration, the LCC calculation reveals that the hypothetical consumer represented by that data point is impacted by the standard level. By accounting for consumers who already purchase more-efficient products, DOE avoids overstating the potential benefits from increasing product efficiency.

DOE calculated the LCC and PBP for consumers of consumer water heaters as if each were to purchase a new product in the first year of required compliance with new or amended standards. New and amended standards apply to consumer water heaters manufactured 5 years after the date on which any new or amended standard is published. (42 U.S.C. 6295(m)(4)(A)(ii)) Therefore, DOE used 2030 as the first full year of compliance with any amended standards for consumer water heaters.

Table IV.25 summarizes the approach and data DOE used to derive inputs to the LCC and PBP calculations. The subsections that follow provide further discussion. Details of the spreadsheet model, and of all the inputs to the LCC and PBP analyses, are contained in chapter 8 of the final rule TSD and its appendices.

BILLING CODE 6450–01–P

Table IV.25 Summary of Inputs and Methods for the LCC and PBP Analysis*

Inputs	Source/Method
Product Cost	Derived by multiplying MPCs by manufacturer and retailer markups and sales tax, as appropriate. Used historical data to derive a price scaling index to project product costs.
Installation Costs	Baseline installation cost determined with data from RSMeans. Assumed no change with efficiency level.
Annual Energy Use	The total annual energy use multiplied by the hours per year. Average number of hours based on field data. Variability: Based on the RECS 2020 and CBECS 2018.
Energy Prices	Natural Gas: Based on EIA's Natural Gas Navigator data for 2022. Electricity: Based on EIA's Form 861 data for 2022. Propane and Fuel Oil: Based on EIA's State Energy Data System ("SEDS") for 2021. Variability: Regional energy prices determined for 50 states and District of Columbia for residential and commercial applications. Marginal prices used for natural gas, propane, and electricity prices.
Energy Price Trends	Based on *AEO2023* price projections.
Repair and Maintenance Costs	Based on RSMeans data and other sources. Assumed variation in cost by efficiency.
Product Lifetime	Based on shipments data, multi-year RECS, American Housing Survey, American Home Comfort Survey data.
Discount Rates	Residential: approach involves identifying all possible debt or asset classes that might be used to purchase the considered appliances, or might be affected indirectly. Primary data source was the Federal Reserve Board's Survey of Consumer Finances. Commercial: Calculated as the weighted average cost of capital. Primary data source was Damodaran Online.
Compliance Date	2030

* Not used for PBP calculation. References for the data sources mentioned in this table are provided in the sections following the table or in chapter 8 of the final rule TSD.

BILLING CODE 6450–01–C

1. Product Cost

To calculate consumer product costs, DOE multiplied the MSPs developed in the engineering analysis by the markups described previously (along with sales taxes). DOE used different markups for baseline products and higher-efficiency products, because DOE applies an incremental markup to the increase in MSP associated with higher-efficiency products.

Examination of historical price data for certain appliances and equipment that have been subject to energy conservation standards indicates that the assumption of constant real prices may, in many cases, overestimate long-term trends in appliance and equipment prices. Economic literature and historical data suggest that the real costs of these products may in fact trend downward over time according to ''learning'' or ''experience'' curves.[69]

In the experience curve method, the real cost of production is related to the cumulative production or ''experience'' with a manufactured product. This

[69] Desroches, L.-B., K. Garbesi, C. Kantner, R. Van Buskirk, and H.-C. Yang. Incorporating Experience Curves in Appliance Standards Analysis. *Energy Policy*. 2013. 52 pp. 402–416; Weiss, M., M. Junginger, M.K. Patel, and K. Blok. A Review of Experience Curve Analyses for Energy Demand Technologies. *Technological Forecasting and Social Change*. 2010. 77(3): pp. 411–428.

experience is usually measured in terms of cumulative production. As experience (production) accumulates, the cost of producing the next unit decreases. The percentage reduction in cost that occurs with each doubling of cumulative production is known as the learning rate. In typical experience curve formulations, the learning rate parameter is derived using two historical data series: cumulative production and price (or cost). DOE obtained historical PPI data for water heating equipment from 1950–1961, 1968–1973, and 1977–2022 for electric consumer water heaters and from 1967–1973 and 1977–2022 for all other consumer water heaters from the U.S. Bureau of Labor Statistics' (''BLS'').[70] The PPI data reflect nominal prices, adjusted for product quality changes. An inflation-adjusted (deflated) price index for heating equipment manufacturing was calculated by dividing the PPI series by the implicit price deflator for Gross Domestic Product Chained Price Index.

From 1950 to 2006, the deflated price index for consumer water heaters was mostly decreasing, or staying flat. Since then, the index has risen, primarily due to rising prices of copper, aluminum, and steel products which are the major raw material used in water heating equipment. The rising prices for copper and steel products were attributed to a series of global events, from strong demand from China and other emerging economies to the recent severe delay in commodity shipping due to the COVID–19 pandemic. Given the slowdown in global economic activity in recent years and the lingering impact from the global pandemic, DOE believes that the extent to which the trends of the past five years will continue is very uncertain. DOE also assumes that any current supply chain constraints are short-lived and will not persist to the first year of compliance. Given the uncertainty regarding the magnitude and direction of potential future price trends, DOE decided to use constant prices as the default price assumption to project future consumer water heater prices. Thus, projected prices for the LCC and PBP analysis are equal to the 2022 values for each efficiency level in each product class. However, DOE performed a sensitivity analysis utilizing both a decreasing and an increasing price trend (see appendix 8C). The relative comparison of potential standard levels remains the same regardless of which price trend is utilized and the conclusions of the analysis do not change.

BWC requested that DOE detail its methods in utilizing price learning curves for both heat pump water heater and condensing gas products, as was indicated in Section IV(F)(1) of the July 2023 NOPR, so that stakeholders may review them. BWC suggested the additional components required to manufacture higher efficiency products required by this proposal, in addition to their more complex manufacturing processes, will continue to compel higher product costs than is currently expected of non-condensing gas and electric resistance water heaters common in the market today, economies of scale notwithstanding. (BWC No. 1164 at p. 17) The available data only allow estimation of price trends for water heaters as a group, not for different efficiency levels of water heaters. DOE agrees that the product costs of heat pump water heater and condensing gas products will continue to be higher than non-condensing gas and electric resistance water heaters. However, it is reasonable to expect that factors affecting water heaters as a whole, such as growing experience in production or changes in commodity prices, will affect all water heaters. Thus, for this final rule, it used the same price trend projection for all water heaters.

2. Installation Cost

The installation cost is the cost to the consumer of installing the consumer water heater, in addition to the cost of the water heater itself. The cost of installation covers all labor, overhead, and material costs associated with the replacement of an existing water heater or the installation of a water heater in a new home, as well as delivery of the new water heater, removal of the existing water heater, and any applicable permit fees. Higher-efficiency water heaters may require consumers to incur additional installation costs.

DOE's analysis of installation costs estimated specific installation costs for each sample household based on building characteristics given in RECS 2020 and CBECS 2018. For this final rule, DOE used 2023 RSMeans data for the installation cost estimates, including labor costs.[71] [72] [73] [74] DOE's analysis of installation costs accounted for regional differences in labor costs by aggregating city-level labor rates from RSMeans into 50 U.S. States and the District of Columbia to match RECS 2020 data and CBECS 2018 data.

PHCC stated that the costs calculated for the installation costs are too low. PHCC commented that the data source RSMeans is intended for larger contractor businesses and the data has not been properly adjusted for small businesses. PHCC noted a discrepancy in the water heater installation time between their RSMeans source and DOE's report. (PHCC, No. 1151 at p. 4) PHCC stated that the values listed in the overhead category for costs are not correct and questioned the 10% profit, believing it to be understated. PHCC commented that the overhead category will include office utilities and rent, support staff, supervisors, estimators, advertising, truck and tool acquisition expenses, fuel and maintenance, technician non-productive time and depreciation. PHCC estimated that vehicle and tooling can be 15% to 20% of a technician's hourly rate. PHCC commented that DOE's assumption of $27 per hour overhead for 1 residential plumber is too low. (PHCC, No. 1151 at p. 5) In response, RSMeans is a reputable source for cost estimation and it provides the national average labor rate for different crew types as well as regional rates, regardless of business size. DOE acknowledges that some individual contractors may depart from cost estimates determined by RSMeans, however RSMeans remains the most comprehensive and nationally representative data source for contractor rates and costs. The RSMeans database includes tens of thousands of individual line items and cost engineers spend tens of thousands of hours validating these costs every year. Thousands of contractors rely on RSMeans to determine cost estimates.[75] DOE adjust the labor rates for different regions based on where the sample household or building is located. In regards to PHCC's concern over the labor rate and overhead, DOE notes that the $27 per hour overhead for a residential plumber is pointing to 63% markup compared to the bare hourly rate. Taking into account regional difference, the exact

dollar value of the markup increases for regions with labor rates higher than national average. For this final rule, DOE maintained the method of calculating labor rates as used in the July 2023 NOPR.

a. Basic Installation Costs and Inputs

First, DOE estimated basic installation costs that are applicable to all consumer water heaters, in replacement, new owner, and new home or building installations. These costs include putting in place and setting up the consumer water heater, gas piping and/or electrical hookup, permits, water piping, removal of the existing consumer water heater, and removal or disposal fees.

NMHC and NAA commented that in existing or future commercial-to-residential conversions, by the nature of the building construction, historic building considerations or zero lot lines result in building facades that are frequently not available for vent terminations. They claimed that these buildings may be taller than a new residential building and existing structural frame geometries and shaft locations significantly influence dwelling unit configurations, in which cases new vent piping or condensate drains may need to traverse space outside of the affected dwelling unit to reach a building shaft with sufficient space to add piping. NMHC and NAA claimed that such piping runs will virtually always exceed the lengths cited for cost-analysis in the TSD and entail substantial additional costs unconsidered by DOE. (NMHC and NAA, No. 996 at p. 4) Gas Association Commenters argued that the installation cost did not address the breadth of existing multifamily configurations like high-rise, low-rise buildings, historic structures and adaptive reuse projects (*i.e.,* commercial to residential conversions). (Gas Association Commenters, No. 1181 at p. 4) In response, DOE notes that current shipments of consumer water heaters to commercial buildings are small, approximately 5 percent of total shipments (see chapter 9 of final rule TSD). These are typically small offices, restaurants, or smaller retailers with similar hot water demand to residential households, otherwise they would be utilizing commercial water heating equipment outside the scope of this final rule. Any existing commercial-to-residential building conversions would be present in the CBECS 2018. Any future commercial-to-residential conversions are speculative at this time. Even if vent piping for gas-fired water heaters were prohibitive for a given building, electric water heaters are available to supply hot water at lower cost to each individual unit, so there is no reason to expect substantially higher costs for these residential units. Their impacts would be very similar to those estimated for medium ESWH in new construction and/or multi-family buildings and thus captured by the analysis. Furthermore, if the existing commercial building utilizes a central commercial boiler to supply hot water, DOE expects that such building conversions will take advantage of the existing central commercial boiler system to supply hot water to the newly built residential units. Also, in order to satisfy the building codes, these conversions typically require very extensive reconstructions including building new central shafts that accommodate all of the piping and vents related to plumbing, HVAC and water heating needs. These shafts could serve the condensation withdrawal as required for the heat pump water heaters or condensing gas water heaters. In regards to the length of the piping runs, DOE's analysis includes a distribution of a wide range of piping length which covers the additional piping requirements. Regarding existing multi-family buildings, DOE clarifies that the analysis does include costs separately for multi-family buildings of various sizes (see appendix 8D), and the RECS sample includes such multi-family buildings, therefore they are captured in the LCC analysis. The majority of multi-family buildings utilize electric storage water heaters.

b. Gas-Fired and Oil-Fired Storage Water Heater Installation Costs

For gas-fired and oil-fired water heater installations, DOE included a number of additional costs (''adders'') for a fraction of the sample households. Most of these additional cost adders are associated with installing higher efficiency consumer water heater designs in replacement installations.

For replacement installations, DOE conducted a detailed analysis of installation costs when a baseline (or minimum efficiency) consumer water heater is replaced with higher efficiency design options, with particular attention to space constraint issues (associated with larger dimensions for certain higher efficiency consumer water heaters), venting issues, and condensate withdrawal (for power vented and condensing gas-fired water heaters). Due to the larger dimensions of higher efficiency storage water heaters, installation adders included removing and replacing door jambs (to be able to fit the larger sized water heater). DOE also takes into account that a fraction of installations would include adding tempering valves for water heaters with increased set-point temperatures due to the household preference. For non-condensing gas-fired and oil-fired water heaters, additional costs included updating flue vent connectors, vent resizing, and chimney relining. For non-condensing power vented and condensing gas-fired storage water heaters, additional costs included adding a new flue vent, combustion air intake for direct vent installations, concealing vent pipes for indoor installations, addressing an orphaned furnace (by updating flue vent connectors, vent resizing, or chimney relining), and condensate removal. Freeze protection is accounted for in the cost of condensate removal for a fraction of condensing gas-fired water heaters installed in non-conditioned spaces.

DOE also included installation adders for new owner and new construction installations. For non-condensing gas-fired and oil-fired storage water heaters, a new flue vent and accounting for other commonly vented heating appliances are the only adders. For power vented and condensing gas-fired water heaters, the adders include new flue vent, combustion air vent for direct vent installations, and condensate removal.

ONE Gas commented that venting costs are systematically under-estimated but did not provide more data. ONE Gas argued that the Department does not provide illustrations of the full range of site conditions covered or confirmation data for its distributional data. (ONE Gas, No. 1200 at p. 10) ONE Gas argued that the Department uses a simplistic presumption of single-family household replacement installation requirements (*e.g.,* venting into masonry chimneys, common venting with furnace) for multifamily households whose water heater vents atmospherically into a common vent shared with other households, which neglects various concerns. (ONE Gas, No. 1200 at p. 10) PHCC requested clarification on the language on page 8D–7 of the NOPR TSD surrounding masonry chimneys. PHCC commented that the language gets confusing as it discusses lined masonry chimneys but then considers metal lining systems. PHCC noted that masonry chimneys must be tile lined for gas venting and it is unclear if DOE views the use of a flexible metal liner kit as a lined chimney. Furthermore, PHCC indicated the need for more clarification on the use of flexible liners in chases, as those chases should contain metallic double wall vents. Finally, PHCC requested clarification on the discussion surrounding isolated water heaters that

are not gas-fired nor vented products, as PHCC is not clear on why they are called isolated and what their relationship is with common venting. (PHCC, No. 1151 at p. 3)

In response, DOE notes that sources and references used in the analysis for deriving the methodology are presented in chapter 8 of the TSD and its appendices. DOE is aware that in some multifamily buildings, existing non-condensing storage water heaters of more than one unit can be commonly vented with other equipment vented using a Category I vent. In some cases, replacement of one water heater may require re-assessment of the shared vent path. However, this final rule does not require a condensing level for gas storage water heaters. DOE notes that it is challenging to acquire data on how frequently water heaters are commonly vented in multifamily buildings that allow DOE to statistically account for the cost impact on its own. DOE estimates, however, certain fractions by region where chimney venting is applied and believes that, besides those typical cases where chimney venting is shared by a water heater and a furnace, those installation cases have captured to some extent the costs applicable for vent path reassessment. In regards to the PHCC's comment on appendix 8D of NOPR TSD, to clarify, DOE accounts for different types of venting used in the field; venting through a masonry chimney and venting through a metal vent going through the roof are both included. For venting in the masonry chimney, DOE takes into account the cost for relining the chimney and venting for orphaned furnace/boiler where applicable in retrofits. Specifically, when venting through the chimney, DOE accounts for the cost of chimney re-lining and resizing of the vent connector should the retrofit require that. Additionally, ''isolated'' water heaters as explained in the documentation refer to water heaters that are not commonly vented or do not require venting at all, for which there are no common venting related costs considered. See chapter 8 and appendix 8D of the final rule TSD for details.

CHPK stated that the modification associated with increasing insulation, the addition of a thermal flue damper, or an electronic ignition and an electronic flue damper would require an electric supply to gas-fired storage water heaters, and would potentially reduce vent temperatures resulting in excessive condensation developing in the vent. According to CHPK, these modifications would result in additional costs of providing an electric outlet for gas storage water heaters in a replacement situation and perhaps venting issues. (CHPK, No. 1008 at p. 1) DOE took into account in the calculation of installation costs the issues CHPK raised and applied a cost adder for an electric outlet and condensate treatment for the efficiency levels that require those.

Regarding statements from some stakeholders that significant installation barriers are associated with gas condensing water heaters, the CA IOUs referred DOE to a report docketed in 2019 titled ''Investigation of Installation Barriers and Costs for Condensing Gas Appliances.'' Key findings from this report indicate that these challenges impact less than 5 percent of condensing gas retrofit installations for residential and commercial applications, and that condensate management and chimney relining were minor concerns for installing gas condensing products. (CA IOUs, No. 1175 at p. 2) DOE agrees that installation challenges will impact only a subset of consumers, and even in those cases, DOE has included additional installation costs into the analysis.

c. Heat Pump Water Heater Installation Costs

For heat pump water heater installations, DOE included a number of adders for a fraction of the sample households. Most of these adders are associated with installing heat pump water heaters in replacement installations.

For replacement installations, DOE conducted a detailed analysis of installation costs when a baseline consumer water heater is replaced with higher efficiency designs, with particular attention to space constraint issues (associated with larger dimensions for heat pump water heaters compared to electric resistance water heaters), condensate withdrawal, and ductwork for heat pump water heaters installed in conditioned spaces. To address the larger dimensions of heat pump water heaters, installation adders included removing and replacing door jambs (to be able to fit the larger sized water heater) or relocating water heater. Freeze protection is accounted for in the cost of condensate removal for a fraction of heat pump water heaters installed in non-conditioned spaces. DOE also included condensate removal installation adders for new owner and new construction heat pump water heater installations. DOE also accounted for the airflow requirements as specified in manufacturer installation manuals in its installation cost model. The additional costs of adding louvered doors, venting, or relocating a water heater are included for a fraction of installations, mainly for heat pump water heaters installed in indoor locations. See appendix 8D of the final rule TSD for more details.

PHCC commented that DOE acknowledges that up to 40% of installations could face space constrained heat pump installations and the suggestion that DOE provides to use louvered doors may not be applicable to all installations and the use of ducted air installations should be accounted for. (PHCC, No. 1151 at p. 4) PHCC noted that on page 8D–6 of NOPR TSD there are no modifications to remove and replace door jambs for basements and garages, but plumbing, building and mechanical codes require doorways to be of sufficient size to replace equipment without future removal of doors and door frames. (PHCC, No. 1151 at p. 3) NMHC and NAA noted that DOE's suggestion that it may be possible to ignore manufacturers' specified volume of space for heat pump water heater installation based on ''current research'' is not acceptable as it conflicts with building code requirements to comply with manufacturer's instructions. NMHC and NAA also commented that DOE's suggestion for installation of heat pump water heaters by replacing utility closet doors with louvered doors is not viable as it ignores the impacts of increases in equipment noise in the smaller area of the typical apartment home. (NMHC and NAA, No. 996 at p. 4) Essency argued that the cost of moving the heat pump water heater was not calculated as there are significant additional electrical, plumbing, and other construction work that are required. (Essency, No. 1194 at p. 2) EEI commented that it is important to recognize that installing heat pump water heater units in space-constrained areas (like closets or under stairs or in crawl spaces) will require significant retrofit costs given heat pump water heaters' physical operating requirements and the potential need for additional equipment. EEI commented that non-ducted heat pump water heaters require at least 700 cu ft of space to operate properly and achieve DOE's estimated efficiency levels, as shown in manufacturer specifications. EEI noted that 10 to 40 percent of water heaters are located in closets based on a survey by Southern Company. EEI commented that DOE's analysis does not include a realistic cost estimate for replacing electric resistance water heaters with heat pump water heaters in closets where walls, ceilings, and doors must be removed and replaced or ductwork

added in space constrained areas. EEI argued that DOE's analysis does not accurately account for the replacement costs in other space-constrained environments such as crawl spaces, attics, utility rooms, or laundry rooms (EEI, No. 1198 at pp. 5–6) Armada argued that ideal efficiency conditions for heat pump water heaters require 1000 cubic feet of air. Armada argued that many homes cannot support such space demands, and use of heat pump water heaters will increase home heating costs for many consumers, diminishing any savings. Armada argued that only in very rare circumstances would consumers be able to quickly replace an electric storage water heater in an emergency, as many homes will require construction to accommodate the space and environment requirements of a heat pump water heater such as installing louvered doors or building ductwork. (Armada, No. 1193 at p. 6)

In response to the preceding comments, DOE notes that the analysis takes into account the cost of moving the water heater to a different location or adding a louvered door for some installations. In the field, plumbers would guide the customers to select a way that works for them. In the analysis, DOE acknowledges the possible occurrence of those additional costs and on top of those DOE also applied a distribution of installation cost adders that ranges from $0 to $4,000 in total for the most challenging installations, averaging $2,000 (see appendix 8D).

NRECA commented that manufactured and small homes experience greater impact from both noise and cold air exhaust than larger homes that have more space to isolate the noise of the water heater and more air volume to buffer cold air exhaust. They commented that constrained spaces may not have enough room for mitigation measures such as supply and exhaust air ducting or noise dampening equipment. NRECA added that consumers will not welcome any increase in their electricity bills resulting from their heating system needing to work harder because of the heat pump water heater drawing on the warm air as its heat source. (NRECA, No. 1127 at p. 6). NRECA commented that manufactured and small homes will face unique installation challenges with heat pump water heaters. They noted that small and manufactured homes in NRECA member territories typically use 40- to 50-gallon lowboys, tall tanks, or tanks specifically designed for manufactured home closets, and that although DOE created a small electric storage water heater product class that covers some lowboy products this does not include tank sizes and form factors that electric cooperatives typically observe in space constrained spaces. NRECA cited the La Plata Electric Association (''LPEA'') pilot study where 20 heat pump water heaters were installed in owner-occupied manufactured homes and due to the complexity of installation, concluded that a majority of manufactured homes are not good candidates for a heat pump water heater. NRECA stated that although heat pump water heaters can be installed in some constrained spaces, they are likely not the best option when they cause high installation costs, noise and cold air impacts, and potentially unsightly installations to make the heat pump water heater fit a space that was never designed to accommodate it, and there often is no other available space in a small home to relocate the water heater, and reducing tank size can cause negative user experience. (NRECA, No. 1127 at pp. 6–7) NRECA commented that because low-and-moderate income consumers disproportionately face complex installations, they are likely to disproportionately bear costs rather than savings as a result of the proposed rule and they received multiple examples from electric cooperatives illustrating that installation costs are far higher than DOE's estimates. (NRECA, No. 1127 at p. 8)

NEEA noted that its research shows that heat pump water heaters can be installed in a wide range of conditions and climates, including very cold climates, and continue to deliver significant energy savings. (NEEA, No. 1199 at pp. 3–4) NEEA commented that its research supports DOE's installation cost analysis. (NEEA, No. 1199 at p. 7). However, BWC highlighted that NEEA is a regional organization that operates its programs primarily in the Northwestern United States and only included those consumers who had already made the decision to take advantage of available heat pump water heater rebate programs. (BWC, No. 1164 at p. 20)

In response, DOE acknowledges that manufactured homes and small homes typically have greater challenges in installing a heat pump water heater. Installing a heat pump water heater in such homes may require additional installation costs, as described above, more so than an average single-family home. The LCC analysis accounts for the higher installation costs for such homes. However, in many cases, such homes can utilize a small electric storage water heater instead of a heat pump water heater, significantly reducing their total installed cost. In terms of the cooling effect of the heat pump module, DOE took that into account in its energy use analysis the additional heating it might need in compensation, as discussed in section IV.E.3 of this document. DOE acknowledges that for low income homeowners, higher installation costs would indeed need more years of energy savings to pay back or may even lead to net cost, and this is accounted for in the overall LCC results. For renters, since they won't bear the first cost, it will more likely be economically beneficial (as discussed in section IV.I.1 of this document).

In the July 2023 NOPR, DOE did extensive revisions to its installation cost model to include installations of low-boy water heaters. DOE estimated around 10 percent of the total 20 to 55 gallon electric storage water heater market to be low boy water heaters. DOE assessed that many of these installations would require significant installation costs in order to install a heat pump water heater. DOE notes that at the proposed standard, most models currently serving the small electric water heater market will remain available.

A.O. Smith argued that retrofit costs associated with space-constrained installs are under-represented, especially for the lowboy electric resistance water heater to heat pump water heater transition. A.O. Smith also argued that undersizing an electric storage water heater (''ESWH'') and raising the temperature would not be possible in scenarios where a heat pump water heater would not fit in a confined space (which represents half of the modeled outcomes). A.O. Smith stated that while the difference in size for tall ESWH replacements is accounted for with a ~3 inch diameter increase, this same change is not accounted for in a substantial way for lowboys which present an even greater size constraint challenge. (A.O. Smith, No. 1182 at pp. 8–9) A.O. Smith pointed out that they could not find the referenced ''review of studies'' mentioned in Appendix 8D of the NOPR TSD which was supposed to include a literature review and a comparison of results of studies (related to lowboy costs) in response to previously submitted comments. (A.O. Smith, No. 1182 at p. 9) AHRI commented that DOE is not adequately considering the retrofit costs associated with space constrained retrofits. Specifically, DOE did not consider the added product and installation costs that would be faced by homeowners when replacing medium draw pattern lowboy or ''short'' electric resistance water heater with a heat pump water

heater. AHRI noted that consumers would not have the option to install an over-heated tank in lieu of facing space constrained scenarios as electric resistance storage water heaters with the capability of being overheated will not be permitted under the proposed energy conservation standard. AHRI stated that replacement of a lowboy with a heat pump would require the use of a more expensive split heat pump and would have additional installation costs. (AHRI, No. 1167 at p. 7)

DOE is aware of the challenges of replacing a low boy water heater with a heat pump water heater, especially in confined space and in small homes or manufactured homes. As discussed above and in the July 2023 NOPR, DOE applied significant installation cost adders to those installations to encompass the additional labor hour and materials needed to install such water heaters.

A.O. Smith argued that DOE did not fully account for the increased product and installation costs associated with split-system heat pump water heater designs that would be used to replace lowboy installations. A.O. Smith recommended that DOE incorporate higher product and installation costs associated with split designs for 13.7 percent of shipments in the medium electric storage water heater product class. (A.O. Smith, No. 1182 at p. 9) For this final rule DOE conducted further research on installing a heat pump water heater in a split system configuration. Currently there are not many models available for split system configuration and thus there are limited installation examples. DOE maintained its main analytical approach while adding a local installation cost sensitivity analysis for installing a split system heat pump water heater. Specifically, DOE modeled the cost line items needed for the installation of a 44-gallon low boy tank with a split heat pump module, which is a commonly used lowboy tank size for medium ESWHs. Appendix 8D of the final rule TSD provides more details on this sensitivity analysis. In summary, DOE found that the installation costs of a split system heat pump water heater are not necessarily higher than an integrated heat pump in a constrained space. Since DOE already applies a significant adder to the installation of an integrated heat pump water heater in these households, the overall average LCC savings would be more positive for the adopted heat pump level had DOE included this split heat pump option for medium electric storage water heaters in the main analysis. Even though the retail price for a split system heat pump water heater may be higher than an integrated heat pump, the lower installation cost for a split system heat pump water heater compared to an integrated heat pump water heater in a confined space and in small homes or manufactured homes is likely to result in an overall lower total installed cost. Should the market include more split heat pump models in the future, the likely cost impacts will decrease for consumers with water heaters in a confined space and in small homes or manufactured homes.

A.O. Smith argued that DOE's analysis assumed that all water heaters in manufactured homes are 30 gal and therefore did not account for the costs of these units transitioning to heat pump levels. A.O. Smith also pointed out that DOE acknowledges that 40 gal are also common standards for manufactured homes. (A.O. Smith, No. 1182 at p. 10) In response, DOE notes that the statement A.O. Smith was referencing was in a consultant report, where 30 gallon was only an example made to represent the cost breakdown of water heaters typically used in mobile homes. In DOE's actual analysis, different standard sizes were considered (see section IV.E.2 for more information).

Rheem found the reported installation costs for heat pump water heater to be lower than expected, but the incremental installation costs between EL 0 and EL 3 aligned with their internal installation cost data. Rheem noted that as operation at high tank temperatures is expected to be representative of electric resistance water heater operation, the installation of a mixing valve should be included in DOE's analysis. (Rheem, No. 1177 at p. 9) DOE has found that for some applications mixing valves are currently being used in order to have higher hot water temperature for dishwashers or clothes washers, to provide more hot water capacity, and to reduce bacterial growth, while making sure the delivered water is within a safe range.[76] Some water heaters have internal mixing valves that are meant to increase available hot water. In some cases, mixing valves could be used to address the increased hot water needs when the number of people in the household increases without replacing the entire water heater. DOE's updated test procedure includes a method to test water heaters in the highest storage tank temperature mode, which would be more representative for these types of installations (this is discussed more in section V.D.1). DOE's analysis in this final rule accounts for a fraction of installations that utilize a mixing valve.

[76] See *www.geappliances.com/appliance/GE-Smart-50-Gallon-Electric-Water-Heater-with-Flexible-Capacity-GE50S10BMM.*

3. Annual Energy Consumption

For each sampled household and building, DOE determined the energy consumption for consumer water heaters at different efficiency levels using the approach described previously in section IV.E of this document.

Higher-efficiency water heaters reduce the operating costs for a consumer, which can lead to greater use of the water heater. A direct rebound effect occurs when a product that is made more efficient is used more intensively, such that the expected energy savings from the efficiency improvement may not fully materialize. At the same time, consumers benefit from increased utilization of products due to rebound. Although some households may increase their water heater use in response to increased efficiency, DOE does not include the rebound effect in the LCC analysis because the increased utilization of the water heater provides value to the consumer. DOE does include rebound in the NIA for a conservative estimate of national energy savings and the corresponding impact to consumer NPV. See chapter 10 of the FR TSD for more details.

4. Energy Prices

Because marginal energy price more accurately captures the incremental savings associated with a change in energy use from higher efficiency, it provides a better representation of incremental change in consumer costs than average electricity prices. Therefore, DOE applied average energy prices for the energy use of the product purchased in the no-new-standards case, and marginal energy prices for the incremental change in energy use associated with the other efficiency levels considered.

DOE derived average monthly marginal residential and commercial electricity, natural gas, and LPG prices for each state using data from EIA.[77] [78] [79]

[77] U.S. Department of Energy-Energy Information Administration, Form EIA–861M (formerly EIA–826) detailed data (2022) (Available at: *www.eia.gov/electricity/data/eia861m/*) (Last accessed December 1, 2023).

[78] U.S. Department of Energy-Energy Information Administration, Natural Gas Navigator (2022) (Available at: *www.eia.gov/naturalgas/data.php*) (Last accessed December 1, 2023).

[79] U.S. Department of Energy-Energy Information Administration, State Energy Data System (''SEDS'') (2021) (Available at: *www.eia.gov/state/seds/*) (Last accessed December 1, 2023).

DOE calculated marginal monthly regional energy prices by: (1) first estimating an average annual price for each region; (2) multiplying by monthly energy price factors, and (3) multiplying by seasonal marginal price factors for electricity, natural gas, and LPG. The analysis used historical data up to 2022 for residential and commercial natural gas and electricity prices and historical data up to 2021 for LPG and fuel oil prices. Further details may be found in chapter 8 of the final rule TSD.

GAAS argued that DOE has not fully responded to their previous suggestion of using the CMER (Consumer Marginal Energy Rates) method for energy prices. (GAAS, No. 1139 at p. 1)

DOE has evaluated other estimates of marginal energy prices but maintains its approach in the final rule, since the data used to develop those prices are nationally representative. Stakeholders have previously proposed alternative methods and data to estimate marginal natural gas prices. However, DOE compared its seasonal marginal price factors developed from the EIA data to marginal price factors for 23 gas tariffs provided by the Gas Technology Institute for the 2016 residential boilers energy conservation standards rulemaking. DOE found that the winter price factors used by DOE are generally comparable to those computed from the tariff data, indicating that DOE's marginal price estimates are reasonable at average usage levels. The summer price factors are also generally comparable. Of the 23 tariffs analyzed, eight have multiple tiers, and of these eight, six have ascending rates and two have descending rates. The tariff-based marginal factors use an average of the two tiers as the commodity price. A full tariff-based analysis would require information about the household's total baseline gas usage (to establish which tier the consumer is in), and a weight factor for each tariff that determines how many customers are served by that utility on that tariff. These data are generally not available in the public domain. DOE's use of EIA State-level data effectively averages overall consumer sales in each State, and so incorporates information from all utilities. DOE's approach is, therefore, more representative of a large group of consumers with diverse baseline gas usage levels than an approach that uses only tariffs. DOE notes that within a State, there could be significant variation in the marginal price factors, including differences between rural and urban rates. In order to take this to account, DOE developed marginal price factors for each individual household using RECS 2015 billing data. These data are then normalized to match the average State marginal price factors, which are equivalent to a consumption-weighted average marginal price across all households in the State. DOE's methodology allows energy prices to vary by sector, region and season. For more details on the comparative analysis and marginal price analysis, see appendix 8E of the final rule TSD.

To estimate energy prices in future years, DOE multiplied the 2022 energy prices by the projection of annual average price changes for each of the 50 U.S. states and District of Columbia from the reference case in *AEO2023,* which has an end year of 2050.[80] To estimate price trends after 2050, DOE used the average annual growth rate in prices from 2046 to 2050 based on the methods used in the 2022 Life-Cycle Costing Manual for the Federal Energy Management Program (''FEMP'').[81]

AWHI suggested that the CA IOUs outline a price forecast scenario that more accurately accounts for future changes in energy costs. (AWHI, No. 1036 at p. 4) Gas Association Commenters argued that energy price assumptions from AEO are consistently overestimated and therefore should not be used (70% of the time was an overestimate for residential and 86% of the time was an overestimate for commercial sector between the 2010 and 2023 AEO projections). They argued that a distribution of prices should be used and not a forecasted mean. (Gas Association Commenters, No. 1181 at p. 34) Rinnai stated that DOE's average and marginal consumer energy price forecasts (from EIA) for electricity and gaseous fuels have historically overstated prices (particularly for natural gas). Rinnai stated that DOE should instead use energy prices employed in the Federal Trade Commission (''FTC'') Energy Guide labels because the uncertainty of applying forecasted prices shouldn't be primary drivers of LCC costs/savings and because FTC's use of AEO energy prices is audited annually and approved as published in the **Federal Register** prior to use for the EnergyGuide program. (Rinnai, No. 1186 at pp. 26–28) ONE Gas argued that consumer energy price forecasts from the *AEO* have been shown to be notoriously unreliable from forecasting year to forecasting year, and they systematically overpredict natural gas prices over time. (ONE Gas, No. 1200 at pp. 10–11) In response, DOE relies on AEO forecast for the energy price projection across appliance standards work as a cross-cutting methodology. Current energy prices are developed using other EIA data sources as described above. DOE acknowledges that it is difficult to project the future trend for any source given the uncertainty and unpredictability. However, AEO 2023 projects relatively flat energy price trends out to 2050 (see appendix 8E). AEO as issued by EIA remains the most comprehensive and trustworthy source and DOE maintains its methodology for this final rule. The energy prices developed for FTC are consistent with DOE's development of current energy prices (although here the analysis relies on marginal energy prices).

5. Maintenance and Repair Costs

Repair costs are associated with repairing or replacing product components that have failed in an appliance; maintenance costs are associated with maintaining the operation of the product. Typically, small incremental increases in product efficiency produce no, or only minor, changes in repair and maintenance costs compared to baseline efficiency products. DOE included additional maintenance and repair costs for higher efficiency consumer water heaters (including maintenance costs associated with condensate withdrawal, heat pump component filter cleaning, and deliming of the heat exchanger and repair costs associated with electronic ignition, controls, and blowers for fan-assisted designs, compressor, evaporator fan) based on 2023 RSMeans data.[82] DOE accounted for regional differences in labor costs by using RSMeans regional cost factors.

Ravnitzky stated that non-heat pump water heaters are less likely to require maintenance or repair than heat pump water heaters because they have a less complex design with fewer moving parts. (Ravnitzky, No. 73 at p. 1) Essency argued that maintenance costs are underestimated for heat pump water heaters because the lifetime of some components in heat pump water heaters will require replacements of parts once the heater is out of warranty. (Essency, No. 1194 at p. 3) Rheem voiced support

for DOE's handling of operational and maintenance costs over the life of the water heater. (Rheem, No. 1177 at p. 9)

In response to Ravnitzky, research conducted by DOE has not shown that heat pump water heaters have different lifetimes than electric resistance storage water heaters. DOE has factored any additional maintenance or repair costs into the LCC. DOE takes into account replacement of certain parts after the warranty period. For the replacement of the heating element (which Essency provided as an example in its comment), the replacement cost is accounted for the fraction where it occurs and annualized across the years of use. The repair and maintenance cost summary in the final rule TSD represents the average cost with some households experiencing more or less than the reported value.

6. Product Lifetime

Product lifetime is the age at which an appliance is retired from service. DOE conducted an analysis of water heater lifetimes based on the methodology described in a journal paper.[83] For this analysis, DOE relied on RECS 1990, 1993, 2001, 2005, 2009, 2015, and 2020.[84] DOE also used the U.S. Census's biennial American Housing Survey (''AHS''), from 1974–2021, which surveys all housing, noting the presence of a range of appliances.[85] DOE used the appliance age data from these surveys, as well as the historical water heater shipments, to generate an estimate of the survival function. The survival function provides a lifetime range from minimum to maximum, as well as an average lifetime. DOE estimates the average product lifetime to be around 15 years for storage water heaters.

Stanonik argued that increased average lifetimes for consumer storage water heaters are calculated estimates rather than based on field data thus leading to overstatements of average lifetime. Stanonik also argued that the increased complexity of newer products realistically would result in shorter lifetimes and more scenarios where ''replace'' might be a cheaper alternative than ''repair,'' and that these scenarios are not reflected well in the analysis. (Stanonik, No. 1197 at p. 2) NMHC and NAA noted that AHRI assumes a 10–13 year lifespan for water heaters, which is less than DOE's estimated lifetime. (NMHC and NAA, No. 996 at p. 6) DOE has conducted an extensive literature review, including studies and surveys and warranty information, to determine its product lifetimes, as discussed in appendix 8G. DOE also utilizes Weibull distribution for the product lifetime to capture the field variations.

Noritz disputed that condensing and non-condensing products have the same average lifespan based on their internal testing. Noritz argued that the less complex nature of the non-condensing product in their testing typically lasts between 10 and 20 percent longer than a similar condensing product. Noritz argued that the analysis conducted by DOE that proposes the average lifespan of the two products to be identical will impact the LCC and payback analysis. (Noritz, No. 1202 at p. 3). In response, DOE has not found any evidence in its research pointing to a significantly different lifespan for the two types of water heaters. As described in appendix 8G, the data sources cited did not indicate any systematic decrease in lifetime for gas-fired condensing products. For this final rule, DOE maintains its methodology of assuming the same lifetime within product classes.

BWC noticed that the 2010 rulemaking reports an average lifetime of 13 years, rather than the assumed 15 years in the current rulemaking. BWC claimed that the lower product lifetime conclusions reached by DOE in the 2010 rulemaking appear to be more consistent with the evidence presented in the NOPR TSD. Specifically, in Figure 8G.4.6 in the TSD, the inflection points of the curves in this figure more closely align with the assumed product lifetimes established as part of DOE's 2010 rulemaking, and in the case of electric storage water heaters, indicate a product lifetime that is lower still. The assumed lifetime of 13 years for heat pump water heater products is also shared by the ENERGY STAR program in its materials that promote these products. BWC requested that DOE elaborate on the reason for an increase in product lifetimes from the assumptions deployed in the 2010 rulemaking to the longer product lifetimes assumed in the July 2023 NOPR. BWC also requested that DOE explain the apparent discrepancies between the graphic demonstration of product lifetimes in 8G.4.6 and those expressed in Table 8G.4.1. (BWC, No. 1164 at pp. 3–4)

From the 2010 Final Rule to this rulemaking, DOE was able to collect more evidence from literature review on product lifetime as well as develop a more robust survival function to calculate the lifetimes. Regarding the figure in the NOPR TSD, the inflection point represents the lifetime most water heaters will live to, whereas the average takes into account those who live an unusually short or long lifetime. The lifetime distribution in this rulemaking, compared to that of the 2010 rulemaking, has an early start, taking into account those that retire starting from year two, and a longer tail, allowing some water heaters to survive much longer than average. DOE believes that it is beneficial to capture the variations in lifetime and thus maintain its methodology in this final rule.

BWC expressed support for DOE conducting a sensitivity analysis for all water heater product classes, as they claimed this is an effective way for this rulemaking to account for the reality that product lifetimes are not constant across efficiency levels and decrease with increased efficiency and complexity of a system. (BWC, No. 1164 at p. 4) In order to evaluate the impact of the lifetime on the economic analysis results, for this final rule DOE conducted a sensitivity analysis, where two additional lifetime scenarios were evaluated. The sensitivity results do not change DOE's conclusion of economic justification of the adopted standards (see appendix 8G of the final rule TSD for the comparison of results).

7. Discount Rates

In the calculation of LCC, DOE applies discount rates appropriate to households to estimate the present value of future operating cost savings. DOE estimated a distribution of discount rates for consumer water heaters based on the opportunity cost of consumer funds.

DOE applies weighted average discount rates calculated from consumer debt and asset data, rather than marginal or implicit discount rates.[86] The LCC

[86] The implicit discount rate is inferred from a consumer purchase decision between two otherwise identical goods with different first cost and operating cost. It is the interest rate that equates the increment of first cost to the difference in net present value of lifetime operating cost, incorporating the influence of several factors: transaction costs; risk premiums and response to uncertainty; time preferences; interest rates at which a consumer is able to borrow or lend. The

Continued

analysis estimates net present value over the lifetime of the product, so the appropriate discount rate will reflect the general opportunity cost of household funds, taking this time scale into account. Given the long time horizon modeled in the LCC analysis, the application of a marginal interest rate associated with an initial source of funds is inaccurate. Regardless of the method of purchase, consumers are expected to continue to rebalance their debt and asset holdings over the LCC analysis period, based on the restrictions consumers face in their debt payment requirements and the relative size of the interest rates available on debts and assets. DOE estimates the aggregate impact of this rebalancing using the historical distribution of debts and assets.

To establish residential discount rates for the LCC analysis, DOE identified all relevant household debt or asset classes in order to approximate a consumer's opportunity cost of funds related to appliance energy cost savings. It estimated the average percentage shares of the various types of debt and equity by household income group using data from the Federal Reserve Board's triennial Survey of Consumer Finances [87] (''SCF'') starting in 1995 and ending in 2019. Using the SCF and other sources, DOE developed a distribution of rates for each type of debt and asset by income group to represent the rates that may apply in the year in which amended standards would take effect. DOE assigned each sample household a specific discount rate drawn from one of the distributions. The average rate across all types of household debt and equity and income groups, weighted by market share of each product class, is 4.2 percent. See chapter 8 of the final rule TSD for further details on the development of consumer discount rates.

To establish commercial discount rates for the small fraction of consumer water heaters installed in commercial buildings, DOE estimated the weighted-average cost of capital using data from Damodaran Online.[88] The weighted-average cost of capital is commonly used to estimate the present value of cash flows to be derived from a typical company project or investment. Most companies use both debt and equity capital to fund investments, so their cost of capital is the weighted average of the cost to the firm of equity and debt financing. DOE estimated the cost of equity using the capital asset pricing model, which assumes that the cost of equity for a particular company is proportional to the systematic risk faced by that company. DOE's commercial discount rate approach is based on the methodology described in a Lawrence Berkeley National Laboratory report, and the distribution varies by business activity.[89] The average rate for consumer water heaters used in commercial applications in this final rule analysis, across all business activity and weighted by the market share of each product class, is 6.9 percent.

See chapter 8 of this final rule TSD for further details on the development of consumer and commercial discount rates.

8. Energy Efficiency Distribution in the No-New-Standards Case

To accurately estimate the share of consumers that would be affected by a potential energy conservation standard at a particular efficiency level, DOE's LCC analysis considered the projected distribution (market shares) of product efficiencies under the no-new-standards case (*i.e.,* the case without amended or new energy conservation standards). This approach reflects the fact that some consumers may purchase products with efficiencies greater than the baseline levels.

To estimate the energy efficiency distribution of consumer water heaters for 2030, DOE used available shipments data by efficiency including in previous AHRI submitted historical shipment data,[90] ENERGY STAR unit shipments data,[91] and data from a 2023 BRG Building Solutions report. [92] To cover gaps in the available shipments data, DOE used DOE's public CCD model database [93] and AHRI certification directory.[94]

The estimated market shares for the no-new-standards case for consumer water heaters are shown in Table IV.26. See chapter 8 of the final rule TSD for further information on the derivation of the efficiency distributions.

BILLING CODE 6450–01–P

implicit discount rate is not appropriate for the LCC analysis because it reflects a range of factors that influence consumer purchase decisions, rather than the opportunity cost of the funds that are used in purchases.

** 0.91 UEF at 30 gallon effective storage volume and 0.92 UEF at 35 gallon effective storage volume.

BILLING CODE 6450–01–C

The LCC Monte Carlo simulations draw from the efficiency distributions and assign an efficiency to the water heater purchased by each sample household in the no-new-standards case according to these distributions.

Finally, DOE considered the 2019 AHCS survey,[95] which includes questions to recent purchasers of HVAC equipment regarding the perceived efficiency of their equipment (Standard, High, and Super High Efficiency), as well as questions related to various household and demographic characteristics. DOE did not find similar data for consumer water heaters, but believes that the HVAC data is relevant to other larger appliances such as consumer water heaters since they similarly represent large energy end uses. From these data, DOE found that households with larger square footage exhibited a higher fraction of High- or Super-High efficiency equipment installed. The fraction of respondents with ''super high efficiency'' equipment was larger by approximately 5 percent for larger households and correspondingly smaller for smaller households. DOE therefore used the AHCS data to adjust its water heater efficiency distributions as follows: (1) the market share of higher efficiency equipment for households under 1,500 sq. ft. was decreased by 5 percentage points; and (2) the market share of condensing equipment for households above 2,500 sq. ft. was increased by 5 percentage points.

DOE acknowledges that economic factors may play a role when consumers, commercial building owners, or builders decide on what type of water heater to install. However, assignment of water heater efficiency for a given installation based solely on economic measures such as life-cycle cost or simple payback period most likely would not fully and accurately reflect actual real-world installations. There are a number of market failures discussed in the economics literature that illustrate how purchasing decisions with respect to energy efficiency are unlikely to be perfectly correlated with energy use, as described below. While this literature is not specific to water heaters, DOE finds that the method of assignment, which is in part random, simulates behavior in the water heater market, where market failures and other consumer preferences result in purchasing decisions not being perfectly aligned with economic interests, more realistically than relying only on apparent cost-effectiveness criteria derived from the limited information in CBECS or RECS. DOE further emphasizes that its approach does not assume that all purchasers of water

[95] Decision Analysts, 2019 American Home Comfort Studies (Available at: *www.decisionanalyst.com/Syndicated/HomeComfort/*) (Last accessed January 5, 2024).

heaters make economically irrational decisions (*i.e.,* the lack of a correlation is not the same as a negative correlation). As part of the random assignment, some homes or buildings with large hot water use will be assigned higher efficiency water heaters, and some homes or buildings with particularly low hot water use will be assigned baseline water heaters. By using this approach, DOE acknowledges the variety of market failures and other consumer behaviors present in the water heater market, and does not assume certain market conditions unsupported by the available evidence.

First, consumers are motivated by more than simple financial trade-offs. There are consumers who are willing to pay a premium for more energy-efficient products because they are environmentally conscious.[96] There are also several behavioral factors that can influence the purchasing decisions of complicated multi-attribute products, such as water heaters. For example, consumers (or decision makers in an organization) are highly influenced by choice architecture, defined as the framing of the decision, the surrounding circumstances of the purchase, the alternatives available, and how they're presented for any given choice scenario.[97] The same consumer or decision maker may make different choices depending on the characteristics of the decision context (*e.g.,* the timing of the purchase, competing demands for funds), which have nothing to do with the characteristics of the alternatives themselves or their prices. Consumers or decision makers also face a variety of other behavioral phenomena including loss aversion, sensitivity to information salience, and other forms of bounded rationality.[98] R.H. Thaler, who won the Nobel Prize in Economics in 2017 for his contributions to behavioral economics, and Sunstein point out that these behavioral factors are strongest when the decisions are complex and infrequent, when feedback on the decision is muted and slow, and when there is a high degree of information asymmetry.[99] These characteristics describe almost all purchasing situations of appliances and equipment, including water heaters. The installation of a new or replacement water heater is done infrequently, as evidenced by the mean lifetime for water heaters. Additionally, it would take at least one full water heating season for any impacts on operating costs to be fully apparent. Further, if the purchaser of the water heater is not the entity paying the energy costs (*e.g.,* a building owner and tenant), there may be little to no feedback on the purchase. Additionally, there are systematic market failures that are likely to contribute further complexity to how products are chosen by consumers, as explained in the following paragraphs.

The first of these market failures—the split-incentive or principal-agent problem—is likely to affect water heaters more than many other types of appliances. The principal-agent problem is a market failure that results when the consumer that purchases the equipment does not internalize all of the costs associated with operating the equipment. Instead, the user of the product, who has no control over the purchase decision, pays the operating costs. There is a high likelihood of split incentive problems in the case of rental properties where the landlord makes the choice of what water heater to install, whereas the renter is responsible for paying energy bills. In the LCC sample, a significant fraction of households with a water heater are renters. For example, for the medium electric storage water heaters LCC sample, nearly 30 percent of households are renters, whereas for the small electric storage water heater LCC sample, nearly 50 percent of households are renters. These fractions are significantly higher for low-income households (see section IV.I of this document and chapter 11 of the final rule TSD). The principle-agent problem can also impact homeowners. For example, in new construction, builders influence the type of water heater used in many homes but do not pay operating costs. Finally, contractors install a large share of water heaters in replacement situations, and they can exert a high degree of influence over the type of water heater purchased based on which products they are familiar with.

In addition to the split-incentive problem, there are other market failures that are likely to affect the choice of water heater efficiency made by consumers. For example, emergency replacements of essential equipment such as water heaters are strongly biased toward like-for-like replacement (*i.e.,* replacing the non-functioning equipment with a similar or identical product). Time is a constraining factor during emergency replacements and it may not be possible to consider the full range of available options on the market. The consideration of alternative product options is far more likely for planned replacements and installations in new construction.

Additionally, Davis and Metcalf[100] conducted an experiment demonstrating that the nature of the information available to consumers from EnergyGuide labels posted on air conditioning equipment results in an inefficient allocation of energy efficiency across households with different usage levels. Their findings indicate that households are likely to make decisions regarding the efficiency of the climate control equipment of their homes that do not result in the highest net present value for their specific usage pattern (*i.e.,* their decision is based on imperfect information and, therefore, is not necessarily optimal).

In part because of the way information is presented, and in part because of the way consumers process information, there is also a market failure consisting of a systematic bias in the perception of equipment energy usage, which can affect consumer choices. Attari, et al.[101] show that consumers tend to underestimate the energy use of large energy-intensive appliances but overestimate the energy use of small appliances. Water heaters are one of the largest energy-consuming end-uses in a home. Therefore, it is likely that consumers systematically underestimate the energy use associated with water heater, resulting in less cost-effective water heater purchases.

These market failures may affect a sizeable share of the consumer population. A study by Houde[102]

indicates that there is a significant subset of consumers that appear to purchase appliances without taking into account their energy efficiency and operating costs at all, though subsequent studies using alternative methodologies have highlighted other consumer groups who are to some extent responsive to local energy prices with their appliance purchases.[103] The extent to which consumers are perceptive of energy prices and product efficiency when making appliance purchasing decisions is a topic of ongoing research.

Although consumer water heaters are predominantly installed in the residential sector, some are also installed in commercial buildings (less than 10 percent of projected shipments; see chapter 9 of the final rule TSD). There are market failures relevant to consumer water heaters installed in commercial applications as well. It is often assumed that because commercial and industrial customers are businesses that have trained or experienced individuals making decisions regarding investments in cost-saving measures, some of the commonly observed market failures present in the general population of residential customers should not be as prevalent in a commercial setting. However, there are many characteristics of organizational structure and historic circumstance in commercial settings that can lead to underinvestment in energy efficiency.

First, a recognized problem in commercial settings is the principal-agent problem, where the building owner (or building developer) selects the equipment and the tenant (or subsequent building owner) pays for energy costs.[104] [105] Indeed, more than a quarter of commercial buildings in the CBECS 2018 sample are occupied at least in part by a tenant, not the building owner (indicating that, in DOE's experience, the building owner in some cases is not responsible for paying energy costs). Additionally, some commercial buildings have multiple tenants. There are other similar misaligned incentives embedded in the organizational structure within a given firm or business that can impact the choice of a water heater. For example, if one department or individual within an organization is responsible for capital expenditures (and therefore equipment selection) while a separate department or individual is responsible for paying the energy bills, a market failure similar to the principal-agent problem can result.[106] Additionally, managers may have other responsibilities and often have other incentives besides operating cost minimization, such as satisfying shareholder expectations, which can sometimes be focused on short-term returns.[107] Decision-making related to commercial buildings is highly complex and involves gathering information from and for a variety of different market actors. It is common to see conflicting goals across various actors within the same organization as well as information asymmetries between market actors in the energy efficiency context in commercial building construction.[108]

Second, the nature of the organizational structure and design can influence priorities for capital budgeting, resulting in choices that do not necessarily maximize profitability.[109] Even factors as simple as unmotivated staff or lack of priority-setting and/or a lack of a long-term energy strategy can have a sizable effect on the likelihood that an energy efficient investment will be undertaken.[110] U.S. tax rules for commercial buildings may incentivize lower capital expenditures, since capital costs must be depreciated over many years, whereas operating costs can be fully deducted from taxable income or passed through directly to building tenants.[111]

Third, there are asymmetric information and other potential market failures in financial markets in general, which can affect decisions by firms with regard to their choice among alternative investment options, with energy efficiency being one such option.[112] Asymmetric information in financial markets is particularly pronounced with regard to energy efficiency investments.[113] There is a dearth of information about risk and volatility related to energy efficiency investments, and energy efficiency investment metrics may not be as visible to investment managers,[114] which can bias firms towards more certain or familiar options. This market failure results not because the returns from energy efficiency as an investment are inherently riskier, but because information about the risk itself tends not to be available in the same way it is for other types of investment, like stocks or bonds. In some cases energy efficiency is not a formal investment category used by financial managers, and if there is a formal category for energy efficiency within the investment portfolio options assessed by financial managers, they are seen as weakly strategic and not seen as likely to increase competitive advantage.[115] This information asymmetry extends to commercial investors, lenders, and real-estate financing, which is biased against new and perhaps unfamiliar technology (even though it may be economically beneficial).[116] Another market failure known as the first-mover disadvantage can exacerbate this bias against adopting new technologies, as the successful integration of new technology in a particular context by one actor generates information about cost-savings, and other actors in the market can then benefit from that information by following suit; yet because the first to adopt a new technology bears the risk but cannot keep to themselves all the informational benefits, firms may inefficiently underinvest in new technologies.[117]

In sum, the commercial and industrial sectors face many market failures that can result in an under-investment in energy efficiency. This means that discount rates implied by hurdle rates [118] and required payback periods of many firms are higher than the appropriate cost of capital for the investment.[119] The preceding arguments for the existence of market failures in the commercial and industrial sectors are corroborated by empirical evidence. One study in particular showed evidence of substantial gains in energy efficiency that could have been achieved without negative repercussions on profitability, but the investments had not been undertaken by firms.[120] The study found that multiple organizational and institutional factors caused firms to require shorter payback periods and higher returns than the cost of capital for alternative investments of similar risk. Another study demonstrated similar results with firms requiring very short payback periods of 1–2 years in order to adopt energy-saving projects, implying hurdle rates of 50 to 100 percent, despite the potential economic benefits.[121] A number of other case studies similarly demonstrate the existence of market failures preventing the adoption of energy-efficient technologies in a variety of commercial sectors around the world, including office buildings,[122] supermarkets,[123] and the electric motor market.[124]

The existence of market failures in the residential and commercial sectors is well supported by the economics literature and by a number of case studies. Although these studies are not specifically targeted to the water heater market, they cover decision-making generally and the impact of energy efficiency, operating costs, and future savings/expenditures on those decisions, all of which apply to the purchase of a consumer water heater. DOE is not aware of any market failure studies specifically and narrowly focused on water heaters and so relies on the available literature discussed above. If DOE developed an efficiency distribution that assigned water heater efficiency in the no-new-standards case solely according to energy use or economic considerations such as life-cycle cost or payback period, the resulting distribution of efficiencies within the building sample would not reflect any of the market failures or behavioral factors above. DOE thus concludes such a distribution would not be representative of the water heater market.

DOE further notes that, in the case of gas-fired storage, oil-fired storage, and electric storage water heaters (≤55 gal), the distribution of efficiency in the current market is heavily weighted toward baseline efficiency or efficiency at EL 1. Accordingly, in the no new-standards case, most consumers are assigned EL 0 or EL 1 in accordance with the market data. As a result, any variation to DOE's efficiency assignment methodology will not produce substantially differing results than presented in this final rule, as most consumers will continue to be assigned the same efficiency regardless of the details of the methodology. In other words, as most consumers in the storage water heater market are choosing baseline or near-baseline efficiency products, there would be no significant difference between a random

assignment of those efficiency levels to consumers as to another type of assignment methodology such as one that tried to consider consumer rationality more explicitly—in either case nearly every individual consumer would be assigned a baseline or near-baseline efficiency product. This may be in contrast to a product with a broad distribution of efficiency levels purchased in the market, where changing the assignment methodology could more significantly impact the assignment of an efficiency level to individual consumers and therefore impact the results.

Gas Association Commenters and Atmos Energy argued that random assignment methodology is unreasonable because it overstates standards-compliant outcomes in the base case by capturing decisions that consumers would naturally choose on their own for economically beneficial reasons and it understates outcomes in the rule case by disproportionately including unattractive economic outcomes. Gas Association Commenters argued that consumer economic preference is not accounted for in random assignments, and argued that consumer choice models, which were used for fuel switching scenarios in gas furnaces, should be used in water heaters. Gas Association Commenters argued that random assignment creates extreme examples of economic benefits and consequences that heavily skew averages and are the least realistic outcomes as they would be the most obvious economic consumer choice. Gas Association Commenters argued that DOE has cases in their analysis where a standards-compliant product is the cheapest option but because of random assignment, a less-efficient, more expensive option is initially assigned, skewing benefits for rule scenarios. In its comment, Gas Association Commenters proposed alternatives to random assignment. (Gas Association Commenters, No. 1181 at p. 10 and pp. 11–23; Atmos Energy, No. 1183 at pp. 6–7) Rinnai argued that DOE has not yet addressed the central criticism of the random assignment of base case efficiencies which is that DOE has not justified through either correlation or causation of random assignment to the alleged market failures it represents. Rinnai argued that there are many better alternate approaches to solving market failures beyond appliance standards. Rinnai argued that base case random assignment implies that consumers only make rational economic decisions in rulemaking scenarios. Rinnai argued many of the same points made in other comments already mentioned in this document; namely: consumers in base case choosing worse efficiency products even when doing so is more expensive; highly favorable economic outcomes that skew results; base case irrationality versus rulemaking case rational economic decision making. (Rinnai, No. 1186 at pp. 31–33)

ONE Gas argued that in its comments that past issues of random assignment of consumers to appliance purchase decisions in the base case life cycle cost analysis has been an enduringly contentious issue with the Department's TSD approach, and the Department appears to have not undertaken measures to address stakeholder concerns of that kind. ONE Gas noted that more detailed review of this issue by industry stakeholders is ongoing. ONE Gas argued that the Department has never presented analysis that justifies linkages between market failure and random purchase behavior and no evidence is provided in the Preliminary Analysis TSD document that the Department has included additional consideration of NASEM peer review recommendation that calls on the Department to improve its coverage of market failure in relation to the setting of appliance minimum efficiency standards. ONE Gas proposed to the Department that it use alternative means of defining consumer base case efficiencies based upon one of two of the following base case definition strategies for consumer simulations: correlated consumer attributes approach or rational consumer economic choice approach. (ONE Gas, No. 1200 at pp. 11–12) NPGA, APGA, AGA, and Rinnai noted that DOE's response to comments on its failing to address consumer choice and to account for consumers making choices based on rational economic terms in the July 2023 NOPR is arbitrary, capricious, and without foundation. NPGA, APGA, AGA, and Rinnai commented that instead of referencing actual interviews or studies, DOE pivoted to a ''cherry-picked'' library of behavioral economics papers that have no bearing or relevance to water heaters or the proposed rule. (NPGA, APGA, AGA, and Rinnai, No. 441 at p. 4) AHRI recommended that DOE provide a theory of market performance tailored to the specific situation for each and every rulemaking. AHRI commented that DOE should build an analytical approach that reflects some degree of market efficiency, rather than assuming complete market efficiency. AHRI acknowledges that this may necessitate a rethinking of the Monte Carlo method and the assignment of base and standard case efficiencies. (AHRI, No. 1167 at p. 17) AHRI highlighted that AHRI demonstrated there are ways to use the current Monte Carlo approach to generate results and then use alternative ranking systems to assign base and standards case efficiencies. (AHRI, No. 1167 at p. 18) AHRI commented that DOE misunderstands the role of plumbing contractors in the decision process and DOE implies that the influence of plumbing contractors on water heater type purchased in the replacement scenario is a form of market failure. AHRI claimed this is incorrect as contractors serve as the information mediators to overcome one of the key sources of possible market failure identified by DOE—the absence of knowledge from consumers who rarely purchase water heaters. (AHRI, No. 1167 at p. 18) AHRI posed the following questions for DOE related to market failure: ''Why has DOE not adopted the National Academies of Sciences (NAS) peer review recommendations and when will it do so? On what basis has DOE determined that there are significant market failures for residential water heaters, how prevalent are these failures and do standards address them? How will DOE modify its random assignment approach to be more responsive to actual market conditions? '' (AHRI, No. 1167 at p. 18) Gas Association Commenters argued the tab ''No-New Standards Case UEF'' of the analysis tool incorrectly states an equation (relative to the coded version) for how square footage of residences impacts likelihood of efficiency of products. (Gas Association Commenters, No. 1181 at p. 35) Gas Association Commenters argued that adjustment factors used based on square footage do not make sense for this analysis and instead size of household should be used. (Gas Association Commenters, No. 1181 at p. 35) Gas Association Commenters argued that estimated fractions of shipments by market shares do not exactly match the stated distributions (see specifics in comment). (Gas Association Commenters, No. 1181 at p. 35) ONE Gas commented that, unlike many other products covered by EPCA, consumers rarely have opportunity to consider other water heating options when hot water is unavailable in a residence, a premium exists to restore service, especially since water heater failure is rarely anticipated by an average consumer; when time or other circumstances allow, the consumer is likely to make a rational consumer choice based, first and foremost, on minimizing installed cost;

life cycle cost considerations and other factors play a role in decision making, provided comparative installed costs are available to the consumer. (ONE Gas, No. 1200 at p. 5)

In response, DOE notes that even for consumers who are motivated and informed, the choice of product efficiency that perfectly minimizes life-cycle cost is highly nuanced and requires access to many sources of information. To make a decision that maximizes benefits for any given consumer, that consumer would need to consider information including utility bills for at least a year (and have the ability to disaggregate the portion of the utility bill specific to the water heater), the expected lifetime of the product, knowledge of equipment and installation costs up front, knowledge of each potential product's efficiency and performance in the field, future repair and maintenance costs, the value of future operating savings and costs in the present year, *etc.* This is a time-consuming and nontrivial calculation for even the most motivated consumer and requires significant data collection to make even a decent approximation. While there is some information easily available to the consumer prior to making a purchase (*e.g.,* labels, technical specifications, price estimates, *etc.*), this information typically assumes an average household. Therefore, for a consumer wishing to make an informed decision that results in minimization of life-cycle costs in the no-new-standards case based on such a label, it would require knowing how their own situation differs from an average national household (*e.g.,* hot water usage, energy price, ambient indoor air temperature, inlet water temperature, *etc.*). This evaluation is very complex. These challenges are part of the reason why consumer perception of energy consumption of appliances is varied and the extent to which consumers choose product efficiency based on this perceived energy consumption is mixed, as discussed in some of the literature cited above. There is empirical evidence that, on average, consumers' perceived energy consumption of household appliances and equipment does not match the actual energy consumption.

Acknowledging this consumer behavior, PHCC commented that in the case of replacement due to a failed water heater, many consumers will prioritize a water heater that is readily available within their price range and will not consider energy efficiency in their decision. They further comment that most consumers never even look at the energy label, they just want hot water at the lowest cost. (PHCC, No. 1151 at p. 6)

As stated above, the use of a random assignment of water heater efficiency in the no-new-standards case of LCC model is a methodological approach that reflects the full range of consumer behaviors in this market, including consumers who make informed and economically beneficial decisions and other consumers who, due to the market failures discussed, do not or cannot make such perfectly economically beneficial decisions. The methodology is further constrained by shipments data by efficiency level; it must produce an overall distribution that matches the available data. In the simplest case, where baseline market shares are split between one lower efficiency level and one higher efficiency level, DOE's methodology results in the following groups of consumers:

(1) Consumers who, in the absence of standards, choose a lower efficiency product with a lower life-cycle cost based on their surveyed hot water usage. These consumers are making an optimal choice from the perspective of cost savings in the model in the no-new-standards case. With amended standards, they are made to purchase a more efficient product and therefore experience a net cost in the standards case. The efficiency assignment model is already assigning minimal-cost choices to this fraction of consumers in the no-new-standards case.

(2) Consumers who, in the absence of standards, choose a higher efficiency product that also lowers their life-cycle cost compared to the baseline efficiency product. These consumers are making a cost-minimizing choice in the model in the no-new-standards case. With amended standards, these consumers are not impacted because they are already purchasing a standards-compliant product. The efficiency assignment model is already assigning minimal-cost choices to this fraction of consumers in the no-new-standards case.

(3) Consumers who, in the absence of standards, choose a lower efficiency product that does not minimize their life-cycle cost. The market failures discussed above apply to these consumers, preventing them from making the choice that minimizes their costs in the no-new-standards case. With amended standards, they are made to purchase a more efficient product that ultimately results in a lower life-cycle cost. These consumers experience a net benefit as a result of the standard.

(4) Consumers who, in the absence of standards, choose a higher efficiency product that does not lower their life-cycle cost compared to the baseline or lower efficiency product. Although these consumers are choosing a higher efficiency product in the no-new-standards case, they may have incomplete knowledge of the energy consumption of the equipment or may value environmental features such as efficiency more heavily, resulting in a choice of a higher efficiency product that does not lower life-cycle cost compared to a baseline or lower efficiency product. With amended standards, these consumers are not impacted because they are already purchasing a standards-compliant product.

DOE's methodological approach is a proxy that ultimately reflects a diversity of scenarios for consumers and therefore the range of outcomes that will result from this diversity. The approach already reflects market share outcomes consistent with some degree of market efficiency and optimal decision-making among some consumers, but the approach also acknowledges a number of factors that hinder perfect decision-making for others. Furthermore, the model produces an overall distribution of efficiency that matches the available shipments data.

Although DOE's random assignment methodology does not explicitly model consumer decision making, nor does it take a stance on the rationality or irrationality of specific consumers, DOE believes that the approach would be consistent with a model in which some share of consumers make economically optimal decisions, and some consumers—in the face of market failures—do not. The use of a random assignment of water heater efficiency is a methodological approach that reflects the full range of consumer behaviors in this market, including consumers who make economically beneficial decisions and consumers who, due to market failures, do not or cannot make such economically beneficial decisions, both of which occur in reality. Within those constraints, DOE then assigns product efficiencies to consumers in the LCC, consistent with the economics literature discussed above, to reflect neither purely rational nor purely irrational decision-making.

DOE's analytical approach reflects some degree of market efficiency. An alternative approach which assumes consumer behavior is based solely on cost outcomes, for example by ranking LCCs and using those to assign efficiencies as suggested by the commenters, is not evidenced by the scientific literature surveyed above or by any data submitted in the course of this rulemaking. Such an approach would depend on the assumption, for example, that homeowners know—as a rule—the efficiency of their homes' water heater and water heating energy use, such that they always make water heating investments accordingly. Similarly, such an approach would assume that, faced with a water heater failure, homeowners will always select as a replacement the most economically beneficial available model. Given the work documenting market failures in

energy efficiency contexts described above, DOE believes that such assumptions would bias the outcome of the analysis to the least favorable results. DOE's approach, by contrast, recognizes that assumptions like these hold for some consumers some of the time—but not all consumers and not at all times.

As part of the random assignment, some households or buildings with large water heating loads will be assigned higher-efficiency water heaters in the no-new-standards case, and some households or buildings with particularly low water heating loads will be assigned baseline water heaters—*i.e.,* the lowest cost investments.

DOE ran a sensitivity to look at the base-case shipment distribution in 2030 that would be expected if every consumer made their purchasing decision based on minimizing their life-cycle costs to understand how this compares to actual consumer purchases based on the data on shipments by efficiency. If every consumer in the LCC sample chose a product that minimized their total life-cycle cost (*i.e.,* perfectly rational, cost-minimizing consumers), the resulting distribution of products by efficiency would deviate significantly from the actual efficiency distribution, as determined from market share data and shipments data by efficiency. For example, for medium ESWHs, the baseline efficiency (EL 0, representing an electric resistance water heater) results in a minimum life-cycle cost for only 36 percent of all consumers in the LCC analysis, while higher efficiency heat pump water heaters (ELs 1, 2, and 3) result in a minimum life-cycle cost for the remaining 64 percent of consumers. Therefore, in a scenario in which all consumers made cost-minimizing choices, one would expect the efficiency distribution of new shipments in 2030, without any amended standards, to be 36 percent electric resistance medium ESWHs and 64 percent heat pump medium ESWHs (at various efficiencies). However, the projected efficiency distribution in 2030, based on existing market share and actual shipments data (and even accounting for the recent growth trend of heat pump water heaters), is that only 12 percent of the market will be heat pump water heaters despite the fact that these water heaters would result in lower total life-cycle costs for 64 percent of consumers, *i.e.,* at least half of consumers will be selecting a water heater that does not minimize their costs. This significant discrepancy suggests the presence of the market failures discussed previously in the medium ESWH market, which prevents a significant portion of consumers from making purchasing decisions that would minimize their life-cycle costs.

Regarding the role of contractors, DOE notes that they can exert a high degree of influence over the type of water heater purchased. DOE acknowledges that they can serve as an information mediator. However, it is possible for a contractor to also influence the decision toward a familiar like-for-like replacement, for example, or perhaps the quickest replacement option available (*e.g.,* based on equipment availability). An individual contractor may not be familiar with every product option available on the market. Ultimately, there are multiple actors involved in the decision-making process which results in complex purchasing behavior.

As DOE has noted, there is a complex set of behavioral factors, with sometimes opposing effects, affecting the water heater market. It is impractical to model every consumer decision incorporating all of these effects at this extreme level of granularity given the limited available data. Given these myriad factors, DOE estimates the resulting distribution of such a model would be very scattered with high variability. It is for this reason DOE utilizes a random distribution (after accounting for market share constraints) to approximate these effects. This is the standard methodological approach used on all of DOE's prior rules. The methodology is not an assertion of economic irrationality, but instead, it is a methodological approximation of complex consumer behavior. The analysis is neither necessarily biased toward high or low energy savings. The methodology does not preferentially assign lower-efficiency water heaters to households in the no-new-standards case where savings from the rule would be greatest, nor does it preferentially assign lower-efficiency water heaters to households in the no-new-standards case where savings from the rule would be smallest. However, it is worth noting that energy use could be improperly estimated if preferences for energy efficiency are correlated with demand for hot water. Some consumers were assigned the water heaters that they would have chosen if they had engaged in the kind of perfect economic thinking upon which the commenters have focused. Others were assigned less-efficient water heaters even where a more-efficient water heater would eventually result in life-cycle savings, simulating scenarios where, for example, various market failures prevent consumers from realizing those savings. Still others were assigned water heaters that were more efficient than one would expect simply from life-cycle costs analysis, reflecting, say, ''green'' behavior, whereby consumers ascribe independent value to minimizing harm to the environment.

DOE cites the available economic literature of which it is aware on this subject, supporting the existence of the various market failures in other appliance markets which would give rise to such a distribution, and has requested more data or studies on this topic in the May 2020 RFI, March 2022 preliminary analysis, and July 2023 NOPR. DOE is not aware of any specific study regarding how consumer water heaters (and their efficiency) are purchased.

In summary, DOE's efficiency assignment methodology produces overall results that are consistent with the observed distribution of efficiency across products as seen in the shipments data. The methodology also results in a share of consumers being assigned product efficiencies that minimize their lifetime costs in the absence of standards. This represents consumers making informed decisions regarding the efficiency of their products, without amended standards. These consumers will be negatively impacted by the adopted standard levels and the analysis accounts for these impacts. However, the methodology also acknowledges that some consumers are unable to minimize the life-cycle costs of their products for a variety of reasons discussed in the economics literature (*e.g.,* renters with no say in the products purchased for their household). Even for motivated and informed consumers, the information and data required to ultimately make the best product choice that minimizes life-cycle cost is complex and time-consuming. As a result, there are a subset of consumers for whom adopting more stringent standard levels will result in life-cycle savings. In contrast to some commenters' characterization, DOE's methodology already reflects some degree of market efficiency in terms of consumer choice of product efficiency, but it also reflects a variety of observed effects that inhibit perfect market efficiency. This is representative of the water heater market. On the whole, when accounting for both consumers negatively impacted by, as well as those benefiting from, amended standards, DOE's analysis demonstrates that there are economically justified savings.

Finally, DOE notes that the recommendations of the NAS report, which pertain to the processes by which DOE analyzes energy conservation

standards, will be addressed as part of a separate notice-and-comment process.

9. Payback Period Analysis

The payback period is the amount of time (expressed in years) it takes the consumer to recover the additional installed cost of more-efficient products, compared to baseline products, through energy cost savings. Payback periods that exceed the life of the product mean that the increased total installed cost is not recovered in reduced operating expenses.

The inputs to the PBP calculation for each efficiency level are the change in total installed cost of the product and the change in the first-year annual operating expenditures relative to the baseline. DOE refers to this as a ''simple PBP'' because it does not consider changes over time in operating cost savings. The PBP calculation uses the same inputs as the LCC analysis when deriving first-year operating costs.

As noted previously, EPCA establishes a rebuttable presumption that a standard is economically justified if the Secretary finds that the additional cost to the consumer of purchasing a product complying with an energy conservation standard level will be less than three times the value of the first year's energy savings resulting from the standard, as calculated under the applicable test procedure. (42 U.S.C. 6295(o)(2)(B)(iii)) For each considered efficiency level, DOE determined the value of the first year's energy savings by calculating the energy savings in accordance with the applicable DOE test procedure, and multiplying those savings by the average energy price projection for the year in which compliance with the amended standards would be required.

Armada noted that the EPCA creates a rebuttable presumption that an energy conservation standard is economically justified if the additional cost is less than three times the value of the first year's energy savings, but the initial costs to switch from an electric resistance storage water heater to one with heat pump technology is greater than a three-year payback period, and that assumes the consumer's home can accommodate a heat pump water heater. (Armada, No. 1193 at pp. 5–6) In response, DOE notes that the rebuttable presumption provision is not a requirement that the average PBP of a standard must be less than three years. Rather, it establishes a presumption that a standard meeting that criteria is economically justified, which is then evaluated further using the other criteria used to evaluate economic justification. Whether the presumption is or is not met, a determination of economic justification must be based on the criteria specified by EPCA, as is the case for this final rule.

10. Accounting for Product Switching

For the preliminary analysis, DOE did not account for the product switching under potential standards. For the July 2023 NOPR and this final rule, DOE maintained the same approach and did not include any product switching in its analysis, other than consumers potentially downsizing their electric storage water heater to a small electric water heater, as discussed in more detail in section IV.G.1 of this document. DOE assumes that any product switching as a result of the proposed standards is likely to be minimal.

As discussed in the specific examples below, the costs to switch to another product class are higher than simply purchasing a standards-compliant product in the same product class. When faced with the need to replace a water heater, a consumer can either install a standards-compliant product of the same product class as they originally had, or spend even more to switch to an alternative product class. Because of this higher cost to switch, DOE concludes it is extremely unlikely that consumers would choose to spend more to switch product classes specifically in response to amended standards. In the absence of amended standards, some consumers choose to switch for reasons other than simply cost, and that is reflected in historical market trends that are incorporated into the analysis. However, for the purposes of the analysis, the issue is whether *more* consumers would switch due to the higher incremental costs of standards-compliant products. DOE concludes that this is very unlikely and therefore market trends will be unaffected.

In the hypothetical case of a consumer switching from a gas-fired storage water heater to an electric water heater (storage or instantaneous), there are likely additional installation costs necessary to add an electrical connection since both of these types of electric water heaters require high wattage. These are costs above and beyond the normal installation costs included in the LCC analysis. In some cases, it may be possible to install a 120-volt heat pump storage water heater with minimal additional installation costs, particularly if there is a standard electrical outlet nearby already. In most cases, however, a standard 240-volt electrical storage water heater would be installed. To do so, the consumer would need to add a 240-volt circuit to either an existing electrical panel or upgrade the entire panel if there is insufficient room for the additional amperage. The installation of a new 240-volt circuit by a qualified electrician will be at least several hundred dollars. Panel upgrade costs are significant and can be approximately $750—$2,000 to upgrade to a 200-amp electrical panel.[125] Older homes and homes with gas-fired space heating (*e.g.,* homes with gas furnaces) are more likely to need an electrical panel upgrade in order to install an electric storage water heater, given the relatively modest electrical needs of the home at the time of construction. Given the significant additional installation costs for nearly all homes potentially switching to an electric water heater, DOE estimates that very few consumers would switch from gas-fired storage water heaters to electric water heaters as a result of an energy conservation standard, especially at the proposed standard at TSL 2. At TSL 2, the average total installed cost of an electric storage water heater is $1,855 compared to the average total installed cost of $1,578 for a gas-fired storage water heater (see section V.B.1 of this document). Further, these costs do not include the electrical upgrade costs necessary when switching from a gas-fired to an electric water heater. When including those costs, the average total installed cost to switch to an electric water heater is significantly higher than the standards-compliant gas-fired storage water heater (electric instantaneous water heaters were not analyzed in this rule, however the electrical panel upgrade cost alone is nearly as much as a standards-compliant gas-fired storage water heater). Switching from a gas-fired to an electrical water heater is especially unlikely in the case of an emergency replacement where time is a critical factor. When a water heater fails, consumers typically have limited time to make a decision on which new water heater the consumer is going to choose to purchase and rely upon replacing the water heater with one that is similar to the one that failed. Consumers are unlikely to invest in switching fuels to a water heater that utilizes a different fuel source in the emergency replacement scenario.

In the hypothetical case of a consumer switching from an electric storage water heater to a gas-fired water heater, there are, similarly, additional installation costs necessary to add a gas connection. Based on RECS 2020, DOE estimates that only 25 percent of homes with an electric storage water heater currently

[125] For example, see: *www.homeadvisor.com/cost/electrical/upgrade-an-electrical-panel/#upgrade* (last accessed Dec. 1, 2023).

use natural gas and an additional 25 percent reported that natural gas is available in the neighborhood. Therefore, the option to switch to a gas-fired water heater is not available to half of consumers and for another 25 percent, it would require bringing in a natural gas connection from the street level to the home. Additionally, switching to a gas-fired water heater would require the installation of new gas plumbing in the home, even if the home currently uses natural gas, which would add several hundreds of dollars to the installation costs.[126] An additional 10 percent of homes use LPG, but the fuel costs are much more expensive than natural gas and requires significant gas line connection upgrades to connect the LPG tank to the water heater. Even in homes with an existing gas connection, new venting would need to be installed for either gas-fired storage water heaters or gas-fired instantaneous water heaters. Installing new venting represents a significant additional cost when switching from an electric water heater to a gas fired heater. The LCC averages presented in V.B.1 of this document for the gas-fired water heaters include some situations where vent replacement is not necessary, and none of the replacement situations require adding gas lines, therefore typical installation costs for switching from an electric water heater to a gas-fired water heater would be higher than the averages presented in section V.B.1 of this document. Therefore, the total installed costs for either gas-fired option, including all the necessary venting and additional gas lines in the home, are larger than replacing the electrical storage water heater with a standards-compliant model (at the proposed level). As a result, DOE estimates that very few consumers would switch from electric storage water heaters to gas-fired water heaters as a result of an energy conservation standard, particularly in the case of an emergency replacement.

Even if some consumers of medium ESWHs elected to switch to a non-electric water heater (*e.g.,* a GSWH), despite the additional costs of doing so and instead of simply purchasing a standards-compliant medium ESWH, the rule would still save a significant amount of energy. These consumers would still need to purchase a standards-compliant GSWH. Such switching from medium ESWHs to GSWHs or GIWHs would result in a slight increase in FFC energy consumption for these consumers, however that is more than made up for by the rest of the savings from medium ESWH consumers, even after accounting for consumers switching to small ESWHs. The energy savings for the rest of the medium ESWHs are at least an order of magnitude larger than any incremental increase in energy consumption from a small subset of consumers who might switch to GSWHs or GIWHs. Under the assumption that all such consumers who switch to gas-fired water heaters face an increase in cost, the total percentage of existing medium ESWH consumers experiencing a net cost as a result of the rule would therefore increase by a proportional amount. For example, even if 10 percent of medium ESWH consumers elected to switch to gas-fired water heaters despite the costs, the percentage of consumers experiencing a net cost would increase by at most 10 percent and the average LCC savings for medium ESWH consumers would still be positive, which would not change DOE's conclusion that the standards adopted are economically justified.

Lastly, in the hypothetical case of a consumer switching from a GSWH to a GIWH, there are additional installation costs necessary as well. The vast majority of GSWHs utilize non-condensing technology that utilizes Category I type B metal vent material, whereas switching to GIWHs would require Category III or Category IV venting material. Regarding non-condensing GIWHs, A.O. Smith noted that these utilize Category III venting (A.O. Smith, No. 1182 at p. 15). Condensing GIWHs require Category IV venting. Switching from a GSWH to a GIWH would therefore require replacing the venting in either case. Replacing the venting system would result in significant installation costs. Additionally, given the significantly higher Btu/h input required for instantaneous water heaters, it may be necessary to upgrade the gas line feeding the water heater to a larger diameter when switching from GSWH to GIWH. This is especially true if the line also services a gas furnace. Upgrading a gas line could add several hundred dollars in extra costs or more. As a result of all the cost considerations above, DOE estimates that very few consumers would switch from GSWHs to GIWHs specifically as a result of the incremental costs of the amended energy conservation standard for GSWH, particularly in the case of an emergency replacement.

Ravnitzky expressed concern that the proposed standards favor heat pump water heaters over gas-fired or electric resistance water heaters. Ravnitzky claimed that the proposed standards would result in non-heat pump water heaters becoming more expensive and less competitive in the market and may force some consumers to switch to heat pump water heaters.[127] (Ravnitzky, No. 73 at p. 1)

In response, given the upfront cost differential for heat pump electric storage water heaters and gas-fired water storage heaters, DOE does not expect that the adopted standards would induce consumers to switch to heat pump water heaters. In addition, DOE notes that gas-fired storage water heaters are not being eliminated as a result of the standards being established in this final rule.

According to NPGA, APGA, AGA, and Rinnai, DOE made an assumption about product switching, then reinforced its assumption without analysis, ignoring the possibility that consumers may want to switch product classes based on the proposed rule, but product classes may not be available for such switching, and based on this assumption, DOE conveniently omitted any installation costs in its LCC and PBP analysis, showing its market analysis is inherently flawed and must be reevaluated. (NPGA, APGA, AGA, and Rinnai, No. 441 at p. 4–5) DOE notes that its assessment is based on the comparison of total installed costs needed to switch from product class to product class. In response, DOE determined that there would be minimal switching due to the additional installation cost for a variety of possible scenarios, as discussed above. Specifically in the case of switching from a GSWH to a GIWH, these costs include upgrading gas lines and replacing the venting. Like-for-like replacement for the water heater product classes considered in this rulemaking, as DOE determined and summarized in the installation cost analysis, is the most cost efficient. DOE does not reject the idea that consumers may choose a different product class in response to the no new standards case for reasons other than just total costs. Indeed, the shipments projection accounts for recent market trends that show growing consumer demand for GIWHs compared to GSWHs.

NMHC and NAA stated that DOE's assumption of minimal product switching as a result of the proposed standard fails to account for forced product switching driven by typical

[126] For example, see: *www.homeadvisor.com/cost/plumbing/install-or-repair-gas-pipes/* (last accessed March 8, 2024).

[127] Ravnitsky incorrectly asserted that the proposed standards would require a minimum UEF of 0.96 for gas-fired water heaters, 0.95 for electric resistance water heaters, and 0.85 for heat pump water heaters.

space limitations in existing multifamily dwellings where frequently the water heater shares a small closet with stacked laundry facilities and owners will be forced to switch to instantaneous water heaters with additional installation costs associated with venting, larger-sized gas supply piping, or electrical panel upsizing. (NMHC and NAA, No. 996 at p. 5) In response, DOE notes that existing market trends are incorporated into the shipments analysis and projection. To the extent that some product classes are becoming more prevalent in certain types of buildings, that is reflected in the no-new-standards case shipments projection. The most commonly used electric water heater for the scenario described by NMHC and NAA would be a low-boy electric storage water heater, likely to be in the small ESWH product class. This rule does not amend standards for small ESWHs and therefore the consumers of this product class will not be impacted. As DOE has discussed above, the costs to switch product classes in response to amended standards are larger than simply purchasing standards-compliant products within the same product classes. Therefore DOE estimates that no additional switching will occur beyond existing market trends.

NRECA stated that a large percentage of co-op consumers have no access to natural gas service and have no affordable alternative option for a product that performs equivalent to electric resistance water heating, and therefore eliminating electric resistance water heating as an option in the market would pose a serious problem for many of the consumer-members served by cooperatives. They commented that these consumers that could not afford heat pump water heaters or their housing stock does not allow for their installation may be forced to choose electric tankless (or instantaneous) water heaters, which units may provide good comfort to consumers but have negative impacts to utilities by potentially creating spikes in demand of 20 kW instantaneously. NRECA commented that adding to a cooperative's peak demand can significantly raise their costs and add to the electric rates of all their consumer-members who must bear the cost. NRECA stated that at least one cooperative told them that most new housing stock in their territory is being equipped with electric tankless units and that it is not clear that DOE's analysis accounts for switching from electric storage to instantaneous electric. (NRECA, No. 1127 at p. 9) In response, DOE reiterates that a significant cost adder has been applied to the fraction of electric storage consumers that have challenging installation cases. For these consumers, DOE considered several downsizing options with significantly lower installation costs, including switching to a small electric storage water heater, and took that impact into account in its shipment analysis (see section IV.G.1.a of this document). In regards to the grid impact, this is discussed more in section III.A.3 of this document. Finally, DOE notes that although it did not analyze electric instantaneous water heaters, they represent a very small market share at present. DOE did include, however, an option to pair a small electric storage water heater with a ''booster'' instantaneous water heater as one of the switching options for medium electric storage water heaters (see section IV.G.1.a of this document).

Atmos Energy argued that because the cost to fuel switch is high, DOE fails to ''acknowledge the equally prohibitive costs that will be associated with high efficiency gas appliances as a result of this proposal and the lack of gas-fired replacements in the market.'' (Atmos Energy, No. 1183 at p. 6). Rinnai argued that DOE has failed to take into account substitution effects in replacement markets. Rinnai stated that the following are lacking from the analysis: replacement of water heaters with same category of consumer water heaters that meet a particular standard level; replacement with water heaters using different fuel or different product category (*e.g.,* GSWH to GIWH; GSWH to ESWH; ESWH to GSWH, *etc.*); and repair of existing product; thereby delaying the replacement. (Rinnai, No. 1186 at pp. 30–31) The Gas Association Commenters commented that the proposals in the July 2023 NOPR would create an enhanced market for heat pumps, diminishing competition between gas and electric water heaters. (Gas Association Commenters, No. 1181 at pp. 32–39) A.O. Smith stated that storage and tankless water heaters use incompatible venting systems (GSWH use Cat I while non-condensing tankless water heaters use Cat III). (A.O. Smith, No. 1182 at p. 15) As discussed above, DOE estimates that switching between gas-fired and electric water heaters as a result of the rule is likely to be negligible, as is switching from gas-fired storage to instantaneous water heaters, due to the high installation costs of such switching, (costs that are acknowledged to be high by Atmos Energy in their comment). DOE finds no evidence that there would be a lack of gas-fired water heater models available in the standards case for replacements. Many such models are currently available by multiple manufacturers. DOE acknowledges that in the standards case, many electric water heaters would transition to heat pump water heaters. However, since DOE estimates negligible switching between electric and gas-fired water heaters, there is no reason to expect this would alter the competition between electric and gas-fired water heater markets. Furthermore, many manufacturers produce both electric and gas-fired water heaters. Lastly, DOE agrees that gas-fired storage and instantaneous water heaters use incompatible venting systems and therefore switching from storage to instantaneous would require significant extra installation costs. See chapter 8 and appendix 8D of the final rule TSD for detailed description of the installation costs.

Noritz commented that the ability to replace a water heater in an emergency is an important attribute of value to consumers, and changes in installation patterns raise costs and impose other time-related constraints such as changing venting patterns, carpentry to make changes to the house, and possible electrical work to complete installation. (Noritz, No. 1202 at pp. 1–2) PHCC commented that in the case of replacement due to a failed water heater, many consumers will prioritize a water heater that is readily available within their price range and will not consider energy efficiency in their decision. According to PHCC, energy efficiency increases costs and decreases demand which leads to a longer wait time for installation and makes a more energy efficient water heater an unattractive option in a time when households simply care about having hot water and a working water heater as soon as possible. (PHCC, No. 1151 at p. 6) DOE agrees that in emergency replacement, like-for-like equipment provides the most convenience to the consumer. However, DOE estimates that the installation of condensing equipment, including the flue venting, the condensate pump, and neutralizer can be accomplished as part of an emergency replacement, meaning that for emergency replacements, non-condensing equipment do not bring significant additional value.

11. Analytical Results

AHRI commented that DOE does not provide a measure of uncertainty in LCC results. AHRI commented that each independent variable in LCC analysis has uncertainty, and DOE does not document how confident DOE should be in its estimates. AHRI asked DOE the

following questions related to model uncertainty: What is the estimated standard deviation around the mean change in LCC at each EL and for each product class? (AHRI, No. 1167 at p. 23) AHRI commented that DOE does not take account of the fact that operating costs, including energy, are deductible as business expenses for Federal and some state income taxes for commercial customers in its LCC analysis and asks for DOE's justification for not taking it into account. AHRI recommended that DOE considers the effects of this tax deductibility in computing the change in life cycle cost. AHRI claimed that failing to account for this is inconsistent with other aspects of DOE's analyses. (AHRI, No. 1167 at p. 16)

In response, DOE clarifies that it uses probability distributions for a number of input variables that are reasonably expected to exhibit natural variation and diversity in practice (*e.g.,* lifetime, repair cost, installation costs). These probability distributions are modeling diversity. In contrast, DOE addresses input uncertainty primarily with the use of sensitivity scenarios. To determine whether the conclusions of the analysis are robust, DOE performed several sensitivity scenarios with more extreme versions of these input variables (*e.g.,* high/low economic growth and energy price scenarios, alternative price trend scenarios, alternative mean lifetime scenarios). The relative comparison of potential standard levels in the analysis remains the same throughout these sensitivity scenarios, confirming that the conclusion of economic justification is robust despite some input uncertainty. Furthermore, DOE provides a range of statistics in the LCC spreadsheet, including median values and values at various percentiles for many intermediate variables, as well as the full data output table for all 10,000 samples. For example, the 25th and 75th percentiles of average LCC savings for all ELs for all product classes are available in the LCC spreadsheet. DOE also provides a distribution of impacts, including consumers with a net benefit, net cost, and not impacted by the rule in the LCC spreadsheet and in chapter 8 of the final rule TSD.

DOE develops probabilities for as many inputs to the LCC analysis as possible, to reflect the distribution of impacts as comprehensively as possible. For example, DOE develops probabilities for building sampling, installation costs, lifetime, discount rate, and efficiency distribution, among other inputs. If there are insufficient data with respect to a specific input parameter to create a robust probability distribution, DOE will utilize a single input parameter. Such approach is neither arbitrary nor capricious; it is informed by the available data.

The installation cost estimates are the result of a significant research and cite multiple sources, as discussed at length in section IV.F.2 and appendix 8D of the final rule TSD. DOE has incorporated feedback from various stakeholders and revised those costs for this final rule.

Regarding deductible business expenses, DOE notes that equipment purchases would also be deductible, and that increased equipment expenses and lower operating expenses would have opposing effects on total deductions. Even if overall deductions were to decrease as a result of the rule, those savings could be easily invested in other parts of the business in order to have no net impact on a business' tax burden. Furthermore, DOE notes that the estimation of commercial discount rates accounts for the tax deductibility of the energy costs and capital investment depreciation and therefore the net present value of the future operating cost savings in the LCC analysis should already reflect that effect.

DOE provides stakeholders with the opportunity to provide accurate data to represent a breadth of operating conditions, prices, and use cases. In the absence of stakeholder provided information, DOE makes a good-faith effort to collect reliable data from various sources and summarize assumptions on the missing parameters. The Monte Carlo simulation and its large number of samples (10,000 for each product class) ensures that the results converge to a representative average. For some inputs whose uncertainty is not well characterized, such as future equipment prices or economic growth conditions, DOE performed a series of sensitivity analyses to ensure that the results of the analysis are not strongly dependent on those inputs and that the conclusions of the analysis remain the same. As a result, DOE's conclusion of economic justification is robust to a broad range of sensitivity scenarios which capture the uncertainty inherent in economic projections.

DOE acknowledges that in the LCC, there may be a handful of outcomes with large benefits or costs. Large outlier LCC savings, both positive and negative, may affect the average of LCC savings across the whole sample of impacted consumers. In particular, for medium ESWHs, there are some outcomes with LCC savings that are over 10 times the average across the whole sample. Therefore, for medium ESWHs, DOE considered an additional sensitivity analysis that eliminated these outcomes with large benefits. Specifically, DOE removed outcomes with positive LCC savings that exceed the absolute magnitude of the largest LCC costs, so that the final distribution of outcomes is bounded by similar extremes (positive and negative). This sensitivity removes 245 outcomes out of 8,801 impacted consumers. The resulting average LCC savings in the sensitivity analysis are reduced to $581, compared to $859 in the reference case. Although the average LCC savings are reduced in this sensitivity analysis, they remain positive and there continue to be significant energy and environmental savings. DOE continues to conclude that the adopted standard level for medium ESWHs is economically justified even in this sensitivity analysis that eliminates large positive results.

DOE further notes that such cases in the LCC, represented with outcomes resulting in large benefits or large costs, are likely to occur in the real-world as a reflection of the variability in the household characteristics across the United States. For example, a household with high usage (*e.g.,* 5 plus occupants with frequent showering) located in an area with higher than average electricity rates, with lower than average installation costs (*e.g.,* there is sufficient electrical, drainage, and space to accommodate the heat pump water heater) will result in that household seeing net benefits greater than the average population. Such a scenario is reflected in the model as a high-benefits case. While DOE conducted the sensitivity to test its conclusion that the standards adopted are economically justified even with conservative assumptions, DOE also believes that such high benefits or high costs cases reflect the realities of household characteristics across the United States.

G. Shipments Analysis

DOE uses projections of annual product shipments to calculate the national impacts of potential amended or new energy conservation standards on energy use, NPV, and future manufacturer cash flows.[128] The shipments model takes an accounting approach, tracking market shares of each product class and the vintage of units in the stock. Stock accounting uses product shipments as inputs to estimate the age distribution of in-service product stocks for all years. The age distribution of in-service product stocks

[128] DOE uses data on manufacturer shipments as a proxy for national sales, as aggregate data on sales are lacking. In general, one would expect a close correspondence between shipments and sales.

is a key input to calculations of both the NES and NPV, because operating costs for any year depend on the age distribution of the stock.

DOE developed shipment projections based on historical data and an analysis of key market drivers for each product. DOE estimated consumer water heater shipments by projecting shipments in three market segments: (1) replacement of existing consumer water heaters; (2) new housing; and (3) new owners in buildings that did not previously have a consumer water heater or existing water heater owners that are adding an additional consumer water heater.[129]

To project water heater replacement shipments, DOE developed retirement functions from water heater lifetime estimates and applied them to the existing products in the housing stock, which are tracked by vintage. DOE calculated replacement shipments using historical shipments and lifetime estimates. Annual historical shipments sources are: (1) Appliance Magazine; [130] (2) the Air-Conditioning, Heating, and Refrigeration Institute (''AHRI'') website; [131] (3) multiple AHRI data submittals; [132] (4) the BRG Building Solutions 2022 report; (5) ENERGY STAR unit shipments data; [133] (6) Oil Heating Magazine; [134] and the 2010 Heating Products Final Rule. In addition, DOE adjusted replacement shipments by taking into account demolitions, using the estimated changes to the housing stock from *AEO2023.*

To project shipments to the new housing market, DOE used the *AEO2023* housing starts and commercial building floor space projections to estimate future numbers of new homes and commercial building floor space. DOE then used data from U.S. Census Characteristics of New Housing,[135] [136] Home Innovation Research Labs Annual Builder Practices Survey,[137] RECS 2020, AHS 2021, and CBECS 2018 to estimate new construction water heater saturations by consumer water heater product class.[138]

DOE estimated shipments to the new owners' market based on residual shipments from the calculated replacement and new construction shipments compared to historical shipments in the last 5 years (2018–2023 for this NOPR). DOE compared this with data from the Decision Analysts' 2002 to 2022 American Home Comfort Study [139] and 2022 BRG data, which showed similar historical fractions of new owners. DOE assumed that the new owner fraction in 2030 would be equal to the 10-year average of the historical data (2013–2022) and then decrease to zero by the end of the analysis period (2059). If the resulting fraction of new owners is negative, DOE assumed that it was primarily due to equipment switching or non-replacement and added this number to replacements (thus reducing the replacements value).

For the preliminary analysis and NOPR, assumptions regarding future policies encouraging electrification of households and electric water heating were speculative at that time, so such policies were not incorporated into the shipments projection.

DOE acknowledges, however, that ongoing electrification policies at the Federal, State, and local levels are likely to encourage installation of electric water heaters in new homes and adoption of electric water heaters in homes that currently use gas-fired water heaters. For example, the Inflation Reduction Act includes incentives for heat pump water heaters and electrical panel upgrades. However, there are many uncertainties about the timing and impact of these policies that make it difficult to fully account for their likely impact on gas and electric water heater market shares in the time frame for this analysis (*i.e.,* 2030 through 2059). Nonetheless, DOE's shipments projections account for impacts that are most likely in the relevant time frame. The assumptions are described in chapter 9 and appendix 9A of the final rule TSD. The changes result in a decrease in gas-fired storage water heater shipments in the no-new-standards case in 2030 compared to the preliminary analysis. DOE acknowledges that electrification policies may result in a larger decrease in shipments of gas-fired water heaters than projected in this final rule, especially if stronger policies are adopted in coming years. However, this would occur in the no-new amended standards case and thus would only reduce the energy savings estimated in this adopted rule. For example, if incentives and rebates shifted 5 percent of shipments in the no-new amended standards case from gas-fired storage water heaters to heat pump electric storage water heaters, then the energy savings estimated for gas-fired storage water heaters in this adopted rule would decline by approximately 5 percent. The estimated consumer impacts are likely to be similar, however, except that the percentage of consumers with no impact at a given efficiency level would increase. DOE notes that the economic justification for the adopted rule would not change if DOE included the impact of incentives and rebates in the no-new-standards case, even if the absolute magnitude of the savings were to decline.

Gas Association Commenters advised that DOE should use State-level data rather than national data with differentiation between new and replacement market shares for each efficiency level in its analysis. Gas Association Commenters included specifics that they believe support this approach. (Gas Association Commenters, No. 1181 at pp. 35–37)

[129] The new owners primarily consist of households that add or switch to a different water heater option during a major remodel. Because DOE calculates new owners as the residual between its shipments model compared to historical shipments, new owners also include shipments that switch away from water heater product class to another.

DOE has taken into account differences between new and replacement market throughout its shipments analysis. DOE does not have detailed State-level data and so did not consider it in its analysis.

GAAS commented that the shipment analysis should include historical and projections of shipments for water heaters broken down by end use applications and replacement versus new construction values. GAAS stated this would show that high efficiency options are gaining in market share without the need for more stringent energy efficiency standards. GAAS also commented that the Inflation Reduction Act (''IRA'') projections should be included in electric water heater sale projections. (GAAS, No. 1139 at p. 7)

DOE's shipments analysis has considered historical and projected shipments disaggregated by applications and by replacement vs. new constructions markets using available data. Further details are available in chapter 9 and appendix 9A of the final rule TSD. DOE has accounted for recent trends in the adoption of high efficiency products in its analysis, including the impacts of recent policies incentivizing higher efficiency products in some jurisdictions.

BWC asked for further clarification on what measures were taken by DOE to ensure that product shipments that may have been recorded in several of the referenced sources in section IV.G of this document were not accounted for multiple times, thus skewing the results of the data. (BWC, No. 1164 at p. 22)

DOE carefully evaluated each data source and then cross-checked against multiple available data sources. DOE validated its estimates to avoid double-counting. Chapter 9 and appendix 9A provide a description of how data sources were utilized in the shipments analysis. In summary, some data sources provided an overview of the overall market (*e.g.,* BRG data) whereas other data sources focused on a narrower subset (*e.g.,* ENERGY STAR shipments) by efficiency level, capacity, or other characteristic. All of these data sources complement each other.

BWC disagreed with DOE's estimate that heat pump water heaters currently account for approximately 8 percent of current sales in the United States. (BWC No. 1164 at p. 14) BWC disagreed with DOE's assumption that small electric storage water heaters make up 11 percent of the total market for electric storage water heaters with capacities ranging from 20 to 55 gallons and expressed that the actual figure is much higher. BWC commented that it is prepared to discuss the basis for this belief in a confidential conversation with DOE. (BWC, No. 1164 at p. 15)

DOE derived its estimates based on available data sources of historical shipments and markets shares as discussed in further detail in chapter 9 and appendix 9A. DOE clarifies that its estimate of small electric storage water heaters are specifically for those that meet the definition of the small electric storage water heater product class, based on the distribution of capacities and first-hour ratings available in the data sources and model databases. Some smaller capacity storage water heaters may not meet the definition of small electric storage water heaters. DOE also clarifies that its estimate of market shares at various efficiency levels (including heat pump water heaters), based on the data sources discussed in chapter 8 and appendix 8I, are presented for the first year of compliance (2030) and account for any recent historical trends. By 2030, DOE estimates that the heat pump water heater market share of the electric storage water heater market will exceed 10 percent.

EEI commented that DOE projects electric storage water heater (20–55 gallons except small electric storage water heaters) shipments dropping by well over 30 percent in the first year and never recovering compared to the ''no new standards'' case under the proposed rule, and this type of demand destruction could lead manufacturers to invest in and increase production of other less-efficient products. (EEI, No. 1198 at p. 4)

DOE acknowledges that some consumers may opt to change products, from electric storage water heaters to small electric storage water heaters, in response to the standard. This market dynamic is discussed in more detail in section IV.G.1.a of this document. Although DOE estimates that approximately 30 percent of electric storage water heater shipments will shift to small electric storage water heaters in the amended-standards case, this is not demand destruction as the commenter as characterized. This is a shift in consumer demand to an alternate product that is currently available. DOE acknowledges that that this shift will result in lower energy savings than if no consumers switched products, and this is accounted for in the analyses. DOE further notes that at the adopted standard level, the minimum efficiency requirement for small electric storage water heaters is still achievable with electric resistance heating technology; therefore, for this product class, manufacturers will continue to produce similar water heaters to those that are produced today. While there will be an increase in production for small electric water heaters to meet this increased demand, there will also be an increase in the production of efficient water heaters to meet the demand of the rest of the electric storage water heater market.

1. Impact of Potential Standards on Shipments

a. Impact of Consumer Choice for Electric Storage Water Heaters

DOE applied a consumer choice model to estimate the impact on electric storage water heaters shipments in the case of a heat pump water heater standard. As noted previously (*see* section IV.F.10 of this document), DOE did not include other product switching (*e.g.,* using different fuels) in its analysis as this is likely to be a minimal effect. This is especially true in the case of an emergency replacement.

DOE accounted for the potential of consumers selecting one or more smaller electric storage water heaters with or without a ''booster'' instantaneous water heater instead of replacing a larger electric storage water heater with a heat pump water heater.[140] DOE analyzed two main scenarios for a heat pump standard: (1) When electric storage water heaters ≥20 gal and ≤55 gal, excluding small ESWHs, could potentially downsize to the small electric storage water heater product class, due to a heat pump standard to electric storage water heaters ≥20 gal and ≤55 gal, excluding small ESWHs only; and (2) A heat pump water heater standard for all ESWH product classes, where ESWHs could potentially downsize to very small water heaters. DOE identified households from the electric consumer water heater sample that might downsize at each of the considered standard levels based on water heater sizing criteria and matching to the different consumer choice options that would result in no loss of utility. DOE assigned an effective storage volume and draw pattern to sampled consumer water heaters based on data from RECS 2020 and CBECS 2018. DOE selected the households or buildings that would downsize based on the fact that the consumer would have a financial incentive to downsize in the short term (*e.g.,* lower first cost), even though in some cases downsizing might not be advantageous in the long run compared

[140] *See* Rheem's booster instantaneous water heater, which can increase the availability of hot water for storage tank water heaters at *www.rheem.com/innovations/innovation_residential/water-heater-booster/.*

to installing a heat pump water heater. Table IV.27 and Table IV.28 show the resulting estimated shipment market share impacted for each scenario. Additional details of this analysis can be found in chapter 9 and appendix 8D of the TSD.

Table IV.27 Consumer Choice Results for Electric Storage Water Heaters (Assuming Heat Pump Standard for Electric Storage Water Heaters, ≥ 20 gal and ≤ 55 gal, excluding Small ESWHs Only)

Consumer Choice Options	Efficiency Level, Market Share Impacted (%)			
	0	1	2	3
Not Switching	100%	70%	70%	70%
Small ESWH	0%	15%	15%	15%
Small ESWH + Booster	0%	9%	9%	9%
Two Small ESWH	0%	5%	5%	5%

Table IV.28 Consumer Choice Results for Electric Storage Water Heaters (Assuming Heat Pump Standard for all Electric Storage Water Heater Product Classes)

Consumer Choice Options	Efficiency Level, Market Share Impacted (%)			
	0	1	2	3
Small Electric Storage Water Heaters, ≥ 20 gal and ≤ 35 gal and FHR < 51 gal				
Not Switching	100%	6%		
Very Small ESWH + One Booster	0%	90%		
Two Very Small ESWH	0%	3%		
Two Very Small ESWH + One Booster	0%	0%		
Electric Storage Water Heaters, ≥ 20 gal and ≤ 55 gal, excluding Small ESWHs				
Not Switching	100%	82%	83%	81%
Very Small ESWH + One Booster	0%	9%	9%	9%
Two Very Small ESWH	0%	6%	6%	6%
Two Very Small ESWH + One Booster	0%	3%	3%	4%

The shipments model considers the switching that might occur in each year of the analysis period (2030–2059). To do so, DOE estimated the switching in the first year of the analysis period (2030), using data on willingness to pay, in the LCC analysis and derived trends from 2030 to 2059. The shipments model also tracks the number of additional consumer water heaters shipped in each year. *See* appendix 9A of this final rule TSD for further details regarding how DOE estimated switching between various electric water heater options.

BWC commented that the findings presented in appendix 9A of the July 2023 NOPR TSD do not align with its understanding of what has occurred in the residential water heater market since the most recent rulemaking on these products took effect in 2015. BWC also questioned how DOE could have accounted for grid-enabled water heater shipments in this appendix when the BRG report, referenced as the source for this appendix's findings, does not account for shipments of these types of products. For these reasons, BWC would welcome an opportunity to discuss this matter further confidentially with DOE. (BWC, No. 1164 at p. 22)

DOE derived its estimates based on multiple available data sources and shipments model. The BRG report is only one data source. Other sources include AHRI shipments data available online, shipments data submitted confidentially to DOE, shipment estimates from ENERGY STAR, EIA's Annual Electric Power Industry Report, and estimates from trade magazines, as discussed in chapter 9. DOE used the combination of all these data to estimate shipments of the smaller product classes, such as electric storage water heaters greater than 55 gallons. DOE also clarifies that it did not propose or adopt standards for grid-enabled water heaters and therefore they were not specifically considered in the analysis.

BWC recommended that DOE utilize information that is specific to the residential water heater market in supporting its claims relative to consumer preferences. In the absence of such information, BWC asked that DOE take a proactive approach by working directly with manufacturers, trade associations, consumer advocates, and other knowledgeable stakeholders to collect information that is timely and relevant to the products that are subject to this rulemaking through confidential interviews and disaggregated surveys. (BWC, No. 1164 at p. 24)

DOE has considered available information and data sources, including interviews with manufacturers, industry market research reports, confidentially submitted data, and feedback from an industry consultant. There are, however, no specific data or studies on consumer decision-making preferences that DOE is aware of, specifically with respect to the water heater market, other than what is revealed by shipments data and the market share of various products currently available. DOE derived its estimates of efficiency distributions based on these market data. Regarding DOE's estimates of consumer preferences and market failures, these are based on a wide body of economics literature as discussed in more detail in section IV.F.8 of this document.

b. Impact of Repair vs. Replace

DOE estimated a fraction of consumer water heater replacement installations

that choose to repair their equipment, rather than replace their equipment in the new standards case. The approach captures not only a decrease in consumer water heater replacement shipments, but also the energy use from continuing to use the existing consumer water heater and the cost of the repair. DOE assumes that the demand for water heating is inelastic and, therefore, that no household or commercial building will forgo either repairing or replacing their equipment (either with a new consumer water heater or a suitable water heating alternative).

For details on DOE's shipments analysis, consumer choice, and the repair option, *see* chapter 9 of the final rule TSD.

H. National Impact Analysis

The NIA assesses the national energy savings (''NES'') and the NPV from a national perspective of total consumer costs and savings that would be expected to result from new or amended standards at specific efficiency levels.[141] (''Consumer'' in this context refers to consumers of the product being regulated.) DOE calculates the NES and NPV for the potential standard levels considered based on projections of annual product shipments, along with the annual energy consumption and total installed cost data from the energy use and LCC analyses. For the present analysis, DOE projected the energy savings, operating cost savings, product costs, and NPV of consumer benefits over the lifetime of consumer water heaters sold from 2030 through 2059.

DOE evaluates the impacts of new or amended standards by comparing a case without such standards with standards-case projections. The no-new-standards case characterizes energy use and consumer costs for each product class in the absence of new or amended energy conservation standards. For this projection, DOE considers historical trends in efficiency and various forces that are likely to affect the mix of efficiencies over time. DOE compares the no-new-standards case with projections characterizing the market for each product class if DOE adopted new or amended standards at specific energy efficiency levels (*i.e.,* the TSLs or standards cases) for that class. For the standards cases, DOE considers how a given standard would likely affect the market shares of products with efficiencies greater than the standard.

DOE uses a spreadsheet model to calculate the energy savings and the national consumer costs and savings from each TSL. Interested parties can review DOE's analyses by changing various input quantities within the spreadsheet. The NIA spreadsheet model uses typical values (as opposed to probability distributions) as inputs.

Table IV.29 summarizes the inputs and methods DOE used for the NIA analysis for the final rule. Discussion of these inputs and methods follows the table. *See* chapter 10 of the final rule TSD for further details.

Table IV.29 Summary of Inputs and Methods for the National Impact Analysis

Inputs	Method
Shipments	Annual shipments from shipments model.
Compliance Date of Standard	2030
Efficiency Trends	No-new-standards case: Based on historical data. Standard cases: Roll-up in the compliance year and then DOE estimated growth in shipment-weighted efficiency in all the standards cases.
Annual Energy Consumption per Unit	Annual weighted-average values are a function of energy use at each TSL.
Total Installed Cost per Unit	Annual weighted-average values are a function of cost at each TSL. Incorporates projection of future product prices based on historical data.
Annual Energy Cost per Unit	Annual weighted-average values as a function of the annual energy consumption per unit and energy prices.
Repair and Maintenance Cost per Unit	Annual values do not change with efficiency level.
Energy Price Trends	*AEO2023* projections (to 2050) and extrapolation thereafter.
Energy Site-to-Primary and FFC Conversion	A time-series conversion factor based on *AEO2023*.
Discount Rate	Three and seven percent.
Present Year	2023

1. Product Efficiency Trends

A key component of the NIA is the trend in energy efficiency projected for the no-new-standards case and each of the standards cases. Section IV.F.8 of this document describes how DOE developed an energy efficiency distribution for the no-new-standards case (which yields a shipment-weighted average efficiency) for each of the considered product classes for the year of anticipated compliance with an amended or new standard. To project the trend in efficiency absent amended standards for consumer water heaters over the entire shipments projection period, DOE used available historical shipments data and manufacturer input. The approach is further described in chapter 10 of the final rule TSD.

For the standards cases, DOE used a ''roll-up'' scenario to establish the shipment-weighted efficiency for the year that standards are assumed to become effective (2030). In this scenario, the market shares of products in the no-new-standards case that do not meet the standard under consideration

[141] The NIA accounts for impacts in the United States and U.S. territories.

would ''roll up'' to meet the new standard level, and the market share of products above the standard would remain unchanged.

To develop standards-case efficiency trends after 2030, DOE used historical shipment data and current consumer water heater model availability by efficiency level (*see* chapter 8). DOE estimated growth in shipment-weighted efficiency by assuming that the implementation of ENERGY STAR's performance criteria and other incentives would gradually increase the market shares of higher efficiency water heaters meeting ENERGY STAR requirements such as EL 3 and above for gas-fired storage water heaters and EL 2 and above for electric storage water heaters (≥20 gal V_{eff} >55 gal).DOE also took into account increased incentives for higher efficiency equipment and electrification efforts. For oil-fired storage water heaters and electric storage water heaters (>55 gal V_{eff} ≤120 gal), DOE assumed a constant market share throughout the analysis period (2030–2059).

BWC cautioned DOE against using ENERGY STAR performance criteria data to assume growth in market shares for higher efficiency water heaters after 2030 in the no-new-standards case. BWC noted that ENERGY STAR's Residential Water Heater Specification 4.0 (effective March 29, 2022, to April 18, 2023) incentivized the purchase of high efficiency water heater products, such as heat pump water heaters, but the penetration rate for these products in the market remains low, as ENERGY STAR's 2022 Unit Shipment and Market Penetration Report Summary reports only a 3-percent market penetration for these products. In contrast, Figure 10.2.2 of the NOPR TSD assumes heat pump water heaters making up 11 percent of the market by 2030 in the no-new-standards case, which appears unlikely when considering the information released by ENERGY STAR cited above. (BWC, No. 1164 at p. 3)

DOE derived its estimates based on multiple available data sources and shipments model, not just ENERGY STAR shipment data. DOE's estimated market share of higher efficiency equipment is based on these data as well as on existing policies and incentives that drive a higher adoption of higher efficiency equipment in the no-new-standards case, as discussed in more detail in appendix 8I and 9A. DOE notes that if the analysis assumed a lower market share projection of heat pump water heaters in the no-new-standards case, this would result in a higher estimate of energy savings from the adopted standards, which would only further support DOE's conclusion of economic justification.

2. National Energy Savings

The national energy savings analysis involves a comparison of national energy consumption of the considered products between each potential standards case (''TSL'') and the case with no new or amended energy conservation standards. DOE calculated the national energy consumption by multiplying the number of units (stock) of each product (by vintage or age) by the unit energy consumption (also by vintage). DOE calculated annual NES based on the difference in national energy consumption for the no-new-standards case and for each higher efficiency standard case. DOE estimated energy consumption and savings based on site energy and converted the electricity consumption and savings to primary energy (*i.e.,* the energy consumed by power plants to generate site electricity) using annual conversion factors derived from *AEO2023.* Cumulative energy savings are the sum of the NES for each year over the timeframe of the analysis.

Use of higher-efficiency products is sometimes associated with a direct rebound effect, which refers to an increase in utilization of the product due to the increase in efficiency. DOE examined a 2009 review of empirical estimates of the rebound effect for various energy-using products.[142] This review concluded that the econometric and quasi-experimental studies suggest a mean value for the direct rebound effect for household water heating of around 10 percent. DOE also examined a 2012 ACEEE paper[143] and a 2013 paper by Thomas and Azevedo.[144] Both of these publications examined the same studies that were reviewed by Sorrell, as well as Greening *et al.*,[145] and identified methodological problems with some of the studies. The studies believed to be most reliable by Thomas and Azevedo show a direct rebound effect for water heating products in the 1-percent to 15-percent range, while Nadel concludes that a more likely range is 1 to 12 percent, with rebound effects sometimes higher for low-income households that could not afford to adequately heat their homes prior to weatherization. DOE applied a rebound effect of 10 percent for consumer water heaters used in residential applications based on studies of other residential products and the value used for consumer water heaters in the 2010 Final Rule for Heating Products, and 0 percent for consumer water heaters in commercial applications, which also matches EIA's National Energy Modeling System (''NEMS'') for residential and commercial water heating and is consistent with other recent energy conservation standards rulemakings.[146] [147] [148] [149] The calculated NES at each efficiency level is therefore reduced by 10 percent in residential applications. DOE also included the rebound effect in the NPV analysis by accounting for the additional net benefit from increased consumer water heaters usage, as described in section IV.H.3 of this document.

In 2011, in response to the recommendations of a committee on ''Point-of-Use and Full-Fuel-Cycle Measurement Approaches to Energy Efficiency Standards'' appointed by the National Academy of Sciences, DOE announced its intention to use FFC measures of energy use and greenhouse gas and other emissions in the national impact analyses and emissions analyses included in future energy conservation standards rulemakings. 76 FR 51281 (Aug. 18, 2011). After evaluating the approaches discussed in the August 18, 2011 notice, DOE published a statement of amended policy in which DOE explained its determination that EIA's

National Energy Modeling System (''NEMS'') is the most appropriate tool for its FFC analysis and its intention to use NEMS for that purpose. 77 FR 49701 (Aug. 17, 2012). NEMS is a public domain, multi-sector, partial equilibrium model of the U.S. energy sector [150] that EIA uses to prepare its *Annual Energy Outlook.* The FFC factors in corporate losses in production and delivery in the case of natural gas (including fugitive emissions) and additional energy used to produce and deliver the various fuels used by power plants. The approach used for deriving FFC measures of energy use and emissions is described in appendix 10B of the final rule TSD.

EEI commented that the fossil fuel equivalency methodology, employed in DOE's impact assessment of proposed changes to efficiency standards, was developed in an earlier era when the penetration of renewable energy generation was low. EEI commented that continuing to apply fossil fuel equivalency factors leads to the false conclusion that renewable energy generation has the same primary energy losses as fossil generation and that these energy losses represent similar economic loss. EEI stated that EIA is moving to the captured energy approach in all of its analyses as of June 2023, and DOE should follow EIA's lead and update its methodology as soon as possible to create more realistic estimates of primary energy savings and electricity sector emissions reductions. (EEI, No. 1198 at pp. 6–8)

As previously mentioned, DOE converts electricity consumption and savings to primary energy using annual conversion factors derived from the EIA's *AEO2023.* Traditionally, EIA has used the fossil fuel equivalency approach to report noncombustible renewables' contribution to total primary energy. The fossil fuel equivalency approach applies an annualized weighted-average heat rate for fossil fuel power plants to the electricity generated (in kWh) from noncombustible renewables. EIA recognizes that using captured energy (the net energy available for direct consumption after transformation of a noncombustible renewable energy into electricity) or incident energy (the mechanical, radiation, or thermal energy that is measurable as the ''input'' to the device) are possible approaches for converting renewable electricity to a common measure of primary energy, but used the fossil fuel equivalency approach in *AEO2023* and other reporting of energy statistics used in this final rule. DOE contends that it is important for it to maintain consistency with *AEO2023* in DOE's accounting of primary energy savings from energy efficiency standards.

3. Net Present Value Analysis

The inputs for determining the NPV of the total costs and benefits experienced by consumers are (1) total annual installed cost, (2) total annual operating costs (energy costs and repair and maintenance costs), and (3) a discount factor to calculate the present value of costs and savings. DOE calculates net savings each year as the difference between the no-new-standards case and each standards case in terms of total savings in operating costs versus total increases in installed costs. DOE calculates operating cost savings over the lifetime of each product shipped during the projection period.

As discussed in section IV.F.1 of this document, DOE used constant prices as the default price assumption to project future consumer water heater prices. However, DOE also developed consumer water heater price trends based on historical PPI data. DOE applied the same trends to project prices for each product class at each considered efficiency level as a sensitivity analysis. DOE's projection of product prices is described in appendix 10C of the final rule TSD.

To evaluate the effect of uncertainty regarding the price trend estimates, DOE investigated the impact of different product price projections on the consumer NPV for the considered TSLs for consumer water heaters. In addition to the default price trend, DOE considered two product price sensitivity cases: (1) a price decline case and (2) price increase case based on PPI data. The derivation of these price trends and the results of these sensitivity cases are described in appendix 10C of the final rule TSD.

The energy cost savings are calculated using the estimated energy savings in each year and the projected price of the appropriate form of energy. To estimate energy prices in future years, DOE multiplied the average regional energy prices by the projection of annual national-average residential energy price changes in the Reference case from *AEO2023,* which has an end year of 2050. To estimate price trends after 2050, the 2046–2050 average was used for all years. As part of the NIA, DOE also analyzed scenarios that used inputs from variants of the *AEO2023* Reference case that have lower and higher economic growth. Those cases have lower and higher energy price trends compared to the Reference case. NIA results based on these cases are presented in appendix 10C of the final rule TSD.

In considering the consumer welfare gained due to the direct rebound effect, DOE accounted for change in consumer surplus attributed to additional water heating from the purchase of a more efficient unit. Overall consumer welfare is generally understood to be enhanced from rebound. The net consumer impact of the rebound effect is included in the calculation of operating cost savings in the consumer NPV results. *See* appendix 10E of the final rule TSD for details on DOE's treatment of the monetary valuation of the rebound effect.

In calculating the NPV, DOE multiplies the net savings in future years by a discount factor to determine their present value. For this final rule, DOE estimated the NPV of consumer benefits using both a 3-percent and a 7-percent real discount rate. DOE uses these discount rates in accordance with guidance provided by the Office of Management and Budget (''OMB'') to Federal agencies on the development of regulatory analysis.[151] The discount rates for the determination of NPV are in contrast to the discount rates used in the LCC analysis, which are designed to reflect a consumer's perspective. The 7-percent real value is an estimate of the average before-tax rate of return to private capital in the U.S. economy. The 3-percent real value represents the ''social rate of time preference,'' which is the rate at which society discounts future consumption flows to their present value.

Atmos Energy argued that increased efficiency in water heaters could lead to an increase in water usage which could further drought in southern and western states. Atmos Energy argued that a full evaluation of rebound effects of the proposal should be conducted and that increased water usage should be calculated and evaluated as an environmental cost of the proposal. (Atmos Energy, No. 1183 at p. 5)

DOE has considered rebound effects in its analysis. DOE notes that the impacts of changes in water usage on regional water supply are not captured

within the scope of DOE's standards analysis.

I. Consumer Subgroup Analysis

In analyzing the potential impact of new or amended energy conservation standards on consumers, DOE evaluates the impact on identifiable subgroups of consumers that may be disproportionately affected by a new or amended national standard. The purpose of a subgroup analysis is to determine the extent of any such disproportional impacts. DOE evaluates impacts on particular subgroups of consumers by analyzing the LCC impacts and PBP for those particular consumers from alternative standard levels. For this final rule, DOE analyzed the impacts of the considered standard levels on three subgroups: (1) low-income households, (2) senior-only households, and (3) small businesses. The analysis used subsets of the RECS 2020 sample composed of households and CBECS 2018 sample composed of commercial buildings that meet the criteria for the three subgroups. DOE used the LCC and PBP spreadsheet model to estimate the impacts of the considered efficiency levels on these subgroups. Chapter 11 in the FR TSD describes the consumer subgroup analysis.

1. Low-Income Households

Low-income households are significantly more likely to be renters or live in subsidized housing units and less likely to be homeowners. DOE notes that in these cases, the landlord purchases the equipment and may pay the gas bill as well. RECS 2020 includes data on whether a household pays for the gas bill, allowing DOE to categorize households appropriately in the analysis.[152] For this consumer subgroup analysis, DOE considers the impact on the low-income household narrowly, excluding any costs or benefits that are accrued by either a landlord or subsidized housing agency. This allows DOE to determine whether low-income households are disproportionately affected by an amended energy conservation standard in a more representative manner. DOE takes into account a fraction of renters that face product switching (when landlords switch to products that have lower upfront costs but higher operating costs, which will be incurred by tenants).

The majority of low-income households that experience a net cost at higher efficiency levels are homeowner households, as opposed to renters. These households either have a smaller capacity water heater or lower hot water use. Unlike renters, homeowners would bear the full cost of installing a new water heater. For these households, a potential rebate program to reduce the total installed costs would be effective in lowering the percentage of low-income consumers with a net cost. DOE understands that the landscape of low-income consumers with a water heater may change before the compliance date of amended energy conservation standards, if finalized. For example, point-of-sale rebate programs are being considered that may moderate the impact on low-income consumers to help offset the total installed cost of a higher efficiency water heater, particularly given the lower total installed cost of smaller capacity water heater. Currently, DOE is aware that the Inflation Reduction Act will likely include incentives for certain water heaters, although the specific implementation details have yet to be finalized. DOE is also aware of State or utility program rebates in the Northeast or California, for example, that support additional heat pump deployment as a result of decarbonization policy goals. Point-of-sale rebates or weatherization programs could also reduce the total number of low-income consumers that would be impacted because the household no longer has a water heater to upgrade.

BWC cautioned DOE against relying as heavily as it does in this proposal on state, local, and/or utility rebate programs to decrease the upfront installation costs for condensing gas-fired water heaters, as well as heat pump water heaters. While recognizing the existence of many rebate programs today, BWC questions how many of these rebates will continue in place if the Department finalizes this proposal. This is therefore a scenario BWC urged DOE to account for in its subgroup analysis as BWC believes it will reveal cost burdens that are much higher on the low-income households than what is presently assumed in this NOPR. (BWC, No. 1164 at p. 19). For consumers in subsidized housing, BWC urged the Department to consider two realistic outcomes regarding product rebates that are designed to cover upfront installation costs. The first is that many or all third parties will stop offering these rebates once federal, state, and/or local regulatory bodies require the use of high-efficiency appliances. (BWC No. 1164 at p. 26) The second is the cost that these consumers will experience when their highly efficient product reaches the end of its useful life. Many rebate programs are designed to assist consumers with project costs associated with fuel-switching or upgrading a lower efficiency product with a more expensive, higher efficiency counterpart. However, many if not most of these rebate programs do not apply to installations where a highly efficient product is undergoing a like-for-like replacement. (BWC No. 1164 at p. 27)

Rheem argued that IRA will not impact water heaters sold at the efficiency levels proposed by DOE; therefore, low-income households will not benefit from 25C tax credits. Rheem pointed out that Energy Star specification has recently been updated and recommended that DOE address the new levels. This includes that Energy Star has indicated that they will sunset gas-fired water heater specification and therefore should not be used to determine uptake of higher efficiency gas-fired WH. (Rheem, No. 1177 at pp. 16–17).

In response to the above comments regarding rebates, DOE clarifies that it does not rely on the existence of rebate programs to justify the energy conservation standards. DOE's installation costs are estimated based on labor and material costs, as described in chapter 8 and appendix 8D, without any rebates. DOE merely notes that the potential existence of such programs in the future would only improve the economic justification of this rule.

Health Advocates and Joint Advocates of Energy Efficiency argued that 67 percent of low-income households face a high-energy burden where they must spend 3 times more of their income on energy costs compared to median spending (8.1 percent vs 2.3 percent). Health Advocates argued that renters (disproportionately low-income households) would benefit from this rule because landlords have no incentive to install efficient water heaters as tenants usually pay the energy bills. (Health Advocates, No. 1179 at p. 2; Joint Advocates of Energy Efficiency, No. 1165 at p. 2) In response, DOE notes that it has considered the impacts on low-income households. Low-income homeowners (including owners of manufactured homes) are more likely to have smaller water heaters that either are not subject to amended standards (in the case of small ESWHs) or have modest incremental costs. Low-income renters are unlikely to bear the equipment and installation costs of replacing their water heater but

[152] RECS 2020 includes a category for households that pay only some of the gas bill. For the low-income consumer subgroup analysis, DOE assumes that these households pay 50 percent of the gas bill, and, therefore, would receive 50 percent of operating cost benefits of an amended energy conservation standard.

are more likely to pay energy costs and therefore see operating benefits from the rule. DOE has evaluated the full distribution of impacts in the LCC analysis, including consumers that experience a net cost and consumers that experience a net benefit, and concludes that on the whole, the rule is economically justified.

Gas Association Commenters argued that if better regional market share data were used, regions with low or negative LCC savings would impact the overall outcome differently. Gas Association Commenters included tables in their submitted comment summarizing these argued regional impacts. Gas Association Commenters also argued that DOE is missing subsets of low-income households by only using those who are most likely to directly pay utility bills. They stated that utilities can also be a function of rent where higher utility costs can still be passed on to the end user. (Gas Association Commenters, No. 1181 at p. 6 and pp. 23–25) DOE acknowledges that there may be some regional variation in LCC impacts and these results are available in the LCC spreadsheet. DOE further acknowledges that some fraction of consumers will experience a net cost, as presented in the LCC. However, DOE concludes that on the whole, the rule continues to be economically justified, with the incorporation of a much larger RECS 2020 sample. The average LCC savings remain positive. With respect to low-income households, DOE took into account both scenarios where the households do or do not directly pay their utility bills, and these are included in the low-income subgroup analysis as discussed in chapter 11.

NRECA commented that the subgroup is too narrowly defined to include low-income homeowners and urged DOE to account for consumers near but above the poverty level who can also experience a high burden when the installation cost for a heat pump water heater easily takes up 10 percent of their annual income. NRECA also noted that manufactured housing comprises 25 percent or more of the co-op's residential housing stock and that these same homes present challenges for heat pump water heater adoption due to space constraints. NRECA suggested that DOE should improve its analysis by using low-and-moderate income instead of poverty-level in the subgroup and assigning proportionally higher occurrences of expensive installations to this subgroup. (NRECA, No. 1127 at pp. 5–6) In contrast, NYSERDA commented that the proposed standard will bring significant benefits to low-and-moderate income households and to disadvantaged communities. (NYSERDA, No. 1192 at p. 3) DOE notes that the low-income subgroup is specifically defined for households meeting poverty thresholds, as defined in chapter 11. While households slightly above these thresholds are not included in the low-income subgroup analysis, they are part of the overall LCC analysis. On the whole, DOE concludes that the rule is economically justified for both the overall LCC consumer sample as well as the low-income subgroup. Households that do not meet the low-income threshold but are nonetheless energy insecure are likely to experience impacts that fall in between the overall LCC results and the low-income subgroup results, which would still be economically justified. As noted above, energy insecure homeowners with smaller water heaters will either experience smaller incremental equipment costs on average or have water heaters not subject to amended standards, and energy insecure renters would benefit similarly to low-income renters.

ECSC argued that heat pump water heater installations will be hindered by lack of contractor availability in rural areas. (ECSC, No. 1185 at pp. 1–2) Regarding contractor availability, DOE notes that while heat pump water heaters are not as common today, they will become very common by the compliance date of the rule. Many contractors at present are able to install different types of water heaters, including heat pump water heaters. At the adopted standard level, the existing market for small electric storage water heaters is preserved, which reduces the level of contractor training and investment needed than if higher standards were adopted for all electric storage water heaters. While DOE acknowledges there is a ramp up in contractor training required by 2030, the adopted standard level allows for a more incremental transition to heat pump technology. Furthermore, DOE notes that the emergence of workforce programs supported by the Inflation Reduction Act and the Bipartisan Infrastructure Law will begin to support the training and education of the workforce needed to support the clean energy transition.

BWC disagreed with the Department excluding any costs or benefits that are accrued by a landlord when analyzing impacts to the low-income household subgroup. While BWC understood that these costs and benefits are not imposed directly on renters, they will indirectly lead to impacts on renters that DOE should account for, such as increased rent rates resulting from landlords attempting to recoup the initial project installation costs, as well as increased maintenance costs likely to result for the installation of a higher efficiency product. (BWC No. 1164 at p. 26) Armada argued that DOE failed to acknowledge that landlords will be forced to increase rent or other costs to cover the purchase and installation of more efficient options, and a landlord will have to dedicate a bedroom to a water heater or reconfigure the duct-work of the property to accommodate the water heater. Armada argued that these are major changes that will harm residents the most, and these proposed efficiency standards which will effectively mandate heat pump technology will only compound the existing affordable housing issue. (Armada, No. 1193 at pp. 6–7) DOE finds no evidence that significant rental cost increases would occur. Rental prices are largely dictated by supply and demand of housing in individual locations, not the sum of equipment costs in those rentals, such that two similar rentals could have widely differing prices in different cities. Furthermore, a landlord would be responsible for replacing an end-of-life water heater in the no-new-standards case as well yet the rent is unlikely to increase simply because of this regular maintenance. The installation costs estimated in the LCC already include any potential replacement of venting for gas-fired water heaters and other installation costs for ESWHs, however there is never a need to ''dedicate a bedroom'' to a new water heater. Additionally, even if there are significant extra costs for the installation of a heat pump water heater (see section IV.F.2.d of this document), the analysis includes the potential to switch to a small ESWH for consumers with lower hot water demand as an alternative to minimize installation costs (see section IV.G.1 of this document). Finally, even if a landlord were to fully pass on the incremental costs due to amended standards, those costs would presumably be spread out over a monthly rent spanning many years, possibly the lifetime of the water heater, resulting in relatively small monthly rent increases. It is for these reasons that the low-income subgroup analyzes impacts assuming renters do not bear installation costs. However, as described in section IV.F of this document, for the overall LCC analysis, DOE makes the simplifying assumption that all installation and equipment costs are paid for by the consumer of the equipment, including renters. Therefore, the main LCC results do assume that

landlords pass on all costs and yet the analysis still finds that the rule is economically justified.

For consumers in subsidized housing, BWC urged the Department to consider two realistic outcomes regarding product rebates that are designed to cover upfront installation costs. The first is that many or all third parties will stop offering these rebates once federal, state, and/or local regulatory bodies require the use of high-efficiency appliances. (BWC No. 1164 at p. 26) The second is the cost that these consumers will experience when their highly efficient product reaches the end of its useful life. Many rebate programs are designed to assist consumers with project costs associated with fuel-switching or upgrading a lower efficiency product with a more expensive, higher efficiency counterpart. However, many if not most of these rebate programs do not apply to installations where a highly efficient product is undergoing a like-for-like replacement. (BWC No. 1164 at p. 27)

DOE clarifies that the analysis does not assume that installation costs are reduced by rebates or incentives. Rather, the analysis uses these existing programs as part of the shipments projection and the projection of market shares at different efficiency levels in the no-new-standards case. This merely characterizes the market up to the compliance date of the adopted standards.

2. Senior-Only Households

Senior-only households are households with occupants who are all at least 65 years of age. RECS 2020 includes information on the age of household occupants, allowing for the identification of senior-only households from the sample. Senior-only households comprised 23.5 percent of the country's households. In estimating the LCC impacts to senior-only households, it is assumed that any residual value of a long-lived product is capitalized in the value of the home.

3. Small Business Subgroup

DOE identified small businesses in CBECS 2018 using threshold levels for maximum number of employees within each building principal building activity. DOE received no comments regarding small businesses impacts relevant to products within the scope of this final rule.

J. Manufacturer Impact Analysis

1. Overview

DOE performed an MIA to estimate the financial impacts of amended energy conservation standards on manufacturers of consumer water heaters and to estimate the potential impacts of such standards on direct employment and manufacturing capacity. The MIA has both quantitative and qualitative aspects and includes analyses of projected industry cash flows, the INPV, investments in research and development (''R&D'') and manufacturing capital, and domestic manufacturing employment. Additionally, the MIA seeks to determine how amended energy conservation standards might affect manufacturing employment, capacity, and competition, as well as how standards contribute to overall regulatory burden. Finally, the MIA serves to identify any disproportionate impacts on manufacturer subgroups, including small business manufacturers.

The quantitative part of the MIA primarily relies on the GRIM, an industry cash flow model with inputs specific to this rulemaking. The key GRIM inputs include data on the industry cost structure, unit production costs, product shipments, manufacturer markups, and investments in R&D and manufacturing capital required to produce compliant products. The key GRIM outputs are the INPV, which is the sum of industry annual cash flows over the analysis period, discounted using the industry-weighted average cost of capital, and the impact to domestic manufacturing employment. The model uses standard accounting principles to estimate the impacts of more stringent energy conservation standards on a given industry by comparing changes in INPV and domestic manufacturing employment between a no-new-standards case and the various standards cases. To capture the uncertainty relating to manufacturer pricing strategies following amended standards, the GRIM estimates a range of possible impacts under different manufacturer markup scenarios.

The qualitative part of the MIA addresses manufacturer characteristics and market trends. Specifically, the MIA considers such factors as a potential standard's impact on manufacturing capacity, competition within the industry, the cumulative impact of other DOE and non-DOE regulations, and impacts on manufacturer subgroups. The complete MIA is outlined in chapter 12 of the final rule TSD.

DOE conducted the MIA for this rulemaking in three phases. In Phase 1 of the MIA, DOE prepared a profile of the consumer water heater manufacturing industry based on the market and technology assessment, preliminary manufacturer interviews, and publicly available information. This included a top-down analysis of consumer water heater manufacturers that DOE used to derive preliminary financial inputs for the GRIM (*e.g.,* revenues; materials, labor, overhead, and depreciation expenses; selling, general, and administrative expenses (''SG&A''); and R&D expenses). DOE also used public sources of information to further calibrate its initial characterization of the consumer water heater manufacturing industry, including company filings of form 10–K from the SEC,[153] corporate annual reports, the U.S. Census Bureau's *Quarterly Survey of Plant Capacity Utilization*,[154] U.S. Census Bureau's *Annual Survey of Manufactures* (''*ASM*''),[155] and reports from D&B Hoovers.[156]

In Phase 2 of the MIA, DOE prepared a framework industry cash-flow analysis to quantify the potential impacts of amended energy conservation standards. The GRIM uses several factors to determine a series of annual cash flows starting with the announcement of the standard and extending over a 30-year period following the compliance date of the standard. These factors include annual expected revenues, costs of sales, SG&A and R&D expenses, taxes, and capital expenditures. In general, energy conservation standards can affect manufacturer cash flow in three distinct ways: (1) creating a need for increased investment, (2) raising production costs per unit, and (3) altering revenue due to higher per-unit prices and changes in sales volumes.

In addition, during Phase 2, DOE developed interview guides to distribute to manufacturers of consumer water heaters in order to develop other key GRIM inputs, including product and capital conversion costs, and to gather additional information on the anticipated effects of energy conservation standards on revenues, direct employment, capital assets, industry competitiveness, and subgroup impacts.

In Phase 3 of the MIA, DOE conducted structured, detailed

[156] The D&B Hoovers login is available at *app.dnbhoovers.com* (last accessed Dec. 1, 2023).

interviews with representative manufacturers. During these interviews, DOE discussed engineering, manufacturing, procurement, and financial topics to validate assumptions used in the GRIM and to identify key issues or concerns. As part of Phase 3, DOE also evaluated subgroups of manufacturers that may be disproportionately impacted by amended standards or that may not be accurately represented by the average cost assumptions used to develop the industry cash flow analysis. Such manufacturer subgroups may include small business manufacturers, low-volume manufacturers, niche players, and/or manufacturers exhibiting a cost structure that largely differs from the industry average. DOE identified one subgroup for a separate impact analysis: small business manufacturers. The small business subgroup is discussed in section VI.B of this document, ''Review under the Regulatory Flexibility Act'' and in chapter 12 of the final rule TSD.

2. Government Regulatory Impact Model and Key Inputs

DOE uses the GRIM to quantify the changes in cash flow due to new or amended standards that result in a higher or lower industry value. The GRIM uses a standard, annual, discounted cash-flow analysis that incorporates manufacturer costs, manufacturer markups, shipments, and industry financial information as inputs. The GRIM models changes in costs, distribution of shipments, investments, and manufacturer margins that could result from an amended energy conservation standard. The GRIM spreadsheet uses the inputs to arrive at a series of annual cash flows, beginning in 2023 (the base year of the analysis) and continuing to 2059. DOE calculated INPVs by summing the stream of annual discounted cash flows during this period. For manufacturers of consumer water heaters, DOE used a real discount rate of 9.3 percent, which was derived from industry financials and then modified according to feedback received during manufacturer interviews.

The GRIM calculates cash flows using standard accounting principles and compares changes in INPV between the no-new-standards case and each standards case. The difference in INPV between the no-new-standards case and a standards case represents the financial impact of the new or amended energy conservation standard on manufacturers. As discussed previously, DOE developed critical GRIM inputs using a number of sources, including publicly available data, results of the engineering analysis, and information gathered from industry stakeholders during the course of manufacturer interviews. The GRIM results are presented in section V.B.2 of this document. Additional details about the GRIM, the discount rate, and other financial parameters can be found in chapter 12 of the final rule TSD.

a. Manufacturer Production Costs

Manufacturing more efficient products is typically more expensive than manufacturing baseline products due to the use of more complex components, which are typically more costly than baseline components. The changes in the MPCs of covered products can affect the revenues, gross margins, and cash flow of the industry.

As discussed in section IV.C.1 of this document, DOE conducted a market analysis of currently available models listed in DOE's CCD to determine which efficiency levels were most representative of the current distribution of consumer water heaters available on the market. DOE also completed physical teardowns of commercially available units to determine which design options manufacturers may use to achieve certain efficiency levels for each water heater category analyzed. DOE requested comments from stakeholders and conducted interviews with manufacturers concerning these initial efficiency levels, which have been updated based on the feedback DOE received. For a complete description of the MPCs, *see* section IV.C of this document and chapter 5 of the final rule TSD.

b. Shipments Projections

The GRIM estimates manufacturer revenues based on total unit shipment projections and the distribution of those shipments by efficiency level. Changes in sales volumes and efficiency mix over time can significantly affect manufacturer finances. For this analysis, the GRIM uses the NIA's annual shipment projections derived from the shipments analysis from 2023 (the base year) to 2059 (the end year of the analysis period). *See* section IV.G of this document and chapter 9 of the final rule TSD for additional details.

c. Product and Capital Conversion Costs

Amended energy conservation standards could cause manufacturers to incur conversion costs to bring their production facilities and equipment designs into compliance. DOE evaluated the level of conversion-related expenditures that would be needed to comply with each considered efficiency level in each product class. For the MIA, DOE classified these conversion costs into two major groups: (1) product conversion costs; and (2) capital conversion costs. Product conversion costs are investments in research, development, testing, marketing, and other non-capitalized costs necessary to make product designs comply with amended energy conservation standards. Capital conversion costs are investments in property, plant, and equipment necessary to adapt or change existing production facilities such that new compliant product designs can be fabricated and assembled.

To evaluate the level of product conversion costs manufacturers would likely incur to comply with amended energy conservation standards, DOE relied on feedback from manufacturer interviews. DOE contractors conducted interviews with manufacturers of gas-fired storage, gas-fired instantaneous, oil-fired storage, electric storage, electric instantaneous, tabletop, and grid-enabled water heaters. The interviewed manufacturers account for approximately 84 percent of sales of consumer water heaters covered by this rulemaking. DOE used market share weighted feedback from interviews to extrapolate industry-level product conversion costs from the manufacturer feedback.

To evaluate the level of capital conversion costs manufacturers would likely incur to comply with amended energy conservation standards, DOE relied on estimates of equipment and tooling from its engineering analysis and on feedback from manufacturer interviews. DOE modeled the green field investments required for a major manufacturer to set up a production facility. The investment figures included capital required for manufacturing equipment, tooling, conveyors, and facility. DOE then modeled the incremental investment required by more stringent standards. DOE multiplied the incremental investment by the number of ''major'' (*i.e.,* high-volume) manufacturers. These investment levels aligned with feedback from interviews. Additionally, DOE determined that smaller manufacturers would have lower investment levels given their lower production volumes, relative to ''major'' manufacturers, and accounted for those lower investments for manufacturers with lower market share. DOE updated its conversion cost estimates for the product classes analyzed in this final rule by incorporating refined equipment, tooling, conveyor, and space estimates generated from the product teardown analysis, but otherwise maintained its

conversion cost methodology from the July 2023 NOPR.

In general, DOE assumes all conversion-related investments occur between the year of publication of the final rule and the year by which manufacturers must comply with the new standard. The conversion cost figures used in the GRIM can be found in section V.B.2 of this document. For additional information on the estimated product and capital conversion costs, *see* chapter 12 of the final rule TSD.

d. Manufacturer Markup Scenarios

MSPs include direct manufacturing production costs (*i.e.,* labor, materials, and overhead estimated in DOE's MPCs) and all non-production costs (*i.e.,* SG&A, R&D, and interest), along with profit. To calculate the MSPs in the GRIM, DOE applied manufacturer markups to the MPCs estimated in the engineering analysis for each analyzed product class and efficiency level. Modifying these manufacturer markups in the standards case yields different sets of impacts on manufacturers. For the MIA, DOE modeled two standards-case manufacturer markup scenarios to represent uncertainty regarding the potential impacts on prices and profitability for manufacturers following the implementation of amended energy conservation standards: (1) a preservation of gross margin percentage scenario; and (2) a preservation of operating profit scenario. These scenarios lead to different manufacturer markup values that, when applied to the MPCs, result in varying revenue and cash flow impacts.

Under the preservation of gross margin percentage scenario, DOE applied a single uniform ''gross margin percentage'' across all efficiency levels, which assumes that manufacturers would be able to maintain the same amount of profit as a percentage of revenues at all efficiency levels within a product class. As MPCs increase with efficiency, this scenario implies that the per-unit dollar profit will increase. DOE estimated gross margin percentages of 24 percent for the gas-fired storage water heaters, 22 percent for electric storage water heaters, and 23 percent for oil-fired storage water heaters.[157] Manufacturers tend to believe it is optimistic to assume that they would be able to maintain the same gross margin percentage as their production costs increase, particularly for minimally efficient products. Therefore, this scenario represents a high bound to industry profitability under an amended energy conservation standard.

Under the preservation of operating profit scenario, DOE modeled a situation in which manufacturers are not able to increase per-unit operating profit in proportion to increases in MPCs. In the preservation of operating profit scenario, as the cost of production goes up under a standards case, manufacturers are generally required to reduce their manufacturer markups to a level that maintains base-case operating profit. DOE implemented this scenario in the GRIM by lowering the manufacturer markups at each TSL to yield approximately the same earnings before interest and taxes in the standards case as in the no-new-standards case in the year after the compliance date of the amended standards. The implicit assumption behind this scenario is that the industry can only maintain its operating profit in absolute dollars after the standard.

A comparison of industry financial impacts under the two scenarios is presented in section V.B.2.a of this document.

3. Discussion of MIA Comments

a. Conversion Costs

In response to the July 2023 NOPR, BWC submitted written comments about the accuracy of DOE's conversion cost estimates. BWC stated that it continues to appreciate DOE considering conversion costs as part of its analysis. However, BWC asserted that the industry conversion costs DOE estimated in the July 2023 NOPR are understated and far lower than the cost that manufacturers will realistically incur. BWC offered to discuss these findings during confidential conversation with the consultants that DOE engaged for this rulemaking. (BWC, 1164 at pp. 4–5)

AHRI asserted that under the standards proposed in the July 2023 NOPR, manufacturers would need to produce exponentially more heat pump water heaters, requiring many manufacturers to build new plants, retrofit existing lines, or both. Additionally, AHRI expressed concern that supply chains and labor shortages could compound these difficulties. (AHRI, No. 1167 at p. 12)

To evaluate the level of conversion costs industry would likely incur to comply with potential amended energy conservation standards, DOE relied on feedback from confidential manufacturer interviews and estimates of equipment, tooling, conveyor, and space from the engineering and product teardown analyses. DOE interviewed a range of manufacturers in advance of the July 2023 NOPR, which together account for approximately 84 percent of U.S. sales of consumer water heaters covered by this final rule. For this final rule, DOE reexamined its conversion cost estimates from the July 2023 NOPR. For all product classes analyzed in this final rule, DOE updated its conversion cost estimates by incorporating refined equipment, tooling, conveyor, and space estimates generated from the product teardown analysis, but otherwise maintained its conversion cost methodology from the July 2023 NOPR. *See* section IV.J.2.c of this document and chapter 12 of the final rule TSD for additional details on DOE's conversion cost methodology and investment estimates.

In response to the July 2023 NOPR, AHRI stated that it supported the inclusion of amortization of product conversion costs under standards into the projected MSP in a recent rulemaking for microwave ovens, and urges DOE to use this methodology in all rulemakings.[158] AHRI further asked DOE to explain the justification for amortizing conversion costs in one instance but not in all. (AHRI, No. 1167 at pp. 20–21)

DOE models different standards-case manufacturer markup scenarios to represent uncertainty regarding the potential impacts on prices and profitability for manufacturers following the implementation of amended energy conservation standards. The analyzed manufacturer markup scenarios vary by rulemaking as they are meant to reflect the potential range of financial impacts for manufacturers of the specific covered product or equipment. For the July 2023 NOPR, DOE applied a preservation of gross margin percentage scenario to reflect an upper bound to industry profitability under amended standards and a preservation of operating profit scenario to reflect a lower bound of industry profitability under amended standards. 88 FR 49058, 49128. For consumer water heaters, manufacturing more efficient products is generally more expensive than manufacturing baseline or minimally efficient products, as reflected by the MPCs estimated in the engineering analysis (*see* section IV.C.1.e of this document). Under the preservation of gross margin scenario for consumer

[157] The gross margin percentage of 24 percent for gas-fired storage is based on a manufacturer markup of 1.31. The gross margin percentage of 22 percent for electric storage is based on a manufacturer markup of 1.28. The gross margin percentage of 23 percent for oil-fired storage is based on a manufacturer markup of 1.30.

[158] Technical Support Document: Energy Efficiency Program For Commercial And Industrial Equipment: Microwave Ovens. Available at *www.regulations.gov/document/EERE-2017-BT-STD-0023-0022*.

water heaters, incremental increases in MPCs at higher efficiency levels result in an increase in per-unit dollar profit per unit sold. As shown in Table V.18, under the preservation of gross margin scenario, the standards case INPV increases relative to the no-new-standards case INPV for the adopted TSL (*i.e.,* TSL 2). This implies that the increase in cashflow from the higher MSP is outweighed by the estimated conversion costs at the adopted level. In other words, under the preservation of gross margin scenario, the consumer water heater industry *recovers* conversion costs incurred as a result of amended standards. The approach used in the microwave ovens rulemaking (*i.e.,* a conversion cost recovery scenario) modeled a scenario in which manufacturers recover investments through an increase in their manufacturer markup. 88 FR 39912, 39935. DOE implemented this scenario in the microwave ovens GRIM by calibrating the standards case manufacturer markups for each product class at each efficiency level to cause manufacturer INPV in the standards cases to be equal to the INPV in the no-new-standards case. Thus, if DOE applied a conversion cost recovery scenario in this rulemaking, the potential change in INPV at the adopted TSL would be within the range of estimated impacts resulting from the preservation of gross margin scenario and preservation of operating profit scenario. As such, DOE maintained the two standards-case manufacturer markup scenarios used in the July 2023 NOPR for this final rule as they most appropriately reflect the upper (least severe) and lower (more severe) impacts to manufacturer profitability under amended standards.

b. Cumulative Regulatory Burden

In response to the July 2023 NOPR, AHRI submitted written comments regarding cumulative regulatory burden. AHRI urged DOE to consider the high volume of regulatory activity that directly affects manufacturers of consumer water heaters and expressed concern that DOE was rushing to publish recent rulemakings, risking significant revision that will prolong uncertainty, confuse consumers, and potentially undermine broader policy goals. AHRI cited standards and test procedure rulemakings in regards not only to consumer water heaters, but also to consumer boilers, consumer pool heaters, a final rule pertaining to standards for commercial water heaters, small electric motors, commercial and industrial pumps, commercial and multifamily high-rise and low-rise residential, as well as low and zero NOx actions by California Air Resources Board (''CARB'') and individual air quality management districts, State building code changes, ENERGY STAR potentially setting a max-tech requirement for gas storage water heaters, and Federal and State refrigerant regulations as regulatory actions that impact consumer water heater manufacturers. (AHRI, No. 1167 at pp. 7–9)

In response to the July 2023 NOPR, BWC commented that the impact of cumulative regulatory burden experienced by manufacturers is not limited to conversion costs, but also to the preparations manufacturers must undergo in order to respond to proposed rules. BWC further stated that DOE has promulgated several major rulemakings that will directly impact the products that BWC manufactures, in addition to actions undertaken by other governments and programs, and that the ability of manufacturers to draw on outside resources for assistance will be severely limited by the concurrent needs of many manufacturers across rulemakings, particularly in the case of third-party laboratories. BWC stated that due to the burden this rulemaking will place on third-party labs, as well as the general burden of multiple concurrent ongoing regulatory actions, BWC strongly disagreed with DOE's decision not to consider test rulemakings as part of its analysis. (BWC, No. 1164 at pp. 24–26) BWC also stated that, due to concurrent regulatory actions regarding energy efficiency at both the State and Federal levels, it disagreed with DOE's conclusion in section VI.B.5 of the July 2023 NOPR that there are no rules or regulations that duplicate, overlap, or conflict with this proposed rule and encouraged DOE to account for all of these issues, ideally allowing manufacturers more time to review and respond to DOE rulemakings when requested. (BWC, No. 1164 at p. 24)

DOE analyzes cumulative regulatory burden pursuant to section 13(g) of Appendix A. 10 CFR part 430, subpart C, appendix A, section 13(g); 10 CFR 431.4. DOE notes some of the rules (*e.g.,* consumer boilers) detailed by AHRI are not finalized. Regulations that are not yet finalized are not considered as cumulative regulatory burden, as the timing, cost, and impacts of unfinalized rules are speculative. However, to aid stakeholders in identifying potential cumulative regulatory burden, DOE does list rulemakings that have proposed rules, which have tentative compliance dates, compliance levels, and compliance cost estimates. The results of this analysis can be found in section V.B.2.e of this document. As shown in Table V.21, DOE analyzed the consumer boilers, consumer pool heaters, and commercial water heaters rulemakings as part of its cumulative regulatory burden analysis. Regarding small electric motors, DOE published a notice of proposed determination (''NOPD'') on February 6, 2023. As such, DOE would not consider the small electric motors rulemaking as contributing to cumulative regulatory burden since DOE did not propose to amend its energy conservation standards. 88 FR 7629. Regarding commercial and industrial pumps, DOE similarly would not consider the commercial and industrial pumps rulemaking as contributing to cumulative regulatory burden since DOE did not propose to amend its energy conservations standards.

Regarding AHRI's comment about ultra-low NO_X and zero NO_X regulations, DOE notes that in its analysis of cumulative regulatory burden, DOE considers Federal, product specific regulations that have compliance dates within 3 years of one another. DOE is not aware of any Federal or State ultra-low NO_X or zero NO_X regulations specific to consumer water heaters with compliance dates within the 7-year cumulative regulatory burden timeframe (2027–2033).[159] DOE notes that certain localities (*i.e.,* California Air Districts) have adopted regulations requiring ultra-low NO_X consumer water heaters. DOE accounts for the portion of ultra-low NO_X shipments in its analysis. DOE notes that a California Air District—the Bay Area Air Quality Management District Board of Directors—has adopted amendments to eliminate NO_X emissions from certain gas-fired consumer water heaters beginning in 2027.[160] There are currently no natural gas-fired water heaters on the market that would meet the zero NO_X standards, though manufacturers may choose to develop them. Regarding building code changes in states

[159] California Air Resources Board (''CARB'') has stated that it is committed to explore developing and proposing zero-emission GHG standards for new space and water heaters sold in California as part of the 2022 State Strategy for the State Implementation Plan adopted in September 2022. However, at the time of issuance, CARB has not proposed or adopted such standards for consumer water heaters. Additional information is available at: *ww2.arb.ca.gov/our-work/programs/zero-emission-appliance-standards/about.* (Last accessed Nov. 29, 2023).

[160] Available at: *www.baaqmd.gov/~/media/dotgov/files/rules/reg-9-rule-4-nitrogen-oxides-from-fan-type-residential-central-furnaces/2021-amendments/documents/20230315_rg0906-pdf.pdf?rev=436fcdb037324b0b8f0c981d869e684d&sc_lang=en.*

requiring heat pump water heating, DOE's accounts for increased incentives for higher efficiency equipment and electrification efforts in its shipments analysis. *See* section IV.H.1 of this document for additional information on product efficiency trends.

Regarding Federal and State refrigerant regulations, EPA published a final rule pertaining to the phaseout of HFC refrigerants with high global warming potential (''GWP'') in specific sectors or subsectors on October 24, 2023. 88 FR 73098. However, EPA does not adopt provisions to limit the manufacture of heat pump water heaters with HFC refrigerants in that final rule. EPA restricts the use of HFCs and blends containing HFCs with a GWP of 150 or greater beginning January 1, 2025 for all foam subsectors, including rigid polyurethane for use in water heaters. As discussed in chapter 3 of the final rule TSD, DOE found that water heater manufacturers have already begun transitioning to alternative blowing agents for insulation foam. Additionally, DOE notes that the January 1, 2025 compliance date falls outside the cumulative regulatory burden timeframe. Regarding the comments about EPA's new ENERGY STAR levels, DOE notes that participating in ENERGY STAR is voluntary and not considered in DOE's analysis of cumulative regulatory burden.

Regarding BWC's request that DOE not discount the costs for stakeholders to review rulemakings, although appreciative that monitoring and responding to rulemakings does impose costs for stakeholders, DOE believes that this is outside the scope of analysis for individual product rulemakings. Because EPCA requires DOE to establish and maintain the energy conservation program for consumer products and to periodically propose new and amended standards (or propose that standards for products do not need to be amended) and test procedures, DOE considers this rulemaking activity to be part of the analytical baseline (*i.e.,* in the no-new-standards case and the standards case). That is, these activities (*e.g.,* reviewing proposed rules or proposed determinations) would exist regardless of the regulatory option that DOE adopts through a rulemaking and would be independent from the conversion costs required to adapt product designs and manufacturing facilitates to meet an amended standard.

c. Manufacturing Capacity

A.O. Smith noted that while it supports the intent of DOE's proposal to move the minimum energy conservation standards for a subset of consumer water heaters, A.O. Smith remains concerned with the feasibility of implementing these dramatic shifts in the time frame proposed. A.O. Smith commented that the July 2023 NOPR would drive an unprecedented transformation for the water heater industry, impacting manufacturers, its supply chain, distributors, plumbers, and installers. A.O. Smith noted that it invested significant capital in its heat pump manufacturing facility following the April 2010 Final Rule in anticipation of a ramp up in demand, which did not materialize. A.O. Smith noted it plans to make the necessary investments to transition to heat pump water heaters, but expressed concern that uncertainty in the market may place these investments at risk. A.O. Smith further expressed concern about the availability of the necessary components at the scale the July 2023 NOPR would require, as well as the current shortage of workers with the necessary skills and experience to manufacture heat pump water heaters. (A.O. Smith, No. 1182 at pp. 17–19) Gas Association Commenters questioned the realism of ramping up heat pump water heater capacity, stating that DOE did not provide sufficient analysis showing how manufacturers could produce an additional 3 to 4 million electric heat pump water heaters per year. (Gas Association Commenters, No. 1181 at p. 33)

Rheem commented it is committed to transitioning the majority of its electric storage water heaters to heat pump water heaters within the 5-year compliance period, which Rheem views as sufficiently long to complete the conversion. Rheem recommended that DOE and other Federal agencies promote awareness of this rulemaking and the future of water heating in the United States, particularly among plumbers, contractors, and consumers. (Rheem, No. 1177 at p. 10)

DOE recognizes that the standards proposed in the July 2023 NOPR and adopted in this final rule would require investments to update production facilities and redesign products. DOE accounts for product and capital conversion costs in the MIA. *See* section IV.J.2.c of this document. Regarding industry's ability to ramp up production within the 5-year compliance period, DOE believes that having a major manufacturer sign on to the Joint Stakeholder Recommendation is a testament to industry's ability to ramp up capacity to produce the volumes necessary to support the heat pump water heater market that will be required by TSL 2 by the compliance date of the amended standards. Regarding the uncertainty in the market related to heat pump water heaters, DOE recognizes that amended standards could lead to shifts in the market towards smaller electric storage water heater sizes which can meet the adopted standard levels without the use of heat pump technology. DOE accounts for the potential market shift in its shipments analysis, a key input to the GRIM. For this final rule, DOE assumes a portion of consumers would select one or more smaller electric storage water heaters with or without a ''booster'' instantaneous water heater instead of replacing a larger electric storage water heater with a heat pump water heater under amended standards, *see* IV.G.1 of this document for additional details. DOE notes that measures such as requiring high-temperature testing will be required for certain electric storage water heaters. As discussed in section V.D.1 of this document, the use of high-temperature testing will be required for small electric resistance water heaters that are able to continuously store water at a higher temperature than the delivered water temperature setpoint since DOE expects that consumers will use the high-temperature mode as part of the regular operation of their water heater. By implementing the high-temperature test method for certain smaller electric storage water heaters designed to compete with larger electric storage water heaters by operating at a higher temperature, DOE will ensure that representations for such products are accurate and provide consumers with the means to directly compare these products to the larger water heaters they will likely compete with. In other words, the high-temperature test method would create an equivalent basis of comparison for products which can offer the same effective storage capacity. *See* section V.D.1 of this document for information on high-temperature testing.

K. Emissions Analysis

The emissions analysis consists of two components. The first component estimates the effect of potential energy conservation standards on power sector and site (where applicable) combustion emissions of CO_2, NO_X, SO_2, and Hg. The second component estimates the impacts of potential standards on emissions of two additional greenhouse gases, CH_4 and N_2O, as well as the reductions in emissions of other gases due to ''upstream'' activities in the fuel production chain. These upstream activities comprise extraction, processing, and transporting fuels to the site of combustion.

The analysis of electric power sector emissions of CO_2, NO_X, SO_2, and Hg

uses emissions intended to represent the marginal impacts of the change in electricity consumption associated with amended or new standards. The methodology is based on results published for the *AEO,* including a set of side cases that implement a variety of efficiency-related policies. The methodology is described in appendix 13A in the final rule TSD. The analysis presented in this notice uses projections from *AEO2023.* Power sector emissions of CH_4 and N_2O from fuel combustion are estimated using Emission Factors for Greenhouse Gas Inventories published by the EPA.[161]

The on-site operation of consumer water heaters involves combustion of fossil fuels and results in emissions of CO_2, NO_X, SO_2, CH_4, and N_2O where these products are used. Site emissions of these gases were estimated using Emission Factors for Greenhouse Gas Inventories and, for NO_X and SO_2, emissions intensity factors from an EPA publication.[162]

FFC upstream emissions, which include emissions from fuel combustion during extraction, processing, and transportation of fuels, and ''fugitive'' emissions (direct leakage to the atmosphere) of CH_4 and CO_2, are estimated based on the methodology described in chapter 15 of the final rule TSD.

The emissions intensity factors are expressed in terms of physical units per MWh or MMBtu of site energy savings. For power sector emissions, specific emissions intensity factors are calculated by sector and end use. Total emissions reductions are estimated using the energy savings calculated in the national impact analysis.

BWC recommended including emissions as a result of increased manufacturing of parts at a higher standard level, such as compressors, evaporators, and other parts for heat pump water heaters. Additionally, BWC mentioned that the leaking of refrigerant in heat pump water heaters may result in additional unaccounted-for emissions and BWC is discouraged that DOE has already declined to take the emission from refrigerant leakages into account in the Energy Conservation Standards for Consumer Pool Heater Final Rule. BWC commented that ASHRAE standards are in development to measure refrigerant leakage expectations for heat pump products that could be leveraged in future DOE analysis. (BWC No. 1164 at p. 5)

DOE's emissions analysis is guided by section 16.h of Appendix A,[163] which states that DOE calculates emissions reductions of carbon dioxide, sulfur dioxide, nitrogen oxides, methane, nitrous oxides, and mercury likely to be avoided based on an analysis that includes specific components. These components only include direct emissions from use of covered products and emissions in the full-fuel-cycle. DOE has never considered air pollutant emissions associated with manufacturing or transport of products or emissions of refrigerants. Even if DOE considered the emissions from refrigerants, DOE estimates that refrigerant leakages in heat pump water heaters will be rare and can be prevented with regular inspection and repair, which DOE accounts for as repair and maintenance costs in its LCC analysis. If refrigerant leaks do occur, the associated emissions increase would still be negligible compared to the emissions savings of this rule. Accounting for refrigerant leakage would not change the economic justification of the rule.

1. Air Quality Regulations Incorporated in DOE's Analysis

DOE's no-new-standards case for the electric power sector reflects the *AEO,* which incorporates the projected impacts of existing air quality regulations on emissions. *AEO2023* reflects, to the extent possible, laws and regulations adopted through mid-November 2022, including the emissions control programs discussed in the following paragraphs the emissions control programs discussed in the following paragraphs, and the Inflation Reduction Act.[164]

SO_2 emissions from affected electric generating units (''EGUs'') are subject to nationwide and regional emissions cap-and-trade programs. Title IV of the Clean Air Act sets an annual emissions cap on SO_2 for affected EGUs in the 48 contiguous States and the District of Columbia (''DC''). (42 U.S.C. 7651 *et seq.*) SO_2 emissions from numerous States in the eastern half of the United States are also limited under the Cross-State Air Pollution Rule (''CSAPR''). 76 FR 48208 (Aug. 8, 2011). CSAPR requires these States to reduce certain emissions, including annual SO_2 emissions, and went into effect as of January 1, 2015.[165] The *AEO* incorporates implementation of CSAPR, including the update to the CSAPR ozone season program emission budgets and target dates issued in 2016. 81 FR 74504 (Oct. 26, 2016). Compliance with CSAPR is flexible among EGUs and is enforced through the use of tradable emissions allowances. Under existing EPA regulations, for states subject to SO_2 emissions limits under CSAPR, any excess SO_2 emissions allowances resulting from the lower electricity demand caused by the adoption of an efficiency standard could be used to permit offsetting increases in SO_2 emissions by another regulated EGU.

However, beginning in 2016, SO_2 emissions began to fall as a result of the Mercury and Air Toxics Standards (''MATS'') for power plants.[166] 77 FR 9304 (Feb. 16, 2012). The final rule establishes power plant emission standards for mercury, acid gases, and non-mercury metallic toxic pollutants. Because of the emissions reductions under the MATS, it is unlikely that excess SO_2 emissions allowances resulting from the lower electricity demand would be needed or used to permit offsetting increases in SO_2 emissions by another regulated EGU. Therefore, energy conservation standards that decrease electricity generation will generally reduce SO_2 emissions. DOE estimated SO_2 emissions reduction using emissions factors based on *AEO2023.*

Chapter 1. Available at *www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors#Proposed/* (last accessed July 12, 2021).

[163] Appendix A to Subpart C of Part 430—Procedures, Interpretations, and Policies for Consideration of New or Revised Energy Conservation Standards and Test Procedures for Consumer Products and Certain Commercial/Industrial Equipment. *https://www.ecfr.gov/current/title-10/chapter-II/subchapter-D/part-430/subpart-C/appendix-Appendix%20A%20to%20Subpart%20C%20of%20Part%20430.*

[164] For further information, see the Assumptions to *AEO2023* report that sets forth the major assumptions used to generate the projections in the Annual Energy Outlook. Available at *www.eia.gov/outlooks/aeo/assumptions/* (last accessed Dec. 1, 2023).

[165] CSAPR requires States to address annual emissions of SO_2 and NO_X, precursors to the formation of fine particulate matter (''$PM_{2.5}$'') pollution, in order to address the interstate transport of pollution with respect to the 1997 and 2006 $PM_{2.5}$ National Ambient Air Quality Standards (''NAAQS''). CSAPR also requires certain States to address the ozone season (May–Sept.) emissions of NO_X, a precursor to the formation of ozone pollution, in order to address the interstate transport of ozone pollution with respect to the 1997 ozone NAAQS. 76 FR 48208 (Aug. 8, 2011). EPA subsequently issued a supplemental rule that included an additional five States in the CSAPR ozone season program; 76 FR 80760 (Dec. 27, 2011) (Supplemental Rule), and EPA issued the CSAPR Update for the 2008 ozone NAAQS. 81 FR 74504 (Oct. 26, 2016).

[166] In order to continue operating, coal power plants must have either flue gas desulfurization or dry sorbent injection systems installed. Both technologies, which are used to reduce acid gas emissions, also reduce SO_2 emissions.

CSAPR also established limits on NO_X emissions for numerous States in the eastern half of the United States. Energy conservation standards would have little effect on NO_X emissions in those States covered by CSAPR emissions limits if excess NO_X emissions allowances resulting from the lower electricity demand could be used to permit offsetting increases in NO_X emissions from other EGUs. In such case, NOx emissions would remain near the limit even if electricity generation goes down. Depending on the configuration of the power sector in the different regions and the need for allowances, however, NO_X emissions might not remain at the limit in the case of lower electricity demand. That would mean that standards might reduce NOx emissions in covered States. Despite this possibility, DOE has chosen to be conservative in its analysis and has maintained the assumption that standards will not reduce NO_X emissions in States covered by CSAPR. Standards would be expected to reduce NO_X emissions in the States not covered by CSAPR. DOE used *AEO2023* data to derive NO_X emissions factors for the group of States not covered by CSAPR.

The MATS limit mercury emissions from power plants, but they do not include emissions caps and, as such, DOE's energy conservation standards would be expected to slightly reduce Hg emissions. DOE estimated mercury emissions reduction using emissions factors based on *AEO2023*, which incorporates the MATS.

L. Monetizing Emissions Impacts

As part of the development of this final rule, for the purpose of complying with the requirements of Executive Order 12866, DOE considered the estimated monetary benefits from the reduced emissions of CO_2, CH_4, N_2O, NO_X, and SO_2 that are expected to result from each of the TSLs considered. In order to make this calculation analogous to the calculation of the NPV of consumer benefit, DOE considered the reduced emissions expected to result over the lifetime of products shipped in the projection period for each TSL. This section summarizes the basis for the values used for monetizing the emissions benefits and presents the values considered in this final rule.

To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

1. Monetization of Greenhouse Gas Emissions

DOE estimates the monetized benefits of the reductions in emissions of CO_2, CH_4, and N_2O by using a measure of the SC (''SC'') of each pollutant (*e.g.,* SC–CO_2). These estimates represent the monetary value of the net harm to society associated with a marginal increase in emissions of these pollutants in a given year, or the benefit of avoiding that increase. These estimates are intended to include (but are not limited to) climate-change-related changes in net agricultural productivity, human health, property damages from increased flood risk, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services.

DOE exercises its own judgment in presenting monetized climate benefits as recommended by applicable Executive orders, and DOE would reach the same conclusion presented in this rulemaking in the absence of the social cost of greenhouse gases. That is, the social costs of greenhouse gases, whether measured using the February 2021 interim estimates presented by the IWG on the Social Cost of Greenhouse Gases or by another means, did not affect the rule ultimately adopted by DOE.

DOE estimated the global social benefits of CO_2, CH_4, and N_2O reductions using SC–GHG values that were based on the interim values presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990,* published in February 2021 by the IWG (''February 2021 SC–GHG TSD''). The SC–GHG is the monetary value of the net harm to society associated with a marginal increase in emissions in a given year, or the benefit of avoiding that increase. In principle, the SC–GHG includes the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk and natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services. The SC–GHG therefore, reflects the societal value of reducing emissions of the gas in question by one metric ton. The SC–GHG is the theoretically appropriate value to use in conducting benefit-cost analyses of policies that affect CO_2, N_2O and CH4 emissions.

As a member of the IWG involved in the development of the February 2021 SC–GHG TSD, DOE agreed that the interim SC–GHG estimates represent the most appropriate estimate of the SC–GHG until revised estimates are developed reflecting the latest, peer-reviewed science. *See* 87 FR 78382, 78406–78408 for discussion of the development and details of the IWG SC–GHG estimates.

There are a number of limitations and uncertainties associated with the SC–GHG estimates. First, the current scientific and economic understanding of discounting approaches suggests discount rates appropriate for intergenerational analysis in the context of climate change are likely to be less than 3 percent, near 2 percent or lower.[167] Second, the IAMs used to produce these interim estimates do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature and the science underlying their ''damage functions''—*i.e.,* the core parts of the IAMs that map global mean temperature changes and other physical impacts of climate change into economic (both market and nonmarket) damages—lags behind the most recent research. For example, limitations include the incomplete treatment of catastrophic and non-catastrophic impacts in the integrated assessment models, their incomplete treatment of adaptation and technological change, the incomplete way in which inter-regional and intersectoral linkages are modeled, uncertainty in the extrapolation of damages to high temperatures, and inadequate representation of the relationship between the discount rate and uncertainty in economic growth over long time horizons. Likewise, the socioeconomic and emissions scenarios used as inputs to the models do not reflect new information from the last decade of scenario generation or the full range of projections. The modeling limitations do not all work in the same direction in terms of their influence on the SC–CO_2 estimates. However, as discussed in the February 2021 SC–GHG TSD, the IWG has recommended that, taken together, the limitations suggest that the interim SC–GHG estimates used in this final rule likely underestimate the damages from GHG emissions. DOE concurs with this assessment.

DOE's derivations of the SC–CO_2, SC–N_2O, and SC–CH_4 values used for this

[167] Interagency Working Group on Social Cost of Greenhouse Gases. 2021. Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990. February. United States Government. Available at *www.whitehouse.gov/briefing-room/blog/2021/02/26/a-return-to-science-evidence-based-estimates-of-the-benefits-of-reducing-climate-pollution/.*

final rule are discussed in the following sections, and the results of DOE's analyses estimating the benefits of the reductions in emissions of these GHGs are presented in section V.B.6 of this document.

The Attorney General of TN asserted that the standards improperly rely on faulty social-cost-of-carbon estimate. (Attorney General of TN, No. 1149 at p. 2) In response, DOE noted that the Interagency Working Group's (IWG) Social Costs of Greenhouse Gas (SC–GHG) estimates were developed over many years, using transparent process, peer-reviewed methodologies, the best science available at the time of that process, and with input from the public. The IWG's 2016 TSD[168] and the 2017 National Academies report provide detailed discussions of the ways in which the modeling underlying the development of the SC–GHG estimates addressed quantified sources of uncertainty.[169] In the February 2021 SC–GHG TSD, the IWG stated that the models used to produce the interim estimates do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature. In the judgment of the IWG, these and other limitations suggest that the range of four interim SC–GHG estimates presented in the TSD likely underestimate societal damages from GHG emissions.

DOE is aware that in December 2023, EPA issued a new set of SC–GHG estimates in connection with a final rulemaking under the Clean Air Act. [170] As DOE had used the IWG interim values in proposing this rule and is currently reviewing the updated 2023 SC–GHG values, for this final rule, DOE used these updated 2023 SC–GHG values to conduct a sensitivity analysis of the value of GHG emissions reductions. DOE notes that because EPA's estimates are considerably higher than the IWG's interim SC–GHG values applied for this final rule, an analysis that uses the EPA's estimates results in significantly greater climate-related benefits. However, such results would not affect DOE's decision in this final rule. As stated elsewhere in this document, DOE would reach the same conclusion regarding the economic justification of the standards presented in this final rule without considering the IWG's interim SC–GHG values, which DOE agrees are conservative estimates. For the same reason, if DOE were to use EPA's higher SC–GHG estimates, they would not change DOE's conclusion that the standards are economically justified.

a. Social Cost of Carbon

The SC–CO_2 values used for this final rule were based on the values developed for the February 2021 SC–GHG TSD, which are shown in Table IV.30 in 5-year increments from 2020 to 2050. The set of annual values that DOE used, which was adapted from estimates published by EPA,[171] is presented in appendix 14A of the final rule TSD. These estimates are based on methods, assumptions, and parameters identical to the estimates published by the IWG (which were based on EPA modeling) and include values for 2051 to 2070. DOE expects additional climate benefits to accrue for products still operating after 2070, but a lack of available SC–CO_2 estimates for emissions years beyond 2070 prevents DOE from monetizing these potential benefits in this analysis.

Table IV.30. Annual SC-CO_2 Values from 2021 Interagency Update, 2020–2050 (2020$ per Metric Ton CO_2)

Year	Discount Rate and Statistic			
	5%	3%	2.5%	3%
	Average	Average	Average	95th percentile
2020	14	51	76	152
2025	17	56	83	169
2030	19	62	89	187
2035	22	67	96	206
2040	25	73	103	225
2045	28	79	110	242
2050	32	85	116	260

DOE multiplied the CO_2 emissions reduction estimated for each year by the SC–CO_2 value for that year in each of the four cases. DOE adjusted the values to 2022$ using the implicit price deflator for gross domestic product (''GDP'') from the Bureau of Economic Analysis. To calculate a present value of the stream of monetary values, DOE discounted the values in each of the four cases using the specific discount rate that had been used to obtain the SC–CO_2 values in each case.

b. Social Cost of Methane and Nitrous Oxide

The SC–CH_4 and SC–N_2O values used for this final rule were based on the values developed for the February 2021 SC–GHG TSD. Table IV.31 shows the updated sets of SC–CH_4 and SC–N_2O estimates from the latest interagency update in 5-year increments from 2020 to 2050. The full set of annual values used is presented in appendix 14A of the final rule TSD. To capture the uncertainties involved in regulatory impact analysis, DOE has determined it is appropriate to include all four sets of SC–CH_4 and SC- N_2O values, as recommended by the IWG. DOE derived values after 2050 using the approach described above for the SC–CO_2.

Table IV.31. Annual SC-CH_4 and SC-N_2O Values from 2021 Interagency Update, 2020–2050 (2020$ per Metric Ton)

Year	SC-CH_4				SC-N_2O			
	Discount Rate and Statistic				Discount Rate and Statistic			
	5%	3%	2.5%	3%	5%	3%	2.5 %	3%
	Average	Average	Average	95th percentile	Average	Average	Average	95th percentile
2020	670	1500	2000	3900	5800	18000	27000	48000
2025	800	1700	2200	4500	6800	21000	30000	54000
2030	940	2000	2500	5200	7800	23000	33000	60000
2035	1100	2200	2800	6000	9000	25000	36000	67000
2040	1300	2500	3100	6700	10000	28000	39000	74000
2045	1500	2800	3500	7500	12000	30000	42000	81000
2050	1700	3100	3800	8200	13000	33000	45000	88000

DOE multiplied the CH_4 and N_2O emissions reduction estimated for each year by the SC–CH_4 and SC–N_2O estimates for that year in each of the cases. DOE adjusted the values to 2022$ using the implicit price deflator for gross domestic product (''GDP'') from the Bureau of Economic Analysis. To calculate a present value of the stream of monetary values, DOE discounted the values in each of the cases using the specific discount rate that had been used to obtain the SC–CH_4 and SC–N_2O estimates in each case.

c. Sensitivity Analysis Using Updated SC–GHG Estimates

In December 2023, EPA issued an updated set of SC–GHG estimates (2023 SC–GHG) in connection with a final rulemaking under the Clean Air Act.[172] These estimates incorporate recent research and address recommendations of the National Academies (2017) and comments from a 2023 external peer review of the accompanying technical report. For this rulemaking, DOE used these updated 2023 SC–GHG values to conduct a sensitivity analysis of the value of GHG emissions reductions associated with alternative standards for consumer water heaters. This sensitivity analysis provides an expanded range of potential climate benefits associated with amended standards. The final year of EPA's new 2023 SC–GHG estimates is 2080; therefore, DOE did not monetize the climate benefits of GHG emissions reductions occurring after 2080.

The overall climate benefits are greater when using the higher, updated 2023 SC–GHG estimates, compared to the climate benefits using the older IWG SC–GHG estimates. The results of the sensitivity analysis are presented in appendix 14C of the final rule TSD.

[172] *See www.epa.gov/environmental-economics/scghg.*

2. Monetization of Other Emissions Impacts

For the final rule, DOE estimated the monetized value of NO_X and SO_2 emissions reductions from electricity generation using benefit-per-ton estimates for that sector from the EPA's Benefits Mapping and Analysis Program.[173] DOE used EPA's values for $PM_{2.5}$-related benefits associated with NO_X and SO_2 and for ozone-related benefits associated with NO_X for 2025 and 2030, and 2040, calculated with discount rates of 3 percent and 7 percent. DOE used linear interpolation to define values for the years not given in the 2025 to 2040 period; for years beyond 2040, the values are held constant. DOE combined the EPA regional benefit-per-ton estimates with regional information on electricity consumption and emissions from *AEO2023* to define weighted-average national values for NO_X and SO_2 (*see* appendix 14B of the final rule TSD).

DOE also estimated the monetized value of NO_X and SO_2 emissions reductions from site use of natural gas in consumer water heaters using benefit per ton estimates from the EPA's Benefits Mapping and Analysis Program. Although none of the sectors covered by EPA refers specifically to residential and commercial buildings, the sector called ''area sources'' would be a reasonable proxy for residential and commercial buildings.[174] The EPA document provides high and low estimates for 2025 and 2030 at 3- and 7-percent discount rates.[175] DOE used the same linear interpolation and extrapolation as it did with the values for electricity generation.

DOE multiplied the site emissions reduction (in tons) in each year by the associated $/ton values, and then discounted each series using discount rates of 3 percent and 7 percent as appropriate.

M. Utility Impact Analysis

The utility impact analysis estimates the changes in installed electrical capacity and generation projected to result for each considered TSL. The analysis is based on published output from the NEMS associated with *AEO2023*. NEMS produces the *AEO* Reference case, as well as a number of side cases that estimate the economy-wide impacts of changes to energy supply and demand. For the current analysis, impacts are quantified by comparing the levels of electricity sector generation, installed capacity, fuel consumption and emissions in the *AEO2023* Reference case and various side cases. Details of the methodology are provided in the appendices to chapter 15 of the final rule TSD.

The output of this analysis is a set of time-dependent coefficients that capture the change in electricity generation, primary fuel consumption, installed capacity and power sector emissions due to a unit reduction in demand for a given end use. These coefficients are multiplied by the stream of electricity savings calculated in the NIA to provide estimates of selected utility impacts of potential new or amended energy conservation standards. The utility

[173] U.S. Environmental Protection Agency. Estimating the Benefit per Ton of Reducing Directly-Emitted $PM_{2.5}$, $PM_{2.5}$ Precursors and Ozone Precursors from 21 Sectors. Available at *www.epa.gov/benmap/estimating-benefit-ton-reducing-directly-emitted-pm25-pm25-precursors-and-ozone-precursors* (last accessed Dec. 1, 2023).

[174] ''Area sources'' represents all emission sources for which states do not have exact (point) locations in their emissions inventories. Because exact locations would tend to be associated with larger sources, ''area sources'' would be fairly representative of small dispersed sources like homes and businesses.

[175] ''Area sources'' are a category in the 2018 document from EPA but are not used in the 2021 document cited above. *See: www.epa.gov/sites/default/files/2018-02/documents/source apportionmentbpttsd_2018.pdf.*

analysis also estimates the impact on gas utilities in terms of projected changes in natural gas deliveries to consumers for each TSL.

N. Employment Impact Analysis

DOE considers employment impacts in the domestic economy as one factor in selecting a standard. Employment impacts from new or amended energy conservation standards include both direct and indirect impacts. Direct employment impacts are any changes in the number of employees of manufacturers of the products subject to standards. The MIA addresses those impacts. Indirect employment impacts are changes in national employment that occur due to the shift in expenditures and capital investment caused by the purchase and operation of more-efficient appliances. Indirect employment impacts from standards consist of the net jobs created or eliminated in the national economy, other than in the manufacturing sector being regulated, caused by (1) reduced spending by consumers on energy, (2) reduced spending on new energy supply by the utility industry, (3) increased consumer spending on the products to which the new standards apply and other goods and services, and (4) the effects of those three factors throughout the economy.

One method for assessing the possible effects on the demand for labor of such shifts in economic activity is to compare sector employment statistics developed by the Labor Department's Bureau of Labor Statistics (''BLS''). BLS regularly publishes its estimates of the number of jobs per million dollars of economic activity in different sectors of the economy, as well as the jobs created elsewhere in the economy by this same economic activity. Data from BLS indicate that expenditures in the utility sector generally create fewer jobs (both directly and indirectly) than expenditures in other sectors of the economy.[176] There are many reasons for these differences, including wage differences and the fact that the utility sector is more capital-intensive and less labor-intensive than other sectors. Energy conservation standards have the effect of reducing consumer utility bills. Because reduced consumer expenditures for energy likely lead to increased expenditures in other sectors of the economy, the general effect of efficiency standards is to shift economic activity from a less labor-intensive sector (*i.e.,* the utility sector) to more labor-intensive sectors (*e.g.,* the retail and service sectors). Thus, the BLS data suggest that net national employment may increase due to shifts in economic activity resulting from energy conservation standards.

DOE estimated indirect national employment impacts for the standard levels considered in this final rule using an input/output model of the U.S. economy called Impact of Sector Energy Technologies version 4 (''ImSET'').[177] ImSET is a special-purpose version of the ''U.S. Benchmark National Input-Output'' (''I–O'') model, which was designed to estimate the national employment and income effects of energy-saving technologies. The ImSET software includes a computer-based I–O model having structural coefficients that characterize economic flows among 187 sectors most relevant to industrial, commercial, and residential building energy use.

DOE notes that ImSET is not a general equilibrium forecasting model, and that there are uncertainties involved in projecting employment impacts, especially changes in the later years of the analysis. Because ImSET does not incorporate price changes, the employment effects predicted by ImSET may over-estimate actual job impacts over the long run for this rule. Therefore, DOE used ImSET only to generate results for near-term timeframes (2030–2034), where these uncertainties are reduced. For more details on the employment impact analysis, see chapter 16 of the final rule TSD.

V. Analytical Results and Conclusions

The following section addresses the results from DOE's analyses with respect to the considered energy conservation standards for consumer water heaters. It addresses the TSLs examined by DOE, the projected impacts of each of these levels if adopted as energy conservation standards for consumer water heaters, and the standards levels that DOE is adopting in this final rule. Additional details regarding DOE's analyses are contained in the final rule TSD supporting this document.

A. Trial Standard Levels

In general, DOE typically evaluates potential new or amended standards for products and equipment by grouping individual efficiency levels for each class into TSLs. Use of TSLs allows DOE to identify and consider manufacturer cost interactions between the product classes, to the extent that there are such interactions, and price elasticity of consumer purchasing decisions that may change when different standard levels are set. The changes to the shipments model will drive differential national impacts both on the consumer and manufacturer side that are more realistic of how the market may change in response to amended DOE standards.

In the analysis conducted for this final rule, DOE analyzed the benefits and burdens of six TSLs for consumer water heaters. DOE developed TSLs that combine efficiency levels for each analyzed product class. DOE presents the results for the TSLs in this document, while the results for all efficiency levels that DOE analyzed are in the final rule TSD.

Table V.1 presents the TSLs and the corresponding efficiency levels that DOE has identified for potential amended energy conservation standards for consumer water heaters. TSL 6 represents the maximum technologically feasible (''max-tech'') energy efficiency for all product classes. TSL 5 represents the highest efficiency level for each product class with a positive NPV at the 7-percent discount rate for all product classes. For gas-fired gas storage water heater, the NPV at the 7-percent discount rate is negative from EL 3 to EL 5. Therefore, TSL 5 is constructed by reducing the efficiency level for gas-fired storage water heaters (*i.e.,* EL 2) and with the same efficiency level for all other product classes compared to the max-tech. TSL 4 represents the highest efficiency level for each product class with the maximum NPV at the 7-percent discount rate for all product classes. Therefore, TSL 4 is constructed by reducing the efficiency level for electric storage water heaters (*i.e.,* EL 2). TSL 3 represents an interim energy efficiency level between the Joint Stakeholder Recommendation (*i.e.,* TSL 2) and TSL 4. TSL 2 represents the Joint Stakeholder Recommendation. Finally, because EL 1 is the lowest analyzed efficiency level above baseline, TSL 1 is constructed with EL 1 for all product classes, except for electric storage water heaters (20 gal $\leq V_{eff} \leq$ 55 gal) which is set equal to the current standard level.

Table V.1 Trial Standard Levels for Consumer Water Heaters

Product Class	Trial Standard Level					
	1	2	3	4	5	6
	Efficiency Level					
Gas-fired Storage Water Heaters (20 gal ≤ V_{eff} ≤ 55 gal)	1	2	2	2	2	5
Oil-fired Storage Water Heaters (V_{eff} ≤ 50 gal)	1	2	2	2	2	2
Small electric storage water heaters (20 gal ≤ V_{eff} ≤ 35 gal and FHR < 51 gal)	0	0	1	1	1	1
Electric Storage Water Heaters (20 gal ≤ V_{eff} ≤ 55 gal, excluding small electric storage water heaters)	0	1	1	2	3	3
Electric Storage Water Heaters (55 gal < V_{eff} ≤ 120 gal)	1	1	1	2	3	3

DOE constructed the TSLs for this final rule to include ELs representative of ELs with similar characteristics (*i.e.,* using similar technologies and/or efficiencies, and having roughly comparable equipment availability). The use of representative ELs provided for greater distinction between the TSLs. While representative ELs were included in the TSLs, DOE considered all efficiency levels as part of its analysis.[178]

B. Economic Justification and Energy Savings

1. Economic Impacts on Individual Consumers

DOE analyzed the economic impacts on consumer water heater consumers by looking at the effects that potential new and amended standards at each TSL would have on the LCC and PBP. DOE also examined the impacts of potential standards on selected consumer subgroups. These analyses are discussed in the following sections.

a. Life-Cycle Cost and Payback Period

In general, higher-efficiency products affect consumers in two ways: (1) purchase price increases and (2) annual operating costs decrease. Inputs used for calculating the LCC and PBP include total installed costs (*i.e.,* product price plus installation costs), and operating costs (*i.e.,* annual energy use, energy prices, energy price trends, repair costs, and maintenance costs). The LCC calculation also uses product lifetime and a discount rate. Chapter 8 of the final rule TSD provides detailed information on the LCC and PBP analyses.

Table V.2 through Table V.11 show the LCC and PBP results for the TSLs considered for each product class. In the first of each pair of tables, the simple payback is measured relative to the baseline product. In the second table, the impacts are measured relative to the efficiency distribution in the in the no-new-standards case in the compliance year (see section IV.F.8 of this document). Because some consumers purchase products with higher efficiency in the no-new-standards case, the average savings are less than the difference between the average LCC of the baseline product and the average LCC at each TSL. The savings refer only to consumers who are affected by a standard at a given TSL. Those who already purchase a product with efficiency at or above a given TSL are not affected. Consumers for whom the LCC increases at a given TSL experience a net cost.

Table V.2 Average LCC and PBP Results for Gas-fired Storage Water Heaters (20 gal ≤ V_{eff} ≤ 55 gal)

TSL	Efficiency Level	Average Costs *2022$*				Simple Payback *years*	Average Lifetime *years*
		Installed Cost	First Year's Operating Cost	Lifetime Operating Cost	LCC		
0	0	1,432	242	2,868	4,300	NA	14.5
1	1	1,470	237	2,815	4,285	8.4	14.5
2,3,4,5	2	1,578	226	2,689	4,267	9.1	14.5
6	5	2,241	198	2,410	4,651	18.5	14.5

Note: The results for each TSL are calculated assuming that all consumers use products at that efficiency level. The PBP is measured relative to the baseline product.

[178] Efficiency levels that were analyzed for this final rule are discussed in section IV.C of this document. Results by efficiency level are presented in TSD chapters 8, 10, and 12.

Table V.3 Average LCC Savings Relative to the No-New-Standards Case for Gas-fired Storage Water Heaters (20 gal ≤ V_{eff} ≤ 55 gal)

TSL	Efficiency Level	Life-Cycle Cost Savings	
		Average LCC Savings* *2022$*	Percent of Consumers that Experience Net Cost
1	1	15	20.3
2,3,4,5	2	29	40.5
6	5	(285)	69.8

* The savings represent the average LCC for affected consumers. Numbers in parentheses denote negative values.

Table V.4 Average LCC and PBP Results for Oil-fired Storage Water Heaters (V_{eff} ≤ 50 gal)

4	2	613	1.4
5,6	3	190	38.8

* The savings represent the average LCC for affected consumers. Numbers in parentheses denote negative values.

b. Consumer Subgroup Analysis

In the consumer subgroup analysis, DOE estimated the impact of the considered TSLs on low-income households, senior-only households, and small businesses. Table V.12 through Table V.16 compare the average LCC savings and PBP at each efficiency level for the consumer subgroups with

similar metrics for the entire consumer sample for each consumer water heater product class analyzed. In most cases, the average LCC savings and PBP for low-income households and senior-only households at the considered efficiency levels are not substantially different from the average for all households. Chapter 11 of the final rule TSD presents the complete LCC and PBP results for the subgroups.

Table V.12 Comparison of LCC Savings and PBP for Consumer Subgroups and All Households; Gas-fired Storage Water Heaters (20 gal ≤ V_{eff} ≤ 55 gal)

c. Rebuttable Presumption Payback

As discussed in section III.F.2 of this document, EPCA establishes a rebuttable presumption that an energy conservation standard is economically justified if the increased purchase cost for a product that meets the standard is less than three times the value of the first-year energy savings resulting from the standard. In calculating a rebuttable presumption payback period for each of the considered TSLs, DOE used discrete values, and, as required by EPCA, based the energy use calculation on the DOE test procedures for consumer water heaters. In contrast, the PBPs presented in section V.B.1.a of this document were calculated using distributions that reflect the range of energy use in the field.

Table V.17 presents the rebuttable-presumption payback periods for the considered TSLs for consumer water heaters. While DOE examined the rebuttable-presumption criterion, it considered whether the standard levels considered for this rule are economically justified through a more detailed analysis of the economic impacts of those levels, pursuant to 42 U.S.C. 6295(o)(2)(B)(i), that considers the full range of impacts to the consumer, manufacturer, Nation, and environment. The results of that analysis serve as the basis for DOE to definitively evaluate the economic justification for a potential standard level, thereby supporting or rebutting the results of any preliminary determination of economic justification.

Table V.17 Comparison of Rebuttable-Presumption Payback Periods

TSL	1	2	3	4	5	6
GSWH	5.8	7.4	7.4	7.4	7.4	12.4
OSWH	4.1	5.7	5.7	5.7	5.7	5.7
ESWH (20 gal ≤ V_{eff} ≤ 35 gal, FHR < 51 gal)	NA	NA	12.4	12.4	12.4	12.4
ESWH (20 gal ≤ V_{eff} ≤ 55 gal, excluding Small ESWH)	NA	3.7	3.7	3.2	3.4	3.4
ESWH (55 gal < V_{eff} ≤ 120 gal)	0.3	0.3	0.3	0.6	1.5	1.5

2. Economic Impacts on Manufacturers

DOE performed an MIA to estimate the impact of amended energy conservation standards on manufacturers of consumer water heaters. The next section describes the expected impacts on manufacturers at each considered TSL. Chapter 12 of the final rule TSD explains the analysis in further detail.

a. Industry Cash Flow Analysis Results

In this section, DOE provides GRIM results from the analysis, which examines changes in the industry that would result from a standard. The following tables summarize the estimated financial impacts (represented by changes in INPV) of potential amended energy conservation standards on manufacturers of consumer water heaters, as well as the conversion costs that DOE estimates manufacturers of consumer water heaters would incur at each TSL.

As discussed in section IV.J.2.d of this document, DOE modeled two scenarios to evaluate a range of cash flow impacts on the consumer water heater industry: (1) the preservation of gross margin percentage scenario and (2) the preservation of operating profit. Under the preservation of gross margin percentage scenario, DOE applied a single uniform ''gross margin percentage'' across all efficiency levels. As MPCs increase with efficiency, this scenario implies that the per-unit dollar profit would also increase. DOE assumed a ''gross margin percentage'' of 31 percent for gas-fired storage water heaters, 30 percent for oil-fired storage

water heaters, and 28 percent for all electric storage water heaters. These gross margin percentages (and corresponding manufacturer markups) are the same as the ones DOE assumed in the engineering analysis and the no-new-standards case of the GRIM. Because this scenario assumes that a manufacturer's absolute dollar markup would increase as MPCs increase in the standards cases, it represents the upper bound to industry profitability under potential new energy conservation standards.

The preservation of operating profit scenario reflects manufacturers' concerns about their inability to maintain margins as MPCs increase to reach more stringent efficiency levels. In this scenario, while manufacturers make the necessary investments required to convert their facilities to produce compliant products, operating profit does not change in absolute dollars and decreases as a percentage of revenue.

Each of the modeled manufacturer markup scenarios results in a unique set of cash flows and corresponding industry values at each TSL. In the following discussion, the INPV results refer to the difference in industry value between the no-new-standards case and each standards case resulting from the sum of discounted cash flows from 2023 through 2059. To provide perspective on the short-run cash flow impact, DOE includes in the discussion of results a comparison of free cash flow between the no-new-standards case and the standards case at each TSL in the year before new standards are required.

Table V.18 Manufacturer Impact Analysis for Consumer Water Heaters under the Preservation of Gross Margin Scenario

	Units	No-New-Standards Case	Trial Standard Level					
			1	2	3	4	5	6
INPV	*2022$ millions*	1,478.8	1,484.2	1,506.9	1,438.9	1,447.6	1,447.5	1,473.5
Change in INPV*	*2022$ millions*	-	5.5	28.2	(39.8)	(31.2)	(31.3)	(5.2)
	%	-	0.4	1.9	(2,7)	(2.1)	(2.1)	(0.4)
Free Cash Flow (2029)	*2022$ millions*	124.0	121.0	17.3	(24.1)	(29.3)	(48.8)	(155.0)
Change in Free Cash Flow (2029)	*2022$ millions*	-	(3.0)	(106.7)	(148.1)	(153.3)	(172.8)	(279.0)
	%	-	(2.4)	(86.0)	(119.4)	(123.6)	(139.4)	(225.0)
Product Conversion Costs	*2022$ millions*	-	3.5	11.1	13.3	13.6	14.6	25.1
Capital Conversion Costs	*2022$ millions*	-	4.0	228.7	319.0	330.4	373.1	601.1
Total Investment Required**	*2022$ millions*	-	7.5	239.8	332.4	344.0	387.6	626.2

* Numbers in parentheses indicate a negative number.

**Numbers may not sum exactly due to rounding.

Table V.19 Manufacturer Impact Analysis for Consumer Water Heaters under the Preservation of Operating Profit Scenario

	Units	No-New-Standards Case	Trial Standard Level*					
			1	2	3	4	5	6
INPV	*2022$ millions*	1,478.8	1,470.3	1,203.4	1,087.2	1,058.6	1,000.7	769.2
Change in INPV	*2022$ millions*	-	(8.4)	(275.3)	(391.5)	(420.1)	(478.1)	(709.5)
	%	-	(0.6)	(18.6)	(26.5)	(28.4)	(32.3)	(48.0)
Free Cash Flow (2029)	*2022$ millions*	124.0	121.0	17.3	(24.1)	(29.3)	(48.8)	(155.0)
Change in Free Cash Flow (2029)	*2022$ millions*	-	(3.0)	(106.7)	(148.1)	(153.3)	(172.8)	(279.0)
	%	-	(2.4)	(86.0)	(119.4)	(123.6)	(139.4)	(225.0)
Product Conversion Costs	*2022$ millions*	-	3.5	11.1	13.3	13.6	14.6	25.1
Capital Conversion Costs	*2022$ millions*	-	4.0	228.7	319.0	330.4	373.1	601.1
Total Investment Required**	*2022$ millions*	-	7.5	239.8	332.4	344.0	387.6	626.2

* Numbers in parentheses indicate a negative number.
**Numbers may not sum exactly due to rounding.

At TSL 1, DOE estimates that impacts on INPV would range from −$8.4 million to $5.5 million, or a change in INPV of −0.6 percent to 0.4 percent. At TSL 1, industry free cash flow is $121.0 million, which is a decrease of $3.0 million, or a drop of 2.4 percent, compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $7.5 million. At TSL 1, approximately 73 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 1 would set the energy conservation standard for gas-fired storage water heaters at EL 1, oil-fired storage water heaters at EL 1, small electric storage water heaters at baseline efficiency level (*i.e.,* EL 0), electric storage water heaters with an effective storage volume of at least 20 gallons and less than or equal to 55 gallons (excluding small electric storage water heaters) at baseline, and electric storage water heaters with effective storage volumes above 55 gallons at EL 1. At TSL 1, DOE estimates that manufacturers would incur approximately $3.5 million in product conversion costs, as some gas-fired storage water heaters and electric storage water heaters would need to be redesigned to comply with the standard. DOE also estimates that manufacturers would incur approximately $4.0 million in capital conversion costs at TSL 1 to accommodate the need for increased capacity for gas-fired and electric storage water heaters.

At TSL 1, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 1.6 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Given the relatively small increase in production costs, DOE does not project a notable drop in shipments in the year the standard takes effect. In the preservation of gross margin scenario, manufacturers are able to fully pass on this slight cost increase to consumers. In the preservation of gross margin percentage scenario, the slight increase in cashflow from the higher MSP outweighs the $7.5 million in conversion costs, causing a slightly positive change in INPV at TSL 1 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup and the $7.5 million in conversion costs incurred by manufacturers cause a slightly negative change in INPV at TSL 1 under the preservation of operating profit scenario.

At TSL 2, DOE estimates that impacts on INPV would range from −$275.3 million to $28.2 million, or a change in INPV of −18.6 percent to 1.9 percent. At TSL 2, industry free cash flow is $17.3 million, which is a decrease of $106.7 million, or a drop of 86.0 percent compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $239.8 million. At TSL 2, approximately 24 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 2 would set the energy conservation standard for gas-fired storage water heaters at EL 2, oil-fired storage water heaters at EL 2, small electric storage water heaters at baseline, electric storage water heaters with an effective storage volume of at least 20 gallons and less than 55 gallons (excluding small electric storage water heaters) at EL 1, and electric storage water heaters with an effective storage

volume of above 55 gallons at EL 1. At TSL 2, DOE estimates that manufacturers would incur approximately $11.1 million in product conversion costs, as some gas-fired storage water heaters and electric storage water heaters would need to be redesigned to comply with the standard. While small electric storage water heaters could remain reliant on electric resistance technology, most electric storage water heaters would need to transition to heat pump technology. In 2023, heat pump electric storage water heaters comprise approximately 3 percent of the electric storage water heater market. At TSL 2, heat pump water heaters are expected to comprise approximately 61 percent of the electric storage water heater market in 2030 since all electric storage water heaters (except for small electric storage) would need to meet heat pump levels, driving large investments to expand production capacity of heat exchangers and to optimize production costs. Driven by the need for increased heat exchanger production capacity, DOE estimates that manufacturers would incur approximately $207.6 million in capital conversion costs for electric storage water heaters (and $228.7 million in capital conversion costs for all product classes) at TSL 2.

At TSL 2, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 36.6 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Despite an increase in production costs, DOE does not project a notable drop in shipments in the year the standard takes effect. In the preservation of gross margin scenario, manufacturers are able to fully pass on this cost increase to consumers. In the preservation of gross margin percentage scenario, the increase in cashflow from the higher MSP outweighs the $239.8 in conversion costs, causing a slightly positive change in INPV at TSL 2 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup and the $239.8 million in conversion costs incurred by manufacturers cause a negative change in INPV at TSL 2 under the preservation of operating profit scenario.

At TSL 3, DOE estimates that impacts on INPV would range from −$391.5 million to −$39.8 million, or a change in INPV of −26.5 percent to −2.7 percent. At TSL 3, industry free cash flow is −$24.1 million, which is a decrease of $148.1 million, or a drop of 119.4 percent, compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $332.4 million. At TSL 3, approximately 17 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 3 would set the energy conservation standard for gas-fired storage water heaters at EL 2, oil-fired storage water heaters at EL 2, small electric storage water heaters at EL 1, electric storage water heaters with an effective storage volume of at least 20 gallons and less than 55 gallons (excluding small electric storage water heaters) at EL 1, and electric storage water heaters with an effective storage volume of above 55 gallons at EL 1. At TSL 3, DOE estimates that manufacturers would incur approximately $13.3 million in product conversion costs, as some gas-fired storage water heaters and electric storage water heaters with an effective storage volume of between 20 and 55 gallons would need to be redesigned to comply with the standard. In 2023, heat pump electric storage water heaters comprise approximately 3 percent of the electric storage water heater market. In 2030 (the analyzed compliance year), heat pump electric storage water heaters would comprise 100 percent of the electric storage water heater market, driving large investments in product redesign and expanding heat exchanger manufacturing capacity. This would necessitate small electric storage water heater manufacturers developing split-system heat pump designs. Driven by the need for increased heat exchanger production capacity, DOE estimates that the industry would incur approximately $297.9 million in capital conversion costs for electric storage water heaters (and $319.0 million in capital conversion costs for all product classes) at TSL 3.

At TSL 3, the large conversion costs result in a free cash flow dropping below zero in the years before the standards year. The negative free cash flow calculation indicates manufacturers may need to access cash reserves or outside capital to finance conversion efforts.

At TSL 3, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 54.7 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Given the projected increase in production costs, DOE expects an estimated 15.4 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. The increase in cashflow from the higher MSP is outweighed by the $332.4 million in conversion costs and the drop in annual shipments, causing a slightly negative change in INPV at TSL 3 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup, $332.4 million in conversion costs incurred by manufacturers, and the drop in annual shipments cause a large negative change in INPV at TSL 3 under the preservation of operating profit scenario.

At TSL 4, DOE estimates that impacts on INPV would range from −$420.1 million to −$31.2 million, or a change in INPV of −28.4 percent to −2.1 percent. At TSL 4, industry free cash flow is −$29.3 million, which is a decrease of −$153.3 million, or a drop of 123.6 percent, compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $344.0 million. At TSL 4, approximately 17 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 4 would set the energy conservation standard for gas-fired storage water heaters at EL 2, oil-fired storage water heaters at EL 2, small electric storage water heaters at EL 1, electric storage water heaters with an effective storage volume of at least 20 gallons and less than 55 gallons (excluding small electric storage water heaters) at EL 2, and electric storage water heaters with an effective storage volume of above 55 gallons at EL 2. At TSL 4, DOE estimates that manufacturers would incur approximately $13.6 million in product conversion costs, as some gas-fired storage water heaters, electric storage water heaters with an effective storage volume of between 20 and 55 gallons, and electric storage water heaters with an effective storage volume of above 55 gallons would need to be redesigned to comply with the standard. In 2023, heat

pump electric storage water heaters comprise approximately 3 percent of the electric storage water heater market. In 2030 (the analyzed compliance year), heat pump electric storage water heaters would comprise 100 percent of the electric storage water heater market, driving large investments in product redesign and expanding heat exchanger manufacturing capacity. This would necessitate small electric storage water heater manufacturers developing split-system heat pump designs. Driven by the need for increased heat exchanger production capacity, DOE estimates that the industry would incur approximately $309.3 million in capital conversion costs for electric storage water heaters (and $330.4 million in capital conversion costs for all product classes) at TSL 4.

At TSL 4, the large conversion costs result in a free cash flow dropping below zero in the years before the standards year. The negative free cash flow calculation indicates manufacturers may need to access cash reserves or outside capital to finance conversion efforts.

At TSL 4, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 58.7 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Given the projected increase in production costs, DOE expects an estimated 15.2 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. The increase in cashflow from the higher MSP is outweighed by the $344.0 million in conversion costs and the drop in annual shipments, causing a slightly negative change in INPV at TSL 4 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup, $344.0 million in conversion costs incurred by manufacturers, and the drop in annual shipments cause a large negative change in INPV at TSL 4 under the preservation of operating profit scenario.

At TSL 5, DOE estimates that impacts on INPV would range from −$478.1 million to −$31.3 million, or a change in INPV of −32.3 percent to −2.1 percent. At TSL 5, industry free cash flow is −$48.8 million, which is a decrease of $172.8 million, or a drop of 139.4 percent compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $387.6 million. At TSL 5, approximately 14 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 5 would set the energy conservation standard for gas-fired storage water heaters at EL 2, oil-fired storage water heaters at EL 2, small electric storage water heaters at EL 1, electric storage water heaters with an effective storage volume of less than 55 gallons (excluding small electric storage water heaters) at EL 3, and electric storage water heaters with effective an volume of above 55 gallons at EL 3. At TSL 5, DOE estimates that manufacturers would incur approximately $14.6 million in product conversion costs, as some gas-fired storage water heaters, electric storage water heaters with an effective storage volume of between 20 and 55 gallons, and electric storage water heaters with an effective storage volume above 55 gallons would need to be redesigned to comply with the standard. In 2023, heat pump electric storage water heaters comprise approximately 3 percent of the electric storage water heater market. At TSL 5, 100 percent of electric storage water heaters would need to meet heat pump levels, driving large investments in product redesign and expanding heat exchanger manufacturing capacity. This would necessitate small electric storage water heater manufacturers developing split-system heat pump designs. Additionally, requiring larger condensers for gas-fired storage water heaters would require significant investments in capacity. Driven by the need for increased heat exchanger production capacity for electric storage water heaters and increased production capacity for larger condensers for gas-fired storage water heaters, DOE estimates that the industry would incur approximately $373.1 million in capital conversion costs at TSL 5.

At TSL 5, the large conversion costs result in a free cash flow dropping below zero in the years before the standards year. The negative free cash flow calculation indicates manufacturers may need to access cash reserves or outside capital to finance conversion efforts.

At TSL 5, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 66.6 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Given the projected increase in production costs, DOE expects an estimated 16.0 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. The increase in cashflow from the higher MSP is outweighed by the $387.6 million in conversion costs and the drop in annual shipments, causing a slightly negative change in INPV at TSL 5 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup, the $387.6 million in conversion costs incurred by manufacturers, and the drop in annual shipments cause a large negative change in INPV at TSL 5 under the preservation of operating profit scenario.

At TSL 6, DOE estimates that impacts on INPV would range from −$709.5 million to −$5.2 million, or a change in INPV of −48.0 percent to −0.4 percent. At TSL 6, industry free cash flow is −$155.0 million, which is a decrease of $279.0 million, or a drop of 225.0 percent, compared to the no-new-standards case value of $124.0 million in 2029, the year leading up to the standards year. Industry conversion costs total $626.2 million. At TSL 6, approximately 2 percent of consumer water heater shipments are expected to meet the required efficiency levels by the analyzed 2030 compliance date.

TSL 6 would set the energy conservation standard for gas-fired storage water heaters at EL 5, oil-fired storage water heaters at EL 2, small electric storage water heaters at EL 1, electric storage water heaters with an effective storage volume of less than 55 gallons (excluding small electric storage water heaters) at EL 3, and electric storage water heaters with an effective storage volume of above 55 gallons at EL 3. At TSL 6, DOE estimates that manufacturers would incur approximately $25.1 million in product conversion costs, as some gas-fired storage water heaters and electric storage water heaters with an effective storage volume of between 20 and 55 gallons would need to be redesigned to comply with the standard. In 2023, heat pump electric storage water heaters comprise approximately 3 percent of the electric storage water heater market. At TSL 6, 100 percent of electric storage water heaters would need to meet heat pump levels, driving large investments in product redesign and expanding heat

exchanger manufacturing capacity. This would necessitate small electric storage water heater manufacturers developing split-system heat pump designs. Additionally, requiring larger condensers, electronic ignition, power venting, and larger heat exchangers for gas-fired storage water heaters would require significant investments in capacity. Driven by the need for increased heat exchanger production capacity for electric storage water heaters and increased production capacity for electronic ignition, power venting, larger heat exchangers, and larger condensers for gas-fired storage water heaters, DOE estimates that the industry would incur approximately $601.1 million in capital conversion costs at TSL 6.

At TSL 6, the large conversion costs result in a free cash flow dropping below zero in the years before the standards year. The negative free cash flow calculation indicates manufacturers may need to access cash reserves or outside capital to finance conversion efforts.

At TSL 6, the shipment-weighted average MPC for consumer water heaters covered by this rulemaking increases by 101.6 percent relative to the no-new-standards case shipment-weighted average MPC for all water heaters in 2030. Given the projected increase in production costs, DOE expects an estimated 19.4 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. In this scenario, the increase in cashflow from the higher MSP is outweighed by the $626.2 million in conversion costs and the drop in annual shipments, causing a slightly negative change in INPV at TSL 6 under this scenario.

Under the preservation of operating profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case in 2031 (a year after the analyzed compliance year), but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2031. This reduction in the manufacturer markup, the $626.2 million in conversion costs, and the drop in annual shipments incurred by manufacturers cause a significant negative change in INPV at TSL 6 under the preservation of operating profit scenario.

b. Direct Impacts on Employment

To quantitatively assess the potential impacts of amended energy conservation standards on direct employment in the consumer water heater industry, DOE used the GRIM to estimate the domestic labor expenditures and number of direct employees in the no-new-standards case and in each of the standards cases during the analysis period.

Labor expenditures related to product manufacturing depend on the labor intensity of the product, the sales volume, and an assumption that wages remain fixed in real terms over time. The total labor expenditures in each year are calculated by multiplying the total MPCs by the labor percentage of MPCs. The total labor expenditures in the GRIM were then converted to total production employment levels by dividing production labor expenditures by the average fully burdened wage multiplied by the average number of hours worked per year per production worker. To do this, DOE relied on hourly wages from the engineering analysis and the *ASM* inputs: [179] Production Workers' Annual Hours, Production Workers for Pay Period, and Number of Employees. DOE also relied on the BLS employee compensation data [180] to determine the fully burdened wage ratio. The fully burdened wage ratio factors in paid leave, supplemental pay, insurance, retirement and savings, and legally required benefits.

The number of production employees is then multiplied by the U.S. labor percentage to convert total production employment to total domestic production employment. The U.S. labor percentage represents the industry fraction of domestic manufacturing production capacity for the covered product. This value is derived from manufacturer interviews, product database analysis, and publicly available information. DOE estimates that 80 percent of consumer water heaters analyzed in this final rule are produced domestically.

The domestic production employees estimate covers production line workers, including line supervisors, who are directly involved in fabricating and assembling products within the OEM facility. Workers performing services that are closely associated with production operations, such as materials handling tasks using forklifts, are also included as production labor. DOE's estimates only account for production workers who manufacture the specific products covered by this final rule.

Non-production employees account for the remainder of the direct employment figure. The non-production employees estimate covers domestic workers who are not directly involved in the production process, such as sales, engineering, human resources, and management. Using the amount of domestic production workers calculated above, non-production domestic employees are extrapolated by multiplying the ratio of non-production workers in the industry compared to production employees. DOE assumes that this employee distribution ratio remains constant between the no-new-standards case and standards cases.

Direct employment is the sum of domestic production employees and non-production employees. Using the GRIM, DOE estimates in the absence of new energy conservation standards there would be 4,110 domestic production and non-production employees for consumer water heaters in 2030. Table V.20 shows the range of the impacts of energy conservation standards on U.S. manufacturing employment in the consumer water heaters industry. The following discussion provides a qualitative evaluation of the range of potential impacts presented in Table V.20.

[179] U.S. Census Bureau's Annual Survey of Manufactures: 2018–2021 (Available at: *www.census.gov/programs-surveys/asm/data/tables.html*) (last accessed January 18, 2024).

[180] U.S. Bureau of Labor Statistics. *Employer Costs for Employee Compensation.* (September 2023) (Dec. 15, 2023) Available at *www.bls.gov/news.release/archives/ecec_12152023.pdf* (last accessed Jan. 1, 2024).

Table V.20 Domestic Direct Employment Impacts for Consumer Water Heater Manufacturers in 2030

	No-New-Standards Case	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5	TSL 6
Direct Employment in 2030 (Production workers + Non-Production Workers)	4,110	4,110 to 4,120	2,941 to 5,544	2,393 to 5,480	2,393 to 5,504	2,393 to 5,760	441 to 7,350
Potential Changes in Direct Employment Workers in 2030*	-	0 to 10	(1,168) to 1,434	(1,716) to 1,370	(1,716) to 1,394	(1,716) to 1,650	(3,669) to 3,240

*DOE presents a range of potential employment impacts. Numbers in parentheses denote negative values.

The direct employment impacts shown in Table V.20 represent the potential domestic employment changes that could result following the compliance date for the consumer water heater product classes analyzed in this final rule. Manufacturing employment could increase or decrease due to the labor content of the various products being manufactured domestically or if manufacturers decided to move production facilities abroad because of the amended standards. The upper-bound estimate corresponds to an increase in the number of domestic workers that would result from amended energy conservation standards if manufacturers continue to produce the same scope of covered products within the United States after compliance takes effect. The lower-bound estimate reflects the risk of manufacturers re-evaluating production siting decisions in response to amended energy conservation standards. This conservative lower bound of domestic direct employment varies by TSL and product class. For this final rule, DOE reassessed and adjusted its conservative lower bound of potential domestic direct employment impacts to account for the potential that gas-fired storage water heater OEMs may re-evaluate domestic manufacturing locations at certain analyzed TSLs.

For electric storage water heaters (which account for approximately 51 percent of shipments in 2030), the lower end of the domestic employment range represents the potential decrease in production workers if manufacturing of heat pump electric storage water heaters moves to lower labor-cost countries in response to the large investments necessary to expand heat exchanger production capacity. To establish the estimated change in domestic direct employment for electric storage water heaters, the direct employment analysis assumed a reduction in domestic employment commensurate with the percentage of electric storage water heater shipments that transition to heat pump designs. For gas-fired storage water heaters (which account for approximately 49 percent of shipments in 2030), the lower bound represents a shift of all domestic production workers to foreign production locations at max-tech (TSL 6). At max-tech, it is possible that manufacturers would revisit their siting decisions based on the need for increased production capacity for larger condensers. DOE applied this conservative assumption to establish a lower bound that avoids underestimating the potential direct employment impacts.

Additional detail on the analysis of direct employment can be found in chapter 12 of the final rule TSD. Additionally, the employment impacts discussed in this section are independent of the employment impacts from the broader U.S. economy, which are documented in chapter 16 of the final rule TSD.

c. Impacts on Manufacturing Capacity

Industry concerns around manufacturing capacity were driven by potential technology transitions. In particular, manufacturers focused on the transition to heat pump technology for electric storage water heaters with rated storage volumes of between 20 and 55 gallons. The vast majority of sales today in this product class are electric resistance water heaters. DOE estimates that approximately 3 percent of current electric storage consumer water heater sales are heat pump units. At the final rule level, all electric storage water heaters, excluding small electric storage water heaters, would need to incorporate heat pump technology. Industry would need to add capacity to produce an additional three to four million heat pump electric storage water heater units per year. In interviews, manufacturers noted that heat pump electric storage water heaters are more complex to manufacture than electric resistance water heaters. DOE estimated conversion costs based on both industry feedback and estimates of capital investment from the engineering analysis. DOE's analysis indicated significant investment in additional production floor space and in production capacity for heat exchangers. At TSL 2, conversion costs total $239.8 million, presuming all OEMs of electric storage water heaters, excluding small electric storage water heaters, invest in the transition to heat pump models.

d. Impacts on Subgroups of Manufacturers

As discussed in section IV.J.1 of this document, using average cost assumptions to develop an industry cash flow estimate may not be adequate for assessing differential impacts among manufacturer subgroups. Small manufacturers, niche manufacturers, and manufacturers exhibiting a cost structure substantially different from the industry average could be affected disproportionately. DOE used the results of the industry characterization to group manufacturers exhibiting similar characteristics. Consequently, DOE identified small business manufacturers as a subgroup for a separate impact analysis.

For the small business subgroup analysis, DOE applied the small business size standards published by the U.S. Small Business Administration (''SBA'') to determine whether a company is considered a small business. The size standards are codified at 13 CFR part 121. To be categorized as a small business under North American Industry Classification System (''NAICS'') code 335220, ''Major Household Appliance Manufacturing,'' a consumer water heater manufacturer and its affiliates may employ a

maximum of 1,500 employees. The 1,500-employee threshold includes all employees in a business's parent company and any other subsidiaries. Based on this classification, DOE identified three manufacturers that qualify as domestic small businesses.

The small business subgroup analysis is discussed in more detail in chapter 12 of the final rule TSD. DOE examines the potential impacts of this final rule on small business manufacturers in section VI.B of this document.

e. Cumulative Regulatory Burden

One aspect of assessing manufacturer burden involves looking at the cumulative impact of multiple DOE standards and the regulatory actions of other Federal agencies and States that affect the manufacturers of a covered product or equipment. While any one regulation may not impose a significant burden on manufacturers, the combined effects of several existing or impending regulations may have serious consequences for some manufacturers, groups of manufacturers, or an entire industry. Multiple regulations affecting the same manufacturer can strain profits and lead companies to abandon product lines or markets with lower expected future returns than competing products. For these reasons, DOE conducts an analysis of cumulative regulatory burden as part of its rulemakings pertaining to appliance efficiency.

For the cumulative regulatory burden analysis, DOE examined Federal, product-specific regulations that could affect consumer water heater manufacturers and that take effect approximately 3 years before or after the estimated compliance date (2030). This information is presented in Table V.21.

BILLING CODE 6450–01–P

Table V.21 Compliance Dates and Expected Conversion Expenses of Federal Energy Conservation Standards Affecting Consumer Water Heater Original Equipment Manufacturers

* This column presents the total number of OEMs identified in the energy conservation standard rule that is contributing to cumulative regulatory burden.

** This column presents the number of OEMs producing consumer water heaters that are also listed as OEMs in the identified energy conservation standard that is contributing to cumulative regulatory burden.

*** This column presents industry conversion costs as a percentage of product revenue during the conversion period. Industry conversion costs are the upfront investments manufacturers must make to sell compliant products/equipment. The revenue used for this calculation is the revenue from just the covered product/equipment associated with each row. The conversion period is the timeframe over which conversion costs are made and lasts from the publication year of the final rule to the compliance year of the energy conservation standard. The conversion period typically ranges from 3 to 5 years, depending on the rulemaking.

† These rulemakings are at the NOPR stage, and all values are subject to change until finalized through publication of a final rule.

‡ For the refrigerators, refrigerator-freezers, and freezers energy conservation standards direct final rule, the compliance year (2029 or 2030) varies by product class.

BILLING CODE 6450–01–C

DOE received several comments in response to the July 2023 NOPR about cumulative regulatory burden. DOE addresses those comments in section IV.J.3.b of this document.

3. National Impact Analysis

This section presents DOE's estimates of the national energy savings and the NPV of consumer benefits that would result from each of the TSLs considered as potential amended standards.

a. National Energy Savings

To estimate the energy savings attributable to potential amended standards for consumer water heaters, DOE compared their energy consumption under the no-new-standards case to their anticipated energy consumption under each TSL. The savings are measured over the entire lifetime of products purchased in the 30-year period that begins in the year of anticipated compliance with amended standards (2030–2059). Table V.22 presents DOE's projections of the national energy savings for each TSL considered for consumer water heaters. The savings were calculated using the approach described in section IV.H.2 of this document.

Table V.22 Cumulative National Energy Savings for Consumer Water Heaters; 30 Years of Shipments (2030–2059)

OMB Circular A–4 [181] requires agencies to present analytical results, including separate schedules of the monetized benefits and costs that show the type and timing of benefits and costs. Circular A–4 also directs agencies to consider the variability of key elements underlying the estimates of benefits and costs. For this rulemaking, DOE undertook a sensitivity analysis using 9 years, rather than 30 years, of product shipments. The choice of a 9-year period is a proxy for the timeline in EPCA for the review of certain energy conservation standards and potential revision of and compliance with such revised standards.[182] The review timeframe established in EPCA is generally not synchronized with the product lifetime, product manufacturing cycles, or other factors specific to consumer water heaters. Thus, such results are presented for informational purposes only and are not indicative of any change in DOE's analytical methodology. The NES sensitivity analysis results based on a 9-year analytical period are presented in Table V.23. The impacts are counted over the lifetime of consumer water heaters purchased during the period 2030–2038.

[181] U.S. Office of Management and Budget. *Circular A–4: Regulatory Analysis.* Available at *www.whitehouse.gov/omb/information-for-agencies/circulars* (last accessed Jan. 18. 2024). DOE used the prior version of Circular A–4 (September 17, 2003) in accordance with the effective date of the November 9, 2023 version.

[182] EPCA requires DOE to review its standards at least once every 6 years, and requires, for certain products, a 3-year period after any new standard is promulgated before compliance is required, except that in no case may any new standards be required within 6 years of the compliance date of the previous standards. (42 U.S.C. 6295(m)) While adding a 6-year review to the 3-year compliance period adds up to 9 years, DOE notes that it may undertake reviews at any time within the 6-year period and that the 3-year compliance date may yield to the 6-year backstop. A 9-year analysis period may not be appropriate given the variability that occurs in the timing of standards reviews and the fact that for some products, the compliance period is 5 years rather than 3 years.

b. Net Present Value of Consumer Costs and Benefits

DOE estimated the cumulative NPV of the total costs and savings for consumers that would result from the TSLs considered for consumer water heaters. In accordance with OMB's guidelines on regulatory analysis,[183] DOE calculated NPV using both a 7-percent and a 3-percent real discount rate. Table V.24 shows the consumer NPV results with impacts counted over the lifetime of products purchased during the period 2030–2059.

Table V.24 Cumulative Net Present Value of Consumer Benefits for Consumer Water Heaters; 30 Years of Shipments (2030–2059)

Discount Rate	Trial Standard Level					
	1	2	3	4	5	6
	billion 2022$

The previous results reflect the use of a default trend to estimate the change in price for consumer water heaters over the analysis period (*see* section IV.F.1 of this document). DOE also conducted a sensitivity analysis that considered one

[183] U.S. Office of Management and Budget. *Circular A–4: Regulatory Analysis.* September 17, 2003. *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A4/a-4.pdf* (last accessed July 1, 2021).

scenario with a price decline compared to the reference case and one scenario with a price increase compared to the reference case. The results of these alternative cases are presented in appendix 10C of the final rule TSD. In the price-decline case, the NPV of consumer benefits is higher than in the default case. In the price increase case, the NPV of consumer benefits is lower than in the default case.

c. Indirect Impacts on Employment

DOE estimates that amended energy conservation standards for consumer water heaters will reduce energy expenditures for consumers of those products, with the resulting net savings being redirected to other forms of economic activity. These expected shifts in spending and economic activity could affect the demand for labor. As described in section IV.N of this document, DOE used an input/output model of the U.S. economy to estimate indirect employment impacts of the TSLs that DOE considered. There are uncertainties involved in projecting employment impacts, especially changes in the later years of the analysis. Therefore, DOE generated results for near-term timeframes (2030–2034), where these uncertainties are reduced.

The results suggest that the adopted standards are likely to have a negligible impact on the net demand for labor in the economy. The net change in jobs is so small that it would be imperceptible in national labor statistics and might be offset by other, unanticipated effects on employment. Chapter 16 of the final rule TSD presents detailed results regarding anticipated indirect employment impacts.

4. Impact on Utility or Performance of Products

As discussed in section III.F.1.d of this document, DOE has concluded that the standards adopted in this final rule will not lessen the utility or performance of the consumer water heaters under consideration in this rulemaking. Manufacturers of these products currently offer units that meet or exceed the adopted standards.

5. Impact of Any Lessening of Competition

DOE considered any lessening of competition that would be likely to result from new or amended standards. As discussed in section III.F.1.e of this document, EPCA directs the Attorney General of the United States (''Attorney General'') to determine the impact, if any, of any lessening of competition likely to result from a proposed standard and to transmit such determination in writing to the Secretary within 60 days of the publication of a proposed rule, together with an analysis of the nature and extent of the impact. To assist the Attorney General in making this determination, DOE provided the Department of Justice (''DOJ'') with copies of the NOPR and the TSD for review. In its assessment letter responding to DOE, DOJ concluded that the proposed energy conservation standards for consumer water heaters are unlikely to have a significant adverse impact on competition. DOE is publishing the Attorney General's assessment at the end of this final rule.

6. Need of the Nation To Conserve Energy

Enhanced energy efficiency, where economically justified, improves the Nation's energy security, strengthens the economy, and reduces the environmental impacts (costs) of energy production. Reduced electricity demand due to energy conservation standards is also likely to reduce the cost of maintaining the reliability of the electricity system, particularly during peak-load periods. Chapter 15 in the final rule TSD presents the estimated impacts on electricity-generating capacity, relative to the no-new-standards case, for the TSLs that DOE considered in this rulemaking.

Energy conservation resulting from potential energy conservation standards for consumer water heaters is expected to yield environmental benefits in the form of reduced emissions of certain air pollutants and greenhouse gases. Table V.26 provides DOE's estimate of cumulative emissions reductions expected to result from the TSLs considered in this rulemaking. The emissions were calculated using the multipliers discussed in section IV.K of this document. DOE reports annual emissions reductions for each TSL in chapter 13 of the final rule TSD.

Note: Totals may not equal sums due to rounding.

As part of the analysis for this rule, DOE estimated monetary benefits likely to result from the reduced emissions of CO_2 that DOE estimated for each of the considered TSLs for consumer water heaters. Section IV.L of this document discusses the estimated SC–CO_2 values that DOE used. Table V.27 presents the value of CO_2 emissions reduction at each TSL for each of the SC–CO_2 cases. The time-series of annual values is presented for the selected TSL in chapter 14 of the final rule TSD.

DOE is well aware that scientific and economic knowledge about the contribution of CO_2 and other GHG emissions to changes in the future global climate and the potential resulting damages to the global and U.S. economy continues to evolve rapidly. DOE, together with other Federal agencies, will continue to review methodologies for estimating the monetary value of reductions in CO_2 and other GHG emissions. This ongoing review will consider the comments on this subject that are part of the public record for this and other rulemakings, as well as other methodological assumptions and issues. DOE notes, however, that the adopted standards are economically justified even without inclusion of monetized benefits of reduced GHG emissions.

DOE also estimated the monetary value of the economic benefits associated with NO_X and SO_2 emissions reductions anticipated to result from the considered TSLs for consumer water heaters. The dollar-per-ton values that DOE used are discussed in section IV.L of this document. Table V.30 presents the present value for NO_X emissions reduction for each TSL calculated using 7-percent and 3-percent discount rates, and Table V.31 presents similar results for SO_2 emissions reductions. The results in these tables reflect application of EPA's low dollar-per-ton values, which DOE used to be conservative. The time-series of annual values is presented for the selected TSL in chapter 14 of the final rule TSD.

Table V.30 Present Value of NO_X Emissions Reduction for Consumer Water Heaters Shipped in 2030–2059

TSL	7% Discount Rate	3% Discount Rate
	million 2022$	
1	710	2,020
2	9,781	27,898
3	11,061	31,658
4	13,023	37,373
5	13,430	38,594
6	23,946	69,019

Table V.31 Present Value of SO_2 Emissions Reduction for Consumer Water Heaters Shipped in 2030–2059

TSL	7% Discount Rate	3% Discount Rate
	million 2022$	
1	2.0	5.6
2	1,926	5,477
3	2,324	6,648
4	2,666	7,626
5	2,723	7,796
6	2,667	7,642

Not all the public health and environmental benefits from the reduction of greenhouse gases, NO_X, and SO_2 are captured in the values above, and additional unquantified benefits from the reductions of those pollutants as well as from the reduction of direct PM and other co-pollutants may be significant. DOE has not included monetary benefits of the reduction of Hg emissions because the amount of reduction is very small.

7. Other Factors

The Secretary of Energy, in determining whether a standard is economically justified, may consider any other factors that the Secretary deems to be relevant. (42 U.S.C. 6295(o)(2)(B)(i)(VII)) No other factors were considered in this analysis.

8. Summary of Economic Impacts

Table V.32 presents the NPV values that result from adding the estimates of the economic benefits resulting from reduced GHG and NO_X and SO_2 emissions to the NPV of consumer benefits calculated for each TSL considered in this rulemaking. The consumer benefits are domestic U.S. monetary savings that occur as a result of purchasing the covered products, and are measured for the lifetime of products shipped during the period 2030–2059. The climate benefits associated with reduced GHG emissions resulting from the adopted standards are global benefits, and are also calculated based on the lifetime of consumer water heaters shipped during the period 2030–2059.

Table V.32 Consumer NPV Combined with Present Value of Climate Benefits and Health Benefits

Category	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5	TSL 6
Using 3% Discount Rate for Consumer NPV and Health Benefits (billion 2022$)						
5% Average SC-GHG case	3.9	119	131	162	164	202
3% Average SC-GHG case	4.8	132	146	179	182	235
2.5% Average SC-GHG case	5.5	142	156	192	195	258
3% 95th percentile SC-GHG case	7.3	166	184	224	228	318
Using 7% Discount Rate for Consumer NPV and Health Benefits (billion 2022$)

3% Average SC-GHG case	2.4	54	58	72	73	100
2.5% Average SC-GHG case	3.1	63	69	85	86	123
3% 95th percentile SC-GHG case	4.9	88	96	117	119	183

C. Conclusion

When considering new or amended energy conservation standards, the standards that DOE adopts for any type (or class) of covered product must be designed to achieve the maximum improvement in energy efficiency that the Secretary determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A)) In determining whether a standard is economically justified, the Secretary must determine whether the benefits of the standard exceed its burdens by, to the greatest extent practicable, considering the seven statutory factors discussed previously. (42 U.S.C. 6295(o)(2)(B)(i)) The new or amended standard must also result in significant conservation of energy. (42 U.S.C. 6295(o)(3)(B))

For this final rule, DOE considered the impacts of new and amended

standards for consumer water heaters at each TSL, beginning with the maximum technologically feasible level, to determine whether that level was economically justified. Where the max-tech level was not justified, DOE then considered the next most efficient level and undertook the same evaluation until it reached the highest efficiency level that is both technologically feasible and economically justified and saves a significant amount of energy.

To aid the reader as DOE discusses the benefits and/or burdens of each TSL, tables in this section present a summary of the results of DOE's quantitative analysis for each TSL. In addition to the quantitative results presented in the tables, DOE also considers other burdens and benefits that affect economic justification. These include the impacts on identifiable subgroups of consumers who may be disproportionately affected by a national standard and impacts on employment.

DOE also notes that the economics literature provides a wide-ranging discussion of how consumers trade off up-front costs and energy savings in the absence of government intervention. Much of this literature attempts to explain why consumers appear to undervalue energy efficiency improvements. There is evidence that consumers undervalue future energy savings as a result of (1) a lack of information; (2) a lack of sufficient salience of the long-term or aggregate benefits; (3) a lack of sufficient savings to warrant delaying or altering purchases; (4) excessive focus on the short term, in the form of inconsistent weighting of future energy cost savings relative to available returns on other investments; (5) computational or other difficulties associated with the evaluation of relevant tradeoffs; and (6) a divergence in incentives (for example, between renters and owners, or builders and purchasers). Having less than perfect foresight and a high degree of uncertainty about the future, consumers may trade off these types of investments at a higher than expected rate between current consumption and uncertain future energy cost savings.

In DOE's current regulatory analysis, potential changes in the benefits and costs of a regulation due to changes in consumer purchase decisions are included in two ways. First, if consumers forego the purchase of a product in the standards case, this decreases sales for product manufacturers, and the impact on manufacturers attributed to lost revenue is included in the MIA. Second, DOE accounts for energy savings attributable only to products actually used by consumers in the standards case; if a standard decreases the number of products purchased by consumers, this decreases the potential energy savings from an energy conservation standard. DOE provides estimates of shipments and changes in the volume of product purchases in chapter 9 of the final rule TSD. However, DOE's current analysis does not explicitly control for heterogeneity in consumer preferences, preferences across subcategories of products or specific features, or consumer price sensitivity variation according to household income.[184]

While DOE is not prepared at present to provide a fuller quantifiable framework for estimating the benefits and costs of changes in consumer purchase decisions due to an energy conservation standard, DOE is committed to developing a framework that can support empirical quantitative tools for improved assessment of the consumer welfare impacts of appliance standards. DOE has posted a paper that discusses the issue of consumer welfare impacts of appliance energy conservation standards, and potential enhancements to the methodology by which these impacts are defined and estimated in the regulatory process.[185] DOE welcomes comments on how to more fully assess the potential impact of energy conservation standards on consumer choice and how to quantify this impact in its regulatory analysis in future rulemakings.

1. Benefits and Burdens of TSLs Considered for Consumer Water Heater Standards

Table V.33 and Table V.34 summarize the quantitative impacts estimated for each TSL for consumer water heaters. The national impacts are measured over the lifetime of consumer water heaters purchased in the 30-year period that begins in the anticipated year of compliance with amended standards (2030–2059). The energy savings, emissions reductions, and value of emissions reductions refer to full-fuel-cycle results. DOE is presenting monetized benefits of GHG emissions reductions in accordance with the applicable Executive orders, and DOE would reach the same conclusion presented in this notice in the absence of the social cost of greenhouse gases, including the Interim Estimates presented by the Interagency Working Group because the consumer benefits alone outweigh the costs of the adopted rule (as described in section V.C of this document). The efficiency levels contained in each TSL are described in section V.A of this document.

Consumer Net Benefits	0.4	25	25	33	33	30
Total Net Benefits	2.4	54	58	72	73	100

Note: This table presents the costs and benefits associated with consumer water heaters shipped during the period 2030−2059. These results include benefits to consumers which accrue after 2059 from the products shipped during the period 2030−2059.

* Climate benefits are calculated using four different estimates of the SC-CO_2, SC-CH_4, and SC-N_2O. Together, these represent the global SC-GHG. For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3-percent discount rate are shown; however, DOE emphasizes the value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for NO_X and SO_2) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits, but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. The health benefits are presented at real discount rates of 3 and 7 percent. *See* section IV.L of this document for more details.

† Total and net benefits include consumer, climate, and health benefits. For presentation purposes, total and net benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.

‡ Costs include incremental equipment costs as well as installation costs.

BILLING CODE 6450–01–C

DOE first considered TSL 6, which represents the max-tech efficiency levels for all product classes. At TSL 6, the design options for GSWHs include condensing technology; the design options for ESWHs include heat pump technology; and the design options for oil-fired storage water heaters (''OSWHs'') include extra insulation and multi-flue heat exchangers. TSL 6 would require extensive changes to the way manufacturers currently produce water heaters. At TSL 6, approximately 2 percent of consumer water heater

shipments are expected to meet the required efficiency levels by the 2030 compliance date. This includes approximately 0.2 percent of shipments for GSWHs, 17 percent of shipments for OSWHs, 1 percent of small ESWH, 5 percent of ESWH with an effective storage volume of less than 55 gallons (excluding small ESWH) shipments, and 11 percent of ESWHs with an effective storage volume greater than or equal to 55 gallons shipments. There would be a significant ramp up in manufacturing capacity, especially for gas storage and electric storage water heaters, needed to support the market due to the transition to accommodate these advanced technologies.

TSL 6 would save an estimated 30.8 quads of energy, an amount DOE considers significant. Under TSL 6, the NPV of consumer benefit would be $30 billion using a discount rate of 7 percent, and $115 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 6 are 803 Mt of CO_2, 8,534 thousand tons of CH_4, 4.7 thousand tons of N_2O, 1,851 thousand tons of NO_X, 127 thousand tons of SO_2, and 0.9 tons of Hg. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 6 is $43 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at TSL 6 is $27 billion using a 7-percent discount rate and $77 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 6 is $100 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 6 is $235 billion. The estimated total NPV is provided for additional information; however, DOE primarily relies upon the NPV of consumer benefits when determining whether a proposed standard level is economically justified.

At TSL 6, consumers will experience an average LCC cost of $285 for GSWHs, which is primarily driven by the total installed cost increases for gas condensing technology. For OSWHs, consumers will experience an average LCC savings of $141. For electric storage water heaters 20 to 35 gallons, consumers will experience an LCC cost of $750. For GSWHs, the consumers experiencing a net LCC cost is 70 percent, and for small ESWHs, the consumers experiencing a net LCC cost is 77 percent.

At TSL 6, the projected change in INPV ranges from a decrease of $709.5 million to a decrease of $5.2 million, which corresponds to a decrease of 48.0 percent and a decrease of 0.4 percent, respectively. The range of the impacts is driven primarily by the ability of manufacturers to recover their compliance costs. DOE estimates that industry must invest $626.2 million to comply with standards set at TSL 6. DOE understands that manufacturers would need to significantly upgrade their facilities to accommodate heat pump technology for ESWHs. Upgrades to produce heat pump electric storage water heaters include expansion of heat exchanger facilities and inclusion of refrigeration charging systems. In addition, manufacturers would need to expand their component sourcing of compressors and more sophisticated controls to produce these more advanced technology products. DOE estimates that manufacturers would need to scale up production of heat pump electric storage water heaters from approximately 3 percent of ESWH sales today (0.14 million units in 2023) to 100 percent of ESWH units in 2030. DOE believes significant research and development efforts would also be needed to support the introduction of a wider variety of heat pump water heater models in the market to meet the various needs of consumers, especially split-system heat pump water heaters that would be needed to support the replacement of small electric storage water heaters. Currently, there are very limited split-system heat pump water heater models commercially available in the United States, which are produced by only a few manufacturers and are sold in low quantities. DOE is concerned that sufficient products may not be available to support the small electric storage water heaters market, and new products may not be introduced by a large majority of water heater manufacturers by the compliance date of this final rule. In sum, DOE is concerned that industry will not be able to transition to 100 percent of electric storage water heaters to heat pump designs within a 5-year compliance window, as would be necessary to comply with TSL 6.

DOE is also concerned about training the workforce that would be needed to install and service the heat pump water heater market by the compliance date of the standards. ESWHs are typically installed by plumbers. Advanced-technology water heaters require the ability to work with refrigerants similar to that of heating, ventilation, and air conditioning servicing contractors. DOE hopes that the emergence of workforce programs supported by the Inflation Reduction Act and the Bipartisan Infrastructure Law will begin to support the training and education of the workforce needed to support the clean energy transition. However, DOE understands this transition will take time and the workforce may not be ready at the scale necessary to support TSL 6.

The Secretary concludes that at TSL 6 for consumer water heaters, the benefits of energy savings, positive NPV of consumer benefits, emission reductions, and estimated monetary value of the emissions reductions would be outweighed by economic impacts to manufacturers, primarily driven by the ramp up in scale and offerings needed to support both ESWH and GWSH efficiencies at TSL 6, the economic costs for small ESWH consumers (many of whom are low income), and the distinct impact of high initial costs for low-income consumers purchasing replacement water heaters in emergency circumstances. Approximately 0.2 percent of gas storage water heater shipments and approximately 4 percent of all electric storage water heaters shipments would meet TSL 6 efficiencies by 2030. DOE also notes that new technologies have recently been introduced into the heat pump water heater market, such as 120-volt water heaters, whose efficiencies are lower than TSL 6. Such 120-volt water heaters can be more readily adopted by more households, lowering installation costs. While DOE expects continued innovation in the heat pump water heater market at this time, DOE is worried that prematurely requiring TSL 6 efficiency levels will remove these new products from the market prematurely. The Secretary is also concerned about the uncertainty in the market to ensure GSWHs and ESWHs will continue to be available to all consumers, including small ESWH replacements. Consequently, the Secretary has concluded that TSL 6 is not economically justified.

DOE then considered TSL 5, which represents the max-tech efficiency levels for all product classes except for GSWHs, which includes a lower non-condensing efficiency level. At TSL 5, the design options for GSWHs include either gas-actuated or electric flue dampers instead of condensing technologies. For the remainder of the product classes, the efficiency levels and technologies are the same as in TSL 6: that is, for ESWHs, TSL 5 includes max-technology efficiency levels for heat pump water heaters across all

ESWH product classes, including small ESWHs. Approximately 14 percent of consumer water heater shipments are expected to meet the TSL 5 efficiency levels by the 2030 compliance date. The percentage of shipments expected to meet or exceed the efficiency levels in TSL 5 is the same as TSL 6 for all product classes except for GSWH. For GSWHs, approximately 23 percent of shipments are expected to meet TSL 5 efficiencies by the compliance date of the amended standards. At TSL 5, the standard would transition all consumer electric storage water heaters to heat pump technology across all effective storage volumes, delivery capacity offerings, and sizes in the market.

TSL 5 would save an estimated 24.9 quads of energy, an amount DOE considers significant. Under TSL 5, the NPV of consumer benefit would be $33 billion using a discount rate of 7 percent, and $111 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 5 are 462 Mt of CO_2, 4,228 thousand tons of CH_4, 4.1 thousand tons of N_2O, 919 thousand tons of NO_X, 128 thousand tons of SO_2, and 0.9 tons of Hg. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 5 is $24 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at TSL 5 is $16 billion using a 7-percent discount rate and $46 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 5 is $73 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 5 is $182 billion. The estimated total NPV is provided for additional information; however, DOE primarily relies upon the NPV of consumer benefits when determining whether a proposed standard level is economically justified.

At TSL 5, DOE estimates that consumers will see a life-cycle cost savings for all product classes, except for small ESWH. At TSL 5, the average LCC savings is $29 for GSWH consumers, which is driven by the lower installed costs as compared to the TSL 6 condensing level. While the LCC savings are positive for a majority of consumers across TSL 5 product classes, 77 percent of small ESWH consumers will experience a net cost when installing a split-system heat pump water heater.

At TSL 5, the projected change in INPV ranges from a decrease of $478.1 million to a decrease of $31.3 million, which corresponds to a decrease of 32.3 percent and a decrease of 2.1 percent, respectively. DOE estimates that industry must invest $387.6 million to comply with standards set at TSL 5. The primary driver of high conversion costs is the industry's investment to meet market demand for heat pump electric storage water heaters. DOE estimates that manufacturers would need to scale up production of heat pump electric storage water heaters from approximately 3 percent of all ESWH units (0.14 million units in 2023) to 100 percent of units in 2030. As a part of this scale-up, manufacturers would need to develop new split-system heat pumps for the small electric storage water heater market. Manufacturers would likely need to invest in cost optimization of existing designs, in new designs, and in additional manufacturing capacity for heat pump water heaters.

Similar to the discussion at TSL 6, DOE's concerns continue to be driven by the ramp up in manufacturing, research, and development that would be needed to support the heat pump water heater market to continue today's volumes. TSL 5 would require the expansion of heat pump lines and the introduction of new products to support the entire market, especially small ESWHs.

The Secretary concludes that at TSL 5 for consumer water heaters, the benefits of energy savings, positive NPV of consumer benefits, emission reductions, and estimated monetary value of the emissions reductions would be outweighed by the impacts on manufacturers, driven by the uncertainty in the ramp up needed to support a full transition of all volumes to heat pump water heaters for ESWHs, the impacts on consumers of small ESWHs, and the increase in initial costs. While the LCC savings are positive for a majority of consumers across TSL 5 product classes, 56 percent of small ESWH consumers would experience net costs when installing a split-system heat pump water heater. DOE is concerned about the increase in first costs for consumers forced to purchase a replacement water heater when their existing water heater fails and the inability for the market to introduce cost-optimized heat pump water heaters as an offering to consumers to help mitigate the initial first cost increase. As at TSL 5, DOE is also concerned about the workforce being ready to service and install at the volumes necessary to support such a transition in 5 years. Consequently, the Secretary has concluded that TSL 5 is not economically justified.

DOE then considered TSL 4, which represents a lower efficiency level for ESWHs and maintains the same efficiency levels for OSWHs and GSWHs as at TSL 5. At TSL 4, the design options for GSWHs include either gas-actuated or electric flue dampers; the design options for OSWHs include extra insulation and multi-flue heat exchangers; and the design options for ESWHs include heat pump technology. Approximately 17 percent of consumer water heater shipments are expected to meet the TSL 4 efficiency levels by the 2030 compliance date. The percentage of shipments in 2030 expected to meet the analyzed level in TSL 4 for ESWHs is approximately 11 percent, which is a significant increase from the max-tech efficiency levels required at TSL 5 and TSL 6. However, for small ESWH, the percentage of shipments expected to meet TSL 4 remains at approximately 1 percent. At TSL 4, the standard would transition all consumer electric storage water heaters to heat pump technology, but at a more moderate efficiency level for ESWHs except for small ESWHs. DOE still expects this transition to be significant, but DOE notes that manufacturers have more experience producing ESWHs, excluding small ESWHs, at these efficiency levels due to the prevalence of the ENERGY STAR program. DOE also expects the programs from the Inflation Reduction Act, including the appliance rebates and tax credits, would help support the expansion of this market.

TSL 4 would save an estimated 24.3 quads of energy, an amount DOE considers significant. Under TSL 4, the NPV of consumer benefit would be $33 billion using a discount rate of 7 percent, and $111 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 4 are 448 Mt of CO_2, 4,078 thousand tons of CH_4, 4.0 thousand tons of N_2O, 886 thousand tons of NO_X, 126 thousand tons of SO_2, and 0.9 tons of Hg. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 4 is $23 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at TSL 4 is $16 billion using a 7-percent discount rate and $45 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health

benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 4 is $72 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 4 is $179 billion. The estimated total NPV is provided for additional information; however, DOE primarily relies upon the NPV of consumer benefits when determining whether a proposed standard level is economically justified.

The average LCC across all product classes is positive, except for the small ESWH. DOE continues to be concerned about the development of new models that would need to be introduced into the split-system heat pump water heater market to support the small ESWH replacements. As DOE noted in discussing TSL 6, only a few manufacturers produce consumer water heaters today in very small volumes and would not be able to support the entire small ESWH market today. Similar to TSLs 5 and 6, 77 percent of small ESWH consumers will experience a net cost when installing a split-system heat pump water heater.

At TSL 4, the projected change in INPV ranges from a decrease of $420.1 million to a decrease of $31.2 million, which corresponds to a decrease of 28.4 percent and a decrease of 2.1 percent, respectively. DOE estimates that industry must invest $344.0 million to comply with standards set at TSL 4. For ESWH manufacturers, stepping down from max-tech provides greater flexibility in the design process and reduces the level of model-specific optimization. This results in lower conversion costs. However, manufacturers would still need to develop new split-system heat pumps for the small ESWH market and scale up production capacity for integrated heat pump water heaters. As previously discussed, DOE estimates that manufacturers would need to scale up production of heat pump electric storage water heaters from approximately 3 percent of ESWH sales in 2023 to 100 percent of units in 2030.

The Secretary concludes that at TSL 4 for consumer water heaters, the benefits of energy savings, positive NPV of consumer benefits, emission reductions, and estimated monetary value of the emissions reductions would be outweighed by the manufacturing concerns and by the uncertainty associated with the industry's ability to ramp up production at the levels necessary to meet a standard at TSL 4 within a 5-year period. Given TSL 4 represents a lower efficiency level that would require less model-specific optimization, DOE expects the research and development efforts to be smaller and DOE does expect significant ramp-up of this greater efficiency market segment in response to the incentive programs. However, DOE continues to be concerned about industry's ability to produce more than three million heat pump water heater units a year, while introducing new innovative products to meet consumers' needs and optimizing to produce lower-cost products. As at TSLs 6 and 5, DOE is concerned that the efficiency level required by TSL 4 may preclude the introduction of 120-volt water heaters into the broader market, which DOE considered as a qualitative factor and has considered in its decision-making. Adopting a standard level at TSL 4 would prevent innovation around these technologies (such as reducing their costs). Consequently, the Secretary has concluded that TSL 4 is not economically justified.

DOE then considered TSL 3, which represents the same levels as TSL 4 except includes a lower efficiency level for ESWHs. For those ESWHs less than 55 gallons of effective storage volume (including small ESWHs), TSL 3 includes an ''entry'' level heat pump efficiency level to accommodate some of the new product innovations that have been recently introduced into the market. At TSL 3, currently available 120–V heat pump water heaters would be able to comply with the required efficiencies. For ESWHs greater than 55 gallons of effective storage volume, TSL 3 includes an incremental increase in heat pump efficiency over the current standards. At TSL 3, the standard would still transition all consumer electric storage water heaters to heat pump technology. As previously noted, heat pump technology currently comprises approximately 3 percent of the electric storage water heater market. TSL 3 would shift 100 percent of electric storage water heaters to heat pumps, driving large investments in design of new heat pump offerings and new product capacity. Approximately 17 percent of consumer water heater shipments are expected to meet the TSL 3 efficiency levels by the 2030 compliance date. The percentage of shipments expected to meet or exceed the efficiency levels at TSL 3 is the same as TSL 4 for all product classes except for ESWHs. The percentage of shipments in 2030 expected to meet the analyzed level in TSL 3 for ESWHs is approximately 11 percent. However, for small ESWHs, the percentage of shipments expected to meet TSL 3 remains at approximately 1 percent in 2030.

TSL 3 would save an estimated 21.0 quads of energy, an amount DOE considers significant. Under TSL 3, the NPV of consumer benefit would be $25 billion using a discount rate of 7 percent and $88 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 3 are 379 Mt of CO_2, 3,413 thousand tons of CH_4, 3.5 thousand tons of N_2O, 742 thousand tons of NO_X, 109 thousand tons of SO_2, and 0.8 tons of Hg. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 3 is $20 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at TSL 3 is $13 billion using a 7-percent discount rate and $38 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 3 is $58 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 3 is $146 billion. The estimated total NPV is provided for additional information; however, DOE primarily relies upon the NPV of consumer benefits when determining whether a proposed standard level is economically justified.

At TSL 3, the average LCC impact is a savings across all product classes, except for the small ESWH. Similar to TSLs 4, 5, and 6, 77 percent of small ESWH consumers will experience a net cost when installing a split-system heat pump water heater.

At TSL 3, the projected change in INPV ranges from a decrease of $391.5 million to a decrease of $39.8 million, which corresponds to a decrease of 26.5 percent and a decrease of 2.7 percent, respectively. DOE estimates that industry must invest $332.4 million to comply with standards set at TSL 3. Manufacturers would need to develop new split-system heat pumps for the small ESWH market. They would also need to scale up production capacity for integrated heat pump water heaters.

The Secretary concludes that at TSL 3 for consumer water heaters, the benefits of energy savings, positive NPV of consumer benefits, emission reductions, and estimated monetary value of the emissions reductions would be outweighed by the uncertainty associated with the ability for industry to meet the demand necessary to

support the entire market for ESWHs, including the workforce transition needed to service and install all of these heat pump water heaters. For small ESWHs, DOE estimates that the fraction of consumers experiencing a net cost is 56 percent. Based on those costs to small ESWH consumers and the possible difficulty of meeting the market needs within the compliance timeframe, the Secretary has concluded that TSL 3 is not economically justified.

DOE then considered TSL 2, which represents the baseline efficiency level for small ESWHs and heat pump efficiency levels for all other ESWHs. TSL 2 also includes max-tech efficiency levels for OSWHs and a moderate increase in efficiency for GSWHs. TSL 2 also aligns most closely with the Joint Stakeholder Recommendation efficiency levels, with minor differences to the small ESWH product class as discussed in section IV.C of this document. Approximately 24 percent of consumer water heater shipments are expected to meet the TSL 2 efficiency levels by the 2030 compliance date. The percentage of shipments expected to meet or exceed the efficiency levels at TSL 2 is the same as TSL 3 for all product classes except for small ESWHs. The percentage of shipments in 2030 expected to meet the TSL 2 efficiency levels for ESWHs is approximately 24 percent. However, since TSL 2 for small ESWHs represents the baseline efficiency level, all small ESWHs are expected to meet TSL 2 levels, compared to only 1 percent of small ESWH shipments at TSL 3. While DOE recognizes that TSL 2 is not the TSL that maximizes net monetized benefits, DOE has determined that TSL 2 is designed to achieve the maximum improvement in energy efficiency that is technologically feasible and economically justified.

TSL 2 would save an estimated 17.6 quads of energy, an amount DOE considers significant. Under TSL 2, the NPV of consumer benefit would be $25 billion using a discount rate of 7 percent and $82 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 2 are 332 Mt of CO_2, 3,058 thousand tons of CH_4, 2.9 thousand tons of N_2O, 665 thousand tons of NO_X, 90 thousand tons of SO_2, and 0.6 ton of Hg. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 3 is $17 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at TSL 2 is $12 billion using a 7-percent discount rate and $33 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 2 is $54 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 2 is $132 billion. The estimated total NPV is provided for additional information; however, DOE primarily relies upon the NPV of consumer benefits when determining whether a proposed standard level is economically justified.

At TSL 2, the average LCC impact is a savings for all product classes. The average LCC impact is a savings of $29 for GSWHs, savings of $141 for OSWHs, savings of $859 for ESWHs (20 gal $\leq V_{eff} \leq$ 55 gal) excluding small ESWHs, and savings of $458 for ESWHs (55 gal $< V_{eff} \leq$ 120 gal). The fraction of consumers experiencing a net LCC cost is 41 percent for GSWHs, 27 percent for OSWHs, 35 percent for ESWHs (20 gal $\leq V_{eff} \leq$ 55 gal) excluding small ESWHs, and 0 percent for ESWHs (55 gal $< V_{eff} \leq$ 120 gal). Consumers of small ESWH (20 gal $\leq V_{eff} \leq$ 35 gal) are not impacted at TSL 2, as the standard is not proposed to be amended.

At TSL 2, the projected change in INPV ranges from a decrease of $275.3 million to an increase of $28.2 million, which corresponds to a decrease of 18.6 percent and an increase of 1.9 percent, respectively. DOE estimates that industry must invest $239.8 million to comply with standards set at TSL 2.

At higher TSLs, the primary driver of high conversion costs is the industry's investment to meet market demand for heat pump electric storage water heaters. TSL 2 preserves the existing market for small ESWHs, allowing small ESWHs utilizing only electric resistance technology (*i.e.,* that do not utilize a heat pump) to remain in the market. In turn, this reduces the level of investment needed to meet market demand for heat pump water heaters. DOE estimates industry would need to scale up production of heat pump electric storage water heaters from approximately 3 percent of ESWHs today to 61 percent of ESWHs in 2030, a significant reduction from higher TSLs. This approach, while still requiring a significant ramp up in manufacturing capacity for heat pump water heaters, allows for a more incremental transition to heat pump technology. It limits the investment required of manufacturers relative to higher TSLs that would require transitioning the entire ESWH market to heat pump technology and recognizes the benefits of providing additional time for small electric storage water heater designs using heat pump technology to mature. DOE believes that having a major manufacturer sign on to the Joint Stakeholder Recommendation is a testament to industry's ability to ramp up capacity to produce the volumes necessary to support the heat pump water heater market that will be required by TSL 2 by the compliance date of the amended standards.[186]

After considering the analysis and weighing the benefits and burdens, the Secretary has concluded that standards set at TSL 2 for consumer water heaters would be economically justified. At this TSL, the average LCC savings for consumers of all product classes are expected to be positive. The average LCC savings across all ESWH, excluding small ESWHs, consumers is $1,867. At TSL 2, the efficiency levels for ESWHs allow for continued development and innovation with 120–V heat pump ESWHs as well as split-system heat pump ESWHs. The efficiency levels at TSL 2 also allow for existing small ESWHs to remain on the market, providing an important option for a subset of consumers. The FFC national energy savings are significant and the NPV of consumer benefits is positive using both a 3-percent and 7-percent discount rate. These national benefits vastly outweigh the costs. The positive LCC savings—a different way of quantifying consumer benefits—reinforces this conclusion. The standard levels at TSL 2 are economically justified even without weighing the estimated monetary value of emissions reductions. When those emissions reductions are included—representing $17 billion in climate benefits (associated with the average SC–GHG at a 3-percent discount rate), and $12 billion (using a 7-percent discount rate) or $33 billion (using a 3-percent discount rate) in health benefits—the rationale becomes stronger still.

In addition, DOE considered that the efficiency levels across TSL 2 are generally representative of the Joint Stakeholder Recommendation. More specifically, DOE believes the Joint Stakeholder agreement from a cross section group of stakeholders provides DOE with a good indication of stakeholder views on this rulemaking

[186] As detailed in II.B.2 of this document, Rheem is a signatory to the Joint Stakeholder Recommendation. BWC was an original signatory to the Joint Stakeholder Recommendation, which included a recommendation of heat pump levels for ESWHs with rated storage volumes greater than 35 gallons, but subsequently removed itself as a signatory after the July 2023 NOPR after raising concerns about how DOE proposed to align with the Joint Stakeholder Recommendation.

and with some assurance that industry can transition to these levels and the market will see significant benefits, as indicated by DOE's analysis.

Accordingly, the Secretary has concluded that TSL 2 would offer the maximum improvement in efficiency that is technologically feasible and economically justified, and would result in the significant conservation of energy. Although results are presented here in terms of TSLs, DOE analyzes and evaluates all possible ELs for each product class in its analysis. TSL 2 comprises efficiency levels that offer significant LCC savings while keeping the percentage of consumers experiencing a net cost at a modest level. In particular, lower-income homeowners who currently use small ESWHs are significantly less likely to be disproportionately impacted at TSL 2 than at higher TSLs. TSL 2 also reduces the percentage of the market that would be transitioning to heat pump water heaters within a 5-year period. While DOE understands the ramp up to accommodate heat pump water heaters at TSL 2 is still significant, DOE believes manufacturers can leverage their existing operations, knowledge, workforce networks, and R&D to scale at a level needed to support an amended standard at TSL 2. Lastly, TSL 2 most closely represents the recommended standard levels submitted by Joint Stakeholders to DOE, providing further support for standard levels set at TSL 2, a factor the Secretary considers significant.

As discussed in section IV.F.9 of this document, DOE does not expect any significant amount of switching across product classes as a result of the adopted standards, with the exception of ESWHs and small ESWHs. There are a number of significant additional costs involved in switching from electric equipment to gas equipment and vice versa, such as replacing an electrical panel or installing new gas lines (both inside and outside of the home) and new venting. These additional costs can possibly exceed $1,000 on top of the installed costs estimated in this final rule, making product switching as a result of standards very likely to be a minimal effect at most.

Therefore, based on the above considerations, DOE adopts the conservation standards for consumer water heaters at TSL 2 for those product classes where there are existing applicable UEF standards. For the remaining product classes, DOE adopts converted standards in the UEF metric based on the amended appendix E test procedure. Altogether, the new and amended energy conservation standards for consumer water heaters, which are expressed as UEF, are shown in Table V.35. Note that this table does not show product classes for which standards remain unchanged by this final rule.

BILLING CODE 6450–01–P

Table V.35 New and Amended Energy Conservation Standards for Consumer Water Heaters

Product Class	Effective Storage Volume and Input Rating* *(if applicable)*	Draw Pattern	Uniform Energy Factor
Gas-fired Storage Water Heater	< 20 gal	Very Small	$0.2062 - (0.0020 \times V_{eff})$
		Low	$0.4893 - (0.0027 \times V_{eff})$
		Medium	$0.5758 - (0.0023 \times V_{eff})$
		High	$0.6586 - (0.0020 \times V_{eff})$
	≥20 gal and ≤55 gal	Very Small	$0.3925 - (0.0020 \times V_{eff})$
		Low	$0.6451 - (0.0019 \times V_{eff})$
		Medium	$0.7046 - (0.0017 \times V_{eff})$
		High	$0.7424 - (0.0013 \times V_{eff})$
	> 100 gal	Very Small	$0.1482 - (0.0007 \times V_{eff})$
		Low	$0.4342 - (0.0017 \times V_{eff})$
		Medium	$0.5596 - (0.0020 \times V_{eff})$
		High	$0.6658 - (0.0019 \times V_{eff})$
Oil-fired Storage Water Heater	≤50 gal	Very Small	$0.2909 - (0.0012 \times V_{eff})$
		Low	$0.5730 - (0.0016 \times V_{eff})$
		Medium	$0.6478 - (0.0016 \times V_{eff})$
		High	$0.7215 - (0.0014 \times V_{eff})$
	> 50 gal	Very Small	$0.1580 - (0.0009 \times V_{eff})$
		Low	$0.4390 - (0.0020 \times V_{eff})$
		Medium	$0.5389 - (0.0021 \times V_{eff})$
		High	$0.6172 - (0.0018 \times V_{eff})$
Very Small Electric Storage Water Heater	< 20 gal	Very Small	$0.5925 - (0.0059 \times V_{eff})$
		Low	$0.8642 - (0.0030 \times V_{eff})$
		Medium	$0.9096 - (0.0020 \times V_{eff})$
		High	$0.9430 - (0.0012 \times V_{eff})$
Small Electric Storage Water Heater	≥20 gal and ≤35 gal	Very Small	$0.8808 - (0.0008 \times V_{eff})$
		Low	$0.9254 - (0.0003 \times V_{eff})$
Electric Storage Water Heaters	≥20 and ≤ 55 gal (excluding small electric storage water heaters)	Very Small	2.30
		Low	2.30
		Medium	2.30
		High	2.30
	>55 gal and ≤120 gal	Very Small	2.50
		Low	2.50
		Medium	2.50
		High	2.50
	>120 gal	Very Small	$0.3574 - (0.0012 \times V_{eff})$
		Low	$0.7897 - (0.0019 \times V_{eff})$
		Medium	$0.8884 - (0.0017 \times V_{eff})$
		High	$0.9575 - (0.0013 \times V_{eff})$
Tabletop Water Heater	<20 gal	Very Small	$0.5925 - (0.0059 \times V_{eff})$
		Low	$0.8642 - (0.0030 \times V_{eff})$
	≥20 gal	Very Small	$0.6323 - (0.0058 \times V_{eff})$
		Low	$0.9188 - (0.0031 \times V_{eff})$
Instantaneous Oil-fired Water Heater	<2 gal and ≤210,000 Btu/h	Very Small	0.61
		Low	0.61
		Medium	0.61
		High	0.61
	≥2 gal and ≤210,000 Btu/h	Very Small	$0.2780 - (0.0022 \times V_{eff})$
		Low	$0.5151 - (0.0023 \times V_{eff})$
		Medium	$0.5687 - (0.0021 \times V_{eff})$
		High	$0.6147 - (0.0017 \times V_{eff})$
Instantaneous Electric Water Heater	≥2 gal	Very Small	$0.8086 - (0.0050 \times V_{eff})$
		Low	$0.9123 - (0.0020 \times V_{eff})$
		Medium	$0.9252 - (0.0015 \times V_{eff})$
		High	$0.9350 - (0.0011 \times V_{eff})$

BILLING CODE 6450–01–C

2. Annualized Benefits and Costs of the Adopted Standards

The benefits and costs of the adopted standards can also be expressed in terms of annualized values. The annualized net benefit is (1) the annualized national economic value (expressed in 2022$) of the benefits from operating products that meet the adopted standards (consisting primarily of operating cost savings from using less energy), minus increases in product purchase costs, and (2) the annualized monetary value of the climate and health benefits.

Table V.36 shows the annualized values for consumer water heaters under TSL 2, expressed in 2022$. The results under the primary estimate are as follows.

Using a 7-percent discount rate for consumer benefits and costs and health benefits from reduced NO_X and SO_2 emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated cost of the standards adopted in this rule is $2,623 million per year in increased equipment costs, while the estimated annual benefits are $5,655 million in reduced equipment operating costs, $1,051 in monetized climate benefits, and 1,416 in monetized health benefits. In this case, the net benefit would amount to $5,499 per year.

Using a 3-percent discount rate for all benefits and costs, the estimated cost of the standards is $2,586 million per year in increased equipment costs, while the estimated annual benefits are $7,566 million in reduced operating costs, $1,051 million in monetized climate benefits, and $2,033 million in monetized health benefits. In this case, the net benefit would amount to $8,065 million per year.

BILLING CODE 6450–01–P

Table V.36 Annualized Benefits and Costs of Adopted Standards (TSL 2) for Consumer Water Heaters

	Million 2022$/year		
	Primary Estimate	Low-Net-Benefits Estimate	High-Net-Benefits Estimate
3% discount rate			
Consumer Operating Cost Savings	7,566	7,078	8,065
Climate Benefits*	1,051	1,039	1,063
Health Benefits**	2,033	2,009	2,058
Total Benefits†	10,650	10,125	11,186
Consumer Incremental Product Costs‡	2,586	3,023	2,398
Net Benefits	8,065	7,102	8,788
Change in Producer Cashflow (INPV)‡‡	(28) - 3	(28) - 3	(28) - 3
7% discount rate			
Consumer Operating Cost Savings	5,655	5,294	6,024
Climate Benefits* (3% discount rate)	1,051	1,039	1,063
Health Benefits**	1,416	1,400	1,432
Total Benefits†	8,122	7,732	8,519
Consumer Incremental Product Costs‡	2,623	2,984	2,467
Net Benefits	5,499	4,748	6,052
Change in Producer Cashflow (INPV)‡‡	(28) – 3	(28) - 3	(28) - 3

Note: This table presents the costs and benefits associated with consumer water heaters shipped during the period 2030−2059. These results include consumer, climate, and health benefits that accrue after 2059 from the products shipped during the period 2030−2059. The Primary, Low Net Benefits, and High Net Benefits Estimates utilize projections of energy prices from the *AEO2023* Reference case, Low Economic Growth case, and High Economic Growth case, respectively. In addition, incremental equipment costs reflect a medium decline rate in the Primary Estimate, a low decline rate in the Low Net Benefits Estimate, and a high decline rate in the High Net Benefits Estimate. The methods used to derive projected price trends are explained in sections IV.F.1 and IV.F.4 of this document. Note that the Benefits and Costs may not sum to the Net Benefits due to rounding.

* Climate benefits are calculated using four different estimates of the global SC-GHG (see section IV.L of this document). For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown; however, DOE emphasizes the value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health

benefits, but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. *See* section IV.L of this document for more details.
† Total benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.
‡ Costs include incremental equipment costs as well as installation costs.
‡‡ Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. *See* sections IV.F and IV.H of this document. DOE's national impacts analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). *See* section IV.J of this document. In the detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. The annualized change in INPV is calculated using the industry weighted average cost of capital value of 9.6 percent that is estimated in the manufacturer impact analysis (*see* chapter 12 of the final rule TSD for a complete description of the industry weighted average cost of capital). For consumer water heaters, the annualized change in INPV ranges from -$28 million to $3 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. *See* section V.C of this document. DOE is presenting the range of impacts to the INPV under two scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated annualized change in INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the annualized net benefit calculation for this final rule, the annualized net benefits would range from $8,037 million to $8,068 million at 3-percent discount rate and would range from $5,471 million to $5,502 million at 7-percent discount rate.

BILLING CODE 6450–01–C

3. Conversion Factor Final Rule Enforcement Policy

As discussed in section II.B.1 of this document, the currently applicable standards were established by the December 2016 Conversion Factor Final Rule, which utilized mathematical conversion equations to translate EF-based standards to the UEF metric for products that were on the market at the time. 81 FR 96204.

In that final rule, DOE issued an enforcement policy to ensure that individual models manufactured prior to July 13, 2015 that complied with the existing EF standards and remained unchanged in design would be tested to the EF metric and not be harmed by the transition to the UEF metric. 81 FR 96204, 96226–96227. This was done to prevent ''overrating'' to the minimum UEF standard; manufacturers are required to disclose the actual performance in the same metric as all other products. *Id.* The Department stated that these models will continue to remain subject to the enforcement policy until compliance with amended energy conservation standards is required. *Id.*

As a result, today's market continues to offer consumer water heaters that do not meet the current UEF-based standards (this is depicted in appendix 3A to the TSD). This final rule adopts amended energy conservation standards for consumer water heaters. Upon the compliance date of this final rule, the 2016 enforcement policy is terminated for all water heaters.

4. Severability

Finally, DOE added a new paragraph to 10 CFR 430.32 to make explicit the agency's intent that each energy conservation standard for each product class is separate and severable from one another, and that if any energy conservation standard for any product class is stayed or determined to be invalid by a court of competent jurisdiction, the remaining energy conservation standards for the other product classes shall continue in effect. Because this is an expression of DOE's intent, public comment on this paragraph is not relevant. This severability clause is intended to clearly express the Department's intent that should an energy conservation standard for any product class be stayed or invalidated, energy conservation standards for the other product classes shall continue in effect. In the event a court were to stay or invalidate one or more energy conservation standards for any product class as finalized, the Department would want the remaining energy conservation standards for the other product classes as finalized to remain in full force and legal effect.

D. Test Procedure Applicability

Manufacturers, including importers, must use product-specific certification templates to certify compliance to DOE. For consumer water heaters, the certification template reflects the general certification requirements specified at 10 CFR 429.12 and the product-specific requirements specified at 10 CFR 429.17. DOE has not proposed to amend the product-specific certification requirements for these products in this standards rulemaking. These requirements will be addressed in a separate rulemaking.

As discussed in section III.C of this document, DOE most recently amended the test procedure for these products at appendix E in the June 2023 TP Final Rule.

In light of the new and amended standards being adopted by this final rule, DOE is creating new provisions to specify how the appendix E test procedure should be applied. DOE is providing further clarifications around certain aspects of the appendix E test procedure to account for the products which would use this test procedure to determine UEF ratings. These amendments to the test procedure and related provisions are discussed in the following sections.

1. High-Temperature Testing

The current DOE test procedure calls for an outlet water temperature of 125 °F ± 5 °F. 88 FR 40406, 40422. This temperature is consistent with data DOE has on water heater thermostat settings in the field. For example, as discussed in chapter 7 of the final rule TSD, a 2015 study of 127 homes with electric resistance water heaters in central Florida showed that audited hot water setpoint temperatures averaged 127 °F (52.8 °C) (Std. Dev: 11.5 °F (6.4 °C)) and field measurement studies in California showed the median setpoint temperature to be 123 °F (50.6 °C). Additionally, as of 2017, survey data show that over 75% of contractors usually or always set the tank thermostat to 120 °F (*see* chapter 7 of the final rule TSD).[187] Further, the energy use analysis in this rulemaking uses water heater thermostat settings that are based on a 2006–2020 contractor survey conducted by Clear Seas.[188] [189] This annual survey of more than 300 plumbing/hydronic heating contractor firms indicated that 41 percent of responding contractors *always* install a water heater with a setpoint temperature of 120 °F, 20 percent always install with a setpoint temperature higher than 120 °F, and 39 percent *usually* install with a setpoint of 120 °F. DOE assumed that half of the latter portion installed the water heater at 120 °F, resulting in an overall distribution of 61 percent of water heaters set to 120 °F, and 39 percent with setpoints uniformly distributed between 120 °F and 140 °F, resulting in an average setpoint of approximately 124 °F. In the July 2014 UEF TP Final Rule, DOE cited data that found the average set point temperature for consumer water heaters in the field is 124.2 °F (51.2 °C). 79 FR 40542, 40554. A compilation of field data across the United States and southern Ontario by Lawrence Berkeley National Laboratory had also found a median daily outlet water temperature of 122.7 °F (50.4 °C). *Id.* Taken together, these data indicate that the outlet water temperature of 125 °F ± 5 °F used in the DOE test procedure is representative of average water heater temperature settings in the field, with 120 °F being the most common setting.

However, after the December 2016 Conversion Factor Final Rule issued amended standards for electric storage water heaters with rated storage volumes above 55 gallons that could only be met through the use of heat pump technology, DOE observed a market shift towards smaller electric storage water heater sizes where the standards could be met through electric resistance heating. These smaller water heaters have a setting or mode that continuously stores water at a higher temperature then uses a mixing valve to deliver water at the temperature setpoint. As a result, a new market began to emerge for consumers who still desired effective storage volumes above 55 gallons but did not want to install heat pump water heaters: electric resistance storage water heaters with rated storage volumes less than 55 gallons but with significantly higher effective storage volumes due to higher storage tank temperatures. 88 FR 40406, 40446. DOE anticipates a similar market shift in response to this final rule as the new standards for electric storage water heaters with capacities greater than or equal to 20 gallons and less than or equal to 55 gallons are met through the use of heat pump technology, while the standards for small electric storage water heaters (capacities greater than or equal to 20 gallons and less than or equal to 35 gallons) can be met by electric resistance heating technology.

As stated in the July 2022 TP SNOPR and the June 2023 TP Final Rule, consumers would be expected to use the high-temperature mode on these small electric storage water heaters as part of the regular operation of their water heater because consumers are electing to purchase an undersized water heater based on its capacity-boosting ability. Accordingly, for such products, a representative average use cycle must encompass the ''capacity boosting'' capability, as this is the mode that the consumer will likely be using once the water heater is installed in the field. 88 FR 49058, 49164. However, before the June 2023 TP Final Rule, the DOE test procedure did not have a provision for measuring energy use of water heaters that continuously store water at a higher temperature to boost capacity. The June 2023 TP Final Rule established a high-temperature test method that would allow consumers to compare the energy efficiency of water heaters that increase capacity through elevated storage temperatures with water heaters that use larger tank volumes to achieve the same capacity. However, DOE deferred the implementation of high-temperature testing provisions to this energy conservation standards rulemaking. 88 FR 40406, 40448. This has allowed DOE to consider details of the implementation to best suit the needs of the market in a standards-case-scenario.

Whereas the June 2023 TP Final Rule established how to conduct a high-temperature test, this standards rulemaking establishes which products must use the high-temperature test method. In this final rule, DOE is adopting the proposed provisions for the application of the high-temperature test method, clarifying how the maximum tank temperature can be verified, adopting additional exemptions for very small and large electric storage water heaters, and permitting optional representations for heat pump water heaters using the high-temperature test method.

DOE received the following general comments in response to the July 2023 NOPR and December 2023 SNOPR regarding general support, applicability, and potential concerns around high-temperature testing and the use of effective storage volume. DOE also addresses information received regarding impacts associated with high-temperature testing.

The Joint Advocacy Groups supported DOE's proposed implementation of the effective storage volume and high temperature testing provisions, stating their agreement with DOE's determination that high-temperature testing is representative of the average use cycle for electric storage water heaters that offer consumers the ability to increase storage tank temperature. The Joint Advocacy Groups added that this proposal would also help ensure the expected savings from the proposed standards are realized. (Joint Advocacy Groups, No. 1165 at p. 7) NEEA supported DOE's proposed use of effective storage volume and high-temperature testing, asserting that it would effectively inhibit the use of small, overheated tanks installed with mixing valves as a means of circumventing heat pump-level standards, and would ensure the energy savings projected in the NOPR are

[189] Clear Seas Research. 2020 Water Heater Study, available online at: *clearseasresearch.com.* (Last accessed: May 1, 2023).

realized. (NEEA, No. 1199 at pp. 7–8) CEC supported DOE's proposed high-temperature testing provisions, stating that they would close a significant loophole that would allow smaller, less-efficient storage water heaters to operate with higher effective storage volumes. (CEC, No. 1173 at p. 12) The Joint Stakeholders stated their support of the effective storage volume provisions, conditional on their narrow application to certain electric resistance storage water heaters, to aid in ensuring the expected savings from the proposed standards are realized.

The CA IOUs agreed that rated storage volume is no longer an appropriate measure for hot water service and supported the transition to using the effective storage volume metric, stating that such an approach is consistent with comments that they and others have provided previously in this rulemaking. The CA IOUs noted that only certain electric resistance storage water heaters would be subject to the high-temperature test method, and the effective storage volume would be equivalent to the rated storage volume for all other consumer water heaters. The CA IOUs recommended that DOE plainly state that high-temperature testing is applicable only for those electric storage water heaters with a maximum set point temperature above 135 °F, and that the effective storage volume for all other consumer water heaters is equal to the rated volume. (CA IOUs, No. 1175 at p. 2) The Joint Stakeholders also requested that DOE clarify the application of high-temperature testing and effective storage volume requirements with regards to product classes other than electric storage water heaters. (Joint Stakeholders, No. 1156 at pp. 1–2)

Rheem requested clarification on whether high-temperature testing is intended for electric instantaneous water heaters with rated storage volumes greater than or equal to 2 gallons. Rheem recommended that the high-temperature test method not apply to these products, as they are not direct replacements for heat pump water heaters. (Rheem, No. 1177 at p. 3)

To clarify, the high-temperature test method is applicable only to electric storage water heaters. It is not applicable to electric instantaneous water heaters. Consumer electric instantaneous water heaters, like consumer electric storage water heaters, are statutorily limited to an input rate of 12 kW (which corresponds to the typical household circuit limitations in residential buildings). (42 U.S.C. 6291(27)(A)–(B)) Instantaneous-type water heaters have at least 4,000 Btu/h of input per gallon of water stored. (42 U.S.C. 6291(27)(B)) Considering these two limitations, the maximum volume that a consumer electric instantaneous water heater could have is approximately 10 gallons. For the reasons detailed in section V.D.1.c of this document, products of this size are unlikely to use elevated temperatures to directly replace the consumer utility of a water heater with a larger stored volume of water. And, in response to the CA IOUs' request, DOE clarifies the verification of the maximum tank temperature in section V.D.1.b of this document, which does more than simply state the applicability of the high-temperature test method is based on a maximum setpoint.

NYSERDA supported the use of the effective storage volume and the high-temperature test method, but noted that, although the high-temperature test applies only to certain electric storage water heaters, the appendix E test procedure would also result in an effective storage volume greater than rated storage volume for all other water heaters when $T_{max,1}$ is greater than 130 °F and also more than 5 °F higher than the delivery temperature, $T_{del,2}$.[190] NYSERDA therefore asked for clarification on how the effective storage volume metric is applied to different water heaters. (NYSERDA, No. 1192 at pp. 5–6, 7)

DOE is maintaining the provisions in appendix E, which result in a higher effective storage volume to products that have an internal tank temperature five degrees above the delivery set point temperature in order to assess products on an equivalent effective storage volume basis. As discussed in the June 2023 TP Final Rule, this would typically only apply if the product has a built-in mixing valve and normally operates in a manner that elevates the storage tank temperature in its default mode. Therefore, the increased effective storage volume is representative of the actual performance of such a model in its default mode. In the June 2023 TP Final Rule, DOE presented test data which demonstrated that only models with this specific design had effective storage volumes greater than rated storage volumes, and that all other traditional models of storage water heaters were unaffected.

GEA expressed support for DOE's proposals regarding high-temperature testing and the scope of products to which it would apply. GEA stated that DOE's proposed rule appropriately recognizes the importance of integrated mixing valves and accounts for them. However, GEA concurred with AHRI's comments regarding needed clarifications to the test procedure and standard and to the appropriate temperature limits for high-temperature testing (which are discussed in more detail later in this section). (GEA, No. 1203 at pp. 1–2)

Rheem agreed that the transition from electric resistance to heat pump storage water heaters presents an incentive to increase the temperature of an electric resistance storage water heater to increase the amount of hot water it can deliver. Rheem also stated that high-temperature testing should only be valid for products that operate with a stored volume of water (*i.e.,* storage-type or circulating). (Rheem, No. 1177 at p. 2) Relatedly, Rheem supported the application of the high-temperature test method to tabletop water heaters because these products can be used to replace heat pump water heaters. (Rheem, No. 1177 at p. 3)

Other commenters provided feedback for DOE to consider additional potential impacts of the high-temperature test method on the market. BWC stated that elements of the test procedure, such as the method for circulating water heaters and the application of high-temperature testing, appeared to be incomplete in the June 2023 TP Final Rule, and that DOE has continued to revise these aspects of the test procedure in the July 2023 NOPR. (BWC, No. 1164 at p. 7) AHRI raised concerns with the high-temperature test provisions for electric storage water heaters, stating that these provisions and their implications should have been fully addressed in the recent test procedure rulemaking because manufacturers require additional time to understand the proposal and how it would be implemented. AHRI stated that DOE has not provided clear direction in the July 2023 NOPR as to how the high-temperature test will be applied and enforced. (AHRI, No. 1167 at p. 2) AHRI and its members asserted that DOE has not provided sufficient test data for stakeholders to understand the impacts of the high-temperature test method on electric resistance storage water heaters. (AHRI, No. 1167 at p. 2)

A.O. Smith commented that the purpose of the high-temperature test method was to prevent circumvention of heat pump-level standards for larger electric storage water heaters by means of using a smaller electric resistance storage water heater operating at a higher temperature. A.O. Smith also

[190] $T_{max,1}$ is the maximum measured mean tank temperature after cut-out following the first draw of the 24-hour simulated-use test. $T_{del,2}$ is the average outlet water temperature during the 2nd draw of the 24-hour simulated-use test. See section 1.15 of appendix E.

noted that there may be additional avenues by which industry could avoid transitioning the market to heat pump water heaters. A.O. Smith recommended addressing these concerns in a supplemental NOPR prior to finalizing this rulemaking. A.O. Smith commented that understanding the relationship between maximum temperature offering, effective storage volume, FHR, and UEF is a prerequisite for evaluating the proposed efficiency levels for the electric storage water heater product classes. (A.O. Smith, No. 1182 at pp. 3–4)

A.O. Smith also asserted that DOE has not provided justification nor testing data to demonstrate that the direct substitution of effective storage volume instead of rated storage volume will make up for the known negative impact that testing at higher temperatures will have on UEF. Citing EPCA, A.O. Smith noted that DOE must account for the change in efficiency resulting from an amended test procedure and recommended that DOE test baseline very small and small electric storage water heaters according to the new test procedure to ensure that the proposed standards do not result in a stringency increase. To this end, A.O. Smith also provided its own test data, which demonstrate the reduction in UEF as a result of the high-temperature test method. A.O. Smith recommended that DOE adjust the standards to allow for these reduced ratings to remain compliant and minimize manufacturer redesign burden. (A.O. Smith, No. 1182 at pp. 3–4)

Rheem and A.O. Smith provided data that demonstrate the impact of high-temperature testing on these rated values for very small and small electric storage water heaters, while NEEA provided insights from its own testing regarding the relationship between temperature and FHR. (Rheem, No. 1177 at p. 21; A.O. Smith, No. 1182 at pp. 6–7) NEEA stated that the FHR increases by 2.5 gallons for every 5 °F increase in tank temperature from 125 °F. (NEEA, No. 1199 at pp. 7–8) Rheem stated that the boost in FHR from the high temperature will occur only for the first draw of the FHR test, and then afterwards the recovery rate will be the same, and the commenter provided an equation to estimate the increased FHR. (Rheem, No. 1177 at p. 21)

DOE reviewed the information from Rheem, A.O. Smith, and NEEA in addition to its own test data to evaluate the impact of the high-temperature test. For example, in the process of developing the June 2023 TP Final Rule, DOE collected data on one 50-gallon electric storage water heater set to three different tank temperature set points (one of them being the maximum setting that would be used for the high-temperature test method). 88 FR 40406, 40447.

The results of DOE's assessments on very small electric storage water heaters follow in section V.D.1.c of this document. DOE's calculations and data from stakeholders have led DOE to conclude that the high-temperature test method should not be required for very small electric storage water heaters.

In its own modeling analysis, Rheem identified that electric storage water heaters with rated storage volumes between 20 and 35 gallons would be noncompliant with the proposed standards if tested to the high-temperature test method, and therefore, all such products would have to be redesigned to use an exemption. (Rheem, No. 1177 at p. 2)

DOE has identified 35 certified basic models of small electric storage water heaters in its market assessment (*see* appendix 3A to the final rule TSD) and determined that all of these models heat water using electric resistance elements and, as currently designed, do not meet any of the criteria for an exemption to the requirement to determine UEF according to the high temperature test method. For example, most of these products are likely capable of heating and storing water at or above the temperature threshold criterion that would, if they were capable of only heating and storing water at that temperature or less, exempt them from high temperature testing (the temperature criterion is discussed in more detail in the following section of this document). (Heat pump small electric storage water heaters, discussed later in this paragraph, were not certified to DOE.) Based on the calculations provided by Rheem and NEEA, DOE has determined that the vast majority of these small electric storage water heaters are capable of achieving an FHR of more than 51 gallons when set to the highest temperature set point (as would be required under high-temperature testing), and thus these products would qualify for the medium draw pattern when tested to the high-temperature test method. As such, these products would be subject to the standards for electric storage water heaters under 55 gallons generally and not the standards for small electric storage water heaters, which are applicable only for products in the very small and low draw patterns. Further, the models that would remain in the low draw pattern (having an FHR less than 51 gallons) would have an effective storage volume greater than 35 gallons, such that they would not be considered small electric storage water heaters, either. Therefore, these specific small electric storage water heaters would be subject to standards being adopted for electric storage water heaters with 20–55 gallons of storage volume generally (*i.e.*, the standards for small electric storage water heaters would not apply), which are met through use of heat pump technology, unless they are redesigned to be eligible for one of the exemptions from high-temperature testing. If a product were redesigned to become eligible for an exemption, then the high-temperature test method would not be required, and thus these electric resistance products would remain as small electric storage water heaters and be subject to the standards being adopted for small electric storage water heaters, which can be met using electric resistance heating.

Additionally, in response to A.O. Smith's concern regarding the potential need to adjust small electric storage water heater standards to account for the impact of the high-temperature test, DOE notes that redesigns to the thermostat capabilities of electric storage water heaters are expected to be relatively low-cost for manufacturers, and products redesigned in such a manner would still be able to serve the majority of the market based on consumer field usage data (as described above). In a final rule amending test procedures for commercial water-heating equipment, DOE evaluated the implications of removing a temperature criterion of 180 °F that previously was part of the definition of a commercial water heater. 81 FR 79261, 79285 (Nov. 10, 2016). In that final rule, it was discussed that redesigning water heaters to account for the 180 °F temperature threshold can be achieved through replacement of a single part, the thermostat, which can be very easily and inexpensively changed to allow for heating water to greater than 180 °F. *Id.* In 2016 A.O. Smith commented that a thermostat designed to deliver water temperatures in excess of 180 °F can be installed at no additional cost on products that are consumer water heaters in all other respects. *Id.* (*See also* A.O. Smith, Docket No. EERE–2014–BT–TP–0008, No. 27 at pp. 6–7). In light of these previous stakeholder comments there is no reason to believe that, for small electric storage water heaters, redesigning models to limit the temperature to 135 °F would increase the price of the product. Hence, DOE expects thermostat redesigns to become a common strategy for manufacturers to offer small electric storage water heaters

after the compliance date of this final rule.

However, this does not mean that all small electric storage water heaters available today would require redesign to be compliant with the amended standards set forth in this final rule. As discussed in section V.D.1.d of this document, the high-temperature test method is not required for heat pump water heaters; therefore, the high-temperature test method would not affect heat pump configurations on the market today. For example, consumers can continue to use circulating heat pump water heaters in small electric storage water heater configurations (*i.e.,* with small separate tanks) for cases where a small electric storage water heater is desired but without the specific design exemptions that electric resistance products would require. DOE has identified four recent models on the market—two of which have been marked for sale in the United States—which offer this capability.[191]

Consequently, DOE concludes that no compliant products on the market today will be required to use the high-temperature test method in order to demonstrate compliance with the standards being adopted in this final rule. Therefore, DOE is not establishing any specific enforcement provisions beyond the requirements of the appendix E test procedure with regards to the high temperature test method.

DOE recognizes that there may be additional ways for industry to develop alternatives to heat pump water heaters for consumers; however, DOE aims to have all products that offer the same performance, capacity, and consumer utility be treated equally under standards. The development and implementation of the high-temperature test method is one way to assure this for products that vary temperature to accomplish these ends. In addition to this, DOE is amending the definitions of the product classes to more accurately capture the branches of the market under which performance, capacity, and consumer utility can be grouped. This is discussed in section IV.A.1.e of this document.

PHCC commented that the storage temperature cannot be raised beyond the ability of a mixing valve to safely regulate the outlet water temperature, and that mixing valves are not inexpensive. PHCC asserted that the device itself can be 25 percent to 30 percent of the cost of the water heater itself, and along with additional labor, material, maintenance, and operational costs, which the commenter suggested would result in mixing valves not being a commonly used solution today. PHCC also warned that installation of water heaters at elevated temperatures without a mixing valve causes a serious safety risk in addition to increased standby losses. In its comment, PHCC stated that the creation of the limited capacity will almost ensure that the high-temperature outcomes will happen, and if so, DOE should consider mandating mixing valves to ensure safety for consumers. (PHCC, No. 1151 at p. 2)

The price of a mixing valve and its installation would vary depending on whether the mixing valve is shipped with the water heater, built into the water heater, or part of a standard installation kit. DOE understands the estimate of a mixing valve being 25 to 30 percent of the water heater's material price may reflect a separately purchased mixing valve. However, as discussed throughout this rulemaking and the most recent test procedure rulemaking, water heaters with built-in mixing valves or with mixing valves in the water heater's installation kit could become more common. Based on DOE's teardown analyses (as described in section IV.C.1.c of this document and chapter 5 of the final rule TSD), mixing valves that are provided by the water heater manufacturer could be significantly less expensive than ones purchased separately due to the volume in which water heater manufacturers can supply these. In the LCC analysis, DOE uses an estimate of approximately $75 per unit material price (before markup) based on the aforementioned teardown analyses assuming that the mixing valve can likely be provided by the water heater manufacturer in a scenario with amended standards.

While DOE agrees with PHCC that mixing valves are a safety feature and should be used to temper extra-hot water to a degree that does not pose such a high scalding risk, the Department notes that EPCA does not delegate DOE the authority to issue regulations mandating such a consumer safety feature. Instead, DOE is statutorily obligated to ensure that its energy conservation standards can be met by products that are safe for consumers (see the screening analysis criteria in section IV.B). In its analysis of amended standards for consumer water heaters in this final rule, DOE has determined that the standards for small electric storage water heaters can be met by products that either limit the high temperature capability or are compatible with mixing valves in order to protect consumers from scalding.

Therefore, as stated earlier, in this final rule, DOE is adopting the proposed provisions for the high-temperature test method, clarifying how the maximum tank temperature can be verified, adopting additional exemptions for very small and large electric storage water heaters, and permitting optional representations for heat pump water heaters using the high-temperature test method.

a. Maximum Tank Temperature

In the July 2023 NOPR, DOE proposed that certain water heaters that have a maximum setpoint temperature capable of heating and storing water above 135 °F would be required to conduct the high temperature test, while water heaters that can only heat and store water at or below 135 °F would not be required to undergo such testing. 88 FR 49058, 49165. In arriving at the 135 °F setpoint, DOE considered: (1) the effective storage volume of a small electric storage water heater with a rated storage volume of 35 gallons for various mean tank temperatures; and (2) potential consumer uses for higher storage tank temperatures. *Id.* The effective storage volume at various temperatures provides insight into the likelihood a small electric storage water heater would operate in a capacity-boosting mode, and in the July 2023 NOPR the Department provided a table that showed the effective storage volume for various tank temperature settings. Table V.37 from the July 2023 NOPR is reproduced here also. *Id.*

[191] Product literature for models of heat pump small electric storage water heaters can be found docketed at *www.regulations.gov/docket/EERE-2017-BT-STD-0019.* In the December 2023 SNOPR the Department had erroneously stated that there are no longer heat pump circulating water heaters available on the market (*see* 88 FR 89330, 89333) due to changes in a manufacturer's website.

Table V.37 Effective Storage Volume of a Water Heater with a 35-gallon Rated Storage Volume at Various Mean Tank Temperatures

Mean Tank Temperature (°F)	V_{eff} of Water Heater with 35-gallon V_r (gallons)
125	35
130	38
135	41
140	44
145	47
150	50
155	53
160	56
165	59
170	62

For instance, it is unlikely a consumer would purchase a 35-gallon small electric storage water heater and set the tank temperature to 130 °F to increase the effective storage volume to 38 gallons, which is less than a 9 percent increase in effective storage volume. On the other hand, at a maximum setpoint of 140 °F, a 35-gallon small electric storage water heater could replace up to a 44-gallon heat pump water heater, which represents more than a 25 percent increase in effective capacity. *Id.* The market share of medium electric storage water heaters around 40 gallons is approximately 40 percent. As a result, DOE proposed a maximum temperature setpoint of 135 °F.

However, DOE also recognizes that increased capacity is not the only reason a consumer may want a higher tank storage temperature. Higher temperature setpoints can allow consumers to pair water heaters with clothes washers or dishwashers that lack heating elements and can be used to reduce bacterial growth. While the data shows that only a small percentage of consumers are utilizing tank temperature setpoints greater than 135 °F, DOE notes that the 135 °F maximum temperature setpoint is not a temperature limit. There are heat pump models of small electric water heaters available on the market that are exempt from the high temperature testing provisions and have temperature setpoints of 140 °F or higher.[192] Additionally, DOE proposed that units capable of storing water at a setpoint above 135 °F only through a temporary, consumer-initiated mode lasting no longer than 120 hours would not be subject to high temperature testing. This would allow consumers to initiate the temporary, high-heat mode prior to using a clothes washer or dishwasher that lacks a heating element for special cleaning loads, *e.g.,* when dust mites or norovirus may be of particular concern. This temporary mode would also allow consumers to periodically raise the temperature of the tank past 135 °F to quickly eliminate any bacteria growth in the tank. For instance, if a consumer shuts their water heater off or puts it into a low-temperature vacation mode to conserve energy while not in use, they can use the temporary, high-heat mode to quickly eliminate any bacteria in the tank. Finally, DOE also notes that a setpoint of 135 °F is well within the range of many recommendations for controlling bacteria growth in storage water heaters.[193]

In response to the July 2023 NOPR, the Joint Advocacy Groups supported the proposed 135 °F threshold for high temperature testing provisions, adding that a threshold of 140 °F could significantly undermine the intent of the proposed standards by allowing 35-gallon water heaters to reach an effective storage volume of 44 gallons without being tested in a representative manner. The Joint Advocacy Groups also agreed with DOE's tentative determination that the proposed 135 °F threshold would not compromise the utility of the water heater for consumers who desire hotter water for certain situations. (Joint Advocacy Groups, No. 1165 at pp. 7–8) NEEA also urged DOE not to set the limit to require high-temperature testing any higher than 135 °F. (NEEA, No. 1199 at pp. 7–8)

BWC, on the other hand, urged DOE to consider increasing the temperature criterion for the high-temperature test exemption from 135 °F to 140 °F because residential electric storage water heaters that heat water to 140 °F serve a distinct health and safety function, as the Centers for Disease Control (''CDC'') recommends maintaining this temperature to mitigate the formation or presence of legionella bacteria. (BWC, No. 1164 at p. 9) AHRI also suggested that the temperature criterion for the high-temperature test exemptions be increased to 140 °F because setting the internal tank temperature to 140 °F may produce significant health and safety benefits to consumers (*i.e.,* killing legionella, norovirus, and dust mites). AHRI provided information that showed that washing clothes and bedding at 140 °F is one of the suggested guidelines that healthcare agencies provide to kill dust mites and norovirus. Additionally, AHRI cited information from the CDC, which recommends storing hot water above 140 °F to control for legionella. (AHRI, No. 1167 at p. 3–4)

A.O. Smith similarly commented that a temperature of 140 °F is recommended to wash bedding and linens to kill dust mites and norovirus. The commenter also referenced DOE's website, which recommends that people with suppressed immune systems may want

[192] Product literature for models of heat pump small electric storage water heaters can be found docketed at *www.regulations.gov/docket/EERE-2017-BT-STD–0019.* See, for example, models marketed to reach up to 145 °F: *www.nyle.com/wp-content/uploads/2023/01/SB-E008T-010323.pdf* and *www.heatwater.com/wp-content/uploads/2021/09/SB-C6-112923.pdf* (Last accessed Jan. 18, 2024).

[193] According to the CDC, legionella generally grow well between 77 °F and 113 °F, but growth slows between 113 °F and 120 °F, and legionella begin to die above 120 °F. See the CDC's Legionella Environmental Assessment Form. Centers for Disease Control and Prevention. Available online at *www.cdc.gov/legionella/downloads/legionella-environmental-assessment-p.pdf.* (Last accessed: Jan. 18, 2024).

to keep their tank temperature at 140 °F and install limited devices on taps and baths. A.O. Smith stated that several codes, including the National Plumbing Code of Canada,[194] require electric resistance storage water heaters to be shipped at a 140 °F set point; therefore, allowing a 140 °F set point would reduce manufacturer burden from having to produce separate model lines for the United States and Canada. (A.O. Smith, No. 1182 at p. 6) A.O. Smith collected data on water heater temperatures from a survey of 500 homeowners. The data, A.O. Smith stated, showed that 63 percent of respondents adjusted the water heater set point from the factory-shipped temperature.[195] Of those who adjusted the set point, 45 percent increased the set point, 38 percent decreased the set point, and 17 percent had done both. A.O. Smith also gathered data from 40-gallon ''connected'' water heaters [196] which showed that a total of 10 percent of customers have set the temperature higher than 135 °F, whereas 5 percent of customers have the temperature higher than 140 °F. A.O. Smith argued that it believes a threshold of 140 °F for exemption from high-temperature testing better maintains consumer utility. (A.O. Smith, No. 1182 at p. 6)

Rheem noted that the EF test procedure, which had been in use for over 25 years, had a representative nominal tank temperature between 130 and 140 °F, so a temperature of 140 °F is representative for a subset of water heaters in the field today. Rheem stated that, in addition to requirements in Canada, the CDC also recommends temperature control limits that store hot water above 140 °F. (Rheem, No. 1177 at p. 4)

Finally, the CA IOUs strongly recommended that the temperature criterion for the high-temperature test method exemptions be reduced to no more than 130 °F. The CA IOUs expressed concern that a temperature as high as 135 °F would still enable small electric storage water heaters to directly compete with a larger heat pump water heaters and erode the anticipated savings from heat pump-level standards. The CA IOUs calculated that if a lowboy water heater with 35 gallons of rated storage volume and a 51-gallon FHR were to operate at 135 °F with a thermostatic mixing valve, it would have an effective storage volume of 42 gallons and a new FHR of 56 gallons—which would appear to be in the range of the 20–55 gallon electric storage water heater class. Therefore, the CA IOUs stated that the high-temperature test should be required for electric storage water heaters that have a permanent mode or setting in which the water heater is capable of heating and storing water above the test procedure design temperature of 125 °F. (CA IOUs, No. 1175 at pp. 3–4)

First, in response to A.O. Smith's concern about manufacturer burden, DOE notes that harmonizing the factory-shipped setpoint temperature between the United States and Canada may not eliminate manufacturer burden. Specifically, the current minimum efficiency requirements for electric resistance storage water heaters are different in Canada, and several manufacturers currently offer distinct models in Canada to meet these requirements. *See* chapter 3 of the final rule TSD for more details on Canada's minimum efficiency requirements.

With respect to the comments on both raising and lowering the maximum setpoint temperature proposed in the July 2023 NOPR, DOE first notes that the maximum setpoint temperature is based on the expected use for these products. Data show that consumers do not generally use very high temperature setpoints even in light of CDC guidance, so the ''upper limit'' of temperatures found in normal installations appears to be lower than the 140 °F suggested by some stakeholders.

In the July 2023 NOPR, DOE tentatively determined that small electric storage water heaters that can heat and store water above 135 °F will be substantially more likely to be used permanently at higher temperatures to increase capacity (as discussed in section V.D.1 of this document). Commenters advocating for a higher maximum setpoint temperature of 140 °F do not dispute DOE's determination that small electric storage water heaters that can heat and store water above 135 °F will be substantially more likely to be used permanently at higher temperatures to increase capacity. Instead, they focus on the health and safety benefits of setting the tank temperature to 140 °F. DOE recognizes that higher temperatures, *e.g.,* 140 °F, can more quickly control bacterial growth in storage water heaters. But, as discussed previously, DOE is not limiting the maximum temperature setpoint for small electric water heaters. Based on DOE's and A.O. Smith's data, approximately 10% of consumers use a setpoint temperature greater than 135 °F. For these consumers who prefer setpoint temperatures greater than 135 °F, there are small electric heat pump water heaters on the market today that have setpoint temperatures above 140 °F, and these models would not be affected by the high-temperature testing provision. Further, as noted earlier, the temporary mode exemption will allow owners of electric resistance storage water heaters to periodically increase the temperature above 135 °F, and for up to 120 hours (or five days) at a time, if desired for short-term disinfection applications.

With respect to the comment from the CA IOUs that DOE lower the temperature to 130 °F, DOE thinks it is unlikely that a consumer would purchase a 35 gallon small electric water heater and operate it at 130 °F to increase the capacity by 3 gallons. While Rheem suggested that DOE refer to the outdated EF test procedure to determine what temperatures are considered typical, the current UEF test procedure can provide more recent insight. The current test method is based on a normal delivery temperature of 125 °F ± 5 °F (as discussed previously), and within this normal range, consumer storage-type water heaters may sometimes contain water at 130 °F due to natural deviations from the setpoint temperature.

For example, commercially available electric storage water heaters that are marketed today to boost the capacity using higher storage tank temperatures all do so with temperatures above 135 °F. One product tested by DOE has a ''High'' setting that results in a tank temperature of about 140 °F, and the setting below that resulted in a tank temperature of 125 °F. There was no setting observed to boost capacity at a tank temperature of 135 °F. Another manufacturer offers a 55-gallon product with a variety of settings allowing the user to get ''performance equivalency'' of a 65-, 80-, or 100-gallon tank, stating that the tank raises the temperature safely up to 170 °F. 88 FR 40406, 40446.

[194] National Plumbing Code of Canada 2020, page 200. Available online at: *nrc-publications.canada.ca/eng/view/ft/?id=6e7cabf5-d83e-4efd-9a1c-6515fc7cdc71r.* (Last accessed: Oct. 31, 2023).

[195] DOE notes that clause 23.3 of UL Standard 174, ''Household Electric Storage Tank Water Heaters,'' was recently updated to require that the temperature-regulating control shall be set before leaving the factory to a control position corresponding to a water temperature no higher than 51.7 °C (125 °F). When the water heater is equipped with a thermostatic mixing valve in addition to the temperature regulating control, the factory setting of the water temperature mixing valve shall be no higher than 51.7 °C (125 °F), and the temperature-regulating control shall be factory set no higher than 60 °C (140 °F). These updates went into effect on October 14, 2023. This standard can be accessed online at:*www.shopulstandards.com/ProductDetail.aspx?productId=UL174_11_S_20040429.* (Last accessed: Nov. 30, 2023).

[196] A.O. Smith did not specify whether these units were connected to a utility demand-response program or were otherwise equipped with WiFi-enabled controls and monitoring.

At the lowest level of capacity boosting, this model is offering 18 percent additional effective storage volume (going from 55 gallons to 65 gallons), which would indicate a temperature around 140 °F as well. These designs demonstrate that storing water at 140 °F is a useful temperature for boosting capacity, whereas 135 °F may not be.

Crystal also recommended that DOE review the allowed usage of germicidal UV–C water treatment in recirculating hot- and warm-water lines to complement or substitute thermal disinfection cycles. According to Crystal, this is allowed under regulation in several countries around the world, and therefore products and research are available on the market as well as ongoing novel technology adoptions improving the sustainability and energy efficiency and maintenance of this field further. (Crystal, No. 577 at p. 1)

DOE has not found examples of consumer water heaters using UV treatment to disinfect hot water lines. However, to address issues like this, one manufacturer produces a point-of-use water heater that uses ozone generation to disinfect the water in the pipes and at the faucet while still delivering hot water at a temperature that is comfortable for hand-washing (the unit is advertised to have a maximum set point temperature of 120 °F).[197] Additionally, circulating water heaters (discussed more in section IV.A.1.a of this document) are a type of storage water heater that can maintain the water in the pipes at a high temperature so that all of the water in the system stays at a safe temperature and does not stagnate. The high temperature test will not impede the function of either of these types of products, as discussed later. Another manufacturer uses an antimicrobial enamel coating inside the water heater tank to prevent the growth of bacteria, mold, and mildew on the surface of the tank lining (though it is not advertised to specifically prevent legionella growth).[198]

b. Verification of Maximum Tank Temperature

As discussed in the previous section, in the July 2023 NOPR, DOE proposed that products that are unable to heat and store water at a set point above 135 °F would not be required to test using the high-temperature test method. 88 FR 49058, 49165. DOE received the following comments in response to the July 2023 NOPR requesting clarification on the maximum tank temperature, how it is measured, and specific tolerances around required values as well as criteria for products exempt of the high-temperature test method.

BWC asked for DOE to further clarify what design factors would constitute a product that is not capable of heating and storing water above 135 °F. Specifically, BWC sought additional information on whether the exemption criteria would be based on a direct user interface function which operates the product or, instead, a thermostat capable of being set above 135 °F. The commenter provided examples of configurations with surface-mount thermostats and electronic controls, with and without mixing valves, to inquire whether these configurations would be exempt from the high temperature test. (BWC, No. 1164 at pp. 7–8)

AHRI asked DOE to elaborate on how it would enforce the high-temperature test method. The commenter stated that most electric storage water heaters utilize a surface-mount thermostat, which is unsophisticated and has a large temperature tolerance—as a result, the mean tank temperature may vary appreciably from the temperature set point. AHRI stated that the mean tank temperature will typically be lower than the thermostat setting. As a result, AHRI requested feedback on whether the enforcement of the high-temperature test method would be based on thermostat set points or on test data (in the case that it is test data, AHRI recommended a temperature tolerance of ± 5 °F on $T_{max,1}$ prior to requiring high-temperature testing in appendix E). AHRI recommended that DOE measure the maximum tank temperature using the $T_{max,1}$ measurement in the simulated-use test because it is commonly used in the industry to evaluate the effective storage volume and is referenced in the regulations already (manufacturers and labs are familiar with how to test for $T_{max,1}$, and there would be minimal burden associated with determining the tank temperature based on this metric). (AHRI, No. 1167 at p. 4)

A.O. Smith also requested that DOE clarify how the temperature criterion for the high-temperature test is determined—whether it is a set point or whether it is a measurement. A.O. Smith stated that additional specificity is necessary because most electric resistance storage water heaters on the market use mechanical controls (*e.g.,* bi-metallic thermostats) which turn the elements on and off, resulting in larger temperature variation around the set point. A.O. Smith also requested that DOE clarify the enforcement provisions surrounding the level of external consumer intervention required to be exempt from the high-temperature test. (A.O. Smith, No. 1182 at p. 5)

Rheem requested clarification on how the maximum temperature a water heater is capable of storing water at is measured (whether it be the maximum temperature on the thermostat settings, the maximum temperature within the tank, the maximum mean tank temperature, or the maximum outlet temperature as measured by a test in section 29 of UL 174–2021.6.[199] Rheem recommended the use of $T_{max,1}$ to verify the temperature that a water heater can heat and store water to. (Rheem, No. 1177 at p. 5) Rheem recommended that DOE require certification and disclosure in product literature of the maximum temperature, FHR, and UEF when tested to the high-temperature requirements. Rheem also recommended that DOE establish enforcement provisions to ensure the maximum temperature aligns with the certified values. Rheem commented that a tolerance of ± 5 °F for the maximum tank temperature and ± 3 percent on the effective storage volume would be necessary due to variability in the test procedure and the imprecise operation of bi-metallic thermostat controllers. Rheem also asked for clarification on how DOE would conduct enforcement testing, and if DOE will run tests at both temperature conditions, then what steps must be taken between the two simulated-use tests. (Rheem, No. 1177 at p. 6)

In response to these requests for clarification, DOE clarifies that the exemption will be determined based on $T_{max,1}$, which is a measured parameter in the current test procedure that represents the maximum measured mean tank temperature after cut-out following the first draw of the 24-hour simulated-use test. In order to develop product-specific enforcement provisions for the high-temperature test method, DOE must first identify whether manufacturers should certify this value privately; as such, a certification was not suggested in the July 2023 NOPR. DOE is deferring this determination to a separate rulemaking addressing certification and enforcement provisions for consumer water heaters and is not codifying any specific requirements in this final rule.

In addition to this topic, Rheem suggested that, instead of conducting the high-temperature test at the

[197] For more information, see product literature available online at: *www.intellihot.com/wp-content/uploads/2023/01/Legionator-Product-Spec-Sheet-2.23.pdf.* (Last accessed: Nov. 28, 2023).

[198] For more information, see product press release available online at: *www.microban.com/bradford-white.* (Last accessed: Nov. 29, 2023).

[199] See UL 174–2021.6, UL Standard for Safety Household Electric Storage Tank Water Heaters.

maximum tank temperature, the high-temperature test should be conducted at a standardized temperature. Rheem recommended that the high-temperature test be performed at 160 °F ± 5 °F as a representative temperature for this type of water heater operation by 2029. Rheem stated that 160 °F is in between the 135 °F temperature criterion and the 180 °F maximum temperature (given that UL 174–2021 safety standard limits the maximum tank temperature to 185 °F). Rheem commented that future demand-response programs will also require operation at or above 160 °F. (Rheem, No. 1177 at p. 5)

In response to Rheem's request for a fixed set point temperature for high-temperature testing, DOE notes that not all water heaters with the capability to store water above 135 °F will necessarily have the capability to store water at 160 °F; hence, DOE is not adopting any changes to the set point requirements for the high-temperature test method. While the test may not be carried out at the exact temperature to which the water heater would be set in the field, it would be representative of the maximum temperature the water heater can sustain safely, which is important for consumer purchase decisions. UEF decreases with increased tank temperature; therefore, the water heater is expected to perform at least as well as a high-temperature rating evaluated at the highest tank temperature set point, all other environmental conditions the same. Should additional information become available regarding the set point temperatures of consumer electric resistance storage water heaters in the field, DOE may consider it in a future test procedure rulemaking.

c. Very Small and Large Electric Storage Water Heaters

In response to the July 2023 NOPR, some commenters stated that very small electric storage water heaters (*i.e.,* products with less than 20 gallons of rated storage volume) should not have to test to the high-temperature test method because these products are too small to reasonably substitute for larger heat pump water heaters, so it may be unlikely that these products are set to a high tank set point temperature.

Rheem suggested that the high-temperature test should be narrowly applied only to those electric storage water heaters which have potential to introduce a circumvention risk for heat pump water heater standards. In its comments, Rheem indicated that these products would be tabletop and electric storage water heaters with rated storage volumes greater than or equal to 20 gallons and less than or equal to 35 gallons. Rheem recommended that high-temperature testing should not apply to all other electric water heaters with storage volume. (Rheem, No. 1177 at p. 2) In its analysis, Rheem determined that a 19-gallon very small electric storage water heater would need to store water at 180 °F to achieve an FHR of approximately 51 gallons, which is much higher than is typically observed in consumer water heaters. On this basis, Rheem stated that very small electric storage water heaters cannot match the delivery capacities of 20–55 gallon electric storage water heaters, which would otherwise require heat pump technology. (Rheem, No. 1177 at pp. 2–3)

For electric resistance storage water heaters with rated storage volumes less than 20 gallons, AHRI recommended that high-temperature testing not be required because these units are unlikely to get into medium draw patterns at higher test temperatures. (AHRI, No. 1167 at p. 6)

A.O. Smith commented that, because small electric storage water heaters are the most likely to be operated at a higher temperature with a mixing valve to match the performance of larger water heaters, the high-temperature test method should be limited to small electric storage water heaters only. From its own testing of a 17-gallon very small electric storage water heater, A.O. Smith determined that increasing the set point from 125 °F to 150 °F resulted in a 43-percent increase in effective storage volume, but only a 4-percent increase in FHR, and thus A.O. Smith concluded that very small electric storage water heaters cannot match the performance of larger water heaters, even when operating at their highest set point temperatures. A.O. Smith recommended that DOE specify the high-temperature test only applies to 20–35 gallon products in order to maintain representativeness while reducing manufacturer testing burden. A.O. Smith commented that this would still ''close the loophole'' for heat pump water heater circumvention. (A.O. Smith, No. 1182 at pp. 6–7) Providing this information, A.O. Smith recommended that electric resistance storage water heaters of less than 20 gallons or greater than 55 gallons should be exempt from the high-temperature test method. (A.O. Smith, No. 1182 at p. 7)

To evaluate a potential exemption, DOE reviewed test data it had collected from very small electric storage water heaters in support of the proposed standards. These products, ranging in rated storage volume between 1.8 gallons and 19.9 gallons, all had delivery capacities in the very small or low draw patterns. Per its calculations, DOE also came to the same conclusion as commenters: no model would be capable of achieving an FHR high enough to place the water heater in the medium draw pattern at the highest tank temperature set point.

Based on DOE's data and information presented by commenters, DOE agrees that products with rated storage volumes of less than 20 gallons would not likely be set to higher temperatures to boost household delivery capacity as a substitute for a larger water heater. Therefore, DOE is exempting all very small electric storage water heaters from having to test to the high-temperature test method to demonstrate compliance with new UEF-based standards.

In addition to the previous suggestions provided by manufacturers, DOE received comments from NYSERDA and the CA IOUs suggesting that the high-temperature test method does not serve a purpose for larger electric resistance storage water heaters. NYSERDA stated that the high-temperature test method should not apply to larger-volume electric resistance storage water heaters that are already subject to heat pump-level standards. (NYSERDA, No. 1192 at p. 6) NYSERDA stated that exempting electric storage water heaters larger than 55 gallons of rated storage volume from the high-temperature test method (or potentially capping the effective storage volume) would reduce test burden and allow manufacturers to maintain the status quo for larger electric resistance storage water heaters. (NYSERDA, No. 1192 at p. 6) The CA IOUs suggested that DOE amend the calculations for effective storage volume such that products with rated storage volumes less than or equal to 120 gallons would be capped at an effective storage volume of 120 gallons. (CA IOUs, No. 1175 at pp. 3–4)

DOE agrees with NYSERDA and the CA IOUs that for products above a certain volume threshold, it is unlikely that testing according to the high-temperature method would provide more representative ratings. Specifically, the currently applicable standards for electric storage water heaters greater than 55 gallons of rated storage volume and less than or equal to 120 gallons of rated storage volume correspond to products with heat pump technology, such that all of these products on the market today are heat pump water heaters. (See 10 CFR 430.32(d)). Heat pump water heaters, discussed further in section V.D.1.d of this document, would already be exempt from the high-temperature test

method, as it is unlikely to be more representative for these products. Therefore, it is logical to exempt products that are 55–120 gallons of rated storage volume from the high-temperature test method, as this would be synonymous with the heat pump water heater exemption. Next, while DOE has not observed consumer electric storage water heaters on the market beyond 120 gallons of rated storage volume, it is unlikely that such very large products would rely on high-temperature operation to provide consumers with additional capacity: these products already contain rated storage volumes that are greater than those of products that have to comply with heat pump-level standards, such that the elevated temperature is not necessary to provide as much capacity as a heat pump water heater. Because of this, DOE has concluded that it is reasonable to exempt any electric storage water heater greater than 55 gallons of rated storage volume from the high-temperature test method.

This exemption for large electric storage water heaters additionally prevents potential backsliding from the standards of 55–120 gallon products, a concern brought up by multiple stakeholders and discussed in section IV.A.1.e of this document, because the rated storage volume and effective storage volume would thus be equal for any model greater than 55 gallons. An electric storage water heater between 55 and 120 gallons of rated storage volume would be required to demonstrate compliance with standards in accordance with the normal temperature test method, meaning that it cannot use the high temperature test method to increase its effective storage volume beyond 120 gallons and become subject to less-stringent standards.

d. Optional Representations for Heat Pump Water Heaters

In the July 2023 NOPR, DOE proposed that high-temperature testing would not apply to products that meet the definition of ''heat pump-type'' water heater at 10 CFR 430.2. 88 FR 49058, 49166.

CEC stated their appreciation of DOE's recognition for the significant non-efficiency grid benefit potential provided by maximizing the thermal storage of heat pump water heaters through the use of higher set point temperatures and thermostatic mixing valves. (CEC, No. 1173 at p. 12)

Rheem supported allowing optional high-temperature representations for certain heat pump water heaters because high-temperature operation might become more representative of heat pump water heater installations for three main reasons: (1) the increased need for demand-response water heaters that can perform advanced load-up and high-temperature energy storage, (2) the longer recovery time for heat pumps can be offset by storing water at a higher temperature to increase the amount of hot water immediately available, and (3) because a heat pump increases the size of the water heater, a comparable FHR can require elevated storage temperature. Rheem suggested that high-temperature operation for heat pump water heaters could cause even units with high UEF ratings to perform worse in the field. (Rheem, No. 1177 at pp. 2–4)

As noted in section V.D.1 of this document, if a water heater in its default mode of operation [200] has an internal tank temperature that significantly exceeds the delivery set point temperature, the calculation of effective storage volume captures this effect even without the high-temperature test method. (*See* section 6.3.1.1 of appendix E.) The FHR test would be carried out in this default mode and capture the increased delivery capacity. The 24-hour simulated-use test would be carried out in this default mode and would capture the increased standby losses from the higher-temperature operation. Therefore, if any heat pump water heater is designed to boost the tank temperature and incorporate a mixing valve as part of its normal operation, the effective storage volume, FHR, and UEF values resulting from the appendix E test procedure as written would be representative of this type of operation in the field.

DOE did not receive any other comments requesting that the high-temperature test method be made optional for voluntary representations of heat pump water heaters; however, DOE understands there is potential need to demonstrate storage and delivery capacity for heat pump water heaters representative of high-temperature operation that is not the default mode. Heat pump water heaters, unlike traditional electric resistance storage water heaters, can offer more modes to control the way the compressor and backup elements behave as a natural outcome of having more than one way to heat the water, and increasing storage tank temperature could be one potential way to increase delivery capacity when the compressor operates alone (*i.e.,* offers a slower recovery speed). In the June 2023 TP Final Rule, DOE adopted optional metrics for voluntary representations of heat pump water heaters to demonstrate performance in a variety of different environmental conditions because this information, DOE surmised, would be relevant for consumer information, and manufacturers already tested products to these alternate conditions. 88 FR 40406, 40437–40438. Similarly, DOE has determined that optional high-temperature representations would be relevant for consumer information as the market transitions towards this technology.

First, as discussed earlier, certain consumers using certain water heater configurations may desire higher set point temperatures, in which case the high-temperature test method could provide representative performance results. Second, as indicated by Rheem, future heat pump water heater control strategies could use variation of the storage tank temperature to compensate for slower compressor recovery periods when backup elements are either absent or disabled. A.O. Smith commented that consumers may be led to ''upsize'' when transitioning to a heat pump water heater (*see* section IV.C.1.b of this document for further discussion of this comment); however, as Rheem suggested, high-temperature performance data could enable consumers to purchase smaller, less expensive heat pump water heaters if the high-temperature performance data demonstrate equivalent performance to a larger product.

Unlike the mandatory requirement for electric resistance storage water heaters, the high-temperature test is optional for heat pump water heaters. This is because DOE expects the representativeness of this test method to depend on the designs of heat pump water heaters that emerge within the compliance period of this final rule. At this time, heat pump water heaters comprise a relatively small portion of the market; therefore, consumer preferences and usage are not yet as well understood (whereas, for electric resistance storage water heaters, several commenters indicated that the high-temperature test method would be representative of field applications). Should higher tank temperatures become more prevalent in field use as a result of a technology transition, DOE may revisit the implementation of the high-temperature test method in a future test procedure rulemaking.

e. Temporary Mode

Some electric resistance water heaters could offer high-temperature modes that

[200] Section 5.1.1 of appendix E outlines the determination of the operational mode for testing heat pump water heaters, which shall be the default mode unless otherwise specified.

allow for set points above the intended delivery temperature to boost delivery capacity, but only temporarily before automatically reverting to the normal temperature mode. This contrasts with several models that are currently available, which remain in the high-temperature setting until the consumer changes the mode or setting to deactivate the high-temperature mode. Temporary modes would be intended for occasional use in situations in which there is a short-term increased demand for hot water, while non-temporary modes would be more likely to be used long-term. In the June 2023 TP Final Rule, DOE discussed comments it received from stakeholders regarding water heaters with high-temperature modes. Specifically, stakeholders indicated that high-temperature modes are not intended to be the primary mode of operation and should not be used continuously, and that testing in these modes would not reflect their intended use. 88 FR 40406, 40449.

DOE understands that temporary high-temperature modes would be unlikely to be used long-term because they would automatically return the set point to a more typical temperature after a certain period of time has elapsed. Because these temporary modes cannot be used permanently, in the July 2023 NOPR DOE tentatively determined that units capable of storing water at a set point above 135 °F only through a temporary, consumer-initiated, high-temperature mode lasting no longer than 120 hours should not be subject to high-temperature testing. 88 FR 49058, 49165. DOE expects that such products would operate in non-high temperature modes for the majority of the time and, therefore, testing in the high-temperature mode would not be representative. Thus, DOE proposed to limit the high-temperature mode duration to 120 hours as a reasonable amount of time that demand may be temporarily higher than normal (such as when guests are visiting). Further, DOE expected that models with permanent high-temperature modes, whether shipped from the factory with that mode as the default mode or simply as a user-selectable mode, would be likely to be used continuously in the high-temperature mode. Therefore, DOE tentatively concluded it is representative to test such water heaters in the high-temperature modes and is proposing to require such testing. *Id.*

GEA commented that DOE's 120-hour limit without user intervention for extra demand is an appropriate approach for maintaining consumer utility and the energy-saving benefits of such features. (GEA, No. 1203 at pp. 1–2)

AHRI requested that DOE provide additional information on what meets the definition of a ''consumer-initiated'' high-temperature mode, which, if lasting less than 120 hours, would deem the product exempt from the high-temperature test method. AHRI also inquired as to the type of interaction by the user that is necessary to satisfy the requirement and whether the user can create a schedule. AHRI raised a concern that if products fail to meet the specific requirement for the temporary mode exemption, products tested to the high-temperature test method would not be able to comply with standards. (AHRI, No. 1167 at p. 4) BWC also asked for DOE to further clarify what a ''permanent mode or setting'' meant for the high-temperature test exemption. (BWC, No. 1164 at pp. 7–8)

Stanonik stated that the proposed addition of high-temperature testing provisions is confusing, and added that the provisions may be read to apply to most electric storage water heaters despite the fact that DOE explains the provisions are only meant to apply to a subset of them. Stanonik requested DOE clarify if the act of changing the thermostat on a consumer water heater would be considered an ''external consumer intervention'' that would then exclude the water heater from high-temperature testing. (Stanonik, No. 1197 at p. 1)

Rheem stated that it was generally supportive of the outlined exemptions from the high-temperature test, except for the temporary setting exemption. Although Rheem had suggested that DOE investigate temporary modes of operation in the test procedure rulemaking, Rheem indicated in its comments to the July 2023 NOPR that such an exemption would not be necessary if the test method were clarified and the temperature criterion were raised from 135 °F to 140 °F. (Rheem, No. 1177 at pp. 6–7)

In response to these requests from stakeholders, DOE is clarifying what would constitute consumer intervention for the purpose of the high-temperature test exemption. As discussed in section V.D.1.b of this document, a high-temperature mode would be one in which the water heater can achieve a $T_{max,1}$ greater than 135 °F during the 24-hour simulated-use test. If the water heater is set to such a mode, and the only time when it can achieve a $T_{max,1}$ greater than 135 °F is in the period of time that lasts 120 hours or less after the mode or setting is engaged by the user, then this would constitute a temporary high-temperature mode. To be exempt from the high-temperature test method, such a temporary high-temperature mode can only be activated via user intervention with the water heater. Once the temporary period of high-temperature operation has elapsed, the water heater must return to a lower tank temperature that would result in a $T_{max,1}$ less than or equal to 135 °F. If the user wishes to extend the period beyond 120 hours, they must reactivate the mode manually.

The purpose of this exemption is to allow products to increase capacity when there are limited times of high demand. Therefore, the consumer would have to manually activate the mode (*e.g.,* pushing a physical or digital button) if the high-temperature mode is required. If, instead, a product adheres to a regular schedule of high-temperature operation, a product would operate in a manner that demonstrates a consistent need for additional capacity, and in such a case the high-temperature test method would be more representative of the average daily use cycle of the product. For this reason, a scheduled setting would not be exempt from the high-temperature test method. For the normal-temperature test to remain representative of the ratings of the product, the water heater must permanently return to a mode in which the $T_{max,1}$ will not exceed 135 °F at any time after the temporary high-temperature operation has elapsed, and the only way in which the water heater would return to an elevated temperature is if the consumer interacts with the product manually again.

In response to Stanonik's question, the act of manually changing the set point temperature to achieve a mode in which the water heater can attain a $T_{max,1}$ beyond 135 °F is generally addressed in section V.D.1.b of this document. If the consumer can set the water heater to permanently heat and store water beyond 135 °F, then the water heater is not exempt from the high-temperature test. As outlined in section V.D.1.g of this document, such a model would not pass the second criterion for exemption.

f. Demand-Response Water Heaters

In the July 2023 NOPR, DOE proposed to exempt from high-temperature testing any water heaters that can only heat and store water at temperatures above 135 °F in response to instructions received from a utility or third-party demand-response program. DOE reasoned that the additional energy consumption from high-temperature water storage in demand-response water heaters is compensated for by periods of water heater inactivity (*i.e.,* a curtailment period) and, thus, demand-response water heaters do not engage in high-

temperature water storage in order to directly increase capacity over a representative average use cycle of 24 hours. 88 FR 49058, 49166.

AHRI stated that it appreciated the exemptions from the high-temperature test method, especially regarding demand-response water heaters; however, AHRI asserted the demand-response exemption was not clearly defined. AHRI requested DOE clarify the extent of this exemption for manufacturers. (AHRI, No. 1167 at p. 2) AHRI commented that setting an arbitrary maximum temperature for electric storage water heaters may create potential issues for consumers in jurisdictions with demand-response requirements. Specifically, AHRI stated that load-up events for demand-response water heaters allow products to store energy, and limiting the temperature of the water heater will limit its load-up capability. AHRI requested that DOE consider increasing the temperature criterion for the high-temperature test exemptions in order to accommodate this function of demand-response water heaters. (AHRI, No. 1167 at p. 3)

BWC expressed concerns with how DOE's high-temperature test method might impact demand-response electric resistance water heaters, suggesting that there could still be complications for these products even with the exemption from the high-temperature test method. BWC stated that the purpose of demand-response controls, as required in many states, is to heat the unit to a higher temperature during off-peak hours to store energy during times of peak electric grid demand, and that these controls can be activated by either the utility or the consumer themselves. BWC commented that water heaters would be incapable of storing water at or above 135 °F if the proposal were finalized, which would limit the load-shifting capabilities of demand-response water heaters. (BWC, No. 1164 at p. 8)

In response to commenters' concern about demand-response water heaters being limited to 135 °F, DOE is clarifying the meaning of its proposed exemption to the high-temperature test method. As noted previously, DOE proposed that electric storage water heaters capable of heating and storing water over 135 °F only in response to utility demand response signals would not be subject to high-temperature testing. This exemption was proposed so that water heaters intended for use in demand-response programs would not have to limit their temperature, provided that the ability to raise the temperature is initiated only as part of the water heater's use in a demand-response program. (This does not, however, preclude a demand-response water heater from also having a manual temporary high-heat mode as described in the previous section.)

In this final rule, DOE is adopting an exemption to the high-temperature test method that will allow demand-response programs to elevate the temperature of the water heater to any temperature that the unit is capable of achieving, so long as the unit can only achieve those temperatures as a result of the demand-response operation and not as a result of the user increasing the set point temperature. For example, a product with its maximum user-operable set point can store water at or below 135 °F during normal operation, but in response to utility signals requesting a load-up, the product can increase the temperature to 160 °F (as an example) would be exempt from the high-temperature test method because the user cannot set the water heater to continuously operate above 135 °F. Whereas continuous operation above 135 °F would increase the effective storage volume and FHR of the water heater, a load-up event that prompts the water heater to increase the temperature above this point does not. The load-up event only temporarily boosts the temperature so that the water heater can rely on stored energy throughout peak grid demand periods instead of relying on electricity from the grid; therefore, over the course of a representative average-use cycle (one day), the water heater does not provide extra capacity compared to when it is set to a lower temperature and allowed to recover the tank throughout the day.

Additionally, AHRI questioned whether grid-enabled water heaters are also exempt from the high-temperature testing method. (AHRI, No. 1167 at p. 3) BWC also requested clarification on whether the high-temperature test method would apply to grid-enabled water heaters, as this was not mentioned in either the June 2023 TP Final Rule or the July 2023 NOPR. (BWC, No. 1164 at pp. 8–9) Rheem argued that, because grid-enabled water heaters are intended for demand-response, they are not a direct replacement for heat pump water heaters to a great extent, and that the high-temperature test method need not apply to grid-enabled water heaters. (Rheem, No. 1177 at p. 3)

Grid-enabled water heaters, discussed in section IV.A.1.e, are defined as having rated storage volumes greater than 75 gallons (see 10 CFR 430.2). In section V.D.1.c of this final rule, DOE concluded that products with rated storage volumes greater than 55 gallons would be exempt from the high-temperature test method. As a result, all grid-enabled water heaters are exempt from the high-temperature test method. Grid-enabled water heaters are a specific subset of electric storage water heater products, which must be enrolled with a grid utility program and are designed for the purpose of demand-response control. As such, DOE expects that these products achieve higher storage temperatures as a result of utility signals and not as a result of a consumer's need for additional hot water. Therefore, DOE has concluded that it is representative for grid-enabled water heaters to test to a normal set point temperature and not the high-temperature test method.

g. Summary of the High-Temperature Test Method Applicability

As a result of the considerations discussed in the previous sections, DOE is establishing that the high-temperature test method must be conducted for all electric storage water heaters, except for those meeting the following exemptions.

The first exemption is for products that are not capable of heating the stored water beyond a $T_{max,1}$ temperature of 135 °F. If the product has a $T_{max,1}$ less than or equal to 135 °F when tested in the user-operable mode that results in its highest set point, the product is exempt. This temperature criterion allows the water heater to maintain its utility of providing hotter water for certain consumer needs without increasing the temperature so much that the water heater can be used as a direct substitute for a larger water heater that must comply with more stringent standards. Beyond this temperature, the high-temperature test method is more representative of the product's use in the field.

The second exemption is for heat pump water heaters. As discussed previously, heat pump water heaters are unlikely to be used to a significant extent at high temperatures. However, in the event that a heat pump water heater is designed for high-temperature operation, the heat pump water heaters are allowed to use the high-temperature test method optionally for voluntary representations, but normal set point operation (section 5.1.1 of appendix E) is the mode that must be used to demonstrate compliance with standards.

The third exemption is for demand-response water heaters, specifically those products which can only attain temperatures beyond 135 °F when requested to do so by a utility signal. If a product does not allow the consumer to operate it in a manner that would result in a $T_{max,1}$ beyond 135 °F but does allow the grid to increase the tank temperature above this point, it remains

exempt from the high-temperature test method.

The fourth exemption is for water heaters that allow the user to raise the temperature beyond 135 °F, but only for a maximum of 120 hours before automatically resetting to a temperature setting that results in $T_{max,1}$ at or below 135 °F. This allows water heaters to provide flexible-capacity modes for times when consumers may experience increased occupancy in the residence and thus a greater demand for hot water. The water heater must return to a mode that would result in a $T_{max,1}$ less than or equal to 135 °F after the 120-hour period elapses unless the user activates the boost mode again.

The fifth exemption is for water heaters of in-size categories where high-temperature operation is not expected to be representative of the product's function over an average daily use cycle. Very small electric storage water heaters (those with rated storage volumes less than 20 gallons) and large electric storage water heaters (those with rated storage volumes greater than 55 gallons) are not expected to use higher temperatures to boost capacity in order to be direct substitutes for products which have significantly more stringent standards.

This final rule adopts these five exemptions for section 5.1.2 of appendix E and 10 CFR 429.17.

2. Circulating Water Heaters

a. Separate Storage Tank Requirements

In response to the December 2023 SNOPR, NYSERDA encouraged DOE to review the test procedure to ensure that defining circulating water heaters as storage-type water heaters is consistent with the test method developed for these products. (NYSERDA, No. 1406 at p. 2)

The test method for circulating water heaters, as established by the June 2023 TP Final Rule, requires these products to be connected to a separate storage tank to serve as the volume of hot water that the circulating water heater requires for its function. *See* section 4.10 of the appendix E test procedure. As such, when a circulating water heater is tested per the appendix E test method, the test method will account for the stored volume of hot water and the standby losses that occur from it. This is analogous to how other traditional storage-type water heaters are tested.

When considering the potential impact of the proposed standards for electric storage water heaters on the availability of products to pair with heat pump circulating water heaters, DOE tentatively decided in the July 2023 NOPR that it would be more representative to pair such a product with an electric resistance storage water heater, surmising that is unlikely for consumers to pair a circulating heat pump water heater with an integrated heat pump water heater because they would already receive the energy-saving benefits of the integrated heat pump water heater. 88 FR 49058, 49167. Thus, in the July 2023 NOPR, DOE proposed to amend the separate storage tank requirement for a heat pump circulating water heater to reflect an electric resistance storage water heater that would be compliant with the proposed standards. Specifically, this proposed requirement was to pair a heat pump circulating water heater with a 30 gallon ± 5 gallon electric resistance storage water heater in the low draw pattern. *Id.*

In response to the July 2023 NOPR, some commenters indicated that heat pump circulating water heaters would be paired with a variety of tank sizes, meaning it would be impractical to base a rating for these products on just one tank pairing. Additionally, some commenters recommended alternative separate storage tank requirements to those proposed, or requested clarification.

A.O. Smith noted that gas-fired circulating water heaters present on the market today are only used in commercial applications, and the UFHWST tank pairing for these products is not common in residential applications, as it would result in a more expensive installation compared to a gas-fired storage water heater. (A.O. Smith, No. 1182 at p. 13)

BWC stated that it does not believe heat pump circulating water heaters should be coupled with 30 gallon ± 5 gallons electric storage water heaters in the appendix E test method for these products because this would not be realistic or representative of most real-world installations, which will typically rely on much larger tanks due to the slower recovery rate of a heat pump. BWC added that heat pump circulating water heaters are designed to meet a variety of unique residential applications in the field, which include different tank sizes and setups to provide adequate hot water, each of which would produce different efficiency ratings when tested; if forced to test to just one tank size, BWC stated that it would be compelled to cite to consumers an efficiency rating that is likely inflated and inaccurate compared to what the consumer will see in practice. BWC added further that a UFHWST, like that which is used for other types of circulating water heaters, would be a more representative pairing for heat pump circulating water heaters. (BWC, No. 1164 at pp. 12–13) Rheem suggested that heat pump circulating water heaters be certified with an UFHWST similar to other types of circulating water heaters because heat pump circulating water heaters may be developed to not rely on the use of backup electric resistance elements in an electric storage water heater tank. (Rheem, No. 1177 at pp. 14–15)

In section IV.A.1.a of this document, DOE discussed its decision to consider circulating water heaters as storage-type water heaters. Therefore, circulating electric heat pump water heaters would be classified as electric storage water heaters and subject to the applicable electric storage water heater standards. DOE does not intend to stifle innovation in or misinform consumers on the efficiency and performance characteristics of heat pump circulating water heaters, which could be used by consumers in lieu of traditional heat pump water heaters. In the test procedure rulemaking, DOE received an abundance of feedback indicating that these products are most likely to be paired with electric resistance storage water heaters, which was the basis for the proposed tank pairing in the July 2023 NOPR. Notwithstanding the recommendations from BWC and Rheem, there remains uncertainty regarding the sizes of UFHWSTs that could be paired with a heat pump circulating water heater should these products not be used with electric resistance storage water heaters. Products DOE has found on the market have demonstrated positive results from case studies while being paired up with nominal 40-gallon electric resistance storage water heaters,[201] so it is expected that the products available today would remain compatible with slightly smaller tanks as well. Therefore, in this final rule, DOE concludes that an electric resistance storage water heater that is 30 gallons ± 5 gallons and in the low draw pattern is still a representative pairing based on feedback received in the test procedure rulemaking.

In response to the December 2023 SNOPR, BWC commented that manufacturers will need to be able to test gas-fired circulating water heaters with a greater range of unfired hot water storage tank volumes than that which is specified in the June 2023 TP Final Rule. (BWC, No. 1413 at p. 2)

[201] A case study published by Nyle Water Heating Systems demonstrates the use of a circulating heat pump water heater with a nominal 40-gallon electric storage water heater. See online at: *www.nyle.com/wp-content/uploads/2021/09/Case-Study-3.2.pdf* (Last accessed: Jan. 5, 2024).

However, without consumer gas-fired circulating water heaters on the market, there is insufficient information (other than the feedback received during the test procedure rulemaking) to make a determination to amend the separate storage tank pairing for these products. The test method to pair gas-fired circulating water heaters with 80- to 120-gallon unfired hot water storage tanks was developed after careful consideration of numerous comments provided in that rulemaking. While finalizing the amendment as proposed, DOE will continue to assess the representativeness of the separate storage tank provisions in the appendix E test procedure and address these concerns in a future test procedure rulemaking if necessary.

Rheem stated its understanding that circulating water heaters would be tested with a manufacturer-specified storage tank, and that the storage tanks described in section 4.10 of appendix E would only be used if there was no manufacturer-specified storage tank. (Rheem, No. 1408 at p. 2) AHRI and A.O. Smith requested that DOE clarify whether a manufacturer would be able to make efficiency representations of circulating water heaters that are designed and specified (or shipped) for use with a storage tank that does not fall into the volume ranges outlined in the test procedure and enforcement provisions. (A.O. Smith, No. 1182 at p. 7; AHRI, No. 1167 at pp. 13–14)

The Department intends for the separate storage tank requirements in section 4.10 to apply to circulating water heaters, which are storage-type water heaters that are not sold with a tank. DOE understands that there may be some confusion based on the wording of section 1.19 of appendix E, which reads that a ''water heater requiring a storage tank'' means a water heater without a storage tank specified or supplied by the manufacturer that cannot meet the requirements of sections 2 and 5 of appendix E without the use of a storage water heater or unfired hot water storage tank. The current wording of section 1.19 in appendix E inadvertently conflates circulating water heaters with split-system water heaters—the distinctions between these two are discussed in section IV.A.1.f.i of this document. As such, DOE is making a minor amendment to section 1.19 of appendix E to resolve industry confusion around these distinctions after determining that it is clearer to define a ''water heater requiring a storage tank'' as a water heater without a storage tank supplied by the manufacturer that cannot meet the requirements of sections 2 and 5 of appendix E without the use of a storage water heater or unfired hot water storage tank. This edit removes the possibility that a water heater could have a manufacturer-specified tank pairing but would have to be tested with a different separate storage tank. Simultaneously DOE is clarifying in section 4.10 of appendix E that those setup provisions apply to water heaters requiring a storage tank—a term that is essentially synonymous with ''circulating water heater.''

In response to the questions from AHRI and A.O. Smith, representations of circulating water heaters must be made in accordance with the separate storage tank requirements in the appendix E test procedure. The compliance of the circulating water heater with the appropriate storage water heater standards would be determined based on the storage volume of the tank selected, which in turn determines the effective storage volume of the circulating water heater. For all types of circulating water heaters, should a manufacturer desire to report its performance to multiple tank sizes, each tank size would constitute a separate basic model.

Reporting requirements are not being established in this rulemaking addressing energy conservation standards for consumer water heaters, however, and DOE will propose these requirements in a separate rulemaking.

b. Product-Specific Enforcement Provisions

In the July 2023 NOPR, DOE proposed a series of steps it would take to ensure that the UFHWST used in assessment testing is as close as possible to the model that was used to determine the circulating water heater's rating. As stated earlier, reporting requirements are not being addressed in this rulemaking, but will be considered separately. 88 FR 49058, 49167. The intent of DOE's proposal was to create a procedure that would default to using the same tank that the circulating water heater manufacturer used, but in the extenuating circumstance wherein that tank is unavailable to DOE, the model could still be tested.

A.O. Smith recommended that DOE bolster the enforcement provisions and definitions outlining what would constitute a circulating water heater to prevent the emergence of electric resistance circulating water heater configurations. (A.O. Smith, No. 1182 at pp. 12–13) A.O. Smith also asked DOE to clarify certification requirements for circulating water heaters. (A.O. Smith, No. 1182 at p. 7) BWC stated that several provisions leave open the possibility that DOE could conduct enforcement testing with a significantly different UFHWST, including the possibility of testing with a different manufacturer's tank. BWC added that this could lead to unfair results, and that instead DOE should allow manufacturers to provide DOE with the UFHWST that is to be paired with the circulating water heater. (BWC, No. 1164 at pp. 13–14) BWC requested that DOE reconsider its proposed product-specific enforcement provisions for circulating water heaters, which include the steps DOE would take to test with an UFHWST as similar as possible to the one used by the manufacturer to rate the circulating water heater, so that the manufacturer could provide the UFHWST to DOE for testing. (BWC, No. 1164 at pp. 13–14) Rheem requested that DOE clarify whether the effective storage volume is a more appropriate metric to use than rated storage volume in the enforcement provisions proposed. Rheem supported the enforcement provisions proposed for testing these products but suggested that DOE test at the lowest storage volume available within the 80–120 gallon range for UFHWSTs. (Rheem, No. 1177 at pp. 14–15)

In response to the request from BWC, DOE does not directly source the tank from manufacturers as it would limit the ability for independent assessment testing given that manufacturers are not always notified when assessment testing occurs.

In response to Rheem's question about rewriting provisions to use the effective storage volume metric, it is unclear where a change would apply, because the provisions outline the steps with regard to the characteristics of the UFHWST, and UFHWSTs have a certified storage volume rather than an effective storage volume.

As such, DOE is finalizing the product-specific enforcement provisions for circulating water heaters as proposed in the July 2023 NOPR. DOE may re-evaluate the product-specific enforcement provisions for these products in a separate rulemaking.

3. Water Heaters Less Than 2 Gallons

The July 2023 NOPR proposed to establish new UEF-based standards for electric and gas storage-type water heaters with less than 20 gallons of effective storage volume. In its market assessment DOE has found models of consumer electric storage-type water heaters which are less than 2 gallons in nominal volume. In order for manufacturers to determine compliance for these products, the test procedure must include provisions for calculating

the rated storage volume and effective storage volume.

The current method to determine storage tank volume in the appendix E test procedure, as amended by the June 2023 TP Final Rule, states:

''For water heaters with a rated storage volume greater than or equal to 2 gallons and for separate storage tanks used for testing circulating water heaters, determine the storage capacity, of the water heater or separate storage tank under test, in gallons (liters), by subtracting the tare weight from the gross weight of the storage tank when completely filled with water at the supply water temperature specified in section 2.3.''

(See section 5.2.1 of the amended appendix E test procedure); 88 FR 40406, 40478.

However, this method does not explicitly cover storage-type water heaters less than 2 gallons which will be covered under the proposed new UEF-based standards. Therefore, in the July 2023 NOPR, DOE proposed to amend section 5.2.1 such that it is applicable to water heaters of all volumes and not restricted to only products greater than or equal to 2 gallons.

No comments were received in response to this proposal. Therefore, DOE is adopting this update to appendix E as proposed in the July 2023 NOPR.

4. Other Topics

In the June 2023 TP Final Rule, DOE adopted optional provisions at section 2.8 of appendix E to allow manufacturers to make voluntary representations of heat pump water heater performance in a variety of alternative conditions that could be useful for consumers installing these products in different locations. These alternative conditions would not be used to determine compliance with the UEF standards at 10 CFR 430.32(d) but were provided to permit representations at the NEEA Advanced Water Heating Specification version 8.0 conditions.[202] 88 FR 40406, 40476.

Rheem requested that DOE address certification and enforcement provisions for heat pump water heaters being tested to the optional test conditions in section 2.8 of appendix E. (Rheem, No. 1177 at p. 7)

DOE reiterates that optional conditions cannot be used to demonstrate compliance with standards. DOE is not adopting certification and enforcement provisions for optional test conditions in this final rule but may consider this in a future rulemaking addressing these topics.

VI. Procedural Issues and Regulatory Review

A. Review Under Executive Orders 12866, 13563, and 14094

Executive Order (''E.O.'') 12866, ''Regulatory Planning and Review,'' as supplemented and reaffirmed by E.O. 13563, ''Improving Regulation and Regulatory Review,'' 76 FR 3821 (Jan. 21, 2011) and amended by E.O. 14094, ''Modernizing Regulatory Review,'' 88 FR 21879 (April 11, 2023), requires agencies, to the extent permitted by law, to (1) propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to quantify); (2) tailor regulations to impose the least burden on society, consistent with obtaining regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations; (3) select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity); (4) to the extent feasible, specify performance objectives, rather than specifying the behavior or manner of compliance that regulated entities must adopt; and (5) identify and assess available alternatives to direct regulation, including providing economic incentives to encourage the desired behavior, such as user fees or marketable permits, or providing information upon which choices can be made by the public. DOE emphasizes as well that E.O. 13563 requires agencies to use the best available techniques to quantify anticipated present and future benefits and costs as accurately as possible. In its guidance, the Office of Information and Regulatory Affairs (''OIRA'') in the Office of Management and Budget (''OMB'') has emphasized that such techniques may include identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes. For the reasons stated in this preamble, this final regulatory action is consistent with these principles.

Section 6(a) of E.O. 12866 also requires agencies to submit ''significant regulatory actions'' to OIRA for review. OIRA has determined that this final regulatory action constitutes a ''significant regulatory action'' within the scope of section 3(f)(1) of E.O. 12866. Accordingly, pursuant to section 6(a)(3)(C) of E.O. 12866, DOE has provided to OIRA an assessment, including the underlying analysis, of benefits and costs anticipated from the final regulatory action, together with, to the extent feasible, a quantification of those costs; and an assessment, including the underlying analysis, of costs and benefits of potentially effective and reasonably feasible alternatives to the planned regulation, and an explanation why the planned regulatory action is preferable to the identified potential alternatives. These assessments are summarized in this preamble, and further detail can be found in the technical support document for this rulemaking.

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis (''IRFA'') and a final regulatory flexibility analysis (''FRFA'') for any rule that by law must be proposed for public comment, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by E.O. 13272, ''Proper Consideration of Small Entities in Agency Rulemaking,'' 67 FR 53461 (Aug. 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel's website (*www.energy.gov/gc/office-general-counsel*). DOE has prepared the following FRFA for the products that are the subject of this rulemaking.

For manufacturers of consumer water heaters, the SBA has set a size threshold, which defines those entities classified as ''small businesses'' for the purposes of the statute. DOE used the SBA's small business size standards to determine whether any small entities would be subject to the requirements of the rule. (See 13 CFR part 121.) The size standards are listed by North American Industry Classification System (''NAICS'') code and industry description and are available at *www.sba.gov/document/support-table-size-standards.* Manufacturing of consumer water heaters is classified under NAICS 335220, ''Major Household Appliance Manufacturing.'' The SBA sets a threshold of 1,500

[202] Representations of rated values for consumer water heaters must be made in accordance with the provisions of the Federal test procedure, appendix E. (42 U.S.C. 6293(c)).

employees or fewer for an entity to be considered as a small business for this category.

1. Need for, and Objectives of, Rule

EPCA prescribed energy conservation standards for consumer water heaters (42 U.S.C. 6295(e)(1)) and directed DOE to conduct two cycles of rulemakings [203] to determine whether to amend these standards. (42 U.S.C. 6295(e)(4)) EPCA further provides that, not later than 6 years after the issuance of any final rule establishing or amending a standard, DOE must publish either a notice of determination that standards for the product do not need to be amended, or a NOPR including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6295(m)(1))

2. Significant Issues Raised by Public Comments in Response to the IRFA

In response to the July 2023 NOPR, the Gas Association Commenters submitted comments noting that DOE identified only two small businesses, neither of which produce gas-fired water heaters. As a result, the Gas Association Commenters stated that DOE has no data on small businesses that produce gas-fired water heaters relative to redesign costs, product availability, or whether the proposed efficiency levels could cause small businesses to exit the market. (Gas Association Commenters No. 1181, pp. 38–39)

NPGA, APGA, AGA, and Rinnai stated that as the two small businesses DOE identified in the July 2023 NOPR analysis do not produce gas-fired water heaters, DOE cannot know what the effect on small businesses that manufacture gas-fired water heaters could be as DOE has no data on their redesign costs, product availability, or whether the standards proposed in the July 2023 NOPR would force these manufacturers to leave the market. Therefore, NPGA, APGA, AGA, and Rinnai asserted that the July 2023 NOPR fails to comply with Executive Order 13272, ''Proper Consideration of Small Entities in Agency Rulemaking,'' and must be addressed. (NPGA, APGA, AGA, and Rinnai, No. 441 at p. 5)

For the IRFA conducted in support of the July 2023 NOPR, DOE identified one small domestic original equipment manufacturer (''OEM'') of oil-fired storage water heaters and one small domestic OEM of electric storage water heaters. For this FRFA, DOE refreshed its product database to include up-to-date information on the consumer water heater models marketed for the United States. Based on its comprehensive review of the market, DOE identified an additional small, domestic OEM of electric storage water heaters. Therefore, DOE maintains its finding from the IRFA that there are no small, domestic OEMs that manufacture gas-fired water heaters. As such, DOE does not expect that the standards adopted in this final rule would directly impact small businesses that manufacture gas-fired water heaters.

BWC expressed concern about the extensive resources such an undertaking would divert from ongoing projects, as well as its potentially more severe impacts on smaller manufacturers, including component suppliers. (BWC, No. 1164 at p. 15) ASA stated that manufacturers and distributors, including small businesses, would be negatively affected by increased costs for both units and installation and that consumer choice would be restricted. ASA requested that DOE update data used to develop these standards. (ASA, No. 1160 at p. 1)

DOE agrees that the impacts small manufacturers experience may differ compared to larger, more diversified manufacturers. DOE conducts a regulatory flexibility analysis to understand and assess the potential impacts to small domestic OEMs that produce consumer water heaters for the U.S. market in accordance with the procedures and policies published on February 19, 2003. 68 FR 7990. *See* section VI.B.3 of this document for a discussion of potential impacts of amended standards on the three small businesses with U.S. manufacturing facilities identified.

3. Description and Estimated Number of Small Entities Affected

For this FRFA, DOE refreshed its product database to use up-to-date information on the models available on the U.S. market and estimate the number of companies that could be small business manufacturers of products covered by this rulemaking. DOE's research involved reviewing its CCD,[204] California Energy Commission's Modernized Appliance Efficiency Database System (''MAEDbS''),[205] EPA's Energy Star Product Finder dataset,[206] AHRI's Directory of Certified Product Performance,[207] individual company websites, and market research tools (*e.g.,* reports from D&B Hoovers) [208] to create a list of companies that manufacture, produce, import, or assemble the products covered by this rulemaking. DOE also asked stakeholders and industry representatives if they were aware of any other small manufacturers during manufacturer interviews.

DOE identified 22 OEMs of electric instantaneous, electric storage, gas-fired instantaneous, gas-fired storage, or oil-fired storage water heaters sold in the United States as part of its July 2023 NOPR analysis. In preparation for the final rule, DOE conducted additional research to ensure an up-to-date data on the consumer water heater market. After a further comprehensive review of the model listings, DOE concluded that three of the manufacturers previously identified do not manufacture consumer water heaters in-house (*i.e.,* they do not own and operate manufacturing facilities that produce consumer water heaters). However, DOE determined there are three additional manufacturers not previously identified that manufacture consumer water heaters in-house. DOE also revised its OEM count estimate to exclude manufacturers of gas-fired instantaneous water heaters since this final rule does not cover gas-fired instantaneous water heaters. Therefore, excluding manufacturers that only offer gas-fired instantaneous water heaters, DOE identified 16 OEMs of consumer water heaters covered by this final rule. Of these 16 OEMs, DOE identified three small, domestic manufacturers affected by amended standards for gas-fired storage water heater, oil-fired storage water heater, or electric storage water heater products. The first small business is an OEM of oil-fired storage water heaters. The other two small businesses are OEMs of electric storage water heaters.

[203] DOE completed the first of these rulemaking cycles on January 17, 2001, by publishing in the **Federal Register** a final rule amending the energy conservation standards for consumer water heaters. 66 FR 4474. Subsequently, DOE completed the second rulemaking cycle to amend the standards for consumer water heaters by publishing a final rule in the **Federal Register** on April 16, 2010. 75 FR 20112.

4. Description of Reporting, Recordkeeping, and Other Compliance Requirements

The first small business is an OEM that certifies three models of oil-fired storage water heaters. One of the three models would meet the standard. Given the small and shrinking market for oil-fired storage water heaters, DOE does not expect the small manufacturer would redesign non-compliant models. Rather, the company would likely reduce its range of model offerings. DOE requested input on the potential impacts of standards on this manufacturer in the July 2023 NOPR, but did not receive any feedback. DOE, therefore, maintains its assumption from the IRFA that this manufacturer would not incur significant conversion costs as a result of this rulemaking.

The second small business is an OEM that certifies eleven models of electric storage water heaters. The company offers two small electric storage water heaters, six electric storage water heaters with an effective storage volume greater than or equal to 20 gallons and less than or equal to 55 gallons, and three electric storage water heaters with effective storage volumes above 55 gallons. At the adopted level (TSL 2), DOE does not expect the two small electric water heater models would require notable redesign as standard levels would remain at the baseline efficiency level (*i.e.,* EL 0) for small electric water heaters. None of the six electric storage water heaters (between 20 and 55 gallons, excluding small electric storage water heaters) would meet the amended standard. However, one of the six electric storage water heaters (between 20 and 55 gallons, excluding small electric storage water heaters) is a heat pump model that would likely not require significant redesign to meet the amended standards. DOE expects the company would expand its heat pump offering rather than redesign the electric resistance products that do not meet the amended standard. The company offers three electric storage water heaters with effective storage volumes above 55 gallons. All three of these are heat pumps that do not meet the amended standard. After reviewing the three electric storage water heaters with effective storage volumes above 55 gallons, DOE believes the three models could be updated to meet the amended standard. In total, the company would need to redesign up to nine models.

DOE assumed the company would need to invest the equivalent of one year of its R&D resources to update its product lines to meet amended standards. Therefore, to derive this company's estimated product conversion costs, DOE scaled the annual industry R&D expenditures for electric storage water heaters in the GRIM by the company's estimated market share. DOE does not anticipate significant capital conversion costs, as the company offers a broad line of heat pump electric storage water heaters today. DOE estimates total conversion costs to be $250,000 for this small manufacturer. Based on market research tools, DOE estimated the company's annual revenue to be approximately $50 million. Taking into account the 5-year conversion period, DOE expects conversion costs to be less than 1 percent of conversion period revenue.[209]

The third small business is an OEM that produces two models of circulating water heaters, which are not currently required to comply with a UEF standard. DOE expects that both of these models would qualify as small electric storage water heaters, and thus would likely be subject to new and amended UEF standards. At the adopted level (TSL 2), the standard required for small electric storage water heaters would remain at the baseline efficiency level. DOE notes that both of the models identified utilize heat pump technology. Therefore, DOE assumes these models would not need to be redesigned to comply with new and amended UEF standards. However, this small manufacturer would need to certify these models at the time of compliance with new and amended standards, incurring testing costs of $3,000 per basic model. 88 FR 40406, 40467. Based on market research tools, DOE estimated the company's annual revenue to be approximately $7.7 million. Taking into account the 5-year conversion period, DOE expects conversion costs to be less than 1 percent of conversion period revenue.[210]

5. Significant Alternatives Considered and Steps Taken To Minimize Significant Economic Impacts on Small Entities

The discussion in the previous section analyzes impacts on small businesses that would result from adopted standards, represented by TSL 2. In reviewing alternatives to the adopted standards, DOE examined energy conservation standards set at lower efficiency levels. While TSL 1 would reduce the impacts on small business manufacturers, it would come at the expense of a reduction in energy savings. TSL 1 achieves 98-percent lower energy savings compared to the energy savings at TSL 2.

Based on the presented discussion, establishing standards at TSL 2 balances the benefits of the energy savings with the potential burdens placed on consumer water heater manufacturers, including small business manufacturers. Accordingly, DOE does not adopt one of the other TSLs considered in the analysis, nor the other policy alternatives examined as part of the regulatory impact analysis and included in chapter 17 of the final rule TSD.

Additional compliance flexibilities may be available through other means. EPCA provides that a manufacturer whose annual gross revenue from all its operations does not exceed $8 million may apply for an exemption from all or part of an energy conservation standard for a period not longer than 24 months after the effective date of a final rule establishing the standard. (42 U.S.C. 6295(t)) Additionally, manufacturers subject to DOE's energy efficiency standards may apply to DOE's Office of Hearings and Appeals for exception relief under certain circumstances. Manufacturers should refer to 10 CFR part 430, subpart E, and 10 CFR part 1003 for additional details.

C. Review Under the Paperwork Reduction Act

Manufacturers of consumer water heaters must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their products according to the DOE test procedures for consumer water heaters, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including consumer water heaters. (*See* generally 10 CFR part 429). The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (''PRA''). This requirement has been approved by OMB under OMB control number 1910–1400. Public reporting burden for the certification is estimated to average 35 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the

[209] DOE calculated total conversion costs as a percent of revenue over the 5-year conversion period using the following calculation: ($0.25 million)/(5 years × $50 million).

[210] DOE calculated total conversion costs as a percent of revenue over the 5-year conversion period using the following calculation: ($6,000)/(5 years × $7,700,000).

data needed, and completing and reviewing the collection of information.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

Pursuant to the National Environmental Policy Act of 1969 (''NEPA''), DOE has analyzed this proposed action rule in accordance with NEPA and DOE's NEPA implementing regulations (10 CFR part 1021). DOE has determined that this rule qualifies for categorical exclusion under 10 CFR part 1021, subpart D, appendix B5.1 because it is a rulemaking that establishes energy conservation standards for consumer products or industrial equipment, none of the exceptions identified in B5.1(b) apply, no extraordinary circumstances exist that require further environmental analysis, and it meets the requirements for application of a categorical exclusion. *See* 10 CFR 1021.410. Therefore, DOE has determined that promulgation of this rule is not a major Federal action significantly affecting the quality of the human environment within the meaning of NEPA and does not require an environmental assessment or an environmental impact statement.

E. Review Under Executive Order 13132

E.O. 13132, ''Federalism,'' 64 FR 43255 (Aug. 10, 1999), imposes certain requirements on Federal agencies formulating and implementing policies or regulations that preempt State law or that have federalism implications. The Executive order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735.

In the July 2023 NOPR, DOE tentatively determined that the proposed rule would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. 88 FR 49058, 49170. Furthermore, DOE stated that EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of the proposed rule and that States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. *Id.* (citing 42 U.S.C. 6297). Accordingly, DOE concluded that no further action was required by E.O. 13132.

As initially discussed in section III.A.2 of this document, the Attorney General of TN commented that the proposed standards have significant federalism implications within the meaning of Executive Order 13132 because: (1) DOE's standards have a preemptive effect on States' procurement standards; and (2) States own and purchase water heaters and therefore the proposed standards' effect on water heater costs directly affect States as purchasers. (Attorney General of TN, No. 1149 at pp. 2–3)

DOE reiterates that this final rule does not have significant federalism implications. DOE has examined this rule and has determined that it would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of this final rule. Additionally, Federal energy efficiency requirements for covered products established under EPCA, including consumer water heaters, generally supersede State laws and regulations concerning energy conservation testing, labeling, and standards. (42 U.S.C. 6297(a)–(c)) States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297) Therefore, no further action is required by Executive Order 13132.

Even if DOE were to find otherwise, with regards to the Attorney General of TN's arguments regarding E.O. 13132, DOE notes that the Attorney General of TN does not provide any examples of a state procurement rule that conflicts with the standards adopted in this rulemaking and DOE is not aware of any such conflicts, nor has the Attorney General of TN provided any examples of States owning and purchasing a substantial number of consumer water heaters. While it is possible that a State may have to revise its procurement standards to reflect the new standards, States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. Absent such information, DOE concludes that no further action would be required by E.O. 13132 even if the Executive order were applicable here. Moreover, assuming the hypothetical preemption alleged by the Attorney General of TN were to present itself, DOE notes that, like all interested parties, states were presented with an opportunity to engage in the rulemaking process early in the development of the proposed rule. Prior to publishing the proposed rulemaking, on May 21, 2020, DOE published and sought public comment on an RFI to collect data and information to help DOE determine whether any new or amended standards for consumer water heaters would result in a significant amount of additional energy savings and whether those standards would be technologically feasible and economically justified. 85 FR 30853. DOE then published a notice of public meeting and availability of the preliminary TSD on March 1, 2022, and sought public comment again. 87 FR 11327. DOE then held a public meeting on April 12, 2022, to discuss and receive comments on the preliminary TSD, which was open to the public, including state agencies. As such, states were provided the opportunity for meaningful and substantial input as envisioned by the Executive order.

F. Review Under Executive Order 12988

With respect to the review of existing regulations and the promulgation of new regulations, section 3(a) of E.O. 12988, ''Civil Justice Reform,'' imposes on Federal agencies the general duty to adhere to the following requirements: (1) eliminate drafting errors and ambiguity, (2) write regulations to minimize litigation, (3) provide a clear legal standard for affected conduct rather than a general standard, and (4) promote simplification and burden reduction. 61 FR 4729 (Feb. 7, 1996). Regarding the review required by section 3(a), section 3(b) of E.O. 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation (1) clearly specifies the preemptive effect, if any, (2) clearly specifies any effect on existing Federal law or regulation, (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction, (4) specifies the retroactive effect, if any, (5) adequately defines key terms, and (6) addresses other important issues

affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of E.O. 12988 requires Executive agencies to review regulations in light of applicable standards in section 3(a) and section 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, this final rule meets the relevant standards of E.O. 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (''UMRA'') requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104–4, sec. 201 (codified at 2 U.S.C. 1531). For a regulatory action likely to result in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of $100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a),(b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a ''significant intergovernmental mandate,'' and requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect them. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820. DOE's policy statement is also available at *energy.gov/sites/prod/files/gcprod/documents/umra_97.pdf*.

DOE has concluded that this final rule may require expenditures of $100 million or more in any one year by the private sector. Such expenditures may include (1) investment in research and development and in capital expenditures by consumer water heater manufacturers in the years between the final rule and the compliance date for the new standards, and (2) incremental additional expenditures by consumers to purchase higher-efficiency consumer water heaters, starting at the compliance date for the applicable standard.

Section 202 of UMRA authorizes a Federal agency to respond to the content requirements of UMRA in any other statement or analysis that accompanies the final rule. (2 U.S.C. 1532(c)) The content requirements of section 202(b) of UMRA relevant to a private sector mandate substantially overlap the economic analysis requirements that apply under section 325(o) of EPCA and Executive Order 12866. The **SUPPLEMENTARY INFORMATION** section of this document and the TSD for this final rule respond to those requirements.

Under section 205 of UMRA, DOE is obligated to identify and consider a reasonable number of regulatory alternatives before promulgating a rule for which a written statement under section 202 is required. (2 U.S.C. 1535(a)) DOE is required to select from those alternatives the most cost-effective and least burdensome alternative that achieves the objectives of the rule unless DOE publishes an explanation for doing otherwise, or the selection of such an alternative is inconsistent with law. As required by 42 U.S.C. 6295(m), this final rule establishes new and amended energy conservation standards for consumer water heaters that are designed to achieve the maximum improvement in energy efficiency that DOE has determined to be both technologically feasible and economically justified, as required by 6295(o)(2)(A) and 6295(o)(3)(B). A full discussion of the alternatives considered by DOE is presented in chapter 17 of the TSD for this final rule.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any proposed rule or policy that may affect family well-being. Although this final rule would not have any impact on the autonomy or integrity of the family as an institution as defined, this rule could impact a family's well-being. When developing a Family Policymaking Assessment, agencies must assess whether: (1) the action strengthens or erodes the stability or safety of the family and, particularly, the marital commitment; (2) the action strengthens or erodes the authority and rights of parents in the education, nurture, and supervision of their children; (3) the action helps the family perform its functions, or substitutes governmental activity for the function; (4) the action increases or decreases disposable income or poverty of families and children; (5) the proposed benefits of the action justify the financial impact on the family; (6) the action may be carried out by State or local government or by the family; and whether (7) the action establishes an implicit or explicit policy concerning the relationship between the behavior and personal responsibility of youth, and the norms of society.

DOE has considered how the benefits of this rule compare to the possible financial impact on a family (the only factor listed that is relevant to this rule). As part of its rulemaking process, DOE must determine whether the energy conservation standards contained in this final rule are economically justified. As discussed in section V.C.1 of this document, DOE has determined that the standards are economically justified because the benefits to consumers far outweigh the costs to manufacturers. Families will also see LCC savings as a result of this rule. Moreover, as discussed further in section V.B.1 of this document, DOE has determined that for the for low-income households, average LCC savings and PBP at the considered efficiency levels are improved (*i.e.,* higher LCC savings and lower payback period) as compared to the average for all households. Further, the standards will also result in climate and health benefits for families.

I. Review Under Executive Order 12630

Pursuant to E.O. 12630, ''Governmental Actions and Interference with Constitutionally Protected Property Rights,'' 53 FR 8859 (March 18, 1988), DOE has determined that this rule would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under the Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516, note) provides for Federal agencies to review most disseminations of information to the public under information quality guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE's guidelines were published at 67 FR 62446 (Oct. 7, 2002). Pursuant to OMB Memorandum M–19–15, Improving Implementation of the Information Quality Act (April 24, 2019), DOE published updated guidelines which are available at *www.energy.gov/sites/prod/files/7=2019/12/f70/DOE%20Final%20Updated%20IQA%20Guidelines%20Dec%202019.pdf*. DOE has reviewed this final rule under the OMB and DOE guidelines and has

concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

E.O. 13211, ''Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,'' 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OIRA at OMB, a Statement of Energy Effects for any significant energy action. A ''significant energy action'' is defined as any action by an agency that promulgates or is expected to lead to promulgation of a final rule, and that (1) is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a significant adverse effect on the supply, distribution, or use of energy, or (3) is designated by the Administrator of OIRA as a significant energy action. For any significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use should the proposal be implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

DOE has concluded that this regulatory action, which sets forth new and amended energy conservation standards for consumer water heaters, is not a significant energy action because the standards are not likely to have a significant adverse effect on the supply, distribution, or use of energy, nor has it been designated as such by the Administrator at OIRA. Accordingly, DOE has not prepared a Statement of Energy Effects on this final rule.

L. Information Quality

On December 16, 2004, OMB, in consultation with the Office of Science and Technology Policy (''OSTP''), issued its Final Information Quality Bulletin for Peer Review (''the Bulletin''). 70 FR 2664 (Jan. 14, 2005). The Bulletin establishes that certain scientific information shall be peer reviewed by qualified specialists before it is disseminated by the Federal Government, including influential scientific information related to agency regulatory actions. The purpose of the Bulletin is to enhance the quality and credibility of the Government's scientific information. Under the Bulletin, the energy conservation standards rulemaking analyses are ''influential scientific information,'' which the Bulletin defines as ''scientific information the agency reasonably can determine will have, or does have, a clear and substantial impact on important public policies or private sector decisions.'' 70 FR 2664, 2667.

In response to OMB's Bulletin, DOE conducted formal peer reviews of the energy conservation standards development process and the analyses that are typically used and prepared a report describing that peer review.[211] Generation of this report involved a rigorous, formal, and documented evaluation using objective criteria and qualified and independent reviewers to make a judgment as to the technical/scientific/business merit, the actual or anticipated results, and the productivity and management effectiveness of programs and/or projects. Because available data, models, and technological understanding have changed since 2007, DOE has engaged with the National Academy of Sciences to review DOE's analytical methodologies to ascertain whether modifications are needed to improve DOE's analyses. DOE is in the process of evaluating the resulting report.[212]

M. Congressional Notification

As required by 5 U.S.C. 801, DOE will report to Congress on the promulgation of this rule prior to its effective date. The Office of Information and Regulatory Affairs has determined that this rule meets the criteria set forth in 5 U.S.C. 804(2).

VII. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this final rule.

List of Subjects

10 CFR Part 429

Administrative practice and procedure, Confidential business information, Energy conservation, Household appliances, Reporting and recordkeeping requirements.

10 CFR Part 430

Administrative practice and procedure, Confidential business information, Energy conservation, Household appliances, Imports, Intergovernmental relations, Reporting and recordkeeping requirements, and Small businesses.

Signing Authority

This document of the Department of Energy was signed on April 24, 2024, by Jeffrey Marootian Principal Deputy Assistant Secretary for Energy Efficiency and Renewable Energy, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE Federal Register Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. This administrative process in no way alters the legal effect of this document upon publication in the **Federal Register**.

Signed in Washington, DC, on April 24, 2024.

Treena V. Garrett,

Federal Register Liaison Officer, U.S. Department of Energy.

For the reasons set forth in the preamble, DOE amends parts 429 and 430 of chapter II, subchapter D, of title 10 of the Code of Federal Regulations, as set forth below:

PART 429—CERTIFICATION, COMPLIANCE, AND ENFORCEMENT FOR CONSUMER PRODUCTS AND COMMERCIAL AND INDUSTRIAL EQUIPMENT

■ 1. The authority citation for part 429 continues to read as follows:

Authority: 42 U.S.C. 6291–6317; 28 U.S.C. 2461 note.

■ 2. Amend § 429.17 by revising paragraph (a)(1)(ii)(C) and adding paragraph (a)(1)(ii)(E) to read as follows:

§ 429.17 Water heaters.

(a) * * *

(1) * * *

(ii) * * *

(C) Any represented value of the rated storage volume must be equal to the mean of the measured storage volumes of all the units within the sample. Any represented value of the effective storage volume must be equal to the mean of the effective storage volumes of all the units within the sample.

* * * * *

(E) For an electric storage water heater that has a permanent mode or setting in which it is capable of heating and storing water above 135 °F, where permanent mode or setting means a mode of operation that is continuous and does not require any external consumer intervention to maintain for longer than 120 hours, except for those that meet the definition of ''heat pump-type'' water heater at § 430.2 of this chapter, whose rated storage volumes

[211] The 2007 ''Energy Conservation Standards Rulemaking Peer Review Report'' is available at the following website: *energy.gov/eere/buildings/downloads/energy-conservation-standards-rulemaking-peer-review-report-0* (last accessed April 1, 2023).

[212] The report is available at *www.nationalacademies.org/our-work/review-of-methods-for-setting-building-and-equipment-performance-standards.*

are less than 20 gallons or greater than 55 gallons, or that are only capable of heating the stored water above 135 °F in response to instructions received from a utility or third-party demand-response program, the following applies:

(*1*) To demonstrate compliance with the energy conservation standards in § 430.32(d)(1) of this chapter, any represented value of uniform energy factor shall be determined based on testing in accordance with section 5.1.1 of appendix E to subpart B of 10 CFR part 430.

(*2*) To demonstrate compliance with the energy conservation standards in § 430.32(d)(2) of this chapter, any represented value of uniform energy factor shall be determined based on high temperature testing in accordance with section 5.1.2 of appendix E to subpart B of 10 CFR part 430.

* * * * *

■ 3. Amend § 429.134 by adding paragraph (d)(4) to read as follows:

§ 429.134 Product-specific enforcement provisions.

* * * * *

(d) * * *

(4) *Circulating water heaters.* A storage tank for testing will be selected as described in paragraphs (d)(4)(i) and (ii) of this section. The effective storage volume of the circulating water heater determined in testing will be measured in accordance with appendix E to subpart B of 10 CFR part 430 with the storage tank that is used for testing.

(i) *Electric heat pump circulating water heaters.* For UEF and first-hour rating testing, electric heat pump circulating water heaters will be tested with a minimally-compliant electric storage water heater (as defined at § 430.2 of this chapter) that has a rated storage volume of between 25 and 35 gallons, and is in the low draw pattern, as determined in accordance with appendix E to subpart B of 10 CFR part 430 and the standards set at § 430.32(d) of this chapter. If the manufacturer certifies the specific model of electric storage water heater used for testing to determine the certified UEF and first-hour rating of the electric heat pump circulating water heater, that model of electric storage water heater will be used for testing. If this is not possible (such as if the electric storage water heater model is no longer available or has been discontinued), testing will be performed with an electric storage water heater that has a minimally-compliant UEF rating, in the low draw pattern, and a rated storage volume that is within ± 3 gallons of the rated storage volume of the electric storage water heater used to determine the certified ratings of the electric heat pump circulating water heater (but not less than 25 gallons and not greater than 35 gallons). If no such model is available, then testing will be performed with a minimally-compliant electric storage water heater that has a rated storage volume of between 25 and 35 gallons and is in the low draw pattern.

(ii) *All other circulating water heaters.* For UEF and first-hour rating testing, circulating water heaters are paired with unfired hot water storage tanks (''UFHWSTs'') that have certified storage volumes between 80 and 120 gallons and are at exactly the minimum thermal insulation standard, in terms of R-value, for UFHWSTs, as per the standards set at § 431.110(a) of this chapter. Testing will be performed as follows:

(A) If the manufacturer certifies the specific model of UFHWST used for testing to determine the certified UEF and first-hour rating of the circulating water heater, that model of UFHWST will be used for testing.

(B) If it is not possible to perform testing with the same model of UFHWST certified by the manufacturer, testing will be carried out with a different model of UFHWST accordingly:

(1) Testing will be performed with an UFHWST from the same manufacturer as the certified UFHWST, with the same certified storage volume as the certified UFHWST, and with a certified R-value that meets but does not exceed the standard set at § 431.110(a) of this chapter. If this is not possible,

(2) Testing will be performed with an UFHWST from a different manufacturer than the certified UFHWST, with the same certified storage volume as the certified UFHWST, and with a certified R-value that meets but does not exceed the standard set at § 431.110(a) of this chapter. If this is not possible,

(3) Testing will be performed with an UFHWST from the same manufacturer as the certified UFHWST, having a certified storage volume within ±5 gallons of the certified UFHWST, and with a certified R-value that meets but does not exceed the standard set at § 431.110(a) of this chapter. If this is not possible,

(4) Testing will be performed with an UFHWST from a different manufacturer than the certified UFHWST, having a certified storage volume within ±5 gallons of the certified UFHWST, and with a certified R-value that meets but does not exceed the standard set at § 431.110(a) of this chapter. If this is not possible,

(5) Testing will be performed with an UFHWST having a certified storage volume between 80 gallons and 120 gallons and with a certified R-value that meets but does not exceed the standard set at § 431.110(a) of this chapter.

* * * * *

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

■ 4. The authority citation for part 430 continues to read as follows:

Authority: 42 U.S.C. 6291–6309; 28 U.S.C. 2461 note.

■ 5. Amend § 430.2 by:
■ a. Revising the definition of ''Circulating water heater'';
■ b. Adding in alphabetical order the definitions of ''Electric circulating water heater'', ''Gas-fired circulating water heater'', and ''Oil-fired circulating water heater''; and
■ c. Revising the definition of ''Tabletop water heater''.

The revisions and additions read as follows:

§ 430.2 Definitions.

* * * * *

Circulating water heater means a water heater that does not have an operational scheme in which the burner, heating element, or compressor initiates and/or terminates heating based on sensing flow; has a water temperature sensor located at the inlet or the outlet of the water heater or in a separate storage tank that is the primary means of initiating and terminating heating; and must be used in combination with a recirculating pump to circulate water and either a separate storage tank or water circulation loop in order to achieve the water flow and temperature conditions recommended in the manufacturer's installation and operation instructions. A circulating water heater constitutes a storage-type water heater.

* * * * *

Electric circulating water heater means a circulating water heater with an input of 12 kW or less (including heat pump-only units with power inputs of no more than 24 A at 250 V).

* * * * *

Gas-fired circulating water heater means a circulating water heater with a nominal input of 75,000 Btu/h or less.

* * * * *

Oil-fired circulating water heater means a circulating water heater with a nominal input of 105,000 Btu/h or less.

* * * * *

Tabletop water heater means a water heater in a rectangular box enclosure

designed to slide into a kitchen countertop space with typical dimensions of 36 inches high, 25 inches deep, and 24 inches wide, and with a certified first-hour rating that results in either the very small draw pattern or the low draw pattern, as specified in Table I in section 5.4.1 of appendix E to subpart B of this part.

* * * * *

■ 6. Amend § 430.23 by revising paragraph (e) to read as follows:

§ 430.23 Test procedures for the measurement of energy and water consumption.

* * * * *

(e) *Water heaters.* (1) The estimated annual operating cost is calculated as:

(i) For a gas-fired or oil-fired water heater, the sum of:

(A) The product of the annual gas or oil energy consumption, determined according to section 6.3.11 or 6.4.7 of appendix E to this subpart, times the representative average unit cost of gas or oil, as appropriate, in dollars per Btu as provided by the Secretary; plus

(B) The product of the annual electric energy consumption, determined according to section 6.3.10 or 6.4.6 of appendix E to this subpart, times the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary. Round the resulting sum to the nearest dollar per year.

(ii) For an electric water heater, the product of the annual energy consumption, determined according to section 6.3.10 or 6.4.6 of appendix E to this subpart, times the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary. Round the resulting product to the nearest dollar per year.

(2) For an individual unit, the uniform energy factor is rounded to the nearest 0.01 and determined in accordance with section 6.3.8 or section 6.4.4 of appendix E to this subpart.

* * * * *

■ 7. Appendix E to subpart B is amended by revising the Note and sections 1.19, 4.10, 5.1.2 and 5.2.1 to read as follows:

APPENDIX E TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF WATER HEATERS

Note: Prior to December 18, 2023, representations with respect to the energy use or efficiency of consumer water heaters covered by this test method, including compliance certifications, must be based on testing conducted in accordance with either this appendix as it now appears or appendix E as it appeared at 10 CFR part 430, subpart B revised as of January 1, 2021. Prior to June 15, 2024, representations with respect to the energy use or efficiency of residential-duty commercial water heaters covered by this test method, including compliance certifications, must be based on testing conducted in accordance with either this appendix as it now appears or appendix E as it appeared at 10 CFR part 430, subpart B revised as of January 1, 2021.

On and after December 18, 2023, representations with respect to energy use or efficiency of consumer water heaters covered by this test method, including compliance certifications, must be based on testing conducted in accordance with this appendix, except as described in the paragraphs that follow. On and after June 15, 2024, representations with respect to energy use or efficiency of residential-duty commercial water heaters covered by this test method, including compliance certifications, must be based on testing conducted in accordance with this appendix, except as follows.

Prior to May 6, 2029, consumer water heaters subject to section 4.10 of this appendix may optionally apply the requirements of section 4.10 of this appendix. For residential-duty commercial water heaters subject to section 4.10 of this appendix the requirements of section 4.10 of this appendix may optionally be applied prior to the compliance date of any final rule reviewing potential amended energy conservation standards for this equipment published after June 21, 2023.

Prior to May 6, 2029, consumer water heaters subject to section 5.1.2 of this appendix (as specified at § 429.17(a)(1)(ii)(E) of this chapter) may optionally apply the requirements of section 5.1.2 of this appendix in lieu of the requirements in section 5.1.1 of this appendix.

On or after May 6, 2029, representations with respect to energy use or efficiency of consumer water heaters subject to sections 4.10 and 5.1.2 of this appendix must be based on testing conducted in accordance with those provisions.

* * * * *

1. * * *

1.19 *Water Heater Requiring a Storage Tank* means a water heater without a storage tank supplied by the manufacturer that cannot meet the requirements of sections 2 and 5 of this appendix without the use of a storage water heater or unfired hot water storage tank.

* * * * *

4. * * *

4.10 *Storage Tank Requirement for Water Heaters Requiring a Storage Tank (i.e., Circulating Water Heaters).* On or after May 6, 2029, when testing a gas-fired, oil-fired, or electric resistance circulating water heater (*i.e.,* any circulating water heater that does not use a heat pump), the tank to be used for testing shall be an unfired hot water storage tank having volume between 80 and 120 gallons (364–546 liters) determined using the method specified in section 5.2.1 of this appendix that meets but does not exceed the minimum energy conservation standards required according to § 431.110 of this chapter. When testing a heat pump circulating water heater, the tank to be used for testing shall be an electric storage water heater that has a measured volume of 30 gallons (±5 gallons), has a First-Hour Rating less than 51 gallons resulting in classification under the low draw pattern, and has a rated UEF equal to the minimum UEF standard specified at § 430.32(d), rounded to the nearest 0.01. The operational mode of the heat pump circulating water heater and storage water heater paired system shall be set in accordance with section 5.1.1 of this appendix. If the circulating water heater is supplied with a separate non-integrated circulating pump, install this pump as per the manufacturer's installation instructions and include its power consumption in energy use measurements.

* * * * *

5. * * *

5.1.2 *High Temperature Testing.* This paragraph applies to electric storage water heaters capable of achieving a $T_{max,1}$ above 135 °F. The following exceptions apply:

(1) Electric storage water heaters that do not have a permanent mode or setting in which the water heater is capable of heating and storing water above 135 °F (as measured by $T_{max,1}$), where permanent mode or setting means a mode of operation that is continuous and does not require any external consumer intervention to maintain for longer than 120 hours;

(2) Electric storage water heaters that meet the definition of ''heat pump-type'' water heater at § 430.2;

(3) Electric storage water heaters that are only capable of heating the stored water above 135 °F in response to instructions received from a utility or third-party demand-response program.

(4) Electric storage water heaters with measured storage volumes (V_{st}) less than 20 gallons or greater than 55 gallons.

This paragraph may optionally apply to electric heat pump water heaters for voluntary representations of high-temperature operation only.

For those equipped with factory-installed or built-in mixing valves, set the unit to maintain the highest mean tank temperature possible while delivering water at 125 °F ±5 °F. For those not so equipped, install an ASSE 1017-certified mixing valve in accordance with the provisions in section 4.3 of this appendix and adjust the valve to deliver water at 125 °F ±5 °F when the water heater is operating at its highest storage tank temperature setpoint. Maintain this setting throughout the entirety of the test.

* * * * *

5.2 * * *2.1 *Determination of Storage Tank Volume.* For water heaters and separate storage tanks used for testing circulating water heaters, determine the storage capacity, $V_{st,}$ of the water heater or separate storage tank under test, in gallons (liters), by subtracting the tare weight, W_t, (measured while the tank is empty) from the gross weight of the storage tank when completely filled with water at the supply water temperature specified in section 2.3 of this appendix, W_f, (with all air eliminated and line pressure applied as described in section 2.6 of this appendix) and dividing the

resulting net weight by the density of water at the measured temperature.

* * * * *

■ 8. Amend § 430.32 by revising paragraph (d) to read as follows:

§ 430.32 Energy and water conservation standard and their compliance dates.

* * * * *

(d) *Water Heaters.* (1) The uniform energy factor of water heaters manufactured May 6, 2029 shall not be less than the following:

Product class	Rated storage volume and input rating (*if applicable*)	Draw pattern	Uniform energy factor [1]
Gas-fired Storage Water Heater	≥20 gal and ≤55 gal	Very Small	$0.3456 - (0.0020 \times V_r)$
		Low	$0.5982 - (0.0019 \times V_r)$
		Medium	$0.6483 - (0.0017 \times V_r)$
		High	$0.6920 - (0.0013 \times V_r)$
	>55 gal and ≤100 gal	Very Small	$0.6470 - (0.0006 \times V_r)$
		Low	$0.7689 - (0.0005 \times V_r)$
		Medium	$0.7897 - (0.0004 \times V_r)$
		High	$0.8072 - (0.0003 \times V_r)$
Oil-fired Storage Water Heater	≤50 gal	Very Small	$0.2509 - (0.0012 \times V_r)$
		Low	$0.5330 - (0.0016 \times V_r)$
		Medium	$0.6078 - (0.0016 \times V_r)$
		High	$0.6815 - (0.0014 \times V_r)$
Electric Storage Water Heaters	≥20 gal and ≤55 gal	Very Small	$0.8808 - (0.0008 \times V_r)$
		Low	$0.9254 - (0.0003 \times V_r)$
		Medium	$0.9307 - (0.0002 \times V_r)$
		High	$0.9349 - (0.0001 \times V_r)$
	>55 gal and ≤120 gal	Very Small	$1.9236 - (0.0011 \times V_r)$
		Low	$2.0440 - (0.0011 \times V_r)$
		Medium	$2.1171 - (0.0011 \times V_r)$
		High	$2.2418 - (0.0011 \times V_r)$
Tabletop Water Heater	≥20 gal and ≤120 gal	Very Small	$0.6323 - (0.0058 \times V_r)$
		Low	$0.9188 - (0.0031 \times V_r)$
		Medium	$0.9577 - (0.0023 \times V_r)$
		High	$0.9884 - (0.0016 \times V_r)$
Instantaneous Gas-fired Water Heater	<2 gal and >50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	<2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92
Grid-enabled Water Heater	>75 gal	Very Small	$1.0136 - (0.0028 \times V_r)$
		Low	$0.9984 - (0.0014 \times V_r)$
		Medium	$0.9853 - (0.0010 \times V_r)$
		High	$0.9720 - (0.0007 \times V_r)$

[1] V_r is the rated storage volume (in gallons), as determined pursuant to § 429.17 of this chapter.

(2) The uniform energy factor of water heaters manufactured on or after May 6, 2029 shall not be less than the following:

Product class	Rated storage volume and input rating (*if applicable*)	Draw pattern	Uniform energy factor [1]
Gas-fired Storage Water Heater	<20 gal	Very Small	$0.2062 - (0.0020 \times V_{eff})$
		Low	$0.4893 - (0.0027 \times V_{eff})$
		Medium	$0.5758 - (0.0023 \times V_{eff})$
		High	$0.6586 - (0.0020 \times V_{eff})$
	≥20 gal and ≤55 gal	Very Small	$0.3925 - (0.0020 \times V_{eff})$
		Low	$0.6451 - (0.0019 \times V_{eff})$
		Medium	$0.7046 - (0.0017 \times V_{eff})$
		High	$0.7424 - (0.0013 \times V_{eff})$
	>55 gal and ≤100 gal	Very Small	$0.6470 - (0.0006 \times V_{eff})$
		Low	$0.7689 - (0.0005 \times V_{eff})$
		Medium	$0.7897 - (0.0004 \times V_{eff})$
		High	$0.8072 - (0.0003 \times V_{eff})$
	>100 gal	Very Small	$0.1482 - (0.0007 \times V_{eff})$
		Low	$0.4342 - (0.0017 \times V_{eff})$
		Medium	$0.5596 - (0.0020 \times V_{eff})$
		High	$0.6658 - (0.0019 \times V_{eff})$
Oil-fired Storage Water Heater	≤50 gal	Very Small	$0.2909 - (0.0012 \times V_{eff})$
		Low	$0.5730 - (0.0016 \times V_{eff})$

Product class	Rated storage volume and input rating (*if applicable*)	Draw pattern	Uniform energy factor [1]
	.....	Medium	0.6478 − (0.0016 × V_{eff})
	.....	High	0.7215 − (0.0014 × V_{eff})
	> 50 gal	Very Small	0.1580 − (0.0009 × V_{eff})
	.....	Low	0.4390 − (0.0020 × V_{eff})
	.....	Medium	0.5389 − (0.0021 × V_{eff})
	.....	High	0.6172 − (0.0018 × V_{eff})
Very Small Electric Storage Water Heater	< 20 gal	Very Small	0.5925 − (0.0059 × V_{eff})
	.....	Low	0.8642 − (0.0030 × V_{eff})
	.....	Medium	0.9096 − (0.0020 × V_{eff})
	.....	High	0.9430 − (0.0012 × V_{eff})
Small Electric Storage Water Heater	≥20 gal and ≤35 gal	Very Small	0.8808 − (0.0008 × V_{eff})
	.....	Low	0.9254 − (0.0003 × V_{eff})
Electric Storage Water Heaters	>20 and ≤55 gal (excluding small electric storage water heaters).	Very Small	2.30
	.....	Low	2.30
	.....	Medium	2.30
	.....	High	2.30
	>55 gal and ≤120 gal	Very Small	2.50
	.....	Low	2.50
	.....	Medium	2.50
	.....	High	2.50
	>120 gal	Very Small	0.3574 − (0.0012 × V_{eff})
	.....	Low	0.7897 − (0.0019 × V_{eff})
	.....	Medium	0.8884 − (0.0017 × V_{eff})
	.....	High	0.9575 − (0.0013 × V_{eff})
Tabletop Water Heater	<20 gal	Very Small	0.5925 − (0.0059 × V_{eff})
	.....	Low	0.8642 − (0.0030 × V_{eff})
	≥20 gal	Very Small	0.6323 − (0.0058 × V_{eff})
	.....	Low	0.9188 − (0.0031 × V_{eff})
Instantaneous Oil-fired Water Heater	<2 gal and ≤210,000 Btu/h	Very Small	0.61
	.....	Low	0.61
	.....	Medium	0.61
	.....	High	0.61
	≥2 gal and ≤210,000 Btu/h	Very Small	0.2780 − (0.0022 × V_{eff})
	.....	Low	0.5151 − (0.0023 × V_{eff})
	.....	Medium	0.5687 − (0.0021 × V_{eff})
	.....	High	0.6147 − (0.0017 × V_{eff})
Instantaneous Electric Water Heater	<2 gal	Very Small	0.91
	.....	Low	0.91
	.....	Medium	0.91
	.....	High	0.92
	≥2 gal	Very Small	0.8086 − (0.0050 × V_{eff})
	.....	Low	0.9123 − (0.0020 × V_{eff})
	.....	Medium	0.9252 − (0.0015 × V_{eff})
	.....	High	0.9350 − (0.0011 × V_{eff})
Grid-Enabled Water Heater	>75 gal	Very Small	1.0136 − (0.0028 × V_{eff})
	.....	Low	0.9984 − (0.0014 × V_{eff})
	.....	Medium	0.9853 − (0.0010 × V_{eff})
	.....	High	0.9720 − (0.0007 × V_{eff})

[1] V_{eff} is the Effective Storage Volume (in gallons), as determined pursuant to § 429.17 of this chapter.

(3) The provisions of paragraph (d) of this section are separate and severable from one another. Should a court of competent jurisdiction hold any provision(s) of paragraph (d) of this section to be stayed or invalid, such action shall not affect any other provision of paragraph (d) of this section.

* * * * *

Note: The following letter will not appear in the Code of Federal Regulations.

October 12, 2023

U.S. DEPARTMENT OF JUSTICE,
Antitrust Division, Ami Grace-Tardy,
Assistant General Counsel for Legislation, Regulation and Energy Efficiency, U.S. Department of Energy, Washington, DC 20585

Re: Energy Conservation Standards for Consumer Water Heaters DOE Docket No. EERE–2017–BT–STD–0019

Dear Assistant General Counsel Grace-Tardy:

I am responding to your August 23, 2023 letter seeking the views of the Attorney General about the potential impact on competition of proposed energy conservation standards for consumer water heaters.

Your request was submitted under Section 325(o)(2)(B)(i)(V) of the Energy Policy and Conservation Act, as amended (ECPA), 42 U.S.C. 6295(o)(2)(B)(i)(V), which requires the Attorney General to determine the impact of any lessening of competition that is likely to result from the imposition of proposed energy conservation standards. The Attorney General's responsibility for responding to requests from other departments about the effect of a program on competition has been delegated to the Assistant Attorney General for the Antitrust Division in 28 CFR 0.40(g). The Assistant Attorney General for the

Antitrust Division has authorized me, as the Policy Director for the Antitrust Division, to provide the Antitrust Division's views regarding the potential impact on competition of proposed energy conservation standards on his behalf.

In conducting its analysis, the Antitrust Division examines whether a proposed standard may lessen competition, for example, by substantially limiting consumer choice, by placing certain manufacturers at an unjustified competitive disadvantage, or by inducing avoidable inefficiencies in production or distribution of particular products. A lessening of competition could result in higher prices to manufacturers and consumers.

We have reviewed the proposed standards contained in the notice of proposed rulemaking (''NOPR'') (88 FR 49058, July 28, 2023) and the related Technical Support Document. We have also reviewed public comments and information provided by industry participants and have reviewed the transcript and information presented at the Webinar of the Public Meeting held on September 13, 2023. Based on this review, we do not have an evidentiary basis to conclude that the proposed energy conservation standards for consumer water heaters are likely to substantially lessen competition.

Sincerely,

David G.B. Lawrence,

Policy Director.

BILLING CODE 6450–01–P

FEDERAL REGISTER

Vol. 89 Monday,
No. 88 May 6, 2024

Part VII

Agency for International Development

48 CFR Parts 727, 742, and 752
USAID Acquisition Regulation: Planning, Collection, and Submission of Digital Information; Submission of Activity Monitoring, Evaluation, and Learning Plan to USAID; Final Rule

AGENCY FOR INTERNATIONAL DEVELOPMENT

48 CFR Parts 727, 742, and 752

RIN 0412–AA90

USAID Acquisition Regulation: Planning, Collection, and Submission of Digital Information; Submission of Activity Monitoring, Evaluation, and Learning Plan to USAID

AGENCY: U.S. Agency for International Development.

ACTION: Final rule.

SUMMARY: The United States Agency for International Development (USAID) issuing a final rule amending USAID Acquisition Regulation (AIDAR) that implements USAID requirements for managing digital information as a strategic asset to inform the planning, design, implementation, monitoring, and evaluation of the Agency's foreign assistance programs. This final rule incorporates a new policy on Digital Information Planning, Collection, and Submission Requirements and the corresponding clause as well as a new clause entitled ''Activity Monitoring, Evaluation, and Learning Plan Requirements'' into the (AIDAR). This final rule is intended to reduce the burden on contractors, increase efficiency, and improve the use of data and other forms of digital information across the Agency's programs and operations.

DATES: Effective June 5, 2024.

FOR FURTHER INFORMATION CONTACT: Kelly Miskowski, USAID M/OAA/P, at 202–256–7378 or *policymailbox@usaid.gov* for clarification of content or information pertaining to status or publication schedules. All communications regarding this rule must cite AIDAR RIN No. 0412–AA90.

SUPPLEMENTARY INFORMATION:

A. Background

USAID published a proposed rule in the **Federal Register** at 86 FR 71216 on December 15, 2021, to implement USAID requirements for managing digital information as a strategic asset to inform the planning, design, implementation, monitoring, and evaluation of the Agency's foreign assistance programs as outlined in 48 CFR parts 727, 742, and 752. USAID also published a notice of availability of supplemental document containing data standards in the **Federal Register** at 88 FR 22990 on April 14, 2023, and solicited comments. A response to comments received as well as a revised copy of the supplemental document is included with this rulemaking.

On August 25, 2022, the Office of Science and Technology Policy (OSTP) published a Memorandum (viewable at this address: *https://www.whitehouse.gov/wp-content/uploads/2022/08/08-2022-OSTP-Public-Access-Memo.pdf*). In this memorandum, OSTP provided policy guidance to ensure that publications and their supporting data resulting from federally funded research are publicly accessible without an embargo on their free and public release. This memo was released after publication of the proposed rule. USAID's language around embargoes within this rule is intentionally flexible, granting embargoes on the release of digital objects only in limited circumstances, such as in the interest of international development and foreign policy objectives, consistent with both USAID and OSTP policy and guidance, and no changes have been made to the language of the rule as a result. In implementation, any approval of embargoes will be consistent with OSTP guidance.

B. Discussion and Analysis

Response to Comments on the Proposed Rule

Seventeen respondents submitted public comments in response to the proposed rule. USAID assessed the public comments in the development of the final rule. The full text of the comments is available at the Federal Rulemaking Portal, *www.regulations.gov.* A discussion of the comments and the changes made to the rule as a result of those comments are provided as follows:

1. Summary of Significant Changes

The following significant changes from the proposed rule are made in the final rule:

a. Added definitions for data inventory, digital, and digital method.

b. Revised applicability of 752.227–71 from the micro purchase threshold to the simplified acquisition threshold. Similarly, USAID has added an Alternate clause exempting certain contracts from the requirement to provide a data management plan. Specifically, contracts are exempted that: contain no data; are for emergency food assistance; are for disaster assistance, and transition-assistance activities managed by the Bureau for Humanitarian Assistance (BHA); or are for activities managed by the Bureau for Conflict Prevention and Stabilization's Office of Transition Initiatives (CPS/OTI).

c. The burden and cost estimates have been updated to reflect the changes outlined in paragraph b above, and the comments received related to this estimate are addressed in the revised Regulatory Impact Analysis. Additionally, comments regarding the number of respondents and whether the cost of design, testing, launch, and management of the Digital Front Door (DFD) website was subtracted are addressed as well.

d. Clarified the timeline for submission as outlined in AIDAR 752.227–71(f)(3)(i).

e. Various administrative amendments and clarifications have been added, such as revising references throughout the rule to indicate that the contracting officer, or contracting officer's representative if delegated, has authority to approve on behalf of USAID and renumbering of the AIDAR clause sections to conform with USAID numbering conventions.

2. Analysis of Public Comments

Below are the Agency's responses to comments on the changes proposed to United States Agency for International Development (USAID) Acquisition Regulation (AIDAR): Planning, Collection, and Submission of Digital Information as Well as Submission of Activity Monitoring, Evaluation, and Learning Plan to USAID. The Agency did not address comments unrelated to, or outside the scope of, the revisions of the proposed rule from the existing rule:

a. General Support for the Rule

1. *Comment:* Five respondents (7, 8, 9, 11, and 15) indicated general support for the rule. Some commenters noted that the rule will simplify reporting, reduce redundant data calls, and reduce the burden on contractors.

Response: USAID acknowledges the respondent's support for the rule.

b. Does Not Support the Rule

1. *Comment:* One respondent (16) did not support the rule, indicating that it will make it harder for contractors to act responsibly with data management of affected populations. Other commenters (11, 15) did not indicate a lack of support for the rule as a whole but did note that complex submission requirements may negatively impact local partners, small business, and potential market entrants due to potential cost and needed technical expertise.

Response: USAID acknowledges this feedback to the rule.

c. Data Rights and Protection

Several commenters (6, 7, 8, 11, 13, 14, 15, and 16) brought up issues around privacy, PII, publication, and informed consent, which are addressed in sub-categories as outlined below.

1. Access to Data and Data Rights—

A. *Comment:* Several commenters (6, 11, 13) inquired about whether the DFD will be public and available to other partners like the Development Experience Clearinghouse (DEC) and Development Data Library (DDL).

Response: The DFD is not its own system and is not intended to replace other systems. It is a public facing web page with centralized authentication that will direct users to the appropriate USAID systems for which they have authorized access. This includes but is not necessarily limited to the Development Information Solution (DIS), DEC, and DDL.

B. *Comment:* Commenter #8 specifically asked whether information that is exempt from the DFD (like PII) be submitted to USAID first as a restricted version before being scrubbed and sent to the DFD?

Response: The rule states that the contractor must not submit information to the DFD that contains personally identifiable information. And that to the maximum extent possible, the contractor must remove the association between the set of identifying data and the individual to which it applies unless retaining such information is essential to comply with the terms of the contract and upon written approval from the contracting officer or contracting officer's representative as delegated to submit this information. Otherwise, the ''Submission Requirements'' section states that contractors must ''submit digital information created or obtained in performance of this contract to USAID at the finest level of granularity at which it was collected.''

C. *Comment:* Commenter #16 questioned whether the contractor would be able to effectively restrict access to sensitive data without fear of losing funding.

Response: Some data might be exempted from submission under subsection (f)(4) of the clause, including as determined by the contracting officer or contracting officer's representative as delegated in (f)(4)(ii). The rule provides for categories of information not to submit to USAID. It further states that if the Contractor believes there is a compelling reason not to submit specific digital information that does not fall under an exemption in this section, including circumstances where submission may jeopardize the personal safety of any individual or group, the Contractor must obtain written approval not to submit the digital information from the contracting officer. Further specifics under an individual award may be discussed with a contracting officer.

D. *Comment:* Some commenters (11, 13) noted that they did not believe it was necessary (or questioned when circumstances would require) to provide copies of license agreements for digital information or media releases.

Response: USAID believes it is critical for USAID to have documentation regarding the licenses for the digital information submitted to the DFD so that USAID understands the license parameters for use of the data. As such, data licenses are a submission requirement in this rule.

2. Informed Consent

A. *Comment:* Commenter #16 noted that the rule appears to contemplate large collections of data for purposes that cannot be fully known, which will negate the ability for truly informed consent to be given.

Response: The contract itself will mandate the required information to be collected and requirements relating to human subjects research and USAID's data rights. The rule does not mandate new digital information collections but provides guidance on the management of the specific digital information collected under the contract. To the extent the contractually required collection triggers informed consent requirements under Human Subjects Research, this is governed by AIDAR 752.7012 (the Federal Policy for the Protection of Human Subjects (the ''Common Rule'').

B. *Comment:* Commenter #8 indicated if providing personal information is a requirement for participation in an activity (such as attending a training), then providing such information can no longer be considered ''voluntary.'' This commenter recommended that the rule explicitly address the rights of respondents/human subjects to voluntarily provide (or not provide) this data/PII or to otherwise restrict sharing of personal information.

Response: This rule does not address the provision of personal information as a precondition to receiving services. Existing informed consent requirements already address the voluntary provision of information when respondents elect to participate in human subjects research. Explicitly addressing the rights of respondents/human subjects is outside the scope of this rule. Please also refer to USAID's responses in C.4 of this section covering Protection of Information.

C. *Comment:* Two commenters (11, 13) noted that Ref (f)(1)(v) refers to AIDAR 752.7012; however, this only pertains to the protection of the individual as a research subject, which is not applicable to every contract.

Response: USAID has updated the rule to clarify that this requirement applies only when AIDAR 752.7012 is included in the contract. (See corresponding edits to 752.227–71(f)(1)(v)).

D. *Comment:* Commenter #14 requested clarity on 727.7002 Policy (b)(3) noting that it is unclear if USAID is requiring that the submission contain every signed consent form, an indication that each individual submitted consent, or just a blank copy of the form itself. They recommended adding clarifying language in 752.227–71.

Response: Paragraph (f)(1)(v) of this clause already instructs contractors to provide a ''blank copy'' so no further edits are needed.

3. Preparation of Data

A. *Comment:* Commenter #8 expressed concerns that as written proposed clause 752.227–71 requires submission of data scrubbed of PII. They indicate that scrubbing qualitative data such as speech patterns and other audio/video information is extremely costly and time consuming without sufficient guidance. As such, they recommend providing guidance on identifying high informational value qualitative data and the process for de-identifying these data. Additionally, they recommend: (1) clarifying the definition of ''machine readable'' to exclude unstructured qualitative data like audio/video recordings, interview/focus group notes and transcripts, and (2) revising submission requirement (i) to state, ''Submit machine readable digital information created or obtained in performance of this contract to USAID at the finest level of granularity at which it was collected.''

Response: Since audio or visual files may contain PII, contractors should work with their contracting officer representative to determine whether the information is necessary to submit, if an alternative such as a transcript or summary is acceptable, or an exemption from submission is appropriate. The contractor should address considerations for specific media formats and content during the development of the Data Management Plan. In addition, the draft rule allows flexibility for specific circumstances noting, ''If the Contractor believes there

is a compelling reason not to submit specific digital information that does not fall under an exemption in this section, including circumstances where submission may jeopardize the personal safety of any individual or group, the Contractor must obtain written approval not to submit the digital information from the contracting officer.'' (See 752.227–71(f)(4)(ii) of the Proposed Rule). No revisions to the rule are necessary.

To the commenter's follow-up regarding ''machine readable'', USAID has revised the final rule to indicate that the machine-readability requirement applies only to digital data and datasets, thus excluding digital objects like audio and video files (See edits to 752.227–71(f)(1)(ii)). With regard to the recommendation on submitting digital information at the ''finest level of granularity at which it was collected,'' there already exists a requirement in 752.227–71(f)(1)(i) to ''Submit digital information created or obtained in performance of this contract to USAID at the finest level of granularity at which it was collected.'' No further revisions are necessary. (See also response to c(4)(A) of this section below)

B. *Comment:* Commenter #7 questioned whether there would be analog options, noting that print outs of documents limit digital functionality (*i.e.,* a printed hyperlink cannot provide the additional information that someone may access in a digital copy).

Response: 752.227–71(f)(1)(i) states: ''Use only digital methods and USAID-approved standards to the extent practicable . . .'' This allows for analog options in the event that digital methods are not available or practicable.

4. Protection of Data

A. *Comment:* Some commenters (14, 16) expressed concerns about the broadness of ''finest level of granularity'' and requested that guidance be given as to how granular the data must be.

Response: Regarding the ''finest level of granularity'', some, but not all, USAID contracts will provide technical details regarding the level of granularity required. In the absence of such technical guidance, contractors must collect digital information at a level of granularity that allows them to comply with the terms of their award. Barring specific exceptions outlined in the rule, contractors must submit this digital information at the same level of granularity at which it was obtained, rather than aggregating or otherwise generalizing the information. USAID will not necessarily publish or otherwise share data at the same level of granularity as submitted by the contractor.

B. *Comment:* Commenter #16 noted that some international standards reference 'personal data' rather than PII, which protects broader categories of information to prevent re-identification particularly in areas with humanitarian concerns. Further, they noted that USAID requirements may be contrary to local rules and regulations regarding data protection and asked if partners will be given adequate support in these situations.

Response: USAID adheres to definitions and standards set forth by the Office of Management and Budget (OMB), including those in OMB Circular A–130, which defines personally identifiable information. USAID has processes in place to manage re-identification risks concerning personally identifiable information. In the event a USAID partner identifies a potential concern under local law that could impact their ability to plan for and adhere to the requirements of this clause, they should identify that concern during the Digital Information Planning process and contact their contracting officer representative for additional guidance.

C. *Comment:* Commenter #11 questioned whether USAID would limit methods, applications, or systems used for data collection; how USAID will define when digital data collection methods are impractical; and what process there is for Contractors to justify withholding data information.

Response: This rule does not provide specific requirements regarding applications and systems that contractors must use for data collection. Whether certain methods are impractical will be fact specific and should be addressed with the contracting officer representative. As to the process for contractors to justify withholding ''data information'' [sic], the rule states, ''(ii) If the Contractor believes there is a compelling reason not to submit specific digital information that does not fall under an exemption in this section, including circumstances where submission may jeopardize the personal safety of any individual or group, the Contractor must obtain written approval not to submit the digital information from the contracting officer.''

d. Clarity on Language and Requirements

1. Background, Authority, Timeline, and Editorial

A. *Comment:* Several commenters (8, 11, 13) requested clarity on when to submit digital information noting that the clause says 30 calendar days but also has an option to submit when the information meets the requirements of quality digital information or 30 days after closeout. Some specifically noted that allowing submission after closeout could allow the incumbent access to data which competitors for a follow-on would not. Finally, one commenter (8) asked that USAID consider providing additional time (rather than 30 days after contract end) and resources (including funding) for data submission.

Response: With regard to clarification on the submission timeline, USAID has updated the rule to emphasize that the contractor must adhere to the ''schedule of the contract.'' Should a timeline for a specific digital information not be specified in the award schedule, the language as written requires the contractor to submit the information ''once it meets the requirements of quality digital information,'' regardless of when this criterion is met during the award period. This is stated as a requirement, not as an option. This is intentional since USAID often requires access to finalized (*i.e.,* ''quality'') information well before the end of a typical five year contract. As the contract draws to a close, USAID also recognizes that valuable information funded by the Agency may remain in the contractor's possession, whether in draft or final ''quality'' form. For this reason, there is an additional, non-optional requirement to submit any ''draft'' and ''quality'' digital information not previously submitted, no later than 30-days after contract completion. The fact that the incumbent may still have access to this information during the 30-day period after contract completion does not in itself create a conflict of interest for the incumbent. The clause already allows the contractor to obtain approval from the contracting officer for variations to the 30 day submission period. Any costs associated with such submissions should be anticipated and planned for during proposal submission.

B. *Comment:* Commenter #11 recommended adding ''as approved by USAID's Chief Information Officer'' as in Section (f)(1)(vi)(D)(2) throughout the rest of the section.

Response: USAID believes the language is sufficiently clear as written.

C. *Comment:* Two commenters (11, 13) requested clarity on which parts of the mandates listed in the section 727.7000 of the proposed AIDAR text will be implemented in the Rule.

Response: By implementing this rule, USAID intends to enhance compliance with several mandates which include

but are not necessarily limited to the following: (1) Broad sections of OMB Circular A–130, with a particular focus on Section 5 e. which outlines policy on ''Information Management and Access;'' (2) Foundations for Evidence-Based Policymaking Act, with a focus on Title II, ''Open Government Data Act;'' (3) The 21st Century IDEA Act, with a focus on Section 3, ''Website Modernization;'' and Section 4, ''Digitization of Government Services and Forms;'' (4) Foreign Aid Transparency and Accountability Act, including Section 3 (c) ''Objectives of Guidelines;'' and (5) the Geospatial Data Act, with a focus on Section 2806, ''Geospatial data standards.''

D. *Comment:* Commenter #8 noted that the benefit of supporting institutional learning and public understanding of USAID program impact should be more explicit in the introduction.

Response: USAID appreciates this comment but believes that the preamble is sufficiently clear as written.

E. *Comment:* Commenter #11 asked whether digital information requested includes only information obtained for the purpose of implementing programmatic activities.

Response: USAID refers the respondent to ''727.7003 Contract clause.'' This section specifies the insertion of the clause into ''contracts fully or partially funded with program funds. . . .'' Therefore, the primary focus of this clause is on activities resourced with program funds. However, to limit burden, and per the definitions of ''data'' and ''digital information'' in the clause, there would be no requirement to submit ''information incidental to contract administration, such as financial, administrative, cost or pricing, or management information.'' Please see also USAID's response to the comment in (4)(B) of this section.

F. *Comment:* Commenter #13 indicated that 752.227–71(f) makes a reference to (f)(4) which, the respondent suggests, does not exist.

Response: Section (f)(4) of 752.227–71 is entitled ''Exemptions.''

2. Digital Information, Methods, Objects, and Inventory

A. *Comment:* Two commenters (8, 12) requested a definition of ''digital methods'' per 752.227–71 and noted that as structured, the proposed rule requires submission of digital data that cannot comply with the machine-readable requirement (*i.e.,* audio recordings, transcripts).

Response: USAID has added a definition for ''digital methods'' to Section 727.7001 and the clause 752.227–71(a). USAID appreciates the comment highlighting the challenges with submitting audiovisual files in machine readable format. In light of this issue, USAID has revised the final rule to indicate that the machine-readability requirement applies only to digital data and datasets. (See 752.227–71(f)(1)(ii)).

B. *Comment:* Commenter #11 requested a definition of both ''data inventory'' and ''any digital object''.

Response: USAID appreciates these comments and has added definitions for ''digital'' and ''data inventory'' to Section 727.7001 and the clause 752.227–71(a). USAID notes that ''digital object'' is already defined in the clause.

3. Beneficiary Feedback

A. *Comment:* Commenter #8 requested clarity on how ''beneficiary'' is defined, and who will define the term (*i.e.,* do Contractors identify beneficiaries to elicit feedback from).

Response: This aspect of the rule is intended to implement a recurring requirement of recent appropriations acts. Most recently, in the FY 2022 Consolidated Appropriations Act Congress directed that Development Assistance (DA) funds shall be made available for the regular and systematic collection of feedback obtained directly from beneficiaries to enhance the quality and relevance of such assistance. The term ''beneficiary'' is not defined in this statute; its use herein is intended to be consistent with its use in the AIDAR, agency internal policies (Automated Directives Systems), and other agency policy and procedural documents. At times the individuals who may be considered as ''beneficiaries'' for a particular contract may depend on the specific nature of the contract and the implementation context. USAID believes it is not necessary to create a unique definition of ''beneficiary'' for the purpose of this rule, no changes to the AIDAR text are made. Specific concerns regarding identification of beneficiaries for an award may be discussed with a contracting officer.

B. *Comment:* Commenter #11 requested more clarity on what USAID means by ''feedback'' noting that there may be an appearance of coercion as beneficiaries receive benefits from the program. Given that potential conflict, will USAID use this feedback to assess contractor performance or USAID's performance? Will questions be drafted and solicited through USAID or the contractor?

Response: While USAID does not define the term ''feedback'' per se, the AIDAR clause 752.242–71 contains the definition of ''feedback from beneficiaries'', which emphasizes the voluntary nature of these communications. As with any other data collection process managed by USAID contractors, beneficiary feedback must not be collected through coercion. Contractors must not withhold benefits based on whether a beneficiary provides feedback or the nature of the feedback about the benefits received.

Contracting officers may rely on information obtained from beneficiary feedback, or any other sources, as appropriate in evaluating past performance of offerors as permitted in the FAR. (For examples see FAR 15.305(a)(2)(ii), 13.106–2(b)(3)(ii)) and FAR 12.206). Managers and decision-makers within USAID operating units will determine if beneficiary feedback will also be used to assess USAID's performance. As to whether questions for soliciting feedback from beneficiaries will be drafted by USAID or the contractor, this will depend on the specific contract and the final Activity MEL Plan which should include the contractor's plans for collecting, responding to, and reporting on feedback from beneficiaries, if required by the contract. USAID may consult with contractors as necessary in developing the Activity MEL Plan to ensure the proposed methods of collecting, responding to, and reporting beneficiary feedback is appropriate under the particular contract and activity.

C. *Comment:* Commenter #8 requested clarity on how the information will be used and recommended verification via third party or further guidance to prevent bias.

Response: USAID expects that contractors will review the feedback they receive and use it in their management decision-making as noted in the **Federal Register** notice to enhance the quality and relevance of USAID programs and to maximize the cost-effectiveness and utility of these programs for beneficiaries. We appreciate the recommendation that USAID verify beneficiary feedback information via a third party; if applicable, appropriate means of verifying contract compliance with this rule will be determined for each contract by the contract officer and contract officer's representative.

D. *Comment:* Commenter #12 requested clarity on the term ''cost-effectiveness''—specifically whether contractors will be expected to use feedback generally to over-all cost effectiveness or whether they will perform a formal cost effectiveness analysis.

Response: USAID contractors will not generally be expected to perform a formal cost effectiveness analysis solely based on beneficiary feedback. Rather, USAID expects that feedback from beneficiaries will be generally useful to the management decision-making of the contractor, particularly regarding adaptations a contractor might make to their implementation processes that could improve cost-effectiveness and utility of the assistance provided to beneficiaries.

E. *Comment:* Commenter #10 requested clarity on whether the definition of ''regularly'' collected feedback that is ''appropriate'' and ''feasible'' will be determined by the contractor and USAID during AMELP development.

Response: Rather than establishing the definition of ''regularly'', USAID expects that a determination of ''regular'' feedback collection will depend on the size and scope of the activity and will be determined by the contractor and USAID during AMELP development, unless the frequency of beneficiary feedback collection is specified in the contract.

F. *Comment:* Commenter #14 requested clarity on if beneficiary feedback data collection could be combined with other collections.

Response: Unless mandated to be collected and reported separately by the award terms, beneficiary feedback may be combined with other data collection efforts.

4. Finest Level of Granularity

A. *Comment:* Several commenters (9, 10, 11, 13, 15) requested clarity on the term ''finest level of granularity'' with several requesting that each contract should specify the level of detail (or allow for flexibility to ensure protection of data) noting concerns that a strict interpretation may result in turning over unnecessary, sensitive data. One (10) commenter inquired whether the contractor will use their own definitions of granularity or if there will be a USAID-defined standard or template (or process to determine this level of granularity) and questioned if the DFD submission would include any raw data in digital form.

Response: Some, but not all, USAID contracts will provide technical details regarding the level of granularity required. However, it is not practical to pre-specify levels of data granularity in all contracts, as the Agency may need to allow some contractor discretion in this area. Therefore, during ''Digital information planning requirements'' as specified in paragraph (b) of the clause 752.227–71, contractors should propose a level of granularity that allows them to comply with the terms of their award. Barring specific exceptions outlined in the clause 752.227–71, contractors must submit this digital information at the same level of granularity at which it was obtained, rather than aggregating or otherwise generalizing the information. Depending on the requirements of the contract, the DFD submission process may include the submission of raw data in digital form, to include entering raw data in online DFD templates or the upload of entire datasets.

B. *Comment:* Some commenters (11, 12) requested further information on how the granular data would be used and submitted—specifically asking if it will only be for the purpose of implementing programmatic activities.

Response: USAID's usage of the data will be determined by the data rights clause in the contract.

C. *Comment:* Commenter #16 recommended removing the requirement to share data at the finest level of granularity. Barring that, they requested guidance for exemptions to prevent potential re-identification of parties due to transmission of PII and potential data leaks.

Response: USAID cannot remove the ''finest level of granularity'' requirement without jeopardizing its ability to accomplish its mission. USAID is aware that re-identification risk increases with granularity and appreciates that commenters are aware of this. To this end, USAID has included exemptions from submission (See 752.227–71(f)(4)) and indicated that PII submitted should be limited to the maximum extent practicable (See 752.227–71(d)(2)). Moreover, USAID will not necessarily publish or otherwise share data at the same level of granularity as submitted by the contractor, especially if the contractor submits sensitive data. Regarding the request for additional guidance, this is outside the scope of this rule.

5. Digital Standards, Repositories, and Alternate Technologies

A. *Comment:* Some commenters (11, 13) requested a definition of alternate technology and information on how to know if the Chief Information Officer (CIO) has approved it.

Response: Technologies that are approved for USAID use fluctuate frequently, given the rapidly changing nature of technology itself. This makes it impracticable to provide a list or definition of USAID's approved technologies in a static document. Contractors must seek approval to use alternate technologies by contacting their Contracting Officer. The Contracting Officer will seek approval in consultation with USAID's Office of the Chief Information Officer and USAID policy.

B. *Comment:* Some commenters (11, 13) noted that the hyperlink provided in (h) (*data.usaid.gov/guidelines*) was inoperable and requested access to the information for review.

Response: USAID will update the hyperlink to indicate *data.usaid.gov/standards* (see revised text in 752.227–71(h)). On April 14, 2023 USAID published a Notice of availability of a supplemental document in the **Federal Register** (88 FR 22990) specifically noting that USAID received requests under the comment period for this rule to provide access to the standards. The supplemental document entitled ''USAID Digital Collection and Submission Standards'' was available for comment. USAID collected those comments and provided a response to them in this document.

C. *Comment:* Several commenters (11, 13, 14) requested information on what the USAID approved standards are and if they will be provided to contractors.

Response: USAID published the ''USAID Digital Collection and Submission Standards'' in the **Federal Register** (88 FR 22990) on April 14, 2023 and provided a comment period for the public.

D. *Comment:* Some commenters (11, 13) requested a definition of USAID-approved by digital repository.

Response: USAID is not including a definition of a ''USAID-approved digital repository'' in the rule as this determination is an internal policy decision. USAID's policies on acceptable digital repositories will be informed, in part, by the standards for digital repositories developed by the interagency Subcommittee on Open Science of the National Science and Technology Council (NSTC). This includes those found in the document Desirable Characteristics of Data Repositories for Federally Funded Research, released by OSTP in May 2022 (available at: *https://www.whitehouse.gov/wp-content/uploads/2022/05/05-2022-Desirable-Characteristics-of-Data-Repositories.pdf*).

E. *Comment:* Commenter #9 recommended using or aligning with the International Aid Transparency Initiative rather than a USAID-approved standard.

Response: Since the U.S. Government as a whole is a signatory to IATI (see: *https://iatistandard.org/en/news/united-states-marks-10-years-since-becoming-an-iati-signatory/*), USAID has included IATI as a recommended standard.

Should a data standard for a specific subject area not be available at *data.usaid.gov/standards,* the standard will be indicated in the contract itself or provided to the contractor upon consultation with the Contracting Officer.

F. *Comment:* Commenter #11 asked how USAID will define data standards—in the contract or agreed upon in the data management plan.

Response: USAID published the ''USAID Digital Collection and Submission Standards'' in the **Federal Register** (88 FR 22990) on April 14, 2023, and provided a comment period for the public.

6. Data Management Plan

A. *Comment:* Some commenters (11, 13) requested clarity on the requirements of a Data Management Plan with one noting that if DMP requirements are outlined in ADS 579, they should be directly in the rule as the ADS is USAID internal guidance.

Response: The preamble to the rule contains references to ADS 579 as background information only. However, the specific Data Management Plan (DMP) requirements are outlined in the proposed clause in 752.227–71(c)(2) *What to submit.*

B. *Comment:* Commenter #9 requested that contractors be allowed to identify which data they cannot share with USAID along with an appropriate justification.

Response: AIDAR 752.227–71(f)(4)(ii) indicates that ''[i]f the Contractor believes there is a compelling reason not to submit specific digital information that does not fall under an exemption in this section, including circumstances where submission may jeopardize the personal safety of any individual or group, the Contractor must obtain written approval not to submit the digital information from the contracting officer.''

C. *Comment:* Commenter #8 requested clarity on which types of data and/or contracts will require a DMP.

Response: The rule, as revised, states that the clause applies to ''solicitations and contracts fully or partially funded with program funds exceeding the simplified acquisition threshold.'' (See 727.7003 and 752.227–71) Paragraph (c) of this clause includes the DMP requirements. As outlined in 727.7003, this paragraph is ''[reserved]'' and DMP requirements not applicable when the anticipated contract: (1) does not collect data; (2) implements emergency food assistance under the Food for Peace Act or section 491 of the Foreign Assistance Act of 1961, including for the procurement, transportation, storage, handling and/or distribution of such assistance; (3) implements international disaster assistance under section 491 of the Foreign Assistance Act of 1961 or other authorities administered by the Bureau for Humanitarian Assistance; or (4) implements activities managed by the Bureau for Conflict Prevention and Stabilization's Office of Transition Initiatives, or fully or partially funded with the Complex Crises Fund.

D. *Comment:* Commenter #13 noted that not allowing digital information collection until the DMP is approved may delay implementation.

Response: The contractor must begin award implementation upon formal approval of the award. However, digital information collection must not begin prior to approval of the data inventory and submission of any remaining components of the DMP unless authorized in writing by the contracting officer. Based on multiple lessons learned, USAID believes the value of requiring a DMP to far outweigh potential delays in submissions.

E. *Comment:* Several commenters (8, 10, 11, 14) requested clarity on the timeline, processes, and standards for DMPs—specifically information on what the documentation will look like; how standards will be defined that the contractor may be audited against; who will review/approve DMPs and standards for such approval; how approval officials will be trained as well as the timeline for review with a recommendation that they be reviewed annually; whether USAID will provide a template.

Response: This rule does not provide specific requirements on DMP standards, review, approval, templates, or training of USAID officials. Awards will have varying requirements on these matters, and partners must consult the terms of their award for specific details. These issues will be further addressed by USAID policy which USAID staff must consult in providing direction to implementing partners. For additional information, please consult ADS 579—USAID Development Data (available at: *https://www.usaid.gov/about-us/agency-policy/series-500/579*).

F. *Comment:* Commenter #14 requested that the DMP be part of the AMELP given that many of the requirements overlap (with another (11) asking for clarity on if they are separate requirements.

Response: The requirement to submit a DMP is distinct from the requirement to submit an Activity MEL plan. Both plans serve distinct purposes, as described in the rule, and some activities that do not require an Activity MEL plan may still require a DMP. Unless otherwise precluded by the terms and conditions of their contract, contractors required to submit both a DMP and an Activity MEL plan may submit a DMP as a section of an Activity MEL plan or as a separate stand-alone plan.

7. Activity Monitoring Evaluation and Learning Plan

A. *Comment:* Commenter #13 noted that the clause cites ADS 200/201 which is internal policy and requested that the clause itself address plan requirements.

Response: The only reference to ADS 201 in the proposed AIDAR text is included in section 742.1170–5, as a source of additional information on USAID program cycle activity monitoring, evaluation and learning. The clause at 752.242–71 fully addresses the requirements for the Activity Monitoring, Evaluation, and Learning Plan.

B. *Comment:* Commenter #11 requested adoption of a longer timeline to develop the Activity MEL Plan (currently 90 days) citing UK agencies which use a six- to 12-month timeframe.

Response: Regarding the recommendation to adopt a longer timeline to develop the Activity MEL Plan, USAID, after consideration of the public comment, has determined to maintain the 90-day timeline, unless otherwise specified in the contract schedule. OMB guidance M–18–04 regarding Monitoring and Evaluation Guidelines for Federal Departments and Agencies that Administer United States Foreign Assistance recommends that monitoring and evaluation be planned early. USAID's experience has shown that adherence to a 90-day timeline has provided sufficient time to generate an actionable AMELP without resulting in significant programmatic delays. Without obtaining an AMELP from the contractor in the early stages of activity implementation, USAID faces decreased ability to determine that U.S. Foreign Assistance goals are being met. Notably, AMELPs may be revised and updated, in coordination with USAID, as additional information becomes available.

8. Risk

A. *Comment:* Commenter #16 requested that a limited purpose for the collection be set out as well as time limits of data retention and clear requirements for data security and literacy.

Response: The scope of the contract itself will provide clarity on the purpose of the collection. USAID adheres to the requirements of the Federal Records Act for the retention of records and any

retention requirements on contractors will be outlined in the award. USAID requirements on data literacy and security are determined by the Agency's internal policies. USAID requirements for the contractor on data literacy and security would be outlined in the award.

B. *Comment:* Commenter #13 requested that paragraph (g)(2) be amended to indicate that the government *may* direct an embargo for one year when the contractor submits digital objects as mandating it may result in ineligibility to bid for follow-on contracts.

Response: The rule as currently written indicates that the ''Contractor *may* request . . an embargo. . . .'' and that the ''contracting officer or delegated contracting officer's representative *may* approve an embargo. . . .'' (See 752.227–71(g)(2), emphasis added) This is intentionally permissive language. Per the August 25, 2022, memo from the White House Office of Science and Technology Policy entitled, ''Ensuring Free, Immediate, and Equitable Access to Federally Funded Research,'' USAID may approve embargoes, including those that support foreign policy and international development objectives but currently has no reason to mandate embargoes.

C. *Comment:* Commenter #13 requested that the rule allow for the implementer to add a disclaimer of liability of information per section (f)(vi)(B).

Response: Please note that contractors are already allowed under 752.227–71(f)(1)(vi) of the rule to ''provide additional details or metadata'' regarding the ''quality of submissions of draft digital information.'' This additional information would alert USAID, as well as other potential users of the data, to any potential drawbacks of using the submitted information to draw definitive conclusions.

D. *Comment:* Some commenters (11, 13) requested information on who will perform the ''rigorous risk assessment of digital information submitted to USAID'' and whether there will be guidance or a timeline provided; they additionally asked about permissions and restrictions to digital information to the DFD and whether the public will have access.

Response: USAID's risk assessment process will begin after submission of information via the DFD and will involve multiple experts spanning several parts of the Agency. For additional information, ADS 579 outlines the existing implementation of this process. USAID will apply permissions and restrictions to digital information submitted via the DFD as consistent with its existing information technology policies as outlined in the ADS 500 series. Information submitted via the DFD may be entirely restricted from public view, made available to bona fide research institutions, made partially available to the public, or made entirely available to the public, in accordance with existing U.S. government mandates, depending on the sensitivity of the information or other legal considerations.

e. USAID Systems and Processes

1. Digital Portals

A. *Comment:* Several commenters (6, 11, 12, 13, 17) asked whether this rule will retire existing digital portals such as the DEC, DDL, DIS, FTFMS, and other Mission level systems and if so, that a list of portals, processes, and protocols eliminated be provided with a timeline to ease transition.

Response: The DFD is not its own system and is not intended to replace other systems. It is a public facing web page with centralized authentication that will direct users to the appropriate USAID systems for which they have authorized access. This includes but is not necessarily limited to the Development Information Solution (DIS), Development Experience Clearinghouse (DEC), and Development Data Library (DDL). Upon publication of this rule, contractor requirements in AIDAR Clause (DEC) 752.7005 will be eliminated.

B. *Comment:* Some commenters (6, 8, 13) wondered if legacy documents from existing portals (DEC/DDL) will be available or if these portals can be maintained during the transitional period (and if maintained, how would they change)?

Response: Digital objects that are publicly available via the DEC, DDL, and other public-facing data portals will continue to be available as the DFD requirement is implemented.

C. *Comment:* Some commenters (11, 13, 17) asked that in the event that other portals are not retired, under what circumstances would contractors be required to submit to these other portals (*i.e.* the DIS; or whether draft digital information goes to the DFD or another digital repository).

Response: While the DEC and other submission clauses will be retired upon implementation of this rule, the systems will continue to exist in their current form. However, submission workflows into those systems will take place via the DFD, reducing the total number of URLs required to meet contractual requirements.

D. *Comment:* Some commenters (11, 13) noted that the link to *dfd.usaid.gov* is not live and requested access to review.

Response: The link to the DFD will be active upon publication of the final rule.

E. *Comment:* Commenter #11 asked whether contractors will maintain unique registrations on the DFD for each contract.

Response: The contractor can choose whether to assign a single individual to submit information on behalf of multiple contracts or to assign a single individual to submit information for each individual contract. However, contractors must ensure compliance with the requirements in the clause for each individual award.

F. *Comment:* Commenter #17 requested standard reporting templates for submissions to the DFD and asked about integration of existing monitoring tools. They (17) further asked about USAID's plan to address technical challenges and limitations for global systems implementation and learning curves/technical deficiencies internationally.

Response: Rather than providing standard USAID templates, the user interface for each system will guide partners in entering the information required. To address the learning curve associated with these changes, USAID will continue to provide training, communications, and instructional guides to facilitate the transition.

G. *Comment:* Commenter #8 noted that the current DDL platform has a 500-variable maximum for .csv submission resulting in large datasets needing to be broken up into parts.

Response: The Agency is aware of technical limitations in submitting datasets to the DDL and continues to work to make ongoing enhancements to these technologies.

2. Revisions to Existing Policy

Comment: Two commenters (11, 13) asked whether ADS 302.3.5.21 (Submissions of Datasets to the Development Data Library (DDL) (October 2014)) will be removed or revised as the proposed rule removes AIDAR 752.7005 and the anticipated timeline for removal.

Response: Yes. USAID's internal policy guidance will be amended to reflect the change to the AIDAR. The rule currently removes and reserves AIDAR 752.7005.

3. Contracting Officer's Representative Approvals

A.*Comment:* Some commenters (11, 13) noted that language giving Contracting Officer's Representative

discretion to change submission requirements may lead to confusion, and commenter #11 recommended that COR discretion to tell a contractor where to submit information should be on a mission basis instead. Commenter #11 noted that requiring COR approval each time an exception is necessary is prohibitively costly in politically insecure or otherwise challenging environments.

Response: USAID believes that allowing COR discretion on submission requirements is essential given that submission questions are often fact specific. In addition, USAID is developing guidance for CORs and USAID staff on how to handle such requests in order to ensure a consistent approach to the greatest extent possible. This guidance will also outline alternate technologies and USAID-approved repositories for the submission of digital information. USAID does not agree that COR involvement in granting exemptions is unreasonable in challenging operational environments. To the maximum extent practicable, the contractor should address these challenges during the digital information planning process in order to mitigate unforeseen costs and to obtain necessary approvals should such circumstances arise.

B. *Comment:* Some commenters (11, 13) requested more information on processes for the approval of digital information, to include whether approvals of digital information are granted within or outside the DFD. These commenters also requested information on the submission exemption process.

Response: The means of granting approval will vary based on the type of digital information submitted. USAID has updated the AIDAR requirements in 752.227–71(f)(3)(i) to clarify that with the exception of datasets, the Contractor must submit all other digital objects within 30 days of obtaining the contracting officer or delegated contracting officer representative's approval. This pre-submission approval process will generally take place via email. The direct submission of digital data (*e.g.* indicator data) and datasets via the DFD will trigger a semi-automated approval process that will take place directly within USAID information systems. This process will take place via a combination of system-generated messages and email exchanges with USAID personnel. Exemptions are already addressed in AIDAR 752.227–71(f)(4) and will be granted on a case-by-case basis.

4. Exceptions and Oversight

A. *Comment:* Commenter #11 requested information on the process to exempt data submission when the personal safety of an individual or group is jeopardized.

Response: Circumstances that jeopardize the safety of an individual or group can vary widely, and USAID will address these on a case-by-case basis. To enable USAID to make an informed decision tailored to the specific circumstance, AIDAR 752.227–71(f)(1)(vi)(A) requires that the contractor furnish details and/or metadata regarding known sensitivities within digital information that may jeopardize the personal safety of any individual or group. In addition, contractors should use the digital information planning process to identify any potential security or safety concerns early in the activity to the greatest extent possible.

B. *Comment:* Commenter #7 asked whether there would be USAID/Washington oversight of the recommended contractual requirements.

Response: Contract Officers will monitor individual contracts for compliance with submission requirements. In addition, USAID/Washington will periodically monitor information systems to help ensure that submissions received are consistent with planned submissions identified by the contractor during the digital information planning process. Members of the public who observe that documents or other digital artifacts are missing from USAID's public websites are encouraged to contact USAID directly. In some cases, these documents may be awaiting further curation by staff or exempted from public disclosure due to sensitivities or other legal considerations.

f. Applicability

1. Acquisition vs. Assistance

Comment: Several commenters (5, 6, 8) inquired about whether these provisions would be for contracts only—specifically asking about the use of the word 'contractor' rather than 'implementing partner'.

Response: This rulemaking action is to amend the AIDAR which is USAID's supplement to the FAR. As such, this only pertains to contracts.

2. Existing Contracts

Comment: Some commenters (8, 12) asked whether existing contracts would be amended resulting in revisions to already approved AMELPs or the need to develop DMPs and whether additional funding would be provided for these actions.

Response: The requirements established by this rule will apply to all new contracts that meet the applicability criteria defined in this rule. However, USAID may modify, in accordance with FAR 1.108(d): 1) existing indefinite delivery contracts to include the new AIDAR clauses for future orders, and 2) existing contract or task or delivery order when exercising an option or modifying a contract or order to extend the period of performance.

3. Burden on Small Entities

A. *Comment:* Some commenters (11, 13) inquired as to the need to apply these clauses to any contract above the micro-purchase threshold noting the increased burden on small entities. They requested it to be changed to the Simplified Acquisition Threshold.

Response: USAID accepts the recommendation to revise applicability to contracts above the Simplified Acquisition Threshold. The corresponding changes are made to sections 727.7003 and 752.227–71.

B. *Comment:* Commenter #11 noted that the requirement to submit media release templates is particularly onerous to small business and requested that images be allowed to be credited/captioned by source.

Response: In order to use photos submitted by contractors which contain images of individuals, USAID must establish that the individuals provided consent to appear in the photos. USAID therefore requires media releases for these photos, which cannot be accomplished via photo captioning.

C. *Comment:* Two commenters (10, 15) noted that requiring only digital methods will carry substantial burden and cost which may disadvantage local and new contractors. They recommend allowing a broader range of approaches, from digital to manual (with digital being preferred and used as appropriate and practical) and asked whether USAID approval would be necessary.

Response: Should the contractor encounter obstacles adhering to digital collection methods, the contractor must first identify these in the Data Management Plan. USAID may allow for an alternative collection method on a case-by-case basis per the exception in Section 752.227–71(d)(1)(i). This exception may apply, for instance, to situations where availability of or access to digital technologies is limited; where the knowledge and capacity to use them may be limited; or circumstances where their use may prove overly burdensome.

4. Other Applicability Questions

A. *Comment:* Commenter #6 asked whether this rule covers GIS data projects that are submitted to Missions.

Response: The draft rule applies to ''digital information produced, furnished, acquired, or collected in performance of a USAID contract,'' and therefore also applies to GIS data projects that may be submitted to missions.

B. *Comment:* Commenter #15 asked if the rule is applicable only for US Government standard indicators or custom indicators as well.

Response: The rule applies to both standard and custom indicator data under the broader definition of ''digital information.''

g. Out of Scope

A. *Comment:* Several commenters (1, 2, 3, and 4) included comments which were not within the scope of the rule including topics such as Presidential visits, criticism of the agency broadly, questions about registration, and concerns related to COVID vaccination.

Response: USAID acknowledges receipt of these out-of-scope comments.

B. *Comment:* Commenter #13 inquired about USAID's response to the Paperwork Reduction Act request for comments on the DIS Pilot.

Response: The DIS Pilot comments are addressed separately alongside this rule.

C. *Comment: Commenter* #13 questioned the cost analysis—specifically about the determination of respondents; whether the DIS costs were included in the Rule; whether decommissioning of certain portals was included; and whether the cost of design, testing, launch, and management of the DFD system was considered.

Response: Please see the Regulatory Impact Analysis (RIA) for more detail regarding respondents. Because DIS is intended to be an Agency-wide portfolio management system covering the entire program cycle, internal costs unrelated to this rulemaking effort were not included in the RIA. Costs related to partner submission of information via the Digital Front Door have been added to the revised RIA. USAID's long-term vision is to combine the Development Experience Clearinghouse (DEC) and Development Data Library (DDL) into a single digital repository. As this repository is still in planning stages and is outside the scope of this rulemaking, costs are not available, and USAID did not take them into account in the RIA for this rulemaking. Please see the revised RIA for detail on the estimated cost of establishing the Digital Front Door.

D. *Comment: Commenter* #15 requested suggested language for informed consent forms noting that in order to obtain informed consent, the contractor will need to clearly describe how the data submitted to the DFD will be accessed and used.

Response: Suggested language for informed consent is outside the scope of this rule.

E. *Comment: C*ommenter #8 noted that local partners under assistance may lack the data management capacity to implement this rule.

Response: USAID's assistance awards are outside the scope of this rule.

F. *Comment: C*ommenter #11 requested a definition of forms of informed consent, guidance on collection, and what forms of collection are appropriate to document informed consent.

Response: USAID requirements relative to informed consent for human subjects research are found in *22 CFR part 225* and are thus not covered under the scope of this rule.

*G. Comment: C*ommenter #15 requested that the rule include language regarding coordination of contractors with in-country review boards and other governing bodies.

Response: This is outside the scope of this rule which deals with digital information planning, collection, and submission.

H. *Comment:* Two commenters (11, 13) questioned how USAID will protect proprietary data if contractors submit such data in accordance with (f)(1)(ii) from competitors; how USAID will share data security issues with partners; and how USAID and the contractor will share data security responsibility.

Response: These comments regarding USAID's security responsibilities are beyond the scope of this rule. USAID is subject to legal and policy requirements on implementing adequate safeguards for handling business confidential and proprietary information. Contractors must follow the terms of their award regarding security and privacy requirements.

I. *Comment: C*ommenter #16 indicated concern about the length of time of data retention by USAID, data security for certain local organizations who may lack expertise

Response: USAID retains and disposes of electronic records in accordance with National Archives and Records Administration rules and policies. Regarding concerns that local partners may lack data security expertise and the need for support, this is outside the scope of the rule.

J. *Comment: C*ommenter #7 asked if the DMP requirements will relate in any way to the USAID Digital Strategy requirements of a Digital Learning Plan and the regular requirement of a Learning Agenda; and if so, whether USAID will manage and communicate evolving guidance to contractors on these various mandates.

Response: Specifics on how DMPs relate to internal USAID guidance are outside the scope of this rule.

Summary of Changes and Response to Comments on the Notice of Availability of Supplemental Document, Published in the ***Federal Register*** *at 88 FR 22990 on April 14, 2023*

Three respondents submitted public comments in response to the Notice. USAID reviewed the public comments in the development of the final rule. Based on the comments, the supplemental document has been revised as outlined in (i) below. Additionally, changes to the ''geospatial'' language have been made to align with USAID policy. Note that the text is provided without hyperlinks in this document, but they are available at *data.usaid.gov/standards.* Below are the Agency's responses to comments and the changes made to the rule as a result of those comments are provided as follows:

h. *Comment* #1: requested information on how to access an account.

Response: This is outside the scope of this rulemaking.

i. *Comment* #2: noted that the inclusion of ''Metadata Creation Tools'' may be inappropriate. They indicated that including specific tools may give an appearance of preference or endorsement of such tools as they may not be the best for the job and that updating the AIDAR will take a long time potentially locking in the use of outdated tools.

Response: USAID has updated the standards to cite a non-exhaustive list of potential metadata tools, rather than to explicitly list them under ''Recommended Digital Information Technical Standards.''

j. *Comment* #3: indicated general support for rule and moving to digital information. The respondent requested that there be policies to standardize information collection in the Data Management Plan and noted that USAID may be able to provide standardized templates for data collection.

Response: This comment is outside the scope of the rulemaking. USAID solicited comments as to the standards, including the text of AIDAR 752.227–71(h) that refers to the standards. USAID

received comments on the Data Management Plan during the comment period for the proposed rulemaking, and responses to those comments are available in Section d.6 above.

Response to Comments on DIS Pilot

Seventeen respondents submitted public comments in response to the DIS Pilot. USAID reviewed the public comments in the development of the final rule. Below are the Agency's responses to comments on the DIS Pilot. Some of the comments received will not be addressed as RIN 0412–AA90 makes a response unnecessary. Those comments are summarized in the section below. Additionally, some comments have already been addressed in responses to comments received under the proposed rule which are also summarized below. The Agency did not address comments unrelated to, or outside the scope of, the 30-day Information Collection Notice:

k. General Support for the Collection

1. *Comment:* Commenter #17 indicated general support for the collection. They noted that the rule will simplify reporting, reduce redundant data calls, and reduce the burden on contractors.

Response: USAID acknowledges the support for the collection.

1. Comments That Are Superseded by the Rule

Comment: Two commenters (14, 17) requested information on the burden estimate. Commenter #14 questioned the benefit of the system. Commenter #10 questioned which countries had to implement the pilot. Two commenters (3, 17) questioned the length of the pilot, if the pilot results would be made public, how data migration will occur after the pilot, what language should be included in contracts, and whether RIN 0412–AA90 would be published for comment. Several commenters (3, 12, 13, 14, 16, 17) asked about API and connections to other data systems, standardizing requirements and guidance, concern regarding reidentification and other security risks, what data would need to be submitted, cost allowability, information about approvals and how data will be used, reporting frequency, data aggregation, what indicator information would be used as well as if they can be customized, and other process questions about the pilot. Commenter #3 asked about an OIG Audit and its impact on the pilot. Commenter #8 indicated that on Item 20, Sec 2 (''login.gov username''), the instructions on the access form do not clarify what the username is or if IPs already have one. Commenter #8 also requested clarity on what IPs are expected to do in DIS.

Response: The pilot, applicable to several missions, ended with publication of RIN 0412–AA90. Questions around benefits, API connections, adding contract language, standardization, security, submission requirements, reporting, access forms and other items related to the pilot are superseded by the text of the Rule. The rule also clarifies what contractors must do when submitting digital information to USAID.

m. Comments That Have Been Answered Through Comment Responses to the Rule

Comment: Commenter #13 asked about whether staff will be able to access more than one project or see across a variety of projects. Commenter #2 requested that the system be aligned to build upon the Common Data Model for Nonprofits. Commenter #13 asked about what the Development Experience Clearinghouse is. Commenter #14 asked about integration of various USAID platforms (the Development Data Library, for example).

Response: USAID has provided robust responses to these questions in response to comments received under the rulemaking. Specifically, see sections B.2)(e)(1)(E); B.2)(d)(5); and B.2)(e)(1)(A)–(C) of the **Federal Register** Notice for RIN 0412–AA90 which includes the text of relevant comments and responses.

n. Access to Data

1. *Comment:* Commenter #4 questioned whether a prime contractor will have to enter data for subcontractors or whether the subs will have separate access to enter their data directly.

Response: The clause requires the contractor to submit all digital information produced, furnished, acquired or collected in performance of this contract by its subcontractors at any tier. While some USAID systems may allow delegation of the submission role, it remains the responsibility of the prime contractor to ensure the submission of the digital information per the requirements of the rule.

2. *Comment:* Several commenters (8, 13, 15) asked about system access. Specifically, whether the system will have a place to specify roles in the ''implementing partner user information'' section; how IPs can manage employees offboarding from the system when they leave the IP or award; and whether the system will be open to allow all users to see information or be limited by award.

Response: The system will have a place to specify user roles. The COR will assign the contractor a user role within the system. Once assigned a user role, the contractor will manage further access to the award, including during offboarding. Submitters will only be able to see data for awards with which they are associated in the system; data access is not open to all users.

3. *Comment:* Commenter 16 asked whether the public will be able to access the data in the DIS system.

Response: USAID will release data to the public from its internal systems in keeping with its internal policies as informed by US Government and international transparency commitments. USAID will not provide direct public access to the DIS system.

o. System Design Information

1.*Comment:* Commenter #3) asked if USAID had a help center for DIS and requested a FAQ page.

Response: Contractors can email *AskDIS@usaid.gov* for help center assistance. The DIS Frequently Asked Questions (FAQ) document for contractors is found on the USAID public website (available at: *https://www.usaid.gov/partner-with-us/resources-for-partners/development-information-solution/faqs*).

2.*Comment:* Commenter #13 asked if the DIS will be the place where they enter information about indicators or just view them once reports are submitted.

Response: Per the Rule, USAID contractors will submit all digital information to one centralized portal, the USAID Digital Front Door (DFD). The DFD is intended as a submission mechanism, whereas viewing will take place via established USAID systems and websites.

3. *Comment:* Commenter #13 asked who is responsible for setting up the website for each respective project in DIS (if there are specific indicators being reported for each of the projects).

Response: USAID operating units are responsible for establishing activities in DIS within a contract. The person with the COR role in DIS is responsible for establishing the indicators associated with the activity.

4. *Comment:* Commenter #13 asked if the system will allow for central level viewing of an IP portfolio.

Response: The system currently does not allow for linkages among multiple activities to provide a central portfolio view for an implementing partner.

p. USAID Approval and Oversight

Comment: Commenter #16 requested comment on when comprehensive information about the structure and operation of the DIS system will be available.

Response: USAID will continue to provide information on the Agency's public DIS website (available at: *https://www.usaid.gov/partner-with-us/resources-for-partners/development-information-solution*) as it becomes available.

q. Outside the Scope

Comment: Many commenters (1, 5, 6, 7, 9, and 11) submitted comments that were outside the scope of the DIS Pilot.

Response: USAID acknowledges receipt of these out-of-scope comments.

USAID Digital Collection and Submission Standards

We are publishing the revised Collection & Submission Standards in this final rule. As noted in the regulatory text, the standards can also be found at *data.usaid.gov/standards* with hyperlinks:

USAID's Digital Collection and Submission Standards are a compendium of standards for USAID staff and contractors to use in support of USAID programs and operations. The standards in Section A are required. Section B contains recommended standards that represent industry best practices.

Section A: Required Digital Information Technical Standards

I. File Format Standards

A. Acceptable Non-Proprietary Formats

1. Text and Documents
   (a) Portable Document Format (PDF/A is preferred, however .pdf is acceptable)
   (b) Plain text (.txt)
   (c) LaTeX documents (.tex)
   (d) Hypertext Markup Language (.html)
   (e) Open Document Format (.odt)
   (f) Extensible Markup Language (.xml)
   (g) JavaScript Object Notation (.json)
2. Tables, Spreadsheets, and Databases
   (a) Comma-Separated Values (.csv)
   (b) Tab-separated tables (.txt—sometimes .tsv)
   (c) Comma-separated tables (.csv or .txt)
   (d) Other standard delimiter (*e.g.* colon, pipe)
   (e) Fixed-width
   (f) OpenDocument Spreadsheet (.ods)
3. Audio Files
   (a) WAVE (.wav)
   (b) FLAC (.flac)
   (c) MPEG–3
   (d) MP3
4. Image Files
   (a) JPEG (.jpg or .jp2)
   (b) Portable Network Graphics (.png)
   (c) TIFF (.tiff or .tif)
   (d) Portable Document Format (.pdf)
5. Video Files
   (a) Video File (.mov)
   (b) MPEG–4 (mp4)
   (c) JPEG2 2000 (mj2)
6. Geospatial Files
   (a) QGIS Project (.qgs)
   (b) ESRI Shapefile (.shp, .shx, .dbf)
   (c) Annotated TIFF Raster Files (.tif)
   (d) Keyhole Mark Language (.kml)
   (e) Geographic Data Format based on JSON (.geojson)
   (f) Google Earth GIS Format (.kml, .kmz)
   (g) Well Known Text for Spatial Objects (.wkt)
   (h) Raster GIS File Format
   (i) Unidata Scientific Data Format

II. Subject Area Standards

A. Narrative Text

1. Digital narrative text that is written in the English language, including narrative about USAID programs and operations, must comply with the *Plain Writing Act of 2010* and associated guidelines and resources found on the *federal plain language website.* Because USAID may publish a narrative in keeping with the U.S. Government legislative requirements (*e.g.* the *Foreign Aid Transparency and Accountability Act of 2016*) and other transparency commitments (*e.g. International Aid Transparency Initiative; Open Government Partnership*) or Freedom of Information Act requests, the narrative must be clear, thorough, and descriptive to facilitate public understanding.

B. Geospatial

1. The location(s) where an activity is implemented must be collected at the Exact Site Location. Exact Site Location is defined as a populated place, an actual exact site location, or an exact area or line feature. The location(s) of the activity's intended beneficiaries must be collected at least at the first level administrative boundary. When the location of the activity's intended beneficiaries is considered nationwide, it must be collected at the country/territory level. USAID follows the *Geopolitical Entities, Names, and Codes (GENC) Standard* and additional geospatial data standards as outlined in *ADS 579saa* ''Geographic Data Collection and Submission Standards'' and ADS 579mab ''Activity Location Data.''

C. Date

1. YYYY–MM–DD.

Section B: Recommended Digital Information Technical Standards

USAID recommends the following standards that have not been formally adopted as a requirement by the Agency, but encouraged and recommended for use to improve the management, quality and usefulness of the data. USAID recommends the use of the following standards when appropriate and practicable:

I. Code, Algorithm, and Analytical Files.
A. Javascript (.js)
B. Java
C. .NET
D. Python (.py)
E. Ruby (.rb)
F. R (.r)
G. SQL

II. GS1 Standards—USAID-funded programs beyond Global Health are strongly recommended to adopt GS1 Standards for the supply chain to facilitate product identification, location identification, and product master data of Agency-funded commodities. Additional guidance for implementation of GS1 Standards can be found here.

III. Statistical Data and Metadata eXchange (SDMX) for statistical data.

IV. CGIAR Ontologies for crop and agronomy ontology.

V. FHIR for healthcare data exchange.

VI. ISO 8601 for Date, Time, and Time Zone.

VII. Open Geospatial Consortium (OGC) Standards for geospatial data. The Open Geospatial Consortium (OGC) is an international consortium of more than 500 businesses, government agencies, research organizations, and universities driven to make geospatial (location) information and services FAIR—Findable, Accessible, Interoperable, and Reusable..

VIII. International Aid Transparency Initiative (IATI).

IX. FAIR Data Principles—To the extent possible, USAID-funded data and metadata must align with data principles which are Findable, Accessible, Interoperable, and Reusable.

Resources for creating metadata to meet these standards include, but are not limited to, the following:

I. Content Standard for Digital Geospatial Metadata (CSDGM) Tools.

II. USGS TKME—A Windows platform tool for creating FGDC–CSDGM which can be configured for Biological Data Profile and other extensions. The software program is closely aligned with the Metadata Parser, and can be configured for French and Spanish.

III. mdEditor—Create ISO and FGDC–CSDGM metadata with this web-based tool.

IV. Data dictionary conversion service—Convert a data dictionary table to/from metadata format (instructions).

V. USDA Metavist—A desktop metadata editor for creating FGDC–CSDGM for geospatial metadata. Includes the Biological Data Profile (version 1.6). Produced and maintained by the USDA Forest Service. Download the USGS Alaska Science Center (ASC) Metavist User Guide [PDF] to learn more about the tool and ASC best practices for authors.

VI. Microsoft XML Notepad—A simple intuitive user interface for browsing and editing XML files. Does not automatically produce FGDC–CSDGM records but allows easy editing and validation of existing metadata records. See Advanced Users to learn how to configure this tool.

C. Regulatory Considerations and Determinations

(1) Executive Orders 12866 and 13563

This final rule was drafted in accordance with Executive Order (E.O.) 12866, as amended by E.O. 14094, and E.O. 13563. OMB has determined that this rule is a ''significant regulatory action,'' as defined in section 3(f) of E.O. 12866, as amended, and is therefore subject to review by OMB. This rule is not a major rule under 5 U.S.C. 804.

(2) Expected Cost Impact on the Public

USAID remains committed to reducing the burden on its contractors while maximizing taxpayer value. By launching the USAID Digital Front Door (DFD) as outlined in this clause, USAID intends to reduce the total number of portals through which its contractors must submit information to USAID, thereby reducing time and effort and improving operational efficiency.

The following is a summary of the impact on contractors awarded contracts that include the new AIDAR clause. The cost estimates were developed by subject matter experts based on USAID's experience collecting reports and information products through the Development Experience Clearinghouse (DEC) (see AIDAR 752.7005) and piloting digital data collection through the Development Data Library (DDL) and the Development Information Solution (DIS).

This rule results in a total annualized (7% discount) public net cost of $2.5 million. This annual burden takes into account the current baseline that contractors already prepare, maintain, and submit AMELPs, already remove PII from data prior to submission, already collect standard indicator data, and already request embargoes and data submission exemptions from Contracting officer's Representative on a case-by-case basis. Further, since contractors already submit documents and data to the DEC and DDL, these costs were removed from the overall estimated cost. The following is a summary of the annual public costs over a 20-year time horizon.

Year	Public	Total
1	$1,867,000	$1,867,000
2	2,650,000	2,650,000
3	2,703,000	2,703,000
. . .	2,756,000	2,756,000
20	2,756,000	2,756,000
Total undiscounted costs		65,988,000
Present Value (PV) of Costs Discounted at 7%		54,072,000
Annualized Costs Discounted at 7%		2,514,000

This rule has extensive benefits for the public, contractors, the research community, the private sector, and the USG, though many of these benefits are challenging to quantify. Overarchingly, this rule will increase efficiency for contractors, minimize data errors, and improve the privacy and security of data. Further, this rule will help contractors to produce data assets that are trustworthy, high-quality, and usable by the general public and the research community for accountability, research, communication, and learning. For the public, there is an immense richness in the data collected by USAID and its partners around the world, and this data holds the potential to improve the lives of some of the world's most vulnerable people. When a development project ends, the data can yield new insights for years or decades into the future. It is the responsibility of the Agency and those representing the government to ensure that data is accessible, standardized, and secure. Finally, these estimates have been downwardly adjusted since the publication of the proposed rule to reflect USAID's responses to comments from the public.

In addition, under current protocols, USAID contractors are required to submit digital information to USAID under multiple award requirements using several different information management portals. The maintenance of these separate portals has made it challenging for USAID to integrate this information strategically to render a more holistic and detailed view of its global portfolio. By implementing these changes, USAID intends to reduce administrative burden on contractors and USG staff.

(3) Regulatory Flexibility Act

USAID does not expect this rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, *et seq.* USAID has therefore not performed an Initial Regulatory Flexibility Analysis (IRFA).

(4) Paperwork Reduction Act

This rule contains information collection requirements that have been submitted to the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). This information collection requirement has been assigned OMB Control Number 0412–0620, entitled ''AIDAR: Planning, Collection and Submission of Digital Information and Activity Monitoring, Evaluation, and Learning Plans to USAID''. Following receipt of comments, USAID has made several revisions to this collection to downwardly adjust the burden. Specifically, USAID revised the applicability of 752.227–71 from the micro purchase threshold to the simplified acquisition threshold. Similarly, USAID has added an Alternate clause exempting certain contracts from the requirement to provide a data management plan. Specifically, contracts are exempted that: contain no data; are for emergency food assistance; are for disaster assistance, and transition-assistance

activities managed by the Bureau for Humanitarian Assistance (BHA); or are for activities managed by the Bureau for Conflict Prevention and Stabilization's Office of Transition Initiatives (CPS/OTI). For additional detail, please see the Regulatory Impact Assessment as well as responses to comments in sections B. 2)(g)(C) and B. 2)(f)(3)(A) above.

Additionally, USAID posted a 60-Day Notice of Information Collection: Proposals, Submissions, and Approvals (the ''DIS Pilot'') in the **Federal Register** at 85 FR 83027 on December 21, 2020. USAID published a 30-Day Notice including a response to comments received on May 25, 2021 and solicited additional comments (See 86 FR 28053). Following receipt of additional comments, USAID, with approval from OMB, is providing a response to comments received to the 30-day Collection Notice with this Rulemaking. As the ''DIS Pilot'' collection has been discontinued due to this rulemaking action, this separate information collection approval request has been canceled.

List of Subjects in 48 CFR Parts 727, 742, and 752

Government procurement.

For the reasons discussed in the preamble, USAID amends 48 CFR chapter 7 as set forth below:

■ 1. The authority citation for 48 CFR parts 727, 742, and 752 continues to read as follows:

Authority: Sec. 621, Pub. L. 87–195, 75 Stat. 445, (22 U.S.C. 2381) as amended; E.O. 12163, Sept. 29, 1979, 44 FR 56673; and 3 CFR 1979 Comp., p. 435.

SUBCHAPTER E—GENERAL CONTRACTING REQUIREMENTS

PART 727—PATENTS, DATA, AND COPYRIGHTS

■ 2. Add subpart 727.70 to read as follows:

Subpart 727.70—Digital Information Planning, Collection, and Submission Requirements

Sec.

Subpart 727.70—Digital Information Planning, Collection, and Submission Requirements

727.7000 Scope of subpart.

(a) This part prescribes the policies, procedures, and a contract clause pertaining to data and digital information management. It implements the following requirements:

(1) Digital Accountability and Transparency (DATA) Act of 2014;

(2) Foundations for Evidence-Based Policymaking Act (''Evidence Act'') of 2018;

(3) 21st Century Integrated Digital Experience Act (21st Century IDEA Act);

(4) Foreign Aid Transparency and Accountability (FATAA) Act of 2016;

(5) Geospatial Data Act of 2018;

(6) OMB Circular A–130.

(b) [Reserved]

727.7001 Definitions.

As used in this subpart—

Data means recorded information, regardless of form or the media on which it may be recorded. The term includes technical data and computer software. The term does not include information incidental to contract administration, such as financial, administrative, cost or pricing, or management information.

Data asset is a collection of data elements or data sets that may be grouped together.

Data inventory is the first component of a Data Management Plan (DMP). The data inventory is a list of high-value data assets that the contractor anticipates producing during the period of award performance.

Data management plan (DMP) is a tool that guides the identification of anticipated data assets and outlines tasks needed to manage these assets across a full data lifecycle.

Data set is an organized collection of structured data, including data contained in spreadsheets, whether presented in tabular or non-tabular form. For example, a data set may represent a single spreadsheet, an extensible mark-up language (XML) file, a geospatial data file, or an organized collection of these. A data set does not include unstructured data, such as email or instant messages, PDF files, PowerPoint presentations, word processing documents, images, audio files, or collaboration software.

Digital means the coding scheme generally used in computer technology to represent data.

Digital data means quantitative and qualitative programmatic measurements that are entered directly into a computer. Examples include numeric targets established during activity design or implementation; baseline, mid-line, or final measurements created or obtained via field assessments; surveys or interviews; performance monitoring indicators as specified in the Contractor's approved Activity Monitoring, Evaluation, and Learning (AMELP) (see 752.242–71); evaluation results; or perception metrics collected from beneficiaries on the quality and relevance of International Disaster Assistance and Development Assistance.

Digital information is a subset of data and means:

(1) Digital text;

(2) Digital data;

(3) Digital objects; and

(4) Metadata created or obtained with USAID funding supported by this award that are represented, stored, or transmitted in such a way that they are available to a computer program.

Digital method is a means of using computer technology to gather, process, analyze, transmit, store, or otherwise use data and other forms of information.

Digital object includes digital or computer files that are available to a computer program. Examples include digital word processing or PDF documents or forms related to activity design, assessment reports, periodic progress and performance reports, academic research documents, publication manuscripts, evaluations, technical documentation and reports, and other reports, articles and papers prepared by the contractor, whether published or not. Other examples include data sets, spreadsheets, presentations, publication-quality images, audio and video files, communication materials, information products, extensible mark-up language (XML) files, and software, scripts, source code, and algorithms that can be processed by a computer program.

Digital text includes text-based descriptions of programmatic efforts that are entered directly into a computer, rather than submitted as a digital object.

727.7002 Policy.

(a) It is the policy of USAID to manage data as a strategic asset to inform the planning, design, implementation, monitoring, and evaluation of the Agency's foreign assistance programs. To achieve this, it is also USAID's policy to manage data and digital information across a full life cycle. This life cycle includes the following stages: Govern, Plan, Acquire, Process, Analyze, Curate, and Publish/Share. For more information about the USAID Development Data policy, see ADS Chapter 579 at *https://www.usaid.gov/about-us/agency-policy/series-500/579.* For more information about USAID's Program Cycle policy, see ADS Chapter 201 at *https://www.usaid.gov/about-us/agency-policy/series-200/201.*

(b) In furtherance of this policy, USAID requires that contractors:

(1) Engage in digital information planning, including creating a Data Management Plan (DMP) to identify and plan for the management of data assets that will be produced, furnished, acquired, or collected in a USAID-funded activity.

(2) Use only digital methods and USAID-approved standards, to the extent practicable, to produce, furnish, acquire, or collect information necessary to implement the contract requirements.

(3) Provide documentation of informed consent the contractor receives when obtaining information on individuals.

(4) Submit to USAID digital information produced, furnished, acquired, or collected in performance of a USAID contract at the finest level of granularity employed during contract implementation.

(c) As specified in ADS Chapter 579, USAID implements appropriate controls to restrict data access in a way that balances the potential benefits with any underlying risks to its beneficiaries and contractors.

727.7003 Contract clause.

(a) Insert the clause 752.227–71 to USAID in Section H of solicitations and contracts fully or partially funded with program funds exceeding the simplified acquisition threshold. The contracting officer may insert this clause in other USAID contracts if the contracting officer, in consultation with the requiring office, determines that doing so is in the best interest of the Agency.

(b) Insert the clause at 752.227–71, with its Alternate I when the anticipated contract:

(1) Does not collect data;

(2) Implements emergency food assistance under the Food for Peace Act or section 491 of the Foreign Assistance Act of 1961, including for the procurement, transportation, storage, handling and/or distribution of such assistance;

(3) Implements international disaster assistance under section 491 of the Foreign Assistance Act of 1961 or other authorities administered by the Bureau for Humanitarian Assistance; or

(4) Implements activities managed by the Bureau for Conflict Prevention and Stabilization's Office of Transition Initiatives, or is fully or partially funded with the Complex Crises Fund.

SUBCHAPTER G—CONTRACT MANAGEMENT

PART 742—CONTRACT ADMINISTRATION

Subpart 742.11—Production, Surveillance, and Reporting

■ 3. Amend 742.1170–3, by redesignating paragraphs (b)(2) through (7) as paragraphs (b)(3) through (8) and adding a new paragraph (b)(2).

The addition reads as follows:

742.1170–3 Policy.

* * * * *

(b) * * *

(2) The contract requirements for an activity monitoring, evaluation, and learning plan, as applicable;

* * * * *

■ 4. Add 742.1170–5 to read as follows:

742.1170–5 Activity Monitoring, Evaluation, and Learning Plan requirement and contract clause.

(a) When the requiring office needs information on how the contractor expects to monitor implementation performance and context, conduct or collaborate on an evaluation, and generate evidence to inform learning and adaptive management, the contracting officer may require the contractor to submit an Activity Monitoring, Evaluation, and Learning Plan (AMELP) tailored to specific contract requirements. For more information on monitoring, evaluation, and learning during the design and implementation of activities, see ADS Chapter 201 at *https://www.usaid.gov/about-us/agency-policy/series-200/201.*

(b) Unless instructed otherwise in writing by the requiring office, the contracting officer must insert the clause at 752.242–71 in section F of solicitations and contracts exceeding the simplified acquisition threshold, except as specified in paragraph (c) of this section. The contracting officer may insert this clause in other USAID contracts if the contracting officer, in consultation with the requiring office, determines that an Activity Monitoring, Evaluation, and Learning Plan is necessary, as provided in paragraph (a) of this section.

(c) The clause is not required to be included in contracts for:

(1) Supplies and services that USAID acquires for its own direct use or benefit;

(2) Emergency food assistance under the Food for Peace Act or section 491 of the Foreign Assistance Act of 1961, including for the procurement, transportation, storage, handling and/or distribution of such assistance;

(3) International disaster assistance under section 491 of the Foreign Assistance Act of 1961 or other authorities administered by the Bureau for Humanitarian Assistance; or

(4) Activities managed by the Bureau for Conflict Prevention and Stabilization's Office of Transition Initiatives, or fully or partially funded with the Complex Crises Fund.

SUBCHAPTER H—CLAUSES AND FORMS

PART 752—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 5. Add 752.227–71 to read as follows:

752.227–71. Planning, Collection, and Submission of Digital Information to USAID.

As prescribed in AIDAR 727.7003, insert the following clause in Section H of solicitations and contracts:

Planning, Collection, and Submission of Digital Information to USAID (JUN 2024)

(a) *Definitions.* As used in this clause—

Computer is a fixed or mobile device that accepts digital data and manipulates the information based on a program or sequence of instructions for how data is to be processed.

Data means recorded information, regardless of form or the media on which it may be recorded. The term includes technical data and computer software. The term does not include information incidental to contract administration, such as financial, administrative, cost or pricing, or management information.

Data asset is a collection of data elements or data sets that may be grouped together.

Data inventory is the first component of a Data Management Plan (DMP). The data inventory is a list of high-value data assets that the contractor anticipates producing during the period of award performance.

Data management plan (DMP) is a tool that guides the identification of anticipated data assets and outlines tasks needed to manage these assets across a full data lifecycle.

Data set is an organized collection of structured data, including data contained in spreadsheets, whether presented in tabular or non-tabular form. For example, a data set may represent a single spreadsheet, an extensible mark-up language (XML) file, a geospatial data file, or an organized collection of these. A data set does not include unstructured data, such as email or instant messages, PDF files, PowerPoint presentations, word processing documents, images, audio files, or collaboration software.

Digital means the coding scheme generally used in computer technology to represent data.

Digital data means quantitative and qualitative programmatic measurements that are entered directly into a computer. Examples include numeric targets established during activity design or implementation; baseline, mid-line, or final measurements created or obtained via field assessments; surveys or interviews;

performance monitoring indicators as specified in the Contractor's approved AMELP; evaluation results; or perception metrics collected from beneficiaries on the quality and relevance of International Disaster Assistance and Development Assistance.

Digital information is a subset of data and means:

(i) Digital text;

(ii) Digital data;

(iii) Digital objects; and

(iv) Metadata created or obtained with USAID funding regarding international development or humanitarian assistance activities supported by this award that are represented, stored, or transmitted in such a way that they are available to a computer program.

Digital method is a means of using computer technology to gather, process, analyze, transmit, store, or otherwise use data and other forms of information.

Digital object includes digital or computer files that are available to a computer program. Examples include digital word processing or PDF documents or forms related to activity design, assessment reports, periodic progress and performance reports, academic research documents, publication manuscripts, evaluations, technical documentation and reports, and other reports, articles and papers prepared by the Contractor under this contract, whether published or not. Other examples include data sets, spreadsheets, presentations, publication-quality images, audio and video files, communication materials, information products, extensible mark-up language (XML) files, and software, scripts, source code, and algorithms that can be processed by a computer program.

Digital repository refers to information systems that ingest, store, manage, preserve, and provide access to digital content.

Digital text includes text-based descriptions of programmatic efforts that are entered directly into a computer, rather than submitted as a digital object.

Draft digital information refers to digital information that, in the professional opinion of the Contractor, does not adhere to the information quality standards such that it presents preliminary, unverified, incomplete, or deliberative findings, claims, analysis, or results that may lead the consumer of such material to draw erroneous conclusions.

Granularity refers to the extent to which digital content or objects provide access to detailed, distinct data points. Coarse granularity generally means that distinct data points reflect larger, representational units or have been joined together or aggregated, thus providing less detail. A fine level of granularity generally means that distinct data points reflect smaller, individualized units that have not been aggregated, thus providing a higher level of detail. For example, a data set containing a list of every activity conducted by week would generally exhibit a finer level of granularity than a data set listing the various categories of activities conducted by month. The degree of granularity can be relative to the contents of a specific data set and can be geographic, temporal, or across other dimensions.

Information quality standards means the elements of utility, objectivity, and integrity collectively.

Integrity is an element of the information quality standards that means information has been protected from unauthorized access or revision, to ensure that the information is not compromised through corruption or falsification.

Machine readable means data in a format that can be easily processed by a computer without human intervention while ensuring that no semantic meaning is lost.

Metadata includes structural or descriptive information about digital data or digital objects such as content, format, source, rights, accuracy, provenance, frequency, periodicity, granularity, publisher or responsible party, contact information, method of collection, and other descriptions.

Objectivity is an element of the information quality standards that means whether information is accurate, reliable, and unbiased as a matter of presentation and substance.

Personally identifiable information (PII) means information that can be used to distinguish or trace an individual's identity, either alone or when combined with other information that is linked or linkable to a specific individual. [See Office of Management and Budget (OMB) Circular No. A–130, Managing Federal Information as a Strategic Resource.] PII can include both direct identifiers (such as name, health identification numbers, etc.), and indirect identifiers (geographic location, age) that when linked with other information can result in the identification of an individual.

Publication object is a digital object that has been accepted for publication prior to the end date of this contract and whose content is based on or includes any other digital information created or obtained in performance of this contract. In the research community, a publication object is often synonymous with a quality research manuscript that has been accepted by an academic journal for publication. However, publication objects can also consist of other digital objects (*e.g.,* photos, videos, etc.) published via news media, the internet, or other venues.

Quality digital information means digital information that, in the professional opinion of the Contractor, adheres to the information quality standards and presents reasonably sound and substantiated findings, claims, analysis, or results regarding activities.

Registered with the USAID Digital Front Door (DFD) means: that—

(i) The Contractor entered all mandatory information required to obtain access to the DFD.

(ii) The Contractor agrees to abide by the DFD terms and conditions of use.

(iii) The Government has validated the Contractor's registration by providing access to the DFD.

USAID Digital Front Door (DFD), located at *dfd.usaid.gov* is a website where the Contractor transacts business with USAID, such as submitting digital information.

Utility is an element of the information quality standards that means whether information is useful to its intended users, including the general public, and for its intended purpose.

(b) *Digital information planning requirements.* The Contractor must engage in digital information planning to ensure compliance with the collection and submission of all digital information, as required under this award.

(c) *Data Management Plan (DMP)*—(1) *What is required.* The Contractor must prepare and maintain a Data Management Plan (DMP) that reflects the digital information planning requirements outlined in paragraph (b) of this clause.

(2) *What to submit.* The DMP must be appropriate to the programmatic scope and context of the contract, and to the nature and complexity of the data to be collected or acquired in the course of the contract. The DMP must address, at a minimum, the following:

(i) Data inventory; and

(ii) If requested in writing by the Contracting Officer,

(A) Protocols for data collection, management and storage;

(B) Protocols for maintaining adequate safeguards that include the privacy and security of digital information collected under the award;

(C) Documentation that ensures other users can understand and use the data;

(D) Protocols for preserving digital information and facilitating access by other stakeholders; and

(E) Terms of use on data usage, publication, curation, or other dissemination plans.

(3) *When to submit.* The Contractor must develop and submit, at a minimum, the data inventory component of the DMP to the contracting officer for approval within ninety (90) days after contract award, unless the contracting officer establishes a different time period. The Contractor must submit the remaining components of the DMP to the contracting officer for approval, as soon as they become available. The contractor must not begin digital information collection prior to approval of the data inventory and submission of any remaining components of the DMP unless authorized in writing by the contracting officer.

(4) *When to revise.* The Contractor must revise the DMP as necessary throughout the period of performance of this contract. Any revisions to the plan must be approved by the contracting officer or contracting officer's representative as delegated.

(d) *Digital information production and collection requirements.* (1) The Contractor must:

(i) Use only digital methods to the extent practicable to produce, furnish, acquire, or collect information in performance of this contract. If the Contractor is unable to consistently collect data using digital methods, the Contractor must obtain the contracting officer or delegated contracting officer's representative's approval for any alternative collection method.

(ii) Collect digital information at the finest level of granularity that enables the Contractor to comply with the terms of this contract.

(2) To the extent practicable, the Contractor must limit the collection of PII to only that

which is necessary to comply with the requirements of the contract.

(e) *Registration requirements.* The Contractor must:

(1) Be registered with the USAID Digital Front Door (DFD) within ninety (90) days after award of this contract; and

(2) Maintain access to the DFD during the period of performance of this contract.

(f) *Submission requirements*—(1) *What to submit.* Unless an exemption in paragraph (f)(4) of this section applies, the Contractor must:

(i) Submit digital information created or obtained in performance of this contract to USAID at the finest level of granularity at which it was collected.

(ii) Submit digital information in nonproprietary formats and digital data and data sets in machine readable formats. The Contractor may also submit proprietary formats in addition to a nonproprietary format.

(iii) Submit a copy of any usage license agreement that the Contractor obtained from any third party who granted usage rights for the digital information.

(iv) Submit a copy of any photo or media release template that the Contractor used to obtain permission from any third party for the use of the photo or media.

(v) When the contract includes AIDAR clause 752.7012, Protection of the Individual as a Research Subject, provide a blank copy of the form, document, instructions, or other instruments used to obtain informed consent from persons whose individual information is contained in the original version of the digital object.

(vi) If applicable, provide additional details or metadata regarding:

(A) Where and how to access digital information that the Contractor submits to a USAID-approved digital repository or via alternate technology as approved by USAID's Chief Information Officer;

(B) The quality of submissions of draft digital information;

(C) Known sensitivities within digital information that may jeopardize the personal safety of any individual or group, whether the Contractor has submitted the information or has received a submission exemption;

(D) Digital information for which the Contractor was unable to obtain third party usage rights, a media release, or informed consent or which has other proprietary restrictions.

(2) *Where to submit.* The Contractor must submit digital information through the DFD, unless specifically authorized by the contracting officer in writing to submit to a USAID-approved digital repository instead or via alternate technology as approved by USAID's Chief Information Officer.

(3) *When to submit.* (i) With the exception of data sets, the Contractor must submit all other Digital Objects within 30 days of obtaining the contracting officer or delegated contracting officer representative's approval. Unless otherwise specified in the schedule of the contract or otherwise instructed by the contracting officer or delegated contracting officer's representative, the Contractor must submit data sets and all other digital information created or obtained in performance of this contract to USAID once it meets the requirements of quality digital information. Unless otherwise approved by the contracting officer in writing, within thirty (30) days after the contract completion date, the Contractor must submit all digital information not previously submitted, including both draft digital information and quality digital information required under this contract.

(ii) Upon written approval of the contracting officer or delegated contracting officer's representative, the Contractor must submit draft digital information to USAID when the ''best available'' information is required in order to meet time constraints or other programmatic or operational exigencies.

(4) *Exemptions.* (i) The Contractor must not submit digital information through the DFD that contains:

(A) Classified information.

(B) Personally identifiable information. The Contractor must, to the maximum extent possible, remove the association between the set of identifying data and the individual to which it applies unless retaining such information is essential to comply with the terms of this contract and upon written approval from the contracting officer or delegated contracting officer's representative to submit this information.

(ii) If the Contractor believes there is a compelling reason not to submit specific digital information that does not fall under an exemption in this section, including circumstances where submission may jeopardize the personal safety of any individual or group, the Contractor must obtain written approval not to submit the digital information from the contracting officer.

(5) *Approval requirements.* Upon receipt of digital information submitted by the Contractor, the contracting officer or delegated contracting officer's representative will either approve or reject the submission. When a submission is rejected, the Contractor must make corrections and resubmit the required information. USAID does not consider the submission accepted until the contracting officer or delegated contracting officer's representative provides written approval to the Contractor.

(g) *Publication considerations.* (1) If the Contractor produces a publication object, the Contractor must submit via the DFD a copy of the publication object, the publication acceptance notification, along with a link at which the final published object may be accessed.

(2) For any digital object the Contractor submits in compliance with the terms of this contract, the Contractor may request from the contracting officer or delegated contracting officer's representative an embargo on the public release of the digital object. The contracting officer or delegated contracting officer's representative may approve an embargo request that is for no more than 12 months at a time, with additional scrutiny for digital objects relied upon for journal publication. A determination on this request will be provided to the Contractor in writing.

(3) If the Contractor used a digital object previously submitted via the DFD to generate the publication object, and that digital object is governed by a pre-existing embargo, that embargo will expire on the day the publication object is scheduled for publication. USAID may elect to publish digital information on which the publication object is based as early as the date the publication object is scheduled for publication.

(h) *USAID digital collection and submission standards.* The Contractor must comply with the version of USAID's Digital Collection and Submission Standards in effect on the date of award as outlined at *data.usaid.gov/standards.* If the Contractor is unable to adhere to USAID's Digital Collection and Submission Standards, the Contractor must obtain USAID's written approval for an alternative approach.

(i) *Access to the digital information.* USAID will conduct a rigorous risk assessment of digital information that the Contractor submits to USAID to determine the appropriate permissions and restrictions on access to the digital information. USAID may release the data publicly in full, redact or otherwise protect aspects of the information prior to public release, or hold the information in a non-public status.

(j) *Obligations regarding subcontractors.* (1) The Contractor must furnish, acquire, or collect information and submit to USAID, in accordance with paragraph (f) of this clause, all digital information produced, furnished, acquired, or collected in performance of this contract by its subcontractors at any tier.

(2) The Contractor must insert the terms of this clause, except paragraph (e) of this clause, in all subcontracts.

(End of clause)

Alternate I (JUN 2024). As prescribed in AIDAR 727.7003, substitute the following paragraph (c) for paragraph (c) of the basic clause:

(c) [Reserved]

■ 6. Add 752.242–71 to read as follows:

752.242–71 Activity Monitoring, Evaluation, and Learning Plan

As prescribed in AIDAR 742.1170–5, insert the following clause in section F of solicitations and contracts.

Activity Monitoring, Evaluation, and Learning Plan (JUN 2024)

(a) *Definitions.* As used in this clause—

Activity Monitoring, Evaluation, and Learning Plan (AMELP) means a plan for monitoring, evaluating, and collaborating, learning, and adapting during implementation of a USAID contract. Some USAID documentation may refer to ''MEL Plan'' or ''Activity MEL Plan''. These terms are synonymous.

Contract will be interpreted as ''task order'' or ''delivery order'' when this clause is used in an indefinite-delivery contract.

Evaluation means the systematic collection and analysis of data and information about the characteristics and outcomes of the programming carried out through a contract, conducted as a basis for judgments, to understand and improve effectiveness and efficiency, and timed to inform decisions about current and future programming.

Feedback from beneficiaries means perceptions or reactions voluntarily communicated by a beneficiary of USAID assistance about the USAID assistance received.

Indicator means a quantifiable measure of a characteristic or condition of people, institutions, systems, or processes that might change over time.

Learning activity means efforts for the purpose of generating, synthesizing, sharing, and applying evidence and knowledge.

Monitoring context means the systematic collection of information about conditions and external factors relevant to implementation and performance of the contract.

Output means the tangible, immediate, and intended products or consequences of contract implementation within the Contractor's control or influence.

Outcome means the conditions of people, systems, or institutions that indicate progress or lack of progress toward the achievement of the goals and objectives of the contract.

Performance indicator means an indicator that measures expected outputs and/or outcomes of the contract implementation.

Target means a specific, planned level of results to achieve within a specific timeframe with a given level of resources.

(b) *Requirements.* (1) Unless otherwise specified in the schedule of the contract, the Contractor must develop and submit a proposed AMELP to the contracting officer or delegated contracting officer's representative within ninety (90) days of contract award. The contracting officer or delegated contracting officer's representative will review and provide comments within thirty (30) days after receiving the proposed AMELP. The Contractor must submit a final AMELP for contracting officer or delegated contracting officer's representative approval no later than 15 days after receiving comments.

(2) The Contractor must revise the AMELP as necessary during the period of performance of this contract. Any revisions to the plan must be approved by the contracting officer or delegated contracting officer's representative.

(c) *Content.* (1) The Contractor's proposed AMELP must include, at a minimum, the following:

(i) The Contractor's plan for monitoring, including any existing systems or processes for monitoring progress, any Standard Foreign Assistance Indicators as agreed upon by the contracting officer or delegated contracting officer's representative, any other USAID required indicators, and other relevant performance indicators of the contract's outputs and outcomes, their baseline (or plan for collecting baseline), and targets; and

(ii) The Contractor's plan for regular and systematic collection of feedback from beneficiaries, responding to feedback received, and reporting to USAID a summary of feedback and actions taken in response to the feedback received, or a rationale for why collecting feedback from beneficiaries is not applicable for this contract.

(2) The Contractor's proposed AMELP must be appropriate to the size and complexity of the contract and address the following, as applicable:

(i) Plans for monitoring context and emerging risks that could affect the achievement of the contract's results;

(ii) Plans for any evaluations to be conducted by the contractor, sub-contractor or third-party, including collaboration with an external evaluator;

(iii) Learning activities, including plans for capturing knowledge at the close-out of the contract;

(iv) Estimated resources for the AMELP tasks that are a part of the contract's budget; and

(v) Roles and responsibilities for all proposed AMELP tasks.

[End of clause]

752.7005 [Removed and Reserved]

■ 7. Remove and Reserve 752.7005.

Jami J. Rodgers,

Chief Acquisition Officer.

CUSTOMER SERVICE AND INFORMATION

ELECTRONIC RESEARCH

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: **www.govinfo.gov.**

Federal Register information and research tools, including Public Inspection List and electronic text are located at: **www.federalregister.gov.**

E-mail

FEDREGTOC (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to **https://public.govdelivery.com/accounts/USGPOOFR/subscriber/new**, enter your email address, then follow the instructions to join, leave, or manage your subscription.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to **http://listserv.gsa.gov/archives/publaws-l.html and select** *Join or leave the list (or change settings);* then follow the instructions.

FEDREGTOC and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: **fedreg.info@nara.gov**

The Federal Register staff cannot interpret specific documents or regulations.

FEDERAL REGISTER PAGES AND DATE, MAY

CFR PARTS AFFECTED DURING MAY

At the end of each month the Office of the Federal Register publishes separately a List of CFR Sections Affected (LSA), which lists parts and sections affected by documents published since the revision date of each title.
