PART 202—PRODUCTION OR DISCLOSURE OF MATERIAL OR INFORMATION

Subpart A [Reserved]

Subpart B—Production or Disclosure in Response to Subpoenas or Demands of Courts or Other Authorities

Sec.

202.21 Purpose and scope.
202.22 Production or disclosure prohibited unless approved by appropriate DOE official.
202.23 Procedure in the event of a demand for production or disclosure.
202.24 Final action by the appropriate DOE official.
202.25 Procedure where a decision concerning a demand is not made prior to the time a response to the demand is required.
202.26 Procedure in the event of an adverse ruling.

Subpart A [Reserved]

Subpart B—Production or Disclosure in Response to Subpoenas or Demands of Courts or Other Authorities

Source: 39 FR 35472, Mar. 13, 1974, unless otherwise noted.

§ 202.21 Purpose and scope.

(a) This subpart sets forth the procedures to be followed when a subpoena, order, or other demand (hereinafter referred to as a “demand”) of a court or other authority is issued for the production or disclosure of (1) any material contained in the files of the Department of Energy (DOE), (2) any information relating to material contained in the files of the DOE, or (3) any information or material acquired by any person while such person was an employee of the DOE as a part of the performance of his official duties or because of his official status.

(b) For purposes of this subpart, the term “Employee of the DOE” includes all officers and employees of the United States appointed by, or subject to the supervision, jurisdiction, or control of, the Administrator of DOE.

§ 202.22 Production or disclosure prohibited unless approved by appropriate DOE official.

No employee or former employee of the DOE shall, in response to a demand of a court or other authority, produce any material contained in the file of the DOE or disclose any information relating to material contained in the files of the DOE, or disclose any information or produce any material acquired as part of the performance of his official duties or because of his official status without prior approval of the General Counsel of DOE.

§ 202.23 Procedure in the event of a demand for production or disclosure.

(a) Whenever a demand is made upon an employee or former employee of the DOE for the production of material or the disclosure of information described in §202.21(a), he shall immediately notify the Regional Counsel for the region where the issuing authority is located. The Regional Counsel shall immediately request instructions from the General Counsel of DOE.

(b) If oral testimony is sought by the demand, an affidavit, or, if that is not feasible, a statement by the party seeking the testimony or his attorney, setting forth a summary of the testimony desired, must be furnished for submission by the Regional Counsel to the General Counsel.

§ 202.24 Final action by the appropriate DOE official.

If the General Counsel approves a demand for the production of material or disclosure of information, he shall so notify the Regional Counsel and such other persons as circumstances may warrant.
§ 202.25 Procedure where a decision concerning a demand is not made prior to the time a response to the demand is required.

If response to the demand is required before the instructions from the General Counsel are received, a U.S. attorney or DOE attorney designated for the purpose shall appear with the employee or former employee of the DOE upon whom the demand has been made, and shall furnish the court or other authority with a copy of the regulations contained in this subpart and inform the court or other authority that the demand has been, or is being, as the case may be, referred for the prompt consideration of the appropriate DOE official and shall respectfully request the court or authority to stay the demand pending receipt of the requested instructions.

§ 202.26 Procedure in the event of an adverse ruling.

If the court or other authority declines to stay the effect of the demand in response to a request made in accordance with §202.25 pending receipt of instructions, of if the court or other authority rules that the demand must be complied with irrespective of instructions not to produce the material or disclose the information sought, the employee or former employee upon whom the demand has been made shall respectfully decline to comply with the demand. “United States ex rel Touhy v. Ragen,” 340 U.S. 462.
§205.1 Purpose and scope.

This part establishes the procedures to be utilized and identifies the sanctions that are available in proceedings before the Department of Energy and State Offices, in accordance with parts 209 through 214 of this chapter. Any exception, exemption, appeal, stay, modification, recession, redress or resolution of private grievance sought under the authority of 42 U.S.C. 7194 shall be governed by the procedural rules set forth in 10 CFR part 1003.

[61 FR 35114, July 5, 1996]

§205.2 Definitions.

The definitions set forth in other parts of this chapter shall apply to this part, unless otherwise provided. In addition, as used in this part, the term:

Action means an order, interpretation, notice of probable violation or ruling issued, or a rulemaking undertaken by the DOE or, as appropriate, by a State Office.
Adjustment means a modification of the base period volume or other measure of allocation entitlement in accordance with part 211 of this chapter.

Aggrieved, for purposes of administrative proceedings, describes and means a person with an interest sought to be protected under the FEAA, EPAA, or Proclamation No. 3279, as amended, who is adversely affected by an order or interpretation issued by the DOE or a State Office.

Appropriate Regional Office or appropriate State Office means the office located in the State or DOE region in which the product will be physically delivered.

Assignment means an action designating that an authorized purchaser be supplied at a specified entitlement level by a specified supplier.

Conference means an informal meeting, incident to any proceeding, between DOE or State officials and any person aggrieved by that proceeding.

Consent order means a document of agreement between DOE and a person prohibiting certain acts, requiring the performance of specific acts or including any acts which DOE could prohibit or require pursuant to §205.195.

Duly authorized representative means a person who has been designated to appear before the DOE or a State Office in connection with a proceeding on behalf of a person interested in or aggrieved by that proceeding. Such appearance may consist of the submission of applications, petitions, requests, statements, memoranda of law, other documents, or of a personal appearance, verbal communication, or any other participation in the proceeding.

Exception means the waiver or modification of the requirements of a regulation, ruling or generally applicable requirement under a specific set of facts.

Exemption means the release from the obligation to comply with any part or parts, or any subpart thereof, of this chapter.

DOE means the Department of Energy, created by the FEAA and includes the DOE National Office and Regional Offices.

Interpretation means a written statement issued by the General Counsel or his delegate or Regional Counsel, in response to a written request, that applies the regulations, rulings, and other precedents previously issued, to the particular facts of a prospective or completed act or transaction.

Notice of probable violation means a written statement issued to a person by the DOE that states one or more alleged violations of the provisions of this chapter or any order issued pursuant thereto.

Order means a written directive or verbal communication of a written directive, if promptly confirmed in writing, issued by the DOE or a State Office. It may be issued in response to an application, petition or request for DOE action or in response to an appeal from an order, or it may be a remedial order or other directive issued by the DOE or a State Office on its own initiative. A notice of probable violation is not an order. For purposes of this definition a “written directive” shall include telegrams, telecopies and similar transcriptions.

Person means any individual, firm, estate, trust, sole proprietorship, partnership, association, company, joint-venture, corporation, governmental unit or instrumentality thereof, or a charitable, educational or other institution, and includes any officer, director, owner or duly authorized representative thereof.

Proceeding means the process and activity, and any part thereof, instituted by the DOE or a State Office, either on its own initiative or in response to an application, complaint, petition or request submitted by a person, that may lead to an action by the DOE or a State Office.
Remedial order means a directive issued by the DOE requiring a person to cease a violation or to eliminate or to compensate for the effects of a violation, or both.

Ruling means an official interpretative statement of general applicability issued by the DOE General Counsel and published in the Federal Register that applies the DOE regulations to a specific set of circumstances.

State Office means a State Office of Petroleum Allocation certified by the DOE upon application pursuant to part 211 of this chapter.

Throughout this part the use of a word or term in the singular shall include the plural and the use of the male gender shall include the female gender.

§ 205.3 Appearance before the DOE or a State Office.

(a) A person may make an appearance, including personal appearances in the discretion of the DOE, and participate in any proceeding described in this part on his own behalf or by a duly authorized representative. Any application, appeal, petition, or other document filed by a duly authorized representative shall contain a statement by such person certifying that he is a duly authorized representative, unless a DOE form requires otherwise. Falsification of such certification will subject such person to the sanctions stated in 18 U.S.C. 1001 (1970).

(b) Suspension and disqualification: The DOE or a State Office may deny, temporarily or permanently, the privilege of participating in proceedings, including oral presentation, to any individual who is found by the DOE—

   (1) To have made false or misleading statements, either verbally or in writing;
   (2) To have filed false or materially altered documents, affidavits or other writings;
   (3) To lack the specific authority to represent the person seeking a DOE or State Office action;
   (4) To have engaged in or to be engaged in contumacious conduct that substantially disrupts a proceeding.

§ 205.4 Filing of documents.

(a) Any document, including, but not limited to, an application, request, complaint, petition and other documents submitted in connection therewith, filed with the DOE or a State Office under this chapter is considered to be filed when it has been received by the DOE National Office, a Regional Office or a State Office. Documents transmitted to the DOE must be addressed as required by §205.12. All documents and exhibits submitted become part of an DOE or a State Office file and will not be returned.

(b) Notwithstanding the provisions of paragraph (a) of this section, an appeal, a response to a denial of an appeal or application for modification or rescission, or a reply to a notice of probable violation, the appeal of a remedial order or remedial order for immediate compliance, a response to denial of a claim of confidentiality, or a comment submitted in connection with any proceeding transmitted by registered or certified mail and addressed to the appropriate office is considered to be filed upon mailing.

(c) Hand-delivered documents to be filed with the Office of Exceptions and Appeals shall be submitted to Room 8002 at 2000 M Street, NW., Washington, D.C. All other hand-delivered documents to be filed with the DOE National Office shall be submitted to the Executive Secretariat at 12th and Pennsylvania Avenue, NW., Washington, D.C. Hand-delivered documents to be filed with a Regional Office shall be submitted to the Office of the Regional Administrator. Hand-delivered documents to be filed with a State Office shall be submitted to the office of
§ 205.5 Computation of time.

(a) Days. (1) Except as provided in paragraph (b) of this section, in computing any period of time prescribed or allowed by these regulations or by an order of the DOE or a State Office, the day of the act, event, or default from which the designated period of time begins to run is not to be included. The last day of the period so computed is to be included unless it is a Saturday, Sunday, or Federal legal holiday in which event the period runs until the end of the next day that is neither a Saturday, Sunday, nor a Federal legal holiday.

(2) Saturdays, Sundays or intervening Federal legal holidays shall be excluded from the computation of time when the period of time allowed or prescribed is 7 days or less.

(b) Hours. If the period of time prescribed in an order issued by the DOE or a State Office is stated in hours rather than days, the period of time shall begin to run upon actual notice of such order, whether by verbal or written communication, to the person directly affected, and shall run without interruption, unless otherwise provided in the order, or unless the order is stayed, modified, suspended or rescinded. When a written order is transmitted by verbal communication, the written order shall be served as soon thereafter as is feasible.

(c) Additional time after service by mail. Whenever a person is required to perform an act, to cease and desist therefrom, or to initiate a proceeding under this part within a prescribed period of time after issuance to such person of an order, notice, interpretation or other document and the order, notice, interpretation or other document is served by mail, 3 days shall be added to the prescribed period.

§ 205.6 Extension of time.

When a document is required to be filed within a prescribed time, an extension of time to file may be granted by the office with which the document is required to be filed upon good cause shown.

§ 205.7 Service.

(a) All orders, notices, interpretations or other documents required to be served under this part shall be served personally or by registered or certified mail or by regular United States mail (only when service is effected by the DOE or a State Office), except as otherwise provided.

(b) Service upon a person's duly authorized representative shall constitute service upon that person.

(c) Service by registered or certified mail is complete upon mailing. Official United States Postal Service receipts from such registered or certified mailing shall constitute prima facie evidence of service.

§ 205.8 Subpoenas, special report orders, oaths, witnesses.

(a) In this section the following terms have the definitions indicated unless otherwise provided.

(1) “DOE Official” means the Secretary of the Department of Energy, the Administrator of the Economic Regulatory Administration, the Administrator of Energy Information Administration, the General Counsel of the Department of Energy, the Special Counsel for Compliance, the Assistant Administrator for Enforcement, the Director of the Office of Hearings and Appeals, or the duly authorized delegate of any of the foregoing officials.

(2) “SRO” means a Special Report Order issued pursuant to paragraph (b) of this section.

(b) (1) In accordance with the provisions of this section and as otherwise authorized by law, a DOE Official may sign, issue and serve subpoenas; administer oaths and affirmations; take sworn testimony; compel attendance of and sequester witnesses; control dissemination of any record of testimony taken pursuant to this section; subpoena and reproduce books, papers, correspondence, memoranda, contracts, agreements, or other relevant records.
Department of Energy § 205.8

or tangible evidence including, but not limited to, information retained in computerized or other automated systems in possession of the subpoenaed person. Unless otherwise provided by Subpart O, the provisions of this section apply to subpoenas issued by the office of Hearings and Appeals with respect to matters in proceedings before it.

(2) A DOE Official may issue a Special Report Order requiring any person subject to the jurisdiction of the ERA to file a special report providing information relating to DOE regulations, including but not limited to written answers to specific questions. The SRO may be in addition to any other reports required by this chapter.

(3) The DOE Official who issues a subpoena or SRO pursuant to this section, for good cause shown, may extend the time prescribed for compliance with the subpoena or SRO and negotiate and approve the terms of satisfactory compliance.

(4) Prior to the time specified for compliance, but in no event more than 10 days after the date of service of the subpoena or SRO, the person upon whom the document was served may file a request for review of the subpoena or SRO with the DOE Official who issued the document. The DOE Official then shall forward the request to his supervisor who shall provide notice of receipt to the person requesting review. The supervisor or his designee may extend the time prescribed for compliance with the subpoena or SRO and negotiate and approve the terms of satisfactory compliance.

(5) If the subpoena or SRO is not modified or rescinded within 10 days of the date of the supervisor’s notice of receipt, (i) the subpoena or SRO shall be effective as issued; and (ii) the person upon whom the document was served shall comply with the subpoena or SRO within 20 days of the date of the supervisor’s notice of receipt, unless otherwise notified in writing by the supervisor or his designee.

(6) There is no administrative appeal of a subpoena or SRO.

(c) (1) A subpoena or SRO shall be served upon a person named in the document by delivering a copy of the document to the person named.

(2) Delivery of a copy of the document to a natural person may be made by:

(i) Handing it to the person;

(ii) Leaving it at the person’s office with the person in charge of the office;

(iii) Leaving it at the person’s dwelling or usual place of abode with a person of suitable age and discretion who resides there;

(iv) Mailing it to the person by registered or certified mail, at his last known address; or

(v) Any method that provides the person with actual notice prior to the return date of the document.

(3) Delivery of a copy of the document to a person who is not a natural person may be made by:

(i) Handing it to a registered agent of the person;

(ii) Handing it to any officer, director, or agent in charge of any office of such person;

(iii) Mailing it to the last known address of any registered agent, officer, director, or agent in charge of any office of the person by registered or certified mail, or

(iv) Any method that provides any registered agent, officer, director, or agent in charge of any office of the person with actual notice of the document prior to the return date of the document.

(d)(1) A witness subpoenaed by the DOE shall be paid the same fees and mileage as paid to a witness in the district courts of the United States.

(2) If in the course of a proceeding conducted pursuant to subpart M or O, a subpoena is issued at the request of a person other than an officer or agency of the United States, the witness fees and mileage shall be paid by the person who requested the subpoena. However, at the request of the person, the witness fees and mileage shall be paid by the DOE if the person shows:

(i) The presence of the subpoenaed witness will materially advance the proceeding; and

(ii) The person who requested that the subpoena be issued would suffer a serious hardship if required to pay the witness fees and mileage. The DOE Official issuing the subpoena shall make the determination required by this subsection.
(e) If any person upon whom a subpoena or SRO is served pursuant to this section, refuses or fails to comply with any provision of the subpoena or SRO, an action may be commenced in the United States District Court to enforce the subpoena or SRO.

(f) (1) Documents produced in response to a subpoena shall be accompanied by the sworn certification, under penalty of perjury, of the person to whom the subpoena was directed or his authorized agent that (i) a diligent search has been made for each document responsive to the subpoena, and (ii) to the best of his knowledge, information, and belief each document responsive to the subpoena is being produced unless withheld on the grounds of privilege pursuant to paragraph (g) of this section.

(2) Any information furnished in response to an SRO shall be accompanied by the sworn certification under penalty of perjury of the person to whom it was directed or his authorized agent who actually provides the information that (i) a diligent effort has been made to provide all information required by the SRO, and (ii) all information furnished is true, complete, and correct unless withheld on grounds of privilege pursuant to paragraph (g) of this section.

(3) If any document responsive to a subpoena is not produced or any information required by an SRO is not furnished, the certification shall include a statement setting forth every reason for failing to comply with the subpoena or SRO.

(g) If a person to whom a subpoena or SRO is directed withholds any document or information because of a claim of attorney-client or other privilege, the person submitting the certification required by paragraph (f) of this section also shall submit a written list of the documents or the information withheld indicating a description of each document or information, the date of the document, each person shown on the document as having received a copy of the document, each person shown on the document as having prepared or been sent the document, the privilege relied upon as the basis for withholding the document or information, and an identification of the person whose privilege is being asserted.

(h)(1) If testimony is taken pursuant to a subpoena, the DOE Official shall determine whether the testimony shall be recorded and the means by which the testimony is recorded.

(2) A witness whose testimony is recorded may procure a copy of his testimony by making a written request for a copy and paying the appropriate fees. However, the DOE official may deny the request for good cause. Upon proper identification, any witness or his attorney has the right to inspect the official transcript of the witness' own testimony.

(i) The DOE Official may sequester any person subpoenaed to furnish documents or give testimony. Unless permitted by the DOE Official, neither a witness nor his attorney shall be present during the examination of any other witnesses.

(j)(1) Any witness whose testimony is taken may be accompanied, represented and advised by his attorney as follows:

(i) Upon the initiative of the attorney or witness, the attorney may advise his client, in confidence, with respect to the question asked his client, and if the witness refuses to answer any question, the witness or his attorney is required to briefly state the legal grounds for such refusal; and

(ii) If the witness claims a privilege to refuse to answer a question on the grounds of self-incrimination, the witness must assert the privilege personally.

(k) The DOE Official shall take all necessary action to regulate the course of testimony and to avoid delay and prevent or restrain contemptuous or obstructionist conduct or contemptuous language. DOE may take actions as the circumstances may warrant in
regard to any instances where any attorney refuses to comply with directions or provisions of this section.

[44 FR 23201, Apr. 19, 1979]

§ 205.9 General filing requirements.

(a) Purpose and scope. The provisions of this section shall apply to all documents required or permitted to be filed with the DOE or with a State Office.

(b) Signing. All applications, petitions, requests, appeals, comments or any other documents that are required to be signed, shall be signed by the person filing the document or a duly authorized representative. Any application, appeal, petition, request, complaint or other document filed by a duly authorized representative shall contain a statement by such person certifying that he is a duly authorized representative, unless an DOE form otherwise requires. (A false certification is unlawful under the provisions of 18 U.S.C. 1001 (1970)).

(c) Labeling. An application, petition, or other request for action by the DOE or a State Office should be clearly labeled according to the nature of the action involved (e.g., “Application for Assignment”) both on the document and on the outside of the envelope in which the document is transmitted.

(d) Obligation to supply information. A person who files an application, petition, complaint, appeal or other request for action is under a continuing obligation during the proceeding to provide the DOE or a State Office with any new or newly discovered information that is relevant to that proceeding. Such information includes, but is not limited to, information regarding any other application, petition, complaint, appeal or request for action that is subsequently filed by that person with any DOE office or State Office.

(e) The same or related matters. A person who files an application, petition, complaint, appeal or other request for action by the DOE or a State Office shall state whether, to the best knowledge of that person, the same or related issue, act or transaction has been or presently is being considered or investigated by any DOE office, other Federal agency, department or instrumentality; or by a State Office, a state or municipal agency or court; or by any law enforcement agency; including, but not limited to, a consideration or investigation in connection with any proceeding described in this part. In addition, the person shall state whether contact has been made by the person or one acting on his behalf with any person who is employed by the DOE or any State Office with regard to the same issue, act or transaction or a related issue, act or transaction arising out of the same factual situation; the name of the person contacted; whether the contact was verbal or in writing; the nature and substance of the contact; and the date or dates of the contact.

(f) Request for confidential treatment. (1) If any person filing a document with the DOE or a State Office claims that some or all the information contained in the document is exempt from the mandatory public disclosure requirements of the Freedom of Information Act (5 U.S.C. 552 (1970)), is information referred to in 18 U.S.C. 1905 (1970), or is otherwise exempt by law from public disclosure, and if such person requests the DOE or a State Office not to disclose such information, such person shall file together with the document a second copy of the document from which has been deleted the information for which such person wishes to claim confidential treatment. If the person states that the
information comes within the exception in 5 U.S.C. 552(b)(4) for trade secrets and commercial or financial information, such person shall include a statement specifying why such information is privileged or confidential. If the person filing a document does not submit a second copy of the document with the confidential information deleted, the DOE or a State Office may assume that there is no objection to public disclosure of the document in its entirety.

(2) The DOE or a State Office retains the right to make its own determination with regard to any claim of confidentiality. Notice of the decision by the DOE or a State Office to deny such claim, in whole or in part, and an opportunity to respond shall be given to a person claiming confidentiality of information no less than five days prior to its public disclosure.

(g) Separate applications, petitions or requests. Each application, petition or request for DOE action shall be submitted as a separate document, even if the applications, petitions, or requests deal with the same or a related issue, act or transaction, or are submitted in connection with the same proceeding.

§ 205.10 Effective date of orders.

Any order issued by the DOE or a State Office under this chapter is effective as against all persons having actual notice thereof upon issuance, in accordance with its terms, unless and until it is stayed, modified, suspended, or rescinded. An order is deemed to be issued on the date, as specified in the order, on which it is signed by an authorized representative of the DOE or a State Office, unless the order provides otherwise.

§ 205.11 Order of precedence.

(a) If there is any conflict or inconsistency between the provisions of this part and any other provision of this chapter, the provisions of this part shall control with respect to procedure.

(b) Notwithstanding paragraph (a) of this section, subpart I of part 212 of this chapter shall control with respect to prenotification and reporting and subpart J of part 212 of this chapter shall control with respect to accounting and financial reporting requirements.

§ 205.12 Addresses for filing documents with the DOE.

(a) All applications, requests, petitions, appeals, reports, DOE or FEO forms, written communications and other documents to be submitted to or filed with the DOE National Office in accordance with this chapter shall be addressed as provided in this section. The DOE National Office has facilities for the receipt of transmissions via TWX and FAX. The FAX is a 3M full duplex 4 or 6 minute (automatic) machine.

(6) Documents pertaining to the price of covered products, except those to be submitted to other offices as provided in this part, shall be addressed to the Department of Energy, Code 1000, Attn: (name of person to receive document, if known, and/or labeling as specified in §205.9(c)), Washington, DC 20461.

(7) Documents designated as DOE or FEO forms shall be submitted in accordance with the instructions stated in the form.

(8) “Surplus Product Reports” shall be submitted to the Department of Energy, Post Office Box 19407, Washington, DC 20036.

(9) Documents to be submitted to the Director of Oil Imports, as provided in this part or otherwise, shall be addressed as follows: Director of Oil Imports, Department of Energy, P.O. Box 7414, Washington, DC 20044.

(10) Petitions for rulemaking to be filed with the Economic Regulatory Administration National Office shall be addressed as follows: Economic Regulatory Administration, Attn: Assistant Administrator for Regulations and Emergency Planning (labeled as “Petition for Rulemaking”), 2000 M Street, N.W., Washington, DC 20461.

(b) All reports, applications, requests, notices, complaints, written communications and other documents to be submitted to or filed with an DOE Regional Office in accordance with this chapter shall be directed to one of the following addresses, as appropriate:

**REGION 1**

Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont; Regional Office, Department of Energy, 150 Causeway Street, Boston, Massachusetts 02114.

**REGION 2**

New Jersey, New York, Puerto Rico, Virgin Islands; Regional Office, Department of Energy, 26 Federal Plaza, New York, New York 10007.

**REGION 3**

Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia; Regional Office, Department of Energy, Federal Office Building, 3421 Cherry Street, Philadelphia, Pennsylvania 19102.

**REGION 4**

Alabama, Canal Zone, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina; Regional Office, Department of Energy, 1655 Peachtree Street NW., Atlanta, Georgia 30309.

**REGION 5**

Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin; Regional Office, Department of Energy, 175 West Jackson Street, Chicago, Illinois 60604.

**REGION 6**

Arkansas, Louisiana, New Mexico, Oklahoma, Texas; Regional Office, Department of Energy, 212 North Saint Paul Street, Dallas, Texas 75201.

**REGION 7**

Iowa, Kansas, Missouri, Nebraska; Regional Office, Department of Energy, Federal Office Building, P.O. Box 15000, 112 East 12th Street, Kansas City, Missouri 64106.

**REGION 8**

Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming; Regional Office, Department of Energy, Post Office Box 26247, Belmar Branch, Denver, Colorado 80226.

**REGION 9**

American Samoa, Arizona, California, Guam, Hawaii, Nevada, Trust Territory of the Pacific Islands; Regional Office, Department of Energy, Post Office Box 19407, Washington, DC 20036.
§ 205.13 Where to file.

(a) Except as otherwise specifically provided in other subparts of this part, all documents to be filed with the ERA pursuant to this part shall be filed with the appropriate ERA Regional Office (unless otherwise specified in part 211 of this chapter), except that all documents shall be filed with the ERA National Office that relate to:

1. The allocation and pricing of crude oil pursuant to subpart C of part 211 and part 212 of this chapter;
2. Refinery yield controls pursuant to subpart C of part 211 of this chapter;
3. The pricing of propane, butane and natural gasoline pursuant to part 212 of this chapter and the allocation of butane and natural gasoline pursuant to part 211 of this chapter;
4. The allocation and pricing of middle distillate fuels pursuant to subpart G of part 211 and part 212 of this chapter, filed by electric utilities;
5. The allocation and pricing of aviation fuel pursuant to subpart H of part 211 and part 212 of this chapter, filed by civil air carriers (except air taxi/commercial operators);
6. The allocation and pricing of residual fuel oil pursuant to subpart I of part 211 and part 212 of this chapter, filed by electric utilities;
7. The allocation and pricing of naphtha and gas oil pursuant to subpart J of part 211 and part 212 of this chapter;
8. The allocation and pricing of other products pursuant to subpart K of part 211 and part 212 of this chapter;
9. An application for an exemption under subpart E of this part; requests for a rulemaking proceeding under subpart L of this part or for the issuance of a ruling under subpart K of this part; and petitions to the Office of Private Grievances and Redress under subpart R of this part;
10. The pricing of products pursuant to part 212 of this chapter, filed by a refiner; and
11. The allocation of crude oil and other allocated products to meet Department of Defense needs pursuant to part 211 of this chapter.

(b) Applications by end-users and wholesale purchasers for an allocation under the state set-aside system in accordance with § 211.17 shall be filed with the appropriate State Office.

(c) Applications to a State Office or a DOE Regional Office shall be directed to the office located in the state or region in which the allocated product will be physically delivered. An applicant doing business in more than one state or region must apply separately to each State or region in which a product will be physically delivered, unless the State Offices or Regional Offices involved agree otherwise.

§ 205.14 Ratification of prior directives, orders, and actions.

All interpretations, orders, notices of probable violation or other directives issued, all proceedings initiated, and all other actions taken in accordance with part 205 as it existed prior to the effective date of this amendment, are hereby confirmed and ratified, and shall remain in full force and effect as if issued under this amended part 205, unless or until they are altered.
amended, modified or rescinded in accordance with the provisions of this part.

§ 205.15 Public docket room.

There shall be established at the DOE National Office, 12th and Pennsylvania Avenue, NW., Washington, DC, a public docket room in which shall be made available for public inspection and copying:

(a) A list of all persons who have applied for an exception, an exemption, or an appeal, and a digest of each application;

(b) Each decision and statement setting forth the relevant facts and legal basis of an order, with confidential information deleted, issued in response to an application for an exception or exemption or at the conclusion of an appeal;

(c) The comments received during each rulemaking proceeding, with a verbatim transcript of the public hearing if such a public hearing was held; and

(d) Any other information required by statute to be made available for public inspection and copying, and any information that the DOE determines should be made available to the public.

Subparts B–E [Reserved]

Subpart F—Interpretation

§ 205.80 Purpose and scope.

(a) This subpart establishes the procedures for the filing of a formal request for an interpretation and for the consideration of such request. Responses, which may include verbal or written responses to general inquiries or to other than formal written requests for interpretation filed with the General Counsel or his delegate or a Regional Counsel, are not interpretations and merely provide general information.

(b) A request for interpretation that includes, or could be construed to include an application for an exception or an exemption may be treated solely as a request for interpretation and processed as such.

§ 205.81 What to file.

(a) A person filing under this subpart shall file a "Request for Interpretation," which should be clearly labeled as such both on the request and on the outside of the envelope in which the request is transmitted, and shall be in writing and signed by the person filing the request. The person filing the request shall comply with the general filing requirements stated in §205.9 in addition to the requirements stated in this subpart.

(b) If the person filing the request wishes to claim confidential treatment for any information contained in the request or other documents submitted under this subpart, the procedures set out in §205.9(f) shall apply.

§ 205.82 Where to file.

A request for interpretation shall be filed with the General Counsel or his delegate or with the appropriate Regional Counsel at the address provided in §205.12.

§ 205.83 Contents.

(a) The request shall contain a full and complete statement of all relevant facts pertaining to the circumstances, act or transaction that is the subject of the request and to the DOE action
§ 205.84 DOE evaluation.

(a) Processing. (1) The DOE may initiate an investigation of any statement in a request and utilize in its evaluation any relevant facts obtained by such investigation. The DOE may accept submissions from third persons relevant to any request for interpretation provided that the person making the request is afforded an opportunity to respond to all third person submissions. In evaluating a request for interpretation, the DOE may consider any other source of information. The DOE on its own initiative may convene a conference, if, in its discretion, it considers that such conference will advance its evaluation of the request.

(2) The DOE shall issue its interpretation on the basis of the information provided in the request, unless that information is supplemented by other information brought to the attention of the General Counsel or a Regional Counsel during the proceeding. The interpretation shall, therefore, depend for its authority on the accuracy of the factual statement and may be relied upon only to the extent that the facts of the actual situation correspond to those upon which the interpretation was based.

(3) If the DOE determines that there is insufficient information upon which to base a decision and if upon request additional information is not submitted by the person requesting the interpretation, the DOE may refuse to issue an interpretation.

(b) Criteria. (1) The DOE shall base an interpretation on the FEA and EPAA and the regulations and published rulings of the DOE as applied to the specific factual situation.

(2) The DOE shall take into consideration previously issued interpretations dealing with the same or a related issue.

§ 205.85 Decision and effect.

(a) An interpretation may be issued after consideration of the request for interpretation and other relevant information received or obtained during the proceeding.

(b) The interpretation shall contain a statement of the information upon which it is based and a legal analysis of and conclusions regarding the application of rulings, regulations and other precedent to the situation presented in the request.

(c) Only those persons to whom an interpretation is specifically addressed and other persons upon whom the DOE serves the interpretation and who are directly involved in the same transaction or act may rely upon it. No person entitled to rely upon an interpretation shall be subject to civil or criminal penalties stated in subpart P of this part for any act taken in reliance upon the interpretation, notwithstanding that the interpretation shall thereafter be declared by judicial or other competent authority to be invalid.

(d) An interpretation may be rescinded or modified at any time. Rescission or modification may be effected by notifying persons entitled to rely on the interpretation that it is rescinded or modified. This notification shall include a statement of the reasons for the rescission or modification and, in the case of a modification, a restatement of the interpretation as modified.

(e) An interpretation is modified by a subsequent amendment to the regulations or ruling to the extent that it is inconsistent with the amended regulation or ruling.
(f)(1) Any person aggrieved by an interpretation may submit a petition for reconsideration to the General Counsel within 30 days of service of the interpretation from which the reconsideration is sought. There has not been an exhaustion of administrative remedies until a period of 30 days from the date of service of the interpretation has elapsed without receipt by the General Counsel of a petition for reconsideration or, if a petition for reconsideration of the interpretation has been filed in a timely manner, until that petition has been acted on by the General Counsel. However, a petition to which the General Counsel does not respond within 60 days of the date of receipt thereof, or within such extended time as the General Counsel may prescribe by written notice to the petitioner concerned within that 60 day period, shall be considered denied.

(2) A petition for reconsideration may be summarily denied if—
(i) It is not filed in a timely manner, unless good cause is shown; or
(ii) It is defective on its face for failure to state, and to present facts and legal argument in support thereof, that the interpretation was erroneous in fact or in law, or that it was arbitrary or capricious.

(3) The General Counsel may deny any petition for reconsideration if the petitioner does not establish that—
(i) The petition was filed by a person aggrieved by an interpretation;
(ii) The interpretation was erroneous in fact or in law; or
(iii) The interpretation was arbitrary or capricious. The denial of a petition shall be a final order of which the petitioner may seek judicial review.

§ 205.86 Appeal.

There is no administrative appeal of an interpretation.

[43 FR 14437, Apr. 6, 1978]

Subparts G–J [Reserved]

Subpart K—Rulings

§ 205.150 Purpose and scope.

This subpart establishes the criteria for the issuance of interpretative rulings by the General Counsel. All rulings shall be published in the FEDERAL REGISTER. Any person is entitled to rely upon such ruling, to the extent provided in this subpart.

§ 205.151 Criteria for issuance.

(a) A ruling may be issued, in the discretion of the General Counsel, whenever there have been a substantial number of inquiries with regard to similar factual situations or a particular section of the regulations.

(b) The General Counsel may issue a ruling whenever it is determined that it will be of assistance to the public in applying the regulations to a specific situation.

§ 205.152 Modification or rescission.

(a) A ruling may be modified or rescinded by:
(1) Publication of the modification or rescission in the FEDERAL REGISTER; or
(2) A rulemaking proceeding in accordance with subpart L of this part.

(b) Unless and until a ruling is modified or rescinded as provided in paragraph (a) of this section, no person shall be subject to the sanctions or penalties stated in subpart P of this part for actions taken in reliance upon the ruling, notwithstanding that the ruling shall thereafter be declared by judicial or other competent authority to be invalid. Upon such declaration,
§ 205.153   no person shall be entitled to rely upon the ruling.

§ 205.153   Comments.
A written comment on or objection to a published ruling may be filed at any time with the General Counsel at the address specified in §205.12.

§ 205.154   Appeal.
There is no administrative appeal of a ruling.

Subpart M—Conferences, Hearings, and Public Hearings

§ 205.170   Purpose and scope.
This subpart establishes the procedures for requesting and conducting a DOE conference, hearing, or public hearing. Such proceedings shall be convened in the discretion of the DOE, consistent with the requirements of the FEAA.

§ 205.171   Conferences.
(a) The DOE in its discretion may direct that a conference be convened, on its own initiative or upon request by a person, when it appears that such conference will materially advance the proceeding. The determination as to who may attend a conference convened under this subpart shall be in the discretion of the DOE, but a conference will usually not be open to the public.

(b) A conference may be requested in connection with any proceeding of the DOE by any person who might be aggrieved by that proceeding. The request shall be in writing and shall include a specific showing as to why such conference will materially advance the proceeding. The request shall be addressed to the DOE office that is conducting the proceeding.

(c) A conference may only be convened after actual notice of the time, place, and nature of the conference is provided to the person who requested the conference.

(d) When a conference is convened in accordance with this section, each person may present views as to the issue or issues involved. Documentary evidence may be presented at the conference, but will be treated as if submitted in the regular course of the proceedings. A transcript of the conference will not usually be prepared. However, the DOE in its discretion may have a verbatim transcript prepared.

(e) Because a conference is solely for the exchange of views incident to a proceeding, there will be no formal reports or findings unless the DOE in its discretion determines that such would be advisable.

§ 205.172   Hearings.
(a) The DOE in its discretion may direct that a hearing be convened on its own initiative or upon request by a person, when it appears that such hearing will materially advance the proceedings. The determination as to who may attend a hearing convened under this subpart shall be in the discretion of the DOE, but a hearing will usually not be open to the public. Where the hearing involves a matter arising under part 213, the Director of Oil Imports shall be notified as to its time and place, in order that he or his representative may present views as to the issue or issues involved.

(b) A hearing may only be requested in connection with an application for an exception or an appeal. Such request may be by the applicant, appellant, or any other person who might be aggrieved by the DOE action sought. The request shall be in writing and shall include a specific showing as to why such hearing will materially advance the proceeding. The request shall be addressed to the DOE office that is considering the application for an exception or the appeal.

(c) The DOE will designate an agency official to conduct the hearing, and will specify the time and place for the hearing.

(d) A hearing may only be convened after actual notice of the time, place, and nature of the hearing is provided both to the applicant or appellant and to any other person readily identifiable by the DOE as one who will be aggrieved by the DOE action involved. The notice shall include, as appropriate:
§ 205.173 Public hearings.

(a) A public hearing shall be convened incident to a rulemaking:
(1) When the proposed rule or regulation is likely to have a substantial impact on the Nation's economy or large numbers of individuals or businesses; or
(2) When the DOE determines that a public hearing would materially advance the consideration of the issue. A public hearing may be requested by any interested person in connection with a rulemaking proceeding, but shall only be convened on the initiative of the DOE unless otherwise required by statute.

(b) A public hearing may be convened incident to any proceeding when the DOE in its discretion determines that such public hearing would materially advance the consideration of the issue.

(c) A public hearing may only be convened after publication of a notice in the FEDERAL REGISTER, which shall include a statement of the time, place, and nature of the public hearing.

(d) Interested persons may file a request to participate in the public hearing in accordance with the instructions in the notice published in the FEDERAL REGISTER. The request shall be in writing and signed by the person making the request. It shall include a description of the person's interest in the issue or issues involved and of the anticipated content of the presentation. It shall also contain a statement explaining why the person would be an appropriate spokesperson for the particular view expressed.

(e) The DOE shall appoint a presiding officer to conduct the public hearing. An agenda shall be prepared that shall provide, to the extent practicable, for the presentation of all relevant views by competent spokespersons.

(f) A verbatim transcript shall be made of the hearing. The transcript, together with any written comments submitted in the course of the proceeding, shall be made available for public inspection and copying in the public docket room, as provided in §205.15.

(g) The information presented at the public hearing, together with the written comments submitted and other relevant information developed during the course of the proceeding, shall provide the basis for the DOE decision.

Subpart N [Reserved]
§ 205.190 Purpose and scope.

(a) This subpart establishes the procedures for determining the nature and extent of violations of the DOE regulations in parts 210, 211, and 212 and the procedures for issuance of a Notice of Probable Violation, a Proposed Remedial Order, a Remedial Order, an Interim Remedial Order for Immediate Compliance, a Remedial Order for Immediate Compliance, a Notice of Probable Disallowance, a Proposed Order of Disallowance, an Order of Disallowance, or a Consent Order. Nothing in these regulations shall affect the authority of DOE enforcement officials in coordination with the Department of Justice to initiate appropriate civil or criminal enforcement actions in court at any time.

(b) When any report required by the ERA or any audit or investigation discloses, or the ERA otherwise discovers, that there is reason to believe a violation of any provision of this chapter, or any order issued thereunder, has occurred, is continuing or is about to occur, the ERA may conduct an inquiry to determine the nature and extent of the violation. A Remedial Order or Order of Disallowance may be issued thereafter by the Office of Hearings and Appeals. The ERA may commence enforcement proceedings by serving a Notice of Probable Violation, a Notice of Probable Disallowance, a Proposed Remedial Order, a Proposed Order of Disallowance, or an Interim Remedial Order for Immediate Compliance.

§ 205.191 [Reserved]

§ 205.192 Proposed remedial order.

(a) If the ERA finds, after the 30-day or other period authorized for reply to the Notice of Probable Violation, that a violation has occurred, is continuing, or is about to occur, it may issue a Proposed Remedial Order, which shall set forth the relevant facts and law.

(b) The ERA may issue a Proposed Remedial Order at any time it finds that a violation has occurred, is continuing, or is about to occur even if it has not previously issued a Notice of Probable Violation.

(c) The ERA shall serve a copy of the Proposed Remedial Order upon the person to whom it is directed. The ERA shall promptly publish a notice in the FEDERAL REGISTER which states the person to whom the Proposed Remedial Order is directed, his address, and the products, dollar amounts, time period, and geographical area specified in the Proposed Remedial Order. The notice shall indicate that a copy of the Proposed Remedial Order with confidential information, if any, deleted may be obtained from the ERA and that within 15 days after the date of publication any aggrieved person may file a Notice of Objection with the Office of Hearings and Appeals of accordance with § 205.193. The ERA shall mail copies of the FEDERAL REGISTER notice to all readily identifiable persons who are likely to be aggrieved by issuance of the Proposed Remedial Order as a final order.

(d) The Proposed Remedial Order shall set forth the proposed findings of fact and conclusions of law upon which it is based. It shall also include a discussion of the relevant authorities which support the position asserted, including rules, regulations, rulings, interpretations and previous decisions issued by DOE or its predecessor agencies. The Proposed Remedial Order shall be accompanied by a declaration executed by the DOE employee primarily knowledgeable about the facts of the case stating that, to the best of declarant's knowledge and belief, the findings of fact are correct.

(e) The ERA may amend or withdraw a Proposed Remedial Order at its discretion prior to the date of service of a Statement of Objections in that proceeding. The date of service of the amended documents shall be considered the date of service of the Proposed Remedial Order in calculating the time periods specified in this part 205.

§ 205.192A Burden of proof.

(a) In a Proposed Remedial Order proceeding the ERA has the burden of establishing a prima facie case as to the validity of the findings of fact and conclusions of law asserted therein. The ERA shall be deemed to meet this burden by the service of a Proposed Remedial Order that meets the requirements of § 205.192(d) and any supplemental information that may be made available under § 205.193A.
(b) Once a prima facie case has been established, a person who objects to a finding of fact or conclusion of law in the Proposed Remedial Order has the burden of going forward with the evidence. Furthermore, the proponent of additional factual representations has the burden of going forward with the evidence.

(c) Unless otherwise specified by the Director of the Office of Hearings and Appeals or his designee, the proponent of an order or a motion or additional factual representations has the ultimate burden of persuasion.

§ 205.193 Notice of Objection.

(a) Within 15 days after publication of the notice of a Proposed Remedial Order in the Federal Register any aggrieved person may file a Notice of Objection to the Proposed Remedial Order with the Office of Hearings and Appeals. The Notice shall be filed in duplicate, shall briefly describe how the person would be aggrieved by issuance of the Proposed Remedial Order as a final order and shall state the person’s intention to file a Statement of Objections. No confidential information shall be included in a Notice of Objection. The DOE shall place one copy of the Notice in the Office of Hearings and Appeals Public Docket Room.

(b) A person who fails to file a timely Notice of Objection shall be deemed to have admitted the findings of fact and conclusions of law as stated in the Proposed Remedial Order. If a Notice of Objection is not filed as provided by paragraph (a) of this section, the Proposed Remedial Order may be issued as a final order.

(c) A person who files a Notice of Objection shall on the same day serve a copy of the Notice upon the person to whom the Proposed Remedial Order is directed, the DOE Office that issued the Proposed Remedial Order, and the DOE Assistant General Counsel for Administrative Litigation.

(d) The Notice shall include a certification of compliance with the provisions of this section, the names and addresses of each person served with a copy of the Notice, and the date and manner of service.

(e) If no person files a timely Notice of Objection, ERA may request the Office of Hearings and Appeals to issue the Proposed Remedial Order as a final Remedial Order.

(f) In order to exhaust administrative remedies with respect to a Remedial Order proceeding, a person must file a timely Notice of Objection and Statement of Objections with the Office of Hearings and Appeals.

§ 205.193A Submission of ERA supplemental information.

Within 20 days after service of a Notice of Objection to a Proposed Remedial Order the ERA may serve, upon the person to whom the Proposed Remedial Order was directed, supplemental information relating to the calculations and determinations which support the findings of fact set forth in the Proposed Remedial Order.

§ 205.194 Participants; official service list.

(a) Upon receipt of a Notice of Objection, the Office of Hearings and Appeals shall publish a notice in the Federal Register which states the person to whom the Proposed Remedial Order is directed, his address and the products, dollar amounts, time period, and geographical area specified in the Proposed Remedial Order. The notice shall state that any person who wishes to participate in the proceeding must file an appropriate request with the Office of Hearings and Appeals.

(b) The Office that issued the Proposed Remedial Order and the person to whom the Order is directed shall be considered participants before the Office of Hearings and Appeals at all stages of an enforcement proceeding. Any other person whose interest may be affected by the proceeding may file a request to participate in the proceeding. The request shall contain

(1) The person’s name, address, and telephone number and similar information concerning his duly authorized representative, if any;

(2) A detailed description of the person’s interest in the proceeding:
(3) The specific reasons why the person's active involvement in the proceeding will substantially contribute to a complete resolution of the issues to be considered in the proceeding;
(4) A statement of the position which the person intends to adopt in the proceeding; and
(5) A statement of the particular aspects of the proceeding, e.g., oral argument, submission of briefs, or discovery, in which the person wishes to actively participate.

(c) After considering the requests submitted pursuant to paragraph (b) of this section, the Office of Hearings and Appeals shall determine those persons who may participate on an active basis in the proceeding and the nature of their participation. Participants with similar interests may be required to consolidate their submissions and to appear in the proceeding through a common representative.

(d) Within 30 days after publication of the notice referred to in paragraph (a) of this section, the Office of Hearings and Appeals shall prepare an official service list for the proceeding. Within the same 30 day period the Office of Hearings and Appeals shall mail the official service list to all persons who filed requests to participate. For good cause shown a person may be placed on the official service list as a non-participant, for the receipt of documents only. An opportunity shall be afforded to participants to oppose the placement of a non-participant on the official service list.

(e) A person requesting to participate after the period for submitting requests has expired must show good cause for failure to file a request within the prescribed time period.

(f) The Office of Hearings and Appeals may limit the nature of a person's participation in the proceeding, if it finds that the facts upon which the person's request was based have changed or were incorrect when stated or that the person has not been actively participating or has engaged in disruptive or dilatory conduct. The action referred to in this provision shall be taken only after notice and an opportunity to be heard are afforded.
§ 205.198 Discovery.

(a) If a person intends to file a Motion for Discovery, he must file it at the same time that he files his Statement of Objections or at the same time he files his Response to a Statement of Objections, whichever is earlier. All Motions for Discovery and related filings must be served upon the person to whom the discovery is directed. If the person to whom the discovery is directed is not on the official service list, the documents served upon him shall include a copy of any relevant Notice of Probable Violation, each Response thereto, the Proposed Remedial Order, and any relevant work papers or supplemental information previously provided by ERA. Copies of this material must also be included with the copy of the Statement of Objections served upon the DOE Assistant General Counsel for Administrative Litigation. All other persons on the official service list must be notified that such materials are available from the notifier upon written request.

(b) A participant may submit a Reply to any Response within 10 days after the date of service of the Response.

§ 205.196 Statement of objections.

(a) A person who has filed a Notice of Objection shall file a Statement of Objections to a Proposed Remedial Order within 40 days after service of the Notice of Objection. A request for an extension of time for filing must be submitted in writing and may be granted for good cause shown.

(b) The Statement of Objections shall set forth the bases for the objections to the issuance of the Proposed Remedial Order as a final order, including a specification of the issues of fact or law which the person intends to contest in any further proceeding involving the compliance matter which is the subject of the Proposed Remedial Order. The Statement shall set forth the findings of fact contained in the Proposed Remedial Order which are alleged to be erroneous, the factual basis for such allegations, and any alternative findings which are sought. The Statement shall include a discussion of all relevant authorities which support the position asserted. The Statement may include additional factual representations which are not referred to in the Proposed Remedial Order and which the person contends are material and relevant to the compliance proceeding. For each additional factual representation which the person asserts should be made, the Statement shall include reasons why the factual representation is relevant and material, and the manner in which its validity is or will be established. The person shall also specify the manner in which each additional issue of fact was raised in any prior administrative proceeding which led to issuance of the Proposed Remedial Order, or the reasons why it was not raised.

(c) A Statement of Objections that is filed by the person to whom a Proposed Remedial Order is directed shall include a copy of any relevant Notice of Probable Violation, each Response thereto, the Proposed Remedial Order, and any relevant work papers or supplemental information previously provided by ERA. Copies of this material must also be included with the copy of the Statement of Objections served upon the DOE Assistant General Counsel for Administrative Litigation. All other persons on the official service list must be notified that such materials are available from the notifier upon written request.

§ 205.197 Response to statement of objections; reply.

(a) Within 30 days after service of a Statement of Objections each participant may file a Response. If any motions are served with the Statement of Objections, a participant shall have 30 days from the date of service to respond to such submissions, notwithstanding any shorter time periods otherwise required in this subpart. The Response shall contain a full discussion of the position asserted and a discussion of the legal and factual bases which support that position. The Response may also contain a request that any issue of fact or law advanced in a Statement of Objections be dismissed. Any such request shall be accompanied by a full discussion of the reasons supporting the dismissal.

(b) A participant may submit a Reply to any Response within 10 days after the date of service of the Response.
§ 205.198A Protective order.

(b) A Motion for Discovery may request that:
(1) A person produce for inspection and photocopying non-privileged written material in his possession;
(2) A person respond to written interrogatories;
(3) A person admit to the genuineness of any relevant document or the truth of any relevant fact; or
(4) The deposition of a material witness be taken.

(c) A Motion for Discovery shall set forth the reasons why the particular discovery is necessary in order to obtain relevant and material evidence and shall explain why such discovery would not unduly delay the proceeding.

(d) Within 20 days after a Motion for Discovery is served, a participant or a person to whom the discovery is directed may file a request that the Motion be denied in whole or in part, stating the reasons which support the request.

(e) Discovery may be conducted only pursuant to an Order issued by the Office of Hearings and Appeals. A Motion for Discovery will be granted if it is concluded that discovery is necessary for the party to obtain relevant and material evidence and that discovery will not unduly delay the proceeding.

(f) The Director of the Office of Hearings and Appeals or his designee may issue subpoenas in accordance with § 205.8 in support of Discovery Orders, except that § 205.8 (h)(2), (3), and (4) shall not apply to such subpoenas.

(g) The Office of Hearings and Appeals may order that any direct expenses incurred by a person to produce evidence pursuant to a Motion for Discovery be charged to the person who filed the Motion.

(h) If a person fails to comply with an order relating to discovery, the Office of Hearings and Appeals may order appropriate sanctions.

(i) Any order issued by the Office of Hearings and Appeals with respect to discovery shall be subject to further administrative review or appeal only upon issuance of the determination referred to in § 205.198.

§ 205.199 Evidentiary hearing.

(a) Filing Requirements. At the time a person files a Statement of Objections he may also file a motion requesting an evidentiary hearing be convened. A motion requesting an evidentiary hearing may be filed by any other participant within 30 days after that participant is served with a Statement of Objections.

(b) Contents of Motion for Evidentiary Hearing. A Motion for Evidentiary Hearing shall specify each disputed issue of fact and the bases for the alternative findings the movant asserts. The movant shall also describe the manner in which each disputed issue of fact was raised in any prior administrative proceeding which led to issuance of the Proposed Remedial Order, or why it was not raised. The movant shall with respect to each disputed or alternative finding of fact:
(1) As specifically as possible, identify the witnesses whose testimony is required;
(2) State the reasons why the testimony of the witnesses is necessary; and
(3) State the reasons why the asserted position can be effectively established only through the direct questioning of witnesses at an evidentiary hearing.

(c) Response to Motion for Evidentiary Hearing. Within 20 days after service of any Motion for Evidentiary Hearing, the Office that issued the Proposed Remedial Order shall, and any other participant may file a Response with the Office of Hearings and Appeals. The Response shall specify:
(1) Each particular factual representation which is accepted as correct for purposes of the proceeding;
(2) Each particular factual representation which is denied;
(3) Each particular factual representation which the participant is not in a position to accept or deny;
(4) Each particular factual representation which is not accepted and the participant wishes proven by the submission of evidence;
(5) Each particular factual representation which the participant is prepared to dispute through the testimony of witnesses or the submission of verified documents; and
(6) Each particular factual representation which the participant asserts should be dismissed as immaterial or irrelevant.

(d) Prehearing Conferences. After all submissions with respect to a Motion for Evidentiary Hearing are filed, the Office of Hearings and Appeals may conduct conferences or hearings to resolve differences of view among the participants.

(e) Decision on Motion for Evidentiary Hearing. After considering all relevant information received in connection with the Motion, the Office of Hearings and Appeals shall enter an Order. In the Order the Office of Hearings and Appeals shall direct that an evidentiary hearing be convened if it concludes that a genuine dispute exists as to relevant and material issues of fact and an evidentiary hearing would substantially assist it in making findings of fact in an effective manner. If the Motion for Evidentiary Hearing is granted in whole or in part, the Order shall specify the parties to the hearing, any limitations on the participation of a party, and the issues of fact set forth for the evidentiary hearing. The Order may also require parties that have adopted similar positions to consolidate their presentations and to appear at the evidentiary hearing through a common representative. If the Motion is denied, the Order may allow the movant to file affidavits and other documents in support of his asserted findings of fact.

(f) Review of Decision. The Order of the Office of Hearings and Appeals with respect to a Motion for Evidentiary Hearing shall be subject to further administrative review or appeal only upon issuance of the determination referred to in §205.199B.

(g) Conduct of Evidentiary Hearing. All evidentiary hearings convened pursuant to this section shall be conducted by the Director of the Office of Hearings and Appeals or his designee. At any evidentiary hearing the parties shall have the opportunity to present material evidence which directly relates to a particular issue of fact set forth for hearing. The presiding officer shall afford the parties an opportunity to cross examine all witnesses. The presiding officer may administer oaths and affirmations, rule on objections to the presentation of evidence, receive relevant material, rule on any motion to conform the Proposed Remedial Order to the evidence presented, rule on motions for continuance, dispose of procedural requests, determine the format of the hearing, modify any order granting a Motion for Evidentiary Hearing, direct that written motions or briefs be provided with respect to issues raised during the course of the hearing, issue subpoenas, and otherwise regulate the conduct of the hearing. The presiding officer may take reasonable measures to exclude duplicative material from the hearing, and may place appropriate limitations on the number of witnesses that may be called by a party. The presiding officer may also require that evidence be submitted through affidavits or other documents if the direct testimony of witnesses will unduly delay the orderly
§ 205.199A Hearing for the purpose of oral argument only.

(a) A participant is entitled upon timely request to a hearing to present oral argument with respect to the Proposed Remedial Order, whether or not an evidentiary hearing is requested or convened. A participant's request shall normally be considered untimely, if made more than 10 days after service of a determination regarding any motion filed by the requestor or, if no motions were filed by him, if made after the date for filing his Reply or his Response to a Statement of Objections.

(b) If an evidentiary hearing is convened, and a hearing for oral argument is requested, the Office of Hearings and Appeals shall determine whether the hearing for oral argument shall be held in conjunction with the evidentiary hearing or at a separate time.

(c) A hearing for the purpose of receiving oral argument will generally be conducted only after the issues involved in the proceeding have been delineated, and any written material which the Office of Hearings and Appeals has requested to supplement a Statement of Objections or Responses has been submitted. The presiding officer may require further written submissions in support of any position advanced or issued at the hearing, and shall allow responses any such submissions.

§ 205.199B Remedial order.

(a) After considering all information received during the proceeding, the Director of the Office of Hearings and Appeals or his designee may issue a final Remedial Order. The Remedial Order may adopt the findings and conclusions contained in the Proposed Remedial Order or may modify or rescind any such finding or conclusion to conform the Order to the evidence or on the basis of a determination that the finding or conclusion is erroneous in fact or law or is arbitrary or capricious. In the alternative, the Office of Hearings and Appeals may determine that no Remedial Order should be issued or may remand all or a portion of the Proposed Remedial Order to the issuing DOE office for further consideration or modification. Every determination made pursuant to this section shall state the relevant facts and legal bases supporting the determination.

(b) The DOE shall serve a copy of any determination issued pursuant to paragraph (a) of this section upon the person to whom it is directed, any person who was served with a copy of the Proposed Remedial Order, the DOE office that issued the Proposed Remedial Order, the DOE Assistant General Counsel for Administrative Litigation and any other person on the official service list. Appropriate deletions may be made in the determinations to ensure that confidentiality of information protected from disclosure under 18 U.S.C. 1905 and 5 U.S.C. 552. A copy of the determination with appropriate deletions to protect confidential and proprietary data shall be placed in the Office of Hearings and Appeals Public Docket Room.

§ 205.199C Appeals of remedial order to FERC.

(a) The person to whom a Remedial Order is issued by the Office of Hearings and Appeals may file an administrative appeal if the Remedial Order proceeding was initiated by a Notice of Probable Violation issued after October 1, 1977, or, in those situations in which no Notice of Probable Violation was issued, if the proceeding was initiated by a Proposed Remedial Order issued after October 1, 1977.

(b) Any such appeal must be initiated within 30 days after service of the Order by giving written notice to the Office of Hearings and Appeals that the person to whom a Remedial Order is issued wishes to contest the Order.

(c) The Office of Hearings and Appeals shall promptly advise the Federal Energy Regulatory Commission of its receipt of a notice described in paragraph (b) of this section.

(d) The Office of Hearings and Appeals may, on a case by case basis, set reasonable time limits for the Federal
§ 205.199I Remedies.

(a) A Remedial Order, a Remedial Order for Immediate Compliance, an Order of Disallowance, or a Consent Order may require the person to whom it is directed to roll back prices, to make refunds equal to the amount (plus interest) charged in excess of those amounts permitted under DOE Regulations, to make appropriate compensation to third persons for administrative expenses of effectuating appropriate remedies, and to take such other action as the DOE determines is necessary to eliminate or to compensate for the effects of a violation or any cost disallowance pursuant to §212.83 or §212.84. Such action may include a direction to the person to whom the Order is issued to establish an escrow account or take other measures to
make refunds directly to purchasers of the products involved, notwithstanding the fact that those purchasers obtained such products from an intermediate distributor of such person's products, and may require as part of the remedy that the person to whom the Order is issued maintain his prices at certain designated levels, notwithstanding the presence or absence of other regulatory controls on such person's prices. In cases where purchasers cannot be reasonably identified or paid or where the amount of each purchaser's overcharge is incapable of reasonable determination, the DOE may refund the amounts received in such cases directly to the Treasury of the United States on behalf of such purchasers.

(b) The DOE may, when appropriate, issue final Orders ancillary to a Remedial Order, Remedial Order for Immediate Compliance, Order of Disallowance, or Consent Order requiring that a direct or indirect recipient of a refund pass through, by such means as the DOE deems appropriate, including those described in paragraph (a) of this section, all or a portion of the refund, on a pro rata basis, to those customers of the recipient who were adversely affected by the initial overcharge. Ancillary Orders may be appealed to the Office of Hearings and Appeals only pursuant to subpart H.

§ 205.199J Consent order.

(a) Notwithstanding any other provision of this subpart, the DOE may at any time resolve an outstanding compliance investigation or proceeding, or a proceeding involving the disallowance of costs pursuant to §205.199E with a Consent Order. A Consent Order must be signed by the person to whom it is issued, or a duly authorized representative, and must indicate agreement to the terms contained therein. A Consent Order need not constitute an admission by any person that DOE regulations have been violated, nor need it constitute a finding by the DOE that such person has violated DOE regulations. A Consent Order shall, however, set forth the relevant facts which form the basis for the Order.

(b) A Consent Order is a final Order of the DOE having the same force and effect as a Remedial Order issued pursuant to §205.199B or an Order of Disallowance issued pursuant to §205.199E, and may require one or more of the remedies authorized by §205.199I and §212.84(d)(3). A Consent Order becomes effective no sooner than 30 days after publication under paragraph (c) of this section, unless (1) the DOE makes a Consent Order effective immediately, because it expressly deems it necessary in the public interest, or (2) the Consent Order involves a sum of less than $500,000 in the aggregate, excluding penalties and interest, in which case it will be effective when signed both by the person to whom it is issued and the DOE, and will not be subject to the provisions of paragraph (c) of this section unless the DOE determines otherwise. A Consent Order shall not be appealable pursuant to the provisions of §205.199C or §205.199D and subpart H, and shall contain an express waiver of such appeal or judicial review rights as might otherwise attach to a final Order of the DOE.

(c) When a Consent Order has been signed, both by the person to whom it is issued and the DOE, the DOE will publish notice of such Consent Order in the FEDERAL REGISTER and in a press release to be issued simultaneously therewith. The FEDERAL REGISTER notice and the press release will state at a minimum the name of the company concerned, a brief summary of the Consent Order and other facts or allegations relevant thereto, the address and telephone number of the DOE office at which copies of the Consent Order will be available free of charge, the address to which comments on the Consent Order will be received by the DOE, and the date by which such comments should be submitted, which date will not be less than 30 days after publication of the FEDERAL REGISTER notice. After the expiration of the comment period the DOE may withdraw its agreement to the Consent Order, attempt to negotiate a modification of the Consent Order, or issue the Consent Order as signed. The DOE will publish in the FEDERAL REGISTER, and by press release, notice of any action taken on a Consent Order and such explanation of
the action taken as deemed appropriate. The provisions of this paragraph shall be applicable notwithstanding the fact that a Consent Order may have been made immediately effective pursuant to paragraph (b) of this section (except in cases where the Consent Order involves sums of less than $500,000 in the aggregate, excluding penalties and interest).

(d) At any time and in accordance with the procedures of subpart J, a Consent Order may be modified or rescinded, upon petition by the person to whom the Consent Order was issued, and may be rescinded by the DOE upon discovery of new evidence which is materially inconsistent with evidence upon which the DOE’s acceptance of the Consent Order was based. Modifications of a Consent Order which is subject to public comment under the provisions of paragraph (c) of this section, which in the opinion of the DOE significantly change the terms or the impact of the original Order, shall be republished under the provisions of that paragraph.

(e) Notwithstanding the issuance of a Consent Order, the DOE may seek civil or criminal penalties or compromise civil penalties pursuant to subpart P concerning matters encompassed by the Consent Order, unless the Consent Order by its terms expressly precludes the DOE from so doing.

(f) If at any time after a Consent Order becomes effective it appears to the DOE that the terms of the Consent Order have been violated, the DOE may refer such violations to the Department of Justice for appropriate action in accordance with subpart P.

Subparts P–T [Reserved]

Subpart U—Procedures for Electricity Export Cases

agency is a participant in the adjudication.

Participant means any applicant or intervenor participating in the adjudication.

Adjudication means a formal proceeding employing procedures identical or similar to those required by the Administrative Procedure Act, as codified in 5 U.S.C. 551, 556, and 557, to consider an application to export electricity.

Reasonable prior notice means 7 days' written notice stating the nature and purpose of the communication.

Relevant to the merits means a communication directly related to the merits of a specific adjudication but does not include general background discussions about an entire industry or communications of a general nature made in the course of developing agency policy for future general application.

§§ 205.261–205.269 [Reserved]

§ 205.270 Off-the-record communications.

(a) In any proceeding which is subject to this subpart—

(1) No interested person shall make an off-the-record communication or knowingly cause an off-the-record communication to be made to any decisional employee.

(2) No decisional employee shall make an off-the-record communication or knowingly cause an off-the-record communication to be made to any interested person.

(3) A decisional employee who receives, makes, or knowingly causes to be made an oral communication prohibited by this section shall prepare a memorandum stating the substance of the communication and any responses made to it.

(4) With 48 hours of receiving, making or knowingly causing to be made a communication prohibited by this section, a decisional employee shall deliver all written off-the-record communications and all memoranda prepared in compliance with paragraph (a)(3) of this section to the Director of the Coal and Electricity Division, ERA, who will immediately place the materials described above in the public record associated with the adjudication, available for public inspection.

(5) Upon receipt of a communication knowingly made or knowingly caused to be made by a participant in violation of this section, the Administrator or presiding officer may, to the extent consistent with the interests of justice and the applicable statutory policy, require the participant to show cause why his or her claim or interest in the adjudication should not be dismissed, denied, disregarded, or otherwise adversely affected on account of the violation.

(6) The prohibitions of this section shall apply beginning at the time an adjudication is noticed for hearing (or the person responsible for the communication acquires knowledge that it will be noticed), a protest is filed, or a petition or notice to intervene in opposition to the requested Department action is filed, whichever occurs first.

(b) The prohibition, cited at 18 CFR 1.30(f), against participation in the decision-making process by Department employees who perform investigative or trial functions in an adjudication, shall no longer be applicable to ERA.

Subpart V—Special Procedures for Distribution of Refunds

SOURCE: 44 FR 8566, Feb. 9, 1979, unless otherwise noted.

§ 205.280 Purpose and scope.

This subpart establishes special procedures pursuant to which refunds may be made to injured persons in order to remedy the effects of a violation of the regulations of the Department of Energy. This subpart shall be applicable to those situations in which the Department of Energy is unable to readily identify persons who are entitled to
refunds specified in a Remedial Order, a Remedial Order for Immediate Compliance, an Order of Disallowance or a Consent Order, or to readily ascertain the amounts that such persons are entitled to receive.

§ 205.281 Petition for implementation of special refund procedures.

(a) At any time after the issuance of a Remedial Order (including for purposes of this subpart a Remedial Order for Immediate Compliance and an Order of Disallowance), or a Consent Order, the Special Counsel of the Department of Energy, the ERA Office of Enforcement, or any other enforcement official of the Department of Energy may file with the Office of Hearings and Appeals a Petition for the Implementation of Special Refund Procedures.

(b) The Petition shall state that the person filing it has been unable readily either to identify the persons who are entitled to refunds to be remitted pursuant to a Remedial Order or a Consent Order or to ascertain the amounts of refunds that such persons are entitled to receive. The Petition shall request that the Office of Hearings and Appeals institute appropriate proceedings under this Subpart to distribute the funds referred to in the enforcement documents.

(c) The Petition shall contain a copy of each relevant enforcement document, shall be filed in duplicate, and shall meet the requirements of §205.9 of this part.

§ 205.282 Evaluation of petition by the Office of Hearings and Appeals.

(a) After considering the Petition, the Director of the Office of Hearings and Appeals or his designee shall issue a Proposed Decision and Order. The Proposed Decision and Order shall generally describe the nature of the particular refund proceeding and shall set forth the standards and procedures that the Office of Hearings and Appeals intends to apply in evaluating refund claims.

(b) The Proposed Decision and Order shall be published in the Federal Register together with a statement that any member of the public may submit written comments to the Office of Hearings and Appeals with respect to the matter. At least 30 days following publication in the Federal Register shall be provided for the submission of comments.

(c) After considering the comments submitted, the Director of the Office of Hearings and Appeals or his designee shall issue a final Decision and Order which shall govern the disposition of the refunds. The final Decision and Order shall also be published in the Federal Register.

(d) The final Decision and Order shall set forth the standards and procedures that will be used in evaluating individual Applications for Refunds and distributing the refund amount. Those standards and procedures shall be consistent with the provisions of this subpart.

(e) In establishing standards and procedures for implementing refund distributions, the Office of Hearings and Appeals shall take into account the desirability of distributing the refunds in an efficient, effective and equitable manner and resolving to the maximum extent practicable all outstanding claims. In order to do so, the standards for evaluation of individual claims may be based upon appropriate presumptions.

§ 205.283 Applications for refund.

(a) Any person entitled to a refund pursuant to a final Decision and Order issued pursuant to §205.282 may file an Application for Refund. All Applications must be signed by the applicant and specify the DOE order to which they pertain. Any Application for a refund in excess of $100 must be filed in duplicate, and a copy of that Application will be available for public inspection in the DOE Public Docket Room at 2000 M Street, NW., Washington, DC. Any applicant who believes that his Application contains confidential information must so indicate on the first page of his Application and submit two additional copies of his Application from which the information that the applicant claims is confidential has been deleted, together with a statement specifying why any such information is privileged or confidential.

(b) The contents of an Application for Refund shall be specified in the final
Decision and Order referred to in §205.282(c). A filing deadline for Applications shall also be specified in the final Decision and Order, and shall be no less than 90 days after the publication of the Order in the Federal Register.

(c) Each Application shall be in writing and signed by the applicant, and shall indicate whether the applicant or any person acting on his instructions has filed or intends to file any other Application or claim of whatever nature regarding the matters at issue in the underlying enforcement proceeding. Each Application shall also include a sworn statement by the applicant that all information in his Application is true and correct to the best of his knowledge and belief.

§ 205.284 Processing of applications.

(a) The Director of the Office of Hearings and Appeals may appoint an administrator to evaluate Applications under guidelines established by the Office of Hearings and Appeals. The administrator, if he is not a Federal Government employee, may be compensated from the funds referred to in the Remedial Order or Consent Order. The administrator may design and distribute an optional application form for the convenience of the applicants.

(b) The Office of Hearings and Appeals or its designee may initiate an investigation of any statement made in an Application and may require verification of any document submitted in support of a claim. In evaluating an Application, the Office of Hearings and Appeals or its designee may solicit and consider information obtained from any source and may on its own initiative convene a hearing or conference, if it determines that a hearing or conference will advance its evaluation of an Application.

(c) The Director of the Office of Hearings and Appeals or his designee shall conduct any hearing or conference convened with respect to an Application for Refund and shall specify the time and place for the hearing or conference and notify the applicant. The official conducting the hearing may administer oaths and affirmations, rule on the presentation of information, receive relevant information, dispose of procedural requests, determine the format of the hearing and otherwise regulate the course of the hearing. The provisions of §205.8 of this part which relate to subpoenas and witness fees shall apply to any hearing convened with respect to an application for refund, except that §205.8(h) (2), (3) and (4) shall not apply.

(d) Upon consideration of an Application and other relevant information received during the course of a refund proceeding, the Director of the Office of Hearings and Appeals or his designee shall issue an order granting or denying the Application. The order shall contain a concise statement of the relevant facts and the legal basis for the order. A copy of the order, with such modification as is necessary to ensure the confidentiality of information protected from public disclosure by 18 U.S.C. 1905, may be obtained upon request by an applicant or any other person who participated in the proceeding.

§ 205.285 Effect of failure to file a timely application.

An Application for Refund must be filed no later than the date that the Office of Hearings and Appeals establishes pursuant to §205.283(b). Any Application that is not filed on a timely basis may be summarily dismissed. The Office of Hearings and Appeals or its designee may, however, grant extensions of time for good cause shown. Any request for an extension of time must generally be submitted in writing prior to the deadline.

§ 205.286 Limitations on amount of refunds.

(a) The aggregate amount of all refunds approved by the Office of Hearings and Appeals or its designee in a given case shall not exceed the amount to be remitted pursuant to the relevant DOE enforcement order, plus any accumulated interest, reduced by the amount of any administrative costs approved by the Office of Hearings and Appeals. In the event that the aggregate amount of approved claims exceeds the aggregate amount of funds specified above, the Office of Hearings and Appeals may make refunds on a pro rata basis. The Office of Hearings and Appeals may delay payment of any
§ 205.301 Refunds

Each application should be made at least six months in advance of the initiation of the proposed electricity export, except when otherwise permitted.
§ 205.302  Contents of application.

Every application shall contain the following information set forth in the order indicated below:

(a) The exact legal name of the applicant.

(b) The exact legal name of all partners.

(c) The name, title, post office address, and telephone number of the person to whom correspondence in regard to the application shall be addressed.

(d) The state or territory under the laws of which the applicant is organized or incorporated, or authorized to operate. If the applicant is authorized to operate in more than one state, all pertinent facts shall be included.

(e) The name and address of any known Federal, State or local government agency which may have any jurisdiction over the action to be taken in this application and a brief description of that authority.

(f) A description of the transmission facilities through which the electric energy will be delivered to the foreign country, including the name of the owners and the location of any remote facilities.

(g) A technical discussion of the proposed electricity export's reliability, fuel use and system stability impact on the applicant's present and prospective electric power supply system. Applicant must explain why the proposed electricity export will not impair the sufficiency of electric supply on its system and why the export will not impede or tend to impede the regional coordination of electric utility planning or operation.

(h) The original application shall be signed and verified under oath by an officer of the applicant having knowledge of the matters set forth therein.

§ 205.303  Required exhibits.

There shall be filed with the application and as a part thereof the following exhibits:

(a) Exhibit A. A copy of the agreement or proposed agreement under which the electricity is to be transmitted including a listing of the terms and conditions. If this agreement contains proprietary information that should not be released to the general public, the applicant must identify such data and include a statement explaining why proprietary treatment is appropriate.

(b) Exhibit B. A showing, including a signed opinion of counsel, that the proposed export of electricity is within the corporate power of the applicant, and that the applicant has complied or will comply with all pertinent Federal and State laws.

(c) Exhibit C. A general map showing the applicant's overall electric system and a detailed map highlighting the location of the facilities or the proposed facilities to be used for the generation and transmission of the electric energy to be exported. The detailed map shall identify the location of the proposed border crossing point(s) or power transfer point(s) by Presidential Permit number whenever possible.

(d) Exhibit D. If an applicant resides or has its principal office outside the United States, such applicant shall designate, by irrevocable power of attorney, an agent residing within the United States. A verified copy of such power of attorney shall be furnished with the application.

(e) Exhibit E. A statement of any corporate relationship or existing contract between the applicant and any other person, corporation, or foreign government, which in any way relates to the control or fixing of rates for the purchase, sale or transmission of electric energy.

(f) Exhibit F. An explanation of the methodology (Operating Procedures) to inform neighboring electric utilities in the United States of the available capacity and energy which may be in excess of the applicant's requirements before delivery of such capacity to the foreign purchaser. Approved firm export, diversity exchange and emergency exports are exempted from this requirement. Those materials required by this section which have been filed previously with the ERA may be incorporated by reference.

§ 205.304  Other information.

Where the application is for authority to export less than 1,000,000 kilowatt hours annually, applicants need
not furnish the information called for in §§205.302(g) and 205.303 (Exhibit C). Applicants, regardless of the amount of electric energy to be exported, may be required to furnish such supplemental information as the ERA may deem pertinent.

§ 205.305 Transferability.

(a) An authorization to transmit electric energy from the United States to a foreign country granted by order of the ERA under section 202(e) of the Federal Power Act shall not be transferable or assignable. Provided written notice is given to the ERA within 30 days, the authorization may continue in effect temporarily in the event of the involuntary transfer of this authority by operation of law (including transfers to receivers, trustees, or purchasers under foreclosure or judicial sale). This continuance is contingent on the filing of an application for permanent authorization and may be effective until a decision is made thereon.

(b) In the event of a proposed voluntary transfer of this authority to export electricity, the transferee and the transferor shall file jointly an application pursuant to this subsection, setting forth such information as required by §§205.300 through 205.304, together with a statement of reasons for the transfer.

(c) The ERA may at any time subsequent to the original order of authorization, after opportunity for hearing, issue such supplemental orders as it may find necessary or appropriate.

§ 205.306 Authorization not exclusive.

No authorization granted pursuant to section 202(e) of the Act shall be deemed to prevent an authorization from being granted to any other person or entity to export electric energy or to prevent any other person or entity from making application for an export authorization.

§ 205.307 Form and style; number of copies

An original and two conformed copies of an application containing the information required under §§205.300 through 205.309 must be filed.

§ 205.308 Filing schedule and annual reports.

(a) Persons authorized to transmit electric energy from the United States shall promptly file all supplements, notices of succession in ownership or operation, notices of cancellation, and certificates of concurrence. In general, these documents should be filed at least 30 days prior to the effective date of any change.

(b) A change in the tariff arrangement does not require an amendment to the authorization. However, any entity with an authorization to export electric energy shall file with the ERA, and the appropriate state regulatory agency, a certified copy of any changed rate schedule and terms. Such changes may take effect upon the date of filing of informational data with the ERA.

(c) Persons receiving authorization to transmit electric energy from the United States shall submit to the ERA, by February 15 each year, a report covering each month of the preceding calendar year detailing the gross amount of kilowatt-hours of energy, by authorized category, received or delivered, and the cost and revenue associated with each category.

(Approved by the Office of Management and Budget under Control No. 1901-0245)

§ 205.309 Filing procedures and fees.

Applications shall be addressed to the Office of Utility Systems of the Economic Regulatory Administration. Every application shall be accompanied by a fee of $500.00. Fee payment shall be by check, draft, or money order payable to the Treasurer of the United States. Copies of applications and notifications of rate changes shall be furnished to the Federal Energy Regulatory Commission and all affected State public utility regulatory agencies.
§ 205.320 Who shall apply.
(a) Any person, firm, co-operative, corporation or other entity who operates an electric power transmission or distribution facility crossing the border of the United States, for the transmission of electric energy between the United States and a foreign country, shall have a Presidential Permit, in compliance with Executive Order 10485, as amended by Executive Order 12038. Such applications should be filed with the Office of Utility Systems of the Economic Regulatory Administration.

(b) In connection with applications hereunder, attention is directed to the provisions of §§ 205.300 to 205.309, above, concerning applications for authorization to transmit electric energy from the United States to a foreign country pursuant to section 202(e) of the Federal Power Act.

§ 205.321 Time of filing.
Pursuant to the DOE’s responsibility under the National Environmental Policy Act, the DOE must make an environmental determination of the proposed action. If, as a result of this determination, an environmental impact statement (EIS) must be prepared, the permit processing time normally will be 18-24 months. If no environmental impact statement is required, then a six-month processing time normally would be sufficient.

§ 205.322 Contents of application.
Every application shall be accompanied by a fee prescribed in §205.326 of this subpart and shall provide, in the order indicated, the following:
(a) Information regarding the applicant.
(1) The legal name of the applicant;
(2) The legal name of all partners;
(3) The name, title, post office address, and telephone number of the person to whom correspondence in regard to the application shall be addressed;
(4) Whether the applicant or its transmission lines are owned wholly or in part by a foreign government or directly or indirectly assisted by a foreign government or instrumentality thereof; or whether the applicant has any agreement pertaining to such ownership by or assistance from any foreign government or instrumentality thereof.
(5) List all existing contracts that the applicant has with any foreign government, or any foreign private concerns, relating to any purchase, sale or delivery of electric energy.
(b) Information regarding the transmission lines to be covered by the Presidential Permit.
(i) A technical description providing the following information: (A) Number of circuits, with identification as to whether the circuit is overhead or underground; (B) the operating voltage and frequency; and (C) conductor size, type and number of conductors per phase.
(ii) If the proposed interconnection is an overhead line the following additional information must also be provided: (A) The wind and ice loading design parameters; (B) a full description and drawing of a typical supporting structure including strength specifications; (C) structure spacing with typical ruling and maximum spans; (D) conductor (phase) spacing; and (E) the designed line to ground and conductor side clearances.
(iii) If an underground or underwater interconnection is proposed, the following additional information must also be provided: (A) Burial depth; (B) type of cable and a description of any required supporting equipment, such as insulation medium pressurizing or forced cooling; and (C) cathodic protection scheme. Technical diagrams which
Department of Energy

§ 205.323

provide clarification of any of the above items should be included.

(2) A general area map with a scale not greater than 1 inch=40 kilometers (1 inch=25 miles) showing the overall system, and a detailed map at a scale of 1 inch=8 kilometers (1 inch=5 miles) showing the physical location, longitude and latitude of the facility on the international border. The map shall indicate ownership of the facilities at or on each side of the border between the United States and the foreign country. The maps, plans, and description of the facilities shall distinguish the facilities or parts thereof already constructed from those to be constructed.

(3) Applications for the bulk power supply facility which is proposed to be operated at 138 kilovolts or higher shall contain the following bulk power system information:

(i) Data regarding the expected power transfer capability, using normal and short time emergency conductor ratings;

(ii) System power flow plots for the applicant's service area for heavy summer and light spring load periods, with and without the proposed international interconnection, for the year the line is scheduled to be placed in service and for the fifth year thereafter. The power flow plots submitted can be in the format customarily used by the utility, but the ERA requires a detailed legend to be included with the power flow plots;

(iii) Data on the line design features for minimizing television and/or radio interference caused by operation of the subject transmission facilities;

(iv) A description of the relay protection scheme, including equipment and proposed functional devices;

(v) After receipt of the system power flow plots, the ERA may require the applicant to furnish system stability analysis for the applicant's system.

(c) Information regarding the environmental impacts shall be provided as follows for each routing alternative:

(1) Statement of the environmental impacts of the proposed facilities including a list of each flood plain, wetland, critical wildlife habitat, navigable waterway crossing, Indian land, or historic site which may be impacted by the proposed facility with a description of proposed activities therein.

(2) A list of any known Historic Places, as specified in 36 CFR part 800, which may be eligible for the National Register of Historic Places.

(3) Details regarding the minimum right-of-way width for construction, operation and maintenance of the transmission lines and the rationale for selecting that right-of-way width.

(4) A list of threatened or endangered wildlife or plant life which may be located in the proposed alternative.

(d) A brief description of all practical alternatives to the proposed facility and a discussion of the general environmental impacts of each alternative.

(e) The original of each application shall be signed and verified under oath by an officer of the applicant, having knowledge of the matters therein set forth.

§ 205.323 Transferability.

(a) Neither a permit issued by the ERA pursuant to Executive Order 10485, as amended, nor the facility shall be transferable or assignable. Provided written notice is given to the ERA within 30 days, the authorization may continue in effect temporarily in the event of the involuntary transfer of the facility by operation of law (including transfers to receivers, trustees, or purchases under foreclosure or judicial sale). This continuance is contingent on the filing of an application for a new permit and may be effective until a decision is made thereon.

(b) In the event of a proposed voluntary transfer of the facility, the permittee and the party to whom the transfer would be made shall file a joint application with the ERA pursuant to this paragraph, setting forth information as required by §205.320 et seq., together with a statement of reasons for the transfer. The application shall be accompanied by a filing fee pursuant to §205.326.

(c) No substantial change shall be made in any facility authorized by permit or in the operation thereof unless or until such change has been approved by the ERA.

(d) Permits may be modified or revoked without notice by the President
§ 205.324 Form and style; number of copies.

All applicants shall file an original and two conformed copies of the application and all accompanying documents required under §§ 205.320 through 205.327.

§ 205.325 Annual report.

Persons receiving permits to construct, connect, operate or maintain electric transmission facilities at international boundaries shall submit to the ERA, by February 15 each year, a report covering each month of the preceding calendar year, detailing by category the gross amount of kilowatt-hours of energy received or delivered and the cost and revenue associated with each category.

§ 205.326 Filing procedures and fees.

Applications shall be forwarded to the Office of Utility Systems of the Economic Regulatory Administration and shall be accompanied by a filing fee of $150. The application fee will be charged irrespective of the ERA's disposition of the application. Fee payment shall be by check, draft, or money order payable to the Treasurer of the United States. Copies of applications shall be furnished to the Federal Energy Regulatory Commission and all affected State public utility regulatory agencies.

§ 205.327 Other information.

The applicant may be required after filing the application to furnish such supplemental information as the ERA may deem pertinent. Such requests shall be written and a prompt response will be expected. Protest regarding the supplying of such information should be directed to the Administrator of the ERA.

§ 205.328 Environmental requirements for Presidential Permits—Alternative 1.

(a) NEPA Compliance. Except as provided in paragraphs (c) and (e) of this section, when an applicant seeks a Presidential Permit, such applicant will be responsible for the costs of preparing any necessary environmental document, including an Environmental Impact Statement (EIS), arising from ERA's obligation to comply with the National Environmental Policy Act of 1969 (NEPA). ERA will determine whether an environmental assessment (EA) or EIS is required within 45 days of the receipt of the Presidential Permit application and of environmental information submitted pursuant to 10 CFR 205.322 (c) and (d). ERA will use these and other sources of information as the basis for making the environmental determination:

(1) If an EIS is determined to be necessary, the applicant shall enter into a contract with an independent third party, which may be a Government-owned, contractor-operated National Laboratory, or a qualified private entity selected by ERA. The third party contractor must be qualified to conduct an environmental review and prepare an EIS, as appropriate, under the supervision of ERA, and may not have a financial or other interest in the outcome of the proceedings. The NEPA process must be completed and approved before ERA will issue a Presidential Permit.

(2) If an EA is determined to be necessary, the applicant may be permitted to prepare an environmental assessment pursuant to 10 CFR 1506.5(b) for review and adoption by ERA, or the applicant may enter into a third party contract as set forth in this section.

(b) Environmental Review Procedure. Except as provided in paragraphs (c) and (e) of this section, environmental documents, including the EIS, where necessary, will be prepared utilizing the process set forth above. ERA, the applicant, and the independent third party, which may be a Government-owned, contractor-operated National Laboratory or a private entity, shall enter into an agreement in which the applicant will engage and pay directly for the services of the qualified third party to prepare the necessary environmental documents. The agreement shall outline the responsibilities of each party and its relationship to the other two parties regarding the work to be done or supervised. ERA shall approve the information to be developed and supervise the gathering, analysis
and presentation of the information. In addition, ERA will have the authority to approve and modify any statement, analysis, and conclusion contained in the environmental documents prepared by the third party. Before commencing preparation of the environmental document the third party will execute an ERA-prepared disclosure document stating that it does not have any conflict of interest, financial or otherwise, in the outcome of either the environmental process or the Permit application.

(c) Financial Hardship. Whenever ERA determines that a project is no longer economically feasible, or that a substantial financial burden would be imposed by the applicant bearing all of the costs of the NEPA studies, ERA may waive the requirement set forth in paragraphs (a) and (b) of this section and perform the necessary environmental review, completely or in part, with its own resources.

(d) Discussions Prior to Filing. Prior to the preparation of any Presidential Permit application and environmental report, a potential applicant is encouraged to contact ERA and each affected State public utility regulatory agency to discuss the scope of the proposed project and the potential for joint State and Federal environmental review.

(e) Federal Exemption. Upon a showing by the applicant that it is engaged in the transaction of official business of the Federal Government in filing the application pursuant to 10 CFR 205.320 et seq., it will be exempt from the requirements of this section.

[48 FR 33819, July 25, 1983]

§ 205.329 Environmental requirements for Presidential Permits—Alternative 2.

(a) NEPA Compliance. Except as provided in paragraph (b) and (e) of this section, applicants seeking Presidential Permits will be financially responsible for the expenses of any contractor chosen by ERA to prepare any necessary environmental document arising from ERA’s obligation to comply with the National Environmental Policy Act of 1969 (NEPA) in issuing such Presidential Permits:

(1) ERA will determine whether an Environmental Impact Statement (EIS) or an Environmental Assessment (EA) is required within 45 days of receipt of the Presidential Permit application and of the environmental information submitted pursuant to 10 CFR 205.322 (c) and (d). ERA will use these and other sources of information as the basis for making the environmental determination.

(2) If an EIS is determined to be necessary, ERA will notify the applicant of the fee for completing the EIS within 90 days after the submission of the application and environmental information. The fee shall be based on the expenses estimated to be incurred by DOE in contracting to prepare the EIS (i.e., the estimated fee charges to ERA by the contractor). DOE employee salaries and other fixed costs, as set forth in OMB Circular A–25, shall not be included in the applicant’s fee. Fee payment shall be by check, draft, or money order payable to the Treasurer of the United States, and shall be submitted to ERA. Upon submission of fifty percent of the environmental fee, ERA will provide to the applicant a tentative schedule for completion of the EIS.

(3) If an EA is determined to be necessary, the applicant may be permitted to prepare an environmental assessment pursuant to 40 CFR 1506.5(b) for review and adoption by ERA, or the applicant may choose to have ERA prepare the EA pursuant to the fee procedures set forth above.

(4) The NEPA process must be completed and approved before ERA will issue a Presidential Permit.

(b) Financial Hardship. Whenever ERA determines that a project is no longer economically feasible, or that a substantial financial burden would be imposed by the applicant bearing all of the costs of the NEPA studies, ERA may waive the requirement set forth in paragraphs (a) and (b) of this section and perform the necessary environmental review, completely or in part, with its own resources.

(c) Discussions Prior to Filing. Prior to the preparation of any Presidential Permit application and environmental
§ 205.350 General purpose.

The purpose of this rule is to establish a procedure for the Office of International Affairs and Energy Emergencies (IE) to obtain current information regarding emergency situations on the electric energy supply systems in the United States so that appropriate Federal emergency response measures can be implemented in a timely and effective manner. The data also may be utilized in developing legislative recommendations and reports to the Congress.

(Authorized by the Office of Management and Budget under control number 1901–0288)

§ 205.351 Reporting requirements.

For the purpose of this section, a report or part of a report may be made jointly by two or more entities. Every electric utility or other entity engaged in the generation, transmission or distribution of electric energy for delivery and/or sale to the public shall report promptly, through the DOE Emergency Operations Center, by telephone, the occurrence of any event such as described in paragraphs (a) through (d) of this section. These reporting procedures are mandatory. Entities that fail to comply within 24 hours will be contacted and reminded of their reporting obligation.

(a) Loss of Firm System Loads, caused by:

(1) Any load shedding actions resulting in the reduction of over 100 megawatts (MW) of firm customer load for reasons of maintaining the continuity of the bulk electric power supply system.

(2) Equipment failures/system operational actions attributable to the loss of firm system loads for a period in excess of 15 minutes, as described below:

(i) Reports from entities with a previous year recorded peak load of over 3000 MW are required for all such losses of firm loads which total over 300 MW.

(ii) Reports from all other entities are required for all such losses of firm loads which total over 200 MW or 50 percent of the system load being supplied immediately prior to the incident, whichever is less.

(3) Other events or occurrences which result in a continuous interruption for 3 hours or longer to over 50,000 customers, or more than 50 percent of the total customers being served immediately prior to the interruption, whichever is less.

(b) Voltage Reductions or Public Appeals:

...
§ 205.352 Information to be reported.  

The emergency situation data shall be supplied to the DOE Emergency Operations Center in accordance with the current DOE pamphlet on reporting procedures. The initial report shall include the utility name; the area affected; the time of occurrence of the initiating event; the duration or an estimate of the likely duration; an estimate of the number of customers and amount of load involved; and whether any known critical services such as hospitals, military installations, pumping stations or air traffic control systems, were or are interrupted. To the extent known or reasonably suspected, the report shall include a description of the events initiating the disturbance. The DOE may require further clarification during or after restoration of service.  

(Approved by the Office of Management and Budget under control number 1901–0288)

§ 205.353 Special investigation and reports.  

If directed by the Director, Office of Energy Emergency Operations in writing and noticed in the Federal Register, a utility or other subject entity experiencing a condition described in §205.351 above shall submit a full report of the technical circumstances surrounding a specific power system disturbance, including the restoration procedures utilized. The report shall be filed at such times as may be directed by the Director, Office of Energy Emergency Operations.  

(Approved by the Office of Management and Budget under control number 1901–0288)
§ 205.370 Applicability.

Sections 202(c) and 202(d) of the Federal Power Act are applicable to any “entity” which owns or operates electric power generation, transmission or distribution facilities. An “entity” is a private or public corporation (utility), a governmental agency, a municipality, a cooperative or a lawful association of the foregoing. Under this section, the DOE has the authority to order the temporary connection of facilities, or the generation or delivery of electricity, which it deems necessary to alleviate an emergency. Such orders shall be effective for the time specified and will be subject to the terms and conditions the DOE specifies. The DOE retains the right to cancel, modify or otherwise change any order, with or without notice, hearing, or report. Requests for action under these regulations will be accepted from any “entity,” State Public Utility Commission, State Energy Agency, or State Governor. Actions under these regulations also may be initiated by the DOE on its own motion. Orders under this authority may be made effective without prior notice.

§ 205.371 Definition of emergency.

“Emergency,” as used herein, is defined as an unexpected inadequate supply of electric energy which may result from the unexpected outage or breakdown of facilities for the generation, transmission or distribution of electric power. Such events may be the result of weather conditions, acts of God, or unforeseen occurrences not reasonably within the power of the affected “entity” to prevent. An emergency also can result from a sudden increase in customer demand, an inability to obtain adequate amounts of the necessary fuels to generate electricity, or a regulatory action which prohibits the use of certain electric power supply facilities. Actions under this authority are envisioned as meeting a specific inadequate power supply situation. Extended periods of insufficient power supply as a result of inadequate planning or the failure to construct necessary facilities can result in an emergency as contemplated in these regulations. In such cases, the impacted “entity” will be expected to make firm arrangements to resolve the problem until new facilities become available, so that a continuing emergency order is not needed. Situations where a shortage of electric energy is projected due solely to the failure of parties to agree to terms, conditions or other economic factors relating to service, generally will not be considered as emergencies unless the inability to supply electric service is imminent. Where an electricity outage or service inadequacy qualifies for a section 202(c) order, contractual difficulties alone will not be sufficient to preclude the issuance of an emergency order.

§ 205.372 Filing procedures; number of copies.

An original and two conformed copies of the applications and reports required under §§ 205.370 through 205.379 shall be filed with the Division of Power Supply and Reliability, Department of Energy. Copies of all documents also shall be served on:
(a) The Federal Energy Regulatory Commission;
(b) Any State Regulatory Agency having responsibility for service standards, or rates of the “entities” that are affected by the requested order;
(c) Each “entity” suggested as a potential source for the requested emergency assistance;
(d) Any “entity” that may be a potential supplier of transmission services;
(e) All other “entities” not covered under paragraphs (c) and (d) of this section which may be directly affected by the requested order; and
(f) The appropriate Regional Reliability Council.

§ 205.373 Application procedures.

Every application for an emergency order shall set forth the following information as required. This information shall be considered by the DOE in determining that an emergency exists and in deciding to issue an order pursuant to sections 202(c) and 202(d) of the Federal Power Act.
(a) The exact legal name of the applicant and of all other “entities” named in the application.
(b) The name, title, post office address, and telephone number of the person to whom correspondence in regard to the application shall be addressed.

(c) The political subdivision in which each “entity” named in the application operates, together with a brief description of the area served and the business conducted in each location.

(d) Each application for a section 202(c) order shall include the following baseline data:

1. Daily peak load and energy requirements for each of the past 30 days and projections for each day of the expected duration of the emergency;
2. All capacity and energy receipts or deliveries to other electric utilities for each of the past 30 days, indicating the classification for each transaction;
3. The status of all interruptible customers for each of the past 30 days and the anticipated status of these customers for each day of the expected duration of the emergency, assuming both the granting and the denial of the relief requested herein;
4. All scheduled capacity and energy receipts or deliveries to other electric utilities for each day of the expected duration of the emergency.

(e) A description of the situation and a discussion of why this is an emergency, including any necessary background information. This should include any contingency plan of the applicant and the current level of implementation.

(f) A showing that adequate electric service to firm customers cannot be maintained without additional power transfers.

(g) A description of any conservation or load reduction actions that have been implemented. A discussion of the achieved or expected results or these actions should be included.

(h) A description of efforts made to obtain additional power through voluntary means and the results of such efforts; and a showing that the potential sources of power and transmission services designated pursuant to paragraphs (i) through (k) of this section informed that the applicant believed that an emergency existed within the meaning of §205.371.

(i) A listing of proposed sources and amounts of power necessary from each source to alleviate the emergency and a listing of any other “entities” that may be directly affected by the requested order.

(j) Specific proposals to compensate the supplying “entities” for the emergency services requested and to compensate any transmitting “entities” for services necessary to deliver such power.

(k) A showing that, to the best of the applicant’s knowledge, the requested relief will not unreasonably impair the reliability of any “entity” directly affected by the requested order to render adequate service to its customers.

(l) Description of the facilities to be used to transfer the requested emergency service to the applicant’s system.

(1) If a temporary interconnection under the provisions of section 202(c) is proposed independently, the following additional information shall be supplied for each such interconnection:

(i) Proposed location;

(ii) Required thermal capacity or power transfer capability of the interconnection;

(iii) Type of emergency services requested, including anticipated duration;

(iv) An electrical one line diagram;

(v) A description of all necessary materials and equipment; and

(vi) The projected length of time necessary to complete the interconnection.

(2) If the requested emergency assistance is to be supplied over existing facilities, the following information shall be supplied for each existing interconnection:

(i) Location;

(ii) Thermal capacity of power transfer capability of interconnection facilities; and

(iii) Type and duration of emergency services requested.

(m) A general or key map on a scale not greater than 100 kilometers to the centimeter showing, in separate colors, the territory serviced by each “entity” named in the application; the location of the facilities to be used for the generation and transmission of the requested emergency service; and all connection points between systems.
§ 205.374 Responses from “entities” designated in the application.

Each “entity” designated as a potential source of emergency assistance or as a potential supplier of transmission services and which has received a copy of the application under §205.373, shall have three (3) calendar days from the time of receipt of the application to file the information designated below with the DOE. The DOE will grant extensions of the filing period when appropriate. The designated “entities” shall provide an analysis of the impact the requested action would have on its system reliability and its ability to supply its own interruptible and firm customers. The effects of the requested action on the ability to serve firm loads shall be clearly distinguished from the ability to serve contractually interruptible loads. The designated “entity” also may provide other information relevant to the requested action, which is not included in the reliability analysis. Copies of any response shall be provided to the applicant, the Federal Energy Regulatory Commission, any State Regulatory Agency having responsibility for service standards or rates of any “entity” that may be directly involved in the proposed action, and the appropriate Regional Electric Reliability Council. Pursuant to section 202(c) of the Federal Power Act, DOE may issue an emergency order even though a designated “entity” has failed to file a timely response.

§ 205.375 Guidelines defining inadequate fuel or energy supply.

An inadequate utility system fuel inventory or energy supply is a matter of managerial and engineering judgment based on such factors as fuels in stock, fuels en route, transportation time, and constraints on available storage facilities. A system may be considered to have an inadequate fuel or energy supply capability when, combined with other conditions, the projected energy deficiency upon the applicant’s system without emergency action by the DOE, will equal or exceed 10 percent of the applicant’s then normal daily net energy for load, or will cause the applicant to be unable to meet its normal peak load requirements based upon use of all of its otherwise available resources so that it is unable to supply adequate electric service to its ultimate customers. The following conditions will be considered in determining that a system has inadequate fuel or energy supply capability:

1. System coal stocks are reduced to 30 days (or less) of normal burn days and a continued downward trend in stock is projected;
2. System residual oil stocks are reduced to 15 days (or less) of normal burn days and a continued downward trend in stocks is projected;
3. System distillate oil stocks which cannot be replaced by alternate fuels are reduced to 15 days (or less) of normal burn days and a continued downward trend in stocks is projected;
4. System natural gas deliveries which cannot be replaced by alternate fuels have been or will be reduced 20 percent below normal requirements and no improvement in natural gas deliveries is projected within 30 days;
5. Delays in nuclear fuel deliveries will extend a scheduled refueling shutdown by more than 30 days; and
6. Water supplies required for power generation have been reduced to the level where the future adequacy of the power supply may be endangered and no near-term improvement in water supplies is projected.

The use of the prescribed criteria does not preclude an applicant from claiming the existence of an emergency when its stocks of fuel or water exceed the amounts and time frames specified above.

§ 205.376 Rates and charges.

The applicant and the generating or transmitting systems from which emergency service is requested are encouraged to utilize the rates and charges contained in approved existing rate schedules or to negotiate mutually satisfactory rates for the proposed
transactions. In the event that the DOE determines that an emergency exists under section 202(c), and the "entities" are unable to agree on the rates to be charged, the DOE shall prescribe the conditions of service and refer the rate issues to the Federal Energy Regulatory Commission for determination by that agency in accordance with its standards and procedures.

§ 205.377 Reports.

In addition to the information specified below, the DOE may require additional reports as it deems necessary.

(a) Where the DOE has authorized the temporary connection of transmission facilities, all "entities" whose transmission facilities are thus temporarily interconnected shall report the following information to the DOE within 15 days following completion of the interconnection:

1. The date the temporary interconnection was completed;
2. The location of the interconnection;
3. A description of the interconnection; and
4. A one-line electric diagram of the interconnection.

(b) Where the DOE orders the transfer of power, the "entity" receiving such service shall report the following information to the DOE by the 10th of each month for the preceding month’s activity for as long as such order shall remain in effect:

1. Amounts of capacity and/or energy received each day;
2. The name of the supplier;
3. The name of any "entity" supplying transmission services; and
4. Preliminary estimates of the associated costs.

(c) Where the DOE has approved the installation of permanent facilities that will be used only during emergencies, any use of such facilities shall be reported to the DOE within 24 hours. Details of such usage shall be furnished as deemed appropriate by the DOE after such notification.

(d) Any substantial change in the information provided under §205.373 shall be promptly reported to the DOE.

(Approved by the Office of Management and Budget under Control No. 1904-0066)

§ 205.378 Disconnection of temporary facilities.

Upon the termination of any emergency for the mitigation of which the DOE ordered the construction of temporary facilities, such facilities shall be disconnected and any temporary construction removed or otherwise disposed of, unless application is made as provided in §205.379 for permanent connection for emergency use. This disconnection and removal of temporary facilities shall be accomplished within 30 days of the termination of the emergency unless an extension is granted by the DOE. The DOE shall be notified promptly when such removal of facilities is completed.

§ 205.379 Application for approval of the installation of permanent facilities for emergency use only.

Application for DOE approval of a permanent connection for emergency use only shall conform with the requirements in §205.373. However, the baseline data specified in §205.373(d) need not be included in an application made under this section. In addition, the application shall state in full the reasons why such permanent connection for emergency use is in the public interest.

PART 207—COLLECTION OF INFORMATION

Subpart A—Collection of Information Under the Energy Supply and Environmental Coordination Act of 1974

Sec.
207.1 Purpose.
207.2 Definitions.
207.3 Method of collecting energy information under ESECA.
207.4 Confidentiality of energy information.
207.5 Violations.
207.6 Notice of probable violation and remedial order.
207.7 Sanctions.
207.8 Judicial actions.
§ 207.1 Purpose.

The purpose of this subpart is to set forth the manner in which energy information which the Administrator is authorized to obtain by sections 11(a) and (b) of ESECA will be collected.

§ 207.2 Definitions.

As used in this subpart:

Administrator means the Federal Energy Administrator of his delegate.

Energy information includes all information in whatever form on (1) fuel reserves, exploration, extraction, and energy resources (including petrochemical feedstocks) wherever located; (2) production, distribution, and consumption of energy and fuels, wherever carried on; and (3) matters relating to energy and fuels such as corporate structure and proprietary relationships, costs, prices, capital investment, and assets, and other matters directly related thereto, wherever they exist.

DOE means the Department of Energy.

Person means any natural person, corporation, partnership, association, consortium, or any entity organized for a common business purpose, wherever situated, domiciled, or doing business, who directly or through other persons subject to their control does business in any part of the United States.

United States, when used in the geographical sense, means the States, the District of Columbia, Puerto Rico, and the territories and possessions of the United States.

§ 207.3 Method of collecting energy information under ESECA.

(a) Whenever the Administrator determines that:

(1) Certain energy information is necessary to assist in the formulation of energy policy or to carry out the purposes of the ESECA of the EPAA; and

(2) Such energy information is not available to DOE under the authority of statutes other than ESECA or that such energy information should, as a matter of discretion, be collected under the authority of ESECA;

He shall require reports of such information to be submitted to DOE at least every ninety calendar days.

(b) The Administrator may require such reports of any person who is engaged in the production, processing, refining, transportation by pipeline, or distribution (at other than the retail level) of energy resources.

(c) The Administrator may require such reports by rule, order, questionnaire, or such other means as he determines appropriate.

(d) Whenever reports of energy information are requested under this subpart, the rule, order, questionnaire, or other means requesting such reports shall contain (or be accompanied by) a recital that such reports are being requested under the authority of ESECA.

(e) In addition to requiring reports, the Administrator may, at his discretion, in order to obtain energy information under the authority of ESECA:

(1) Sign and issue subpoenas in accordance with the provisions of §205.8 of this chapter for the attendance and testimony of witnesses and the production of books, records, papers, and other documents;

(2) Require any person, by rule or order, to submit answers in writing to interrogatories, requests for reports or for other information, with such answers or other submissions made within such reasonable period as is specified in the rule or order, and under oath; and

(3) Administer oaths.

Any such subpoena or rule or order shall contain (or be accompanied by) a recital that energy information is requested under the authority of ESECA.
§ 207.6 Notice of probable violation and remedial order.

(a) Purpose and scope. (1) This section establishes the procedures for determining the nature and extent of violations of this subpart and the procedures for issuance of a notice of probable violation, a remedial order or a remedial order for immediate compliance.

(2) When the DOE discovers that there is reason to believe a violation of any provision of this subpart, or any order issued thereunder, has occurred, is continuing or is about to occur, the DOE may conduct proceedings to determine the nature and extent of the violation and may issue a remedial order thereafter. The DOE may commence such proceeding by serving a notice of probable violation or by issuing a remedial order for immediate compliance.

(b) Whenever the Administrator requests reports of energy information under this subpart, he may specify (in the rule, order or questionnaire or other means by which he has requested such reports) the nature of the showing required to be made in order to satisfy DOE that certain energy information contained in such reports warrants confidential treatment in accordance with this section. He shall, to the maximum extent practicable, either before or after requesting reports, by ruling or otherwise, inform respondents providing energy information pursuant to this subpart of whether such information will be made available to the public pursuant to requests under the Freedom of Information Act (5 U.S.C. 552).

§ 207.5 Violations.

Any practice that circumvents or contravenes or results in a circumvention or contravention of the requirements of any provision of this subpart or any order issued pursuant thereto is a violation of the DOE regulations stated in this subpart.
(2) Within 10 days of the service of a notice of probable violation, the person upon whom the notice is served may file a reply with the DOE office that issued the notice of probable violation at the address provided in §205.12 of this chapter. The DOE may extend the 10-day period for good cause shown.

(3) The reply shall be in writing and signed by the person filing it. The reply shall contain a full and complete statement of all relevant facts pertaining to the act or transaction that is the subject of the notice of probable violation. Such facts shall include a complete statement of the business or other reasons that justify the act or transaction, if appropriate; a detailed description of the act or transaction; and a full discussion of the pertinent provisions and relevant facts reflected in any documents submitted with the reply. Copies of all relevant documents shall be submitted with the reply.

(4) The reply shall include a discussion of all relevant authorities, including, but not limited to, DOE rulings, regulations, interpretations, and decisions on appeals and exceptions relied upon to support the particular position taken.

(5) The reply should indicate whether the person requests or intends to request a conference regarding the notice. Any request not made at the time of the reply shall be made as soon thereafter as possible to insure that the conference is held when it will be most beneficial. A request for a conference must conform to the requirements of subpart M of part 205 of this chapter.

(6) If a person has not filed a reply with the DOE within the 10-day period provided, and the DOE has not extended the 10-day period, the person shall be deemed to have conceded the accuracy of the factual allegations and legal conclusions stated in the notice of probable violation.

(7) If the DOE finds, after the 10-day period provided in §207.6(b)(2), that no violation has occurred, is continuing, or is about to occur, or that for any reason the issuance of a remedial order would not be appropriate, it shall notify, in writing, the person to whom a notice of probable violation has been issued that the notice is rescinded.

(c) Remedial order. (1) If the DOE finds, after the 10-day period provided in §207.6(b)(2), that a violation has occurred, is continuing, or is about to occur, the DOE may issue a remedial order. The order shall include a written opinion setting forth the relevant facts and the legal basis of the remedial order.

(2) A remedial order issued under this subpart shall be effective upon issuance, in accordance with its terms, until stayed, suspended, modified or rescinded. The DOE may stay, suspend, modify or rescind a remedial order on its own initiative or upon application by the person to whom the remedial order is issued. Such action and application shall be in accordance with the procedures for such proceedings provided for in part 205 of this chapter.

(3) A remedial order may be referred at any time to the Department of Justice for appropriate action in accordance with §207.7.

(d) Remedial order for immediate compliance. (1) Notwithstanding paragraphs (b) and (c) of this section, the DOE may issue a remedial order for immediate compliance, which shall be effective upon issuance and until rescinded or suspended, if it finds:

(i) There is a strong probability that a violation has occurred, is continuing or is about to occur;

(ii) Irreparable harm will occur unless the violation is remedied immediately; and

(iii) The public interest requires the avoidance of such irreparable harm through immediate compliance and waier of the procedures afforded under paragraphs (b) and (c) of this section.

(2) A remedial order for immediate compliance shall be served promptly upon the person against whom such order is issued by telex or telegram, with a copy served by registered or certified mail. The copy shall contain a written statement of the relevant facts and the legal basis for the remedial order for immediate compliance, including the findings required by paragraph (d)(1) of this section.

(3) The DOE may rescind or suspend a remedial order for immediate compliance if it appears that the criteria set forth in paragraph (d)(1) of this section
are no longer satisfied. When appropriate, however, such a suspension or rescission may be accompanied by a notice of probable violation issued under paragraph (b) of this section.

(4) If at any time in the course of a proceeding commenced by a notice of probable violation the criteria set forth in paragraph (d)(1) of this section are satisfied, the DOE may issue a remedial order for immediate compliance, even if the 10-day period for reply specified in §207.6(b)(2) of this part has not expired.

(5) At any time after a remedial order for immediate compliance has become effective the DOE may refer such order to the Department of Justice for appropriate action in accordance with §207.7 of this part.

(e) Remedies. A remedial order or a remedial order for immediate compliance may require the person to whom it is directed to take such action as the DOE determines is necessary to eliminate or to compensate for the effects of a violation.

(f) Appeal. (1) No notice of probable violation issued pursuant to this subpart shall be deemed to be an action of which there may be an administrative appeal.

(2) Any person to whom a remedial order or a remedial order for immediate compliance is issued under this subpart shall be deemed to be an action of which there may be an administrative appeal.

§207.7 Sanctions.

(a) General. (1) Penalties and sanctions shall be deemed cumulative and not mutually exclusive.

(2) Each day that a violation of the provisions of this subpart or any order issued pursuant thereto continues shall be deemed to constitute a separate violation within the meaning of the provisions of this subpart relating to criminal fines and civil penalties.

(b) Criminal penalties. Any person who willfully violates any provision of this subpart or any order issued pursuant thereto shall be subject to a fine of not more than $5,000 for each violation. Criminal violations are prosecuted by the Department of Justice upon referral by the DOE.

(c) Civil Penalties. (1) Any person who violates any provision of this subpart or any order issued pursuant thereto shall be subject to a civil penalty of not more than $2,750 for each violation. Actions for civil penalties are prosecuted by the Department of Justice upon referral by the DOE.

(2) When the DOE considers it to be appropriate or advisable, the DOE may compromise and settle, and collect civil penalties.

§207.8 Judicial actions.

(a) Enforcement of subpoenas; contempt. Any United States district court within the jurisdiction of which any inquiry is carried on may, upon petition by the Attorney General at the request of the Administrator, in the case of refusal to obey a subpoena or order of the Administrator issued under this subpart, issue an order requiring compliance. Any failure to obey such an order of the court may be punished by the court as contempt.

(b) Injunctions. Whenever it appears to the Administrator that any person has engaged, is engaged, or is about to engage in any act or practice constituting a violation of any regulation or order issued under this subpart, the Administrator may request the Attorney General to bring a civil action in the appropriate district court of the United States to enjoin such acts or practices and, upon a proper showing, a temporary restraining order or preliminary or permanent injunction shall be granted without bond. The relief sought may include a mandatory injunction commanding any person to comply with any provision of such order or regulation, the violation of which is prohibited by section 12(a) of ESECA, as implemented by this subpart.

§207.9 Exceptions, exemptions, interpretations, rulings and rulemaking.

Applications for exceptions, exemptions or requests for interpretations relating to this subpart shall be filed in
accordance with the procedures provided in subparts D, E and F, respectively, of part 205 of this chapter. Rulings shall be issued in accordance with the procedures of subpart K of part 205 of this chapter. Rulemakings shall be undertaken in accordance with the procedures provided in subpart L of part 205 of this chapter.

PART 209—INTERNATIONAL VOLUNTARY AGREEMENTS

Subpart A—General Provisions

Sec. 209.1 Purpose and scope.
209.2 Delegation.
209.3 Definitions.

Subpart B—Development of Voluntary Agreements

209.21 Purpose and scope.
209.22 Initiation of meetings.
209.23 Conduct of meetings.
209.24 Maintenance of records.

Subpart C—Carrying Out of Voluntary Agreements and Developing and Carrying Out of Plans of Actions

209.31 Purpose and scope.
209.32 Initiation of meetings.
209.33 Conduct of meetings.
209.34 Maintenance of records.

Subpart D—Availability of Information Relating to Meetings and Communications

209.41 Availability of information relating to meetings and communications.

SOURCE: 41 FR 6754, Feb. 13, 1976, unless otherwise noted.

Subpart A—General Provisions

§ 209.1 Purpose and scope.

This part implements the provisions of the Energy Policy and Conservation Act (EPCA) authorizing the Administrator to prescribe standards and procedures by which persons engaged in the business of producing, transporting, refining, distributing, or storing petroleum may develop and carry out voluntary agreements, and plans of action which are required to implement the information and allocation provisions of the International Energy Program (IEP). The requirements of this part do not apply to activities other than those for which section 252 of EPCA makes available a defense to the antitrust laws.

§ 209.2 Delegation.

To the extent otherwise permitted by law, any authority, duty, or responsibility vested in DOE or the Administrator under these regulations may be delegated to any regular full-time employee of the Department of Energy, and, by agreement, to any regular full-time employee of the Department of Justice or the Department of State.

§ 209.3 Definitions.

For purposes of this part—
(a) Administrator means the Administrator of the Department of Energy.
(b) Information and allocation provisions of the International Energy Program means the provisions of chapter V of the Program relating to the Information System, and the provisions at chapters III and IV thereof relating to the international allocation of petroleum.
(d) International Energy Program (IEP) means the program established pursuant to the Agreement on an International Energy Program signed at Paris on November 18, 1974, including (1) the Annex entitled “Emergency Reserves”, (2) any amendment to such Agreement which includes another nation as a Party to such Agreement, and (3) any technical or clerical amendment to such Agreement.
(e) International energy supply emergency means any period (1) beginning on any date which the President determines allocation of petroleum products to nations participating in the international energy program is required by chapters III and IV of such program, and (2) ending on a date on which he determines such allocation is no longer
required. Such a period shall not exceed 90 days, except where the President establishes one or more additional periods by making the determination under paragraph (e)(1) of this section.

(f) Potential participant means any person engaged in the business of producing, transporting, refining, distributing, or storing petroleum products; “participant” means any such person who agrees to participate in a voluntary agreement pursuant to a request to do so by the Administrator.

(g) Petroleum or petroleum products means crude oil, residual fuel oil, or any refined petroleum product (including any natural gas liquid and any natural gas liquid product).

Subpart B—Development of Voluntary Agreements

§ 209.21 Purpose and scope.
(a) This subpart establishes the standards and procedures by which persons engaged in the business of producing, transporting, refining, distributing, or storing petroleum products shall develop voluntary agreements which are required to implement the allocation and information provisions of the International Energy Program.

(b) This subpart does not apply to meetings of bodies created by the International Energy Agency.

§ 209.22 Initiation of meetings.
(a) Any meeting held for the purpose of developing a voluntary agreement involving two or more potential participants shall be initiated and chaired by the Administrator or other regular full-time Federal employee designated by him.

(b) DOE shall provide notice of meetings held pursuant to this subpart, in writing, to the Attorney General, the Federal Trade Commission, and to the Speaker of the House and the President of the Senate for delivery to the appropriate committees of Congress, and to the public through publication in the Federal Register. Such notice shall identify the time, place, and agenda of the meeting, and such other matters as the Administrator deems appropriate. Notice in the Federal Register shall be published at least seven days prior to the date of the meeting.

§ 209.23 Conduct of meetings.
(a) Meetings to develop a voluntary agreement held pursuant to this subpart shall be open to all interested persons. Interested persons desiring to attend meetings under this subpart may be required pursuant to notice to advise the Administrator in advance.

(b) Interested persons may, as set out in notice provided by the Administrator, present data, views, and arguments orally and in writing, subject to such reasonable limitations with respect to the manner of presentation as the Administrator may impose.

§ 209.24 Maintenance of records.
(a) The Administrator shall keep a verbatim transcript of any meeting held pursuant to this subpart.

(b) (1) Except as provided in paragraphs (b)(2) through (4) of this section, potential participants shall keep a full and complete record of any communications (other than in a meeting held pursuant to this subpart) between or among themselves for the purpose of developing a voluntary agreement under this part. When two or more potential participants are involved in such a communication, they may agree among themselves who shall keep such record. Such record shall include the names of the parties to the communication and the organizations, if any, which they represent; the date of the communication; the means of communication; and a description of the communication in sufficient detail to convey adequately its substance.

(2) Where any communication is written (including, but not limited to, telex, telegraphic, telecopied, microfilmed and computer printout material), and where such communication demonstrates on its face that the originator or some other source furnished a copy of the communication to the Office of International Affairs, Department of Energy with the notation “Voluntary Agreement” marked on the first page of the document, no participant need record such a communication or send a further copy to the Department of Energy. The Department of Energy may, upon written notice to potential participants, from time to time, or with reference to particular types of documents, require deposit...
§ 209.31 Purpose and scope.

This subpart establishes the standards and procedures by which persons engaged in the business of producing, transporting, refining, distributing, or storing petroleum products shall carry out voluntary agreements and develop and carry out plans of action which are required to implement the allocation and information provisions of the International Energy Program.

§ 209.32 Initiation of meetings.

(a) Except for meetings of bodies created by the International Energy Agency, any meeting among participants in a voluntary agreement pursuant to this subpart, for the purpose of carrying out such voluntary agreement or developing or carrying out a plan of action pursuant thereto, shall be initiated and chaired by a full-time Federal employee designated by the Administrator.

(b) Except as provided in paragraph (c) of this section, the Administrator shall provide notice of meetings held pursuant to this subpart, in writing, to the Attorney General, the Federal Trade Commission, and to the Speaker of the House and the President of the Senate for delivery to the appropriate committees of Congress. Except during an international energy supply emergency, notice shall also be provided to the public through publication in the Federal Register. Such notice shall identify the time, place, and agenda of

Subpart C—Carrying Out of Voluntary Agreements and Developing and Carrying Out of Plans of Actions

§ 209.31 Purpose and scope.

This subpart establishes the standards and procedures by which persons engaged in the business of producing, transporting, refining, distributing, or storing petroleum products shall carry out voluntary agreements and develop and carry out plans of action which are required to implement the allocation and information provisions of the International Energy Program.

§ 209.32 Initiation of meetings.

(a) Except for meetings of bodies created by the International Energy Agency, any meeting among participants in a voluntary agreement pursuant to this subpart, for the purpose of carrying out such voluntary agreement or developing or carrying out a plan of action pursuant thereto, shall be initiated and chaired by a full-time Federal employee designated by the Administrator.

(b) Except as provided in paragraph (c) of this section, the Administrator shall provide notice of meetings held pursuant to this subpart, in writing, to the Attorney General, the Federal Trade Commission, and to the Speaker of the House and the President of the Senate for delivery to the appropriate committees of Congress. Except during an international energy supply emergency, notice shall also be provided to the public through publication in the Federal Register. Such notice shall identify the time, place, and agenda of
the meeting. Notice in the Federal Register shall be published at least seven days prior to the date of the meeting unless emergency circumstances, IEP requirements or other unanticipated circumstances require the period to be shortened.

(c) During an international energy supply emergency, advance notice shall be given to the Attorney General, the Federal Trade Commission and to the Speaker of the House and the President of the Senate for delivery to the appropriate committees of Congress. Such notice may be telephonic or by such other means as practicable, and shall be confirmed in writing.

§ 209.33 Conduct of meetings.

(a) Subject to the provisions of paragraph (c) of this section, meetings held to carry out a voluntary agreement, or to develop or carry out a plan of action pursuant to this subpart, shall be open to all interested persons, subject to limitations of space. Interested persons desiring to attend meetings under this subpart may be required to advise the Administrator in advance.

(b) Interested persons permitted to attend meetings under this section may present data, views, and arguments orally and in writing, subject to such limitations with respect to the manner of presentation as the Administrator may impose.

(c) Meetings held pursuant to this subpart shall not be open to the public to the extent that the President or his delegate finds that disclosure of the proceedings beyond those authorized to attend would be detrimental to the foreign policy interests of the United States, and determines, in consultation with the Administrator, the Secretary of State, and the Attorney General, that a meeting shall not be open to interested persons or that attendance by interested persons shall be limited.

(d) The requirements of this section do not apply to meetings of bodies created by the International Energy Agency except that no participant in a voluntary agreement may attend any meeting of any such body held to carry out a voluntary agreement or to develop or to carry out a plan of action unless a full-time Federal employee is present.

§ 209.34 Maintenance of records.

(a) The Administrator or his delegate shall keep a verbatim transcript of any meeting held pursuant to this subpart except where (1) due to considerations of time or other overriding circumstances, the keeping of a verbatim transcript is not practicable, or (2) principal participants in the meeting are representatives of foreign governments. If any such record other than a verbatim transcript, is kept by a designee who is not a full-time Federal employee, that record shall be submitted to the full-time Federal employee in attendance at the meeting who shall review the record, promptly make any changes he deems necessary to make the record full and complete, and shall notify the designee of such changes.

(b)(1) Except as provided in paragraphs (b) (2) through (4) of this section, participants shall keep a full and complete record of any communication (other than in a meeting held pursuant to this subpart) between or among themselves or with any other member of a petroleum industry group created by the International Energy Agency, or subgroup thereof for the purpose of carrying out a voluntary agreement or developing or carrying out a plan of action under this subpart, except that where there are several communications within the same day involving the same participants, they may keep a cumulative record for the day. The parties to a communication may agree among themselves who shall keep such record. Such record shall include the names of the parties to the communication and the organizations, if any, which they represent; the date of communication; the means of communication; and a description of the communication in sufficient detail to convey adequately its substance.

(2) Where any communication is written (including, but not limited to, telex, telegraphic, telecopied, microfilmed and computer printout material), and where such communication demonstrates on its face that the originator or some other source furnished a copy of the communication to the Office of International Affairs, Department of Energy with the notation “Voluntary Agreement” on the first
paragraph of the document, no participants need record such a communication or send a further copy to the Department of Energy. The Department of Energy may, upon written notice to participants, from time to time, or with reference to particular types of documents, require deposit with other offices or officials of the Department of Energy. Where such communication demonstrates that it was sent to the Office of International Affairs, Department of Energy with the notation “Voluntary Agreement” on the first page of the document, or such other offices or officials as the Department of Energy has designated pursuant to this section, it shall satisfy paragraph (c) of this section, for the purpose of deposit with the Department of Energy.

(3) To the extent that any communication is procedural, administrative or ministerial (for example, if it involves the location of a record, the place of a meeting, travel arrangements, or similar matters) only a brief notation of the date, time, persons involved and description of the communication need be recorded; except that during an IEA emergency allocation exercise or an allocation systems test such a non-substantive communication between members of the Industry Supply Advisory Group (ISAG) which occur within IEA headquarters need not be recorded.

(4) To the extent that any communication involves matters which recapitulate matters already contained in a full and complete record, the substance of such matters shall be identified, but need not be recorded in detail, provided that reference is made to the record and the portion thereof in which the substance is fully set out.

(c) Except where the Department of Energy otherwise provides, all records and transcripts prepared pursuant to paragraphs (a) and (b) of this section, shall be deposited within seven (7) days after the close of the week (ending Saturday) of their preparation during an international energy supply emergency or a test of the IEA emergency allocation system, and within fifteen (15) days after the close of the month of their preparation during periods of non-emergency, together with any agreement resulting therefrom, with the Department of Energy and shall be available to the Department of Justice, the Federal Trade Commission, and the Department of State. Such records and transcripts shall be available for public inspection and copying to the extent set forth in subpart D. Any person depositing materials pursuant to this section shall indicate with particularity what portions, if any, the person believes are not subject to disclosure to the public pursuant to subpart D and the reasons for such belief.

(d) Any meeting between a participant and an official of DOE for the purpose of carrying out a voluntary agreement or developing or carrying out a plan of action shall, if not otherwise required to be recorded pursuant to this section, be recorded by such official as provided in §204.5.

(e) During international oil allocation under chapters III and IV of the IEP or during an IEA allocation systems test, the Department of Energy may issue such additional guidelines amplifying the requirements of these regulations as the Department of Energy determines to be necessary and appropriate.

(Approved by the Office of Management and Budget under Control No. 1905–0067)

Subpart D—Availability of Information Relating to Meetings and Communications

§209.41 Availability of information relating to meetings and communications.

(a) Except as provided in paragraph (b) of this section, records or transcripts prepared pursuant to this subpart shall be available for public inspection and copying in accordance with section 552 of title 5, United States Code and part 202 of this title.
Department of Energy

(b) Matter may be withheld from disclosure under section 552(b) of title 5 only on the grounds specified in:

(1) Section 552(b)(1), applicable to matter specifically required by Executive Order to be kept secret in the interest of the national defense or foreign policy. This section shall be interpreted to include matter protected under Executive Order No. 11652 of March 8, 1972, establishing categories and criteria for classification, as well as any other such orders dealing specifically with disclosure of IEP related materials;

(2) Section 552(b)(3), applicable to matter specifically exempted from disclosure by statute; and

(3) So much of section 552(b)(4) as relates to trade secrets.

PART 210—GENERAL ALLOCATION AND PRICE RULES

Subpart A—Recordkeeping

Sec. 210.1 Records.

Subparts B–D [Reserved]

Subpart A—Recordkeeping

§ 210.1 Records.

(a) The recordkeeping requirements that were in effect on January 27, 1981, in parts 210, 211, and 212 will remain in effect for (1) all transactions prior to February 1, 1981; and (2) all allowed expenses incurred and paid prior to April 1, 1981 under § 212.78 of part 212. These requirements include, but are not limited to, the requirements that were in effect on January 27, 1981, in § 210.92 of this part; in §§ 211.67(a)(5)(ii); 211.80; 211.109, 211.127; and 211.223 of part 211; and in §§ 212.78(h)(5)(ii); 212.78(h)(6); 212.83(c)(2)(iii)(E)(i); 212.83(c)(2)(iii)(E)(ii); 212.83(c)(2)(iv)(E)(i); 212.93(b)(4)(iii)(B)(i); and § 212.187 of part 212.

(b) Effective February 5, 1985, paragraph (a) of this section shall apply, to the extent indicated, only to firms in the following categories. A firm may be included in more than one category, and a firm may move from one category to another. The fact that a firm becomes no longer subject to the recordkeeping requirements of one category shall not relieve that firm of compliance with the recordkeeping requirements of any other category in which the firm is still included.

(1) Those firms which are or become parties in litigation with DOE, as defined in paragraph (c)(1) of this section. Any such firm shall remain subject to paragraph (a) of this section. DOE shall notify the firm in writing of the final resolution of the litigation and whether or not any of its records must be maintained for a further period. DOE shall notify a firm which must maintain any records for a further period when such records are no longer needed.

(2)(i) Those firms which as of November 30, 1984, have completed making all restitutionary payments required by an administrative or judicial order, consent order, or other settlement or order but which payments are on February 5, 1985, still subject to distribution by DOE. This requirement is applicable to only those firms listed in appendix B. Any such firm shall maintain all records for the time period covered by the administrative or judicial order, consent order, or other settlement or order requiring the payments, evidencing sales volume data for each product subject to controls and customers’ names and addresses, until one of the following: June 30, 1985, unless this period is extended on a firm-by-firm basis; the end of the individual firm’s extension; or the firm is notified in writing that its records are no longer needed.

(ii) Those firms which as of November 30, 1984, are required to make restitutionary or other payments pursuant to an administrative or judicial order, consent order, or other settlement or order. Any such firm shall remain subject to paragraph (a) of this section until the firm completes all
restitutionary payments required by the administrative or judicial order, consent order, or other settlement or order. However, after completing all such payments, a firm shall maintain all records described in paragraph (b)(2)(i) of this section until one of the following: Six months after the firm completes all such payments, unless this period is extended on a firm-by-firm basis; the end of the individual firm’s extension; or the firm is notified in writing that its records are no longer needed.

(3)(i) Those firms with completed audits in which DOE has not yet made a determination to initiate a formal enforcement action and firms under audit which do not have outstanding subpoenas. Any such firm shall maintain all records for the period covered by the audit including all records necessary to establish historical prices or volumes which serve as the basis for determining the lawful prices or volumes for any subsequent regulated transaction which is subject to audit, until one of the following: June 30, 1985, unless this period is extended on a firm-by-firm basis; the end of the individual firm’s extension; or the firm is notified in writing by DOE that its records are no longer needed. However, if a firm in this group shall become a party in litigation, the firm shall then be subject to the recordkeeping requirements for firms in litigation set forth in paragraph (b)(1) of this section.

(ii) Those firms under audit which have outstanding subpoenas on February 5, 1985, or which receive subpoenas at any time thereafter or which have supplied records for an audit as the result of a subpoena enforced after November 1, 1983. Any such firm shall remain subject to paragraph (a) of this section until two years after ERA has notified the firm in writing that is in full compliance with the subpoena or until ERA has received from the firm a sworn certification of compliance with the subpoena as required by 10 CFR 205.8. However, if a firm in this group shall become a party in litigation, the firm shall then be subject to the recordkeeping requirements for firms in litigation set forth in paragraph (b)(1) of this section.

(4) Those firms which are subject to requests for data necessary to verify that crude oil qualifies as “newly discovered” crude oil under 10 CFR 212.79. Any such firm shall maintain the records evidencing such data until one of the following: June 30, 1985, unless this period is extended on a firm-by-firm basis; the end of an individual firm’s extension; or the firm is notified in writing by DOE that its records are no longer needed. However, if a firm in this group shall become a party in litigation, the firm shall then be subject to the recordkeeping requirements for firms in litigation set forth in paragraph (b)(1) of this section.

(5) Those firms whose records are determined by DOE as necessary to complete the enforcement activity relating to another firm which is also subject to paragraph (a) of this section unless such firms required to keep records have received certified notice letters specifically describing the records determined as necessary. At that time, the specific notice will control the recordkeeping requirements. These firms have been identified in appendix A. Any such firm shall maintain these records until one of the following: June 30, 1985, unless this period is extended on a firm-by-firm basis; the end of the individual firm’s extension; or the firm is notified in writing by DOE that its records are no longer needed.

(6) Those firms which participated in the Entitlements program. Any such firm shall maintain its Entitlements-related records until six months after the final judicial resolution (including any and all appeals) of Texaco v. DOE, Nos. 84–391, 84–410, and 84–456 (D. Del.), or the firm is notified by DOE that its records are no longer needed, whichever occurs first.

(c) For purposes of this section:

(1) A firm is “a party in litigation” if:

(i)(A) The firm has received a Notice of Probable Violation, a Notice of Probable Disallowance, a Proposed Remedial Order, or a Proposed Order of Disallowance; or

(B) The firm and DOE are parties in a lawsuit arising under the Emergency Petroleum Allocation Act of 1973, as amended (15 U.S.C. 751 et seq.) or 10 CFR parts 205, 210, 211, or 212; and
Department of Energy § 210.1

(ii)(A) There has been no final (that is, non-appealable) administrative or judicial resolution, or
(B) DOE has not informed the firm in writing that the Department has completed its review of the matter.

(2) A firm means any association, company, corporation, estate, individual, joint-venture, partnership, or sole proprietorship, or any other entity, however organized, including charitable, educational, or other eleemosynary institutions, and state and local governments. A firm includes a parent and the consolidated and unconsolidated entities (if any) which it directly or indirectly controls.

APPENDIX B TO 10 CFR 210.1—FIRMS WITH COMPLETED PAYMENTS SUBJECT TO DISTRIBUTION

The following firms have completed making restitutionary payments to DOE but their payments are still subject to distribution by DOE. Each such firm must maintain relevant records until June 30, 1985, unless this period is extended on a firm-by-firm basis. Relevant records are all records of the firm, including any affiliates, subsidiaries or predecessors in interest, for the time period covered by the judicial or administrative order, consent order, or other settlement or order requiring the payments, evidencing sales volume data for each product subject to controls and customers’ names and addresses.

Subpart D—Producers of Crude Oil

Sec.
212.78 Tertiary incentive crude oil.

Subparts E–I [Reserved]

Subpart D—Producers of Crude Oil

§ 212.78 Tertiary incentive crude oil.

Annual prepaid expenses report. By January 31 of each year after 1980, the project operator with respect to any enhanced oil recovery project for which a report had been filed previously with DOE pursuant to paragraph (h)(2)(i) of this section as that paragraph was in effect on January 27, 1981, shall file with DOE a report in which the operator shall certify to DOE (a) which of the expenses that had been reported previously to DOE pursuant to paragraph (h)(2)(i) of this section as that paragraph was in effect on January 27, 1981, were prepaid expenses; (b) the goods or services for which such expenses had been incurred and paid; (c) the dates on which such goods or services are intended to be used; (d) the dates on which such goods or services actually are used; (e) the identity of each qualified producer to which such prepaid expenses had been attributed; and (f) the percentage of such prepaid expenses attributed to each such qualified producer. An operator shall file an annual prepaid expenses report each year until it has reported the actual use of all the goods and services for which a prepaid expense had been incurred and paid. For purposes of this paragraph, a prepaid expense is an expense for any injectant or fuel used after September 30, 1981, or an expense for any other item to the extent that IRS would allocate the deductions (including depreciation) for that item to the period after September 30, 1981.

(Approved by the Office of Management and Budget under OMB Control No.: 1903–0069)

PART 215—COLLECTION OF FOREIGN OIL SUPPLY AGREEMENT INFORMATION

Sec.
215.1 Purpose.
215.2 Definitions.
215.3 Supply reports.
215.4 Production of contracts and documents.
215.5 Pricing and volume reports.
215.6 Notice of negotiations.

Source: 42 FR 48330, Sept. 23, 1977, unless otherwise noted.

§ 215.1 Purpose.

The purpose of this part is to set forth certain requirements pursuant to section 13 of the Federal Energy Administration Act to furnish information concerning foreign crude oil supply arrangements. The authority set out in this section is not exclusive.
§ 215.2 Definitions.

As used in this subpart:

Administrator means the Federal Energy Administrator or his delegate.

DOE means the Department of Energy.

Host government means the government of the country in which crude oil is produced and includes any entity which it controls, directly or indirectly.

Person means any natural person, corporation, partnership, association, consortium, or any other entity doing business or domiciled in the U.S. and includes (a) any entity controlled directly or indirectly by such a person and (b) the interest of such a person in any joint venture, consortium or other entity to the extent of entitlement to crude oil by reason of such interest.

§ 215.3 Supply reports.

(a) Any person having the right to lift for export by virtue of any equity interest, reimbursement for services, exchange or purchase, from any country, from fields actually in production, (1) an average of 150,000 barrels per day or more of crude oil for a period of at least one year, or (2) a total of 55,000,000 barrels of crude oil for a period of less than one year, or (3) a total of 150,000,000 barrels of crude oil for the period specified in the agreement, pursuant to supply arrangements with the host government, shall report the following information.

(1) Parties (including partners and percentage interest, where applicable).

(2) Grade or grades available; loading terminal or terminals.

(3) Government imposed production limits, if any.

(4) Minimum lifting obligation and maximum lifting rights.

(5) Details of lifting options within the above limits.

(6) Expiration and renegotiation dates.

(7) Price terms including terms of rebates, discounts, and number of days of credit calculated from the date of loading.

(8) Other payments to or interests retained by the host government (i.e. taxes, royalties, and any other payment to the host government) expressed in terms of the applicable rates or payment or preemption terms, or the base to which those rates or terms are applied.

(9) Related service or other fees and cost of providing services.

(10) Restrictions on shipping or disposition.

(11) Other material contract terms.

(b) Reports under this section shall be made no later than (1) 60 days after final issuance of reporting forms implementing this regulation, as announced in the Federal Register, (2) fourteen days after the date when supply arrangements are entered into, or (3) fourteen days after the initial lifting under an agreement in which the parties have tentatively concurred but not signed, whichever occurs first. Reporting shall be based on actual practice between the parties. Material changes in any item which must be reported pursuant to this section shall be reported no later than 30 days after a person receives actual notice of such changes.

(c) Where reports under this section by each participant in a joint operation would be impracticable, or would result in the submission of inaccurate or misleading information, the participants acting together may designate a single participant to report on any of the rights, obligations, or limitations affecting the operation as a whole. Any such designation shall be signed by a duly authorized representative of each participant, and shall specify:

(1) The precise rights, obligations, or limitations to be covered by the designation; and

(2) The reasons for the designation. Such designations shall be submitted to the Assistant Administrator for International Energy Affairs, and shall take effect only upon his written approval, which may at any time be revoked.

§ 215.4 Production of contracts and documents.

Whenever the Administrator determines that certain foreign crude oil supply information is necessary to assist in the formulation of energy policy or to carry out any other function of the Administrator, he may require the production by any person of any agreement or document relating to foreign
oil supply arrangements or reports related thereto. Such material shall be provided pursuant to the conditions prescribed by the Administrator at the time of such order or subsequently. As used in this section, the term “agreement” includes proposed or draft agreements, and agreements in which the parties have tentatively concurred but have not yet signed, between or among persons and a host country.

§ 215.5 Pricing and volume reports.
To the extent not reported pursuant to §215.3, any person lifting for export crude oil from a country shall report to the DOE within 30 days of the date on which he receives actual notice:
(a) Any change (including changes in the timing of collection) by the host government in official selling prices, royalties, host government taxes, service fees, quality or port differentials, or any other payments made directly or indirectly for crude oil; changes in participation ratios; changes in concessionary arrangements; and
(b) Any changes in restrictions on lifting, production, or disposition.

§ 215.6 Notice of negotiations.
Any person conducting negotiations with a host government which may reasonably lead to the establishment of any supply arrangement subject to reporting pursuant to §215.3(a), may reasonably have a significant effect on the terms and conditions of an arrangement subject to §215.3(a), shall notify DOE of such negotiations. Such notice shall be made no later than the later of 30 days after the effective date of this regulation or within 14 days after such negotiations meet the conditions of this section, and shall specify all persons involved and the host government affected. Notice must be in writing to the Assistant Administrator for International Energy Affairs. Where this notice pertains to negotiations to modify a supply agreement previously reported to the Department of Energy under this part, such notice shall include the agreement serial number assigned to the basic agreement.

PART 216—MATERIALS ALLOCATION AND PRIORITY PERFORMANCE UNDER CONTRACTS OR ORDERS TO MAXIMIZE DOMESTIC ENERGY SUPPLIES

Sec. 216.1 Introduction.
216.2 Definitions.
216.3 Requests for assistance.
216.4 Evaluation by DOE of applications.
216.5 Notification of findings.
216.6 Petition for reconsideration.
216.7 Conflict in priority orders.
216.8 Communications.
216.9 Violations.

SOURCE: 43 FR 6212, Feb. 14, 1978, unless otherwise noted.

§ 216.1 Introduction.
(a) This part describes and establishes the procedures to be used by the Department of Energy ("DOE") in considering and making certain findings required by section 101(c)(3) of the Defense Production Act of 1950, as amended, 50 U.S.C. App. 2071(c) (“DPA”). Section 101(c) authorizes the allocation of, or priority performance under contracts or orders (other than contracts of employment) relating to, supplies of materials and equipment in order to maximize domestic energy supplies if the findings described in section 101(c)(3) are made. Among these findings are that such supplies of materials and equipment are critical and essential to maintain or further exploration, production, refining, transportation or the conservation of energy supplies or for the construction and maintenance of energy facilities. The function of finding if such supplies are critical and essential was delegated to the Administrator of the Department of Energy (“DOE”) pursuant to Executive Order
§ 216.2 Definitions.

As used in these regulations:

(a) Secretary means the Secretary of the Department of Energy.

(b) Applicant means a person requesting priorities or allocation assistance in connection with an energy program or project.

(c) Application means the written request of an applicant for assistance.

(d) Assistance means use of the authority vested in the President by DPA section 101(c) to implement priorities and allocation support.

(e) DOC means the Department of Commerce, acting through the Secretary or the delegate of the Secretary.

(f) DOE means the Department of Energy, acting through the Secretary or the delegate of the Secretary.

(g) Eligible energy program or project means a designated activity which maximizes domestic energy supplies by furthering the domestic exploration, production, refining, transportation or conservation of energy supplies or the construction and maintenance of energy facilities within the meaning of DPA section 101(c), as determined by DOE.

(h) FEMA means the Federal Emergency Management Agency.

(i) Materials and equipment means any raw, in-process, or manufactured commodity, equipment, component, accessory, part, assembly or product of any kind.

(j) Person means an individual, corporation, partnership, association, or any other organized group of persons (or legal successor or representative thereof), and includes the United States or any other government and any political subdivisions (or any agency) thereof.

VerDate Aug<31>2005 08:31 Feb 08, 2008 Jkt 214032 PO 00000 Frm 00077 Fmt 8010 Sfmt 8010 Y:\SGML\214032.XXX 214032yshivers on PROD1PC62 with CFR
§ 216.3 Requests for assistance.

(a) Persons who believe that they perform work associated with a program or project which may qualify as an eligible energy program or project and wishing to receive assistance as authorized by DPA section 101(c)(1) may submit an application to DOE requesting DOE to determine whether a program or project maximizes domestic energy supplies and to find whether or not specific supplies of materials or equipment identified in the application are critical and essential for a purpose identified in section 101(c). The application should be sent to: Department of Energy, Procurement and Assistance Management Directorate, Attn: MA-422, Forrestal Building, 1000 Independence Avenue SW., Washington, DC 20585. The application shall contain the following information:

1. The name and address of the applicant and of its duly authorized representative.
2. A description of the energy program or project for which assistance is requested and an assessment of its impact on the maximization of domestic energy supplies.
3. The amount of energy to be produced by the program or project which is directly affected by the supplies of the materials or equipment in question.
4. A statement explaining why the materials or equipment for which assistance is requested are critical and essential to the construction or operation of the energy project or program.
5. A detailed description of the specific supplies of materials and equipment in connection with which assistance is requested, including: Components, performance data (capacity, life duration, etc.), standards, acceptable tolerances in dimensions and specifications, current inventory, present and expected rates of use, anticipated deliveries and substitution possibilities (feasibility of using other materials or equipment).
6. A detailed description of the sources of supply, including: Name of the regular supplying company or companies, other companies capable of supplying the materials and equipment, location of supplying plants or plants capable of supplying the needed materials and equipment, possible suppliers for identical or substitutable materials and equipment and possible foreign sources of supply.
7. A detailed description of the delivery situation, including: Normal delivery times, promised delivery time without priorities assistance, and delivery time required for expeditious fulfillment or completion of the program or project.
8. Evidence of the applicant’s unsuccessful efforts to obtain on a timely basis the materials and equipment in question through normal business channels from current or other known suppliers.
9. A detailed estimate of the delay in fulfilling or completing the energy program or project which will be caused by inability to obtain the specified materials and equipment in the usual course of business.
10. Any known conflicts with rated or authorized controlled material orders already issued pursuant to the DPA for supplies of the described materials and equipment.
11. Quarterly estimates of requirements for controlled materials, if applicable, by shapes and forms as prescribed by the DPAS regulation, §350.31(e)(2).

(b) DOE, on consultation with the DOC, may prescribe standard forms of application or letters of instruction for use by all persons seeking assistance.

c. In addition to the information described above, DOE may from time to time request whatever additional information it reasonably believes is relevant to the discharge of its functions pursuant to DPA section 101(c).

§ 216.4 Evaluation by DOE of applications.

(a) Based on the information provided by the applicant and other available information, DOE will assess the application and (1) determine whether or not the energy program or project in connection with which the application is made maximizes domestic energy supplies and should be designated an eligible energy program or project and (2) find whether the described supplies of materials and equipment are critical...
and essential to the eligible energy program or project.

(b) In determining whether the program or project referred to in the application should be designated an eligible energy program or project, DOE will consider all factors which it considers relevant including, but not limited to, the following:

(1) Quantity of energy involved;
(2) Benefits of timely energy program furtherance or project completion;
(3) Socioeconomic impact;
(4) The need for the end product for which the materials and equipment are allegedly required; and
(5) Established national energy policies.

(c) In findings whether the supplies of materials or equipment described in the application are critical and essential to an eligible energy program or project, DOE will consider all factors which it considers relevant including, but not limited to, the following:

(1) Availability and utility of substitute materials or equipment; and
(2) Impact of the nonavailability of the specific supplies of materials and equipment on the furtherance or timely completion of the approved energy program or project.

(d) Increased costs which may be associated with obtaining materials or equipment without assistance shall not be considered a valid reason for finding the materials and equipment to be critical and essential.

(e) After DOE has determined a program or project to be an eligible energy program or project, this determination shall be deemed made with regard to subsequent applications involving the same program or project unless and until DOE announces otherwise.

§ 216.6 Petition for reconsideration.

If DOE, after evaluating an application in accordance with §216.4, does not determine that the energy program or project maximizes domestic energy supplies or does not find that the supplies of materials and equipment described in the application are critical and essential to an eligible energy program or project, it will so notify the applicant and the applicant may petition DOE for reconsideration. If DOE concludes at any time that findings previously made are no longer valid and should be withdrawn, DOE will so notify the affected applicant(s), and such applicant(s) may petition DOE for reconsideration of the withdrawal decision. Such a petition is deemed accepted when received by DOE at the address stated in §216.8. DOE will consider the petition for reconsideration and either grant or deny the relief requested. Written notice of the decision and of the reasons for the decision will be provided to the applicant. There has not been an exhaustion of administrative remedies until a petition for reconsideration has been submitted and the review procedure completed by grant or denial of the relief requested.
§ 216.7
The denial of relief requested in a petition for reconsideration is a final administrative decision.

§ 216.7 Conflict in priority orders.
If it appears that the use of assistance pursuant to DPA section 101(c) creates or threatens to create a conflict with priorities and allocation support provided in connection with the national defense pursuant to DPA section 101(a), DOE will work with the DOC and other claimant agencies affected by such conflict in an attempt to reschedule deliveries or otherwise accommodate such competing demands. If acceptable solutions cannot be agreed upon by the claimant agencies the FEMA will resolve such conflicts.

§ 216.8 Communications.
All written communications concerning these regulations shall be addressed to:

§ 216.9 Violations.
Any person who willfully furnishes false information or conceals any material fact in the course of the application process or in a petition for reconsideration is guilty of a crime, and upon conviction may be punished by fine or imprisonment or both.

Subpart A—General Provisions

§ 218.1 Purpose and scope.
(a) This part implements section 251 of the Energy Policy and Conservation Act (Pub. L. 94–163) (42 U.S.C. 6271), as amended, which authorizes the President to take such action as he determines to be necessary for performance of the obligations of the United States under chapters III and IV of the Agreement on an International Energy Program (TIAS 8278), insofar as such obligations relate to the mandatory international allocation of oil by International Energy Program participating countries.
(b) Applicability. This part applies to any firm engaged in producing, transporting, refining, distributing or storing oil which is subject to the jurisdiction of the United States.

§ 218.2 Activation/Deactivation.
(a) This rule shall take effect providing:
(1) The International Energy Program has been activated; and,
(2) The President has transmitted this rule to Congress, has found putting such rule into effect is required in order to fulfill obligations of the United States under the International Energy Program and has transmitted such a finding to the Congress together
with a statement of the effective date and manner for exercise of such rule.

(b) This rule shall revert to standby status no later than 60 days after the deactivation of the emergency allocation system activated to implement the International Energy Program.

§ 218.10 Rule.

(a) Upon the determination by the President that an international energy supply emergency exists, firms engaged in producing, transporting, refining, distributing, or storing oil shall take such actions as are determined by the DOE to be necessary for implementation of the obligations of the United States under chapters III and IV of the IEP that relate to the mandatory international allocation of oil by IEP participating countries.

(b) Any actions required in accordance with paragraph (a) of this section shall be stated in supply orders issued by DOE.

(c) No firm to which a supply order is issued shall be required to comply with such order unless the firm to which the oil is to be provided in accordance with
§ 218.11 Supply orders.

(a) A supply order shall require that the firm to which it is issued take actions specified therein relating to supplying the stated volume of oil to a specified recipient including, but not limited to, distributing, producing, storing, transporting or refining oil. A supply order shall include a concise statement of the pertinent facts and of the legal basis on which it is issued, and shall describe the action to be taken.

(b) The DOE shall serve a copy of the supply order on the firm directed to act as stated therein.

(c) The DOE may modify or rescind a supply order on its own motion or pursuant to an application filed in accordance with § 218.32 of this part.

(d) A supply order shall be effective in accordance with its terms, and when served upon a firm directed to act thereunder, except that a supply order shall not remain in effect (1) upon reversion of this rule to standby status or (2) twelve months after the rule has been transmitted to Congress (whichever occurs first) or (3) to the extent that DOE or a court of competent jurisdiction directs that it be stayed, modified, or rescinded.

(e) Any firm issued a supply order pursuant to this subpart may seek modification or rescission of the supply order in accordance with procedures provided in § 218.32 of this part.

§ 218.12 Pricing.

The price for oil subject to a supply order issued pursuant to this subpart shall be based on the price conditions prevailing for comparable commercial transactions at the time the supply order is served.
subpart, the procedures set out in 10 CFR 205.9(f) shall apply.

(c) When to file. An application for review should be filed no later than 5 days after the receipt by the applicant of the supply order that is the subject of the application, or no later than 2 days after the occurrence of an event that results in a substantial change in the facts or circumstances affecting the applicant.

(d) Where to file. The application for review shall be filed with DOE Office of Hearings and Appeals (OHA), 2000 M Street, NW., Washington, DC 20461. Service shall be made on the ERA at the same time the document is filed with OHA and each document filed with the OHA shall include certification that the applicant has complied with the requirements of this paragraph.

(e) Notice. The applicant shall send by United States mail or deliver by hand a copy of the application and any subsequent amendments or other documents relating to the application to the Administrator of the Economic Regulatory Administration of DOE, 2000 M Street, NW., Washington, DC 20461. Service shall be made on the ERA at the same time the document is filed with OHA and each document filed with the OHA shall include certification that the applicant has complied with the requirements of this paragraph.

(f) Contents. (1) The application shall contain a full and complete statement of all relevant facts pertaining to the application and to the DOE action sought. Such facts shall include a complete statement of the business or other reasons that justify review of the supply order and a full description of the pertinent provisions and relevant facts contained in any relevant documents. Copies of all contracts, agreements, leases, instruments, and other documents relevant to the application shall be submitted with the application. A copy of the order of which review is sought shall be included with the application. When the application pertains to only one step of a larger integrated transaction, the facts, circumstances, and other relevant information pertaining to the entire transaction shall be submitted.

(2) The application shall include a discussion of all relevant authorities, including, but not limited to, DOE and DOE rulings, regulations, interpretations and decisions on appeal and exceptions relied upon to support the action sought therein.

(g) DOE evaluation—(1) Processing. (i) The DOE may initiate an investigation of any statement in an application and utilize in its evaluation any relevant facts obtained by such investigation. The DOE may solicit and accept submissions from third parties relevant to any application for review provided that the applicant is afforded an opportunity to respond to all third party submissions. In evaluating an application for review, the DOE may convene a conference, on its own initiative, if, in its discretion, it considers that a conference will advance its evaluation of the application.

(ii) If the DOE determines that there is insufficient information upon which to base a decision and if upon request the necessary additional information is not submitted, the DOE may dismiss the application without prejudice. If the failure to supply additional information is repeated or willful, the DOE may dismiss the application with prejudice. If the applicant fails to provide the notice required by paragraph (e) of this section, the DOE may dismiss the application without prejudice.

(iii) An order dismissing an application for any of the reasons specified in paragraph (g)(1)(ii) of this section shall contain a statement of the grounds for the dismissal. The order shall become final within 5 days of its service upon the applicant, unless within such 5-day period the applicant files an amendment correcting the deficiencies identified in the order. Within 5 days of the filing of such amendment, the DOE shall notify the applicant whether the amendment corrects the specified deficiencies. If the amendment does not correct the deficiencies specified in the order, the order shall become a final order of the DOE of which the applicant may seek judicial review.

(2) An application for review of an order shall be processed only if the applicant demonstrates that—

(i) There is probable cause to believe that the supply order is erroneous, inequitable, or unduly burdensome; or

(ii) There has been discovered a law, regulation, interpretation, ruling, order or decision that was in effect at the time of the application which, if it had been made known to the DOE, would have been relevant to the supply order.
§ 218.33 Stay.

(a) The DOE may issue an order granting a stay if the DOE determines that an applicant has made a compelling showing that it would incur serious and irreparable injury unless immediate stay relief is granted pending determination of an application for review pursuant to this subpart. An application for a stay shall be labeled as such on the application and on the outside of the envelope in which the application is transmitted, and shall be in writing and signed by the firm filing the application. It shall include a description of the proceeding incident to which the stay is being sought and of the facts and circumstances which support the applicant’s claim that it will incur irreparable injury unless immediate stay relief is granted. The application shall comply with the general filing requirements stated in 10 CFR 205.9 in addition to the requirements stated in this section. The DOE on its own initiative may also issue an order granting a stay upon a finding that a firm will incur irreparable injury if such an order is not granted.

(b) An order granting a stay shall expire by its terms within such time after issuance, not to exceed 30 days as the DOE specifies in the order, except that it shall expire automatically 5 days following its issuance if the applicant fails within that period to file an application for review unless within that period the DOE for good cause shown, extends the time during which the applicant may file an application for review.

(c) The order granting or denying a stay is not an order of the DOE subject to administrative review.

§ 218.34 Addresses.

All correspondence, petitions, and any information required by this part shall be submitted to: Administrator, Economic Regulatory Administration, Department of Energy, 2000 M Street, NW., Washington, DC 20461, and to the Director, Office of Hearings and Appeals, Department of Energy, 2000 M Street, NW., Washington, DC 20461.

Subpart E—Investigations, Violations, Sanctions and Judicial Actions

§ 218.40 Investigations.

(a) The DOE may initiate and conduct investigations relating to the scope, nature and extent of compliance by any person with the rules, regulations or statutes of the DOE or any order promulgated by the DOE under the authority of section 251 of EPCA, or any court decree.

(b) Any duly designated and authorized representative of DOE has the authority to conduct an investigation and to take such action as he deems necessary and appropriate to the conduct of the investigation including any action pursuant to §205.8.

(c) There are no parties, as that term is used in adjudicative proceedings, in an investigation under this subpart, and no person may intervene or participate as a matter of right in any investigation under this subpart.
(d) Any person may request the DOE to initiate an investigation pursuant to paragraph (a) of this section. A request for an investigation shall set forth the subject matter to be investigated as fully as possible and include supporting documentation and information. No particular forms or procedures are required.

(e) Any person who is requested to furnish documentary evidence or testimony in an investigation, upon written request, shall be informed of the general purpose of the investigation.

(f) DOE shall not disclose information or documents that are obtained during any investigation unless (1) DOE directs or authorizes the public disclosure of the investigation; (2) the information or documents are a matter of public record; or (3) disclosure is not precluded by the Freedom of Information Act, 5 U.S.C. 552 and 10 CFR part 1004.

(g) During the course of an investigation any person may submit at any time any document, statement of facts or memorandum of law for the purpose of explaining the person’s position or furnish evidence which the person considers relevant to a matter under investigation.

(h) If facts disclosed by an investigation indicate that further action is unnecessary or unwarranted, the investigative file may be closed without prejudice to further investigation by the DOE at any time that circumstances so warrant.

§ 218.41 Violations.

Any practice that circumvents, contravenes or results in the circumvention or contravention of the requirements of any provision of this part 218 or any order issued pursuant thereto is a violation of the DOE regulations stated in this part and is unlawful.

§ 218.42 Sanctions.

(a) General. Any person who violates any provisions of this part 218 or any order issued pursuant thereto shall be subject to penalties and sanctions as provided herein.

(1) The provisions herein for penalties and sanctions shall be deemed cumulative and not mutually exclusive.

(2) Each day that a violation of the provisions of this part 218 or any order issued pursuant thereto continues shall be deemed to constitute a separate violation within the meaning of the provisions of this part relating to fines and civil penalties.

(b) Penalties. (1) Any person who violates any provision of part 218 of this chapter or any order issued pursuant thereto shall be subject to a civil penalty of not more than $5,500 for each violation.

(2) Any person who willfully violates any provision of this part 218 or any order issued pursuant thereto shall be subject to a fine of not more than $10,000 for each violation.

(3) Any person who knowingly and willfully violates any provision of this part 218 or any order issued pursuant thereto with respect to the sale, offer of sale, or distribution in commerce of oil in commerce after having been subject to a sanction under paragraph (b)(1) or (2) of this section for a prior violation of the provisions of this part 218 or any order issued pursuant thereto with respect to the sale, offer of sale, or distribution in commerce of oil shall be subject to a fine of not more than $50,000 or imprisonment for not more than six months, or both, for each violation.

(4) Actions for penalties under this section are prosecuted by the Department of Justice upon referral by the DOE.

(5) When the DOE considers it to be appropriate or advisable, the DOE may compromise and settle any action under this paragraph, and collect civil penalties.

(c) Other Penalties. Willful concealment of material facts, or making of false, fictitious or fraudulent statements or representations, or submission of a document containing false, fictitious or fraudulent statements pertaining to matters within the scope of this part 218 by any person shall subject such persons to the criminal penalties provided in 18 U.S.C. 1001 (1970).

§ 218.43 Injunctions.

Whenever it appears to the DOE that any firm has engaged, is engaging, or is
about to engage in any act or practice
constituting a violation of any regula-
tion or order issued under this part 218,
the DOE may request the Attorney
General to bring a civil action in the
appropriate district court of the United
States to enjoin such acts or practices
and, upon a proper showing, a tem-
porary restraining order or a prelimi-
nary or permanent injunction shall be
granted without bond. The relief
sought may include a mandatory in-
junction commanding any firm to com-
ply with any provision of such order or
regulation, the violation of which is
prohibited by section 524 of the E.P.C.A.

PART 220 [RESERVED]

PART 221—PRIORITY SUPPLY OF
CRUDE OIL AND PETROLEUM
PRODUCTS TO THE DEPARTMENT
OF DEFENSE UNDER THE DEFENSE
PRODUCTION ACT

Subpart A—General

§ 221.1 Scope.

This part sets forth the procedures to
be utilized by the Economic Regu-
latory Administration of the Depart-
ment of Energy and the Department of
Defense whenever the priority supply
of crude oil and petroleum products is
necessary or appropriate to meet na-
tional defense needs. The procedures
available in this part are intended to
supplement but not to supplant other
regulations of the ERA regarding the
allocation of crude oil, residual fuel oil
and refined petroleum products.

§ 221.2 Applicability.

This part applies to the mandatory
supply of crude oil, refined petroleum
products (including liquefied petroleum
gases) and lubricants to the Depart-
ment of Defense for its own use or for
purchases made by the Department of
Defense on behalf of other Federal Gov-
ernment agencies.

Subpart B—Exclusions

§ 221.11 Natural gas and ethane.

The supply of natural gas and ethane
are excluded from this part.

Subpart C—Definitions

§ 221.21 Definitions.

For purposes of this part—

Directive means an official action
taken by ERA which requires a named
person to take an action in accordance
with its provisions.

DOD means the Department of De-
fense, including Military Departments
and Defense Agencies, acting through
either the Secretary of Defense or the
designee of the Secretary.

ERA means the Economic Regulatory
Administration of the Department of
Energy.

National defense means programs for
military and atomic energy production
or construction, military assistance to
any foreign nation, stockpiling and
space, or activities directly related to
any of the above.

Person means any individual, cor-
poration, partnership, association or
any other organized group of persons,
Department of Energy

and includes any agency of the United States Government or any other government.

Priority-rated supply order means any delivery order for crude oil or petroleum products issued by DOD bearing a priority rating issued by ERA under this part.

Supplier means any person other than the DOD which supplies, sells, transfers, or otherwise furnishes (as by consignment) crude oil or petroleum product to any other person.

Subpart D—Administrative Procedures and Sanctions

§ 221.31 Requests by DOD.

(a) When DOD finds that (1) a fuel supply shortage for DOD exists or is anticipated which would have a substantial negative impact on the national defense, and (2) the defense activity for which fuel is required cannot be postponed until after the fuel supply shortage is likely to terminate, DOD may submit a written request to ERA for the issuance to it of a priority rating for the supply of crude oil and petroleum products.

(b) Not later than the transmittal date of its request to ERA, DOD shall notify the Federal Emergency Management Agency that it has requested a priority rating for the supply of crude oil and petroleum products.

(c) Requests from DOD shall set forth the following:

1. The quantity and quality of crude oil or petroleum products determined by DOD to be required to meet national defense requirements;
2. The required delivery dates;
3. The defense-related activity and the supply location for which the crude oil or petroleum product is to be delivered;
4. The current or most recent suppliers of the crude oil or petroleum product and the reasons, if known, why the suppliers will not supply the requested crude oil or petroleum product;
5. The degree to which it is feasible for DOD to use an alternate product in lieu of that requested and, if such an alternate product can be used, the efforts which have been made to obtain the alternate product;
6. The period during which the shortage of crude oil or petroleum products is expected to exist;
7. The proposed supply source for the additional crude oil or petroleum products required, which shall, if practicable, be the historical supplier of such crude oil or product to DOD; and
8. Certification that DOD has made each of the findings required by paragraph (a) of this section.

§ 221.32 Evaluation of DOD request.

(a) Upon receipt of a request from DOD for a priority rating as provided in § 221.31, it shall be reviewed promptly by ERA. The ERA will assess the request in terms of:

1. The information provided under § 221.31;
2. Whether DOD’s national defense needs for crude oil or petroleum products can reasonably be satisfied without exercising the authority specified in this part;
3. The capability of the proposed supplier to supply the crude oil or petroleum product in the amounts required;
4. The known capabilities of alternative suppliers;
5. The feasibility to DOD of converting to and using a product other than that requested; and
6. Any other relevant information.

(b) The ERA promptly shall notify the proposed supplier of DOD’s request for a priority rating specified under this part. The proposed supplier shall have a period specified in the notice, not to exceed fifteen (15) days from the date it is notified of DOD’s request, to show cause in writing why it cannot supply the requested quantity and quality of crude oil or petroleum products. ERA shall consider this information in determining whether to issue the priority rating.

(c) If acceptance by a supplier of a rated order would create a conflict with another rated order of the supplier, it shall include all pertinent information regarding such conflict in its response to the show cause order provided for in subsection (b), and ERA, in consultation with DOD and the Federal Emergency Management Agency shall determine the priorities for meeting all such requirements.
(d) ERA may waive some or all of the requirements of §221.31 or this section where the Secretary of Defense or his designee certifies, and has so notified the Federal Emergency Management Agency, that a fuel shortage for DOD exists or is imminent and that compliance with such requirements would have a substantial negative impact on the national defense.

§ 221.33 Order.

(a) Issuance. If ERA determines that issuance of a priority rating for a crude oil or refined petroleum product is necessary to provide the crude oil or petroleum products needed to meet the national defense requirement established by DOD, it shall issue such a rating to DOD for delivery of specified qualities and quantities of the crude oil or refined petroleum products on or during specified delivery dates or periods. In accordance with the terms of the order, DOD may then place such priority rating on a supply order.

(b) Compliance. Each person who receives a priority-rated supply order pursuant to this part shall supply the specified crude oil or petroleum products to DOD in accordance with the terms of that order.

(c) ERA directives. Notwithstanding any other provisions of this part, where necessary or appropriate to promote the national defense ERA is authorized to issue a directive to a supplier of crude oil or petroleum product requiring delivery of specified qualities and quantities of such crude oil or petroleum products to DOD at or during specified delivery dates or periods.

(d) Use of ratings by suppliers. No supplier who receives a priority-rated supply order or directive issued under the authority of this section may use such priority-rated supply order or directive thereafter be declared by judicial or other competent authority to be invalid.

§ 221.35 Contractual requirements.

(a) No supplier may discriminate against an order or contract on which a priority rating has been placed under this part by charging higher prices, by imposing terms and conditions for such orders or contracts different from other generally comparable orders or contracts, or by any other means.

(b) Contracts with priority ratings shall be subject to all applicable laws and regulations which govern the making of such contracts, including those specified in 10 CFR 211.26(e).

§ 221.36 Records and reports.

(a) Each person receiving an order or directive under this part shall keep for at least two years from the date of full compliance with such order or directive accurate and complete records of deliveries made in accordance with such order or directive.

(b) All records required to be maintained shall be made available upon request for inspection and audit by duly authorized representatives of the ERA.

(Approved by the Office of Management and Budget under control number 1903–0073)

§ 221.37 Violations and sanctions.

(a) Any practice that circumvents or contravenes the requirements of this part or any order or directive issued under this part is a violation of the regulations provided in this part.

(b) Criminal penalties. Any person who willfully performs any act prohibited, or willfully fails to perform any act required by this part or any order or directive issued under this part shall be subject to a fine of not more than $10,000 for each violation or imprisoned for not more than one year for each violation, or both.

(c) Whenever in the judgment of the Administrator of ERA any person has engaged or is about to engage in any acts or practices which constitute or
will constitute a violation of any provision of these regulations, the Administrator may make application to the appropriate court for an order enjoining such acts or practices, or for an order enforcing compliance with such provision.
PART 300—VOLUNTARY GREENHOUSE GAS REPORTING PROGRAM: GENERAL GUIDELINES

Sec. 300.1 General.
300.2 Definitions.
300.3 Guidance for defining and naming the reporting entity.
300.4 Selecting organizational boundaries.
300.5 Submission of an entity statement.
300.6 Emissions inventories.
300.7 Net emission reductions.
300.8 Calculating emission reductions.
300.9 Reporting and recordkeeping requirements.
300.10 Certification of reports.
300.11 Independent verification.
300.12 Acceptance of reports and registration of entity emission reductions.
300.13 Incorporation by reference.

SOURCE: 71 FR 20805, Apr. 21, 2006, unless otherwise noted.

§ 300.1 General.
(a) Purpose. The General Guidelines in this part and the Technical Guidelines incorporated by reference in § 300.13 govern the Voluntary Reporting of Greenhouse Gases Program authorized by section 1605(b) of the Energy Policy Act of 1992 (42 U.S.C. 13385(b)). The purpose of the guidelines is to establish the procedures and requirements for filing voluntary reports, and to encourage corporations, government agencies, non-profit organizations, households and other private and public entities to submit annual reports of their greenhouse gas emissions, emission reductions, and sequestration activities that are complete, reliable and consistent. Over time, it is anticipated that these reports will provide a reliable record of the contributions reporting entities have made toward reducing their greenhouse gas emissions.
(b) Reporting under the program. (1) Each reporting entity, whether or not it intends to register emissions as described in paragraph (c) of this section, must:
   (i) File an entity statement that meets the appropriate requirements in § 300.5(d) through (f) of this part;
   (ii) Use appropriate emission inventory and emission reduction calculation methods specified in the Technical Guidelines (incorporated by reference, see § 300.13), and calculate and report the weighted average quality rating of any emission inventories it reports;
   (iii) Comply with the record keeping requirements in § 300.9 of this part; and
   (iv) Comply with the certification requirements in § 300.10 of this part;
(2) Each reporting entity, whether or not it intends to register emissions as described in paragraph (c) of this section, may report offset reductions achieved by other entities outside their boundaries as long as such reductions are reported separately and calculated in accordance with methods specified in the Technical Guidelines. The third-party entity that achieved these reductions must agree to their being reported as offset reductions, and must also meet all of the requirements of reporting that would apply if the third-party entity reported directly under the 1605(b) program.
(c) Registration requirements. Entities that seek to register reductions must meet the additional requirements referenced in paragraph (c) of this section.
(1) An entity that does not intend to register emissions and emission reductions may choose to report its emissions and/or emission reductions on an entity-wide basis or for selected elements of the entity, selected gases or selected sources.
(2) An entity that does not intend to register emissions may report emission inventories for any year back to 1990 and may report emission reductions for any year back to 1991, relative to a base period of one to four years, ending no earlier than 1990.
(3) An entity that intends to register emissions and emission reductions must meet the additional requirements referenced in paragraph (c) of this section.
(4) An entity that does not intend to register emissions and emission reductions may choose to report its emissions and/or emission reductions on an entity-wide basis or for selected elements of the entity, selected gases or selected sources.
(5) An entity that does not intend to register emissions may report emission inventories for any year back to 1990 and may report emission reductions for any year back to 1991, relative to a base period of one to four years, ending no earlier than 1990.
(6) Registration requirements. Entities that seek to register reductions must meet the additional requirements in this paragraph; although these requirements differ depending on whether the entity is a large or small emitter.
(1) To be eligible for registration, a reduction must have been achieved after 2002, unless the entity has committed under the Climate Leaders or
Climate Vision programs to reduce its entity-wide emissions relative to a base period that ends earlier 2002, but no earlier than 2000.

(2) A large emitter must submit an entity-wide emission inventory that meets or exceeds the minimum quality requirements specified in §300.6(b) and the Technical Guidelines (incorporated by reference, see §300.13). Registered reductions of a large emitter must be based on an entity-wide assessment of net emission reductions, determined in accordance with §300.8 and the Technical Guidelines.

(3) A small emitter must also submit an emission inventory that meets minimum quality requirements specified in §300.6(b) and the Technical Guidelines (incorporated by reference, see §300.13) and base its registered reductions on an assessment of annual changes in net emissions. A small emitter, however, may restrict its inventory and assessment to a single type of activity, such as forest management, building operations or agricultural tillage.

(4) Reporting entities may, under certain conditions, register reductions achieved by other entities:
   (i) Reporting entities that have met the requirements for registering their own reductions may also register offset reductions achieved by other entities if:
       (A) They have an agreement with the third-party entities to do so and these third-party entities have met all of the requirements for registration; or
       (B) They were the result of qualified demand management or other programs and are calculated in accordance with the action-specific method identified in §300.8(h)(5).
   (ii) Small emitters that serve as an aggregator may register offset reductions achieved by non-reporting entities without reporting on their own emissions, as long as they have an agreement with the third-party entities to do so and these third-party entities have met all of the requirements for registration.

(d) Forms. Annual reports of greenhouse gas emissions, emission reductions, and sequestration must be made on forms or software made available by the Energy Information Administration of the Department of Energy (EIA).

(e) Status of reports under previous guidelines. EIA continues to maintain in its Voluntary Reporting of Greenhouse Gases database all reports received pursuant to DOE’s October 1994 guidelines. Those guidelines are available from EIA at http://www.eia.doe.gov/oiaf/1605/guidelns.html.

(f) Periodic review and updating of General and Technical Guidelines. DOE intends periodically to review the General Guidelines and the Technical Guidelines (incorporated by reference, see §300.13) to determine whether any changes are warranted; DOE anticipates these reviews will occur approximately once every three years. These reviews will consider any new developments in climate science or policy, the participation rates of large and small emitters in the 1605(b) program, the general quality of the data submitted by different participants, and any changes to other emissions reporting protocols. Possible changes may include, but are not limited to:
   (1) The addition of greenhouse gases that have been demonstrated to have significant, quantifiable climate forcing effects when released to the atmosphere in significant quantities;
   (2) Changes to the minimum, quantity-weighted quality rating for emission inventories;
   (3) Updates to emission inventory methods, emission factors and other provisions that are contained in industry protocols or standards. The review may also consider updates to any government-developed and consensus-based emission factors for which automatic updating is not provided in the Technical Guidelines;
   (4) Modifications to the benchmarks or emission conversion factors used to calculate avoided and indirect emissions; and
   (5) Changes in the minimum requirements for registered emission reductions.

§ 300.2 Definitions.

This section provides definitions for commonly used terms in this part.

Activity of a small emitter means, with respect to a small emitter, any single category of anthropogenic production,
§ 300.2 10 CFR Ch. II (1–1–08 Edition)

consumption or other action that releases emissions or results in sequestration, the annual changes of which can be assessed generally by using a single calculation method.

Aggregator means an entity that reports to the 1605(b) program on behalf of non-reporting entities. An aggregator may be a large or small emitter, such as a trade association, non-profit organization or public agency.

Anthropogenic means greenhouse gas emissions and removals that are a direct result of human activities or are the result of natural processes that have been affected by human activities.

Avoided emissions means the greenhouse gas emission reductions that occur outside the organizational boundary of the reporting entity as a direct consequence of changes in the entity’s activity, including but not necessarily limited to the emission reductions associated with increases in the generation and sale of electricity, steam, hot water or chilled water produced from energy sources that emit fewer greenhouse gases per unit than other competing sources of these forms of distributed energy.

Base period means a period of 1–4 years used to derive the average annual base emissions, emissions intensity or other values from which emission reductions are calculated.

Base value means the value from which emission reductions are calculated for an entity or subentity. The value may be annual emissions, emissions intensity, kilowatt-hours generated, or other value specified in the 1605(b) guidelines. It is usually derived from actual emissions and/or activity data derived from the base period.

Biogenic emissions mean emissions that are naturally occurring and are not significantly affected by human actions or activity.

Boundary means the actual or virtual line that encompasses all the emissions and carbon stocks that are to be quantified and reported in an entity’s greenhouse gas inventory, including de minimis emissions. Entities may use financial control or another classification method based on ownership or control as the means of determining which sources or carbon stocks fall within this organizational boundary.

Carbon dioxide equivalent means the amount of carbon dioxide by weight emitted into the atmosphere that would produce the same estimated radiative forcing as a given weight of another radiatively active gas. Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured by its estimated global warming potential.

Carbon stocks mean the quantity of carbon stored in biological and physical systems including: trees, products of harvested trees, agricultural crops, plants, wood and paper products and other terrestrial biosphere sinks, soils, oceans, and sedimentary and geological sinks.

Climate Leaders means the EPA sponsored industry-government partnership that works with individual companies to develop long-term comprehensive climate change strategies. Certain Climate Leaders Partners have, working with EPA, set a corporate-wide greenhouse gas reduction goal and have inventoried their emissions to measure progress towards their goal.

Climate VISION means the public-private partnership initiated pursuant to a Presidential directive issued in 2002 that aims to contribute to the President’s goal of reducing greenhouse gas intensity through voluntary frameworks with industry. Climate VISION partners have signed an agreement with DOE to implement various climate-related actions to reduce greenhouse gas emissions.

De minimis emissions means emissions from one or more sources and of one or more greenhouse gases that, in aggregate, are less than or equal to 3 percent of the total annual carbon dioxide (CO2) equivalent emissions of a reporting entity.

Department or DOE means the U.S. Department of Energy.

Direct emissions are emissions from sources within the organizational boundaries of an entity.

Distributed energy means electrical or thermal energy generated by an entity that is sold or otherwise exported outside of the entity’s boundaries for use by another entity.
Department of Energy

§ 300.2

EIA means the Energy Information Administration within the U.S. Department of Energy.

Emissions means the direct release of greenhouse gases to the atmosphere from any anthropogenic (human induced) source and certain indirect emissions (releases) specified in this part.

Emissions intensity means emissions per unit of output, where output is defined as the quantity of physical output, or a non-physical indicator of an entity’s or subentity’s productive activity.

Entity means the whole or part of any business, institution, organization, government agency or corporation, or household that:

(1) Is recognized under any U.S. Federal, State or local law that applies to it;

(2) Is located and operates, at least in part, in the United States; and

(3) The emissions of such operations are released, at least in part, in the United States.

First reduction year means the first year for which an entity intends to register emission reductions; it is the year that immediately follows the start year.

Fugitive emissions means uncontrolled releases to the atmosphere of greenhouse gases from the processing, transmission, and/or transportation of fossil fuels or other materials, such as HFC leaks from refrigeration, SF6 from electrical power distributors, and methane from solid waste landfills, among others, that are not emitted via an exhaust pipe(s) or stack(s).

Greenhouse gases means the gases that may be reported to the Department of Energy under this program. They are:

(1) Carbon dioxide (CO2)
(2) Methane (CH4)
(3) Nitrous oxide (N2O)
(4) Hydrofluorocarbons
   [trifluoromethane-(CHF3)HFC-32]
   [trifluoromethane-CHF3]
   CHF3, CHF2, CH3F, CH2F2, CH3F, CH2F2
(5) Perfluorocarbons
   (perfluoromethane-CF3) HFC-134a
   (perfluoroethane-C3F8, C2F6, C2F10, C3F8, C3F12, C3F14)
(6) Sulfur hexafluoride (SF6)
(7) Chlorofluorocarbons
   [trichlorofluoromethane-CCl3F], CCl3F, CCl2FCClF3, CCl2F2CClF2, CCl2F2CClF2
(8) Other gases or particles that have been demonstrated to have significant, quantifiable climate forcing effects when released to the atmosphere in significant quantities and for which DOE has established or approved methods for estimating emissions and reductions. (NOTE: As provided in §300.6(i), chlorofluorocarbons and other gases with quantifiable climate forcing effects may be reported to the 1605(b) program if DOE has established an appropriate emission inventory or emission reduction calculation method, but reductions of these gases may not be registered.)

Incidental lands are entity landholdings that are a minor component of an entity’s operations and are not actively managed for production of goods and services, including:

(1) Transmission, pipeline, or transportation right of ways that are not managed for timber production;
(2) Land surrounding commercial enterprises or facilities; and
(3) Land where carbon stock changes are determined by natural factors.

Indirect emissions means greenhouse gas emissions from stationary or mobile sources outside the organizational boundary that occur as a direct consequence of an entity’s activity, including but not necessarily limited to the emissions associated with the generation of electricity, steam and hot/chilled water used by the entity.

Large emitter means an entity whose annual emissions are more than 10,000 metric tons of CO2 equivalent, as determined in accordance with §300.5(c).

Net emission reductions means the sum of all annual changes in emissions, eligible avoided emissions and sequestration of the greenhouse gases specifically identified in §300.6(i), and determined to be in conformance with §§300.7 and 300.8 of this part.

Offset means an emission reduction that is included in a 1605(b) report and
§ 300.3 Guidance for defining and naming the reporting entity.

(a) A reporting entity must be composed of one or more businesses, public or private institutions or organizations, households, or other entities having operations that annually release emissions, at least in part, in the United States. Entities may be defined by, as appropriate, a certificate of incorporation, corporate charter, corporate filings, tax identification number, or other legal basis of identification recognized under any Federal, State or local law or regulation. If a reporting entity is composed of more than one entity, all of the entities included must be responsible to the same management hierarchy and all entities that have the same management hierarchy must be included in the reporting entity.

(b) All reporting entities are strongly encouraged to define themselves at the highest level of aggregation. To achieve this objective, DOE suggests the use of a corporate-level definition of the entity, based on filings with the Securities and Exchange Commission or institutional charters. While reporting at the highest level of aggregation is encouraged, DOE recognizes that certain businesses and institutions may conclude that reporting at some lower level is desirable. Federal agencies are encouraged to report at the agency or departmental level, but distinct organizational units (such as a Department of the Interior Fish and Wildlife Service National Wildlife Refuge) may report directly if authorized by their department or agency. Once an entity has determined the level of corporate or institutional management at which it will report (e.g., the holding...
company, subsidiary, regulated sta-
tionary source, state government,
agency, refuge, etc.), the entity must
include all elements of the organiza-
tion encompassed by that management
level and exclude any organizations
that are managed separately. For ex-
ample, if two subsidiaries of a parent
company are to be covered by a single
report, then all subsidiaries of that
parent company must also be included.
Similarly, if a company decides to re-
port on the U.S. and Canadian subsidi-
aries of its North American operations
unit, it must also report on any other
subsidiaries of its North American
unit, such as a Mexican subsidiary.
(c) A name for the defined entity
must be specified by all reporters. For
entities that intend to register reduc-
tions, this should be the name com-
monly used to represent the activities
being reported, as long as it is not also
used to refer to substantial activities
not covered by the entity's reports.
While DOE believes entities should be
given considerable flexibility in defin-
ing themselves at an appropriate level
of aggregation, it is essential that the
name assigned to an entity that in-
tends to register reductions cor-
responds closely to the scope of the op-
erations and emissions covered by its
report. If, for example, an individual
plant or operating unit is reporting as
an entity, it should be given a name
that corresponds to the specific plant
or unit, and not to the responsible sub-
sidiary or corporate entity. In order to
distinguish a parent company from its
subsidiaries, the name of the parent
company generally should not be incor-
porated into the name of the reporting
subsidiary, but if it is, the name of the
parent company usually should be sec-
ondary.
§ 300.4 Selecting organizational bound-
aries.
(a) Each reporting entity must dis-
close in its entity statement the app-
roach used to establish its organiza-
tional boundaries, which should be con-
sistent with the following guidelines:
(1) In general, entities should use fi-
nancial control as the primary basis
for determining their organizational
boundaries, with financial control
meaning the ability to direct the finan-
cial and operating policies of all ele-
ments of the entity with a view to
gaining economic or other benefits
from its activities over a period of
many years. This approach should en-
sure that all sources, including those
controlled by subsidiaries, that are
wholly or largely owned by the entity
are covered by its reports. Sources that
are under long-term lease of the entity
may, depending on the provisions of
such leases, also be considered to be
under the entity's financial control.
Sources that are temporarily leased or
operated by an entity generally would
not be considered to be under its finan-
cial control.
(2) Entities may establish organiza-
tional boundaries using approaches
other than financial control, such as
equity share or operational control,
but must disclose how the use of these
other approaches results in organiza-
tional boundaries that differ from
those resulting from using the finan-
cial control approach.
(3) Emissions from facilities or vehi-
cles that are partially-owned or leased
may be included at the entity’s discre-
tion, provided that the entity has
taken reasonable steps to assure that
doing so does not result in the double
counting of emissions, sequestration or
emission reductions. Emissions reduc-
tions or sequestration associated with
land, facilities or other sources not
owned or leased by an entity may not
be included in the entity’s reports
under the program unless the entity
has long-term control over the emis-
sions or sequestration of the source
and the owner of the source has agreed
that the emissions or sequestration
may be included in the entity's report.
(4) If the scope of a defined entity ex-
tends beyond the United States, the re-
porting entity should use the same ap-
proach to determining its organiza-
tional boundaries in the U.S. and out-
side the U.S.
(b) Each reporting entity must keep
separate reports on emissions or emis-
sion reductions that occur within its
defined boundaries and those that
occur outside its defined boundaries.
Entities must also keep separate re-
ports on emissions and emission reduc-
tions that occur outside the United
States.
86

§ 300.5 Submission of an entity statement.

(a) Determining the type of reporting entity. The entity statement requirements vary by type of reporting entity. For the purposes of these guidelines, there are three types of entities:

1. Large emitters that intend to register emission reductions;
2. Small emitters that intend to register emission reductions; and
3. Emitters that intend to report, but not register emission reductions.

(b) Choosing a start year. The first entity statement describes the make-up, operations and boundaries of the entity, as they existed in the start year.

(i) For all entities, it is the year immediately preceding the first year for which the entity intends to register emission reductions and the last year of the initial base period(s).

(ii) For entities intending to register emission reductions, the start year may be no earlier than 2002, unless the entity has made a commitment to reduce its entity-wide emissions under the Climate Leaders or Climate VISION program. An entity that has made such a commitment may establish a start year derived from the base period of the commitment, as long as it is no earlier than 2000.

(iii) The entity's emissions in its start year or its average annual emissions over a period of up to four years ending in the start year determine whether it qualifies to begin reporting as a small emitter.

(c) Determining and maintaining large or small emitter reporting status. The entity that has demonstrated that its annual emissions are less than or equal to 10,000 metric tons of CO₂ equivalent may participate as a small emitter. To demonstrate that its annual emissions are less than or equal to 10,000 metric tons of CO₂ equivalent, an entity must submit either an estimate of its emissions during its chosen start year or an estimate of its average annual emissions over a continuous period not to exceed four years of time ending in its chosen start year, as long as the operations and boundaries of the entity have not changed significantly during that period.

(ii) For a large emitter, the start year is the first year for which the entity submits a complete emissions inventory under the 1605(b) program.

(iii) The entity's emissions in its start year or its average annual emissions over a period of up to four years ending in the start year determine whether it qualifies to begin reporting as a small emitter.

(d) Entity statements for large emitters intending to register reductions. When a large emitter intending to register emission reductions first reports under these guidelines, it must provide the
following information in its entity statement:

1. The name to be used to identify the participating entity;
2. The legal basis of the named entity;
3. The criteria used to determine:
   i. The organizational boundaries of the entity, if other than financial control; and
   ii. The sources of emissions included or excluded from the entity’s reports, such as sources excluded as de minimis emissions;
4. The names of any parent or holding companies the activities of which will not be covered comprehensively by the entity’s reports;
5. The names of any large subsidiaries or organizational units covered comprehensively by the entity’s reports. All subsidiaries of the entity must be covered by the entity’s reports, but only large subsidiaries must be specifically identified in the entity statement;
6. A list of each country where operations occur, if the entity is including any non-U.S. operations in its report;
7. A description of the entity and its primary U.S. economic activities, such as electricity generation, product manufacturing, service provider or freight transport; for each country listed under paragraph (d)(6) of this section, the large emitter should describe the economic activity in that country.
8. A description of the types of emission sources or sinks to be covered in the entity’s emission inventories, such as fossil fuel power plants, manufacturing facilities, commercial office buildings or heavy-duty vehicles;
9. The names of other entities that substantially share the ownership or operational control of sources that represent a significant part of the reporting entity’s emission inventories, and a certification that, to the best of the certifier’s knowledge, the direct greenhouse gas emissions and sequestration in the entity’s report are not included in reports filed by any of these other entities to the 1605(b) program; and
10. Identification of the start year.

(f) Entity statements for reporting entities not registering reductions. When a participant not intending to register emission reductions first reports under these guidelines, it must provide the following information in its entity statement:

1. The name to be used to identify the reporting entity;
2. The legal basis of the entity;
3. An identification of the entity’s control over the activities covered by the entity’s reports, if other than financial control;
4. The names of any parent or holding companies the activities of which will not be covered comprehensively by the entity’s reports;
5. An identification or description of the primary economic activities of the entity, such as agricultural production, forest management or household operation; if any of the economic activities covered by the entity’s reports occur outside the U.S., a listing of each country in which such activities occur;
6. An identification or description of the specific activity (or activities) and the emissions, avoided emissions or sequestration covered by the entity’s report, such as landfill gas recovery or forest sequestration;
7. A certification that, to the best of the certifier’s knowledge, the direct greenhouse gas emissions and sequestration in the entity’s report are not included in reports filed by any other entities reporting to the 1605(b) program; and
8. Identification of the start year.
§ 300.6 Emissions inventories.

(a) General. The objective of an emission inventory is to provide a full accounting of an entity’s emissions for a particular year, including direct emissions of the first six categories of gases listed in the definition of “greenhouse gases” in § 300.2, indirect emissions specified in paragraph (e) of this section, and all sequestration or other changes in carbon stocks. An emission
inventory must be prepared in accordance with Chapter 1 of the Technical Guidelines (incorporated by reference, see §300.13). An inventory does not include avoided emissions or any offset reductions, and is not subsequently adjusted to reflect future acquisitions, divestitures or other changes to the reporting entity (although a reporting entity often makes these types of adjustments when calculating emission reductions under the guidelines). Entity-wide inventories are a prerequisite for the registration of emission reductions by entities with average annual emissions of more than 10,000 metric tons of \( \text{CO}_2 \) equivalent. Entities that have average annual emissions of less than or equal to 10,000 metric tons of \( \text{CO}_2 \) equivalent are eligible to register emission reductions associated with specific activities without also reporting an inventory of the total emissions, but such entities should inventory and report the emissions associated with the specific activity(ies) they do cover in their reports.

(b) Quality requirements for emission inventories. The Technical Guidelines (incorporated by reference, see §300.13) usually identify more than one acceptable method of measuring or estimating greenhouse gas emissions. Each acceptable method is rated A, B, C or D, with A methods usually corresponding to the highest quality method available and D methods representing the lowest quality method that may be used. Each letter is assigned a numerical rating reflecting its relative quality, 4 for A methods, 3 for B methods, 2 for C methods and 1 for D methods. Entities that intend to register emission reductions must use emission inventory methods that result in a quantity-weighted average quality rating of at least 3.0.

(1) Entities may at any time choose to modify the measurement or estimation methods that they use for their current or future year emission inventories. Such modifications would enable entities to gradually improve the quality of the ratings over time, but prior year inventories may be modified only to correct significant errors.

(2) Entities that have had their emission quantities and the quantity-weighted quality rating of their emissions inventory independently verified may report their emissions and average quality ratings by greenhouse gas, indirect emissions and sequestration, rather than by source or sink category.

(3) Entities that certify that they have used only A or B methods, may forego indicating in their reports the quality ratings of the methods used and may forego calculating the quantity-weighted average quality of their emission inventories.

(c) Using estimation methods not included in the Technical Guidelines. An entity may obtain DOE approval for the use of an estimation method not included in the Technical Guidelines (incorporated by reference, see §300.13) if the method covers sources not described in the Technical Guidelines, or if the method provides more accurate results for the entity's specific circumstances than the methods described in the Technical Guidelines. If an entity wishes to propose the use of a method that is not described in the Technical Guidelines, the entity must provide a written description of the method, an explanation of how the method is implemented (including data requirements), empirical evidence of the method's validity and accuracy, and a suggested rating for the method to DOE's Office of Policy and International Affairs (with a copy to EIA). DOE reserves the right to deny the request, or to assign its own rating to the method. By submitting this information, the entity grants permission to DOE to incorporate the method in a future revision of the Technical Guidelines.

(d) Direct emissions inventories. Direct greenhouse gas emissions that must be reported are the emissions resulting from stationary or mobile sources within the organizational boundaries of an entity, including but not limited to emissions resulting from combustion of fossil fuels, process emissions, and fugitive emissions. Process emissions (e.g., PFC emissions from aluminum production) must be reported along with fugitive emissions (e.g., leakage of greenhouse gases from equipment).

(e) Inventories of indirect emissions associated with purchased energy. (1) To provide a clear incentive for the users
of electricity and other forms of purchased energy to reduce demand, an entity must include the indirect emissions from the consumption of purchased electricity, steam, and hot or chilled water in the entity's inventory as indirect emissions. To avoid double counting among entities, the entity must report all indirect emissions separately from its direct emissions. Entities should use the methods for quantifying indirect emissions specified in the Technical Guidelines (incorporated by reference, see §300.13).

(2) Entities may choose to report other forms of indirect emissions, such as emissions associated with employee commuting, materials consumed or products produced, although such other indirect emissions may not be included in the entity's emission inventory and may not be the basis for registered emission reductions. All such reports of other forms of indirect emissions must be distinct from reports of indirect emissions associated with purchased energy and must be based on emission measurement or estimation methods identified in the Technical Guidelines (incorporated by reference, see §300.13).

(f) Entity-level inventories of changes in terrestrial carbon stocks. Annual changes in managed terrestrial carbon stocks should be comprehensively assessed and reported across the entity, and the net emissions resulting from such changes included in the entity's emission inventory and may not be the basis for registered emission reductions. All such reports of other forms of indirect emissions must be distinct from reports of indirect emissions associated with purchased energy and must be based on emission measurement or estimation methods identified in the Technical Guidelines (incorporated by reference, see §300.13) or approved by DOE.

(g) Treatment of de minimis emissions and sequestration. (1) Although the goal of the entity-wide reporting requirement is to provide an accurate and comprehensive estimate of total emissions, there may be small emissions from certain sources that are unduly costly or otherwise difficult to measure or reliably estimate annually. An entity may exclude particular sources of emissions or sequestration if the total quantities excluded represent less than or equal to 3 percent of the total annual CO₂ equivalent emissions of the entity. The entity must identify the types of emissions excluded and provide an estimate of the annual quantity of such emissions using methods specified in the Technical Guidelines (incorporated by reference, see §300.13) or by using the Simplified Emissions Inventory Tool (SEIT). The results of this estimate of the entity's total excluded annual emissions must be reported to DOE together with the entity's initial entity statement.

(2) After starting to report, each reporting entity that excludes from its annual reports any de minimis emissions must re-estimate the quantity of excluded emissions after any significant increase in such emissions, or every five years, whichever occurs sooner.

(h) Separate reporting of domestic and international emissions. Non-U.S. emissions included in an entity's emission inventory must be separately reported and clearly distinguished from emissions originating in the U.S. Entities must identify any country-specific factors used in the preparation of such reports.

(i) Covered gases. Entity-wide emissions inventories must include the emissions of the first six categories of named gases listed in the definition of "greenhouse gases" in §300.2. Entities may report chlorofluorocarbons and other greenhouse gases with quantifiable climate forcing effects as long as DOE has established a method for doing so, but such gases must be reported separately and emission reductions, if any, associated with such other gases are not eligible for registration.

(j) Units for reporting. Emissions and sequestration should be reported in terms of the mass (not volume) of each gas, using metric units (e.g., metric tons of methane). Entity-wide and sub-entity summations of emissions and reductions from multiple sources must be converted into CO₂ equivalent units using the global warming potentials for each gas in the International Panel on Climate Change's Third Assessment (or most recent) Report, as specified in the Technical Guidelines (incorporated by reference, see §300.13). Entities should specify the units used (e.g., kilograms, or metric tons). Entities may need to use the standard conversion factors specified in the Technical Guidelines to
Department of Energy

convert existing data into the common units required in the entity-level report. Emissions from the consumption of purchased electricity must be calculated by region (from the list provided by DOE in the Technical Guidelines) or country, if outside the United States. Consumption of purchased steam or chilled/hot water must be reported according to the type of system and fuel used to generate it (from the list provided by DOE in the Technical Guidelines). Entities must convert purchased energy to CO$_2$ equivalents using the conversion factors in the Technical Guidelines. Entities should also provide the physical quantities of each type of purchased energy covered by their reports.

§ 300.7 Net emission reductions.

(a) Entities that intend to register emission reductions achieved must comply with the requirements of this section. Entities may voluntarily follow these procedures if they want to demonstrate the achievement of net, entity-wide reductions for years prior to the earliest year permitted for registration. Only large emitters must follow the requirements of paragraph (b) of this section, but small emitters may do so voluntarily. Only entities that qualify as small emitters may use the special procedures in paragraph (c) of this section. Entities seeking to register emission reductions achieved by other entities (offsets) must certify that these emission reductions were calculated in a manner consistent with the requirements of paragraph (d) of this section and use the emission reduction calculation methods identified in § 300.8. All entities seeking to register emission reductions must comply with the requirements of paragraph (e) of this section. Only reductions in the emissions of the first six categories of greenhouse gases listed in the definition of "greenhouse gases" in § 300.2 are eligible for registration.

(b) Assessing net emission reductions for large emitters. (1) Entity-wide reporting is a prerequisite for registering emission reductions by entities with average annual emissions of more than 10,000 metric tons of CO$_2$ equivalent. Net annual entity-wide emission reductions must be based, to the maximum extent practicable, on a full assessment and sum total of all changes in an entity's emissions, eligible avoided emissions and sequestration relative to the entity's established base period(s). This assessment must include all entity emissions, including the emissions associated with any non-U.S. operations covered by the entity statement, although the reductions achieved by non-U.S. operations must be separately totaled prior to being integrated with the net emission reductions achieved by U.S. operations. It must include the annual changes in the total emissions of the entity, including the total emissions of each of the subentities identified in its entity statement. All changes in emissions, avoided emissions, and sequestration must be determined using methods that are consistent with the guidelines described in § 300.8 of this part.

(2) If it is not practicable to assess the changes in net emissions resulting from certain entity activities using at least one of the methods described in § 300.8 of this part, the entity may exclude them from its estimate of net emission reductions. The entity must identify as one or more distinct subentities the sources of emissions excluded for this reason and describe the reasons why it was not practicable to assess the changes that had occurred. DOE believes that few emission sources will be excluded for this reason, but has identified at least two situations where such an exclusion would be warranted. For example, it is likely to be impossible to assess the emission changes associated with a new manufacturing plant that produces a product for which the entity has no historical record of emissions or emissions intensity (emissions per unit of product output). However, once the new plant has been operational for at least a full year, a base period and base value(s) for the new plant could be established and its emission changes assessed in the following year. Until the emission changes of this new subentity can be assessed, it should be identified in the entity's report as a subentity for which no assessment of emission changes is practicable. The other example involves a subentity that has reduced its
output below the levels of its base period. In such a case, the subentity could not use the absolute emissions method and may also be unable to identify an effective intensity metric or other method.

(3) In calculating its net annual emission reductions, an entity should exclude any emissions or sequestration that have been excluded from the entity’s inventory. The entity should also exclude all de minimis and biogenic emissions that are excluded from the entity’s inventory of greenhouse gas emissions from its assessments of emission changes.

(c) Assessing emission reductions for entities with small emissions. (1) Entities with average annual emissions of less than or equal to 10,000 metric tons of CO₂ equivalent are not required to inventory their total emissions or assess all changes in their emissions, eligible avoided emissions and sequestration to qualify for registered reductions. These entities may register emission reductions that have occurred since 2002 and that are associated with one or more specific activities, as long as they:

(i) Perform a complete assessment of the annual emissions and sequestration associated with each of the activities upon which they report, using methods that meet the same quality requirements applicable to entity-wide emission inventories; and

(ii) Determine the changes in the emissions, eligible avoided emissions or sequestration associated with each of these activities.

(2) An entity reporting as a small emitter must report on one or more specific activities and is encouraged, but not required to report on all activities occurring within the entity boundary. Examples of small emitter activities include: vehicle operations; product manufacturing processes; building operations or a distinct part thereof, such as lighting; livestock operations; crop management; and power generation. For example, a farmer managing several woodlots and also producing a wheat crop may report emission reductions associated with managing an individual woodlot. However, the farmer must also assess and report the net sequestration resulting from managing all the woodlots within the entity’s boundary. The small emitter is not required to report on emissions or reductions associated with growing the wheat crop.

(3) A small emitter must certify that the reductions reported were not caused by actions likely to cause increases in emissions elsewhere within the entity’s operations. This certification should be based on an assessment of the likely direct and indirect effects of the actions taken to reduce greenhouse gas emissions.

(d) Net emission reductions achieved by other entities (offset reductions or emission reductions submitted by aggregators). A reporting entity or aggregator under certain conditions may report or register all or some of the net emission reductions achieved by entities that choose not to report under the section 1605(b) program. In all cases, an agreement must exist between the reporting entity or aggregator and the other entity that specifies the quantity of the emission reductions (or increases) achieved by the other entity that may be reported or registered as an offset reduction by the reporting entity or aggregator. A large emitter that is reporting on behalf of other entities must meet all of the requirements applicable to large emitters, including submission of an entity statement, an emissions inventory, and an entity-wide assessment of emission reductions. If an aggregator is a small emitter, it may choose to report only on the activities, emissions and emission reductions of the entities on behalf of which it is reporting and not to report on any of its own activities or emission reductions. The reporting entity or aggregator must include in its report all of the information on the other entity, including an entity statement, an emissions inventory (when required), and an assessment of emission reductions that would be required if the other entity were directly reporting to EIA. The net emissions reductions (or increases) of each other entity will be evaluated separately by EIA to determine whether they are eligible for registration in accordance with the guidelines of this part. Those registered reductions (or increases) assigned by the
other entity, by agreement, to a reporting entity or aggregator will be included in EIA’s summary of all registered offset reductions for that entity or aggregator. If the agreement between the reporting entity and other entity is discontinued, for any reason, the reporting entity must inform EIA and must identify any emission reductions previously reported that could be attributable to an increase in the carbon stocks of the other entity. Such reductions will be removed by EIA from the records of the reporting entity’s offset reductions.

(e) Net emission reductions to be reported by other entities as offset reductions. Entities must identify in their report the quantity of any net emission reductions covered by the report, if any, that another entity will report as an offset reduction, including the name of the other entity;

(f) Adjusting for year-to-year increases in net emissions. (1) Normally, net annual emission reductions covered by the report, if any, that another entity will report as an offset reduction, including the name of the other entity;

§ 300.8 Calculating emission reductions.

(a) Choosing appropriate emission reduction calculation methods. (1) An entity must choose the method or methods it will use to calculate emission reductions from the list provided in paragraph (h) of this section. Each of the calculation methods has special characteristics that make it applicable to only certain types of emissions and activities. An entity should select the appropriate calculation method based on several factors, including:

(i) How the entity’s subentities are defined;

(ii) How the reporter will gather and report emissions data; and

(iii) The availability of other types of data that might be needed, such as production or output data.

(2) For some entities, a single calculation method will be sufficient, but many entities may need to apply more than one method because discrete components of the entity require different calculation methods. In such a case, the entity will need to select a method for each subentity (or discrete component of the entity with identifiable emission or reductions). The emissions and output measure (generally a physical measure) of each subentity must be clearly distinguished and reported separately. Guidance on the selection and specification of calculation methods is provided in Chapter 2 of the Technical Guidelines (incorporated by reference, see §300.13).
§ 300.8

(b) Identifying subentities for calculating reductions. If more than one calculation method is to be used, an entity must specify the portion of the entity (the subentity) to which each method will be applied. Each subentity must be clearly identified. From time to time, it may be necessary to modify existing or create new subentities. The entity must provide to EIA a full description of such changes, together with an explanation of why they were required.

(c) Choosing a base period for calculating reductions. In general, the base period used in calculating emission reductions is the single year or up to four-year period average immediately preceding the first year of calculated emission reductions.

(d) Establishing base values. To calculate emission reductions, an entity must establish a base value against which to compare reporting year performance. The minimum requirements for base values for each type of calculation method are specified in Chapter 2 of the Technical Guidelines (incorporated by reference, see § 300.13). In most cases, a historic base value derived from emissions or other data gathered during the base period, is the minimum requirement specified. Entities may, however, choose to establish base values that are more stringent than the base values derived from the methods specified in Chapter 2 of the Technical Guidelines as long as their report indicates the rationale for the alternative base value and demonstrates that it would result in a smaller quantity of emission reductions.

(e) Emission reduction and subentity statements. For each subentity, an entity must submit to EIA the following information:

1. An identification and description of the method used to calculate emission reductions, including:
   (i) The type of calculation method;
   (ii) The measure of output used (if any); and
   (iii) The method-specific base period for which any required base value will be calculated.

2. The base period used in calculating reductions. When an entity starts to report, the base period used in calculating reductions must end in the start year. However, over time the reporting entity may find it necessary to revise or establish new base periods and base values in response to significant changes in processes or output of the subentity.

3. A description of the subentity and its primary economic activity or activities, such as electricity generation, product manufacturing, service provider, freight transport, or household operation; and

4. A description of the emission sources or sinks covered, such as fossil fuel power plants, manufacturing facilities, commercial office buildings or heavy-duty vehicles.

(f) Changes in calculation methods, base periods and base values. When significant changes occur in the composition or output of reporting entities, a reporting entity may need to change previously specified calculation methods, base periods or base values. A reporting entity should make such changes only if necessary and it should fully document the reasons for any changes. The Technical Guidelines (incorporated by reference, see § 300.13) describe when such changes should be made and what information on such changes must be provided to DOE. In general, such changes should not result in any alterations to previously reported or registered emission reductions. A reporting entity may alter previously reported or registered emission reductions only if necessary to correct significant errors.

(g) Continuous reporting. To ensure that the summation of entity annual reports accurately represents net, multi-year emission reductions, an entity must submit a report every year, beginning with the first reduction year. An entity may use a specific base period to determine emission reductions in a given future year only if the entity has submitted qualified reports for each intervening year. If an interruption occurs in the annual reports of an entity, the entity must subsequently report on all missing years prior to qualifying for the registration of additional emission reductions.
(h) Calculation methods. An entity must calculate any change in emissions, avoided emissions or sequestration using one or more of the methods described in this paragraph and in the Technical Guidelines (incorporated by reference, see §300.13).

(1) Changes in emissions intensity. An entity may use emissions intensity as a basis for determining emission reductions as long as the entity selects a measure of output that is:

(i) A reasonable indicator of the output produced by the entity;
(ii) A reliable indicator of changes in the entity's activities;
(iii) Related to emissions levels; and
(iv) Any appropriate adjustments for acquisitions, divestitures, insourcing, outsourcing, or changes in products have been made, as described in the Technical Guidelines (incorporated by reference, see §300.13).

(2) Changes in absolute emissions. An entity may use changes in the absolute (actual) emissions (direct and/or indirect) as a basis for determining net emission reductions as long as the entity makes only those adjustments required by the Technical Guidelines (incorporated by reference, see §300.13). An entity intending to register emission reductions may use this method only if the entity demonstrates in its report that any reductions derived from such changes were not achieved as a result of reductions in the output of the entity, and certifies that emission reductions are not the result of major shifts in the types of products or services produced. Entities may report, but not register, such reductions even if the output associated with such emissions is declining.

(3) Changes in carbon storage (for actions within entity boundaries). An entity may use changes in carbon storage as a basis for determining net emission reductions as long as the entity uses estimation and measurement methods that comply with the Technical Guidelines (incorporated by reference, see §300.13), and has included an assessment of the net changes in all sinks in its inventory.

(4) Changes in avoided emissions (for actions within entity boundaries). An entity may use changes in avoided emissions to determine its emission reductions. Avoided emissions eligible to be included in the calculation of net emission reductions that qualify for registration include those associated with the sale of electricity, steam, hot water or chilled water generated from non-emitting or low-emitting sources as a basis for determining net emission reductions as long as:

(i) The measurement and calculation methods used comply with the Technical Guidelines (incorporated by reference, see §300.13);
(ii) The entity certifies that any increased sales were not attributable to the acquisition of a generating facility that had been previously operated, unless the entity's base period includes generation values from the acquired facility's operation prior to its acquisition; and
(iii) Generators of distributed energy that have net emissions in their base period and intend to report reductions resulting from changes in eligible avoided emissions, use a method specified in the Technical Guidelines (incorporated by reference, see §300.13) that integrates the calculation of reductions resulting from both changes in emissions intensity and changes in avoided emissions.

(5) Action-specific emission reductions (for actions within entity boundaries). A number of source- or situation-specific methods are provided in the Technical Guidelines and these methods must be used to assess the annual changes in emissions for the specific sources or situation addressed by these methods. In addition, a generic action-specific method is identified in the Technical Guidelines. An entity intending to register reductions may use the generic action-specific approach only if it is not possible to measure accurately emission changes by using one of the methods identified in paragraphs (h)(1) through (h)(4) of this section. Entities that intend to register reductions and that use the generic action-specific approach must explain why it is not possible to use any of these other methods. An entity not intending to register reductions may use the generic action-specific method to determine emission reductions, as long as the entity demonstrates that the estimate is based on analysis that:
(i) Uses output, utilization and other factors that are consistent, to the maximum extent practicable, with the action's actual performance in the year for which reductions are being reported;
(ii) Excludes any emission reductions that might have resulted from reduced output or were caused by actions likely to be associated with increases in emissions elsewhere within the entity's operations; and
(iii) Uses methods that are in compliance with the Technical Guidelines (incorporated by reference, see § 300.13).

(i) Summary description of actions taken to reduce emissions. Each reported emission reduction must be accompanied by an identification of the types of actions that were the likely cause of the reductions achieved. Entities are also encouraged to include in their reports information on the benefits and costs of the actions taken to reduce greenhouse gas emissions, such as the expected rates of return, life cycle costs or benefit to cost ratios, using appropriate discount rates.

(j) Emission reductions associated with plant closings, voluntary actions and government (including non-U.S. regulatory regimes) requirements. (1) Each report of emission reductions must indicate whether the reported emission reductions were the result, in whole or in part, of plant closings, voluntary actions, or government requirements. EIA will presume that reductions that were not the result of plant closings or government requirements are the result of voluntary actions.

(2) If emission reductions were, in whole or in part, the direct result of plant closings that caused a decline in output, the report must identify the reductions as such; these reductions do not qualify for registration. EIA will presume that reductions calculated using the emissions intensity method do not result from a decline in output.

(3) If the reductions were associated, in whole or part, with U.S. or non-U.S. government requirements, the report should identify the government requirement involved and the effect these requirements had on the reported emission reductions. If, as a result of the reduction, a non-U.S. government issued to the reporting entity a credit or other financial benefit or regulatory relief, the report should identify the government requirement involved and describe the specific form of benefit or relief provided.

(k) Determining the entity responsible for emission reductions. The entity that EIA will presume to be responsible for emission reduction, avoided emission or sequestered carbon is the entity with financial control of the facility, land or vehicle which generated the reported emissions, generated the energy that was sold so as to avoid other emissions, or was the place where the sequestration action occurred. If control is shared, reporting of the associated emission reductions should be determined by agreement between the entities involved so as to avoid double-counting; this agreement must be reflected in the entity statement and in any report of emission reductions. EIA will presume that an entity is not responsible for any emission reductions associated with a facility, property or vehicle excluded from its entity statement.

§ 300.9 Reporting and recordkeeping requirements.

(a) Starting to report under the guidelines. An entity may report emissions and sequestration on an annual basis beginning in any year, but no earlier than the base period of 1987-1990 specified in the Energy Policy Act of 1992. To be recognized under these guidelines, all reports must conform to the measurement methods established by the Technical Guidelines (incorporated by reference, see § 300.13).

(b) Revisions to reports submitted under the guidelines. (1) Once EIA has accepted a report under this part, it may be revised by the reporting entity only under the circumstances specified in this paragraph and related provisions of the Technical Guidelines (incorporated by reference, see § 300.13). In general:

(i) Revised reports may be submitted to correct errors that have a significant effect on previously estimated emissions or emission reductions; and

(ii) Emission inventories may be revised in order to create a consistent time series based on improvements in
§ 300.10 Certification of reports.

(a) General requirement and certifying official. All reports submitted to EIA must include a certification statement, as provided in paragraph (b) of this section, signed by a certifying official of the reporting entity. A household report may be certified by one of its members. All other reports must be certified by the chief executive officer, agency head, or an officer or employee of the entity who is responsible for reporting the entity’s compliance with environmental regulations.

(b) Certification statement requirements. All entities, whether reporting or registering reductions, must certify the following:

1. The information reported is accurate and complete;

2. Reporting entities must provide the corrected or improved data to EIA, together with an explanation of the significance of the change and its justification.

3. If a change in calculation methods (for inventories or reductions) is made for a particular year, the reporting entity must, if feasible, revise its base value to assure methodological consistency with the reporting year value.

4. Definition and deadline for annual reports. Entities must report emissions on a calendar year basis, from January 1 to December 31. To be included in the earliest possible EIA annual report of greenhouse gas emissions reported under this part, entity reports that have not been independently verified must be submitted to DOE no later than July 1 for emissions occurring during the previous calendar year. Reports that have been independently verified must be submitted by September 1 for emissions occurring during the previous year.

5. Recordkeeping. Entities intending to register reductions must maintain adequate supporting records of base period data for the duration of their participation in the 1605(b) program. Supporting records for all reporting year data must be maintained for at least three years subsequent to the relevant reporting year to enable verification of all information reported. The records should document the basis for the entity’s report to EIA, including:

(i) The content of entity statements, including the identification of the specific facilities, buildings, land holding and other operations or emission sources covered by the entity’s reports and the legal, equity, operational and other bases for their inclusion;

(ii) Information on the identification and assessment of changes in entity boundaries, processes or products that might have to be reported to EIA;

(iii) Any agreements or relevant communications with other entities or third parties regarding the reporting of emissions or emission reductions associated with sources the ownership or operational control of which is shared;

(iv) Information on the methods used to measure or estimate emissions, and the data collection and management systems used to gather and prepare this data for inclusion in reports;

(v) Information on the methods used to calculate emission reductions, including the basis for:

1. The selection of the specific output measures used, and the data collection and management systems used to gather and prepare output data for use in the calculation of emission reductions;

2. The selection and modification of all base years, base periods and baselines used in the calculation of emission reductions;

3. Any baseline adjustments made to reflect acquisitions, divestitures or other changes;

4. Any models or other estimation methods used; and

5. Any internal or independent verification procedures undertaken.

6. Confidentiality. DOE will protect trade secret and commercial or financial information that is privileged or confidential as provided in 5 U.S.C. 552(b)(4). An entity must clearly indicate in its 1605(b) report the information for which it requests confidentiality. DOE will handle requests for confidentiality of information submitted in 1605(b) reports in accordance with the process established in DOE’s Freedom of Information regulations at 10 CFR §1004.11.
§ 300.11 Independent verification.

(a) General. Entities are encouraged to have their annual reports reviewed by independent and qualified auditors, as described in paragraphs (b), (c), and (f) of this section.

(b) Qualifications of verifiers. (1) DOE envisions that independent verification will be performed by professional verifiers (i.e., individuals or companies that provide verification or “attestation” services). EIA will consider a report to the program to be independently verified if:

(i) The lead individual verifier and other members of the verification team are accredited by one or more independent and nationally-recognized accreditation programs, described in paragraph (c) of this section, for the types of professionals needed to determine compliance with DOE’s 1605(b) guidelines;

(ii) The lead verifier has experience managing an auditing or verification process, including the recruitment and allocation of other individual verifiers, and has been empowered to make decisions relevant to the provision of a verification statement; and

(iii) All members of a verification team have education, training and/or professional experience that matches the tasks performed by the individual verifiers, as deemed necessary by the verifier accreditation program.

(2) As further guidance, all members of the verification team should be familiar with:

(i) The subject matter covered by the scope of the verification;

(ii) The requirements of this part;
(iii) Greenhouse gas emission and emission reduction quantification;
(iv) Data and information auditing sampling methods; and
(v) Risk assessment and methodologies and materiality analysis procedures outlined by other domestic and international standards.

(3) An individual verifier should have a professional degree or accreditation in engineering (environmental, industrial, chemical), accounting, economics, or a related field, supplemented by specific training and/or experience in emissions reporting and accounting, and should have his or her qualifications and continuing education periodically reviewed by an accreditation program. The skills required for verification are often cross-disciplinary. For example, an individual verifier reviewing a coal electric utility should be knowledgeable about mass balance calculations, fuel purchasing accounting, flows and stocks of coals, coal-fired boiler operation, and issues of entity definition.

(4) Companies that provide verification services must use professionals that possess the necessary skills and proficiency levels for the types of entities for which they provide verification services. Continuing training may be required to ensure all individuals have up-to-date knowledge regarding the tasks they perform.

(c) Qualifications of organizations accrediting verifiers. Organizations that accredit individual verifiers must be nationally recognized certification programs. They may include, but are not limited to the: American Institute of Certified Public Accountants; American National Standards Institute’s Registrar Accreditation Board program for Environmental Management System auditors (ANSI-RAB-EMS); Board of Environmental, Health and Safety Auditor Certification; California Climate Action Registry; Clean Development Mechanism Executive Board; and the United Kingdom Accreditation Scheme.

(d) Scope of verification. (1) As part of any independent verification, qualified verifiers must use their expertise and professional judgment to verify for accuracy, completeness and consistency with DOE’s guidelines of:

(i) The content of entity statements, annual reports and the supporting records maintained by the entity;
(ii) The representation in entity statements (or lack thereof) of any significant changes in entity boundaries, products, or processes;
(iii) The procedures and methods used to collect emissions and output data, and calculate emission reductions (for entities with widely dispersed operations, this process should include on-site reviews of a sample of the facilities);
(iv) Relevant personnel training and management systems; and
(v) Relevant quality assurance/quality control procedures.

(2) DOE expects qualified verifiers to refer to the growing body of literature on methods of evaluating the elements listed in paragraph (d)(1) of this section, such as the California Climate Action Registry Certification Protocol, the Climate Leaders Inventory Management Plan Checklist, and the draft ISO 14064.3 Protocol for Validation, Verification and Certification.

(e) Verification statement. Both the verifier and, if relevant, an officer of the company providing the verification service must sign the verification statement. The verification statement shall attest to the following:

(1) The verifier has examined all components listed in paragraph (d) of this section;
(2) The information reported in the verified entity report and this verification statement is accurate and complete;
(3) The information reported by the entity has been compiled in accordance with this part;
(4) The information reported on the entity report is consistent with information submitted in prior years, if any, or any inconsistencies with prior year’s information are documented and explained in the entity statement;
(5) The verifier used due diligence to assure that direct emissions, emission reductions, and/or sequestration reported are not reported by any other entity;
(6) Any emissions, emission reductions, or sequestration that were
§ 300.12 Acceptance of reports and registration of entity emission reductions.

(a) Acceptance of reports. EIA will review all reports to ensure they are consistent with this part and with the Technical Guidelines (incorporated by reference, see § 300.13). EIA will also review all reports for completeness, internal consistency, arithmetic accuracy and plausibility. Subject to the availability of adequate resources, EIA intends to notify entities of the acceptance or rejection of any report within six months of its receipt.

(b) Registration of emission reductions. EIA will review each accepted report to determine if emission reductions were calculated using an acceptable base period (usually ending no earlier than 2002), and to confirm that the report complies with the other provisions of this part. EIA will also review its records to verify that the reporting entity has submitted accepted annual reports for each year between the establishment of its base period and the year covered by the current report. EIA will notify the entity that reductions meeting these requirements have been credited to the entity as "registered reductions" which can be held by the reporting entity for use (including transfer to other entities) in the event a future program that recognizes such reductions is enacted into law.

(c) Rejection of reports. If EIA does not accept a report or if it determines that emission reductions intended for registration do not qualify, EIA will return the report to the sender with an explanation of its inadequacies. The reporting entity may resubmit a modified report for further consideration at any time.

(d) EIA database and summary reports. The Administrator of EIA will establish a publicly accessible database composed of all reports that meet the definitional, measurement, calculation, and certification requirements of these guidelines. EIA will maintain separate subtotals of direct emissions, indirect emissions and carbon fluxes. A portion of the database will provide summary information on the emissions and registered emission reductions of each reporting entity.
$300.13 Incorporation by reference.

The Technical Guidelines for the Voluntary Reporting of Greenhouse Gases (1605(b)) Program (January 2007), referred to throughout this part as the “Technical Guidelines,” have been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. You may obtain a copy of the Technical Guidelines from the Office of Policy and International Affairs, U.S. Department of Energy, 1000 Independence Ave., SW., Washington, DC 20585, or by visiting the following Web site: http://www.policy.energy.gov/enhancingGHGregistry/technicalguidelines/. The Technical Guidelines also are available for inspection at the National Archives and Record Administration (NARA). For more information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

[71 FR 20805, Apr. 21, 2006, as amended at 72 FR 4413, Jan. 31, 2007]

SUBCHAPTER C [RESERVED]
SUBCHAPTER D—ENERGY CONSERVATION

PARTS 400–417 [RESERVED]

PART 420—STATE ENERGY PROGRAM

§ 420.1 Purpose and scope.
It is the purpose of this part to promote the conservation of energy, to reduce the rate of growth of energy demand, and to reduce dependence on imported oil through the development and implementation of a comprehensive State Energy Program and the provision of Federal financial and technical assistance to States in support of such program.

§ 420.2 Definitions.
As used in this part:
Alternative transportation fuel means methanol, denatured ethanol, and other alcohols; mixtures containing 85 percent or more by volume of methanol, denatured ethanol, and other alcohols with gasoline or other fuels; natural gas; liquified petroleum gas; hydrogen; coal-derived liquid fuels; fuels (other than alcohol) derived from biological materials (including neat biodiesel); and electricity (including electricity from solar energy).
Assistant Secretary means the Assistant Secretary for Energy Efficiency and Renewable Energy or any official to whom the Assistant Secretary's
functions may be redelegated by the Secretary.

British thermal unit (Btu) means the quantity of heat necessary to raise the temperature of one pound of water one degree Fahrenheit at 39.2 degrees Fahrenheit and at one atmosphere of pressure.

Building means any structure which includes provision for a heating or cooling system, or both, or for a hot water system.

Carpool means the sharing of a ride by two or more people in an automobile.

Carpool matching and promotion campaign means a campaign to coordinate riders with drivers to form carpools and/or vanpools.

Commercial building means any building other than a residential building, including any building constructed for industrial or public purposes.

Commercially available means available for purchase by the general public or target audience in the State.

Deputy Assistant Secretary means the Deputy Assistant Secretary for Building Technology, State and Community Programs or any official to whom the Deputy Assistant Secretary's functions may be redelegated by the Assistant Secretary.

Director, Office of State and Community Programs means the official responsible for DOE's formula grant programs to States, or any official to whom the Director's functions may be redelegated by the Assistant Secretary.

DOE means the Department of Energy.

Energy audit means any process which identifies and specifies the energy and cost savings which are likely to be realized through the purchase and installation of particular energy efficiency measures or renewable energy measures.

Energy efficiency measure means any capital investment that reduces energy costs in an amount sufficient to recover the total cost of purchasing and installing such measure over an appropriate period of time and maintains or reduces non-renewable energy consumption.

Environmental residual means any pollutant or pollution causing factor which results from any activity.

Exterior envelope physical characteristics means the physical nature of those elements of a building which enclose conditioned spaces through which thermal energy may be transferred to or from the exterior.

Governor means the chief executive officer of a State, the District of Columbia, Puerto Rico, or any territory or possession of the United States, or a person duly designated in writing by the Governor to act upon his or her behalf.

Grantee means the State or other entity named in the notice of grant award as the recipient.

HVAC means heating, ventilating and air-conditioning.

IBR means incorporation by reference.

Industrial facility means any fixed equipment or facility which is used in connection with, or as part of, any process or system for industrial production or output.

Institution of higher education has the same meaning as such term is defined in section 1201(a) of the Higher Education Act of 1965 (20 U.S.C. 1141(a)).

Metropolitan Planning Organization means that organization required by the Department of Transportation, and designated by the Governor as being responsible for coordination within the State, to carry out transportation planning provisions in a Standard Metropolitan Statistical Area.

Model Energy Code, 1993, including Errata, means the model building code published by the Council of American Building Officials, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. The availability of this incorporation by reference is given in §420.6(b).

Park-and-ride lot means a parking facility generally located at or near the trip origin of carpools, vanpools and/or mass transit.

Petroleum violation escrow funds. For purposes both of exempting petroleum violation escrow funds from the matching requirements of §420.12 and of applying the limitations specified under §420.18(b), this term means any funds
§ 420.2

distributed to the States by the Department of Energy or any court and identified as Alleged Crude Oil Violation funds, together with any interest earned thereon by the States, but excludes any funds designated as “excess funds” under section 3003(d) of the Petroleum Overcharge Distribution and Restitution Act, subtitle A of title III of the Omnibus Budget Reconciliation Act of 1986, Public Law 99–509, and the funds distributed under the “Warner Amendment,” section 155 of Public Law 97–377.

Plan means a State Energy Program plan including required program activities in accordance with § 420.15 and otherwise meeting the applicable provisions of this part.

Political subdivision means a unit of government within a State, including a county, municipality, city, town, township, parish, village, local public authority, school district, special district, council of governments, or any other regional or intrastate governmental entity or instrumentality of a local government exclusive of institutions of higher learning and hospitals.

Preferential traffic control means any one of a variety of traffic control techniques used to give carpools, vanpools, and public transportation vehicles priority treatment over single occupant vehicles other than bicycles and other two-wheeled motorized vehicles.

Program activity means one or more State actions, in a particular area, designed to promote energy efficiency, renewable energy and alternative transportation fuel.

Public building means any building which is open to the public during normal business hours, including:

(1) Any building which provides facilities or shelter for public assembly, or which is used for educational office or institutional purposes;

(2) Any inn, hotel, motel, sports arena, supermarket, transportation terminal, retail store, restaurant, or other commercial establishment which provides services or retail merchandise;

(3) Any general office space and any portion of an industrial facility used primarily as office space;

(4) Any building owned by a State or political subdivision thereof, including libraries, museums, schools, hospitals, auditoriums, sport arenas, and university buildings; and

(5) Any public or private non-profit school or hospital.

Public transportation means any scheduled or nonscheduled transportation service for public use.

Regional Office Director means the director of a DOE Regional Office with responsibility for grants administration or any official to whom that function may be redelegated.

Renewable energy means a non-depletable source of energy.

Renewable energy measure means any capital investment that reduces energy costs in an amount sufficient to recover the total cost of purchasing and installing such measure over an appropriate period of time and that results in the use of renewable energy to replace the use of non-renewable energy.

Residential building means any building which is constructed for residential occupancy.

Secretary means the Secretary of DOE.

SEP means the State Energy Program under this part.

Small business means a private firm that does not exceed the numerical size standard promulgated by the Small Business Administration under section 3(a) of the Small Business Act (15 U.S.C. 632) for the Standard Industrial Classification (SIC) codes designated by the Secretary of Energy.

Start-up business means a small business which has been in existence for 5 years or less.

State means a State, the District of Columbia, Puerto Rico, or any territory or possession of the United States.

State or local government building means any building owned and primarily occupied by offices or agencies of a State; and any building of a unit of local government or a public care institution which could be covered by part H, title III, of the Energy Policy and Conservation Act, 42 U.S.C. 6372–6372c.

Transit level of service means characteristics of transit service provided which indicate its quantity, geographic area of coverage, frequency and quality (comfort, travel, time, fare and image).

Urban area traffic restriction means a setting aside of certain portions of an urban area as restricted zones where...
§ 420.6 Reference standards.

(a) The following standards which are not otherwise set forth in this part are incorporated by reference and made a part of this part. The following standards have been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. A notice of any change in these materials will be published in the Federal Register. The standards incorporated by reference are available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(b) The following standards are incorporated by reference in this part:

§ 420.5 Reports.

(a) Each State receiving financial assistance under this part shall submit to the cognizant Regional Office Director a quarterly program performance report and a quarterly financial status report.

(b) Reports under this section shall contain such information as the Secretary may prescribe in order to monitor effectively the implementation of a State’s activities under this part.

(c) The reports shall be submitted within 30 days following the end of each calendar year quarter.
§ 420.10 Purpose.

This subpart specifies the procedures that apply to the Formula Grant part of the State Energy Program, which allows States to apply for financial assistance to undertake a wide range of required and optional energy-related activities provided for under § 420.15 and § 420.17. Funding for these activities is allocated to the States based on funds available for any fiscal year, as described under § 420.11.

§ 420.11 Allocation of funds among the States.

(a) The cognizant Regional Office Director shall provide financial assistance to each State having an approved annual application from funds available for any fiscal year to develop, modify, or implement a plan.

(b) DOE shall allocate financial assistance to develop, implement, or modify plans among the States from funds available for any fiscal year, as follows:

(1) If the available funds equal $25.5 million, such funds shall be allocated to the States according to Table 1 of this section.

(2) The base allocation for each State is listed in Table 1.

(3) If the available funds for any fiscal year are less than $25.5 million, then the base allocation for each State shall be reduced proportionally.

(4) If the available funds exceed $25.5 million, $25.5 million shall be allocated as specified in Table 1 and any in excess of $25.5 million shall be allocated as follows:

(i) One-third of the available funds is divided among the States equally;

(ii) One-third of the available funds is divided on the basis of the population of the participating States as contained in the most recent reliable census data available from the Bureau of the Census, Department of Commerce, for all participating States at the time DOE needs to compute State formula shares; and

(iii) One-third of the available funds is divided on the basis of the energy consumption of the participating States as contained in the most recent State Energy Data Report available from DOE’s Energy Information Administration.

(c) The budget period covered by the financial assistance provided to a State...
§ 420.12 State matching contribution.  
(a) Each State shall provide cash, in-kind contributions, or both for SEP activities in an amount totaling not less than 20 percent of the financial assistance allocated to the State under § 420.11(b).  
(b) Cash and in-kind contributions used to meet this State matching requirement are subject to the limitations on expenditures described in § 420.18(a), but are not subject to the 20 percent limitation in § 420.18(b).  
(c) Nothing in this section shall be read to require a match for petroleum violation escrow funds used under this subpart.  

§ 420.13 Annual State applications and amendments to State plans.  
(a) To be eligible for financial assistance under this subpart, a State shall submit to the cognizant Regional Office Director an original and two copies of the annual application executed by the Governor, including an amended State plan or any amendments to the State plan needed to reflect changes in the activities the State is planning to undertake for the fiscal year concerned. The date for submission of the annual State application shall be set by DOE.  
(b) An application shall include:  
(1) A face sheet containing basic identifying information, on Standard Form (SF) 424;  
(2) A description of the energy efficiency, renewable energy, and alternative transportation fuel goals to be achieved, including wherever practicable:  
(i) An estimate of the energy to be saved by implementation of the State plan;  
(ii) Why the goals were selected;  
(iii) How the attainment of the goals will be measured by the State; and  
(iv) How the program activities included in the State plan represent a strategy to achieve these goals;  
(3) With respect to financial assistance under this subpart, a goal, consisting of an improvement of 25 percent or more in the efficiency of use of energy in the State concerned in the calendar year 2012, as compared to the calendar year 1990, and may contain interim goals;  
(4) For the budget period for which financial assistance will be provided:  
(i) A total program budget with supporting justification, broken out by object category and by source of funding;  
(ii) The source and amount of State matching contribution;  
(iii) A narrative statement detailing the nature of State plan amendments and of new program activities;  
(iv) For each program activity, a budget and listing of milestones; and  
(v) An explanation of how the minimum criteria for required program activities prescribed in § 420.15 have been implemented and are being maintained.  
(5) If any of the activities being undertaken by the State in its plan have environmental impacts, a detailed description of the increase or decrease in environmental residuals expected from implementation of a plan defined as far as possible through the use of information to be provided by DOE and an indication of how these environmental factors were considered in the selection of program activities.  
(6) If a State is undertaking program activities involving purchase or installation of materials or equipment for weatherization of low-income housing, an explanation of how these activities would supplement and not supplant the existing DOE program under 10 CFR part 440.  
(7) A reasonable assurance to DOE that it has established policies and procedures designed to assure that Federal financial assistance under this subpart will be used to supplement, and not to supplant, State and local funds, and to the extent practicable, to increase the amount of such funds that otherwise would be available, in the absence of such Federal financial assistance, for those activities set forth in the State Energy Program plan approved pursuant to this subpart;  
(8) An assurance that the State shall comply with all applicable statutes and regulations in effect with respect to the periods for which it receives grant funding; and  

[61 FR 35895, July 8, 1996, as amended at 64 FR 46114, Aug. 24, 1999]
§ 420.14 Review and approval of annual State applications and amendments to State plans.

(a) After receipt of an application for financial assistance under this subpart and for approval of an amendment, if any, to a State plan, the cognizant Regional Office Director may request the State to submit within a reasonable period of time any revisions necessary to make the application complete and to bring the application into compliance with the requirements of subparts A and B of this part. The cognizant Regional Office Director may reject the application in a written decision, including a statement of reasons, which shall be subject to administrative review under §420.19 of subparts A and B of this part.

(b) On or before 60 days from the date that a timely filed application is complete, the cognizant Regional Office Director shall—

(1) Approve the application in whole or in part to the extent that—

(i) The application conforms to the requirements of subparts A and B of this part;

(ii) The proposed program activities are consistent with a State's achievement of its energy conservation goals in accordance with §420.13; and

(iii) The provisions of the application regarding program activities satisfy the minimum requirements prescribed by §§420.15 and 420.17 as applicable;

(2) Approve the application in whole or in part subject to special conditions designed to ensure compliance with the requirements of subparts A and B of this part; or

(3) Disapprove the application if it does not conform to the requirements of subparts A and B of this part.

§ 420.15 Minimum criteria for required program activities for plans.

A plan shall satisfy all of the following minimum criteria for required program activities.

(a) Mandatory lighting efficiency standards for public buildings shall:

(1) Be implemented throughout the State, except that the standards shall be adopted by the State as a model code for those local governments of the State for which the State's constitution reserves the exclusive authority to adopt and implement building standards within their jurisdictions;

(2) Apply to all public buildings (except for public buildings owned or leased by the United States), above a certain size, as determined by the State;

(3) Be no less stringent than the provisions of ASHRAE/IESNA 90.1-1989, and should be updated by enactment of, or support for the enactment into local codes or standards, which, at a minimum, are comparable to provisions of ASHRAE/
IESNA 90.1–1989 which is incorporated by reference in accordance with 5 U.S.C. 552 (a) and 1 CFR part 51. The availability of this incorporation by reference is given in §420.6; and

(4) For existing public buildings, contain the elements deemed appropriate by the State.

(b) Program activities to promote the availability and use of carpools, vanpools, and public transportation shall:

(1) Have at least one of the following actions under implementation in at least one urbanized area with a population of 50,000 or more within the State or in the largest urbanized area within the State if that State does not have an urbanized area with a population of 50,000 or more:

(i) A carpool/vanpool matching and promotion campaign;

(ii) Park-and-ride lots;

(iii) Preferential traffic control for carpoolers and public transportation patrons;

(iv) Preferential parking for carpools and vanpools;

(v) Variable working schedules;

(vi) Improvement in transit level of service for public transportation;

(vii) Exemption of carpools and vanpools from regulated carrier status;

(viii) Parking taxes, parking fee regulations or surcharge on parking costs;

(ix) Full-cost parking fees for State and/or local government employees;

(x) Urban area traffic restrictions;

(xi) Geographical or time restrictions on automobile use; or

(xii) Area or facility tolls; and

(2) Be coordinated with the relevant Metropolitan Planning Organization, unless no Metropolitan Planning Organization exists in the urbanized area, and not be inconsistent with any applicable Federal requirements.

(c) Mandatory standards and policies affecting the procurement practices of the State and its political subdivisions to improve energy efficiency shall—

(1) With respect to all State procurement and with respect to procurement of political subdivisions to the extent determined feasible by the State, be under implementation; and

(2) Contain the elements deemed appropriate by the State to improve energy efficiency through the procurement practices of the State and its political subdivisions.

(d) Mandatory thermal efficiency standards for new and renovated buildings shall—

(1) Be implemented throughout the State, with respect to all buildings (other than buildings owned or leased by the United States, buildings whose peak design rate of energy usage for all purposes is less than one watt (3.4 Btu's per hour) per square foot of floor space for all purposes, or manufactured homes), except that the standards shall be adopted by the State as a model code for those local governments of the State for which the State’s law reserves the exclusive authority to adopt and implement building standards within their jurisdictions;

(2) Take into account the exterior envelope physical characteristics, HVAC system selection and configuration, HVAC equipment performance and service water heating design and equipment selection;

(3) For all new commercial and multifamily high-rise buildings, be no less stringent than provisions of sections 7–12 of ASHRAE/IESNA 90.1–1989, and should be updated by enactment of, or support for the enactment into local codes or standards, which, at a minimum, are comparable to provisions of ASHRAE/IESNA 90.1–1989; and

(4) For all new single-family and multifamily low-rise residential buildings, be no less stringent than the Model Energy Code, 1993, and should be updated by enactment of, or support for the enactment into local codes or standards, which, at a minimum, are comparable to the Model Energy Code, 1993, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. The availability of this incorporation by reference is given in §420.6;

(5) For renovated buildings:

(i) Apply to those buildings determined by the State to be renovated buildings; and

(ii) Contain the elements deemed appropriate by the State regarding thermal efficiency standards for renovated buildings.

(e) A traffic law or regulation which permits the operator of a motor vehicle
§ 420.16 Extensions for compliance with required program activities.

An extension of time by which a required program activity must be ready for implementation may be granted if DOE determines that the extension is justified. A written request for an extension, with accompanying justification and an action plan acceptable to DOE for achieving compliance in the shortest reasonable time, shall be made to the cognizant Regional Office Director. Any extension shall be only for the shortest reasonable time that DOE determines necessary to achieve compliance. The action plan shall contain a schedule for full compliance and shall identify and make the most reasonable commitment possible to provision of the resources necessary for achieving the scheduled compliance.

§ 420.17 Optional elements of State Energy Program plans.

(a) Other appropriate activities or programs may be included in the State plan. These activities may include, but are not limited to, the following:

(1) Program activities of public education to promote energy efficiency, renewable energy, and alternative transportation fuels;

(2) Program activities to increase transportation energy efficiency, including programs to accelerate the use of alternative transportation fuels for government vehicles, fleet vehicles, taxis, mass transit, and privately owned vehicles;

(3) Program activities for financing energy efficiency measures and renewable energy measures—

(i) Which may include loan programs and performance contracting programs for leveraging of additional public and private sector funds and program activities which allow rebates, grants, or other incentives for the purchase of energy efficiency measures and renewable energy measures; or

(ii) In addition to or in lieu of program activities described in paragraph (a)(3)(i) of this section, which may be used in connection with public or non-profit buildings owned and operated by a State, a political subdivision of a State or an agency or instrumentality of a State, or an organization exempt from taxation under section 501(c)(3) of the Internal Revenue Code of 1986 including public and private non-profit schools and hospitals, and local government buildings;

(4) Program activities for encouraging and for carrying out energy audits with respect to buildings and industrial facilities (including industrial processes) within the State;

(5) Program activities to promote the adoption of integrated energy plans which provide for:

(i) Periodic evaluation of a State's energy needs, available energy resources (including greater energy efficiency), and energy costs; and

(ii) Utilization of adequate and reliable energy supplies, including greater energy efficiency, that meet applicable safety, environmental, and policy requirements at the lowest cost;
(6) Program activities to promote energy efficiency in residential housing, such as:

(i) Program activities for development and promotion of energy efficiency rating systems for newly constructed housing and existing housing so that consumers can compare the energy efficiency of different housing; and

(ii) Program activities for the adoption of incentives for builders, utilities, and mortgage lenders to build, service, or finance energy efficient housing;

(7) Program activities to identify unfair or deceptive acts or practices which relate to the implementation of energy efficiency measures and renewable energy measures and to educate consumers concerning such acts or practices;

(8) Program activities to modify patterns of energy consumption so as to reduce peak demands for energy and improve the efficiency of energy supply systems, including electricity supply systems;

(9) Program activities to promote energy efficiency as an integral component of economic development planning conducted by State, local, or other governmental entities or by energy utilities;

(10) Program activities (enlisting appropriate trade and professional organizations in the development and financing of such programs) to provide training and education (including, if appropriate, training workshops, practice manuals, and testing for each area of energy efficiency technology) to building designers and contractors involved in building design and construction or in the sale, installation, and maintenance of energy systems and equipment to promote building energy efficiency;

(11) Program activities for the development of building retrofit standards and regulations, including retrofit ordinances enforced at the time of the sale of a building;

(12) Program activities to provide support for prefeasibility and feasibility studies for projects that utilize renewable energy and energy efficiency resource technologies in order to facilitate access to capital and credit for such projects;

(13) Program activities to facilitate and encourage the voluntary use of renewable energy technologies for eligible participants in Federal agency programs, including the Rural Electrification Administration and the Farmers Home Administration; and

(14) In accordance with paragraph (b) of this section, program activities to implement the Energy Technology Commercialization Services Program.

(b) This section prescribes requirements for establishing State-level Energy Technology Commercialization Services Program as an optional element of State plans.

(1) The program activities to implement the functions of the Energy Technology Commercialization Services Program shall:

(i) Aid small and start-up businesses in discovering useful and practical information relating to manufacturing and commercial production techniques and costs associated with new energy technologies;

(ii) Encourage the application of such information in order to solve energy technology product development and manufacturing problems;

(iii) Establish an Energy Technology Commercialization Services Program affiliated with an existing entity in each State;

(iv) Coordinate engineers and manufacturers to aid small and start-up businesses in solving specific technical problems and improving the cost effectiveness of methods for manufacturing new energy technologies;

(v) Assist small and start-up businesses in preparing the technical portions of proposals seeking financial assistance for new energy technology commercialization; and

(vi) Facilitate contract research between university faculty and students and small start-up businesses, in order to improve energy technology product development and independent quality control testing.

(2) Each State Energy Technology Commercialization Services Program shall develop and maintain a data base of engineering and scientific experts in
§ 420.18 Expenditure prohibitions and limitations.

(a) No financial assistance provided to a State under this subpart shall be used:

(1) For construction, such as construction of mass transit systems and exclusive bus lanes, or for construction or repair of buildings or structures;

(2) To purchase land, a building or structure or any interest therein;

(3) To subsidize fares for public transportation;

(4) To subsidize utility rate demonstrations or State tax credits for energy conservation measures or renewable energy measures; or

(5) To conduct, or purchase equipment to conduct, research, development or demonstration of energy efficiency or renewable energy techniques and technologies not commercially available.

(b) No more than 20 percent of the financial assistance awarded to the State for this program shall be used to purchase office supplies, library materials, or other equipment whose purchase is not otherwise prohibited by this section. Nothing in this paragraph shall be read to apply this 20 percent limitation to petroleum violation escrow funds used under this subpart.

(c) Demonstrations of commercially available energy efficiency or renewable energy techniques and technologies are permitted, and are not subject to the prohibitions of §420.18(a)(1), or to the limitation on equipment purchases of §420.18(b).

(d) A State may use regular or revolving loan mechanisms to fund SEP services which are consistent with this subpart and which are included in the State's approved SEP plan. The State may use loan repayments and any interest on the loan funds only for activities which are consistent with this subpart and which are included in the State's approved SEP plan.

(e) A State may use funds under this subpart for the purchase and installation of equipment and materials for energy efficiency measures and renewable energy measures, including reasonable design costs, subject to the following terms and conditions:

(1) Such use must be included in the State's approved plan and, if funded by petroleum violation escrow funds, must be consistent with any judicial or administrative terms and conditions imposed upon State use of such funds;

(2) A State may use for these purposes no more than 50 percent of all funds allocated by the State to SEP in a given year, regardless of source, except that this limitation shall not include regular and revolving loan programs funded with petroleum violation escrow funds, and is subject to waiver by DOE for good cause. Loan documents shall ensure repayment of principal and interest within a reasonable period of time, and shall not include provisions of loan forgiveness.

(3) Buildings owned or leased by the United States are not eligible for energy efficiency measures or renewable energy measures under paragraph (e) of this section;

(4) Funds must be used to supplement and no funds may be used to supplant weatherization activities under the Weatherization Assistance Program for Low-Income Persons, under 10 CFR part 440;

(5) Subject to paragraph (f) of this section, a State may use a variety of financial incentives to fund purchases and installation of materials and equipment under paragraph (e) of this section including, but not limited to, regular loans, revolving loans, loan...
buy-downs, performance contracting, rebates and grants.

(f) The following mechanisms are not allowed for funding the purchase and installation of materials and equipment under paragraph (e) of this section:

(1) Rebates for more than 50 percent of the total cost of purchasing and installing materials and equipment (States shall set appropriate restrictions and limits to insure the most efficient use of rebates); and

(2) Loan guarantees.

§ 420.19 Administrative review.

(a) A State shall have 20 days from the date of receipt of a decision under § 420.14 to file a notice requesting administrative review in accordance with paragraph (b) of this section. If an applicant does not timely file such a notice, the decision under § 420.14 shall become final for DOE.

(b) A notice requesting administrative review shall be filed with the cognizant Regional Office Director and shall be accompanied by a written statement containing supporting arguments. If the cognizant Regional Office Director has disapproved an entire application for financial assistance, the State may request a public hearing.

(c) A notice or any other document shall be deemed filed under this section upon receipt.

(d) On or before 15 days from receipt of a notice requesting administrative review which is timely filed, the cognizant Regional Office Director shall forward to the Deputy Assistant Secretary, the notice requesting administrative review, the decision under § 420.14 as to which administrative review is sought, a draft recommended final decision for concurrence, and any other relevant material.

(e) If the State requests a public hearing on the disapproval of an entire application for financial assistance under this subpart, the Deputy Assistant Secretary, within 15 days, shall give actual notice to the State and FEDERAL REGISTER notice of the date, place, time, and procedures which shall apply to the public hearing. Any public hearing under this section shall be informal and legislative in nature.

(f) On or before 45 days from receipt of documents under paragraph (d) of this section or the conclusion of the public hearing, whichever is later, the Deputy Assistant Secretary shall concur in, concur in as modified, or issue a substitute for the recommended decision of the cognizant Regional Office Director.

(g) On or before 15 days from the date of receipt of the determination under paragraph (f) of this section, the Governor may file an application for discretionary review by the Assistant Secretary. On or before 15 days from filing, the Assistant Secretary shall send a notice to the Governor stating whether the Assistant Secretary's determination will be reviewed. If the Assistant Secretary grants a review, a decision shall be issued no later than 60 days from the date review is granted. The Assistant Secretary may not issue a notice or decision under this paragraph without the concurrence of the DOE Office of General Counsel.

(h) A decision under paragraph (f) of this section shall be final for DOE if there is no review under paragraph (g) of this section. If there is review under paragraph (g) of this section, the decision thereunder shall be final for DOE and no appeal shall lie elsewhere in DOE.

(i) Prior to the effective date of the termination or suspension of a grant award for failure to implement an approved State plan in compliance with the requirements of this subpart, a grantee shall have the right to written notice of the basis for the enforcement action and of the opportunity for public hearing before the DOE Financial Assistance Appeals Board notwithstanding any provisions to the contrary of 10 CFR 600.22, 600.24, 600.25, and 600.243. To obtain a public hearing, the grantee must request an evidentiary hearing, with prior FEDERAL REGISTER notice, in the election letter submitted under Rule 2 of 10 CFR 1024.4 and the request shall be granted notwithstanding any provisions to the contrary of Rule 2.

[61 FR 35895, July 8, 1996, as amended at 64 FR 46114, Aug. 24, 1999]
Subpart C—Implementation of Special Projects Financial Assistance

§ 420.30 Purpose and scope.
(a) This subpart sets forth DOE's policies and procedures for implementing special projects financial assistance under this part.
(b) For years in which such funding is available, States may apply for financial assistance to undertake a variety of State-oriented energy-related special projects activities in addition to the funds provided under the regular SEP grants.
(c) The types of funded activities may vary from year to year, and from State to State, depending upon funds available for each type of activity and DOE and State priorities.
(d) A number of end-use sector programs in the Office of Energy Efficiency and Renewable Energy participate in the funding of these activities, and the projects must meet the requirements of those programs.
(e) The purposes of the special project activities are:
(1) To utilize States to accelerate deployment of energy efficiency, renewable energy, and alternative transportation fuel technologies;
(2) To facilitate the commercialization of emerging and underutilized energy efficiency and renewable energy technologies; and
(3) To increase the responsiveness of Federally funded technology development efforts to the needs of the marketplace.

§ 420.31 Notice of availability.
(a) If in any fiscal year DOE has funds available for special projects, DOE shall publish in the Federal Register one or more notice(s) of availability of SEP special projects financial assistance.
(b) Each notice of availability shall cite this part and shall include:
(1) Brief descriptions of the activities for which funding is available;
(2) The amount of money DOE has available or estimates it will have available for award for each type of activity, and the total amount available;
(3) The program official to contact for additional information, application forms, and the program guidance/solicitation document; and
(4) The dates when:
   (i) The program guidance/solicitation will be available; and
   (ii) The applications for financial assistance must be received by DOE.

§ 420.32 Program guidance/solicitation.
After the publication of the notice of availability in the Federal Register, DOE shall, upon request, provide States interested in applying for one or more project(s) under the special projects financial assistance with a detailed program guidance/solicitation that will include:
(a) The control number of the program;
(b) The expected duration of DOE support or period of performance;
(c) An application form or the format to be used, location for application submission, and number of copies required;
(d) The name of the DOE program office contact from whom to seek additional information;
(e) Detailed descriptions of each type of program activity for which financial assistance is being offered;
(f) The amount of money available for award, together with any limitations as to maximum or minimum amounts expected to be awarded;
(g) Deadlines for submitting applications;
(h) Evaluation criteria that DOE will apply in the selection and ranking process for applications for each program activity;
(i) The evaluation process to be applied to each type of program activity;
(j) A listing of program policy factors if any that DOE may use in the final selection process, in addition to the results of the evaluations, including:
   (1) The importance and relevance of the proposed applications to SEP and the participating programs in the Office of Energy Efficiency and Renewable Energy; and
   (2) Geographical diversity;
(k) Reporting requirements;
(l) References to:
   (1) Statutory authority for the program;
   (2) Applicable rules; and
§ 420.33 Application requirements.

(a) Consistent with § 420.32 of this part, DOE shall set forth general and special project activity-specific requirements for applications for special projects financial assistance in the program guidance/solicitation.

(b) In addition to any other requirements, all applications shall provide:

1. A detailed description of the proposed project, including the objectives of the project in relationship to DOE's program and the State's plan for carrying it out;

2. A detailed budget for the entire proposed period of support, with written justification sufficient to evaluate the itemized list of costs provided on the entire project; and

3. An implementation schedule for carrying out the project.

(c) DOE may, subsequent to receipt of an application, request additional budgetary information from a State when necessary for clarification or to make informed preaward determinations.

(d) DOE may return an application which does not include all information and documentation required by this subpart, 10 CFR part 600, or the program guidance/solicitation, when the nature of the omission precludes review of the application.

§ 420.34 Matching contributions or cost-sharing.

DOE may require (as set forth in the program guidance/solicitation) States to provide either:

(a) A matching contribution of at least a specified percentage of the Federal financial assistance award; or

(b) A specified share of the total cost of the project for which financial assistance is provided.

§ 420.35 Application evaluation.

(a) DOE staff at the cognizant Regional Office shall perform an initial review of all applications to ensure that the State has provided the information required by this subpart, 10 CFR part 600, and the program guidance/solicitation.

(b) DOE shall group, and technically evaluate according to program activity, all applications determined to be complete and satisfactory.

(c) DOE shall select evaluators on the basis of their professional qualifications and expertise relating to the particular program activity being evaluated.

1. DOE anticipates that evaluators will primarily be DOE employees; but

2. If DOE uses non-DOE evaluators, DOE shall require them to comply with all applicable DOE rules or directives concerning the use of outside evaluators.

[61 FR 35895, July 8, 1996, as amended at 64 FR 46114, Aug. 24, 1999]

§ 420.36 Evaluation criteria.

The evaluation criteria, including program activity-specific criteria, will be set forth in the program guidance/solicitation document.

§ 420.37 Selection.

(a) DOE may make selection of applications for award based on:

1. The findings of the technical evaluations;

2. The priorities of DOE, SEP, and the participating program offices;

3. The availability of funds for the various special project activities; and

4. Any program policy factors set forth in the program guidance/solicitation.

(b) The Director, Office of State and Community Programs makes the final selections of projects to be awarded financial assistance.

§ 420.38 Special projects expenditure prohibitions and limitations.

(a) Expenditures under the special projects are subject to 10 CFR part 600 and to any prohibitions and limitations required by the DOE programs that are providing the special projects funding.
(b) DOE must state any expenditure prohibitions or limitations specific to a particular category of special projects in the annual SEP special projects solicitation/guidance.

[64 FR 46114, Aug. 24, 1999]

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

Subpart A—General Provisions

Sec.
430.1 Purpose and scope.
430.2 Definitions.

Subpart B—Test Procedures

430.21 Purpose and scope.
430.22 Reference sources.
430.23 Test procedures for the measurement of energy and water consumption.
430.24 Units to be tested.
430.25 Laboratory Accreditation Program.
430.27 Petitions for waiver and applications for interim waiver.

APPENDIX A1 TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Electric Refrigerators and Electric Refrigerator-Freezers

APPENDIX B1 (ALTERNATIVE) TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Freezers

APPENDIX C TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Dishwashers

APPENDIX D TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Clothes Dryers

APPENDIX E TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Water Heaters

APPENDIX F TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Room Air Conditioners

APPENDIX G TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Unvented Home Heating Equipment

APPENDIX H TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Television Sets

APPENDIX I TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Conventional Ranges, Conventional Cooking Tops, Conventional Ovens, and Microwave Ovens

APPENDIX J TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Automatic and Semi-Automatic Clothes Washers

APPENDIX K TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Automatic and Semi-Automatic Clothes Washers

APPENDIXES K–L TO SUBPART B OF PART 430 [RESERVED]

APPENDIX M TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners

APPENDIX N TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Furnaces and Boilers

APPENDIX O TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Vented Home Heating Equipment

APPENDIX P TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Pool Heaters

APPENDIX Q TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Fluorescent Lamp Ballasts

APPENDIX R TO SUBPART B OF PART 430—Uniform Test Method for Measuring Average Lamp Efficacy (LE) and Color Rendering Index (CRI) of Electric Lamps

APPENDIX S TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Water Consumption of Faucets and Showerheads

APPENDIX T TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Water Consumption of Water Closets and Urinals

APPENDIX U TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Ceiling Fans

APPENDIX V TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Ceiling Fan Light Kits

APPENDIX W TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Medium Base Compact Fluorescent Lamps

APPENDIX X TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Dehumidifiers

APPENDIX Y TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of Battery Chargers

APPENDIX Z TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Energy Consumption of External Power Supplies
Subpart C—Energy and Water Conservation Standards

§ 430.2 Definitions.

For purposes of this part, words shall be defined as provided for in section 321 of the Act and as follows—

Annual fuel utilization efficiency means the efficiency descriptor for furnaces and boilers, determined using test procedures prescribed under section 323 and based on the assumption that all—

(a) Weatherized warm air furnaces or boilers are located out-of-doors;
(b) Warm air furnaces which are not weatherized are located indoors and all combustion and ventilation air is admitted through grill or ducts from the outdoors and does not communicate with air in the conditioned space; and
(c) Boilers which are not weatherized are located within the heated space.

ANSI means the American National Standards Institute.

ASME means the American Society of Mechanical Engineers.

Automatic clothes washer means a class of clothes washer which has a control system which is capable of scheduling a preselected combination of operations, such as regulation of water temperature, regulation of the water fill level, and performance of wash, rinse, drain, and spin functions without the need for user intervention.

Subpart A—General Provisions

§ 430.1 Purpose and scope.

§ 430.2 Definitions.

For purposes of this part, words shall be defined as provided for in section 321 of the Act and as follows—

Annual fuel utilization efficiency means the efficiency descriptor for furnaces and boilers, determined using test procedures prescribed under section 323 and based on the assumption that all—

(a) Weatherized warm air furnaces or boilers are located out-of-doors;
(b) Warm air furnaces which are not weatherized are located indoors and all combustion and ventilation air is admitted through grill or ducts from the outdoors and does not communicate with air in the conditioned space; and
(c) Boilers which are not weatherized are located within the heated space.

ANSI means the American National Standards Institute.

ASME means the American Society of Mechanical Engineers.

Automatic clothes washer means a class of clothes washer which has a control system which is capable of scheduling a preselected combination of operations, such as regulation of water temperature, regulation of the water fill level, and performance of wash, rinse, drain, and spin functions without the need for user intervention.
subsequent to the initiation of machine operation. Some models may require user intervention to initiate these different segments of the cycle after the machine has begun operation, but they do not require the user to intervene to regulate the water temperature by adjusting the external water faucet valves.

Ballast efficacy factor means the relative light output divided by the power input of a fluorescent lamp ballast, as measured under test conditions specified in ANSI Standard C82.2-1984.

Baseboard electric heater means an electric heater which is intended to be recessed in or surface mounted on walls at floor level, which is characterized by long, low physical dimensions, and which transfers heat by natural convection and/or radiation.

Basic model means all units of a given type of covered product (or class thereof) manufactured by one manufacturer and—

(1) With respect to refrigerators and refrigerator-freezers, which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(2) With respect to freezers, which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(3) With respect to dishwashers, which have electrical characteristics which are essentially identical and which do not have any differing physical or functional characteristics which affect energy consumption.

(4) With respect to clothes dryers, which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(5) With respect to water heaters, which have the same primary energy source and which, with the exception of immersed heating elements, do not have any differing electrical, physical, or functional characteristics that affect energy consumption.

(6) With respect to room air conditioners, having essentially identical functional physical and electrical characteristics.

(7) With respect to unvented home heating equipment, having essentially identical functional physical and electrical characteristics.

(8) With respect to television sets, which have identical screen size, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(9) With respect to kitchen ranges and ovens, whose major cooking components have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(10) With respect to clothes washers, which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(11) With respect to central air conditioners, which have electrical characteristics which are essentially identical and which do not have any differing physical or functional characteristics that affect energy consumption.

(12) With respect to furnaces, having the same primary energy source and essentially identical functional, physical and electrical characteristics.

(13) With respect to vented home heating equipment, having the same primary energy source and essentially identical functional, physical and electrical characteristics.

(14) With respect to fluorescent lamp ballasts, which have electrical characteristics, including a Power Factor (P.F.) of equal value, which are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(15) With respect to general service fluorescent lamps, means lamps that have essentially identical light output.
and electrical characteristics—including lumens per watt and color rendering index (CRI)—and that do not have any differing physical or functional characteristics that affect energy consumption or efficacy.

(16) With respect to incandescent reflector lamps, means lamps that have essentially identical light output and electrical characteristics—including lumens per watt—and that do not have any differing physical or functional characteristics that affect energy consumption or efficacy.

(17) With respect to faucets, which have the identical flow control mechanism attached to or installed within the fixture fittings, or the identical water-passage design features that use the same path of water in the highest-flow mode.

(18) With respect to showerheads, which have the identical flow control mechanism attached to or installed within the fixture fittings, or the identical water-passage design features that use the same path of water in the highest-flow mode.

(19) With respect to water closets, which have hydraulic characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect water consumption.

(20) With respect to urinals, which have hydraulic characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect water consumption.

(21) With respect to ceiling fans, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(22) With respect to ceiling fan light kits, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(23) With respect to medium base compact fluorescent lamps, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(24) With respect to dehumidifiers, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(25) With respect to battery chargers, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

(26) With respect to external power supplies, which have electrical characteristics that are essentially identical, and which do not have any differing physical or functional characteristics that affect energy consumption.

Batch means a collection of production units of a basic model from which a batch sample is selected.

Batch sample means the collection of units of the same basic model from which test units are selected.

Batch sample size means the number of units in a batch.

Batch size means the number of units in a batch.

Battery charger means a device that charges batteries for consumer products, including battery chargers embedded in other consumer products.

Blowout has the meaning given such a term in ASME A112.19.2M–1995. (See § 430.22)

BR incandescent reflector lamp means a reflector lamp that has a bulged section below the bulb’s major diameter and above its approximate base line as shown in Figure 1 (RB) on page 7 of ANSI C79.1–1994. A BR30 lamp has a lamp wattage of 85 or less and a BR40 lamp has a lamp wattage of 120 or less.

Btu means British thermal unit, which is the quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit.

Casement-only means a room air conditioner designed for mounting in a casement window with an encased assembly with a width of 14.8 inches or less and a height of 11.2 inches or less.

Casement-slider means a room air conditioner with an encased assembly designed for mounting in a sliding or casement window with a width of 15.5 inches or less.
Ceiling electric heater means an electric heater which is intended to be recessed in, surface mounted on, or hung from a ceiling, and which transfers heat by radiation and/or convection (either natural or forced).

Ceiling fan means a nonportable device that is suspended from a ceiling for circulating air via the rotation of fan blades.

Ceiling fan light kit means equipment designed to provide light from a ceiling fan that can be—
(1) Integral, such that the equipment is attached to the ceiling fan prior to the time of retail sale; or
(2) Attachable, such that at the time of retail sale the equipment is not physically attached to the ceiling fan, but may be included inside the ceiling fan at the time of sale or sold separately for subsequent attachment to the fan.

Central air conditioner means a product, other than a packaged terminal air conditioner, which is powered by single phase electric current, air cooled, rated below 65,000 Btu per hour, not contained within the same cabinet as a furnace, the rated capacity of which is above 225,000 Btu per hour, and is a heat pump or a cooling unit only.

Central system humidifier means a class of humidifier designed to add moisture into the air stream of a heating system.

Clothes washer means a consumer product designed to clean clothes, utilizing a water solution of soap and/or detergent and mechanical agitation or other movement, and must be one of the following classes: automatic clothes washers, semi-automatic clothes washers, and other clothes washers.

Coil family means a group of coils with the same basic design features that affect the heat exchanger performance. These features are the basic configuration, i.e., A-shape, V-shape, slanted or flat top, the heat transfer surfaces on refrigerant and air sides (flat tubes vs. grooved tubes, fin shapes), the tube and fin materials, and the coil circuitry. When a group of coils has all these features in common, it constitutes a “coil family.”

Cold temperature fluorescent lamp means a fluorescent lamp specifically designed to start at $-20^\circ F$ when used with a ballast conforming to the requirements of ANSI Standard C78.1-1991, and is expressly designated as a cold temperature lamp both in markings on the lamp and in marketing materials, including but not limited to catalogs, sales literature, and promotional material.

Colored fluorescent lamp means a fluorescent lamp designated and marketed as a colored lamp, and with either of the following characteristics: a CRI less than 40, as determined according to the method given in CIE Publication 13.2 (see 10 CFR 430.22), or a lamp correlated color temperature less than 2,500K or greater than 6,600K.

Colored incandescent lamp means an incandescent lamp designated and marketed as a colored lamp that has a CRI less than 50, as determined according to the method given in CIE Publication 13.2 (see 10 CFR 430.22); has a correlated color temperature less than 2,500K or greater than 4,600K; has a lens containing 5 percent or more neodymium oxide; or contains a filter to suppress yellow and green portions of the spectrum and is specifically designed, designated and marketed as a plant light.

Color Rendering Index or CRI means the measured degree of color shift objects undergo when illuminated by a light source as compared with the color of those same objects when illuminated by a reference source of comparable color temperature.

Color television set means an electrical device designed to convert incoming broadcast signals into color television pictures and associated sound.

Compact refrigerator/refrigerator-freezer/freezer means any refrigerator, refrigerator-freezer or freezer with total volume less than 7.75 cubic feet (220 liters)(rated volume as determined in Appendix A1 and B1 of subpart B of this part) and 36 inches (0.91 meters) or less in height.

Condenser-evaporator coil combination means a condensing unit made by one manufacturer and one of several evaporator coils, either manufactured by the same manufacturer or another manufacturer, intended to be combined with that particular condensing unit.
Condensing unit means a component of a central air conditioner which is designed to remove the heat absorbed by the refrigerant and to transfer it to the outside environment, and which consists of an outdoor coil, compressor(s), and air moving device.

Consumer product means any article (other than an automobile, as defined in Section 501(1) of the Motor Vehicle Information and Cost Savings Act):

(1) Of a type—
   (i) Which in operation consumes, or is designed to consume, energy or, with respect to showerheads, faucets, water closets, and urinals, water; and
   (ii) Which, to any significant extent, is distributed in commerce for personal use or consumption by individuals;
(2) Without regard to whether such article of such type is in fact distributed in commerce for personal use or consumption by an individual, except that such term includes fluorescent lamp ballasts, general service fluorescent lamps, incandescent reflector lamps, showerheads, faucets, water closets, and urinals distributed in commerce for personal or commercial use or consumption.

Conventional cooking top means a class of kitchen ranges and ovens which is a household cooking appliance consisting of a horizontal surface containing one or more surface units which include either a gas flame or electric resistance heating.

Conventional oven means a class of kitchen ranges and ovens which is a household cooking appliance consisting of one or more compartments intended for the cooking or heating of food by means of either a gas flame or electric resistance heating. It does not include portable or countertop ovens which use electric resistance heating for the cooking or heating of food and are designed for an electrical supply of approximately 120 volts.

Conventional range means a class of kitchen ranges and ovens which is a household cooking appliance consisting of one or more compartments intended for the cooking or heating of food by means of either a gas flame or electric resistance heating. It does not include portable or countertop ovens which use electric resistance heating for the cooking or heating of food and are designed for an electrical supply of approximately 120 volts.

Convertible cooking appliance means any kitchen range and oven which is a household cooking appliance designed by the manufacturer to be changed in service from use with natural gas to use with LP-gas, and vice versa, by incorporating in the appliance convertible orifices for the main gas burners and a convertible gas pressure regulator.

Cooking products means consumer products that are used as the major household cooking appliances. They are designed to cook or heat different types of food by one or more of the following sources of heat: gas, electricity, or microwave energy. Each product may consist of a horizontal cooking top containing one or more surface units and/or one or more heating compartments. They must be one of the following classes: conventional ranges, conventional cooking tops, conventional ovens, microwave ovens, microwave/conventional ranges and other cooking products.

Correlated color temperature means the absolute temperature of a blackbody whose chromaticity most nearly resembles that of the light source.

Covered product means a consumer product:

(1) Of a type specified in section 322 of the Act, or
(2) That is a ceiling fan, ceiling fan light kit, medium base compact fluorescent lamp, dehumidifier, battery charger, external power supply, or torchiere.

Dehumidifier means a self-contained, electrically operated, and mechanically refrigerated encased assembly consisting of—

(1) A refrigerated surface (evaporator) that condenses moisture from the atmosphere;
(2) A refrigerating system, including an electric motor;
(3) An air-circulating fan; and
(4) Means for collecting or disposing of the condensate.

Design voltage with respect to an incandescent lamp means:

(1) The voltage marked as the intended operating voltage;
(2) The mid-point of the voltage range if the lamp is marked with a voltage range; or
(3) 120 V if the lamp is not marked with a voltage or voltage range.

Direct vent system means a system supplied by a manufacturer which provides outdoor air or air from an unheated space (such as an attic or
crawlspace) directly to a furnace or vented heater for combustion and for draft relief if the unit is equipped with a draft control device.

Dishwasher means a cabinet-like appliance which with the aid of water and detergent, washes, rinses, and dries (when a drying process is included) dishware, glassware, eating utensils, and most cooking utensils by chemical, mechanical and/or electrical means and discharges to the plumbing drainage system.

DOE means the Department of Energy.

Electric boiler means an electrically powered furnace designed to supply low pressure steam or hot water for space heating application. A low pressure steam boiler operates at or below 15 pounds per square inch gauge (psig) steam pressure; a hot water boiler operates at or below 160 psig water pressure and 250 °F. water temperature.

Electric central furnace means a furnace designed to supply heat through a system of ducts with air as the heating medium, in which heat is generated by one or more electric resistance heating elements and the heated air is circulated by means of a fan or blower.

Electric clothes dryer means a cabinet-like appliance designed to dry fabrics in a tumbler-type drum with forced air circulation. The heat source is electricity and the drum and blower(s) are driven by an electric motor(s).

Electric heater means an electric appliance in which heat is generated from electrical energy and dissipated by convection and radiation and includes baseboard electric heaters, ceiling electric heaters, floor electric heaters, portable electric heaters, and wall electric heaters.

Electric refrigerator means a cabinet designed for the refrigerated storage of food at temperatures above 32 °F and below 39 °F, configured for general refrigerated food storage, and having a source of refrigeration requiring single phase, alternating current electric energy input only. An electric refrigerator may include a compartment for the freezing and storage of food at temperatures below 32 °F, but does not provide a separate low temperature compartment designed for the freezing and storage of food at temperatures below 8 °F.

Electric refrigerator-freezer means a cabinet which consists of two or more compartments with at least one of the compartments designed for the refrigerated storage of food at temperatures above 32 °F and with at least one of the compartments designed for the freezing and storage of food at temperatures below 8 °F which may be adjusted by the user to a temperature of 0 °F or below. The source of refrigeration requires single phase, alternating current electric energy input only.

Electromechanical hydraulic toilet means any water closet that utilizes electrically operated devices, such as, but not limited to, air compressors, pumps, solenoids, motors, or macerators in place of or to aid gravity in evacuating waste from the toilet bowl.

Energy conservation standard means:
(1) A performance standard which prescribes a minimum level of energy efficiency or a maximum quantity of energy use, or, in the case of showerheads, faucets, water closets, and urinals, water use, for a covered product, determined in accordance with test procedures prescribed under Section 323 of EPCA (42 U.S.C. 6293); or
(2) A design requirement for the products specified in paragraphs (6), (7), (8), (10), (15), (16), (17), and (19) of Section 322(a) of EPCA (42 U.S.C. 6292(a)); and
(3) Includes any other requirements which the Secretary may prescribe under Section 325(r) of EPCA (42 U.S.C. 6295(r)).

ER incandescent reflector lamp means a reflector lamp with an elliptical section below the bulb's major diameter and above its approximate baseline as shown in Figure 1 (RE) on page 7 of ANSI C79.1-1994 (see 10 CFR 430.22) and a finished size and shape shown in ANSI C78.21-1989 including the referenced reflective characteristics in part 7 of ANSI C78.21-1989 (see 10 CFR 430.22).

Estimated annual operating cost means the aggregate retail cost of the energy which is likely to be consumed annually, and in the case of showerheads, faucets, water closets, and urinals, the aggregate retail cost of water and wastewater treatment services likely
to be incurred annually, in representative use of a consumer product, determined in accordance with Section 323 of EPCA (42 U.S.C. 6293).

Evaporator coil means a component of a central air conditioner which is designed to absorb heat from an enclosed space and transfer the heat to a refrigerant.

External power supply means an external power supply circuit that is used to convert household electric current into DC current or lower-voltage AC current to operate a consumer product.

Faucet means a lavatory faucet, kitchen faucet, metering faucet, or replacement aerator for a lavatory or kitchen faucet.

Floor electric heater means an electric heater which is intended to be recessed in a floor, and which transfers by radiation and/or convection (either natural or forced).

Fluorescent lamp means a low pressure mercury electric-discharge source in which a fluorescing coating transforms some of the ultraviolet energy generated by the mercury discharge into light, including only the following:

(1) Any straight-shaped lamp (commonly referred to as 4-foot medium bi-pin lamps) with medium bi-pin bases of nominal overall length of 48 inches and rated wattage of 28 or more.

(2) Any U-shaped lamp (commonly referred to as 2-foot U-shaped lamps) with medium bi-pin bases of nominal overall length between 22 and 25 inches and rated wattage of 28 or more.

(3) Any rapid start lamp (commonly referred to as 8-foot high output lamps) with recessed double contact bases of nominal overall length of 96 inches and 0.800 nominal amperes, as defined in ANSI C78.1-1991.

(4) Any instant start lamp (commonly referred to as 8-foot slimline lamps) with single pin bases of nominal overall length of 96 inches and rated wattage of 52 or more, as defined in ANSI C78.3-1991.

Fluorescent lamp ballast means a device which is used to start and operate fluorescent lamps by providing a starting voltage and current and limiting the current during normal operation.

Flushometer tank means a device whose function is defined in flushometer valve, but integrated within an accumulator vessel affixed and adjacent to the fixture inlet so as to cause an effective enlargement of the supply line immediately before the unit.

Flushometer valve means a valve attached to a pressurized water supply pipe and so designed that when actuated, it opens the line for direct flow into the fixture at a rate and quantity to properly operate the fixture, and then gradually closes to provide trap reseal in the fixture in order to avoid water hammer. The pipe to which this device is connected is in itself of sufficient size, that when open, will allow the device to deliver water at a sufficient rate of flow for flushing purposes.

Forced air central furnace means a gas or oil burning furnace designed to supply heat through a system of ducts with air as the heating medium. The heat generated by combustion of gas or oil is transferred to the air within a casing by conduction through heat exchange surfaces and is circulated through the duct system by means of a fan or blower.

Freezer means a cabinet designed as a unit for the freezing and storage of food at temperatures of 0°F. or below, and having a source of refrigeration requiring single phase, alternating current electric energy input only.

Furnace means a product which utilizes only single-phase electric current, or single-phase electric current or DC current in conjunction with natural gas, propane, or home heating oil, and which—

(a) Is designed to be the principal heating source for the living space of a residence;

(b) Is not contained within the same cabinet with a central air conditioner whose rated cooling capacity is above 65,000 Btu per hour;

(c) Is an electric central furnace, electric boiler, forced-air central furnace, gravity central furnace, or low pressure steam or hot water boiler; and

(d) Has a heat input rate of less than 300,000 Btu per hour for electric boilers and low pressure steam or hot water boilers and less than 225,000 Btu per hour for forced-air central furnaces, gravity central furnaces, and electric
central furnaces, gravity central furnaces, and electric central furnaces.

Gas means either natural gas or propane.

Gas clothes dryer means a cabinet-like appliance designed to dry fabrics in a tumble-type drum with forced air circulation. The heat source is gas and the drum and blower(s) are driven by an electric motor(s).

General Service Fluorescent Lamp means any fluorescent lamp which can be used to satisfy the majority of fluorescent lighting applications, but does not include any lamp designed and marketed for the following nongeneral applications:

1. Fluorescent lamps designed to promote plant growth.
2. Fluorescent lamps specifically designed for cold temperature applications.
3. Colored fluorescent lamps.
4. Impact-resistant fluorescent lamps.
5. Reflectorized or aperture lamps.
6. Fluorescent lamps designed for use in reprographic equipment.
7. Lamps primarily designed to produce radiation in the ultra-violet region of the spectrum.
8. Lamps with a Color Rendering Index of 82 or greater.

General Service Incandescent Lamp means any incandescent lamp (other than a miniature or photographic lamp) that has an E26 medium screw base, a rated voltage range at least partially within 115 to 130 volts, and which can be used to satisfy the majority of lighting applications, but does not include any lamps specifically designed for:

1. Traffic signal, or street lighting service;
2. Airway, airport, aircraft, or other aviation service;
3. Marine, or marine signal service;
4. Photo, projection, sound reproduction, or film viewer service;
5. Stage, studio, or television service;
6. Mill, saw mill, or other industrial process service;
7. Mine service;
8. Headlight, locomotive, street railway, or other transportation service;
9. Heating service;
10. Code beacon, marine signal, lighthouse, reprographic, or other communication service;
11. Medical or dental service;
12. Microscope, map, microfilm, or other specialized equipment service;
13. Swimming pool, or other underwater service;
14. Decorative or showcase service;
15. Producing colored light;
16. Shatter resistance which has an external protective coating; or
17. Appliance service.

Gravity central furnace means a gas fueled furnace which depends primarily on natural convection for circulation of heated air and which is designed to be used in conjunction with a system of ducts.

Heat pump means a product, other than a packaged terminal heat pump, which consists of one or more assemblies, powered by single phase electric current, rated below 65,000 Btu per hour, utilizing an indoor conditioning coil, compressor, and refrigerant-to-outdoor air heat exchanger to provide air heating, and may also provide air cooling, dehumidifying, humidifying circulating, and air cleaning.

Home heating equipment, not including furnaces means vented home heating equipment and unvented home heating equipment.

Immersed heating element means an electrically powered heating device which is designed to operate while totally immersed in water in such a manner that the heat generated by the device is imparted directly to the water.

Incandescent lamp means a lamp in which light is produced by a filament heated to incandescence by an electric current, including only the following:

1. Any lamp (commonly referred to as lower wattage non-reflector general service lamps, including any tungsten halogen lamp) that has a rated wattage between 30 and 199, has an E26 medium screw base, has a rated voltage or voltage range that lies at least partially in the range of 115 and 130 volts, and is not a reflector lamp.

2. Any incandescent reflector lamp.

3. Any general service incandescent lamp (commonly referred to as a high- or higher-wattage lamp) that has a rated wattage above 199 (above 205 for a high wattage reflector lamp).
Incandescent reflector lamp (commonly referred to as a reflector lamp) means any lamp in which light is produced by a filament heated to incandescence by an electric current, which: is not colored or designed for rough or vibration service applications that contains an inner reflective coating on the outer bulb to direct the light; has an R, PAR or similar bulb shape (excluding ER or BR) with an E26 medium screw base; has a rated voltage or voltage range that lies at least partially in the range of 115 and 130 volts; has a diameter that exceeds 2.75 inches; and is either a low(er)-wattage reflector lamp that has a rated wattage between 40 and 205; or a high(er)-wattage reflector lamp that has a rated wattage above 205.

Kerosene means No. 1 fuel oil with a viscosity meeting the specifications as specified in UL–730–1974, section 36.9 and in tables 2 and 3 of ANSI Standard Z91.1–1972.

Lamp Efficacy (LE) means the measured lumen output of a lamp in lumens divided by the measured lamp electrical power input in watts expressed in units of lumens per watt (LPW).

Low consumption has the meaning given such a term in ASME A112.19.2M–1995. (see §430.22)

Low pressure steam or hot water boiler means an electric, gas or oil burning furnace designed to supply low pressure steam or hot water for space heating application. A low pressure steam boiler operates at or below 15 pounds psig steam pressure; a hot water boiler operates at or below 160 psig water pressure and 250 °F. water temperature.

LP-gas means liquified petroleum gas, and includes propane, butane, and propane/butane mixtures.

Major cooking component means either a conventional cooking top, a conventional oven or a microwave oven.

Manufacturer means any person who manufactures a consumer product.

Medium base compact fluorescent lamp means an integrally ballasted fluorescent lamp with a medium screw base, a rated input voltage range of 115 to 130 volts and which is designed as a direct replacement for a general service incandescent lamp; however, the term does not include—

(i) Any lamp that is—

(1) Specifically designed to be used for special purpose applications; and
(ii) Unlikely to be used in general purpose applications, such as the applications described in the definition of “General Service Incandescent Lamp” in this section; or
(2) Any lamp not described in the definition of “General Service Incandescent Lamp” in this section that is excluded by the Secretary, by rule, because the lamp is—

(i) Designed for special applications; and
(ii) Unlikely to be used in general purpose applications.

Microwave/conventional range means a class of kitchen ranges and ovens which is a household cooking appliance consisting of a microwave oven, a conventional oven, and a conventional cooking top.

Microwave oven means a class of kitchen ranges and ovens which is a household cooking appliance consisting of a compartment designed to cook or heat food by means of microwave energy.

Mobile home furnace means a direct vent furnace that is designed for use only in mobile homes.

Monochrome television set means an electrical device designed to convert incoming broadcast signals into monochrome television pictures and associated sound.

Natural gas means natural gas as defined by the Federal Power Commission.

Oil means heating oil grade No. 2 as defined in American Society for Testing and Materials (ASTM) D396–71.

Other clothes washer means a class of clothes washer which is not an automatic or semi-automatic clothes washer.

Other cooking products means any class of cooking products other than the conventional range, conventional cooking top, conventional oven, microwave oven, and microwave/conventional range classes.
§ 430.2

Outdoor furnace or boiler is a furnace or boiler normally intended for installation out-of-doors or in an unheated space (such as an attic or a crawl space).

Packaged terminal air conditioner means a wall sleeve and a separate unencased combination of heating and cooling assemblies specified by the builder and intended for mounting through the wall. It includes a prime source of refrigeration, separable outdoor louvers, forced ventilation, and heating availability energy.

Packaged terminal heat pump means a packaged terminal air conditioner that utilizes reverse cycle refrigeration as its prime heat source and should have supplementary heating availability by builder’s choice of energy.

Person includes any individual, corporation, company, association, firm, partnership, society, trust, joint venture or joint stock company, the government, and any agency of the United States or any State or political subdivision thereof.

Pin-based means (1) the base of a fluorescent lamp, that is not integrally ballasted and that has a plug-in lamp base, including multi-tube, multibend, spiral, and circline types, or (2) a socket that holds such a lamp.

Pool heater means an appliance designed for heating nonpotable water contained at atmospheric pressure, including heating water in swimming pools, spas, hot tubs and similar applications.

Portable electric heater means an electric heater which is intended to stand unsupported, and can be moved from place to place within a structure. It is connected to electric supply by means of a cord and plug, and transfers heat by radiation and/or convention (either natural or forced).

Primary heater means a heating device that is the principal source of heat for a structure and includes baseboard electric heaters, ceiling electric heaters, and wall electric heaters.

Propane means a hydrocarbon whose chemical composition is predominantly C\textsubscript{3}H\textsubscript{8}, whether recovered from natural gas or crude oil.

Rated voltage with respect to incandescent lamps means:

(1) The design voltage if the design voltage is 115 V, 130 V or between 115 V and 130 V:
   (2) 115 V if the design voltage is less than 115 V and greater than or equal to 100 V and the lamp can operate at 115 V; and
   (3) 130 V if the design voltage is greater than 130 V and less than or equal to 150 V and the lamp can operate at 130 V.

Rated wattage, with respect to 4-foot medium bi-pin T8, T10 or T12 lamps, means:

(1) If the lamp is listed in ANSI C78.1–1991, the nominal wattage of a lamp determined by the lamp designation in Annex A.2 of ANSI C78.1–1991; or
(2) If the lamp is a residential straight-shaped lamp, the wattage a lamp consumes when operated on a reference ballast for which the lamp is designed; or
(3) If the lamp is neither listed in ANSI C78.1–1991 nor a residential straight-shaped lamp, the wattage a lamp consumes when using reference ballast characteristics of 236 volts, 0.43 amps and 439 ohms for T10 or T12 lamps or reference ballast characteristics of 300 volts, 0.265 amps and 910 ohms for T8 lamps.

Refrigerator means an electric refrigerator.

Refrigerator-freezer means an electric refrigerator-freezer.

Replacement ballast means a ballast that—

(1) Is designed for use to replace an existing fluorescent lamp ballast in a previously installed luminaire;
(2) Is marked “FOR REPLACEMENT USE ONLY”;
(3) Is shipped by the manufacturer in packages containing not more than 10 fluorescent lamp ballasts; and
(4) Has output leads that when fully extended are a total length that is less than the length of the lamp with which the ballast is intended to be operated.

Residential straight-shaped lamp means a low pressure mercury electric-discharge source in which a fluorescing coating transforms some of the ultraviolet energy generated by the mercury discharge into light, including a straight-shaped fluorescent lamp with medium bi-pin bases of nominal overall
length of 48 inches and is either designed exclusively for residential applications; or designed primarily and marketed exclusively for residential applications.

(1) A lamp is designed exclusively for residential applications if it will not function for more than 100 hours with a commercial high-power-factor ballast.

(2) A lamp is designed primarily and marketed exclusively for residential applications if:
   (i) Is permanently and clearly marked as being for residential use only;
   (ii) Has a life of 6,000 hours or less when used with a commercial high-power-factor ballast;
   (iii) Is not labeled or represented as a replacement for a fluorescent lamp that is a covered product; and
   (iv) Is marketed and distributed in a manner designed to minimize use of the lamp with commercial high-power-factor ballasts.

(3) A manufacturer may market and distribute a lamp in a manner designed to minimize use of the lamp with commercial high-power-factor ballasts by:
   (i) Packaging and labeling the lamp in a manner that clearly indicates the lamp is for residential use only and includes appropriate instructions concerning proper and improper use; if the lamp is included in a catalog or price list that also includes commercial/industrial lamps, listing the lamp in a separate residential section accompanied by notes about proper use on the same page; and providing as part of any express warranty accompanying the lamp that improper use voids such warranty; or
   (ii) Using other comparably effective measures to minimize use with commercial high-power-factor ballasts.

Room air conditioner means a consumer product, other than a “packaged terminal air conditioner,” which is powered by a single phase electric current and which is an encased assembly designed as a unit for mounting in a window or through the wall for the purpose of providing delivery of conditioned air to an enclosed space. It includes a prime source of refrigeration and may include a means for ventilating and heating.

Rough or vibration service incandescent reflector lamp means a reflector lamp: in which a C–11 (5 support), C–17 (8 support), or C–22 (16 support) filament is mounted (the number of support excludes lead wires); in which the filament configuration is as shown in Chapter 6 of the 1993 Illuminating Engineering Society of North America Lighting Handbook, 8th Edition (see 10 CFR 430.22); and that is designated and marketed specifically for rough or vibration service applications.

Secretary means the Secretary of the Department of Energy.

Semi-automatic clothes washer means a class of clothes washer that is the same as an automatic clothes washer except that user intervention is required to regulate the water temperature by adjusting the external water faucet valves.

Showerhead means any showerhead (including a hand held showerhead), except a safety shower showerhead.

Small duct, high velocity system means a heating and cooling product that contains a blower and indoor coil combination that:
   (1) Is designed for, and produces, at least 1.2 inches of external static pressure when operated at the certified air volume rate of 220–350 CFM per rated ton of cooling; and
   (2) When applied in the field, uses high velocity room outlets generally greater than 1000 fpm which have less than 6.0 square inches of free area.

Space constrained product means a central air conditioner or heat pump:
   (1) That has rated cooling capacities no greater than 30,000 BTU/hr;
   (2) That has an outdoor or indoor unit having at least two overall exterior dimensions or an overall displacement that:
      (i) Is substantially smaller than those of other units that are:
         (A) Currently usually installed in site-built single family homes; and
         (B) Of a similar cooling, and, if a heat pump, heating capacity; and
      (ii) If increased, would certainly result in a considerable increase in the usual cost of installation or would certainly result in a significant loss in the utility of the product to the consumer; and
§430.2  10 CFR Ch. II (1–1–08 Edition)

(3) Of a product type that was available for purchase in the United States as of December 1, 2000.

State means a State, the District of Columbia, Puerto Rico, or any territory or possession of the United States.

State regulation means a law or regulation of a State or political subdivision thereof.

Supplementary heater means a heating device that provides heat to a space in addition to that which is supplied by a primary heater. Supplementary heaters include portable electric heaters.

Surface unit means either a heating unit mounted in a cooking top, or a heating source and its associated heated area of the cooking top, on which vessels are placed for the cooking or heating of food.

Television set means a color television set or a monochrome television set.

Through-the-wall air conditioner and heat pump means a central air conditioner or heat pump that is designed to be installed totally or partially within a fixed-size opening in an exterior wall, and:

(1) Is manufactured prior to January 23, 2010;
(2) Is not weatherized;
(3) Is clearly and permanently marked for installation only through an exterior wall;
(4) Has a rated cooling capacity no greater than 30,000 Btu/hr;
(5) Exchanges all of its outdoor air across a single surface of the equipment cabinet; and
(6) Has a combined outdoor air exchange area of less than 800 square inches (split systems) or less than 1,210 square inches (single packaged systems) as measured on the surface described in paragraph (5) of this definition.

Torchiere means a portable electric lamp with a reflector bowl that directs light upward to give indirect illumination.

Unvented gas heater means an unvented, self-contained, free-standing, nonrecessed gas-burning appliance which furnishes warm air by gravity or fan circulation.

Unvented home heating equipment means a class of home heating equipment not including furnaces, used for the purpose of furnishing heat to a space proximate to such heater directly from the heater and without duct connections and includes electric heaters and unvented gas and oil heaters.

Unvented oil heater means an unvented, self-contained, free-standing, nonrecessed oil-burning appliance which furnishes warm air by gravity or fan circulation.

Urinal means a plumbing fixture which receives only liquid body waste and, on demand, conveys the waste through a trap seal into a gravity drainage system, except such term does not include fixtures designed for installations in prisons.

Vented floor furnace means a self-contained vented heater suspended from the floor of the space being heated, taking air for combustion from outside this space. The vented floor furnace supplies heated air circulated by gravity or by a fan directly into the space to be heated through openings in the casing.

Vented home heating equipment or vented heater means a class of home heating equipment, not including furnaces, designed to furnish warmed air to the living space of a residence, directly from the device, without duct connections (except that boots not to exceed 10 inches beyond the casing may be permitted) and includes: vented wall furnace, vented floor furnace, and vented room heater.

Vented room heater means a self-contained, free standing, nonrecessed, vented heater for furnishing warmed air to the space in which it is installed. The vented room heater supplies heated air circulated by gravity or by a fan directly into the space to be heated through openings in the casing.

Vented wall furnace means a self-contained vented heater complete with grilles or the equivalent, designed for incorporation in, or permanent attachment to, a wall of a residence and furnishing heated air circulated by gravity or by a fan directly into the space to be heated through openings in the casing.

Voltage range means a band of operating voltages as marked on an incandescent lamp, indicating that the lamp is designed to operate at any voltage within the band.
Wall electric heater means an electric heater (excluding baseboard electric heaters) which is intended to be recessed in or surface mounted on walls, which transfers heat by radiation and/or convection (either natural or forced) and which includes forced convectors, natural convectors, radiant heaters, high wall or valance heaters.

Water closet means a plumbing fixture that has a water-containing receptor which receives liquid and solid body waste, and upon actuation, conveys the waste through an exposed integral trap seal into a gravity drainage system, except such term does not include fixtures designed for installation in prisons.

Water heater means a product which utilizes oil, gas, or electricity to heat potable water for use outside the heater upon demand, including—

(a) Storage type units which heat and store water at a thermostatically controlled temperature, including gas storage water heaters with an input of 75,000 Btu per hour or less, oil storage water heaters with an input of 105,000 Btu per hour or less, and electric storage water heaters with an input of 12 kilowatts or less;

(b) Instantaneous type units which heat water but contain no more than one gallon of water per 4,000 Btu per hour of input, including gas instantaneous water heaters with an input of 200,000 Btu per hour or less, oil instantaneous water heaters with an input of 210,000 Btu per hour or less, and electric instantaneous water heaters with an input of 12 kilowatts or less; and

(c) Heat pump type units, with a maximum current rating of 24 amperes at a voltage no greater than 250 volts, which are products designed to transfer thermal energy from one temperature level to a higher temperature level for the purpose of heating water, including all ancillary equipment such as fans, storage tanks, pumps, or controls necessary for the device to perform its function.

Water use means the quantity of water flowing through a showerhead, faucet, water closet, or urinal at point of use, determined in accordance with test procedures under Appendices S and T of subpart B of this part.

Weatherized warm air furnace or boiler means a furnace or boiler designed for installation outdoors, approved for resistance to wind, rain, and snow, and supplied with its own venting system.

[42 FR 27988, June 1, 1977]

EDITORIAL NOTE: For Federal Register citations affecting §430.2, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.

EFFECTIVE DATE NOTE: At 72 FR 59919, Oct. 22, 2007, §430.2 was amended by adding definitions of "ARM/simulation adjustment factor," "indoor unit," "outdoor unit," "private labeler," and "tested combination," effective Apr. 21, 2008. For the convenience of the user, the added text is set forth as follows:

§430.2 Definitions.

* * * * *

ARM/simulation adjustment factor means a factor used as part of a DOE-approved alternative rating method (ARM) to improve the accuracy of the calculated ratings for untested split-system central air conditioners or heat pumps. The adjustment factor associated with each outdoor unit must be set such that it reduces the difference between the SEER (HSPF) determined using the ARM and a split-system combination tested in accordance with §430.24(m)(1). The ARM/simulation adjustment factor is an integral part of the ARM and must be a DOE-approved element in accordance with 10 CFR 430.24(m)(4) to (m)(6).

* * * * *

Indoor unit means a component of a split-system central air conditioner or heat pump that is designed to transfer heat between the refrigerant and the indoor air, and which consists of an indoor coil, a cooling mode expansion device, and may include an air moving device.

* * * * *

Outdoor unit means a component of a split-system central air conditioner or heat pump that is designed to transfer heat between the refrigerant and the outdoor air, and which consists of an outdoor coil, compressor(s), an air moving device, and in addition for heat pumps, a heating mode expansion device, reversing valve, and defrost controls.

* * * * *

Private labeler means an owner of a brand or trademark on the label of a consumer
product which bears a private label. A consumer product bears a private label if:

1. Such product (or its container) is labeled with the brand or trademark of a person other than a manufacturer of such product;
2. The person with whose brand or trademark such product (or container) is labeled has authorized or caused such product to be so labeled; and
3. The brand or trademark of a manufacturer of such product does not appear on such label.

Tested combination means a multi-split system with multiple indoor coils having the following features:

1. The basic model of a system used as a tested combination shall consist of one outdoor unit, with one or more compressors, that is matched with between 2 and 5 indoor units; for multi-split systems, each of these indoor units shall be designed for individual operation.
2. The indoor units shall—
   a. Represent the highest sales model family, or another indoor model family if the highest sales model family does not provide sufficient capacity (see ii);
   b. Together, have a nominal capacity that is greater than 50% of the nominal capacity of the outdoor unit;
   c. Not, individually, have a capacity that is greater than 50% of the nominal capacity of the outdoor unit;
   d. Operate at fan speeds that are consistent with the manufacturer's specifications; and
   e. All be subject to the same minimum external static pressure requirement (i.e., 0 inches of water column for non-ducted, see Table 2 in Appendix M to Subpart B of this part for ducted indoor units) while being configurable to produce the same static pressure at the exit of each outlet plenum when manifolded as per section 2.4.1 of Appendix M.

Subpart B—Test Procedures

§ 430.21 Purpose and scope.

This subpart contains test procedures required to be prescribed by DOE pursuant to section 323 of the Act.

§ 430.22 Reference Sources.

(a) Materials incorporated by reference—(1) General. The following standards which are not otherwise set forth in Part 430 are incorporated by reference and made a part of Part 430. The standards listed in this section have been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. The specified versions of the standards are incorporated, and any subsequent amendment to a standard by the standard-setting organization will not affect the DOE test procedures unless and until those test procedures are amended by DOE.

(b) Availability of standards. The standards incorporated by reference are available for inspection at:

(b)(1) American National Standards Institute (ANSI). The ANSI standards listed in this paragraph may be obtained from the American National Standards Institute, 25 W. 43rd Street, 4th Floor, New York, NY 10036, (212) 642–4900.

1. ANSI C78.1–1991, “for Fluorescent Lamps—Rapid-Start Types—Dimensional and Electrical Characteristics”
2. ANSI C78.2–1991, “for Fluorescent Lamps—Preheat-Start Types—Dimensional and Electrical Characteristics of Fluorescent Lamps”
3. ANSI C78.3–1991, “for Fluorescent Lamps—Instant-Start and Cold-Cathode Types—Dimensional and Electrical Characteristics”
5. ANSI C82.3–1983 “for Reference Ballasts for Fluorescent Lamps”
7. ANSI C78.21–1989, “Incandescent Lamps—PAR and R Shapes”

(2) Illuminating Engineering Society of North America (IESNA). The IESNA standards listed in this paragraph may
be obtained from the Illuminating Engineering Society of North America, 120 Wall Street, Floor 17, New York, NY 10005–4001, (212) 248–5000.

(3) International Commission on Illumination (CIE). The CIE standards listed in this paragraph may be obtained from the International Commission on Illumination, CIE Bureau Central, Kegelgasse 27, A-1030, Vienna, Austria. CIE publications are also available from TLA Lighting Consultants, 7 Pond Street, Salem, MA 10970, (508) 745–6870.

1. American National Standards Institute/ American Society of Heating, Refrigerating, and Air-Conditioning Engineers Standard 103–1993, "Methods of Testing for Annual Fuel Utilization Efficiency of Residential Central Furnaces and Boilers," with Errata of October 24, 1996 except for sections 3.0, 7.2.2.5, 8.6.1.1, 9.1.2.2, 9.5.1.1, 9.5.1.2.1, 9.5.1.2.2, 9.5.2.1, 9.7.1, 10.0, 11.2.12, 11.3.12, 11.4.12, 11.5.12 and appendices B and C.

§ 430.23 10 CFR Ch. II (1–1–08 Edition)

(6) American Society of Mechanical Engineers (ASME). The ASME standards listed in this paragraph may be obtained from the American Society of Mechanical Engineers, Service Center, 22 Law Drive, P.O. Box 2900, Fairfield, NJ 07007.

(9) Environmental Protection Agency (EPA), Ariel Rios Building, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, (202) 272–0167.

(c) Reference Standards—(1) General. The standards listed in this paragraph are referred to in the DOE test procedures and elsewhere in 10 CFR part 430 but are not incorporated by reference. These sources are given here for information and guidance.

(2) List of References.
1. National Voluntary Laboratory Accreditation Program Handbook 150–01, "Energy Efficient Lighting Products, Lamps and Luminaires, August 1993." National Voluntary Laboratory Accreditation Program, NIST, Gaithersburg, MD.

EFFECTIVE DATE NOTE: At 72 FR 59920, Oct. 22, 2007, §430.22 was amended as follows, effective Apr. 21, 2008.

a. Paragraph (b)(5)2. is amended by removing "23–1993" and adding in its place "23–2005."

c. Paragraph (b)(5)8. is amended by removing "116–1995" and adding in its place "116–2005 (RA 2005)."

d. Paragraph (b)(8) is amended by removing "210/240–2003" and adding in its place "210/240–2006."

§ 430.23 Test procedures for the measurement of energy and water consumption.

(a) Refrigerators and refrigerator-freezers. (1) The estimated annual operating cost for electric refrigerators and electric refrigerator-freezers without an anti-sweat heater switch shall be the product of the following three factors: (i) The representative average-use cycle of 365 cycles per year, (ii) the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2
(6.3.6 for externally vented units) of appendix A1 of this subpart, and (iii) the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(2) The estimated annual operating cost for electric refrigerators and electric refrigerator-freezers with an anti-sweat heater switch shall be the product of the following three factors: (i) The representative average-use cycle of 365 cycles per year, (ii) half the sum of the average per-cycle energy consumption for the standard cycle and the average per-cycle energy consumption for a test cycle type with the anti-sweat heater switch in the position set at the factory just prior to shipping, each in kilowatt-hours per cycle, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart, and (iii) the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(3) The estimated annual operating cost for any other specified cycle type for electric refrigerators and electric refrigerator-freezers shall be the product of the following three factors: (i) The representative average-use cycle of 365 cycles per year, (ii) the average per-cycle energy consumption for the specified cycle type, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart, and (iii) the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(4) The energy factor for electric refrigerators and electric refrigerator-freezers, expressed in cubic feet per kilowatt-hour per cycle, shall be—

(i) For electric refrigerators and electric refrigerator-freezers not having an anti-sweat heater switch, the quotient of (A) the adjusted total volume in cubic feet, determined according to 6.1 of appendix A1 of this subpart, and (B) the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart, the resulting quotient then being rounded off to the second decimal place, and

(ii) For electric refrigerators and electric refrigerator-freezers having an anti-sweat heater switch, the quotient of (A) the adjusted total volume in cubic feet, determined according to 6.1 of appendix A1 of this subpart, divided by (B) half the sum of the average per-cycle energy consumption for the standard cycle and the average per-cycle energy consumption for a test cycle type with the anti-sweat heater switch in the position set at the factory just prior to shipping, each in kilowatt-hours per cycle, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart, the resulting quotient then being rounded off to the second decimal place.

(5) The annual energy use of electric refrigerators and electric refrigerator-freezers equals the representative average use cycle of 365 cycles per year times the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart.

(6) Other useful measures of energy consumption for electric refrigerators and electric refrigerator-freezers shall be those measures of energy consumption for electric refrigerators and electric refrigerator-freezers which the Secretary determines are likely to assist consumers in making purchasing decisions which are derived from the application of appendix A1 of this subpart.

(7) The estimated regional annual operating cost for externally vented electric refrigerators and externally vented electric refrigerator-freezers shall be the product of the following three factors:

(i) The representative average-use cycle of 365 cycles per year,

(ii) The regional average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2 (6.3.6 for externally vented units) of appendix A1 of this subpart and
(iii) The representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(8) The estimated regional annual operating cost for externally vented electric refrigerators and externally vented electric refrigerator-freezers with an anti-sweat heater switch shall be the product of the following three factors:

(i) The representative average-use cycle of 365 cycles per year,

(ii) Half the sum of the average per-cycle energy consumption for the standard cycle and the average per-cycle energy consumption for a test cycle with the anti-sweat heater switch in the position set at the factory just prior to shipping, each in kilowatt-hours per cycle, determined according to 6.3.7 of appendix A1 of this subpart, and

(iii) The representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(9) The estimated regional annual operating cost for any other specified cycle for externally vented electric refrigerators and externally vented electric refrigerator-freezers shall be the product of the following three factors:

(i) The representative average-use cycle of 365 cycles per year,

(ii) The regional average per-cycle energy consumption for the specified cycle, in kilowatt-hours per cycle, determined according to 6.3.7 of appendix A1 of this subpart, and

(iii) The representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(b) Freezers.

(1) The estimated annual operating cost for freezers without an anti-sweat heater switch shall be the product of the following three factors:

(i) The adjusted net refrigerated volume in cubic feet, determined according to 6.1 of appendix B1 of this subpart, divided by (B) the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to or 6.2 of appendix B1 of this subpart, and

(ii) The representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(2) The energy factor for freezers, expressed in cubic feet per kilowatt-hour per cycle, shall be—

(i) For freezers not having an anti-sweat heater switch, the quotient of (A) the adjusted net refrigerated volume in cubic feet, determined according to 6.1 of appendix B1 of this subpart, and (B) the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2 of appendix B1 of this subpart, the resulting quotient then being rounded off to the second decimal place, and

(ii) For freezers having an anti-sweat heater switch, the quotient of (A) the adjusted net refrigerated volume in cubic feet, determined according to 6.1 of appendix B1 of this subpart, divided by (B) the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to or 6.2 of appendix B1 of this subpart, the resulting product then being rounded off to the nearest dollar per year.
Department of Energy  § 430.23

by (B) half the sum of the average per-cycle energy consumption for the standard cycle and the average per-cycle energy consumption for a test cycle type with the anti-sweat switch in the position set at the factory just prior to shipping, each in kilowatt-hours per cycle, determined according to or 6.2 of appendix B1 of this subpart, the resulting quotient then being rounded off to the second decimal place.

(5) The annual energy use of all freezers equals the representative average-use cycle of 365 cycles per year times the average per-cycle energy consumption for the standard cycle in kilowatt-hours per cycle, determined according to 6.2 of appendix B1 of this subpart.

(6) Other useful measures of energy consumption for freezers which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix B1 of this subpart.

(c) Dishwashers. (1) The Estimated Annual Operating Cost (EAOC) for dishwashers must be rounded to the nearest dollar per year and is defined as follows:

(i) When cold water (50°F) is used,

(A) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times (M - (E_f/2))) + (D_e\times N\times W) \]

(B) For dishwashers not having a truncated normal cycle, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times M) + (D_e\times N\times W) \]

Where, \( D_e, S, N, M, \) and \( E_f \) are defined in paragraph (c)(1)(i) of this section, and \( W \) is the total water energy consumption per cycle for the normal cycle as defined in section 3.6 of Appendix C to this subpart, in kilowatt-hours per cycle and determined according to section 5.4 of Appendix C to this subpart.

(ii) When electrically-heated water (120°F or 140°F) is used,

(A) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times (M - (E_f/2))) + (D_e\times N\times W) \]

(B) For dishwashers not having a truncated normal cycle, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times M) + (D_e\times N\times W) \]

(iii) When gas-heated or oil-heated water is used,

(A) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times (M - (E_f/2))) + (D_e\times N\times W) \]

(B) For dishwashers not having a truncated normal cycle, \[ \text{EAOC} = (D_e\times S) + (D_e\times N\times M) + (D_e\times N\times W) \]

Where, \( D_e, S, N, M, \) and \( E_f \) are defined in paragraph (c)(1)(i) of this section, and \( W \) is the total water energy consumption per cycle for the normal cycle as defined in section 3.6 of Appendix C to this subpart, in Btu’s per cycle and determined according to section 5.5 of appendix C to this subpart.

(2) The energy factor for dishwashers, \( EF \), expressed in cycles per kilowatt-hour is defined as follows:

(i) When cold water (50°F) is used,

(A) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart, \[ EF = 1/(M - (E_f/2)) \]

(B) For dishwashers not having a truncated normal cycle,
\[ EF = \frac{1}{M} \]

Where, 
\( M \) and \( E_D \) are defined in paragraph (c)(1)(i) of this section.

(ii) When electrically-heated water (120°F or 140°F) is used,
(A) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart,
\[ EF = \frac{1}{M - \left( \frac{E_D}{2} \right) + W} \]
(B) For dishwashers not having a truncated normal cycle,
\[ EF = \frac{1}{M + W} \]

Where, 
\( M \) and \( E_D \) are defined in paragraph (c)(1)(i) of this section, and \( W \) is defined in paragraph (c)(1)(ii) of this section.

(3) The estimated annual energy use, \( E_{AEU} \), expressed in kilowatt-hours per year is defined as follows:
(i) For dishwashers having a truncated normal cycle as defined in section 1.15 of appendix C to this subpart,
\[ E_{AEU} = \left( M - \left( \frac{E_D}{2} \right) + W \right) \times N + S \]
Where, 
\( M \), \( E_D \), \( N \) and \( S \) are defined in paragraph (c)(1)(i) of this section, and \( W \) is defined in paragraph (c)(1)(ii) of this section.

(ii) For dishwashers not having a truncated normal cycle,
\[ E_{AEU} = (M + W) \times N + S \]
Where, 
\( M \), \( N \) and \( S \) are defined in paragraph (c)(1)(i) of this section, and \( W \) is defined in paragraph (c)(1)(iii) of this section.

(4) Other useful measures of energy consumption for dishwashers are those which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix C to this subpart.

(d) Clothes dryers. (1) The estimated annual operating cost for clothes dryers shall be—
(i) For an electric clothes dryer, the product of the following three factors: (A) The representative average-use cycle of 416 cycles per year, (B) the total per-cycle energy consumption in kilowatt-hours per cycle, determined according to \( 4.1 \) of appendix D to this subpart, and (C) the representative average unit cost in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year, and
(ii) For a gas clothes dryer, the product of the representative average-use cycle of 416 cycles per year times the sum of (A) the product of the gas dryer electric per-cycle energy consumption in kilowatt-hours per cycle, determined according to \( 4.2 \) of appendix D to this subpart, times the representative average unit cost in dollars per kilowatt-hour as provided by the Secretary plus (B) the product of the total gas dryer gas energy consumption per cycle, in Btu's per cycle, determined according to \( 4.5 \) of appendix D of this subpart, times the representative average unit cost in dollars per Btu as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(2) The energy factor, expressed in pounds of clothes per kilowatt-hour, for clothes dryers shall be either the quotient of a 3-pound bone-dry test load for compact dryers, as defined by \( 2.6.1 \) of appendix D to this subpart or the quotient of a 7 pound bone-dry test load for standard dryers, as defined by \( 2.6.2 \) of appendix D to this subpart, as applicable, divided by the clothes dryer energy consumption per cycle, as determined according to \( 4.1 \) for electric clothes dryers and \( 4.6 \) for gas clothes dryers of appendix D to this subpart, the resulting quotient then being rounded off to the nearest hundredth (.01).

(3) Other useful measures of energy consumption for clothes dryers shall be—
those measures of energy consumption for clothes dryers which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix D to this subpart.

(e) Water Heaters. (1) The estimated annual operating cost for water heaters shall be—
(i) For a gas or oil water heater, the product of the annual energy consumption, determined according to section \( 6.1.8 \) or \( 6.2.5 \) of appendix E of this subpart, times the representative average unit cost of gas or oil, as appropriate, in dollars per Btu as provided by the Secretary, the resulting product then
being rounded off to the nearest dollar per year.

(ii) For an electric water heater, the product of the annual energy consumption, determined according to section 6.1.8 or 6.2.5 of appendix E of this subpart, times the representative average unit cost of electricity in dollars per kilowatt-hour as provided by the Secretary, divided by 3412 Btu per kilowatt-hour, the resulting quotient then being rounded off to the nearest dollar per year.

(2) The energy factor for the water heaters shall be—

(i) For a gas or oil water heater, as determined by section 6.1.7 or 6.2.4 of appendix E of this subpart rounded off to the nearest 0.01.

(ii) For an electric water heater, as determined by section 6.1.7 or 6.2.4 of appendix E of this subpart rounded off to the nearest 0.01.

(3) Other useful measures of energy consumption for water heaters shall be those measures of energy consumption for water heaters which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix E of this subpart.

(4) The alternative uniform test method for measuring the energy consumption of untested water heaters shall be that set forth in section 7.0 of appendix E of this subpart.

(f) Room air conditioners. (1) The estimated annual operating cost for room air conditioners, expressed in dollars per year, shall be determined by multiplying the following three factors: (i) Electrical input power in kilowatts as determined in accordance with 4.2 of appendix F to this subpart rounded off to the nearest dollar per year.

(ii) For an electric water heater, as determined by section 6.1.8 or 6.2.5 of appendix E of this subpart rounded off to the nearest dollar per year.

(2) The energy efficiency ratio for room air conditioners, expressed in Btu's per watt-hour, shall be the quotient of: (i) The cooling capacity in Btu's per hour as determined in accordance with 4.1 of appendix F to this subpart divided by: (ii) The electrical input power in watts as determined in accordance with 4.2 of appendix F to this subpart the resulting quotient then being rounded off to the nearest 0.1 Btu per watt-hour.

(3) The average annual energy consumption for room air conditioners, expressed in kilowatt-hours per year, shall be determined by multiplying together the following two factors: (i) Electrical input power in kilowatts as determined in accordance with 4.2 of appendix F to this subpart, and (ii) A representative average use cycle of 750 hours of compressor operation per year, the resulting product then being rounded off to the nearest kilowatt-hour per year.

(4) Other useful measures of energy consumption for room air conditioners shall be those measures of energy consumption which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix F to this subpart.

(g) Unvented home heating equipment.

(1) The estimated annual operating cost for primary electric heaters, shall be the product of: (i) The average annual electric energy consumption in kilowatt-hours per year, determined according to section 3.1 of appendix G of this subpart and (ii) The representative average unit cost in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(2) The estimated regional annual operating cost for primary electric heaters, shall be the product of: (i) The regional annual electric energy consumption in kilowatt-hours per year for primary heaters determined according to section 3.2 of appendix G of this subpart and (ii) The representative average unit cost in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(3) The estimated operating cost per million Btu output shall be—

(i) For primary and supplementary electric heaters and unvented gas and oil heaters without an auxiliary electric system, the product of: (A) One million; and (B) The representative unit...
§ 430.23

10 CFR Ch. II (1–1–08 Edition)

The average annual energy consumed by the television set in kilowatt-hours per year, determined according to 3.0 of appendix H to this subpart, times the representative average unit cost for electricity, in dollars per kWh, as provided pursuant to section 323(b)(2) of the Act; plus (ii) the total annual gas energy consumption for any natural gas usage, in British thermal units (Btu's) per year, times the representative average unit cost for natural gas, in dollars per Btu, as provided pursuant to section 323(b)(2) of the Act; plus (iii) the total annual gas energy consumption for any propane usage, in British thermal units (Btu's) per year, times the representative average unit cost for propane, in dollars per Btu; plus (iv) the total annual gas energy consumption for any oil usage, in British thermal units (Btu's) per year, times the representative average unit cost for oil, in dollars per Btu; plus (v) the average annual electricity consumption for any auxiliary electric usage, in kilowatt-hours per year, times the representative average unit cost for electricity, in dollars per kWh, as provided pursuant to section 323(b)(2) of the Act; and (vi) the average annual gas energy consumption for any auxiliary gas usage, in British thermal units (Btu's) per year, times the representative average unit cost for natural gas, in dollars per Btu.
dollars per Btu, as provided pursuant to section 323(b)(2) of the Act. The total annual energy consumption for conventional ranges, conventional cooking tops, conventional ovens, microwave ovens, and microwave/conventional ranges shall be as determined according to 4.3, 4.2.2, 4.1.2, and 4.4.3, respectively, of appendix I to this subpart. The estimated annual operating cost shall be rounded off to the nearest dollar per year, except for microwave ovens, for which the estimated annual operating cost shall be rounded off to the nearest one-quarter of a dollar per year.

(2) The cooking efficiency for conventional cooking tops, conventional ovens, and microwave ovens shall be the ratio of the cooking energy output for the test to the cooking energy input for the test, as determined according to 4.2.1, 4.1.3, and 4.4.4, respectively, of appendix I to this subpart. The final cooking efficiency values shall be rounded off to three significant digits.

(3) [Reserved]

(4) The energy factor for conventional ranges, conventional cooking tops, conventional ovens, microwave ovens, and microwave/conventional ranges shall be the ratio of the annual useful cooking energy output to the total annual energy input, as determined according to 4.3, 4.2.3, 4.1.4, 4.4.5, respectively, of Appendix I to this subpart. The final energy factor values shall be rounded off to three significant digits.

(5) There shall be two estimated annual operating costs, two cooking efficiencies, and two energy factors for convertible cooking appliances—(i) an estimated annual operating cost, a cooking efficiency and an energy factor which represent values for those three measures of energy consumption for the operation of the appliance with natural gas; and (ii) an estimated annual operating cost, a cooking efficiency and an energy factor which represent values for those three measures of energy consumption for the operation of the appliance with LP-gas.

(6) The estimated annual operating cost for convertible cooking appliances which represents natural gas usage, as described in paragraph (i)(5)(i) of this section, shall be determined according to paragraph (i)(1) of this section using the total annual gas energy consumption for natural gas times the representative average unit cost for natural gas.

(7) The estimated annual operating cost for convertible cooking appliances which represents LP-gas usage, as described in paragraph (i)(5)(ii) of this section, shall be determined according to paragraph (i)(2) of this section using the representative average unit cost for propane times the total annual energy consumption of the test gas, either propane or natural gas.

(8) The cooking efficiency for convertible cooking appliances which represents natural gas usage, as described in paragraph (i)(5)(i) of this section, shall be determined according to paragraph (i)(2) of this section when the appliance is tested with natural gas.

(9) The cooking efficiency for convertible cooking appliances which represents LP-gas usage, as described in paragraph (i)(5)(ii) of this section, shall be determined according to paragraph (i)(2) of this section, when the appliance is tested with either natural gas or propane.

(10) The energy factor for convertible cooking appliances which represents natural gas usage, as described in paragraph (i)(5)(i) of this section, shall be determined according to paragraph (i)(4) of this section when the appliance is tested with natural gas.

(11) The energy factor for convertible cooking appliances which represents LP-gas usage, as described in paragraph (i)(5)(ii) of this section, shall be determined according to paragraph (i)(4) of this section when the appliance is tested with either natural gas or propane.

(12) Other useful measures of energy consumption for conventional ranges, conventional cooking tops, conventional ovens, microwave ovens and microwave/conventional ranges shall be those measures of energy consumption which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of Appendix I to this subpart.

(j) Clothes washers.

(1) The estimated annual operating cost for automatic
and semi-automatic clothes washers shall be—

(i) When electrically heated water is used, the product of the following three factors:

(A) The representative average-use of 392 cycles per year,

(B) The total per-cycle energy consumption in kilowatt-hours per cycle determined according to 4.1.6 of appendix J before appendix J1 becomes mandatory and 4.1.7 of appendix J1 when appendix J1 becomes mandatory, (see the note at the beginning of appendix J1), and

(C) The representative average unit cost in dollars per kilowatt-hour as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year, and

(ii) When gas-heated or oil-heated water is used, the product of: the representative average-use of 392 cycles per year and the sum of both:

(A) The product of the per-cycle machine electrical energy consumption in kilowatt-hours per cycle, determined according to 4.1.5 of appendix J before the date that appendix J1 to this subpart becomes mandatory or 4.1.6 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory, and the representative average unit cost in dollars per kilowatt-hours as provided by the Secretary, and

(B) The product of the per-cycle water energy consumption for gas-heated or oil-heated water in BTU per cycle, determined according to 4.1.4 of appendix J before the date that appendix J1 becomes mandatory or 4.1.4 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory, and the representative average unit cost in dollars per BTU for oil or gas, as appropriate, as provided by the Secretary, the resulting product then being rounded off to the nearest dollar per year.

(ii) The modified energy factor for automatic and semi-automatic clothes washers is determined in accordance with 4.4 of appendix J before the date that appendix J1 becomes mandatory or 4.4 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory. The result shall be rounded off to the nearest 0.01 cubic foot per kilowatt-hours.

(ii) The energy factor for automatic and semi-automatic clothes washers is determined in accordance with 4.14 of appendix J before the date that appendix J1 becomes mandatory or 4.14 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory. The result shall be rounded off to the nearest 0.01 cubic foot per kilowatt-hours.

(2)(i) The energy factor for automatic and semi-automatic clothes washers shall be those measures of energy consumption which the Secretary determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix J before the date that appendix J1 becomes mandatory or appendix J1 to this subpart becomes mandatory. In addition, the annual water consumption of a clothes washer can be determined by the product of:

(A) The representative average-use of 392 cycles per year, and

(B) The total weighted per-cycle water consumption in gallons per cycle determined according to 4.3.2 of appendix J before the date that appendix J1 becomes mandatory or 4.3.2 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory. The water consumption factor can be determined in accordance with 4.3.3 of appendix J before the date that appendix J1 becomes mandatory or 4.3.3 of appendix J1 upon the date that appendix J1 to this subpart becomes mandatory.

(k)-(l) [Reserved]

Central Air Conditioners and heat pumps. (i) The estimated annual operating cost for cooling-only units and air-source heat pumps shall be one of the following:

(A) The quotient of the cooling capacity, in Btu's per hour, determined...
from the steady-state wet-coil test (A or A2 Test), as described in section 3.2 of appendix M to this subpart, divided by the seasonal energy efficiency ratio (SEER), in Btu's per watt-hour, determined from section 4.1 of appendix M to this subpart;

(B) The representative average use cycle for cooling of 1,000 hours per year;

(C) A conversion factor of 0.001 kilowatt per watt; and

(D) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(ii) For air-source heat pumps which provide only heating or the heating portion of the estimated annual operating cost for air-source heat pumps which provide both heating and cooling, the product of:

(A) The quotient of the standardized design heating requirement, in Btu's per hour, nearest to the heating Region IV minimum design heating requirement, determined in section 4.2 of appendix M to this subpart, divided by the heating seasonal performance factor (HSPF), in Btu's per watt-hour, calculated for heating Region IV corresponding to the above-mentioned standardized design heating requirement and determined in section 4.2 of appendix M to this subpart;

(B) The representative average use cycle for heating of 2,080 hours per year;

(C) The adjustment factor of 0.77 which serves to adjust the calculated heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatts per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(iii) For air-source heat pumps which provide both heating and cooling, the estimated annual operating cost is the sum of the quantity determined in paragraph (m)(1)(i) of this section added to the quantity determined in paragraph (m)(1)(ii) of this section.

(2) The estimated regional annual operating cost for cooling-only units and for air-source heat pumps shall be one of the following:

(i) For cooling-only units or the cooling portion of the estimated regional annual operating cost for air-source heat pumps which provide both heating and cooling, the product of:

(A) The quotient of the cooling capacity, in Btu's per hour, determined from the steady-state wet-coil test (A or A2 Test), as described in section 3.2 of appendix M to this subpart, divided by the seasonal energy efficiency ratio (SEER), in Btu's per watt-hour, determined from section 4.1 of appendix M to this subpart;

(B) The estimated number of regional cooling load hours per year determined from Figure 3 in section 4.3 of appendix M to this subpart;

(C) A conversion factor of 0.001 kilowatts per watt; and

(D) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(ii) For air-source heat pumps which provide only heating or the heating portion of the estimated regional annual operating cost for air-source heat pumps which provide both heating and cooling, the product of:

(A) The estimated number of regional heating load hours per year determined from Figure 2 in section 4.3 of appendix M to this subpart;

(B) The quotient of the standardized design heating requirement, in Btu's per hour, for the appropriate generalized climatic region of interest (i.e., corresponding to the regional heating load hours from “A”) and determined in section 4.2 of appendix M to this subpart, divided by the heating seasonal performance factor (HSPF), in Btu's per watt-hour, calculated for the appropriate generalized climatic region of interest and corresponding to the above-mentioned standardized design heating requirement while being determined in section 4.2 of appendix M to this subpart;
(C) The adjustment factor of 0.77 which serves to adjust the calculated design heating requirement and heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatts per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting product then being rounded off to the nearest dollar per year.

(iii) For air-source heat pumps which provide both heating and cooling, the estimated regional annual operating cost is the sum of the quantity determined in paragraph (m)(3)(i) of this section added to the quantity determined in paragraph (m)(3)(ii) of this section.

(3) The measure(s) of efficiency of performance for cooling-only units and air-source heat pumps shall be one or more of the following:

(i) The cooling mode efficiency measure for cooling-only units and air-source heat pumps which provide cooling shall be the seasonal energy efficiency ratio (SEER), in Btu's per watt-hour, determined according to section 4.1 of appendix M to this subpart, rounded off to the nearest 0.05.

(ii) The heating mode efficiency measure for air-source heat pumps shall be the heating seasonal performance factors (HSPF), in Btu's per watt-hour, determined according to section 4.2 of appendix M to this subpart for each applicable standardized design heating requirement within each climatic region, rounded off to the nearest 0.05.

(iii) The annual efficiency measure for air-source heat pumps which provide heating and cooling, shall be the annual performance factors (APF), in Btu's per watt-hour, determined according to section 4.3 of appendix M to this subpart for each standardized design heating requirement within each climatic region, rounded off to the nearest 0.05.

(4) Other useful measures of energy consumption for central air conditioners shall be those measures of energy consumption which the Secretary of Energy determines are likely to assist consumers in making purchasing decisions and which are derived from the application of appendix M to this subpart.

(5) After September 12, 1988, all measures of energy consumption shall be determined by the test method as set forth in appendix M to this subpart; or by an alternate rating method set forth in §430.23(m)(4) as approved by the Assistant Secretary for Conservation and Renewable Energy in accordance with §430.23(m)(5).

(n) Furnaces.

(1) The estimated annual operating cost for furnaces is the sum of: (i) The product of the average annual fuel energy consumption, in Btu's per year for gas or oil furnaces or in kilowatt-hours per year for electric furnaces, determined according to section 10.2.2 or 10.3 of appendix N of this subpart, respectively, and the representative average unit cost in dollars per Btu for gas or oil, or dollars per kilowatt-hour for electric, as appropriate, as provided pursuant to section 323(b)(2) of the Act, plus (ii) the product of the average annual auxiliary electric energy consumption in kilowatt-hours per year determined according to section 10.2.3 of appendix N of this subpart, and the representative average unit cost in dollars per Btu for gas or oil, or dollars per kilowatt-hour for electric, as appropriate, as provided pursuant to section 323(b)(2) of the Act, the resulting sum then being rounded off to the nearest dollar per year. (For furnaces which operate with variable inputs, an estimated annual operating cost is to be calculated for each degree of oversizing specified in section 10 of appendix N of this subpart.)

(2) The annual fuel utilization efficiency for furnaces, expressed in percent, is the ratio of annual fuel output of useful energy delivered to the heated space to the annual fuel energy input to the furnace determined according to section 10.1 of appendix N of this subpart for gas and oil furnaces and determined in accordance with section 11.1 of American National Standards Institute/American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ANSI/ASHRAE) Standard 103-1993 for electric furnaces.

(3) The estimated regional annual operating cost for furnaces is the sum of: (i) The product of the regional annual fuel energy consumption in Btu's per
year for gas or oil furnaces or in kilo-
watt-hours per year for electric fur-
naces, determined according to section
10.5.1 or 10.5.3 of appendix N of this sub-
part, respectively, and the representa-
tive average unit cost in dollars per
Btu for gas or oil, or dollars per kilo-
watt-hour for electric, as appropriate,
as provided pursuant to section
323(b)(2) of the Act, plus (ii) the pro-
duct of the regional annual auxiliary
electrical energy consumption in kilo-
watt-hours per year, determined ac-
cording to section 10.5.2 of appendix N
of this subpart, and the representative
average unit cost in dollars per kilo-
watt-hour as provided pursuant to sec-
tion 323(b)(2) of the Act, the resulting
sum then being rounded off to the near-
est dollar per year.

(3) The annual fuel utilization efficiency
for furnaces, expressed in percent, is the ratio of
annual fuel output of useful energy deliv-
ered to the heated space to the total
annual energy input to the furnace de-
termined according to section 10.4 of
appendix N of this subpart.

(4) Other useful measures of energy
consumption for furnaces shall be
those measures of energy consumption
which the Secretary determines are likely
and which are derived from the application of appendix
N of this subpart.

(o) Vented home heating equipment. (1)
The annual fuel utilization efficiency for
vented home heating equipment, expressed in percent, which is the ratio
of the annual fuel output of useful en-
ergy delivered to the heated space to the
annual fuel energy input to the
vented heater, shall be determined ei-
ther according to section 4.1.17 of ap-
pendix O of this subpart for vented
heaters without either manual controls
or thermal stack dampers; according to
section 4.2.6 of appendix O of this sub-
part for vented heaters equipped with
manual controls; or according to sec-
tion 4.3.7 of appendix O of this subpart
for vented heaters equipped with ther-
mal stack dampers.

(2) The estimated annual operating
cost for vented home heating equip-
ment is the sum of: (i) The product of
the average annual fuel energy con-
sumption, in Btu's per year for natural
gas, propane, or oil fueled vented home
heating equipment, determined accord-
ing to section 4.6.2 of appendix O of this
subpart, and the representative aver-
age unit cost in dollars per Btu for nat-
ural gas, propane, or oil, as appro-
priate, as provided pursuant to section
323(b)(2) of the Act; plus (ii) The prod-
duct of the average annual auxiliary
electric energy consumption in kilo-
watt-hours per year determined accord-
ing to section 4.6.3 of appendix O of this
subpart, and the representative aver-
age unit cost in dollars per kilowatt-
hours as provided pursuant to section
323(b)(2) of the Act, the resulting
sum then being rounded off to the nearest
dollar per year.

(3) The estimated operating cost per
million Btu output for gas or oil vented
home heating equipment with an auxil-
ary electric system shall be the prod-
uct of: (A) The quotient of one million
Btu divided by the sum of: (1) The prod-
duct of the maximum fuel input in Btu's
per hour as determined in 3.1.1 or 3.1.2
of appendix O of this subpart times the
maximum electric power in watts as
determined in 3.1.3 of appendix O of this
subpart times the quantity 3.412; and
(B) of the sum of: (1) The product of the
maximum fuel input in Btu's per hour
as determined in 3.1.1 of appendix O of
this subpart times the representative unit cost in
dollars per Btu for natural gas, pro-
pane, or oil, as appropriate, as provided
pursuant to section 323(b)(2) of the Act;
plus (2) the product of the maximum
auxiliary electric power in kilowatts as
determined in 3.1.3 of appendix O of this
subpart times the representative unit cost in
dollars per kilowatt-hour as provided pursuant to section
323(b)(2) of the Act; the resulting quan-
tity shall be rounded off to the nearest
0.01 dollar per million Btu output.

(4) Other useful measures of energy
consumption for vented home heating
equipment shall be those measures of
energy consumption which the Sec-
retary determines are likely to assist
consumers in making purchasing deci-
sions and which are derived from the application of appendix O of this sub-
part.
(p) Pool heaters. (1) The estimated annual operating cost for pool heaters is the sum of:
   (i) The product of the average annual fuel energy consumption, in Btu's per year, of natural gas or oil fueled pool heaters, determined according to section 4.2 of appendix P to this subpart, and the representative average unit cost in dollars per Btu for natural gas or oil, as appropriate, as provided pursuant to section 323(b)(2) of the Act; plus
   (ii) The product of the average annual auxiliary electric energy consumption in kilowatt-hours per year determined according to section 4.3 of appendix P to this subpart, and the representative average unit cost in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act, the resulting sum then being rounded off to the nearest dollar per year.

(2) The thermal efficiency of pool heaters, expressed as a percent, shall be determined in accordance with section 4 of appendix P to this subpart.

(q) Fluorescent Lamp Ballasts. (1) The Estimated Annual Energy Consumption (EAEC) for fluorescent lamp ballasts, expressed in kilowatt-hours per year, shall be the product of: (i) The input power in kilowatts as determined in accordance with section 3.3.1 of appendix Q to this subpart, and the representative average use cycle of 1,000 hours per year, with the resulting product then being rounded off to the nearest kilowatt-hour per year.

(2) Ballast Efficacy Factor (BEF) shall be as determined in accordance with section 4.2 of appendix Q to this subpart.

(3) The Estimated Annual Operating Cost (EAOC) for fluorescent lamp ballasts, expressed in dollars per year, shall be the product of: (i) The representative average unit energy cost of electricity in dollars per kilowatt-hour as provided by the Secretary, (ii) the representative average use cycle of 1,000 hours per year, and (iii) the input power in kilowatts as determined in accordance with section 3.3.1 of appendix Q to this subpart, the resulting product then being rounded off to the nearest dollar per year.

(4) Other useful measures which may be applicable. [Reserved]

(r) General Service Fluorescent Lamps and General Service Incandescent Lamps. (1) The estimated annual energy consumption for general service fluorescent lamps and incandescent reflector lamps, expressed in kilowatt-hours per year, shall be the product of the input power in kilowatts as determined in accordance with section 4 of Appendix R to this subpart and an average annual use specified by the manufacturer, with the resulting quotient rounded off to the nearest kilowatt-hour per year. Manufacturers must provide a clear and accurate description of the assumptions used for the estimated annual energy consumption.

(2) The lamp efficacy for general service fluorescent lamps shall be equal to the average lumen output divided by the average lamp wattage as determined in accordance with section 4 of Appendix R of this subpart, with the resulting quotient rounded off to the nearest tenth of a lumen per watt.

(3) The color rendering index of a general service fluorescent lamp shall be tested and determined in accordance with section 4.5 of Appendix R of this subpart and rounded off to the nearest unit.

(s) Faucets. The maximum permissible water use allowed for lavatory faucets, lavatory replacement aerators, kitchen faucets, and kitchen replacement aerators, expressed in gallons and liters per minute (gpm and L/min), shall be measured in accordance to section 2(a) of Appendix S of this subpart. The maximum permissible water use allowed for metering faucets, expressed in gallons and liters per cycle (gal/cycle and L/cycle), shall be measured in accordance to section 2(a) of Appendix S of this subpart.

(t) Showerheads. The maximum permissible water use allowed for showerheads, expressed in gallons and liters per minute (gpm and L/min), shall be measured in accordance to section 2(b) of Appendix S of this subpart.
(u) Water closets. The maximum permissible water use allowed for water closets, expressed in gallons and liters per flush (gpf and Lpf), shall be measured in accordance to section 3(a) of Appendix T of this subpart.

(v) Urinals. The maximum permissible water use allowed for urinals, expressed in gallons and liters per flush (gpf and Lpf), shall be measured in accordance to section 3(b) of Appendix T of this subpart.

(w) Ceiling fans. The airflow and airflow efficiency for ceiling fans, expressed in cubic feet per minute (CFM) and CFM per watt (CFM/watt), respectively, shall be measured in accordance with section 4 of appendix U of this subpart.

(x) Ceiling fan light kits. The efficacy, expressed in lumens per watt (lumens/watt), for ceiling fan light kits with sockets for medium screw base lamps or pin-based fluorescent lamps shall be measured in accordance with section 4 of appendix V of this subpart.

(y) Medium Base Compact Fluorescent Lamps. The initial efficacy, lumen maintenance at 1,000 hours, lumen maintenance at 40-percent of rated life, rapid cycle stress test, and lamp life shall be measured in accordance with section 4 of appendix W of this subpart.

(z) Dehumidifiers. The energy factor for dehumidifiers, expressed in liters per kilowatt hour (L/kWh), shall be measured in accordance with section 4 of appendix X of this subpart.

(aa) Battery Chargers. The energy consumption of a battery charger, expressed as the nonactive energy ratio, shall be measured in accordance with section 4 of appendix Y of this subpart.

(bb) External Power Supplies. The energy consumption of an external power supply, including active mode efficiency in a percentage and the no-load energy consumption in watts, shall be measured in accordance with section 4 of appendix Z of this subpart.

[42 FR 27986, June 1, 1977]

Editorial Note: For Federal Register citations affecting §430.23, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.

Effective Date Note: At 72 FR 59920, Oct. 22, 2007, §430.23 was amended by revising paragraph (m)(3), effective Apr. 21, 2008. For the convenience of the user, the revised text is set forth as follows:

§ 430.23 Test procedures for the measurement of energy and water consumption.

* * * * *

(m) * *

(5) All measures of energy consumption must be determined by the test method as set forth in appendix M to this subpart; or by an alternative rating method set forth in §430.24(m)(4) as approved by the Assistant Secretary for Energy Efficiency and Renewable Energy in accordance with §430.24(m)(5).

* * * * *

§ 430.24 Units to be tested.

When testing of a covered product is required to comply with section 323(c) of the Act, or to comply with rules prescribed under sections 324 or 325 of the Act, a sample shall be selected and tested comprised of units which are production units, or are representative of production units of the basic model being tested, and shall meet the following applicable criteria.

(a)(1) For each basic model of electric refrigerators and electric refrigerator-freezers, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the lower 95 percent confidence limit of the true mean divided by .90.

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumer would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the upper 95 percent confidence limit of the true mean divided by 1.10.

(b)(1) For each basic model of freezers, a sample of sufficient size shall be tested to insure that—

1 Components of similar design may be substituted without requiring additional testing if the represented measures of energy consumption continue to satisfy the applicable sampling provision.
§ 430.24

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 95 percent confidence limit of the true mean divided by 1.10, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the higher of (A) the mean of the sample or (B) the lower 95 percent confidence limit of the true mean divided by .90.

(c)(1) For each basic model 1 of dishwashers, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(d)(1) For each basic model 1 of clothes dryers a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(e)(1) For each basic model 1 of water heaters, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 95 percent confidence limit of the true mean divided by 1.10, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the higher of (A) the mean of the sample or (B) the upper 95 percent confidence limit of the true mean divided by 1.10, and

(e)(2) For each basic model 1 of cooling only room air conditioners, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy efficiency ratio or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(f)(1) For each basic model 1 of room air conditioners, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy efficiency ratio or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(g)(1) For each basic model 1 of non-furnace room air conditioners, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy efficiency ratio or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

Components of similar design may be substituted without requiring additional testing if the represented measures of energy consumption continue to satisfy the applicable sampling provision.
(ii) Any represented value of the annual fuel utilization efficiency or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .925.

(h)(1) For each basic model of television sets, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(i)(1) Except as provided in paragraph (i)(2) of this section, for each basic model of conventional cooking tops, conventional ovens and microwave ovens a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 97 1/2 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy factor or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1/2 percent confidence limit of the true mean divided by .95.

(m)(1) For central air conditioners and heat pumps, each condensing unit (outdoor unit) shall have a condenser-evaporator (outdoor coil-indoor coil) combination selected and a sample of sufficient size tested in accordance with applicable provisions of this subpart such that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of the condenser-evaporator coil combination for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 90 percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the energy factor or other measure of energy consumption of the condenser-evaporator coil combination for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 90 percent confidence limit of the true mean divided by 0.95.

The condenser-evaporator coil combination selected for tests pursuant to paragraph (m)(1) of this section shall be that combination manufactured by the condensing unit manufacturer likely to have the largest volume of retail sales. Components of similar
design may be substituted without requiring additional testing if the represented measures of energy consumption continue to satisfy the applicable sampling provisions of paragraphs (m)(1)(i) and (m)(1)(ii) of this section. For every other condenser-evaporator coil combination manufactured by the same manufacturer or in part by a component manufacturer using that same condensing unit, either—

(i) A sample of sufficient size, comprised of production units or representing production units, shall be tested to ensure that the requirements of paragraphs (m)(1)(i) and (m)(1)(ii) of this section are met for such other condenser-evaporator coil combinations;

or

(ii) The representative values of the measures of energy consumption shall be based on an alternative rating method that has been approved by DOE in accordance with the provisions of paragraphs (m)(4) and (m)(5) of this section.

(3) Whenever the representative values of the measures of energy consumption, as determined by the provisions of paragraph (m)(2)(ii) of this section, do not agree within five percent of the representative values of the measures of energy consumption as determined by actual testing, the representative values determined by actual testing shall be used to comply with section 323(c) of the Act, or to comply with rules prescribed under section 324 of the Act.

(4) The basis of the alternative rating method referred to in paragraph (m)(2)(ii) of this section shall be a representation of the test data and calculations of a mechanical vapor compression refrigeration cycle. The major components in the refrigeration cycle shall be modeled as “fits” to manufacturer performance data or by graphic or tabular performance data. Heat transfer characteristics of coils may be modeled as a function of face area, number of rows, fins per inch, refrigerant circuitry, air flow rate and entering air enthalpy. Additional performance-related characteristics to be considered may include type of expansion device, refrigerant flow rate through the expansion device, power of the indoor fan and degradation coefficient.

(5) Manufacturers who elect to use an alternative rating method for determining measures of energy consumption under paragraphs (m)(2)(ii) and (m)(4) of this section must submit a request to DOE for reviewing the alternative rating method to the Assistant Secretary of Conservation and Renewable Energy, 1000 Independence Avenue, SW., Washington, DC 20585, and receive approval to use the alternative method by the Assistant Secretary before the alternative method may be used for rating central air conditioners.

(6) Each request to DOE for reviewing an alternative rating method shall include:

(i) The name, address and telephone number of the official representing the manufacturer.

(ii) Complete documentation of the alternative rating procedure, including the computer code when a computer model is used.

(iii) Test data for two coils from two different coil families for two different condensing units. The tested capacities for the matched systems for the two condensing units shall differ by at least a factor of two. Rating information for the mixed systems shall include the ratings from testing, and from the alternative rating method.

(iv) Complete test data, product information, and related information to allow DOE to verify the rating information submitted by the manufacturer.

(7) Manufacturers that elect to use an alternative rating method for determining measures of energy consumption under paragraphs (m)(2)(ii) and (m)(4) of this section must either subject a sample of their units to independent testing on a regular basis, e.g., voluntary certification program, or have the representations reviewed and certified by an independent state-registered professional engineer who is not an employee of the manufacturer. The registered professional engineer is to certify that the results of the alternative rating procedure accurately represent the energy consumption of the unit(s). The manufacturer is to keep the registered professional engineer’s certifications on file for review by DOE for as long as said combination is made available for sale by the manufacturer.
Any change to be made to the alternative rating method must be approved by DOE prior to its use for rating.

(b) Manufacturers who choose to use computer simulation or engineering analysis for determining measures of energy consumption under paragraphs (m)(2)(ii) and (m)(5) of this section shall permit representatives of the Department of Energy to inspect for verification purposes the simulation method or methods used. This inspection may include conducting simulations to predict the performance of particular condenser-evaporator coil combinations specified by DOE, analysis of previous simulations conducted by a manufacturer, or both.

(n)(1) For each basic model of furnaces, other than basic models of those sectional cast-iron boilers which may be aggregated into groups having identical intermediate sections and combustion chambers, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample, or (B) the upper 97½ percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the annual fuel utilization efficiency or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample, or (B) the lower 97½ percent confidence limit of the true mean divided by .95.

(2) For the lowest capacity basic model of a group of basic models of those sectional cast-iron boilers having identical intermediate sections and combustion chambers, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample, or (B) the upper 97½ percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the annual fuel utilization efficiency or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample, or (B) the lower 97½ percent confidence limit of the true mean divided by .95.

(3) For the highest capacity basic model of a group of basic models of those sectional cast-iron boilers having identical intermediate sections and combustion chambers, a sample of sufficient size shall be tested to insure that—

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample, or (B) the upper 97½ percent confidence limit of the true mean divided by 1.05, and

(ii) Any represented value of the annual fuel utilization efficiency or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample, or (B) the lower 97½ percent confidence limit of the true mean divided by .95.

(4) For basic model or capacity other than the highest or lowest of the group of basic models of sectional cast-iron boilers having identical intermediate sections and combustion chambers, represented values of measures of energy consumption shall be determined by either—

(i) A linear interpolation of data obtained for the smallest and largest capacity units of the family, or

(ii) Testing a sample of sufficient size to insure that (A) any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than

[1] Components of similar design may be substituted without requiring additional testing if the represented measures of energy consumption continue to satisfy the applicable sampling provision.
1 Components of similar design may be substituted without requiring additional testing if the represented measures of energy consumption continue to satisfy the applicable sampling provision.

(ii) Any represented value of the fuel utilization efficiency or other measure of energy consumption of a basic model for which consumers would favor higher values shall be no greater than the lower of (A) the mean of the sample or (B) the lower 97 1⁄2 percent confidence limit of the true mean divided by .95.

(q)(1) For each basic model of fluorescent lamp ballasts, as defined in paragraph (14) of § 430.2, a sample of sufficient size, no less than four, shall be tested to insure that—

(i) Any represented value of estimated annual operating costs, energy consumption, or other measure of energy consumption of a basic model for which consumers would favor lower values shall be no less than the higher of (A) the mean of the sample or (B) the upper 99 percent confidence limit of the true mean divided by 1.01, and

(ii) Any represented value of the ballast efficacy factor or other measure of the energy consumption of a basic model for which consumers would favor a higher value shall be no greater than the lower of (A) the mean of the sample or (B) the lower 99 percent confidence limit of the true mean divided by 0.99.

(r)(1) For each basic model of general service fluorescent lamp and incandescent reflector lamp, samples of production lamps shall be tested and the results for all samples shall be averaged for a 12-month period. A minimum sample of 21 lamps shall be tested. The manufacturer shall randomly select a minimum of three lamps from each month of production for a minimum of 7 out of the 12-month period. In the instance where production occurs during fewer than 7 of such 12 months, the manufacturer shall randomly select a 3 or more lamps from each month of production, where the number of lamps selected for each month shall be distributed as evenly as practicable among the months of production to attain a minimum sample of 21 lamps. Any represented value of lamp efficacy of a basic model shall be based on the sample and shall be no greater than the lower of the mean of the sample or the lower 95 percent confidence limit of the true mean (XL) divided by 0.97, i.e.,
Components of similar design may be substituted without requiring additional testing if the represented measures of energy or water consumption continue to satisfy the applicable sampling provision.

\[ x = \frac{1}{0.97} \left( \frac{s}{\sqrt{n}} \right) \]

where:
- \( x \) = the mean luminous efficacy of the sample
- \( s \) = the sample standard deviation
- \( t_{0.95} \) = the t statistic for a 95-percent confidence limit for \( n-1 \) degrees of freedom (from statistical tables)
- \( n \) = sample size

(2) For each basic model of general service fluorescent lamp, the color rendering index (CRI) shall be measured from the same lamps selected for the lumen output and watts input measurements in paragraph (r)(1) of this section, i.e., the manufacturer shall measure all lamps for lumen, watts input, and CRI. The CRI shall be represented as the average of a minimum sample of 21 lamps and shall be no greater than the lower of the mean of the sample or the lower 95-percent confidence limit of the true mean \( (X_L) \) divided by 0.97, i.e.,

\[ x = \frac{1}{0.97} \left( \frac{s}{\sqrt{n}} \right) \]

where:
- \( x \) = the mean color rendering index of the sample
- \( s \) = the sample standard deviation
- \( t_{0.95} \) = the t statistic for a 95-percent confidence limit for \( n-1 \) degrees of freedom (from statistical tables)
- \( n \) = sample size

(s) For each basic model of faucet,\(^1\) a sample of sufficient size shall be tested to ensure that any represented value of water consumption of a basic model for which consumers favor lower values shall be no less than the higher of:

1. The mean of the sample or
2. The upper 95 percent confidence limit of the true mean divided by 1.1.

(u) For each basic model\(^1\) of urinal, a sample of sufficient size shall be tested to ensure that any represented value of water consumption of a basic model for which consumers favor lower values shall be no less than the higher of:

1. The mean of the sample or
2. The upper 90 percent confidence limit of the true mean divided by 1.1.

**EFFECTIVE DATE NOTE:** At 72 FR 59920, Oct. 22, 2007, §430.24 was amended by revising paragraph (m), effective Apr. 21, 2008. For the convenience of the user, the revised text is set forth as follows:

§430.24 Units to be tested.

* * * * *

(m)(1) For central air conditioners and heat pumps, each single-package system and each condensing unit (outdoor unit) of a split-system, when combined with a selected evaporator coil (indoor unit) or a set of selected indoor units, must have a sample of sufficient size tested in accordance with the applicable provisions of this subpart. The represented values for any model of single-package system, any model of a tested split-system combination, any model of a tested mini-split system combination, or any model of a tested multi-split system combination must be assigned such that —

---

\(^1\) Components of similar design may be substituted without requiring additional testing if the represented measures of energy or water consumption continue to satisfy the applicable sampling provision.
§ 430.24 10 CFR Ch. II (1–1–08 Edition)

(i) Any represented value of estimated annual operating cost, energy consumption or other measure of energy consumption of the central air conditioner or heat pump for which consumer comfort lower values must be no less than the higher of:
(A) The mean of the sample; or
(B) The upper 95-percent confidence limit of the true mean divided by 1.05.

(ii) Any represented value of the energy efficiency or other measure of energy consumption of the central air conditioner or heat pump for which consumers would favor higher values must be no greater than the lower of:
(A) The mean of the sample; or
(B) The lower 95-percent confidence limit of the true mean divided by 0.95.

(iii) For heat pumps, all units of the sample population must be tested in both the cooling and heating modes and the results used for determining the heat pump’s certified SEER and HSPF ratings in accordance with paragraph (m)(1)(ii) of this section.

(2) For split-system air conditioners and heat pumps, the condenser-evaporator coil combination selected for tests pursuant to paragraph (m)(1) of this section shall include the evaporator coil that is likely to have the largest volume of retail sales with the particular model of condensing unit. For multi-split systems, each model of condensing unit shall be tested with two different sets of indoor units. For one set, a “tested combination” composed entirely of ducted indoor units shall be installed with more than one indoor unit, a “tested combination” as defined in 10 CFR 430.2 shall be used for tests pursuant to paragraph (m)(1) of this section. For multi-split systems, each model of condensing unit shall be tested with two different sets of indoor units. For one set, a “tested combination” composed entirely of non-ducted indoor units shall be installed with more than one indoor unit, a “tested combination” composed entirely of non-ducted indoor units shall be used. Components of similar design may be substituted without requiring additional testing if the represented measures of energy consumption satisfy the applicable sampling provisions of paragraphs (m)(1)(i) and (m)(1)(ii) of this section. However, for any split-system air conditioner having a single-speed compressor, the condenser-evaporator coil combination selected for tests pursuant to paragraph (m)(1) of this section shall include the indoor coil-only unit that is likely to have the largest volume of retail sales with the particular model of outdoor unit. This coil-only requirement does not apply to split-system air conditioners that are only sold and installed with blow-coil indoor units, specifically mini-splits, multi-splits, and through-the-wall units. This coil-only requirement does not apply to any split-system heat pumps. For every other split-system combination that includes the same model of condensing unit but a different model of evaporator coil and for every other mini-split and multi-split system that includes the same model of condensing unit but a different set of evaporator coils, whether the evaporator coil(s) is manufactured by the same manufacturer or by a component manufacturer, either:
(i) A sample of sufficient size, comprised of production units or representing production units, must be tested as complete systems with the resulting ratings for the outdoor unit-indoor unit(s) combination obtained in accordance with paragraphs (m)(1)(i) and (m)(1)(ii) of this section; or
(ii) The representative values of the measures of energy efficiency must be assigned as follows:
(A) Using an alternative rating method (ARM) that has been approved by DOE in accordance with the provisions of paragraphs (m)(4) through (m)(6) of this section; or
(B) For multi-split systems composed entirely of non-ducted indoor units, set equal to the system tested in accordance with paragraph (m)(1) of this section whose tested combination was entirely non-ducted indoor units;
(C) For multi-split systems composed entirely of ducted indoor units, set equal to the system tested in accordance with paragraph (m)(1) of this section whose tested combination was entirely ducted indoor units; and
(D) For multi-split systems having a mix of non-ducted and ducted indoor units, set equal to the mean of the values for the two systems — one having the tested combination of all non-ducted units and the second having the tested combination of all ducted indoor units — tested in accordance with paragraph (m)(1) of this section.

(3) Whenever the representative values of the measures of energy consumption, as determined by the provisions of paragraph (m)(2)(ii) of this section, do not agree within 5 percent of the representative values of the measures of energy consumption as determined by actual testing, the representative values determined by actual testing must be used to comply with section 323(c) of the Act or to comply with rules under section 324 of the Act.

(4) The basis of the ARM referred to in paragraph (m)(2)(ii) of this section must be a representation of the test data and calculations of a mechanical vapor-compression refrigeration cycle. The major components in the refrigeration cycle must be modeled as “fits” to manufacturer performance data or by graphical or tabular performance data. Heat transfer characteristics of coils may be modeled as a function of face area, number of rows, fins per inch, refrigerant circuitry, airflow rate and entering-air enthalpy. Additional performance-related characteristics to be considered may include type of expansion device, refrigerant flow rate through the expansion device, power of the indoor fan and cyclic-degradation coefficient. Ratings for untested combinations must be derived from
the ratings of a combination tested in accordance with paragraph (m)(1) of this section. The seasonal energy efficiency ratio (SEER) and/or heating seasonal performance factor (HSPF) ratings for an untested combination must be set equal to or less than the lower of the SEER and/or HSPF calculated using the applicable DOE-approved alternative rating method (ARM). If the method includes an ARM/simulation adjustment factor(s), determine the value(s) of the factors(s) that yield the best match between the SEER/HSPF determined using the ARM versus the SEER/HSPF determined from testing in accordance with paragraph (m)(1) of this section. Thereafter, apply the ARM using the derived adjustment factor(s) only when determining the ratings for untested combinations having the same outdoor unit.

(5) Manufacturers or private labelers who elect to use an ARM for determining measures of energy consumption under paragraphs (m)(2)(ii)(A) and (m)(4) of this section must submit a request to DOE to review the ARM. Send the request to the Assistant Secretary of Energy Efficiency and Renewable Energy, 1000 Independence Avenue, SW., Washington, DC 20585–0121. Approval must be received from the Assistant Secretary to use the ARM before the ARM may be used for rating split-system central air conditioners and heat pumps. If a manufacturer has a DOE-approved ARM for products also distributed in commerce by a private labeler, the ARM may also be used by the private labeler for rating these products. Once an ARM is approved, DOE may contact a manufacturer to learn if their ARM has been modified in any way and to verify that the ARM is being applied as approved. DOE will give follow-up priority to individual combinations having questionably high ratings (e.g., a coil-only system having a rating that exceeds the rating of a coil-only highest sales volume combination by more than 6 percent).

(ii) Each request to DOE for approval of an alternative rating method must include:

(i) The name, mailing address, telephone number, and e-mail address of the official representing the manufacturer.

(ii) Complete documentation of the alternative rating method to allow DOE to evaluate its technical adequacy. The documentation must include a description of the methodology, state any underlying assumptions, and explain any correlations. The documentation should address how the method accounts for the cyclic-degradation coefficient, the type of expansion device, and, if applicable, the indoor fan-off delay. The requestor must submit any computer programs—including spreadsheets—having less than 200 executable lines that implement the ARM. Longer computer programs must be identified and sufficiently explained, as specified above, but their inclusion in the initial submittal package is optional. Applicability or limitations of the ARM (e.g., only covers single-speed units when operating in the cooling mode, covers units with rated capacities of 3 tons or less, not applicable to the manufacturer’s product line of ductless mini-split systems, etc.) must be stated in the documentation.

(iii) Complete test data from laboratory tests on four mixed (i.e., non-highest-sales-volume combination) systems per each ARM.

(A) The four mixed systems must include four different indoor units and at least two different outdoor units. A particular model of outdoor unit may be tested with up to two of the four indoor units. The four systems must include two low-capacity mixed systems and two high-capacity mixed systems. The low-capacity mixed systems may have any capacity. The rated capacity of each high-capacity mixed system must be at least a factor of two higher than its counterpart low-capacity mixed system. The four mixed systems must meet the applicable energy conservation standard in §430.32(c) in effect at the time of the rating.

(B) The four indoor units must come from at least two different coil families, with a maximum of two indoor units coming from the same coil family. Data for two indoor units from the same coil family, if submitted, must come from testing with one of the “low-capacity mixed systems” and one of the “high capacity mixed systems.” A mixed system indoor coil may come from the same coil family as the highest sales volume combination indoor unit (i.e., the “matched” indoor unit) for the particular outdoor unit. Data on mixed systems where the indoor unit is now obsolete will be accepted towards the ARM-validation submittal requirement if it is from the same coil family as other indoor units still in production.

(C) The first two sentences of paragraph (m)(6)(ii)(B) of this section do not apply if the manufacturer offers indoor units from only one coil family. In this case only, all four indoor coils must be selected from this one coil family. If approved, the ARM will be specifically limited to applications for this one coil family.

(iv) All product information on each mixed system indoor unit, each matched system indoor unit, and each outdoor unit needed to implement the proposed ARM. The calculated ratings for the four mixed systems, as determined using the proposed ARM, must be provided along with any other related information that will aid the verification process.

(v) If request for approval is for an updated ARM, manufacturers must identify modifications made to the ARM since the last submittal, including any ARM simulation adjustment factor(s) added since the ARM was last approved by DOE.

(7) Manufacturers that elect to use an alternative rating method for determining...
measures of energy consumption under paragraphs (m)(2)(ii)(A) and (m)(4) of this section must either subject a sample of their units to independent testing on a regular basis, e.g., through a voluntary certification program, or have the representations reviewed and certified by an independent state-registered professional engineer who is not an employee of the manufacturer. The registered professional engineer is to certify that the results of the alternative rating procedure accurately represent the energy consumption of the unit(s). The manufacturer is to keep the registered professional engineer’s certifications on file for review by DOE for as long as said combination is made available for sale by the manufacturer. Any proposed change to the alternative rating method must be approved by DOE prior to its use for rating.

(8) Manufacturers who choose to use computer simulation or engineering analysis for determining measures of energy consumption under paragraphs (m)(2)(ii)(A) and (m)(4) through (m)(7) of this section must permit representatives of the Department of Energy to inspect for verification purposes the simulation method(s) and computer program(s) used. This inspection may include conducting simulations to predict the performance of particular outdoor unit “indoor unit combinations specified by DOE, analysis of previous simulations conducted by the manufacturer, or both.

* * * * *

§ 430.25 Laboratory Accreditation Program.

The testing for general service fluorescent lamps, general service incandescent lamps, incandescent reflector lamps, and medium base compact fluorescent lamps, shall be performed in accordance with Appendix R to this subpart and shall be conducted by test laboratories accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) or by an accrediting organization recognized by NVLAP. NVLAP is a program of the National Institute of Standards and Technology, U. S. Department of Commerce. NVLAP standards for accreditation of laboratories that test for compliance with standards for lamp efficacy and CRI are given in 15 CFR part 285 as supplemented by NVLAP Handbook 150-01, “Energy Efficient Lighting Products, Lamps and Luminaires.” A manufacturer’s or importer’s own laboratory, if accredited, may conduct the applicable testing.

§ 430.27 Petitions for waiver and applications for interim waiver.

(a)(1) Any interested person may submit a petition to waive for a particular basic model any requirements of §430.23, or of any appendix to this subpart, upon the grounds that the basic model contains one or more design characteristics which either prevent testing of the basic model according to the prescribed test procedures, or the prescribed test procedures may evaluate the basic model in a manner so unrepresentative of its true energy consumption characteristics, or water consumption characteristics (in the case of faucets, showerheads, water closets, and urinals) as to provide materially inaccurate comparative data.

(2) Any interested person who has submitted a Petition for Waiver as provided in this subpart may also file an Application for Interim Waiver of the applicable test procedure requirements.

(b)(1) A Petition for Waiver shall be submitted, in triplicate, to the Assistant Secretary for Conservation and Renewable Energy, United States Department of Energy. Each Petition for Waiver shall:

(i) Identify the particular basic model(s) for which a waiver is requested, the design characteristic(s) constituting the grounds for the petition, and the specific requirements sought to be waived and shall discuss in detail the need for the requested waiver;

(ii) Identify manufacturers of all other basic models marketed in the United States and known to the petitioner to incorporate similar design characteristic(s);

(iii) Include any alternate test procedures known to the petitioner to evaluate in a manner representative of the energy consumption characteristics, or water consumption characteristics (in the case of faucets, showerheads, water closets, and urinals) of the basic model; and

(iv) Be signed by the petitioner or by an authorized representative. In accordance with the provisions set forth
in 10 CFR 1004.11, any request for confidential treatment of any information contained in a Petition for Waiver or in supporting documentation must be accompanied by a copy of the petition, application or supporting documentation from which the information claimed to be confidential has been deleted. DOE shall publish in the Federal Register the petition and supporting documents from which confidential information, if any, as determined by DOE, has been deleted in accordance with 10 CFR 1004.11. Each petitioner, in complying with the requirements of this paragraph, shall file with DOE a statement certifying the names and addresses of each person to whom a notice of the Petition for Waiver has been sent.

(2) Each applicant for Interim Waiver, whether filing jointly with, or subsequent to, a Petition for Waiver with DOE, shall concurrently notify in writing all known manufacturers of domestically marketed units of the same product type (as listed in Section 322(a) of the Act) and shall include in the notice a copy of the Petition for Waiver and a copy of the Application for Interim Waiver. In complying with this section, each applicant shall in the written notification include a statement that the Assistant Secretary for Conservation and Renewable Energy will receive and consider timely written comments on the Application for Interim Waiver. Each applicant, upon filing an Application for Interim Waiver, shall concurrently notify in writing all known manufacturers of domestically marketed units of the same product type (as listed in section 322(a) of the Act). Such certification shall include the names and addresses of such persons. Each applicant also shall comply with the provisions of paragraph (c)(1) of this section with respect to the petition for waiver.

(d) Any person submitting written comments to DOE with respect to an Application for Interim Waiver shall also send a copy of the comments to the applicant.

(e) If administratively feasible, applicant shall be notified in writing of the disposition of the Application for Interim Waiver within 15 business days of receipt of the application. Notice of DOE’s determination on the Application for Interim Waiver shall be published in the Federal Register.

(f) The filing of an Application for Interim Waiver shall not constitute grounds for noncompliance with any requirements of this subpart, until an Interim Waiver has been granted.
(g) An Interim Waiver from test procedure requirements will be granted by the Assistant Secretary for Conservation and Renewable Energy if it is determined that the applicant will experience economic hardship if the Application for Interim Waiver is denied, if it appears likely that the Petition for Waiver will be granted, and/or the Assistant Secretary determines that it would be desirable for public policy reasons to grant immediate relief pending a determination on the Petition for Waiver.

(h) An interim waiver will terminate 180 days after issuance or upon the determination on the Petition for Waiver, whichever occurs first. An interim waiver may be extended by DOE for 180 days. Notice of such extension and/or any modification of the terms or duration of the interim waiver shall be published in the Federal Register, and shall be based on relevant information contained in the record and any comments received subsequent to issuance of the interim waiver.

(i) Following publication of the Petition for Waiver in the Federal Register, a petitioner may, within 10 working days of receipt of a copy of any comments submitted in accordance with paragraph (b)(1) of this section, submit a rebuttal statement to the Assistant Secretary for Conservation and Renewable Energy. A petitioner may rebut more than one response in a single rebuttal statement.

(j) The petitioner shall be notified in writing as soon as practicable of the disposition of each Petition for Waiver. The Assistant Secretary for Conservation and Renewable Energy shall issue a decision on the petition as soon as is practicable following receipt and review of the Petition for Waiver and other applicable documents, including, but not limited to, comments and rebuttal statements.

(k) The filing of a Petition for Waiver shall not constitute grounds for non-compliance with any requirements of this subpart, until a waiver or interim waiver has been granted.

(l) Waivers will be granted by the Assistant Secretary for Conservation and Renewable Energy, if it is determined that the basic model for which the waiver was requested contains a design characteristic which either prevents testing of the basic model according to the prescribed test procedures, or the prescribed test procedures may evaluate the basic model in a manner so unrepresentative of its true energy consumption characteristics, or water consumption characteristics (in the case of faucets, showerheads, water closets, and urinals) as to provide materially inaccurate comparative data. Waivers may be granted subject to conditions, which may include adherence to alternate test procedures specified by the Assistant Secretary for Conservation and Renewable Energy. The Assistant Secretary shall consult with the Federal Trade Commission prior to granting any waiver, and shall promptly publish in the Federal Register notice of each waiver granted or denied, and any limiting conditions of each waiver granted.

(m) Within one year of the granting of any waiver, the Department of Energy will publish in the Federal Register a notice of proposed rulemaking to amend its regulations so as to eliminate any need for the continuation of such waiver. As soon thereafter as practicable, the Department of Energy will publish in the Federal Register a final rule. Such waiver will terminate on the effective date of such final rule.

(n) In order to exhaust administrative remedies, any person aggrieved by an action under this section must file an appeal with the DOE's Office of Hearings and Appeals as provided in 10 CFR part 1003, subpart C.

Department of Energy

1.11 "Variable defrost control" means a long-time automatic defrost system (except the 14-hour defrost qualification does not apply) where successive defrost cycles are determined by an operating condition variable or variables other than solely compressor operating time. This includes any electrical or mechanical device. Demand defrost is a type of variable defrost control.

1.12 "Externally vented refrigerator or refrigerator-freezer" means an electric refrigerator or electric refrigerator-freezer that has an enclosed condenser or an enclosed condenser/compressor compartment and a set of air ducts for transferring the exterior air from outside the building envelope into, through and out of the refrigerator or refrigerator-freezer cabinet; is capable of mixing exterior air with the room air before discharging into, through, and out of the condenser or condenser/compressor compartment; includes thermostatically controlled dampers or controls that enable the mixing of the exterior and room air at low ambient temperatures, and the exclusion of exterior air when the outdoor air temperature is above 80°F or the room air temperature, and may have a thermostatically actuated exterior air fan.

2. Test Conditions

2.1 Ambient temperature. The ambient temperature shall be 90.0 ± 1 °F (32.2 ± 0.6 °C) during the stabilization period and during the test period. The ambient temperature shall be 80 ± 2 °F dry bulb and 67 ± 1 °F wet bulb during the stabilization period and during the test period when the unit is tested in accordance with section 3.3.

2.2 Operational conditions. The electric refrigerator or electric refrigerator-freezer shall be installed and its operating conditions maintained in accordance with HRF–1–1979, section 7.2 through section 7.4.3.3, except that the vertical ambient temperature gradient at locations 10 inches (25.4 cm) out from the centers of the two sides of the unit being tested is to be maintained during the test. Unless the area is obstructed by shields or baffles, the gradient is to be maintained from 2 inches (5.1 cm) above the floor or supporting platform to a height one foot (30.5 cm) above the unit under test. Defrost controls are to be operative and the anti-sweat heater switch is to be "on" during one test and "off" during a second test. Other exceptions are noted in 2.3.2.4 and 5.1 below.

2.3 Conditions for automatic defrost refrigerator-freezers. For automatic defrost refrigerator-freezers, the freezer compartments shall not be loaded with any frozen food packages. Cylindrical metallic masses of dimensions 1.12 ± 0.025 inches (2.9 ± 0.6 cm) in diameter and height shall be attached in good thermal contact with each temperature sensor within the refrigerated compartments. All temperature measuring sensor masses shall be supported by nonthermally conductive supports in such a manner that there will be at least one inch (2.5 cm) of air space separating the thermal mass from contact with any surface. In case of interference with hardware at the sensor locations specified in section 5.1, the sensors shall be placed at the nearest adjacent location such that there will be a one inch air space separating the sensor mass from the hardware.
2.4 Conditions for all-refrigerators. There shall be no load in the freezer compartment during the test.

2.5 Steady State Condition. Steady state temperature measurements in all measured compartments taken at four minute intervals or less during a stabilization period are not changing at a rate greater than 0.02°F (0.02°C), per hour as determined by the applicable condition of A or B.

A. The average of the measurements during a two hour period if no cycling occurs or during a number of complete repetitive compressor cycles through a period of no less than two hours is compared to the average over an equivalent time period with three hours elapsed between the two measurement periods.

B. If A above cannot be used, the average of the measurements during a number of complete repetitive compressor cycles through a period of no less than two hours and including the last complete cycle prior to a defrost period, or if no cycling occurs, the average of the measurements during the last two hours prior to a defrost period; are compared to the same averaging period prior to the following defrost period.

2.6 Exterior air for externally vented refrigerator or refrigerator-freezer. An exterior air source shall be provided with adjustable temperature and pressure capabilities. The exterior air temperature shall be adjustable from 35±1°F (1.7±0.6°C) to 90±1°F (32±0.6°C).

2.6.1 Air duct. The exterior air shall pass from the exterior air source to the test unit through an insulated air duct.

2.6.2 Air temperature measurement. The air temperature entering the condenser or condenser/compressor compartment shall be maintained to ±3°F (1.7°C) during the stabilization and test periods and shall be measured at the inlet point of the condenser or condenser/compressor compartment ("condenser inlet"). Temperature measurements shall be taken from at least three temperature sensors or one sensor per 4 square inches of the air duct cross sectional area, whichever is greater, and shall be averaged. For a unit that has a condenser air fan, a minimum of three temperature sensors at the condenser fan discharge shall be required. Temperature sensors shall be arranged to be at the centers of equally divided cross sectional areas. The exterior air temperature, at its source, shall be measured and maintained to ±1°F (0.6°C) during the test period. The temperature measuring devices shall have an error not greater than ±0.5°F (±0.3°C). Measurements of the air temperature during the test period shall be taken at regular intervals not to exceed four minutes.

2.6.3 Exterior air static pressure. The exterior air static pressure at the inlet point of the unit shall be adjusted to maintain a negative pressure of 0.20±0.05" water column (62 Pa±12.5 Pa) for all airflow rates supplied to the unit. The pressure sensor shall be located on a straight duct with a distance of at least 7.5 times the diameter of the duct upstream and a distance of at least 3 times the diameter of the duct downstream. There shall be four static pressure taps at 90° angles apart. The four pressures shall be averaged by interconnecting the four pressure taps. The air pressure measuring instrument shall have an error not greater than 0.01" water column (0.25 Pa).

3. Test Control Settings

3.1 Model with no user operable temperature control. A test shall be performed during which the compartment temperatures and energy use shall be measured. A second test shall be performed with the temperature control electrically short circuited to cause the compressor to run continuously.

3.2 Model with user operable temperature control. Testing shall be performed in accordance with one of the following sections using the standardized temperatures of:

- Refrigerator: 38°F (3.3°C) fresh food compartment temperature
- Refrigerator-freezer: 5°F (−15°C) freezer compartment temperature
- Refrigerator-freezer: 5°F (−15°C) fresh food compartment temperature
- Refrigerator-freezer: 5°F (−15°C) fresh food compartment temperature

Variable defrost control models: 5°F (−15°C) freezer compartment temperature and 38±2°F fresh food compartment temperature during steady-state conditions with no door-openings. If both settings cannot be obtained, then test with the fresh food compartment temperature at 38±2°F and the freezer compartment as close to 5°F as possible.

3.2.1 A first test shall be performed with all compartment temperature controls set at their median position midway between their warmest and coldest settings. Knob detents shall be mechanically defeated if necessary to attain a median setting. A second test shall be performed with all controls set at either their warmest or their coldest setting (not electrically or mechanically bypassed), whichever is appropriate, to attempt to achieve compartment temperatures measured during the two tests which bound (i.e., one is above and one is below) the standardized temperature for the type of product being tested. If the compartment temperatures measured during these two tests bound the appropriate standardized temperature, then these test results shall be used to determine energy consumption. If the compartment temperature measured with all controls set at their coldest setting is above the standardized temperature, a third test shall be performed with all controls set at their warmest setting and the result of this test
shall be used with the result of the test performed with all controls set at their coldest setting to determine energy consumption. If the compartment temperature measured with all controls set at their warmest setting is below the standardized temperature, and the fresh food compartment temperature is below 45 °F. (7.22 °C.) in the case of a refrigerator or a refrigerator-freezer, excluding an all-refrigerator, then the result of this test alone will be used to determine energy consumption.

3.2.2 Alternatively, a first test may be performed with all temperature controls set at their warmest setting. If the compartment temperature is below the appropriate standardized temperature, and the fresh food compartment temperature is below 45 °F. (7.22 °C.) in the case of a refrigerator or a refrigerator-freezer, excluding an all-refrigerator, then the result of this test alone will be used to determine energy consumption. If the above conditions are not met, then the unit shall be tested in accordance with 3.2.1 above.

3.2.3 Alternatively, a first test may be performed with all temperature controls set at their coldest setting. If the compartment temperature is above the appropriate standardized temperature, a second test shall be performed with all controls set at their warmest control setting and the results of these two tests shall be used to determine energy consumption. If the above condition is not met, then the unit shall be tested in accordance with 3.2.1 above.

3.3 Variable defrost control optional test. After a steady-state condition is achieved, the optional test requires door-openings for 122 seconds every 60 minutes on the fresh food compartment door and a simultaneous 122 second freezer compartment door-opening occurring every 4th hour, to obtain 24 fresh food and six freezer compartment door-openings per 24-hour period. The first freezer door-opening shall be simultaneous with the fourth fresh food door-opening. The doors are to be opened 60° to 90° with an average velocity for the leading edge of the door of approximately 2 ft./sec. Prior to the initiation of the door-opening sequence, the refrigerator defrost control mechanism may be re-initiated in order to minimize the test duration.

4. Test Period

4.1 Test Period. Tests shall be performed by establishing the conditions set forth in Section 2, and using control settings as set forth in Section 3, above.

4.1.1 Nonautomatic Defrost. If the model being tested has no automatic defrost system, the test time period shall start after steady state conditions have been achieved and be of not less than three hours in duration. During the test period, the compressor motor shall complete two or more whole compressor cycles (a compressor cycle is a complete “on” and a complete “off” period of the motor). If no “off” cycling will occur, as determined during the stabilization period, the test period shall be three hours. If incomplete cycling (less than two compressor cycles) occurs during a 24 hour period, the results of the 24 hour period shall be used.

4.1.2 Automatic Defrost. If the model being tested has an automatic defrost system, the test time period shall start after steady state conditions have been achieved and be from one point during a defrost period to the same point during the next defrost period. If the model being tested has a long-time automatic defrost system, the alternative provisions of 4.1.2.1 may be used. If the model being tested has a variable defrost control, the provisions of sections 4.1.2.2 or 4.1.2.3 shall apply. If the model has a dual compressor system the provisions of 4.1.2.4 shall apply.

4.1.2.1 Long-time Automatic Defrost. If the model being tested has a long-time automatic defrost system, the test time period may consist of two parts. A first part would be the same as the test for a unit having no defrost provisions (section 4.1.1). The second part would start when a defrost is initiated when the compressor “on” cycle is terminated prior to start of the defrost heater and terminates at the second turn “on” of the compressor or four hours from the initiation of the defrost heater, whichever comes first. See diagram in Figure 1 to this section.
4.1.2.2 Variable defrost control. If the model being tested has a variable defrost control system, the test shall consist of three parts. Two parts shall be the same as the test for long-time automatic defrost (section 4.1.2.1). The third part is the optional test to determine the time between defrosts (section 5.2.1.3). The third part is used by manufacturers that choose not to accept the default value of $F$ of 0.20, to calculate $CT$.

4.1.2.3 Variable defrost control optional test. After steady-state conditions with no door openings are achieved in accordance with section 3.3 above, the test is continued using the above daily door-opening sequence until stabilized operation is achieved. Stabilization is defined as a minimum of three consecutive defrost cycles with times between defrosts that will allow the calculation of a Mean Time Between Defrosts (MTBD1) that satisfies the statistical relationship of 90 percent confidence. The test is repeated on at least one more unit of the model and until the Mean Time Between Defrosts for the multiple unit tests (MTBD2) satisfies the statistical relationship. If the time between defrosts is greater than 96 hours (compressor “on” time) and this defrost period can be repeated on a second unit, the test may be terminated at 96 hours (CT) and the absolute time value used for MTBD for each unit.

4.1.2.4 Dual compressor systems with automatic defrost. If the model being tested has separate compressor systems for the refrigerator and freezer sections, each with its own automatic defrost system, then the two-part method in 4.1.2.1 shall be used. The second part of the method will be conducted separately for each automatic defrost system. The auxiliary components (fan motors, anti-sweat heaters, etc.) will be identified for
5. Test Measurements

5.1 Temperature Measurements. Temperature measurements shall be made at the locations prescribed in Figures 7.1 and 7.2 of HRF-1-1979 and shall be accurate to within ±0.5°F (0.3°C) of true value. No freeze temperature measurements need be taken in an all-refrigerator model.

If the interior arrangements of the cabinet do not correspond with those shown in Figure 7.1 and 7.2 of HRF-1-1979, measurements shall be taken at selected locations chosen to represent approximately the entire refrigerated compartment. The locations selected shall be a matter of record.

5.1.1 Measured Temperature. The measured temperature of a compartment is to be the average of all sensor temperature readings taken in that compartment at a particular time. Measurements shall be taken at regular intervals not to exceed four minutes.

5.1.2 Compartment Temperature. The compartment temperature for each test period shall be an average of the measured temperatures taken in a compartment during a complete cycle or a number of complete cycles of the compressor motor (one compressor cycle is one complete motor "on" and one complete motor "off" period). For long-time automatic defrost models, compartment temperatures shall be those measured in the first part of the test period specified in 4.1.1. For models equipped with variable defrost controls, compartment temperatures shall be those measured in the first part of the test period specified in 4.1.2.2 above.

5.1.2.1 The number of complete compressor motor cycles over which the measured temperatures in a compartment are to be averaged to determine compartment temperature shall equal to the number of minutes between measured temperature readings, rounded up to the nearest whole minute or a number of complete cycles over a time period exceeding one hour. One of the cycles shall be the last complete compressor motor cycle during the test period.

5.1.2.2 If no compressor motor cycling occurs, the compartment temperature shall be the average of the measured temperatures taken during the last thirty-two minutes of the test period.

5.1.2.3 If incomplete cycling occurs, the compartment temperature shall be the average of the measured temperatures taken during the last three hours of the last complete "on" period.

5.2 Energy Measurements

5.2.1 Per-Day Energy Consumption. The energy consumption in kilowatt-hours per day for each test period shall be the energy expended during the test period as specified in section 4.1 adjusted to a 24 hour period.

The adjustment shall be determined as follows:

5.2.1.1 Nonautomatic and automatic defrost models. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{EP \times 1440}{CT} \]

where

\[ ET = \text{test cycle energy expended in kilowatt-hours per day}, \]

\[ EP = \text{energy expended in kilowatt-hours during the test period}, \]

\[ T = \text{length of time of the test period in minutes}, \]

\[ 1440 = \text{conversion factor to adjust to a 24 hour period in minutes per day}. \]

5.2.1.2 Long-time Automatic Defrost. If the two part test method is used, the energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{1440 \times EP}{1/T_1 + (EP_2 - EP_1)} \times \frac{T_2}{T_1} \]

where

\[ ET \text{ and } 1440 \text{ are defined in 5.2.1.1}, \]

\[ EP_1 = \text{energy expended in kilowatt-hours during the first part of the test}, \]

\[ EP_2 = \text{energy expended in kilowatt-hours during the second part of the test}, \]

\[ T_1 = \text{length of time in minutes of the first and second test parts respectively}, \]

\[ CT = \text{Defrost timer run time in hours required to cause the unit to go through a complete cycle}, \]

\[ 12 = \text{factor to adjust for 50% run time of the compressor in hours per day}. \]

5.2.1.3 Variable defrost control. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{1440 \times EP}{1/T_1 + (EP_2 - EP_1)} \times \frac{T_2}{T_1} \]

where

\[ ET \text{ and } 1440 \text{ are defined in 5.2.1.1}, \]

\[ EP_1 = \text{energy expended in kilowatt-hours during the first part of the test}, \]

\[ EP_2 = \text{energy expended in kilowatt-hours during the second part of the test}, \]

\[ T_1 = \text{length of time in minutes of the first and second test parts respectively}, \]

\[ CT = \text{Defrost timer run time in hours required to cause the unit to go through a complete cycle}, \]

\[ 12 = \text{factor to adjust for 50% run time of the compressor in hours per day}. \]

5.2.1.4 Demand defrost models. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{1440 \times EP}{1/T_1 + (EP_2 - EP_1)} \times \frac{T_2}{T_1} \]

where

\[ ET \text{ and } 1440 \text{ are defined in 5.2.1.1}, \]

\[ EP_1 = \text{energy expended in kilowatt-hours during the first part of the test}, \]

\[ EP_2 = \text{energy expended in kilowatt-hours during the second part of the test}, \]

\[ T_1 = \text{length of time in minutes of the first and second test parts respectively}, \]

\[ CT = \text{Defrost timer run time in hours required to cause the unit to go through a complete cycle}, \]

\[ 12 = \text{factor to adjust for 50% run time of the compressor in hours per day}. \]

5.2.1.5 Inductive defrost models. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{1440 \times EP}{1/T_1 + (EP_2 - EP_1)} \times \frac{T_2}{T_1} \]

where

\[ ET \text{ and } 1440 \text{ are defined in 5.2.1.1}, \]

\[ EP_1 = \text{energy expended in kilowatt-hours during the first part of the test}, \]

\[ EP_2 = \text{energy expended in kilowatt-hours during the second part of the test}, \]

\[ T_1 = \text{length of time in minutes of the first and second test parts respectively}, \]

\[ CT = \text{Defrost timer run time in hours required to cause the unit to go through a complete cycle}, \]

\[ 12 = \text{factor to adjust for 50% run time of the compressor in hours per day}. \]
5.2.1.4 Optional test method for variable defrost controls.

\[
CT = \text{MTBD} \times 0.5
\]

where:

\[
\text{MTBD} = \frac{\Sigma X}{N}
\]

where:

\[X = \text{time between defrost cycles}\]
\[N = \text{number of defrost cycles}\]

5.2.1.5 Dual compressor systems with dual automatic defrost. The two-part test method in section 4.1.2.2 must be used, the energy consumption in kilowatt per day shall be calculated equivalent to:

\[
ET = [(1440 \times EP_1/T_1) + (EP_2 \times T_2/T_1)] \times 12CT_1 + (EP_3 \times T_3/T_1)] \times 12CT_2
\]

where 1440, EP_1, T_1, EP_2, T_2, CT_1, and CT_2 are defined in 5.2.1.2.

EP_1 = energy expended in kilowatt-hours during the second part of the test for the freezer system by the refrigerator system.

EP_2 = total energy expended during the second part of the test for the freezer system.

EP_3 = energy expended in kilowatt-hours during the second part of the test for the refrigerator system by the refrigerator system.

EP_2 = total energy expended during the second part of the test for the refrigerator system.

T_2 and T_3 = length of time in minutes of the second test part for the freezer and refrigerator systems respectively.

CT_1 = compressor ‘on’ time between freezer defrosts (tents of an hour).

CT_2 = compressor ‘on’ time between refrigerator defrosts (tents of an hour).

5.3 Volume measurements. The electric refrigerator or electric refrigerator-freezer total refrigerated volume, VT, shall be measured in accordance with HRF–1–1979, section 3.20 and sections 4.2 through 4.3 and be calculated equivalent to:

\[
VT = VF \times VFF
\]

where

VT = total refrigerated volume in cubic feet,
VF = freezer compartment volume in cubic feet, and
VFF = fresh food compartment volume in cubic feet.

5.4 Externally vented refrigerator or refrigerator-freezer units. All test measurements for the externally vented refrigerator or refrigerator-freezer shall be made in accordance with the requirements of other sections of this appendix, except as modified in this section 5.4 or other sections expressly applicable to externally vented refrigerators or refrigerator-freezers.

5.4.1 Operability of thermostatic and mixing of air controls. Prior to conducting energy consumption tests, the operability of thermostatic controls that permit the mixing of exterior and ambient air when exterior air temperatures are less than 60 °F must be verified. The operability of such controls shall be verified by operating the unit under ambient air temperature of 90 °F and exterior air temperature of 45 °F. If the inlet air entering the condenser or condenser/compressor compartment is maintained at 60 °F, plus or minus three degrees, energy consumption of the unit shall also be measured under 5.4.2.2 and 5.4.2.3. If the inlet air entering the condenser or condenser/compressor compartment is not maintained at 60 °F, plus or minus three degrees, energy consumption of the unit shall also be measured under 5.4.2.4.

5.4.2 Energy consumption tests.

5.4.2.1 Correction factor test. To enable calculation of a correction factor, K, two full cycle tests shall be conducted to measure energy consumption of the unit with air mixing controls disabled and the condenser inlet air temperatures set at 90 °F (32.2 °C) and 80 °F (26.7 °C). Both tests shall be conducted with all compartment temperature controls set at the position midway between their warmest and coldest settings and the anti-sweat heater switch off. Record the energy consumptions \(e_{c0}\) and \(e_{c0}^{'}\) in kWh/day.

5.4.2.2 Energy consumption at 90 °F. The unit shall be tested at 90 °F (32.2 °C) exterior air temperature to record the energy consumption \(e_{c0}\) in kWh/day. For a given setting of the anti-sweat heater, \(i\) corresponds to each of the two states of the compartment temperature control positions.

5.4.2.3 Energy consumption at 60 °F. The unit shall be tested at 60 °F (26.7 °C) exterior air temperature to record the energy consumption \(e_{c0}^{'}\) in kWh/day. For a given setting of the anti-sweat heater, \(i\) corresponds to each of the two states of the compartment temperature control positions.

5.4.2.4 Energy consumption if mixing controls do not operate properly. If the operability of temperature and mixing controls has not been verified as required under 5.4.1, the unit shall be tested at 50 °F (10.0 °C) and 30 °F (–11 °C) exterior air temperatures to record the energy consumptions \(e_{g0}\) and \(e_{g0}^{'}\). For a given setting of the anti-sweat heater, \(i\) corresponds to each of the two states of the compartment temperature control positions.

6. Calculation of Derived Results from Test Measurements

6.1 Adjusted Total Volume. The adjusted total volume, VA, for electric refrigerators under test shall be defined as:

\[
VA = (VF \times CR) + VFF
\]
6.2 Average Per-Cycle Energy Consumption

6.2.1 All-refrigerator Models. The average per-cycle energy consumption for a cycle type is expressed in kilowatt-hours per cycle to the nearest one hundredth (0.01) kilowatt-hour and shall depend upon the temperature attainable in the fresh food compartment as shown below.

6.2.2 Refrigerators and refrigerator-freezers. The average per-cycle energy consumption for a cycle type is expressed in kilowatt-hours per cycle to the nearest one hundredth (0.01) kilowatt-hour and shall be defined in the applicable following manner.

6.2.2.1 If the fresh food compartment temperature is always at or below 45 °F. (−9.4 °C.) in both tests of a refrigerator or at or below 51 °F. (−15 °C.) in both tests of a refrigerator-freezer, the per-cycle energy consumption shall be:

\[ E = ET1 \]

where

- \( E \) is defined in 6.2.1.1,
- \( ET \) is defined in 5.2.1, and
- Number 1 indicates the test period during which the highest freezer compartment temperature was measured.

6.2.2.2 If the conditions of 6.2.2.1 do not exist, the per-cycle energy consumption shall be defined by the higher of the two values calculated by the following two formulas:

\[ E = ET1 + ((ET2 - ET1) \times (38.0 - TR1)/(TR2 - TR1)) \]

\[ E = ET1 + ((ET2 - ET1) \times (k - TF1)/(TF2 - TF1)) \]

where

- \( E \) is defined in 6.2.1.1,
- \( ET \) is defined in 5.2.1,
- \( TR \) and number 1 and 2 are defined in 6.2.1.2,
- \( TF \) is freezer compartment temperature determined according to 5.1.2 in degrees F.,
- \( k \) is a constant 15.0 for refrigerators or 5.0 for refrigerator-freezers each being standardized freezer compartment temperature in degrees F.

6.3 Externally vented refrigerator or refrigerator-freezer. Per-cycle energy consumption measurements for the externally vented refrigerator or refrigerator-freezer shall be calculated in accordance with the requirements of this Appendix, as modified in sections 6.3.1-6.3.7.

6.3.1 Correction factor. A correction factor, \( K \), shall be calculated as:

\[ K = e_{c90}/e_{c50} \]

where \( e_{c50} \) and \( e_{c90} \) = the energy consumption test results as determined under 5.2.2.1.

6.3.2 Combining test results of different settings of compartment temperature controls. For a given setting of the anti-sweat heater, follow the calculation procedures of 6.2 to combine the test results for energy consumption of the unit at different temperature control settings for each condenser inlet air temperature tested under 5.4.2.2, 5.4.2.3, and 5.4.2.4, where applicable, \( e_{i50}, e_{i90}, e_{i50}, \) and \( e_{i90}. \) The combined values are \( e_{i50}, e_{i90}, e_{i50}, \) and \( e_{i90}. \) Where applicable, in kWh/day.

6.3.3 Energy consumption corrections. For a given setting of the anti-sweat heater, the energy consumption \( e_{i50}, e_{i90}, e_{i50}, \) and \( e_{i90}. \) Calculated in 6.3.2 shall be adjusted by multiplying the correction factor \( K \) to obtain the
corrected energy consumptions per day, in kWh/day:

\[ E_{90} = K \times e_{90}, \]
\[ E_{60} = K \times e_{60}, \]
\[ E_{50} = K \times e_{50}, \]
\[ E_{30} = K \times e_{30}, \]

where,

- \( K \) is determined under section 6.3.1, and
- \( e_{90}, e_{60}, e_{50}, \) and \( e_{30} \) are determined under section 6.3.2.

6.3.4 Energy profile equation. For a given setting of the anti-sweat heater, the energy consumption \( E_X \), in kWh/day, at a specific exterior air temperature between 80 °F (26.7 °C) and 60 °F (26.7 °C) shall be calculated by the following equation:

\[ E_X = a + bT_X, \]

where,

- \( T_X \) = exterior air temperature in °F;
- \( a = 3E_{60} - 2E_{90}, \) in kWh/day;
- \( b = (E_{90} - E_{60})/30, \) in kWh/day per °F.

6.3.5 Energy consumption at 80 °F (26.7 °C), 75 °F (23.9 °C) and 65 °F (18.3 °C). For a given setting of the anti-sweat heater, calculate the energy consumptions at 80 °F (26.7 °C), 75 °F (23.9 °C) and 65 °F (18.3 °C) exterior air temperatures, \( E_{80}, E_{75}, \) and \( E_{65} \), respectively, in kWh/day, using the equation in 6.3.4.

6.3.6 National average per cycle energy consumption. For a given setting of the anti-sweat heater, calculate the national average energy consumption, \( E_N \), in kWh/day, using one of the following equations:

\[ E_N = 0.523 \times E_{60} + 0.105 \times E_{65} + 0.181 \times E_{75} + 0.131 \times E_{80}, \] for units not tested under 5.4.2.4,
\[ E_N = 0.257 \times E_{30} + 0.266 \times E_{50} + 0.105 \times E_{65} + 0.181 \times E_{75} + 0.131 \times E_{80}, \] for units tested under 5.4.2.4.

where,

- \( E_{30}, E_{50}, \) and \( E_{60} \) are defined in 6.3.3,
- \( E_{65}, E_{75}, \) and \( E_{80} \) are defined in 6.3.5, and
- the coefficients are weather associated weighting factors.

6.3.7 Regional average per cycle energy consumption. If regional average per cycle energy consumption is required to be calculated, for a given setting of the anti-sweat heater, calculate the regional average per cycle energy consumption, \( E_R \), in kWh/day, for the regions in figure 1 using one of the following equations and the coefficients in the table A:

\[ E_R = a_1 \times E_{60} + c \times E_{65} + d \times E_{75} + e \times E_{80}, \] for a unit that is not required to be tested under 5.4.2.4,
\[ E_R = a \times E_{30} + b \times E_{50} + c \times E_{65} + d \times E_{75} + e \times E_{80}, \] for a unit tested under 5.4.2.4.

where:

- \( E_{30}, E_{50}, \) and \( E_{60} \) are defined in 6.3.3,
- \( E_{65}, E_{75}, \) and \( E_{80} \) are defined in 6.3.5, and
- \( a_1, a, b, c, d, e \) are weather associated weighting factors for the Regions, as specified in Table A.

APPENDIX B1 TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF FREEZERS

1. Definitions.

1.1 “HRF–1–1979” means the Association of Home Appliance Manufacturers standard for household refrigerators, combination refrigerators-freezers, and household freezers, also approved as an American National Standard as a revision of ANSI B38.1–1970.

1.2 “Anti-sweat heater” means a device incorporated into the design of a freezer to prevent the accumulation of moisture on exterior surfaces of the cabinet under conditions of high ambient humidity.

1.3 “Cycle” means the period of 24 hours for which the energy use of a freezer is calculated as though the consumer-activated compartment temperature controls were preset so that the desired compartment temperatures were maintained.

1.4 “Cycle type” means the set of test conditions having the calculated effect of operating a freezer for a period of 24 hours with the consumer-activated controls other than the compartment temperature control set to establish various operating characteristics.

1.5 “Standard cycle” means the cycle type in which the anti-sweat heater switch, when provided, is set in the highest energy consuming position.

1.6 “Adjusted total volume” means the product of, (1) the freezer volume as defined in HRF–1–1979 in cubic feet, times (2) an adjustment factor.

1.7 “Automatic Defrost” means a system in which the defrost cycle is automatically initiated and terminated, with resumption of normal refrigeration at the conclusion of defrost operation. The system automatically prevents the permanent formation of frost on all refrigerated surfaces. Nominal refrigerated food temperatures are maintained during the operation of the automatic defrost system.

1.8 “Long-time Automatic Defrost” means an automatic defrost system where successive defrost cycles are separated by 14 hours or more of compressor-operating time.

1.9 “Stabilization Period” means the total period of time during which steady-state conditions are being attained or evaluated.

1.10 “Variable defrost control” means a long-time automatic defrost system (except the 14-hour defrost qualification does not
apply) where successive defrost cycles are determined by an operating condition variable or variables other than solely compressor operating time. This includes any electrical or mechanical device. Demand defrost is a type of variable defrost control.

1.11 ‘Quick freeze’ means an optional feature on freezers which is initiated manually and shut off manually. It bypasses the compressor in a steady-state operating condition until it is shut off.

2. Test Conditions.

2.1 Ambient temperature. The ambient temperature shall be 90.0 ± 2.0°F (32.2 ± 0.6 °C) during the stabilization period and during the test period. The ambient temperature shall be 80°F dry bulb and 67°F wet bulb during the stabilization period and during the test period when the unit is tested in accordance with section 3.3.

2.2 Operational conditions. The freezer shall be installed and its operating conditions maintained in accordance with HRF–1–1979, section 7.2 through section 7.4.3.3, except that the vertical ambient gradient at locations 10 inches (25.4 cm) out from the centers of the two sides of the unit being tested is to be maintained during the test. Unless the area is obstructed by shields or baffles, the gradient is to be maintained from 2 inches (5.1 cm) above the floor or supporting platform to a height one foot (30.5 cm) above the unit under test. Defrost controls are to be operative and the anti-sweat heater switch is to be ‘on’ during one test and ‘off’ during a second test. The quick freeze option shall be switched off unless specified.

2.3 Steady State Condition. Steady state conditions exist if the temperature measurements taken at four minute intervals or less during a stabilization period are not changing at a rate greater than 0.04 °F (0.023 °C) per hour as determined by the applicable condition of A or B.

A—The average of the measurements during a two hour period if no cycling occurs or during a number of complete repetitive compressor cycles through a period of no less than two hours is compared to the average over an equivalent time period with three hours elapsed between the two measurement periods.

B—if A above cannot be used, the average of the measurements during a number of complete repetitive compressor cycles through a period of no less than two hours and including the last complete cycle prior to a defrost period, or if no cycling occurs, the average of the measurements during the last two hours prior to a defrost period; are compared to the same averaging period prior to the following defrost period.

3. Test Control Settings.

3.1 Model with no user operable temperature control. A test shall be performed during which the compartment temperature and energy use shall be measured. A second test shall be performed with the temperature control electrically short circuited to cause the compressor to run continuously. If the model has the quick freeze option, it is to be used to bypass the temperature control.

3.2 Model with user operable temperature control. Testing shall be performed in accordance with one of the following sections using the standardized temperature of 0.0°F (-17.8 °C). Variable defrost control models shall achieve 0°F during the steady-state conditions prior to the optional test with no door openings.

3.2.1 A first test shall be performed with all temperature controls set at their median position midway between their warmest and coldest settings. Knob detents shall be mechanically defeated if necessary to attain a median setting. A second test shall be performed with all controls set at either their warmest or their coldest setting (not electrically or mechanically bypassed), whichever is appropriate, to attempt to achieve compartment temperatures measured during the two tests which bound i.e., one is above and one is below) the standardized temperature. If the compartment temperatures measured during these two tests bound the standardized temperature, then these test results shall be used to determine energy consumption. If the compartment temperature measured with all controls set at their coldest setting is above the standardized temperature, a third test shall be performed with all controls set at their warmest setting and the result of this test shall be used with the result of the test performed with all controls set at their coldest setting to determine energy consumption. If the compartment temperature measured with all controls set at their warmest setting is below the standardized temperature, then the result of this test alone will be used to determine energy consumption.

3.2.2 Alternatively, a first test may be performed with all temperature controls set at their warmest setting. If the compartment temperature is below the standardized temperature, then the result of this test alone will be used to determine energy consumption. If the above condition is not met, then the unit shall be tested in accordance with 3.2.1 above.

3.2.3 Alternatively, a first test may be performed with all temperature controls set at their coldest setting. If the compartment temperature is above the standardized temperature, a second test shall be performed with all controls set at their warmest setting and the results of these two tests shall be used to determine energy consumption. If
the above condition is not met, then the unit shall be tested in accordance with §2.1 above.

3.3 Variable defrost control optional test. After a steady-state condition is achieved, the door-opening sequence is initiated with an 18±2 second freezer door-opening occurring every eight hours to obtain three door-openings per 24-hour period. The first freezer door-opening shall occur at the initiation of the test period. The door(s) are to be opened 60 to 90° with an average velocity for the leading edge of the door of approximately two feet per second. Prior to the initiation of the door-opening sequence, the freezer defrost control mechanism may be re-initiated in order to minimize the test duration.

4. Test Period.

4.1 Test Period. Tests shall be performed by establishing the conditions set forth in Section 2 and using control settings as set forth in Section 3 above.

4.1.1 Nonautomatic Defrost. If the model being tested has no automatic defrost system, the test time period shall start after steady state conditions have been achieved, and be of not less than three hours' duration. During the test period the compressor motor shall complete two or more whole cycles (a compressor cycle is a complete ‘‘on’’ and a complete ‘‘off’’ period of the motor). If no ‘‘off’’ cycling will occur, as determined during the stabilization period, the test period shall be three hours. If incomplete cycling (less than two compressor cycles) occurs during a 24 hour period, the results of the 24 hour period shall be used.

4.1.2 Automatic Defrost. If the model being tested has an automatic defrost system, the test time period shall start after steady state conditions have been achieved and be from one point during a defrost period to the same point during the next defrost period. If the model being tested has a long-time automatic defrost system, the alternate provisions of 4.1.1 may be used. If the model being tested has a variable defrost control the provisions of 4.1.2 shall apply.

4.1.2.1 Long-time Automatic Defrost. If the model being tested has a long-time automatic defrost system, the test time period may consist of two parts. A first part would be the same as the test for a unit having no defrost provisions (section 4.1.1). The second part would start when a defrost period is initiated during a compressor ‘‘on’’ cycle and terminate at the second turn ‘‘on’’ of the compressor motor or after four hours, whichever comes first.

4.1.2.2 Variable defrost control. If the model being tested has a variable defrost control system, the test shall consist of three parts. Two parts shall be the same as the test for long-time automatic defrost in accordance with section 4.1.2.1 above. The third part is the optional test to determine the time between defrosts (5.2.1.3). The third part is used by manufacturers that choose not to accept the default value of F of 0.20, to calculate CT.

4.1.2.3 Variable defrost control optional test. After steady-state conditions with no door-openings are achieved in accordance with section 3.3 above, the test is continued using the above daily door-opening sequence until stabilized operation is achieved. Stabilization is defined as a minimum of three consecutive defrost cycles with times between defrost that will allow the calculation of a Mean Time Between Defrosts (MTBD) that satisfies the statistical relationship of 90 percent confidence. The test is repeated on at least one more unit of the model and until the Mean Time Between Defrosts for the multiple unit test (MTBD2) satisfies the statistical relationship. If the time between defrosts is greater than 96 hours (compressor ‘‘on’’ time) and this defrost period can be repeated on a second unit, the test may be terminated at 96 hours (CT) and the absolute time value used for MTBD for each unit.

5. Test Measurements.

5.1 Temperature Measurements. Temperature measurements shall be made at the locations prescribed in Figure 7-2 of HRF–I-1979 and shall be accurate to within ±0.5 °F. (0.3 °C.) of true value.

5.1.1 Measured Temperature. The measured temperature is to be the average of all sensor temperature readings taken at a particular time. Measurements shall be taken at regular intervals not to exceed four minutes.

5.1.2 Compartment Temperature. The compartment temperature for each test period shall be an average of the measured temperatures taken during a complete cycle or several complete cycles of the compressor motor (one compressor cycle is one complete motor “on” and one complete motor “off” period). For long-time automatic defrost models, compartment temperature shall be that measured in the first part of the test period specified in 4.1.1. For models equipped with variable defrost controls, compartment temperatures shall be those measured in the first part of the test period specified in 4.1.2.2.

5.1.2.1 The number of complete compressor motor cycles over which the measured temperatures in a compartment are to be averaged to determine compartment temperature shall be equal to the number of minutes between measured temperature readings rounded up to the next whole minute or a number of complete cycles over a time period exceeding one hour. One of the cycles shall be the last complete compressor motor cycles during the test period.

5.1.2.2 If no compressor motor cycling occurs, the compartment temperature shall be the average of the measured temperatures
5.1.2.3 If incomplete cycling occurs (less than one cycle) the compartment temperature shall be the average of all readings taken during the last thirty-two minutes of the last complete "on" period.

5.2 Energy Measurements:

5.2.1 Per-day Energy Consumption. The energy consumption in kilowatt-hours per day for each test period shall be the energy expended during the test period as specified in section 4.1 adjusted to a 24-hour period.

The adjustment shall be determined as follows:

5.2.1.1 Nonautomatic and automatic defrost models. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{EP \times 1440 \times K}{T} \]

where

\( ET \) = test cycle energy expended in kilowatt-hours per day,

\( EP \) = energy expended in kilowatt-hours during the test period,

\( T \) = length of time of the test period in minutes,

\( 1440 \) = conversion factor to adjust to a 24-hour period in minutes per day, and

\( K \) = correction factor of 0.7 for chest freezers and 0.85 for upright freezers to adjust for average household usage, dimensionless.

5.2.1.2 Long-time Automatic Defrost. If the two part test method is used, the energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{(1440 \times K \times \frac{VA}{VT}) + ((EP2 - (EP1 \times \frac{T2}{T1})) \times K \times 12CT)}{T} \]

where

\( ET \), 1440, and \( K \) are defined in 5.2.1.1

\( EP1 \) = energy expended in kilowatt-hours during the first part of the test.

\( EP2 \) = energy expended in kilowatt-hours during the second part of the test.

\( T1 \) and \( T2 \) = length of time of the first and second test parts respectively.

5.2.1.3 Variable defrost control. The energy consumption in kilowatt-hours per day shall be calculated equivalent to:

\[ ET = \frac{(1440 \times EP1 \times T1) + (EP2 - (EP1 \times \frac{T2}{T1}) \times (12CT))}{T} \]

where

\( 1440 \) is defined in 5.2.1.1 and \( EP1 \), \( EP2 \), \( T1 \), \( T2 \), and \( 12 \) are defined in 5.2.1.2.

\( CT \) = (\( CT1 \times CTM \)) \( F \) \( (CTM - CT1) + CT1 \)

where:

\( CT1 \) = least or shortest time between defrost in tenths of an hour (greater than or equal to 6 hours but less than or equal to 12 hours, \( 6 \leq L \leq 12 \))

\( CTM \) = maximum time between defrost cycles in tenths of an hour (greater than \( CT1 \) but not more than 96 hours, \( CT1 < CTM < 96 \))

\( F \) = ratio of per day energy consumption in excess of the least energy and the maximum difference in per day energy consumption and is equal to:

\[ F = \frac{(1/CT - 1/CTM)}{1/CTL - 1/CTM} = (ET - ET1)/(ETM - ET1) or 0.20 in lieu of testing to find \( CT \)

\( ET1 \) = least electrical energy consumed, in kilowatt hours

\( ETM \) = maximum electrical energy consumed, in kilowatt hours

For demand defrost models with no values for \( CT \) and \( CTM \) in the algorithm the default values of 12 and 84 shall be used, respectively.

5.2.1.4 Variable defrost control optional test. Perform the optional test for variable defrost control models to find \( CT \).

\( CT = MTBD \times 0.5 \)

\( MTBD \) = mean time between defrost

\[ MTBD = \frac{\sum X}{N} \]

\( X \) = time between defrost cycles

\( N \) = number of defrost cycles

5.3 Volume measurements. The total refrigerated volume, \( VT \), shall be measured in accordance with HRF–1–1979, section 3.20 and section 5.1 through 5.3.

6. Calculation of Derived Results From Test Measurements.

6.1 Adjusted Total Volume. The adjusted total volume, \( VA \), for freezers under test shall be defined as:

\( VA = VT \times CF \)

where

\( VA \) = adjusted total volume in cubic feet,

\( VT \) = total refrigerated volume in cubic feet,

\( CF \) = correction factor of 1.73, dimensionless.

6.2 Average Per Cycle Energy Consumption:

6.2.1 The average per-cycle energy consumption for a cycle type expressed in kilowatt-hours per cycle to the nearest one hundredth (0.01) kilowatt-hour and shall depend upon the compartment temperature attainable as shown below.

6.2.1.1 If the compartment temperature is always below 0.0 °F. (–17.8 °C.), the average per-cycle energy consumption shall be equivalent to:

\[ E = ET1 \]

where

\( E \) = total per-cycle energy consumption in kilowatt-hours per day.
ET is defined in 5.2.1, and Number 1 indicates the test period during which the highest compartment temperature is measured.

6.2.1.2 If one of the compartment temperatures measured for a test period is greater than 0.0 °F (17.8 °C), the average per-cycle energy consumption shall be equivalent to:

\[ E = E_T + \left( (E_T - E) \times \frac{0.0 - TF}{TF - TF} \right) \]

where

\[ E \text{ is defined in 6.2.1} \]
\[ ET \text{ is defined in 5.2.1} \]
\[ TF = \text{compartment temperature determined according to 5.1.2 in degrees F.} \]

Numbers 1 and 2 indicate measurements taken during the first and second test period as appropriate, and 0.0=Standardized compartment temperature in degrees F.

APPENDIX C TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF DISHWASHERS

1. Definitions

1.1 AHAM means the Association of Home Appliance Manufacturers.

1.2 Compact dishwasher means a dishwasher that has a capacity of less than eight place settings plus six serving pieces as specified in ANSI/AHAM DW-1 (Incorporated by reference, see §430.22), using the test load specified in section 2.7 of this Appendix.

1.3 Cycle means a sequence of operations of a dishwasher which performs a complete dishwashing function, and may include variations or combinations of washing, rinsing, and drying.

1.4 Cycle type means any complete sequence of operations capable of being preset on the dishwasher prior to the initiation of machine operation.

1.5 Non-soil-sensing dishwasher means a dishwasher that does not have the ability to adjust automatically any energy consuming aspect of a wash cycle based on the soil load of the dishes.

1.6 Normal cycle means the cycle type recommended by the manufacturer for completely washing a full load of normally soiled dishes including the power-dry feature.

1.7 Power-dry feature means the introduction of electrically generated heat into the washing chamber for the purpose of improving the drying performance of the dishwasher.

1.8 Preconditioning cycle means any cycle that includes a fill, circulation, and drain to ensure that the water lines and sump area of the pump are primed.

1.9 Sensor heavy response means, for standard dishwashers, the set of operations in a soil-sensing dishwasher for completely washing a load of dishes, four place settings of which are soiled according to ANSI/AHAM DW-1 (Incorporated by reference, see §430.22). For compact dishwashers, this definition is the same, except that two soiled place settings are used instead of four.

1.10 Sensor light response means, for both standard and compact dishwashers, the set of operations in a soil-sensing dishwasher for completely washing a load of dishes, one place setting of which is soiled with half of the gram weight of soils for each item specified in a single place setting according to ANSI/AHAM DW-1 (Incorporated by reference, see §430.22). For compact dishwashers, this definition is the same, except that one soiled place setting is used instead of two.

1.11 Sensor medium response means, for standard dishwashers, the set of operations in a soil-sensing dishwasher for completely washing a load of dishes, two place settings of which are soiled according to ANSI/AHAM DW-1 (Incorporated by reference, see §430.22). For compact dishwashers, this definition is the same, except that one soiled place setting is used instead of two.

1.12 Soil-sensing dishwasher means a dishwasher that has the ability to adjust any energy consuming aspect of a wash cycle based on the soil load of the dishes.

1.13 Standard dishwasher means a dishwasher that has a capacity equal to or greater than eight place settings plus six serving pieces as specified in ANSI/AHAM DW-1 (Incorporated by reference, see §430.22), using the test load specified in section 2.7 of this Appendix.

1.14 Standby mode means the lowest power consumption mode which cannot be switched off or influenced by the user and that may persist for an indefinite time when the dishwasher is connected to the main electricity supply and used in accordance with the manufacturer’s instructions.

1.15 Truncated normal cycle means the normal cycle interrupted to eliminate the power-dry feature after the termination of the last rinse operation.

1.16 Truncated sensor heavy response means the sensor heavy response interrupted to eliminate the power-dry feature after the termination of the last rinse operation.

1.17 Truncated sensor light response means the sensor light response interrupted to eliminate the power-dry feature after the termination of the last rinse operation.

1.18 Truncated sensor medium response means the sensor medium response interrupted to eliminate the power-dry feature.
after the termination of the last rinse operation.

1.19 Water-heating dishwasher means a dishwasher which, as recommended by the manufacturer, is designed for heating cold inlet water (nominal 50 °F) or designed for heating water with a nominal inlet temperature of 120 °F. Any dishwasher designated as water-heating (50 °F or 120 °F inlet water) must provide internal water heating to above 120 °F in at least one wash phase of the normal cycle.

2. Testing conditions:

2.1 Installation Requirements. Install the dishwasher according to the manufacturer's instructions. A standard or compact under-counter or under-sink dishwasher must be tested in a rectangular enclosure constructed of nominal 0.374 inch (9.5 mm) plywood painted black. The enclosure must consist of a top, a bottom, a back, and two sides. If the dishwasher includes a counter top as part of the appliance, omit the top of the enclosure. Bring the enclosure into the closest contact with the appliance that the configuration of the dishwasher will allow.

2.2 Electrical energy supply.

2.2.1 Dishwashers that operate with an electrical supply of 115 volts. Maintain the electrical supply to the dishwasher at 115 volts ±2 percent and within 1 percent of its nameplate frequency as specified by the manufacturer.

2.2.2 Dishwashers that operate with an electrical supply of 240 volts. Maintain the electrical supply to the dishwasher at 240 volts ±2 percent and within 1 percent of its nameplate frequency as specified by the manufacturer.

2.3 Water temperature. Measure the temperature of the water supplied to the dishwasher using a temperature measuring device as specified in section 3.1 of this Appendix.

2.3.1 Dishwashers to be tested at a nominal 140 °F inlet water temperature. Maintain the water supply temperature at 140 ±2 °F.

2.3.2 Dishwashers to be tested at a nominal 120 °F inlet water temperature. Maintain the water supply temperature at 120 ±2 °F.

2.3.3 Dishwashers to be tested at a nominal 50 °F inlet water temperature. Maintain the water supply temperature at 50 ±2 °F.

2.4 Water pressure. Using a water pressure gauge as specified in section 3.4 of this Appendix, maintain the pressure of the water supply at 35 ±2.5 pounds per square inch gauge (psig) when the water is flowing.

2.5 Ambient and machine temperature. Using a temperature measuring device as specified in section 3.1 of this Appendix, maintain the room ambient air temperature at 75 ±5 °F, and ensure that the dishwasher and the test load are at room ambient temperature at the start of each test cycle.

2.6 Test Cycle and Load.

2.6.1 Non-soil-sensing dishwashers to be tested at a nominal inlet temperature of 140 °F. These units must be tested on the normal cycle and truncated normal cycle without a test load if the dishwasher does not heat water in the normal cycle.

2.6.2 Non-soil-sensing dishwashers to be tested at a nominal inlet temperature of 50 °F or 120 °F. These units must be tested on the normal cycle with a clean load of eight place settings plus six serving pieces, as specified in section 2.7 of this Appendix. If the capacity of the dishwasher, as stated by the manufacturer, is less than eight place settings, then the test load must be the stated capacity.

2.6.3 Soil-sensing dishwashers to be tested at a nominal inlet temperature of 50 °F, 120 °F, or 140 °F. These units must be tested first for the sensor heavy response, then tested for the sensor medium response, and finally for the sensor light response with the following combinations of soiled and clean test loads.

2.6.3.1 For tests of the sensor heavy response, as defined in section 1.11 of this Appendix:

(A) For standard dishwashers, the test unit is to be loaded with a total of eight place settings plus six serving pieces as specified in section 2.7 of this Appendix. Four of the eight place settings must be soiled according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces, and all flatware are not soiled.

(B) For compact dishwashers, the test unit is to be loaded with four place settings plus six serving pieces as specified in section 2.7 of this Appendix. Two of the four place settings must be soiled according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces, and all flatware are not soiled.

2.6.3.2 For tests of the sensor medium response, as defined in section 1.11 of this Appendix:

(A) For standard dishwashers, the test unit is to be loaded with a total of eight place settings plus six serving pieces as specified in section 2.7 of this Appendix. Two of the eight place settings must be soiled according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces, and all flatware are not soiled.

(B) For compact dishwashers, the test unit is to be loaded with four place settings plus six serving pieces as specified in section 2.7 of this Appendix. One of the four place settings must be soiled according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces and all flatware are not soiled.

2.6.3.3 For tests of the sensor light response, as defined in section 1.10 of this Appendix:
Department of Energy

Pt. 430, Subpt. B, App. C

(A) For standard dishwashers, the test unit is to be loaded with a total of eight place settings plus six serving pieces as specified in section 2.7 of this Appendix. One of the eight place settings must be soiled with half of the soil load specified for a single place setting according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces, and all flatware are not soiled.

(B) For compact dishwashers, the test unit is to be loaded with four place settings plus six serving pieces as specified in section 2.7 of this Appendix. One of the four place settings must be soiled with half of the soil load specified for a single place setting according to the ANSI/AHAM DW–1 (Incorporated by reference, see §430.22) while the remaining place settings, serving pieces, and all flatware are not soiled.

2.7 Test Load.

2.8 Detergent. Use half the quantity of detergent specified according to ANSI/AHAM DW–1 (Incorporated by reference, see §430.22).

2.9 Testing requirements. Provisions in this Appendix pertaining to dishwashers that operate with a nominal inlet temperature of 50 °F or 120 °F apply only to water-heating dishwashers as defined in section 1.19 of this Appendix.

2.10 Preconditioning requirements. Precondition the dishwasher by establishing the testing conditions set forth in sections 2.1 through 2.5 of this Appendix. Set the dishwasher to the preconditioning cycle as defined in section 1.8 of this Appendix, without using a test load, and initiate the cycle.

3. Instrumentation

Test instruments must be calibrated annually.

3.1 Temperature measuring device. The device must have an error no greater than ±1 °F over the range being measured.

3.2 Timer. Time measurements for each monitoring period shall be accurate to within 2 seconds.

3.3 Water meter. The water meter must have a resolution of no larger than 0.1 gallons and a maximum error no greater than ±1.5 percent of the measured flow rate for all water temperatures encountered in the test cycle.

3.4 Water pressure gauge. The water pressure gauge must have a resolution of one pound per square inch (psi) and must have an error no greater than 5 percent of any measured value over the range of 35 ±2.5 psi.

3.5 Watt-hour meter. The watt-hour meter must have a resolution of 1 watt-hour or less and a maximum error of no more than 1 percent of the measured value for any demand greater than 50 watts.

3.6 Standby wattmeter. The standby wattmeter must have a resolution of 0.1 watt or less, a maximum error of no more than 1 percent of the measured value, and must be capable of operating within the stated tolerances for input voltages up to 5 percent total harmonic distortion. The standby wattmeter must be capable of operating at frequencies from 47 hertz through 63 hertz. Power measurements must have a crest factor of 3 or more at currents of 2 amps RMS or less.

3.7 Standby watt-hour meter. The standby watt-hour meter must meet all the requirements of the standby wattmeter and must accumulate watt-hours at a minimum power level of 20 milliwatts.
4. Test Cycle and Measurements

4.1 Test cycle. Perform a test cycle by establishing the testing conditions set forth in section 2 of this Appendix, setting the dishwasher to the cycle type to be tested, initiating the cycle, and allowing the cycle to proceed to completion.

4.2 Machine electrical energy consumption. Measure the machine electrical energy consumption, M, expressed as the number of kilowatt-hours of electricity consumed by the machine during the entire test cycle, using a watt-hour meter as specified in section 3.6 of this Appendix and using a watt-hour meter as specified in section 3.5 of this Appendix.

4.3 Water consumption. Measure the water consumption, V, expressed as the number of gallons of water delivered to the machine during the entire test cycle, using a water meter as specified in section 3.3 of this Appendix.

4.4 Standby power. Connect the dishwasher to a standby wattmeter or a standby watt-hour meter as specified in sections 3.6 and 3.7, respectively, in this Appendix. Select the conditions necessary to achieve operation in the standby mode as defined in section 1.14 of this Appendix. Monitor the power consumption but allow the dishwasher to stabilize for at least 5 minutes. Then monitor the power consumption for at least an additional 5 minutes. If the power level does not change by more than 5 percent from the maximum observed value during the later 5 minutes and there is no cyclic or pulsing behavior of the load, the load can be considered stable. For stable operation, standby power, S

4.5 Calculation of Derived Results From Test Measurements

5.1 Machine energy consumption.

5.1.1 Machine energy consumption for non-soil-sensing electric dishwashers. Take the value recorded in section 4.2 of this Appendix as the per-cycle machine electrical energy consumption. Express the value, M, in kilowatt-hours per cycle.

5.1.2 Machine energy consumption for soil-sensing electric dishwashers. The machine energy consumption for the sensor normal cycle, M

5.2 Drying energy.

5.2.1 Drying energy consumption for non-soil-sensing electric dishwashers. Calculate the amount of energy consumed using the power-dry feature after the termination of the last rinse option of the normal cycle. Express the value, E

5.2.2 Drying energy consumption for soil-sensing electric dishwashers. The drying energy consumption, E

5.3 Water consumption.

5.3.1 Water consumption for non-soil-sensing dishwashers using electrically heated, gas-heated, or oil-heated water. Take the value recorded in section 4.3 of this Appendix as the per-cycle water energy consumption. Express the value, V, in gallons per cycle.

5.3.2 Water consumption for soil-sensing dishwashers using electrically heated, gas-heated, or oil-heated water. The water consumption for the sensor normal cycle, V

172
Department of Energy

Pt. 430, Subpt. B, App. D

Vₙ = the value recorded in section 4.3.1 of this Appendix for the test of the sensor light response, expressed in gallons per cycle,
Fᵣₙ = the weighting factor based on consumer use of heavy response = 0.05,
Fᵢₙ = the weighting factor based on consumer use of medium response = 0.33,
Fᵣᵢₙ = the weighting factor based on consumer use of light response = 0.62.

5.4 Water energy consumption for non-soil-sensing or soil-sensing dishwashers using electrically heated water.

5.4.1 Dishwashers that operate with a nominal 140 °F inlet water temperature, only. For the normal and truncated normal test cycle, calculate the water energy consumption, W, expressed in kilowatt-hours per cycle and defined as:

W = V(T x K)

Where,

V = reported water consumption in gallons per cycle, as determined in section 5.3.1 of this Appendix,
T = nominal water heater temperature rise = 70 °F,
K = specific heat of water in kilowatt-hours for gallon per degree Fahrenheit = 0.0024.

5.4.2 Dishwashers that operate with a nominal inlet water temperature of 120 °F. For the normal and truncated normal test cycle, calculate the water energy consumption, W, expressed in kilowatt-hours per cycle and defined as:

W = V(T x K)

Where,

V = water consumption in gallons per cycle, as determined in section 5.3.1 of this Appendix,
T = nominal water heater temperature rise = 90 °F,
K = specific heat of water in kilowatt-hours for gallon per degree Fahrenheit = 0.0024.

5.5 Water energy consumption per cycle using gas-heated or oil-heated water.

5.5.1 Dishwashers that operate with a nominal 140 °F inlet water temperature, only.

For each test cycle, calculate the water energy consumption using gas-heated or oil heated water, Wₑ, expressed in Btu's per cycle and defined as:

Wₑ = V(T x C/e)

Where,

V = reported water consumption in gallons per cycle, as determined in section 5.3.2 of this Appendix,
T = nominal water heater temperature rise = 90 °F,
C = specific heat of water in Btu's per gallon per degree Fahrenheit = 8.2,
e = nominal gas or oil water heater recovery efficiency = 0.75.

5.5.2 Dishwashers that operate with a nominal inlet water temperature of 120 °F. For each test cycle, calculate the water energy consumption using gas heated or oil heated water, Wₑ, expressed in Btu's per cycle and defined as:

Wₑ = V(T x C/e)

Where,

V = reported water consumption in gallons per cycle, as determined in section 5.3.2 of this Appendix,
T = nominal water heater temperature rise = 70 °F,
C = specific heat of water in kilowatt-hours for gallon per degree Fahrenheit = 0.0024,
e = nominal gas or oil water heater recovery efficiency = 0.75.

5.6 Annual standby energy consumption. Calculate the estimated annual standby energy consumption. First determine the number of standby hours per year, Hₛ, defined as:

Hₛ = H − (N x L).

Where,

H = the total number of hours per year = 8766 hours per year,
N = the representative average dishwasher use of 215 cycles per year,
L = the average of the duration of the normal cycle and truncated normal cycle, for non-soil-sensing dishwashers with a truncated normal cycle; the average duration of the sensor light response, truncated sensor light response, sensor medium response, truncated sensor medium response, sensor heavy response, and truncated sensor heavy response, for soil-sensing dishwashers without a truncated normal cycle; the average duration of the sensor light response, sensor medium response, sensor heavy response, for soil-sensing dishwashers without a truncated cycle option; the average duration of the sensor light response, sensor medium response, sensor heavy response, for soil-sensing dishwashers with a truncated cycle option; the average duration of the sensor light response, sensor medium response, sensor heavy response, for soil-sensing dishwashers with a truncated cycle option.

Then calculate the estimated annual standby power use, Sₛ, expressed in kilowatt-hours per year and defined as:

Sₛ = Sₓ(Hₛ)/(1000)

Where,

Sₓ = the average standby power in watts as determined in section 4.4.4 of this Appendix.
minute periods until the final weight change of the load is 1 percent or less.

1.3 “Compact” or compact size” means a clothes dryer with a drum capacity of less than 4.4 cubic feet.

1.4 “Cool down” means that portion of the clothes drying cycle when the added gas or electric heat is terminated and the clothes continue to tumble and dry within the drum.

1.5 “Cycle” means a sequence of operation of a clothes dryer which performs a clothes drying operation, and may include variations or combinations of the functions of heating, tumbling and drying.

1.6 “Drum capacity” means the volume of the drying drum in cubic feet.

1.7 “HLD–1” means the test standard promulgated by AHAM and titled “AHAM Performance Evaluation Procedure for Household Tumble Type Clothes Dryers,” June 1974, and designated as HLD–1.

1.8 “HLD–2EC” means the test standard promulgated by AHAM and titled “Test Method for Measuring Energy Consumption of Household Tumble Type Clothes Dryers,” December 1975, and designated as HLD–2EC.

1.9 “Standard size” means a clothes dryer with a drum capacity of 4.4 cubic feet or greater.

1.10 “Moisture content” means the ratio of the weight of water contained by the test load to the bone-dry weight of the test load, expressed as a percent.

1.11 “Automatic termination control” means a dryer control system with a sensor which monitors either the dryer load temperature or its moisture content and with a controller which automatically terminates the drying process. A mark or detent which indicates a preferred automatic termination control setting must be present if the dryer is to be classified as having an “automatic termination control.” A mark is a visible controller single control setting on one or more dryer controls.

1.12 “Temperature sensing control” means a system which monitors dryer exhaust air temperature and automatically terminates the dryer cycle.

1.13 “Moisture sensing control” means a system which utilizes a moisture sensing element within the dryer drum that monitors the amount of moisture in the clothes and automatically terminates the dryer cycle.

2. Testing Conditions

2.1 Installation. Install the clothes dryer in accordance with manufacturer’s instructions. The dryer exhaust shall be restricted by adding the AHAM exhaust simulator described in 3.3.5 of HLD–1. All external joints shall be taped to avoid air leakage. Disconnect all console light or other lighting systems on the clothes dryer which do not consume more than 10 watts during the clothes dryer test cycle.

2.2 Ambient temperature and humidity. Maintain the room ambient air temperature at 75 ±3°F and the room relative humidity at 50±10 percent relative humidity.

2.3 Energy supply.

2.3.1 Electrical supply. Maintain the electrical supply at the clothes dryer terminal block within 1 percent of 120/240 or 120/208Y or 120 volts as applicable to the particular terminal block wiring system and within 1 percent of the nameplate frequency as specified by the manufacturer. If the dryer has a dual voltage conversion capability, conduct test at the highest voltage specified by the manufacturer.

2.3.2 Gas supply.

2.3.2.1 Natural gas. Maintains the gas supply to the clothes dryer at a normal inlet test pressure immediately ahead of all controls at 7 to 10 inches of water column. If the clothes dryer is equipped with a gas appliance pressure regulator, the regulator outlet pressure at the normal test pressure shall be approximately that recommended by the manufacturer. The hourly Btu rating of the burner shall be obtained within ±5 percent of the rating specified by the manufacturer.

The natural gas supplied should have a heating value of approximately 1,025 Btu’s per standard cubic foot. The actual heating value, H, in Btu’s per standard cubic foot, for the natural gas to be used in the test shall be obtained either from measurements made by the manufacturer conducting the test using a standard continuous flow calorimeter as described in 2.4.6 or by the purchase of bottled natural gas whose Btu rating is certified to be at least as accurate a rating as could be obtained from measurements with a standard continuous flow calorimeter as described in 2.4.6.

2.3.2.2 Propane gas. Maintain the gas supply to the clothes dryer at a normal inlet test pressure immediately ahead of all controls at 11 to 13 inches of water column. If the clothes dryer is equipped with a gas appliance pressure regulator, the regulator outlet pressure at the normal test pressure shall be approximately that recommended by the manufacturer. The hourly Btu rating of the burner shall be obtained within ±5 percent of the rating specified by the manufacturer.

The propane gas supplied should have a heating value of approximately 2,500 Btu’s per standard cubic foot. The actual heating value, H, in Btu’s per standard cubic foot, for the propane gas to be used in the test shall be obtained either from measurements made by the manufacturer conducting the test using a standard continuous flow calorimeter as described in 2.4.6 or by the purchase of bottled gas whose Btu rating is certified to be at least as accurate a rating as could be obtained from measurements with a standard continuous calorimeter as described in 2.4.6.
2.4 Instrumentation. Perform all test measurements using the following instruments as appropriate.

2.4.1 Weighing scale for test cloth. The scale shall have a range of 0 to a maximum of 30 pounds with a resolution of at least 0.2 ounces and a maximum error no greater than 0.3 percent of any measured value within the range of 3 to 15 pounds.

2.4.1.2 Weighing scale for drum capacity measurements. The scale should have a range of 0 to a maximum of 500 pounds with resolution of 0.50 pounds and a maximum error no greater than 0.5 percent of the measured value.

2.4.2 Kilowatt-hour meter. The kilowatt-hour meter shall have a resolution of 0.001 kilowatt-hours and a maximum error no greater than 0.5 percent of the measured value.

2.4.3 Gas meter. The gas meter shall have a resolution of 0.001 cubic feet and a maximum error no greater than 0.5 percent of the measured value.

2.4.4 Dry and wet bulb psychrometer. The dry and wet bulb psychrometer shall have an error no greater than ±1°F.

2.4.5 Temperature. The temperature sensor shall have an error no greater than ±1°F.

2.4.6 Standard Continuous Flow Calorimeter. The Calorimeter shall have an operating range of 750 to 3,500 Btu per cubic foot. The maximum error of the basic calorimeter shall be no greater than 0.2 percent of the actual heating value of the gas used in the test. The indicator readout shall have a maximum error no greater than 0.5 percent of the measured value within the operating range and a resolution of 0.2 percent of the full scale reading of the indicator instrument.

2.5 Lint trap. Clean the lint trap thoroughly before each test run.

2.6 Test cloths.

2.6.1 Energy test cloth. The energy test cloth shall be clean and consist of the following:

(a) Pure finished bleached cloth, made with a momie or granite weave, which is a blended fabric of 50 percent cotton and 50 percent polyester and weighs within ±10 percent of 5.75 ounces per square yard after test cloth preconditioning and has 65 ends on the warp and 57 picks on the fill. The individual warp and fill yarns are a blend of 50 percent cotton and 50 percent polyester fibers.

(b) Cloth material that is 24 inches by 36 inches and has been hemmed to 22 inches by 34 inches before washing. The maximum shrinkage after five washes shall not be more than four percent on the length and width.

(c) The number of test runs on the same energy test cloth shall not exceed 25 runs.

2.6.2 Energy stuffer cloths. The energy stuffer cloths shall be made from energy test cloth material and shall consist of pieces of material that are 12 inches by 12 inches and have been hemmed to 10 inches by 10 inches before washing. The maximum shrinkage after five washes shall not be more than four percent on the length and width. The number of test runs on the same energy stuffer cloth shall not exceed 25 runs after test cloth preconditioning.

2.6.3 Test Cloth Preconditioning. A new test cloth load and energy stuffer cloths shall be treated as follows:

(1) Bone dry the load to a weight change of ±1 percent, or less, as prescribed in Section 1.2.

(2) Place test cloth load in a standard clothes washer set at the maximum water fill level. Wash the load for 10 minutes in soft water (17 parts per million hardness or less), using 6.0 grams of AHAM Standard Test Detergent, IIA, per gallon of water. Wash water temperature is to be controlled at 140°F ± 5°F (60°C±2.7°C). Rinse water temperature is to be controlled at 100°F ± 5°F (37°C±2.7°C).

(3) Rinse the load again at the same water temperature.

(4) Bone dry the load as prescribed in Section 1.2 and weigh the load.

(5) This procedure is repeated until there is a weight change of one percent or less.

(6) A final cycle is to be a hot water wash with no detergent, followed by two warm water rinses.

2.7 Test loads.

2.7.1 Compact size dryer load. Prepare a bone-dry test load of energy cloths which weighs 3.00 pounds ± 0.03 pounds. Adjustments to the test load to achieve the proper weight can be made by the use of energy stuffer cloths, with no more than five stuffer cloths per load. Dampen the load by agitating it in water whose temperature is 100°F ± 5°F and consists of 0 to 17 parts per million hardness for approximately two minutes in order to saturate the fabric. Then, extract water from the wet test load by spinning the load until the moisture content of the load is between 66.5 percent to 73.5 percent of the bone-dry weight of the test load.

2.7.2 Standard size dryer load. Prepare a bone-dry test load of energy cloths which weighs 7.00 pounds ± 0.07 pounds. Adjustments to the test load to achieve the proper weight can be made by the use of energy stuffer cloths, with no more than five stuffer cloths per load. Dampen the load by agitating it in water whose temperature is 100°F ± 5°F and consists of 0 to 17 parts per million hardness for approximately two minutes in order to saturate the fabric. Then, extract water from the wet test load by spinning the load until the moisture content of the load is between 66.5 percent to 73.5 percent of the bone-dry weight of the test load.

2.7.3 Method of loading. Load the energy test cloths by grasping them in the center, shaking them to hang loosely and then dropping them in the dryer at random.
2.8 Clothes dryer preconditioning. Before any test cycle, operate the dryer without a test load in the non-heat mode for 15 minutes or until the discharge air temperature is varying less than 1 °F for 10 minutes, which ever is longer, in the test installation location with the ambient conditions within the specified rest condition tolerances of 2.2.

3. Test Procedures and Measurements

3.1 Drum capacity. Measure the drum capacity by sealing all openings in the drum except the loading port with a plastic bag, and ensure that all corners and depressions are filled and that there are no extrusions of the plastic bag through the opening in the drum. Support the dryer’s rear drum surface on a platform scale to prevent deflection of the dryer, and record the weight of the empty dryer. Fill the drum with water to a level determined by the intersection of the door plane and the loading port. Record the temperature of the water and then the weight of the dryer with the added water and then determine the mass of the water in pounds. Add or subtract the appropriate volume depending on whether or not the plastic bag protrudes into the drum interior. The drum capacity is calculated as follows:

\[ C = \frac{W}{d} \]

\[ C = \text{capacity in cubic feet.} \]
\[ w = \text{weight of water in pounds.} \]
\[ d = \text{density of water at the measured temperature in pounds per cubic feet.} \]

3.2 Dryer loading. Load the dryer as specified in 2.7.

3.3 Test cycle. Operate the clothes dryer at the maximum temperature setting and, if equipped with a timer, at the maximum time setting and dry the test load until the moisture content of the test load is between 2.5 percent to 5.0 percent of the bone-dry weight of the test load, but do not permit the dryer to advance into cool down. If required, reset the timer or automatic dry control.

3.4 Data recording. Record for each test cycle:

- Bone-dry weight of the test load described in 2.7.
- Moisture content of the test load as recorded in 3.4.2.
- Moisture content of the test load during a laboratory test cycle expressed as a percent.
- Data recording. For each test cycle:
  - Bone-dry weight of the test load described in 2.7.
  - Moisture content of the wet test load obtained after the test described in 3.3.
- Test room conditions, temperature and percent relative humidity described in 2.2.

3.6.6 For gas dryers—The total kilowatt-hours of electrical energy, \( E_{d} \), consumed during the test described in 3.3.

3.6.6.1 Total kilowatt-hours of electrical energy, \( E_{d} \), consumed during the test described in 3.3.

3.6.6.2 Cubic feet of gas per cycle, \( E_{g} \), consumed during the test described in 3.3.

4. Calculation of Derived Results From Test Measurements

4.1 Total per-cycle electric dryer energy consumption. Calculate the total electric dryer energy consumption per cycle, \( E_{e} \), expressed in kilowatt-hours per cycle and defined as:

\[ E_{e} = \frac{66(W_{w} - W_{d})}{E_{d} \times FU} \]

4.2 Per-cycle gas dryer electrical energy consumption. Calculate the gas dryer electrical energy consumption per cycle, \( E_{e} \), expressed in kilowatt-hours per cycle and defined as:

\[ E_{e} = \frac{GEF}{140/416} \]

4.3 Per-cycle gas dryer gas energy consumption. Calculate the gas dryer gas energy consumption per cycle, \( E_{g} \), expressed in Btu’s per cycle as defined as:

\[ E_{g} = \frac{66(W_{w} - W_{d})}{E_{d} \times FU \times GEF \times 10 \times 8760} \]

4.4 Per-cycle gas dryer continuously burning pilot light gas energy consumption. Calculate the gas dryer continuously burning pilot light gas energy consumption per cycle, \( E_{p} \), expressed in Btu’s per cycle as defined as:

\[ E_{p} = E_{d} \times \frac{140}{416} \times GEF \times \frac{8760}{10} \]
Energy Factor (GEF) as defined in 4.3

4.5 Total per-cycle gas dryer energy consumption expressed in Btu's. Calculate the total gas dryer energy consumption per cycle, \( E_g \), expressed in Btu's per cycle and defined as:

\[
E_g = E_{stby} + E_{up}
\]

where \( E_{stby} \) and \( E_{up} \) are defined in 4.4.

4.6 Total per-cycle gas dryer energy consumption expressed in kilowatt-hours. Calculate the total gas dryer energy consumption per cycle, \( E_{kwh} \), expressed in kilowatt-hours per cycle and defined as:

\[
E_{kwh} = E_g / 3412 \text{ Btu/k Wh}
\]

where \( E_g \) is defined in 4.2, \( E_{kwh} \) is defined in 4.5.

1.11 Standby means the time during which water is not being withdrawn from the water heater. There are two standby time intervals used within this test procedure: \( t_{stby,1} \) represents the elapsed time between the time at which the maximum mean tank temperature is observed after the sixth draw and subsequent recovery and the end of the 24-hour test; \( t_{stby,2} \) represents the total time during the 24-hour simulated use test when water is not being withdrawn from the water heater.

1.12 Storage-type Water Heaters

1.12.1 Electric Storage-type Water Heater

Reserved.

1.12.2 Gas Storage-type Water Heater

1.7.1 Electric Instantaneous Water Heater

Reserved.

1.7.2 Gas Instantaneous Water Heater

1.7.3 Gas Storage-type Water Heater

1.7.4 Gas Heat Pump Water Heater
less, and, if the tank is supplied, has a manufacturer's rated storage capacity of 120 gallons (450 liters) or less. Resistive elements used to provide supplemental heating may use the same circuit as the compressor if (1) an interlocking mechanism prevents concurrent compressor operation and resistive heating or (2) concurrent operation does not result in the maximum current rating of 24 amperes being exceeded. Otherwise, the resistive elements and the heat pump components must use separate circuits. A heat pump water heater may be sold by the manufacturer with or without a storage tank.

a. Heat Pump Water Heater with Storage Tank means an air-to-water heat pump sold by the manufacturer with an insulated storage tank as a packaged unit. The tank and heat pump can be an integral unit or they can be separated.

b. Heat Pump Water Heater without Storage Tank (also called Add-on Heat Pump Water Heater) means an air-to-water heat pump designed for use with a storage-type water heater or a storage tank that is not specified or supplied by the manufacturer.

1.12.4 Oil Storage-type Water Heater means a water heater that uses oil as the energy source, is designed to heat and store water at a thermostatically controlled temperature of less than 200 °F (93 °C), has a nominal energy input of 105,000 Btu/h (110 MJ/h) or less, and has a manufacturer's rated storage capacity of 50 gallons (190 liters) or less.

1.12.5 Storage-type Water Heater of More Than 2 Gallons (7.6 Liters) and Less Than 20 Gallons (76 Liters). Reserved.

1.15 Symbol Usage The following identity relationships are provided to help clarify the symbology used throughout this procedure:

\[ C_p \] specific heat capacity of water
\[ E_{annual} \] annual energy consumption of a water heater
\[ E \] energy factor of a water heater
\[ F_n \] first-hour rating of a storage-type water heater
\[ F_{max} \] maximum gpm (L/min) rating of an instantaneous water heater rated at a temperature rise of 77 °F (42.8 °C) across the heater
\[ i \] a subscript to indicate an ith draw during a test
\[ M \] mass of water removed during the ith draw (i=1 to 6) of the 24-hr simulated use test
\[ M^* \] for storage-type water heaters, mass of water removed during the ith draw (i=1 to n) during the first-hour rating test
\[ M_{in} \] for instantaneous water heaters, mass of water removed continuously during a 10-minute interval in the maximum gpm (L/min) rating test
\[ n \] for storage-type water heaters, total number of draws during the first-hour rating test
\[ Q \] total fossil fuel and/or electric energy consumed during the entire 24-hr simulated use test
\[ Q_d \] daily water heating energy consumption adjusted for net change in internal energy
\[ Q_{adj} \] adjusted daily water heating energy consumption with adjustment for variation of tank to ambient air temperature difference from nominal value
\[ Q_{overall} \] overall adjusted daily water heating energy consumption including \( Q_{acc} \) and \( Q_{MWU} \)
\[ Q_{MWU} \] hourly standby losses
\[ Q_{uhr} \] daily energy consumption to heat water over the measured average temperature rise across the water heater
\[ Q_{MWU} \] adjustment to daily energy consumption, \( Q_{MWU} \), due to variation of the temperature rise across the water heater not equal to the nominal value of 77 °F (42.8 °C)
\[ Q_e \] energy consumption of fossil fuel or heat pump water heaters between thermostat (or burner) cut-out prior to the first draw and cut-out following the first draw of the 24-hr simulated use test
\[ Q_{MWU} \] energy consumption of a modulating instantaneous water heater between cut-out (burner) prior to the first draw and cut-out following the first draw of the 24-hr simulated use test
\[ Q_{r} \] energy consumption of a modulating instantaneous water heater from immediately prior to the fourth draw to burner cut-out following the fourth draw of the 24-hr simulated use test
\[ Q_{stby} \] total energy consumed by the water heater during the standby time interval
\[ Q_{t} \] total fossil fueled and/or electric energy consumed from the beginning of the first draw to the thermostat (or burner) cut-out following the completion of the sixth draw during the 24-hr simulated use test
\[ T_{stby} \] for modulating instantaneous water heaters, steady state outlet water temperature at the minimum fuel input rate
\[ T_{stby} \] mean tank temperature at the beginning of the 24-hr simulated use test
\[ T_{in} \] mean tank temperature at the end of the 24-hr simulated use test
\[ T_{ambient} \] ambient air temperature during standby periods of the 24-hr use test
\[ T_{out} \] for instantaneous water heaters, average outlet water temperature during a 10-minute continuous draw interval in the maximum gpm (L/min) rating test.
Department of Energy

\( T_{\text{out}} \): average outlet water temperature during the \( i \)th draw of the 24-hr simulated use test

\( T_{\text{in}} \): for instantaneous water heaters, average inlet water temperature during a 10-minute continuous draw interval in the maximum gpm (L/min) rating test

\( T_{\text{max}} \): average inlet water temperature during the \( i \)th draw of the 24-hr simulated use test

\( T_{\text{max}} \): maximum measured mean tank temperature after cut-out following the first draw of the 24-hr simulated use test

\( T_{\text{t}} \): average storage tank temperature during the standby period \( T_{\text{t}} \), \( i \) of the 24-hr use test

\( T_{\text{mu}} \): maximum measured mean tank temperature after cut-out following the sixth draw of the 24-hr simulated use test

\( T_{\text{mu}} \): average storage tank temperature during the standby period \( T_{\text{mu}} \), \( i \) of the 24-hr use test

\( T_{\text{max}} \): for storage-type water heaters, average outlet water temperature during the \( i \)th draw (\( i=1 \) to \( n \)) of the first-hour rating test

\( T_{\text{max}} \): for storage-type water heaters, maximum outlet water temperature observed during the \( i \)th draw (\( i=1 \) to \( n \)) of the first-hour rating test

\( T_{\text{mu}} \): for storage-type water heaters, minimum outlet water temperature to terminate the \( i \)th draw during the first-hour rating test

\( U \): standby loss coefficient of a storage-type water heater

\( V_{\text{i}} \): volume of water removed during the \( i \)th draw (\( i=1 \) to \( 6 \)) of the 24-hr simulated use test

\( V_{\text{i}} \): volume of water removed during the \( i \)th draw (\( i=1 \) to \( n \)) during the first-hour rating test

\( V_{\text{in}} \): for instantaneous water heaters, volume of water removed continuously during a 10-minute interval in the maximum gpm (L/min) rating test

\( V_{\text{max}} \): steady state water flow rate of an instantaneous water heater at the rated input to give a discharge temperature of 125\( \, ^\circ \text{F} \pm 5\, ^\circ \text{F} \) (57.2\, ^\circ \text{C} \pm 2.8\, ^\circ \text{C})

\( V_{\text{in}} \): steady state water flow rate of a modulating instantaneous water heater at the minimum input to give a discharge temperature of \( T_{\text{in}} \) up to 135\, ^\circ \text{F} \pm 5\, ^\circ \text{F} \) (57.2\, ^\circ \text{C} \pm 2.8\, ^\circ \text{C})

\( V_{\text{me}} \): measured storage volume of the storage tank

\( W \): weight of storage tank when completely filled with water

\( W \): tare weight of storage tank when completely empty of water

\( \eta \): recovery efficiency

\( \rho \): density of water

\( t_{\text{t}} \): elapsed time between the time the maximum mean tank temperature is observed after the sixth draw and the end of the 24-hr simulated use test

\( t_{\text{stby}} \): overall standby periods when no water is withdrawn during the 24-hr simulated use test

2. Test Conditions

2.1 Installation Requirements. Tests shall be performed with the water heater and instrumentation installed in accordance with Section 4 of this appendix.

2.2 Ambient Air Temperature. The ambient air temperature shall be maintained between \( 65.0\, ^\circ \text{F} \) and \( 70.0\, ^\circ \text{F} \) (18.3\, ^\circ \text{C} \) and \( 21.1\, ^\circ \text{C} \) on a continuous basis. For heat pump water heaters, the dry bulb temperature shall be maintained at \( 67.5\, ^\circ \text{F} \) \pm 1\, ^\circ \text{F} \) \( (19.7\, ^\circ \text{C} \pm 0.6\, ^\circ \text{C}) \) and, in addition, the relative humidity shall be maintained between 40% and 53%.

2.3 Supply Water Temperature. The temperature of the water being supplied to the water heater shall be maintained at \( 50\, ^\circ \text{F} \) \pm 2\, ^\circ \text{F} \) \( (14.4\, ^\circ \text{C} \pm 1.1\, ^\circ \text{C}) \) throughout the test.

2.4 Storage Tank Temperature. The average temperature of the water within the storage tank shall be set to \( 135\, ^\circ \text{F} \) \pm 5\, ^\circ \text{F} \) (57.2\, ^\circ \text{C} \pm 2.8\, ^\circ \text{C})

2.5 Supply Water Pressure. During the test when water is not being withdrawn, the supply pressure shall be maintained between 40 psig (275 kPa) and the maximum allowable pressure specified by the water heater manufacturer.

2.6 Electrical and/or Fossil Fuel Supply.

2.6.1 Electrical. Maintain the electrical supply voltage to within \pm 1% of the center of the voltage range specified by the water heater and/or heat pump manufacturer.

2.6.2 Natural Gas. Maintain the supply pressure in accordance with the manufacturer’s specifications. If the supply pressure is not specified, maintain a supply pressure of 7-10 inches of water column (1.7-2.5 kPa). If the water heater is equipped with a gas appliance pressure regulator, the regulator outlet pressure shall be within \pm 10% of the manufacturer’s specified manifold pressure.

For all tests, use natural gas having a heating value of approximately 1,025 Btu per standard cubic foot (38,190 kJ per standard cubic meter).

2.6.3 Propane Gas. Maintain the supply pressure in accordance with the manufacturer’s specifications. If the supply pressure is not specified, maintain a supply pressure of 11-13 inches of water column (2.7-3.2 kPa). If the water heater is equipped with a gas appliance pressure regulator, the regulator outlet pressure shall be within \pm 10% of the manufacturer’s specified manifold pressure.

For all tests, use propane gas having a heating value of approximately 2,500 Btu per standard cubic foot (93,147 kJ per standard cubic meter).
2.6.4 Fuel Oil Supply. Maintain an uninterrupted supply of fuel oil. Use fuel oil having a heating value of approximately 138,700 Btu per gallon (38,660 kJ per liter).

3. Instrumentation

3.1 Pressure Measurements. Pressure-measuring instruments shall have an error no greater than the following values:

<table>
<thead>
<tr>
<th>Item measured</th>
<th>Instrument accuracy</th>
<th>Instrument precision</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas pressure</td>
<td>±0.1 inch of water column (±0.025 kPa)</td>
<td>±0.05 inch of water column (±0.012 kPa)</td>
</tr>
<tr>
<td>Atmospheric pressure</td>
<td>±0.1 inch of mercury column (±0.34 kPa)</td>
<td>±0.05 inch of mercury column (±0.17 kPa)</td>
</tr>
<tr>
<td>Water pressure</td>
<td>±0.1 pounds per square inch (±6.9 kPa)</td>
<td>±0.50 pounds per square inch (±3.45 kPa)</td>
</tr>
</tbody>
</table>

3.2 Temperature Measurement

3.2.1 Measurement. Temperature measurements shall be made in accordance with the Standard Measurement Guide: Section on Temperature Measurements, ASHRAE Standard 41.1–86.

3.2.2 Accuracy and Precision. The accuracy and precision of the instruments, including their associated readout devices, shall be within the following limits:

<table>
<thead>
<tr>
<th>Item measured</th>
<th>Instrument accuracy</th>
<th>Instrument precision</th>
</tr>
</thead>
<tbody>
<tr>
<td>Air dry bulb temperature</td>
<td>±0.2 °F (±0.1 °C)</td>
<td>±0.1 °F (±0.06 °C)</td>
</tr>
<tr>
<td>Air wet bulb temperature</td>
<td>±0.2 °F (±0.1 °C)</td>
<td>±0.1 °F (±0.06 °C)</td>
</tr>
<tr>
<td>Inlet and outlet water temperatures</td>
<td>±0.2 °F (±0.1 °C)</td>
<td>±0.1 °F (±0.06 °C)</td>
</tr>
<tr>
<td>Storage tank temperatures</td>
<td>±0.5 °F (±0.3 °C)</td>
<td>±0.25 °F (±0.14 °C)</td>
</tr>
</tbody>
</table>

3.2.3 Scale Division. In no case shall the smallest scale division of the instrument or instrument system exceed 2 times the specified precision.

3.2.4 Temperature Difference. Temperature difference between the entering and leaving water may be measured with any of the following:

a. A thermopile
b. Calibrated resistance thermometers
c. Precision thermometers
d. Calibrated thermistors
e. Calibrated thermocouples
f. Quartz thermometers

3.2.5 Thermopile Construction. If a thermopile is used, it shall be made from calibrated thermocouple wire taken from a single spool. Extension wires to the recording device shall also be made from that same spool.

3.2.6 Time Constant. The time constant of the instruments used to measure the inlet and outlet water temperatures shall be no greater than 5 seconds.

3.3 Liquid Flow Rate Measurement. The accuracy of the liquid flow rate measurement, using the calibration if furnished, shall be equal to or less than ±1% of the measured value in mass units per unit time.

3.4 Electric Energy. The electrical energy used shall be measured with an instrument and associated readout device that is accurate within ±1% of the reading.

3.5 Fossil Fuels. The quantity of fuel used by the water heater shall be measured with an instrument and associated readout device that is accurate within ±1% of the reading.

3.6 Mass Measurements. For mass measurements greater than or equal to 10 pounds (4.5 kg), a scale that is accurate within ±1% of the reading shall be used to make the measurement. For mass measurements less than 10 pounds (4.5 kg), the scale shall provide a measurement that is accurate within ±0.1 pound (0.045 kg).

3.7 Heating Value. The higher heating value of the natural gas, propane, or fuel oil shall be measured with an instrument and associated readout device that is accurate within ±1% of the reading. The heating value of natural gas and propane must be corrected for local temperature and pressure conditions.

3.8 Time. The elapsed time measurements shall be measured with an instrument that is accurate within ±0.05 seconds per hour.

3.9 Volume. Volume measurements shall be measured with an accuracy of ±2% of the total volume.

4. Installation

4.1 Water Heater Mounting. A water heater designed to be freestanding shall be placed on a ¾ inch (2 cm) thick plywood platform supported by three 2 × 4 inch (5 cm × 10 cm) runners. If the water heater is not approved for installation on combustible flooring, suitable non-combustible material shall be placed between the water heater and the platform. Counter-top water heaters shall be placed against a simulated wall section. Wall-mounted water heaters shall be supported on a simulated wall in accordance
with the manufacturer-published installation instructions. When a simulated wall is used, the recommended construction is 2 × 4 inch (5 cm × 10 cm) studs, faced with ¾ inch (2 cm) plywood. For heat pump water heaters that are supplied with a storage tank, the two components, if not delivered as a single package, shall be connected in accordance with the manufacturer-published installation instructions and the overall system shall be placed on the above-described plywood platform. If installation instructions are not provided by the heat pump manufacturer, uninsulated 8 foot (2.4 m) long connecting hoses having an inside diameter of ¾ inch (1.6 cm) shall be used to connect the storage tank and the heat pump water heater. With the exception of using the storage tank described in 4.10, the same requirements shall apply for heat pump water heaters that are supplied without a storage tank from the manufacturer. The testing of the water heater shall occur in an area that is protected from drafts.

4.2 Water Supply. Connect the water heater to a water supply capable of delivering water at conditions as specified in Sections 2.3 and 2.5 of this appendix.

4.3 Water Inlet and Outlet Configuration. For freestanding water heaters that are taller than 36 inches (91.4 cm), inlet and outlet piping connections shall be configured in a manner consistent with Figures 1 and 2. Inlet and outlet piping connections for wall-mounted water heaters shall be consistent with Figure 3. For freestanding water heaters that are 36 inches or less in height and not supplied as part of a counter-top enclosure (commonly referred to as an under-the-counter model), inlet and outlet piping shall be installed in a manner consistent with Figures 4, 5, and 6. For water heaters that are supplied with a counter-top enclosure, inlet and outlet piping shall be made in a manner consistent with Figures 7A and 7B, respectively. The vertical piping noted in Figures 7A and 7B shall be located (whether inside the enclosure or along the outside in a recessed channel) in accordance with the manufacturer-published installation instructions.

All dimensions noted in Figures 1 through 7 shall be achieved. All piping between the water heater and the inlet and outlet temperature sensors, noted as T\text{IN} and T\text{OUT} in the figures, shall be Type “L” hard copper having the same diameter as the connections on the water heater. Unions may be used to facilitate installation and removal of the piping arrangements. A pressure gauge and diaphragm expansion tank shall be installed in the supply water piping at a location upstream of the inlet temperature sensor. An appropriately rated pressure and temperature relief valve shall be installed on all water heaters at the port specified by the manufacturer. Discharge piping for the relief valve shall be non-metallic. If heat traps, piping insulation, or pressure relief valve insulation are supplied with the water heater, they shall be installed for testing. Except when using a simulated wall, clearance shall be provided such that none of the piping contacts other surfaces in the test room.
Figure 3.

Figure 4.
Figure 5.

Figure 6.

x = distance from the center of the outlet to the edge of the tank, plus two inches
4.4 Fuel and/or Electrical Power and Energy Consumption. Install one or more instruments which measure, as appropriate, the quantity and rate of electrical energy and/or fossil fuel consumption in accordance with Section 3. For heat pump water heaters that use supplemental resistive heating, the electrical energy supplied to the resistive element(s) shall be metered separately from the electrical energy supplied to the entire appliance or to the remaining components (e.g., compressor, fans, pumps, controls).

4.5 Internal Storage Tank Temperature Measurements. Install six temperature measurement sensors inside the water heater tank with a vertical distance of at least 4 inches (100 mm) between successive sensors. A temperature sensor shall be positioned at the vertical midpoint of each of the six equal...
4.9.1 Flow Control. Establish a natural draft at the flue collar at the value specified in the manufacturer’s instructions. Establish the draft by using a sufficient length of vent pipe connected to the water heater flue outlet, and directed vertically upward. For an oil-fired water heater with a horizontally discharging draft hood outlet, a 90-degree elbow with a diameter equal to the largest flue collar size of the draft hood shall be connected to the draft hood outlet. A length of vent pipe sufficient to establish the draft shall be connected to the elbow fitting and oriented to discharge vertically upward. Direct-vent oil-fired water heaters should be installed with venting equipment as specified in the manufacturer’s instructions, using the minimum vertical and horizontal lengths of vent pipe recommended by the manufacturer.

4.10 Heat Pump Water Heater Storage Tank. The tank to be used for testing a heat pump water heater without a tank supplied by the manufacturer (see Section 1.12.3b) shall be an electric storage-type water heater having a measured volume of 47.0 gallons (178 liters) and less than or equal to the minimum energy conservation standard (as determined in accordance with Section 6.1.7) and less than or equal to the minimum energy conservation standard and 0.02.

5. Test Procedures

5.1 Storage-type Water Heaters, Including Heat Pump Water Heaters.

5.1.1 Determination of Storage Tank Volume. Determine the storage capacity, \( V_s \), of the water heater under test, in gallons (liters), by subtracting the tare weight—measured while the tank is empty—from the gross weight of the storage tank when completely filled with water (with all air eliminated and line pressure applied as described in section 2.5) and dividing the resulting net weight by the density of water at the measured temperature.

5.1.2 Setting the Thermostat. Starting with a tank at the supply water temperature, initiate normal operation of the water heater. After cut-out, determine the mean tank temperature every minute until the maximum value is observed. Determine whether this maximum value for the mean tank temperature is within the range of 135 °F ± 5 °F (57.2 °C ± 2.8 °C). If not, turn off the water heater, adjust the thermostat, drain and refill the tank with supply water. Then, once again, initiate normal operation of the water heater, and determine the maximum mean tank temperature after cut-out. Repeat this sequence until the maximum mean...
5.1.2.2 Tanks with Two or More Thermostats. Follow the same sequence as for a single thermostat tank, i.e. start at the supply water temperature, operate normally until cutout. Determine if the thermostat that controls the uppermost heating element yields a maximum water temperature of 135 °F ± 5 °F (57.2 °C ± 2.8 °C), as measured by the in-tank sensors that are positioned above the uppermost heating element. If the tank temperature at the thermostat is not within 135 °F ± 5 °F (57.2 °C ± 2.8 °C), turn off the water heater, adjust the thermostat, drain and refill the tank with supply water. The thermostat that controls the heating element positioned next highest in the tank shall then be set to yield a maximum water temperature of 135 °F ± 5 °F (57.2 °C ± 2.8 °C). This process shall be repeated until the thermostat controlling the lowest element is correctly adjusted. When adjusting the thermostat that controls the lowest element, the maximum mean tank temperature after cut-out, as determined using all the in-tank sensors, shall be 135 °F ± 5 °F (57.2 °C ± 2.8 °C). When adjusting all other thermostats, use only the in-tank temperature sensors positioned above the heating element in question to evaluate the maximum water temperature after cut-out.

For heat pump water heaters that control an auxiliary resistive element, the thermostat shall be set in accordance with the manufacturer’s installation instructions.

5.1.3 Power Input Determination. For all water heaters, except electric types having immersed heating elements, initiate normal operation and determine the power input, P, to the main burners (including pilot light power, if any) after 15 minutes of operation. For gas and oil-fired water heaters, initiate successive draws when the thermostat acts to reduce the electrical input supplied to the element(s). For electric water heaters having two or more elements that do not operate simultaneously, initiate successive draws when the applicable thermostat acts to reduce the electrical input to the element located vertically highest in the storage tank. For heat pump waters heaters that do not use supplementary resistive heating, initiate successive draws immediately after the electrical input to the compressor is reduced by the action of the water heater’s thermostat. For heat pump waters heaters that use supplementary resistive heating, initiate successive draws immediately after the electrical input to the compressor or the uppermost resistive element is reduced by the action of the applicable water heater thermostat. This draw initiation criterion for heat pump water heaters that use supplemental resistive heating, however, shall only apply when the water located above the thermostat at cut-out is heated to 135 °F ± 5 °F (57.2 °C ± 2.8 °C).

5.1.4 Test Sequence. Establish normal water heater operation. If the water heater is not presently operating, initiate a draw. The draw may be terminated anytime after cut-in occurs. After cut-out occurs (i.e., all thermostats are satisfied), monitor the internal storage tank temperature sensors described in section 4.5 every minute.

Initiate a draw after a maximum mean tank temperature has been observed following cut-out. Record the time when the draw is initiated and designate it as an elapsed time of zero (t* = 0). (The superscript * is used to denote variables pertaining to the first-hour rating test.) Record the outlet water temperature beginning 15 seconds after the draw is initiated and at 5-second intervals thereafter until the draw is terminated. Determine the maximum outlet temperature that occurs during this first draw and record it as T*max, 1. For the duration of this first draw and all successive draws, in addition, monitor the inlet temperature to the water heater to ensure that the required 58 °F ± 2 °F (14.4 °C ± 1.1 °C) test condition is met. Terminate the hot water draw when the outlet temperature decreases to T*max, n+1 < 25 °F (T*max, n+1 < 13.9 °C). Record this temperature as

187
Following draw termination, determine the average outlet water temperature and the mass or volume removed during this first draw and record them as $T_{\text{out},1}$ and $M_1$ or $V_1$, respectively.

Initiate a second and, if applicable, successive draw each time the applicable draw initiation criteria described in section 5.1.4.2 are satisfied. As required for the first draw, record the outlet water temperature 15 seconds after initiating each draw and at 5-second intervals thereafter until the draw is terminated. Determine the maximum outlet temperature that occurs during each draw and record it as $T_{\text{max},i}$, where the subscript $i$ refers to the draw number. Terminate each hot water draw when the outlet temperature decreases to $T_{\text{max},i} - 25^\circ \text{F}$ ($T_{\text{max},i} - 13.9^\circ \text{C}$). Record this temperature as $T_{\text{max},i}$. Calculate and record the average outlet water temperature and the mass or volume removed during each draw ($T'_{\text{out},i}$ and $M_i$ or $V_i$, respectively). Continue this sequence of draw and recovery until one hour has elapsed, then shut off the electrical power and/or fuel supplied to the water heater.

If a draw is occurring at an elapsed time of one hour, continue this draw until the outlet temperature decreases to $T_{\text{max},i} - 25^\circ \text{F}$ ($T_{\text{max},i} - 13.9^\circ \text{C}$), at which time the draw shall be immediately terminated. (The subscript $n$ shall be used to denote quantities associated with the final draw.) If a draw is not occurring at an elapsed time of one hour, a final draw shall be imposed at one hour. This draw shall be immediately terminated when the outlet temperature first indicates a value less than or equal to the cut-off temperature used for the previous draw ($T_{\text{out},i-1}$). For cases where the outlet temperature is close to $T_{\text{max},i-1}$, the final draw shall proceed for a minimum of 30 seconds. If an outlet temperature greater than $T_{\text{max},i-1}$ is not measured within 30 seconds, the draw shall be immediately terminated and zero additional credit shall be given towards first-hour rating (i.e., $M_{r_1} = 0$ or $V_{r_1} = 0$). After the final draw is terminated, calculate and record the average outlet temperature and the mass or volume removed during the draw ($T'_{\text{out},i}$, and $M_i$ or $V_i$, respectively).

5.1.5 24-Hour Simulated Use Test. During the simulated use test, a total of 64.3 ± 1.0 gallons (243 ± 3.8 liters) shall be removed. This value is referred to as the daily hot water usage in the following text.

With the water heater turned off, fill the water heater with supply water and apply pressure as described in section 2.5. Turn on the water heater and associated heat pump unit, if present. After the cut-out occurs, the water heater may be operated for up to three cycles of drawing until cut-in, and then operating until cut-out, prior to the start of the test.

At this time, record the mean tank temperature ($T_m$), and the electrical and/or fuel measurement readings, as appropriate. Begin the 24-hour simulated test use by withdrawing a volume from the water heater that equals one-sixth of the daily hot water usage. Record the average storage tank and ambient temperature every 15 minutes throughout the 24-hour simulated use test unless a recovery or a draw is occurring. At elapsed time intervals of one, two, three, four, and five hours from $t = 0$, initiate additional draws, removing an amount of water equivalent to one-sixth of the daily hot water usage with the maximum allowable deviation for any single draw being ±0.5 gallons (1.9 liters). The quantity of water withdrawn during the sixth draw shall be increased or decreased as necessary such that the total volume of water withdrawn equals 64.3 ± 1.0 gallons (243.4 ± 3.8 liters).

All draws during the simulated use test shall be made at flow rates of 3.0 gallons ±0.25 gallons per minute (11.4 liters ±0.95 liters per minute). Measurements of the inlet and outlet temperatures shall be made 15 seconds after the draw is initiated and at every subsequent 5-second interval throughout the duration of each draw. The arithmetic mean of the hot water discharge temperature and the cold water inlet temperature shall be determined for each draw ($T_{\text{in},i}$ and $T_{\text{out},i}$). Determine and record the net mass or volume removed ($M_i$ or $V_i$), as appropriate, after each draw.

At the end of the recovery period following the first draw, record the maximum mean tank temperature observed after cut-out, $T_{\text{max},1}$, and the energy consumed by an electric resistance, gas or oil-fired water heater, $Q_e$. For heat pump water heaters, the total electrical energy consumed during the first recovery by the heat pump (including compressor, fan, controls, pump, etc.) and, if applicable, by the resistive element(s) shall be recorded as $Q_{\text{hp}}$.

At the end of the recovery period that follows the sixth draw, determine and record the total electrical energy and/or fossil fuel consumed since the beginning of the test, $Q_{\text{fu}}$. In preparation for determining the energy consumed during standby, record the reading given on the electrical energy (watt-hour) meter, the gas meter, and/or the scale used to determine oil consumption, as appropriate. Record the maximum value of the mean tank temperature after cut-out as $T_m$. Except as noted below, allow the water heater to remain in the standby mode until 24 hours have elapsed from the start of the test (i.e., since $= 0$). Prevent the water heater from beginning a recovery cycle during the last hour of the test by turning off the electric power to the electrical heating elements and heat pump, if present, or by turning down the fuel supply to the main burner at
an elapsed time of 24 hours. If a recovery is taking place at an elapsed time of 24 hours, wait until the recovery is complete before reducing the electrical and/or fuel supply to the water heater. For gas instantaneous water heaters, record the flow rate as $V_{\text{max}}$, in pounds per hour, $q$, and record the volume of water, $V_{\text{max}}$, in gallons (liters).

5.2.4.2 Variable Input Instantaneous Water Heaters. If the instantaneous water heater incorporates a controller that permits continuous operation at a reduced input rate, the first three draws shall be conducted using the maximum flow rate, $V_{\text{max}}$, while removing an amount of water equivalent to one-sixth of the daily hot water usage, with the maximum allowable deviation for any one of the three draws being ±0.5 gallons (1.9 liters). After recording the scale or water meter reading, initiate water flow throughout the water heater, record the inlet and outlet water temperatures beginning 15 seconds after the start of the test and at subsequent 5-second intervals throughout the duration of the test. At the end of 10 minutes, turn off the water. Determine the mass of water collected, $M_{\text{max}}$, in pounds, or the total volume of water withdrawn equals $V_{\text{max}}$, in gallons (liters).

5.2.4.3 Fixed Input Instantaneous Water Heaters. Establish normal operation with the discharge water temperature and flow rate set to values of 135 °F ±5 °F (57.2 °C ±2.8 °C) and $V_{\text{max}}$ per Section 5.2.1, respectively. With no draw occurring, record the reading given by the gas meter and/or the electrical energy meter as appropriate. Begin the 24-hour simulated use test by drawing an amount of water out of the water heater equivalent to one-sixth of the daily hot water usage. Record the time when this first draw is initiated and designate it as an elapsed time, $t$, of 0. At elapsed time intervals of one, two, three, four, and five hours from $t = 0$, initiate additional draws, removing an amount of water equivalent to one-sixth of the daily hot water usage, with the maximum allowable deviation for any single draw being ±0.5 gallons (1.9 liters). The quantity of water drawn during the sixth draw shall be increased or decreased as necessary such that the total volume of water withdrawn equals 64.3 gallons ±1.0 gallons (243.4 liters ±3.8 liters).

Measurements of the inlet and outlet water temperatures shall be made 15 seconds after the draw is initiated and at every 5-second interval thereafter throughout the duration of the draw. The arithmetic mean of the hot water discharge temperature and the cold water inlet temperature shall be determined for each draw. Record the scale used to measure the mass of the withdrawn water or the water meter reading, as appropriate, after each draw. At the end of the recovery period following the first draw, determine and record the fossil fuel or electrical energy consumed, $Q$. Following the sixth draw and subsequent recovery, allow the water heater to remain in the standby mode until exactly 24 hours have elapsed since the start of the test (i.e., since $t = 0$). At 24 hours, record the reading given by the gas meter and/or the electrical energy meter as appropriate. Determine the fossil fuel or electrical energy consumed during the entire 24-hour simulated use test and designate the quantity as $Q$.
The second three draws shall be conducted at
V_{\text{min}}. If an outlet temperature of 135 °F ±5 °F
(57.2 °C ±2.8 °C) could not be achieved at the
minimum flow rate permitted by the instant-
taneous water heater, the last three draws
should be lengthened such that the volume
removed is:

\[
V_{4.5.6} = \frac{64.3 \text{ gal}}{6} \times \left[ \frac{77^\circ F}{(T_{\text{min}} - 58^\circ F)} \right]
\]
or
\[
V_{4.5.6} = \frac{243 \text{ L}}{6} \times \left[ \frac{42.8^\circ C}{(T_{\text{min}} - 14.4^\circ C)} \right]
\]

where \(T_{\text{min}}\) is the outlet water temperature at
the flow rate \(V_{\text{min}}\) as determined in Section
5.2.1, and where the maximum allowable var-
ation for any one of the three draws is ±0.5
gallons (1.9 liters). The quantity of water
withdrawn during the sixth draw shall be in-
creased or decreased as necessary such that
the total volume of water withdrawn equals
(32.15 + 3 \times V_{4.5.6}) ±1.0 gallons
((121.7 + 3 \times V_{4.5.6}) ±3.8 liters).

Measurements of the inlet and outlet
water temperatures shall be made 5 seconds
after a draw is initiated and at every 5-sec-
ond interval thereafter throughout the dura-
tion of the draw. Determine the arithmetic
mean of the hot water discharge temperature
and the cold water inlet temperature for
each draw. Record the scale used to measure
the mass of the withdrawn water or the water
meter reading, as appropriate, after
each draw. At the end of the recovery period
following the first draw, determine and
record the fossil fuel or electrical energy
consumed, \(Q_{\text{min}}\). Likewise, record the read-
ing of the meter used to measure fossil fuel
or electrical energy prior to the
progress at the exit temperature of one hour,
the storage capacity of the water heater,
gal (L).

V_1 = \frac{(W_f - W_i)}{\rho}

Where:
\(V_1\) = the volume of water removed
during the first draw of the first-hour rating
test, gal (L)
or, if the mass of water is being measured,
\[V_1 = \frac{M_f}{\rho}\]

Where:
\(M_f\) = the mass of water removed during
the first draw of the first-hour rating test,
lb (kg).
\(\rho\) = the density of water used to fill the tank
 completly filled with water, lb/gal (kg/L).

6.1.1 Storage Tank Capacity. The storage
tank capacity is computed using the follow-
ing:

\[
V_{st} = \frac{(W_f - W_i)}{\rho}
\]

Where:
\(V_{st}\) = the storage capacity of the water heater,
gal (L).
\(W_f\) = the weight of the storage tank when
completely filled with water, lb (kg).
\(W_i\) = the (tare) weight of the storage tank
when completely empty, lb (kg).
\(\rho\) = the density of water used to fill the tank
measured at the temperature of the water,
lb/gal (kg/L).

6.1.2. First-Hour Rating Computation. For
the case in which the final draw is initiated
at or prior to an elapsed time of one hour,
the first-hour rating shall be computed us-
ing,

\[
F_{hr} = \sum_{i=1}^{n} V_i^*
\]

Where:
\(n\) = the number of draws that are completed
during the first-hour rating test.
\(V_i^*\) = the volume of water removed
during the \(i\)th draw of the first-hour rating test,
gal (L)
or, if the mass of water is being measured,
\[V_i^* = \frac{M_i^*}{\rho}\]

Where:
\(M_i^*\) = the mass of water removed during
the \(i\)th draw of the first-hour rating test,
lb (kg).
\(\rho\) = the water density corresponding to the
average outlet temperature measured dur-
ing the \(i\)th draw, \((T_{out,i})\), lb/gal (kg/L).

For the case in which a draw is not in
progress at the elapsed time of one hour and
a final draw is imposed at the elapsed time of
one hour, the first-hour rating shall be cal-
culated using

\[
F_{hr} = \sum_{i=1}^{n-1} V_i^* + V_n^* \left( \frac{T_{out,n} - T_{out,n-1}}{T_{out,n} - T_{out,n-1}} \right)
\]

where \(n\) and \(V_n^*\) are the same quantities as
defined above, and
\(V_n^*\) = the volume of water drawn during the
nth (final) draw of the first-hour rating
test, gal (L)
\(T_{out,n}\) = the average water outlet tem-
perature measured during the (\(n-1\))th draw of
the first-hour rating test, °F (°C).
\(T_{out,n-1}\) = the average water outlet tem-
perature measured during the nth (final) draw
of the first-hour rating test, °F (°C).
6.1.3 Recovery Efficiency. The recovery efficiency for gas, oil, and heat pump storage-type water heaters is computed as:

$$\eta_r = \frac{M_1 C_p \left( T_{\text{del,1}} - T_{\text{in,1}} \right)}{Q_r} + \frac{V_1 \rho_2 C_p \left( T_{\text{max,1}} - T_o \right)}{Q_r}$$

Where:
- $M_1$ = total mass removed during the first draw of the 24-hour simulated use test, lb (kg), or, if the volume of water is being measured, $M_1$ = $V_1 \rho_1$.
- $V_1$ = total volume removed during the first draw of the 24-hour simulated use test, gal (L).
- $\rho_1$ = density of the water at the water temperature measured at the point where the flow volume is measured, lb/gal (kg/L).
- $C_{p1}$ = specific heat of the withdrawn water, Btu/lb°F (kJ/kg°C).
- $T_{\text{del,1}}$ = average water outlet temperature measured during the first draw of the 24-hour simulated use test, °F (°C).
- $T_{\text{in,1}}$ = average water inlet temperature measured during the first draw of the 24-hour simulated use test, °F (°C).
- $T_{\text{max,1}}$ = maximum mean tank temperature recorded after cut-out following the first draw of the 24-hour simulated use test, °F (°C).
- $T_o$ = the mean tank temperature at the end of the 24-hour test period, Btu/h (kJ/h).

The recovery efficiency will be expressed as a percent ($\%$).

6.1.4 Hourly Standby Losses. The hourly standby energy losses are computed as:

$$Q_{\text{stby}} = \frac{V_{\text{stby}} C_p \left( T_{24} - T_{\text{stby}} \right)}{\eta_r}$$

Where:
- $V_{\text{stby}}$ = volume of water stored in the storage tank, gal (L).
- $C_p$ = specific heat of stored water, Btu/lb°F (kJ/kg°C).
- $T_{24}$ = the maximum mean tank temperature observed after the sixth draw, °F (°C).
- $T_{\text{stby}}$ = the hourly standby energy losses of the water heater, Btu/hr (kJ/h).
- $\eta_r$ = the total energy consumed by the water heater between the time at which the maximum mean tank temperature is observed after the sixth draw and the end of the 24-hour test period, Btu/ft² (kJ/°C).
- $t_{\text{stby}}$ = elapsed time between the time at which the maximum mean tank temperature is observed after the sixth draw and the end of the 24-hour simulated use test, h.

The hourly standby loss coefficient for the tank is computed as:

$$UA = \frac{Q_{\text{hr}}}{T_{24,\text{hr}} - T_{24,\text{stby,1}}}$$

Where:
- $UA$ = standby heat loss coefficient of the storage tank, Btu/ft²°F (kJ/°C).
- $Q_{\text{hr}}$ = as defined in this section.
- $T_{24,\text{hr}}$ = overall average storage tank temperature between the time when the maximum mean tank temperature is observed after the sixth draw and the end of the 24-hour simulated use test, °F (°C).
- $T_{24,\text{stby,1}}$ = overall average ambient temperature between the time when the maximum mean tank temperature is observed after the sixth draw and the end of the 24-hour simulated use test, °F (°C).

6.1.5 Daily Water Heating Energy Consumption. The daily water heating energy consumption, $Q_d$, is computed as:

$$Q_d = Q \cdot \frac{\eta_r}{t_{\text{stby,1}}}$$

Where:
- $Q_d$ = daily water heating energy consumption, Btu (kJ).
- $\eta_r$ = as defined in this section.
Q = total energy used by the water heater during the 24-hour simulated use test including auxiliary energy such as pilot lights, pumps, fans, etc., Btu (kJ). (Electrical auxiliary energy shall be converted to thermal energy using the following conversion: 1 kWh = 3,412 Btu.)

\[ Q_{HW} = \sum_{i=1}^{6} M_i C_p \left( T_{in,i} - T_{out,i} \right) / \eta_i \]

Where:

- \( M_i \) is the mass withdrawn for the ith draw (i = 1 to 6), lb (kg).
- \( C_p \) is the specific heat of the water of the ith draw, Btu/lb\(^°\)F (kJ/kg\(^°\)C).
- \( T_{in,i} \) is the average water inlet temperature measured during the ith draw (i = 1 to 6), °F (°C).
- \( T_{out,i} \) is the average water outlet temperature measured during the ith draw (i = 1 to 6), °F (°C).
- \( \eta_i \) is as defined in section 6.1.3.

The adjusted daily water heating energy consumption value. Thus, the daily energy consumption value which takes into account that the temperature difference between the storage tank and ambient air may not be the nominal value of 67.5 °F (57.2 °C) temperature rise.

The energy required to heat the same quantity of water over a 77 °F (42.8 °C) temperature rise, Btu/day (kJ/day), is:

\[ Q_{HW,77°F} = \sum_{i=1}^{6} M_i C_p \left( 135°F - 58°F \right) / \eta_i \]

or

\[ Q_{HW,42.8°C} = \sum_{i=1}^{6} M_i C_p \left( 57.2°C - 14.4°C \right) / \eta_i \]

The difference between these two values is:

\[ Q_{HW} = Q_{HW,77°F} - Q_{HW,42.8°C} \]

Department of Energy

6.2 Instantaneous Water Heaters.

6.2.1 Maximum GPM (L/min) Rating Computation. Compute the maximum gpm (L/min) rating as:

\[ F_{\text{max}} = \frac{M_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(135^\circ\text{F} - 58^\circ\text{F})} \]

or \[ F_{\text{max}} = \frac{M_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(57.2^\circ\text{C} - 14.4^\circ\text{C})} \]

which may be expressed as:

\[ F_{\text{max}} = \frac{M_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(77^\circ\text{F})} \]

or \[ F_{\text{max}} = \frac{M_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(42.8^\circ\text{C})} \]

Where:

- \( M_{10\text{min}} \) = the mass of water collected during the 10-minute test, lb (kg).
- \( T_{\text{del}} \) = the average delivery temperature, °F (°C).
- \( T_{\text{in}} \) = the average inlet temperature, °F (°C).
- \( \rho \) = the density of water at the average delivery temperature, lb/gal (kg/L).

If a water meter is used the maximum gpm (L/min) rating is computed as:

\[ F_{\text{max}} = \frac{V_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(77^\circ\text{F})} \]

or \[ F_{\text{max}} = \frac{V_{10\text{min}}(T_{\text{del}} - T_{\text{in}})}{10(\rho)(42.8^\circ\text{C})} \]

Where:

- \( V_{10\text{min}} \) = the volume of water measured during the 10-minute test, gal (L).
- \( T_{\text{del}} \) = as defined in section 6.2.2.1. \( T_{\text{in}} \) = as defined in this section.

6.2.2 Recovery Efficiency

6.2.2.1 Fixed Input Instantaneous Water Heaters. The recovery efficiency is computed as:

\[ \eta_f = \frac{M_1C_{p1}(T_{\text{del},1} - T_{\text{in},1})}{r} \]

Where:

- \( M_1 \) = mass removed during the first draw of the 24-hour simulated use test, lb (kg).
- \( r \) = as defined in section 6.2.2.1.
- \( C_{p1} \) = specific heat of water, Btu/lb °F (kJ/kg °C).
- \( T_{\text{del},1} \) = average water outlet temperature measured during the first draw of the 24-hour simulated use test, °F (°C).
- \( T_{\text{in},1} \) = average water inlet temperature measured during the first draw of the 24-hour simulated use test, °F (°C).
- \( Q_r \) = the total energy used by the water heater between cut-out prior to the first draw and cut-out following the first draw, including auxiliary energy such as pilot lights, pumps, fans, etc., Btu (kJ). (Electrical auxiliary energy shall be converted to thermal energy using the following conversion: 1 kWh = 3,412 Btu.)

6.2.2.2 Variable Input Instantaneous Water Heaters. For instantaneous water heaters that have a variable firing rate, two recovery efficiency values are computed, one at the maximum input rate and one at the minimum input rate. The recovery efficiency used in subsequent computations is taken as the average of these two values. The maximum recovery efficiency is computed as:

\[ \eta_{r,\text{max}} = \frac{M_1C_{p1}(T_{\text{del},1} - T_{\text{in},1})}{Q_{r,\text{max}}} \]

Where:

- \( M_1 \) = as defined in section 6.2.2.1.
- \( C_{p1} \) = as defined in section 6.2.2.1.
- \( T_{\text{del},1} \) = as defined in section 6.2.2.1.
- \( T_{\text{in},1} \) = as defined in section 6.2.2.1.
- \( Q_{r,\text{max}} \) = the total energy used by the water heater between burner cut-out prior to the first draw and burner cut-out following the first draw, including auxiliary energy such as pilot lights, Btu (kJ).

The minimum recovery efficiency is computed as:

\[ \eta_{r,\text{min}} = \frac{M_4C_{p4}(T_{\text{del},4} - T_{\text{in},4})}{Q_{r,\text{min}}} \]

Where:

- \( M_4 \) = mass withdrawn during the fourth draw, lb (kg), or, if the volume of water is being measured, \( M_4 = V_4/\rho \)

Where:

- \( V_4 \) = total volume removed during the first draw of the 24-hour simulated use test, gal (L).
- \( \rho \) = as defined in section 6.2.2.1.
- \( C_{p4} \) = the specific heat of water, Btu/lb °F (kJ/kg °C).
The average delivery temperature for the fourth draw, °F (°C).

\( T_{\text{del,4}} \) is the average delivery temperature for the fourth draw, °F (°C).

\( T_{\text{in,4}} \) is the average inlet temperature for the fourth draw, °F (°C).

\( Q_{\text{HW}} \) is the total energy consumed between the beginning of the fourth draw and burn-out cut-out following the fourth draw, including auxiliary energy such as pilot lights, Btu (kJ).

The recovery efficiency is computed as:

\[ \eta_r = \frac{\eta_r_{\text{max}} + \eta_r_{\text{min}}}{2} \]

Where:

\( \eta_r_{\text{max}} \) = as calculated above.

\( \eta_r_{\text{min}} \) = as calculated above.

6.2.3 Daily Water Heating Energy Consumption. The daily water heating energy consumption, \( Q_{\text{HW}} \), is computed as:

\[ Q_{\text{HW}} = \sum_{i=1}^{6} \frac{M_i C_p (T_{\text{del, i}} - T_{\text{in, i}})}{\eta_r} \]

Where:

\( M_i \) = the mass withdrawn during the ith draw, lb (kg).

\( C_p \) = the specific heat of water, Btu/lb °F (kJ/kg °C).

\( T_{\text{del, i}} \) = the average delivery temperature of the ith draw, °F (°C).

\( T_{\text{in, i}} \) = the average inlet temperature of the ith draw, °F (°C).

\( \eta_r \) = as calculated in section 6.2.2.2.

The energy required to heat the same quantity of water over a 77 °F (25 °C) temperature rise is:

\[ Q_{\text{HW, 77°F}} = \sum_{i=1}^{6} \frac{M_i C_p (135°F - 58°F)}{\eta_r} \]

or \( Q_{\text{HW, 42.8°C}} = \sum_{i=1}^{6} \frac{M_i C_p (57.2°C - 14.4°C)}{\eta_r} \)

Where:

\( M_i \) = the mass withdrawn during the ith draw, lb (kg).

\( C_p \) = the specific heat of water of the ith draw, Btu/lb °F (kJ/kg °C). 

\( \eta_r \) = as calculated above.

The difference between these two values is:

\[ Q_{\text{HW, 77°F}} - Q_{\text{HW, 42.8°C}} = \sum_{i=1}^{6} \frac{M_i C_p (77°F - 58°F)}{\eta_r} \]

6.2.4 Energy Factor. The energy factor, \( E_f \), is computed as:

\[ E_f = \sum_{i=1}^{6} \frac{M_i C_p (135°F - 58°F)}{Q_{\text{dm}}} \]

or \( E_f = \sum_{i=1}^{6} \frac{M_i C_p (57.2°C - 14.4°C)}{Q_{\text{dm}}} \)

Where:

\( Q_{\text{dm}} \) = the daily water heating energy consumption as computed in accordance with section 6.2.3, Btu (kJ). 

\( M_i \) = the mass associated with the ith draw, lb (kg).

\( C_p \) = the specific heat of water computed at a temperature of (77 °F + 58 °F) / 2, Btu/lb °F ([57.2 °C + 14.4 °C] / 2, kJ/kg °C).

6.2.5 Annual Energy Consumption. The annual energy consumption for instantaneous type water heaters is computed as:

\[ E_{\text{annual}} = 365 \times Q_{\text{dm}} \]

Where:

\( Q_{\text{dm}} \) = the modified daily energy consumption, Btu/day (kJ/day).

365 = the number of days in a year.

7. Ratings for Untested Models

In order to relieve the test burden on manufacturers who offer water heaters which differ only in fuel type or power input, ratings for untested models may be established in accordance with the following procedures. In lieu of the following procedures a manufacturer may elect to test the unit for which a rating is sought.

7.1 Gas Water Heaters. Ratings obtained for gas water heaters using natural gas can be used for an identical water heater which utilizes propane gas if the input ratings are within ±10%.

7.2 Electric Water Heaters

7.2.1 First-Hour Rating. If an electric storage-type water heater is available with more than one input rating, the manufacturer...
shall designate the standard input rating, and the water heater need only be tested with heating elements at the designated standard input ratings. The first-hour ratings for units having power input rating less than the designated standard input rating shall be assigned a first-hour rating equivalent to the first draw of the first-hour rating for the electric water heater with the standard input rating. For units having power inputs greater than the designated standard input rating, the first-hour rating shall be equivalent to that measured for the water heater with the standard input rating.

7.2.2 Energy Factor. The energy factor for identical electric storage-type water heaters, with the exception of heating element wattage, may use the energy factor obtained during testing of the water heater with the designated standard input rating.

APPENDIX F TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF ROOM AIR CONDITIONERS

2. Test conditions. Establish the test conditions described in sections 4 and 5 of ANSI Z234.1–1972 and in accordance with ASHRAE Standard 16-69.

4. Calculations. 4.1 Calculate the cooling capacity (expressed in Btu/hr) as required in section 6.1 of ANSI Z234.1–1972 and in accordance with ASHRAE Standard 16-69.

4.2 Determine the electrical power input (expressed in watts) as required by section 6.5 of ANSI Z234.1–1972 and in accordance with ASHRAE Standard 16-69.

[42 FR 27998, June 1, 1977. Redesignated and amended at 44 FR 37938, June 29, 1979]

APPENDIX G TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF UNVENTED HOME HEATING EQUIPMENT

1. Testing conditions.

1.1 Installation.

1.1.1 Electric heater. Install heater according to manufacturer’s instructions. Heaters shall be connected to an electrical supply circuit of nameplate voltage with a wattmeter installed in the circuit. The wattmeter shall have a maximum error not greater than one percent.

1.1.2 Unvented gas heater. Install heater according to manufacturer’s instructions. Heaters shall be connected to a gas supply line with a gas displacement meter installed between the supply line and the heater according to manufacturer’s specifications. The gas displacement meter shall have a maximum error no greater than one percent. Gas heaters with electric auxiliaries shall be connected to an electrical supply circuit of nameplate voltage with a wattmeter installed in the circuit. The wattmeter shall have a maximum error not greater than one percent.

1.2 Temperature regulating controls. All temperature regulating controls shall be shorted out of the circuit or adjusted so that they will not operate during the test period.

1.3 Fan controls. All fan controls shall be set at the highest fan speed setting.

1.4 Energy supply.

1.4.1 Electrical supply. Supply power to the heater within one percent of the nameplate voltage.

1.4.2 Natural gas supply. For an unvented gas heater utilizing natural gas, maintain the gas supply to the heater with a normal inlet test pressure immediately ahead of all controls at 7 to 10 inches of water column. The regulator outlet pressure at normal supply test pressure shall be approximately that measured for the water heater with the designated standard input rating.

Pt. 430, Subpt. B, App. G
Pt. 430, Subpl. B, App. G

10 CFR Ch. II (1–1–08 Edition)

3. Calculations.

3.1 Annual energy consumption for primary electric heaters. For primary electric heaters, calculate the annual energy consumption \( E_a \) expressed in kilowatt-hours per year and defined as:

\[
E_a = 2080(0.77) DHR
\]

where:

- \( 2080 \) = national average annual heating load hours
- \( 0.77 \) = adjustment factor
- \( DHR \) = design heating requirement and is equal to \( P_e/1.2 \) in kilowatts.

3.2 Annual energy consumption for primary electric heaters by geographic region of the United States. For primary electric heaters, calculate the annual energy consumption by geographic region of the United States \( E_a \) expressed in kilowatt-hours per year and defined as:

\[
E_a = HLI (0.77) DHR
\]

where:

- \( HLI \) = heating load hours for a specific region determined from Figure 1 of this appendix
- \( DHR \) = as defined in 3.1 of this appendix

3.3 Rated output for electric heaters. Calculate the rated output \( Q_{aw} \) for electric heaters, expressed in Btu's per hour, and defined as:

\[
Q_{aw} = P_e (3,412 \text{ Btu/kWh})
\]

where:

- \( P_e \) = as defined in 2.1 of this appendix

3.4 Rated output for unvented heaters using either natural gas, propane, or oil. For unvented heaters using either natural gas, propane, or oil equipped without auxiliary electrical systems, calculate the rated output \( Q_{aw} \), expressed in Btu's per hour, and defined as:

\[
Q_{aw} = P_e + P_a (3,412 \text{ Btu/kWh})
\]

where:

- \( P_e \) = as defined in 2.1 of this appendix
- \( P_a \) = as defined in 2.2 of this appendix

1.2 Natural gas, propane, and oil measurement. Establish the test conditions as set forth in section 1 of this appendix. A natural gas, propane, or oil heater shall be operated for one hour. Using either the nameplate rating or the energy flow instrumentation set forth in section 2.1 of this appendix and the fuel supply rating set forth in sections 1.4.2, 1.4.3, or 1.4.4 of this appendix, as appropriate, determine the maximum fuel input \( P_f \) of the heater under test in Btu's per hour. The energy flow instrumentation shall measure the maximum fuel input with an error no greater than one percent.

1.4 Electric power measurement. Establish the test conditions as set forth in section 1 of this appendix. Allow an electric heater to warm up for at least five minutes before recording the maximum electric power measurement from the wattmeter. Record the maximum electric power \( P_e \) expressed in kilowatts.

2. Oil supply. For an unvented oil heater utilizing kerosene, determine the higher heating value in Btu's per gallon with an error no greater than one percent. Alternatively, the test can be conducted using bottled propane of a higher heating value within ±5 percent of 2,500 Btu's per gallon as long as the actual higher heating value of the bottled propane has been determined with an error no greater than one percent as certified by the supplier.

3.1 Natural gas, propane, and oil measurement. Determine the maximum fuel input \( P_f \) of the heater under test in Btu's per hour. The energy flow instrumentation shall measure the maximum fuel input with an error no greater than one percent.
APPENDIX H TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF TELEVISION SETS

1. DEFINITIONS

1.1 "IRE-unit flat field" means a specific video electrical signal which results in a particular level of brightness of the television screen as established by the Institute of Radio Engineers.

1.2 "Filament keep-warm" means a feature that provides a voltage to keep vacuum tube and/or picture tube filaments warm for the purpose of allowing almost instantaneous response to the power control switch.

1.3 "Operating time" \((t_o)\) means the hours per year during which the television set is operating with power control turned on.

1.4 "Remote control" means an optional feature which allows the user to control the television set from more than one location by a hand held device.

1.5 "Standby power consumption" \((P_s)\) means the minimum amount of energy consumed with the power control switch turned off.

1.6 "Standby time" \((t_s)\) means the hours per year during which the television set is
connected to a power outlet with the power control switch turned off.

1.7 “Vacation switch or master on-off switch” means an optional energy saving feature incorporated into the design of a television set that permits the user to disconnect the filament keep-warm circuit(s).

1.8 “Remote control defeat switch” means a switch which permits the user to disconnect all standby power to a television set.

2. Testing Conditions and Measurements

2.1 Test equipment and test signals. The following equipment and test signals shall be used for testing of television sets.

2.1.1 Regulated power source capable of supplying 120 volts (±12 volts) alternating current.

2.1.2 Signal generator capable of producing radio frequency (RF) television test signals, at a convenient very high frequency (VHF) channel, modulated with, National Television System Committee composite video as follows:

2.1.2.1 Standard White Pattern, RF signal modulated to 87 percent with a 100 IRE-unit flat field.

2.1.2.2 Standard Black Pattern, all adjustments as for 2.1.2.1 except modulated with a zero IRE-unit flat field.

2.1.2.3 The test signals in 2.1.2.1 and 2.1.2.2, supplied by a source whose impedance equals the design antenna impedance of the television set under test, shall be adjusted to a level of 70 decibels (dB) ±3dB, referred to a zero dB level of one femtowatt (3×10⁻¹⁵ watt) available power. (For a 300 ohm source, 70 dB referred to one femtowatt corresponds to an open-circuit voltage of 3.5 millivolts. For the calculation of “available power” use American National Standard C.16.13–1961, Method of Testing Monochrome Television Broadcast Receivers.)

2.1.3 Wattmeter capable of measuring the average power consumption of the television set under test. The wattmeter shall be accurate to within 1 percent of the full scale value. All measurements shall be made on the upper half of the scale of the wattmeter.

2.2 Initial set-up of television set.

2.2.1 Remove all batteries from television sets designed for both battery and alternating current operation. Deactivate all present or automatic controls affecting brightness which are customer options. Adjust all non-customer controls according to the manufacturer’s service procedure.

2.2.2 Apply power to the television set under test from the power source specified in 2.1.1 through the wattmeter specified in 2.1.3. Adjust the volume control to the lowest possible setting.

2.2.3 Connect the output of the signal generator as specified in 2.1.2 to the VHF antenna terminals of the television set. Tune the television set to the channel of the RF signal.

2.3 Measurement of operating power consumption (Pₒ)

2.3.1 Turn on the television set and allow at least five minutes warm-up time. With the synchronization controls adjusted for a stable test pattern, apply the standard white pattern specified in 2.1.2.1 to the television set. Adjust any customer controls other than the volume or synchronization controls for maximum power consumption as indicated by the wattmeter specified in 2.1.3 illuminate any room illumination sensor which has not been deactivated, to produce maximum power consumption. Record the white pattern consumption (Pₒ) as indicated by the wattmeter in watts.

2.3.2 Change the signal source to the standard black pattern specified in 2.1.2.2. Adjust any customer controls, other than the volume or synchronization controls, for the minimum power consumption as indicated by the wattmeter. Cover any room illumination sensor which has not been deactivated. Record the black pattern power consumption (Pₒ) as indicated by the wattmeter in watts.

2.3.3 Compute the operating power consumption (Pₒ) as follows:

\[ Pₒ = (Pₛ + 4Pₛ)/2 \]

where

\[ Pₛ = \text{operating power consumption in watts} \]

\[ Pₛ = \text{as determined from 2.3.1} \]

2.2 Measurements of standby power consumption (Pₛ)

2.4.1 For television sets without either a vacation switch or a remote control defeat switch, turn the power switch off and after two minutes measure the standby power consumption (Pₛ).

2.4.2 For a television set equipped with a remote control defeat switch, a vacation switch or both, turn the power switch, any vacation switch, and any remote control switch off. The standby power is then calculated from the equation:

\[ Pₛ = (Pₒ - Pₒ)/2 \]

where

\[ Pₒ = \text{standby power consumption in watts} \]

\[ Pₒ = \text{as determined from 2.3.2} \]

2.4.3 For television sets equipped with a remote control defeat switch, a vacation switch or both, turn the power switch, any vacation switch, and any remote control switch off and adjust all non-customer controls to the lowest consuming position.

3.0 Average Annual Energy Consumption

\[ E = (Pₒ - 1000)/2 \times (Pₒ - 1000) = 2.2Pₒ + 6.56 \]

where
1.1 **Definitions**

1.1.1 **Built-in** means the product is supported by surrounding cabinetry, walls, or other similar structures.

1.1.2 **Drop-in** means the product is supported by horizontal surface cabinetry.

1.1.3 **Forced convection** means a mode of conventional oven operation in which a fan is used to circulate the heated air within the oven compartment during cooking.

1.1.4 **Freestanding** means the product is not supported by surrounding cabinetry, walls, or other similar structures.

1.1.6 **Normal nonoperating temperature** means the temperature of all areas of an appliance to be tested are within 5°F (2.8°C) of the temperature that the identical areas of the same basic model of the appliance would attain if it remained in the test room for 24 hours while not operating with all oven doors closed and with any gas pilot lights on and adjusted in accordance with manufacturer's instructions.

1.1.7 **Primary energy consumption** means either the electrical energy consumption of a conventional electric oven or the gas energy consumption of a conventional gas oven.

1.1.8 **Secondary energy consumption** means any electrical energy consumption, other than clock energy consumption, of a conventional gas oven.

1.1.9 **Standard cubic foot (L) of gas** means that quantity of gas that occupies 1 cubic foot (L) when saturated with water vapor at a temperature of 60°F (15.6°C) and a pressure of 30 inches of mercury (101.6 kPa) (density of mercury equals 13.595 grams per cubic centimeter).

1.1.10 **Thermocouple** means a device consisting of two dissimilar metals which are joined together and, with their associated wires, are used to measure temperature by means of electromotive force.

1.1.11 **Symbol Usage.** The following identity relationships are provided to help clarify the symbology used throughout this procedure.

2. **Test Conditions**

2.1 **Installation.** A free standing kitchen range shall be installed with the back directly against, or as near as possible to, a vertical wall which extends at least 1 foot above and on either side of the appliance. There shall be no side walls. A drop-in, built-in or wall-mounted appliance shall be installed in an enclosure in accordance with the manufacturer's instructions. These appliances are to be completely assembled with all handles, knobs, guards and the like mounted in place. Any electrical resistance heaters, gas burners, baking racks, and baffles shall be in place in accordance with the manufacturer's instructions; however, broiler pans are to be removed from the oven's baking compartment. Disconnect any electrical clock which uses energy continuously, except for those that are an integral part of the timing or temperature controlling circuit of the oven, cooktop, or microwave oven. Do not disconnect or modify the circuit to any other electrical devices or features.

2.1.1 **Conventional electric ranges, ovens, and cooking tops.** These products shall be connected to an electrical supply circuit with voltage as specified in Section 2.2.1 with a watt-hour meter installed in the circuit. The watt-hour meter shall be as described in Section 2.9.1.
2.1.2 Conventional gas ranges, ovens, and cooking tops. These products shall be connected to a gas supply line with a gas meter installed between the supply line and the appliance, in accordance with the manufacturer’s specifications. The gas meter shall be as described in Section 2.9.2. Conventional gas ranges, ovens and cooking tops with electric ignition devices or other electrical components shall be connected to an electrical supply circuit of nameplate voltage with a watt-hour meter installed in the circuit. The watt-hour meter shall be as described in Section 2.9.1.1.

2.1.3 Microwave ovens. Install the microwave oven in accordance with the manufacturer’s instructions and connect to an electrical supply circuit with voltage as specified in Section 2.2.1. A watt-hour meter and watt meter shall be installed in the circuit and shall be as described in Section 2.9.1.1 and 2.9.1.2. If trial runs are needed to set the ‘on’ time for the test, the test measurements are to be separated according to Section 4, Paragraph 12.6 of IEC 705 Amendment 2. (See 10 CFR 430.22)

2.2 Energy supply.
2.2.1 Electrical supply. Maintain the electrical supply to the conventional range, conventional cooking top, and conventional oven being tested at 240/120 volts except that basic models rated only at 208/120 volts shall be tested at that rating. Maintain the voltage within 2 percent of the above specified voltages. For the microwave oven testing, however, maintain the electrical supply to a microwave oven at 120 volts ±1 volt and at 60 hertz.

2.2.2 Gas supply.
2.2.2.1 Gas burner adjustments. Conventional gas ranges, ovens, and cooking tops shall be tested with all of the gas burners adjusted in accordance with the installation or operation instructions provided by the manufacturer. In every case, the burner must be adjusted with sufficient air flow to prevent a yellow flame or a flame with yellow tips.

2.2.2.2 Natural gas. For testing convertible cooking appliances or appliances which are designed to operate using only natural gas, maintain the natural gas pressure immediately ahead of all controls of the unit under test at 7 to 10 inches of water column (1743.6 to 2490.8 Pa). The regulator outlet pressure shall equal the manufacturer’s recommendation. The natural gas supplied should have a heating value of approximately 1,025 Btu’s per standard cubic foot (93.2 kJ/L). The actual gross heating value, \( H_{\mathrm{g}} \), in Btu’s per standard cubic foot (kJ/L), for the natural gas to be used in the test shall be obtained either from measurements made by the manufacturer conducting the test using equipment that meets the requirements described in Section 2.9.4 or by the use of bottled natural gas whose gross heating value is certified to be at least as accurate a value that meets the requirements in Section 2.9.4.

2.2.2.3 Propane. For testing convertible cooking appliances with propane or for testing appliances which are designed to operate using only LP-gas, maintain the propane pressure immediately ahead of all controls of the unit under test at 11 to 13 inches of water column (2740 to 3238 Pa). The regulator outlet pressure shall equal the manufacturer’s recommendation. The propane supplied should have a heating value of approximately 2,500 Btu’s per standard cubic foot (93.2 kJ/L). The actual gross heating value, \( H_{\mathrm{g}} \), in Btu’s per standard cubic foot (kJ/L), for the propane to be used in the test shall be obtained either from measurements made by the manufacturer conducting the test using equipment that meets the requirements described in Section 2.9.4 or by the use of bottled propane whose gross heating value is certified to be at least as accurate a value that meets the requirements described in Section 2.9.4.

2.2.2.4 Test gas. A basic model of a convertible cooking appliance shall be tested with natural gas, but may also be tested with propane. Any basic model of a conventional range, conventional cooking top, or conventional oven which is designed to operate using only natural gas as the energy source must be tested with natural gas. Any basic model of a conventional range, conventional cooking top, or conventional oven which is designed to operate using only LP gas as the gas energy source must be tested with propane gas.

2.3 Air circulation. Maintain air circulation in the room sufficient to secure a reasonably uniform temperature distribution, but do not cause a direct draft on the unit under test.

2.4 Setting the conventional oven thermostat.
2.4.1 Conventional electric oven. Install a thermocouple approximately in the center of the usable baking space. Provide a temperature indicator system for measuring the oven’s temperature with an accuracy as indicated in Section 2.9.3.2. If the oven thermostat does not cycle on and off, adjust or determine the conventional electric oven thermostat setting to provide an average internal temperature which is \( 325 \pm 5 \) °F (\( 162.8 \pm 2.8 \) °C) higher than the room ambient air temperature. If the oven thermostat operates by cycling on and off, adjust or determine the conventional electric oven thermostat setting to provide an average internal temperature which is \( 325 \pm 5 \) °F (\( 162.8 \pm 2.8 \) °C) higher than the room ambient air temperature. This shall be done by measuring the maximum and minimum temperatures in any three consecutive cut-off/cut-on actions of the electric resistance heaters, excluding the initial cut-off/cut-on action, by the thermostat after the temperature rise of \( 325 \pm 5 \) °F (\( 162.8 \pm 2.8 \) °C) for testing. For testing convertible cooking appliances or appliances which are designed to operate using only natural gas or propane, keep the natural gas or propane pressure at 10 percent above the pressure immediately ahead of all controls of the unit under test. The regulator outlet pressure shall equal the manufacturer’s recommendation.
(180.6 °± 2.8 °C) has been attained by the conventional electric oven. Remove the thermocouple after the thermostat has been set.

2.4.2 Conventional gas oven. Install five parallel-connected, weighted thermocouples, one located at the center of the conventional gas oven’s usable baking space and the other four equally spaced between the center and the corners of the conventional gas oven on the diagonals of a horizontal plane through the center of the conventional gas oven. Each weighted thermocouple shall be constructed of a copper disc that is 1-inch (25.4 mm) in diameter and 1⁄8-inch (3.2 mm) thick. The two thermocouple wires shall be located in two holes in the disc spaced 1⁄2-inch (12.7 mm) apart, with each hole being located 1⁄4-inch (6.4 mm) from the center of the disc. Both thermocouple wires shall be silver-soldered to the copper disc. Provide a temperature indicator system for measuring the oven’s temperature with an accuracy as indicated in Section 2.9.3.2. If the oven thermostat does not cycle on or off, adjust or determine the conventional gas oven thermostat setting to provide an average internal temperature which is 325 ±5 °F (180.6 ±2.8 °C) higher than the room ambient air temperature. If the oven thermostat operates by cycling on and off, adjust or determine the conventional gas oven thermostat setting to provide an average internal temperature which is 325±5 °F (180.6±2.8 °C) for conventional gas ovens and cooking tops, or as indicated in Section 2.9.3.3. If the test block has been cooled (or water heated) between tests the thermocouple hole should be sealed, or other steps taken, to insure that the thermocouple hole is completely dry at the start of the test. Provide a temperature indicator system for measuring the test block temperature with an accuracy as indicated in Section 2.9.3.3.

2.5 Ambient room air temperature. During the test, maintain an ambient room air temperature, T_a, of 77±9 °F (25±5 °C) for conventional ovens and cooking tops, or as indicated in Section 4, Paragraph 12.4 of IEC 705 Amendment 2 for microwave ovens, as measured at least 5 feet (1.5 m) and not more than 8 feet (2.4 m) from the nearest surface of the unit under test and approximately 3 feet (0.9 m) above the floor. The temperature shall be measured with a thermometer or temperature indicating system with an accuracy as specified in Section 2.9.3.1.

2.6 Normal nonoperating temperature. All areas of the appliance to be tested shall attain the normal nonoperating temperature, as defined in Section 1.6, before any testing begins. The equipment for measuring the applicable normal nonoperating temperature shall be as described in Sections 2.9.3.1, 2.9.3.2, 2.9.3.3, 2.9.3.4, and 2.9.3.5, as applicable.

2.7 Test blocks for conventional oven and cooking top. The test blocks shall be made of aluminum alloy No. 6061, with a specific heat of 0.23 Btu/°F (0.96 kJ/(kg °C)) and with any temper that will give a coefficient of thermal conductivity of 1073.3 to 1189.1 Btu-inh·ft·°F (154.8 to 171.5 W/m·°C). Each block shall have a hole at its top. The hole shall be 0.08 inch (2.03 mm) in diameter and 0.80 inch (20.3 mm) deep. The manufacturer conducting the test may provide other means which will ensure that the thermocouple junction is installed at this same position and depth. The bottom of each block shall be flat to within 0.002 inch (0.051 mm) TIR (total indicator reading). Determine the actual weight of each test block with a scale with an accuracy as indicated in Section 2.9.5.

2.7.1 Conventional oven test block. The test block for the conventional oven, W_c, shall be 6.25±0.05 inches (158.8±1.3 mm) in diameter, approximately 2.8 inches (71 mm) high and shall weigh 8.5±0.1 lbs (3.86±0.05 kg). The block shall be finished with an anodic black coating which has a minimum thickness of 0.001 inch (0.025 mm) or with a finish having the equivalent absorptivity.

2.7.2 Small test block for conventional cooking top. The small test block, W_s, shall be 6.25±0.05 inches (158.8±1.3 mm) in diameter, approximately 2.8 inches (71 mm) high and shall weigh 8.5±0.1 lbs (3.86±0.05 kg).

2.7.3 Large test block for conventional cooking top. The large test block for the conventional cooking top, W_l, shall be 9±0.05 inches (228.6±1.3 mm) in diameter, approximately 3.0 inches (76 mm) high and shall weigh 19±0.1 lbs (8.62±0.05 kg).

2.7.4 Thermocouple installation. Install the thermocouple such that the thermocouple junction (where the thermocouple contacts the test block) is at the bottom of the hole provided in the test block and that the thermocouple junction makes good thermal contact with the aluminum block. If the test blocks are to be water cooled between tests the thermocouple hole should be sealed, or other steps taken, to insure that the thermocouple hole is completely dry at the start of the next test. Provide a temperature indicator system for measuring the test block temperature with an accuracy as indicated in Section 2.9.3.3.

2.7.5 Initial test block temperature. Maintain the initial temperature of the test blocks, T_i, within ±4 °F (±2.2 °C) of the ambient room air temperature as specified in Section 2.5. If the test block has been cooled (or heated) to bring it to room temperature, allow the block to stabilize for at least 2 minutes after removal from the cooling (or heating) source, before measuring its initial temperature.

2.8 Microwave oven test load.

2.8.1 Test container. The test container shall be as specified in Section 4, Paragraph 12.2 of IEC 705 Amendment 2.
2.8.2 Test water load. The test water load shall be as specified in Section 4, Paragraph 12.1 of IEC 705 Amendment 2.

2.8.2.1 Test water load and test container temperature. Before the start of the test, the oven and the test container shall be at ambient temperature as specified in Section 4, Paragraph 12.4 of IEC 705 Amendment 2. The test water load shall be contained in a chiller (not the test container) and maintained at 18 ±1.8 °F (10 ±1°C) below the ambient room temperature.

2.9 Instrumentation. Perform all test measurements using the following instruments, as appropriate:

2.9.1 Electrical Measurements.

2.9.1.1 Watt-hour meter. The watt-hour meter for measuring the energy consumption of microwave ovens and cooking tops shall have a resolution of 0.1 watt-hour (3.6 kJ) or less and a maximum error no greater than 1.5 percent of the measured value for any demand greater than 1.5 percent of the measured value.

2.9.1.2 Watt meter. The watt meter used to measure the conventional oven, conventional range, range clock power or the power input of the microwave oven shall have a resolution of 0.2 watt (0.28 L) or less and a maximum error no greater than 1.5 percent of the measured value.

2.9.2 Gas Measurements.

2.9.2.1 Positive displacement meters. The gas meter to be used for measuring the gas consumed by the gas burners of the oven or cooking top shall have a resolution of 0.01 cubic foot (0.28 L) or less and a maximum error no greater than 1 percent of the measured value for any demand greater than 0.2 cubic feet per hour (62.3 L/h). If a positive displacement gas meter is used for measuring the gas consumed by the pilot lights, it shall have a resolution of at least 0.01 cubic foot (0.28 L) or less and have a maximum error no greater than 2 percent of the measured value.

2.9.2.2 Flow meter. If a gas flow meter is used for measuring the gas consumed by the pilot lights, it shall be calibrated to have a maximum error no greater than 1.5 percent of the measured value and a resolution of 1 percent or less of the measured value.

2.9.3 Temperature measurement equipment. The system for measuring the conventional oven temperature shall have an error no greater than ±2 °F (±1.1 °C) when measuring specific temperatures over the range of 68 °F to 230 °F (18.3 °C to 165.6 °C). It shall also have an error no greater than ±2 °F (±1.1 °C) when measuring any temperature difference up to 240 °F (133.3 °C) within the above range.

2.9.3.1 Room temperature indicating system. The temperature measuring device throughout the entire test procedure.

2.9.3.2 Temperature indicator system for measuring test block temperature. The system shall have an error no greater than ±2 °F (±1.1 °C) when measuring specific temperatures over the range of 68 °F to 230 °F (18.3 °C to 165.6 °C). It shall also have an error no greater than ±2 °F (±1.1 °C) when measuring any temperature difference up to 240 °F (133.3 °C) within the above range.

2.9.3.3 Watt-hour meter. The watt-hour meter for measuring test block temperature. The system shall have an error no greater than ±2 °F (±1.1 °C) when measuring specific temperatures over the range of 68 °F to 230 °F (18.3 °C to 165.6 °C). It shall also have an error no greater than ±2 °F (±1.1 °C) when measuring any temperature difference up to 240 °F (133.3 °C) within the above range.

2.9.3.4 Test load temperatures. The thermocouples or other temperature measuring instruments used to measure the test water load temperature shall be as specified in Section 4, Paragraph 12.3 of IEC 705 Amendment 2. Use only one thermometer or other temperature measuring device throughout the test procedure.

2.9.3.5 Temperature indicator system for measuring surface temperatures. The temperature of any surface of an appliance shall be measured by means of a thermocouple in firm contact with the surface. The temperature indicating system shall have an error no greater than ±1 °F (±0.6 °C) over the range of 68 °F to 90 °F (18 °C to 32 °C).

2.9.4 Heating Value. The heating value of the natural gas or propane shall be measured with an instrument and associated readout device that has a maximum error no greater than ±0.5% of the measured value and a resolution of ±0.2% or less of the full scale reading of the indicator instrument. The heating value of natural gas or propane must be corrected for local temperature and pressure conditions.

2.9.5 Scale. The scale used for weighing the test blocks shall have a maximum error no greater than 1 ounce (28.4 g). The scale used for weighing the microwave oven test load shall be as specified in Section 4, Paragraph 12.3 of IEC 705 Amendment 2.

3. Test Methods and Measurements

3.1 Test methods.

3.1.1 Conventional oven. Perform a test by establishing the testing conditions set forth in Section 2, "TEST CONDITIONS," of this Appendix, and adjust any pilot lights of a conventional gas oven in accordance with the manufacturer’s instructions and turn off the gas flow to the conventional cooking top, if so equipped. Before beginning the test, the conventional oven shall be at its normal nonoperating temperature as defined in Section 1.6 and described in Section 2.6. Set the conventional oven test block W, approximately in the center of the usable baking space. If there is a selector switch for selecting the mode of operation of the oven, set it for normal baking. If an oven permits baking by either forced convection by using a fan, or without forced convection, the oven is to be tested in each of those two modes. The oven shall remain on for at least one complete
thermostat “cut-off/cut-on” of the electrical resistance heaters or gas burners after the test block temperature has increased 234 °F (130 °C) above its initial temperature.

3.1.1 Self-cleaning operation of a conventional oven. Establish the test conditions set forth in Section 2, “TEST CONDITIONS,” of this Appendix. Adjust any pilot lights of a conventional gas cooking top in accordance with the manufacturer’s instructions and turn off the gas flow to the conventional cooking top. The temperature of the conventional oven shall be its normal nonoperating temperature as defined in Section 1.6 and described in Section 2.6. Then set the conventional oven to self-clean in accordance with the manufacturer’s instructions. If the self-cleaning process is adjustable, use the average time recommended by the manufacturer for a moderately soiled oven.

3.1.1.2 Continuously burning pilot lights of a conventional gas oven. Establish the test conditions set forth in Section 2, “TEST CONDITIONS,” of this Appendix. Adjust any pilot lights of a conventional gas oven in accordance with the manufacturer’s instructions and turn off the gas flow to the conventional cooking top. If a positive displacement gas meter is used, the test duration shall be sufficient to measure a gas consumption which is at least 200 times the resolution of the gas meter.

3.1.2 Conventional cooking top. Establish the test conditions set forth in Section 2, “TEST CONDITIONS,” of this Appendix. Adjust any pilot lights of a conventional gas cooking top in accordance with the manufacturer’s instructions and turn off the gas flow to the conventional oven(s), if so equipped. The temperature of the conventional cooking top shall be its normal nonoperating temperature as defined in Section 1.6 and described in Section 2.6. Set the test block in the center of the surface unit under test. The small test block, \( W_2 \), shall be used on electric surface units of 7 inches (178 mm) or less in diameter. The large test block, \( W_1 \), shall be used on electric surface units over 7 inches (177.8 mm) in diameter and on all gas surface units. Turn on the surface unit under test and set its energy input rate to the maximum setting. When the test block reaches 144 °F (80 °C) above its initial test block temperature, immediately reduce the energy input rate to 20.5 percent of the maximum energy input rate. After 15±0.1 minutes at the reduced energy setting, turn off the surface unit under test.

3.1.2.1 Continuously burning pilot lights of a conventional gas cooking top. Establish the test conditions set forth in Section 2, “TEST CONDITIONS,” of this Appendix. Adjust any pilot lights of a conventional gas cooking top in accordance with the manufacturer’s instructions and turn off the gas flow to the conventional oven(s). If a positive displacement gas meter is used, the test duration shall be sufficient to measure a gas consumption which is at least 200 times the resolution of the gas meter.

3.1.3 Microwave oven. Establish the testing conditions set forth in Section 2, “TEST CONDITIONS,” of this Appendix. Follow the test procedure as specified in Section 4, Paragraph 12.4 of IEC 705 Amendment 2.

3.2 Test measurements.

3.2.1 Conventional oven test energy consumption. If the oven thermostat controls the oven temperature without cycling on and off, measure the energy consumed, \( E_1 \), when the temperature of the block reaches \( T_O \), which is 234 °F (130 °C) above the initial block temperature, \( T_A \). If the oven thermostat operates by cycling on and off, make the following series of measurements: Measure the block temperature, \( T_A \), and the energy consumed, \( E_1 \), or volume of gas consumed, \( V_A \), at the end of the last “ON” period of the conventional oven before the block reaches \( T_O \). Measure the block temperature, \( T_B \), and the energy consumed, \( E_2 \), or volume of gas consumed, \( V_B \), at the beginning of the next “ON” period. Measure the block temperature, \( T_C \), and the energy consumed, \( E_3 \), or volume of gas consumed, \( V_C \), at the end of that “ON” period. Measure the block temperature, \( T_O \), and the energy consumed, \( E_4 \), or volume of gas consumed, \( V_O \), at the beginning of the following “ON” period. Energy measurements for \( E_1 \), \( E_2 \), \( E_3 \), and \( E_4 \) should be expressed in watt-hours (kJ) for conventional electric ovens and volume measurements for \( V_A \), \( V_B \), \( V_C \), and \( V_O \) should be expressed in standard cubic feet (L) of gas for conventional gas ovens. For a gas oven, measure in watt-hours (kJ) any electrical energy, \( E_E \), consumed by an ignition device or other electrical components required for the operation of a conventional gas oven while heating the test block to \( T_O \). The energy consumed by a continuously operating clock that is an integral part of the timing or temperature control circuit and cannot be disconnected during the test may be subtracted from the oven test energy to obtain the test energy consumption, \( E_{O1} \), or \( E_{O2} \).

3.2.1.1 Conventional oven average test energy consumption. If the conventional oven permits baking by either forced convection or without forced convection and the oven thermostat does not cycle on and off, measure the energy consumed with the forced convection mode, \( E_{O1} \), and without the forced convection mode, \( E_{O2} \), when the temperature of the block reaches \( T_O \) (\( T_O \) is 234 °F (130 °C) above the initial block temperature, \( T_A \)). If the conventional oven permits baking by either forced convection or without forced convection and the oven thermostat operates by cycling on and off, make the following series of measurements with and without the forced convection mode: Measure the block
temperature, $T_\text{O}$, and the energy consumed, $E_\text{O}$, or volume of gas consumed, $V_\text{O}$, at the end of the last “ON” period of the conventional oven before the block reaches $T_\text{D}$. Measure the block temperature, $T_\text{D}$, and the energy consumed, $E_\text{D}$, or volume of gas consumed, $V_\text{D}$, at the beginning of the next “ON” period. Measure the block temperature, $T_\text{D}$, and the energy consumed, $E_\text{D}$, or volume of gas consumed, $V_\text{D}$, at the beginning of the following “ON” period. Energy measurements for $E_\text{O}$, $E_\text{A}$, $E_\text{B}$, $E_\text{C}$ and $E_\text{D}$ should be expressed in watt-hours (kJ) for conventional electric ovens and volume measurements for $V_\text{A}$, $V_\text{B}$, $V_\text{C}$ and $V_\text{D}$ should be expressed in standard cubic feet (L) of gas for conventional gas ovens. For a gas oven that can be operated with or without forced convection, measure in watt-hours (kJ) any electrical energy consumed by an ignition device or other electrical components required for the operation of a conventional gas oven while heating the test block to $T_\text{O}$ using the forced convection mode, $E_{\text{D,}\text{F}}$, and without using the forced convection mode, $E_{\text{D,}\text{NF}}$. The energy consumed by a continuously operating clock that is an integral part of the timing or temperature control circuit and cannot be disconnected during the test may be subtracted from the oven test energy to obtain the test energy consumption, $E_{\text{O,}\text{CT}}$ or $E_{\text{IC}}$.  

3.2.1.2 Energy consumption of self-cleaning operation. Measure the energy consumption, $E_\text{S}$, in watt-hours (kJ) of electricity or the volume of gas consumption, $V_\text{S}$, in standard cubic feet (L) during the self-cleaning test set forth in Section 3.1.1.1. For a gas oven, also measure in watt-hours (kJ) any electrical energy consumed by ignition devices or other electrical components required during the self-cleaning test. The energy consumed by a continuously operating clock that is an integral part of the timing or temperature control circuit and cannot be disconnected during the test may be subtracted from the oven test energy to obtain the energy consumption, $E_{\text{S,}\text{CT}}$, or $E_{\text{IC}}$.  

3.2.1.3 Gas consumption of continuously burning pilot lights. Measure the gas consumption of the pilot lights, $V_{\text{CP}}$, in standard cubic feet (L) of gas and the test duration, $t_{\text{CP}}$, in hours as specified in Section 3.1.2.1. If a gas flow rate meter is used, measure the flow rate, $Q_{\text{CP}}$, in standard cubic feet per hour (L/h).  

3.2.1.4 Clock power. If the conventional oven or conventional range includes an electric clock which is on continuously, and the power rating in watts (J/s.) of this feature is not known, measure the clock power, $P_{\text{CL}}$, in watts (J/s.) The power rating or measurement of continuously operating clocks, that are an integral part of the timing or temperature control circuits and cannot be disconnected during testing, shall be multiplied by the applicable test period to calculate the clock energy consumption, in watt-hours (kJ), during a test. The clock energy consumption, $E_{\text{CL}}$, during a test shall be calculated as

- \[ E_{\text{CL}} = P_{\text{CL}} \times t_{\text{CL}} \]

where $t_{\text{CL}}$ is the clock test period. The clock during the test may then be subtracted from the test energy to obtain the specified test energy consumption value.

3.2.2 Conventional surface unit test energy consumption. For the surface unit under test, measure the energy consumption, $E_{\text{CU}}$, in watt-hours (kJ) of electricity or the volume of gas consumption, $V_{\text{CU}}$, in standard cubic feet (L) of gas and the test block temperature, $T_{\text{CT}}$, at the end of the 15 minute (reduced input setting) test interval for the test specified in Section 3.1.2 and the total time, $t_{\text{CT}}$, in hours, that the unit is under test. Measure any electrical energy, $E_{\text{IC}}$, consumed by an ignition device of a gas heating element in watt-hours (kJ). The energy consumed by a continuously operating clock that is an integral part of the timing or temperature control circuit and cannot be disconnected during the test may be subtracted from the cooktop test energy to obtain the test energy consumption, $E_{\text{CU,}\text{CT}}$ or $E_{\text{IC}}$.

3.2.2.1 Gas consumption of continuously burning pilot lights. If the conventional cooking top under test has one or more continuously burning pilot lights, measure the gas consumed during the test by the pilot lights, $V_{\text{CP}}$, in standard cubic feet (L) of gas, and the test duration, $t_{\text{CP}}$, in hours as specified in Section 3.1.2.1. If a gas flow rate meter is used, measure the flow rate, $Q_{\text{CP}}$, in standard cubic feet per hour (L/h).

3.2.3 Microwave oven test energy consumption and power input. Measurements are to be made as specified in Section 4, Paragraphs 12.4 and 13 of IEC 705 and Amendment 2. Measure the electrical input energy, $E_{\text{MI}}$, in watt-hours (kJ) consumed by the microwave oven during the test. Repeat the tests three times unless the power output value resulting from the second measurement is within 15% of the value obtained from the first measurement as stated in Section 4, Paragraphs 12.6 of IEC 705 Amendment 2. (See 10 CFR 430.22.)

3.3 Recorded values.

3.3.1 Record the test room temperature, $T_\text{R}$, at the start and end of each range, oven or cooktop test, as determined in Section 2.5.  

3.3.2 Record measured test block weights $W_1$, $W_2$, and $W_3$ in pounds (kg).  

3.3.3 Record the initial temperature, $T_\text{I}$, of the test block under test.  

3.3.4 For a conventional oven with a thermostat which operates by cycling on and off, record the conventional oven test measurements $T_\text{A}$, $E_\text{A}$, $T_\text{B}$, $E_\text{B}$, $T_\text{C}$, $E_\text{C}$, $T_\text{D}$, and $E_\text{D}$ for conventional electric ovens or $T_\text{A}$, $V_\text{A}$, $T_\text{B}$, $V_\text{B}$, $T_\text{C}$, $V_\text{C}$, $T_\text{D}$, and $V_\text{D}$ for conventional gas ovens. If the thermostat controls the oven temperature without cycling on and off, record $E_\text{D}$. For a gas oven which also uses
3.3.5 For a conventional oven that can be operated with or without forced convection and the oven thermostat controls the oven temperature without cycling on and off, measure the energy consumed with the forced convection mode, \(E_{O,1}\), and without the forced convection mode, \(E_{O,2}\). If the conventional oven operates with or without forced convection and the thermostat controls the oven temperature by cycling on and off, record the conventional oven test measurements \(T_{A}, E_{A}, T_{B}, E_{B}, T_{C}, E_{C}, T_{D},\) and \(E_{D}\) for conventional electric ovens or \(T_{A}, V_{A}, T_{B}, V_{B}, T_{C}, V_{C}, T_{D},\) and \(V_{D}\) for conventional gas ovens. For a gas oven that can be operated with or without forced convection, measure any electrical energy consumed by an ignition device or other electrical components used during the forced convection mode, \(E_{IO,1}\), and without using the forced convection mode, \(E_{IO,2}\).

3.3.6 Record the measured energy consumption, \(E_{S}\), or gas consumption, \(V_{S}\), for a gas oven, any electrical energy, \(E_{S}\), for the test of the self-cleaning operation of a conventional oven.

3.3.7 Record the gas flow rate, \(Q_{OP}\), or the gas consumption, \(V_{OP}\), and the elapsed time, \(t_{OP}\), that any continuously burning pilot lights of a conventional gas cooking top are under test.

3.3.8 Record the clock power measurement or rating, \(P_{CL}\), in watts (J/s), except for microwave oven tests.

3.3.9 For the surface unit under test, record the electric energy consumption, \(E_{CT}\), or the gas volume consumption, \(V_{CT}\), the final test block temperature, \(T_{CT}\), the total test time, \(t_{CT}\). For a gas cooking top which uses electrical energy for ignition of the burners, also record \(E_{IC}\).

3.3.10 Record the gas flow rate, \(Q_{CP}\), or the gas consumption, \(V_{CP}\), and the elapsed time, \(t_{CP}\), that any continuously burning pilot lights of a conventional gas cooking top are under test.

3.3.11 Record the heating value, \(H_{n}\), as determined in Section 2.2.2.2 for the natural gas supply.

3.3.12 Record the heating value, \(H_{p}\), as determined in Section 2.2.2.3 for the propane supply.

3.3.13 Record the electrical input energy and power input, \(E_{M}\) and \(P_{M}\), for the microwave oven test; the initial and final temperature, \(T_{1}\) and \(T_{2}\), of the test water load; the mass of the test container before filling with the test water load and the mass of the test water load, \(M_{C}\) and \(M_{W}\) respectively; and the measured room temperature, \(T_{0}\), as determined in Section 3.2.3.

4. Calculation of Derived Results From Test Measurements

4.1 Conventional oven.

4.1.1 Test energy consumption. For a conventional oven with a thermostat which operates by cycling on and off, calculate the test energy consumption, \(E_{O}\), expressed in watt-hours (kJ) for electric ovens and in Btu’s (kJ) for gas ovens, and defined as:

\[
E_{O} = E_{AB} + \left[ \frac{T_{O} - T_{AB}}{T_{CD} - T_{AB}} \right] \times (E_{CD} - E_{AB})
\]

for electric ovens, and,

\[
E_{O} = (V_{AB} \times H) + \left[ \frac{T_{O} - T_{AB}}{T_{CD} - T_{AB}} \right] \times (V_{CD} - V_{AB}) \times H
\]
For gas ovens

Where:

\( H = \) either \( H_o \) or \( H_p \), the heating value of the 
gas used in the test as specified in Section 
2.2.2.2 and Section 2.2.2.3, expressed in 
Btu's per standard cubic foot (k) A,

\( T_0 = 234^\circ \text{F (130}^\circ \text{C) plus the initial test block 
temperature.} \)

\[
E_{AB} = \frac{(E_A + E_B)}{2}, \quad E_{CD} = \frac{(E_C + E_D)}{2}
\]

\[
E_{AB} = \frac{(V_A + V_B)}{2}, \quad V_{CD} = \frac{(V_C + V_D)}{2}
\]

\[
T_{AB} = \frac{(T_A + T_B)}{2}, \quad T_{CD} = \frac{(T_C + T_D)}{2}
\]

Where:

\( T_A = \) block temperature in \( ^\circ \text{F (C)} \) at the end 
of the last "ON" period of the conventional 
oven before the test block reaches \( T_O \).

\( T_B = \) block temperature in \( ^\circ \text{F (C)} \) at the be-

coming of the "ON" period following the 
measurement of \( T_A \).

\( T_C = \) block temperature in \( ^\circ \text{F (C)} \) at the be-

coming of the "ON" period which follows 
the measurement of \( T_B \).

\( E_A = \) electric energy consumed in Wh (kJ) at 
the end of the last "ON" period before the 
test block reaches \( T_O \).

\( E_B = \) electric energy consumed in Wh (kJ) at 
the beginning of the "ON" period following 
the measurement of \( T_A \).

\( E_C = \) electric energy consumed in Wh (kJ) at 
the end of the "ON" period which starts 
with \( T_B \).

\( E_D = \) electric energy consumed in Wh (kJ) at 
the beginning of the "ON" period which 
follows the measurement of \( T_C \).

\( V_A = \) volume of gas consumed in standard 
cubic feet (L) at the end of the last "ON" 
period before the test block reaches \( T_O \).

\( V_B = \) volume of gas consumed in standard 
cubic feet (L) at the beginning of the "ON" 
period following the measurement of \( T_A \).

\( V_C = \) volume of gas consumed in standard 
cubic feet (L) at the beginning of the "ON" 
period which starts with \( T_B \).

\( V_D = \) volume of gas consumed in standard 
cubic feet (L) at the beginning of the "ON" 
period which follows the measurement of 
\( T_C \).

The energy consumed by a continuously 
operating clock that cannot be disconnected 
during the test may be subtracted from the 
oven test energy to obtain the oven test energy 
consumption, \( E_o \).

### 4.1.1.1 Average test energy consumption.

If the conventional oven can be operated with 
or without forced convection, determine the 
average test energy consumption, \( E_o \) and 
\( E_{io} \) in watt-hours (kJ) for electric ovens and 
Btu's (kJ) for gas ovens using the following 
equations:

\[
E_o = \frac{(E_{o1})_1 + (E_{o2})_1}{2}
\]

\[
E_{io} = \frac{(E_{io1})_1 + (E_{io2})_1}{2}
\]

Where:

\( (E_o)_1 \) = test energy consumption using the 
forced convection mode in watt-hours (kJ) 
for electric ovens and Btu's (kJ) for gas 
oven as measured in Section 3.2.1.1.

\( (E_{io})_1 \) = test energy consumption without using 
the forced convection mode in watt-hours 
(kj) for electric ovens and Btu's (kJ) for gas 
oven as measured in Section 3.2.1.1.

\( (E_{io})_2 \) = electrical energy consumption in 
3.2.1.1. (\( E_{io})_2 \) = electrical energy consump-

\( Btu's \) (kJ) of a gas oven in forced con-

\( Btu's \) (kJ) for electric ovens and Btu's (kJ) for gas 
oven without using the forced convection mode as 
measured in Section 3.2.1.1.

The energy consumed by a continuously 
operating clock that cannot be disconnected 
during the test may be subtracted from the 
on test energy to obtain the average test 
energy consumption \( E_o \) and \( E_{io} \).

### 4.1.2 Conventional oven annual energy consump-

### 4.1.2.1 Annual cooking energy consumption.

### 4.1.2.1.1 Annual primary energy consump-

### 4.1.2.1.2 Annual useful cooking energy output.
Department of Energy

\[ E_{CO} = \frac{E_O \times Q_O}{W_t \times C_p \times T_S} \]

for gas ovens,

where:

\[ E_t \] = test energy consumption as measured in Section 3.2.1 or as calculated in Section 4.1.1 or 4.1.11.

\[ Q_O = 88.8 \text{ kBu (93,684 kJ)} \] per year, annual useful cooking energy output of conventional gas oven.

\[ W_t, C_p, \text{ and } T_S \] are as defined above.

4.1.2.12 Annual secondary energy consumption for cooking of gas ovens. Calculate the annual secondary energy consumption for cooking, \( E_{SO} \), in kilowatt-hours (kWh) per year and defined as:

\[ E_{SO} = \frac{E_{IO} \times K_e \times Q_O}{W_t \times C_p \times T_S} \]

where:

\[ E_{IO} \] = electrical test energy consumption as measured in Section 3.2.1 or as calculated in Section 4.1.11.

\[ Q_O = 20.3 \text{ kWh (72,480 kJ)} \] per year, annual useful cooking energy output.

\[ K_e, W_t, C_p, \text{ and } T_S \] are as defined in Section 4.1.2.11.

4.1.2.2 Annual energy consumption of any continuously burning pilot lights. Calculate the annual energy consumption of any continuously burning pilot lights, \( E_{PO} \), expressed in Kilowatts (kW) per year and defined as:

\[ E_{PO} = V_{OP} \times H \times (A - B) \]

where:

\[ Q_{WP} \] = pilot gas flow rate in standard cubic feet per hour (L/h), as measured in Section 3.2.1.3.

\[ V_{WP} \] = standard cubic feet (L) of gas consumed by any continuously burning pilot lights, as measured in Section 3.2.1.3.

\[ t_{WP} \] = elapsed test time in hours for any continuously burning pilot lights tested, as measured in Section 3.2.1.3.

\[ H = H_t \text{ or } H_o \] heating value of the gas used in the test as specified in Section 2.2.2.2 and Section 2.2.2.3 in Btu's per standard cubic foot (kWh/L).

\[ A = 8,760, \text{ number of hours in a year.} \]

\[ B = 300, \text{ number of hours per year any continuously burning pilot lights contribute to the heating of an oven for cooking food.} \]

4.1.2.3 Annual conventional oven self-cleaning energy.

4.1.2.3.1 Annual primary energy consumption. Calculate the annual primary energy consumption for conventional oven self-cleaning operations, \( E_{SC} \), in kilowatt-hours (kWh) per year for electric ovens and in Btu's (kJ) for gas ovens, and defined as:

\[ E_{SC} = E_{Sc} \times S_p \times K, \]

for electric ovens,

where:

\[ E_{Sc} \] = energy consumption in watt-hours, as measured in Section 3.2.12.

\[ S_p = 4, \text{ average number of times a self-cleaning operation of a conventional electric oven is used per year.} \]

\[ K = 0.001 \text{ kWh/Wh conversion factor for watt-hours to kilowatt-hours.} \]

or

\[ E_{SC} = V_{Sc} \times H \times S_p \times K, \]

for gas ovens,

where:

\[ V_{Sc} = \text{gas consumption in standard cubic feet (L), as measured in Section 3.2.1.2.} \]

\[ H_t \text{ or } H_o, \text{ the heating value of the gas used in the test as specified in Section 2.2.2.2 and Section 2.2.2.3 in Btu's per standard cubic foot (kWh/L).} \]

\[ S_p = 4, \text{ average number of times a self-cleaning operation of a conventional gas oven is used per year.} \]

4.1.2.3.2 Annual secondary energy consumption for self-cleaning operation of gas ovens. Calculate the annual secondary energy consumption for self-cleaning operations of a gas oven, \( E_{SS} \), expressed in kilowatt-hours (kWh) per year and defined as:

\[ E_{SS} = E_{SS} \times S_p \times K, \]

where:

\[ E_{SS} \] = electrical energy consumed during the self-cleaning operation of a conventional gas oven, as measured in Section 3.2.1.2.

\[ S_p = 4, \text{ average number of times a self-cleaning operation of a conventional gas oven is used per year.} \]

\[ K = 0.001 \text{ kWh/Wh conversion factor for watt-hours to kilowatt-hours.} \]

4.1.2.4 Annual clock energy consumption. Calculate the annual energy consumption of any constantly operating electric clock, \( E_{CL} \), expressed in kilowatt-hours (kWh) per year and defined as:

\[ E_{CL} = P_{CL} \times A \times K, \]

where:

\[ P_{CL} = \text{power rating of clock which is on continuously, in watts, as measured in Section 3.2.1.4.} \]

\[ A = 8,760, \text{ number of hours in a year.} \]

\[ K = 0.001 \text{ kWh/Wh conversion factor for watt-hours to kilowatt-hours.} \]
4.1.2.5 Total annual energy consumption of a single conventional oven.

4.1.2.5.1 Conventional electric oven energy consumption. Calculate the total annual energy consumption of a conventional electric oven, \( E_{AO} \), expressed in kilowatt-hours (kJ) per year and defined as:

\[
E_{AO} = E_{CO} + E_{SC} + E_{CL},
\]

Where:
- \( E_{CO} \) = annual primary cooking energy consumption as determined in Section 4.1.2.1.1.
- \( E_{SC} \) = annual primary self-cleaning energy consumption as determined in Section 4.1.2.3.1.
- \( E_{CL} \) = annual clock energy consumption as determined in Section 4.1.2.4.

4.1.2.5.2 Conventional gas oven energy consumption. Calculate the total annual gas energy consumption of a conventional gas oven, \( E_{AOG} \), expressed in Btu's (kJ) per year and defined as:

\[
E_{AOG} = E_{CO} + E_{SC} + E_{PO},
\]

Where:
- \( E_{CO} \) = annual primary cooking energy consumption as determined in Section 4.1.2.1.1.
- \( E_{PO} \) = annual pilot light energy consumption as determined in Section 4.1.2.2.
- \( E_{SC} \) = annual primary self-cleaning energy consumption as determined in Section 4.1.2.3.1.

4.1.2.6.1 Conventional electric oven energy consumption. If the cooking appliance includes more than one conventional oven, calculate the total annual energy consumption of the conventional ovens using the following equations:

\[
E_{ACO} = \frac{1}{n} \sum_{i=1}^{n} (E_{CO})_i,
\]

is the average annual primary energy consumption for cooking, and where:
- \( n \) = number of conventional ovens in the basic model.
- \( E_{CO} \) = annual primary energy consumption for cooking as determined in Section 4.1.2.1.1. 

\[
E_{ASC} = \frac{1}{n} \sum_{i=1}^{n} (E_{SC})_i;
\]

average annual self-cleaning energy consumption, Where:
- \( n \) = number of self-cleaning conventional ovens in the basic model.
- \( E_{SC} \) = annual primary self-cleaning energy consumption as determined according to Section 4.1.2.3.1.
- \( E_{CL} \) = clock energy consumption as determined according to Section 4.1.2.4.

4.1.2.6.2 Conventional gas oven energy consumption. Calculate the total annual gas energy consumption, \( E_{TOG} \), in Btu's (kJ) per year and defined as:

\[
E_{TOG} = E_{ACO} + E_{ASC} + E_{TPO},
\]

Where:
- \( E_{ACO} \) = average annual primary energy consumption for cooking in Btu's (kJ) per year and is calculated as:

\[
E_{ACO} = \frac{1}{n} \sum_{i=1}^{n} (E_{CO})_i;
\]

Where:
- \( n \) = number of conventional ovens in the basic model.
- \( E_{CO} \) = annual primary energy consumption for cooking as determined in Section 4.1.2.1.1.

and,

\[
E_{ASC} = \frac{1}{n} \sum_{i=1}^{n} (E_{SC})_i;
\]

average annual self-cleaning energy consumption in Btu's (kJ) per year and is calculated as:

\[
E_{ASC} = \frac{1}{n} \sum_{i=1}^{n} (E_{SC})_i;
\]

Where:
- \( n \) = number of self-cleaning conventional ovens in the basic model.
- \( E_{SC} \) = annual primary self-cleaning energy consumption as determined according to Section 4.1.2.3.1.

4.1.2.6. Total annual energy consumption of multiple conventional ovens. If the cooking appliance includes more than one conventional oven, the total annual energy consumption of the conventional ovens using the following equations:

4.1.2.6.1 Conventional electric oven energy consumption. Calculate the total annual energy consumption, \( E_{TO} \), in kilowatt-hours (kJ) per year and defined as:

\[
E_{TO} = E_{ACO} + E_{ASC} + E_{CL},
\]

Where:

\[
E_{ACO} = \frac{1}{n} \sum_{i=1}^{n} (E_{CO})_i,
\]

total energy consumption of any pilot lights.
Where:

\[ E_{\text{PO}} = \text{annual energy consumption of any continuously burning pilot lights determined according to Section 4.1.2.2.} \]

\( n = \text{number of pilot lights in the basic model.} \)

If the oven also uses electrical energy, calculate the total annual electrical energy consumption, \( E_{\text{TOE}} \), in kilowatt-hours (kJ) per year and defined as:

\[ E_{\text{TOE}} = E_{\text{ASO}} + E_{\text{AAS}} + E_{\text{CL}}, \]

Where:

\[ E_{\text{ASO}} = \frac{1}{n} \sum_{i=1}^{n} (E_{\text{SO}})_i, \]

is the average annual secondary energy consumption for cooking.

\( n = \text{number of conventional ovens in the basic model.} \)

\[ E_{\text{SO}} = \text{annual secondary energy consumption for cooking of gas ovens as determined in Section 4.1.2.1.2.} \]

\[ E_{\text{AAS}} = \frac{1}{n} \sum_{i=1}^{n} (E_{\text{SS}})_i, \]

is the average annual secondary self-cleaning energy consumption.

\( n = \text{number of self-cleaning ovens in the basic model.} \)

\[ E_{\text{SS}} = \text{annual secondary self-cleaning energy consumption of gas ovens as determined in Section 4.1.2.3.2.} \]

\[ E_{\text{CL}} = \text{annual clock energy consumption as determined in Section 4.1.2.4.} \]

4.1.3 Conventional oven cooking efficiency.

4.1.3.1 Single conventional oven.

Calculate the conventional oven cooking efficiency, \( E_{\text{AO}} \), using the following equations:

\[ \text{For electric ovens:} \quad \text{Eff}_{\text{AO}} = \frac{W_{i} \times C_{p} \times T_{S}}{E_{O} \times K_{e}}, \]

and,

\[ \text{For gas ovens:} \quad \text{Eff}_{\text{AO}} = \frac{W_{i} \times C_{p} \times T_{S}}{E_{0} + (E_{\text{AOE}} \times K_{e})}, \]

Where:

\( W_{i} = \text{measured weight of test block in pounds (kg).} \)

\( C_{p} \approx 0.23 \text{ Btu/lb}^{-\circ} \text{F} \) (0.96 kJ/kg·°C), specific heat of test block.

\( T_{S} = 234 \text{ °F} \) (130 °C), temperature rise of test block.

\( E_{\text{PO}} \), test energy consumption as measured in Section 3.2.1 or calculated in Section 4.1.1 or Section 4.1.1.1.

\( K_{e} = 3.412 \text{ Btu/Wh} \) (3.6 kJ/Wh), conversion factor for watt-hours to Btu's.

\( E_{\text{AOE}} \), total annual electrical energy consumption as determined in Section 4.1.2.5.2.

\( K_{e} = 3.412 \text{ Btu/kWh} \) (3.600 kJ/kWh), conversion factor for kilowatt-hours to Btu's.

4.1.4 Conventional oven energy factor.

Calculate the energy factor, or the ratio of useful cooking energy output to the total energy input, \( R_{O} \), using the following equations:

\[ \text{For electric ovens,} \quad R_{O} = \frac{O_{O} \times (E_{\text{AO}} \times K_{e})}{E_{\text{TOE}}}, \]

Where:

\( O_{O} = 29.3 \text{ kWh} \) (105,480 kJ), annual useful cooking energy output.

\( E_{\text{AOE}} \), total annual energy consumption for electric ovens as determined in Section 4.1.2.5.2.

\[ \text{For gas ovens:} \quad R_{O} = \frac{O_{O}}{E_{\text{AOE}} \times K_{e}}, \]

Where:

\( O_{O} = 88.8 \text{ kBtu} \) (93,684 kJ), annual useful cooking energy output.

\( E_{\text{AOG}} \), total annual gas energy consumption for conventional gas ovens as determined in Section 4.1.2.5.2.

\( K_{e} = 3.412 \text{ Btu/kWh} \) (3.600 kJ/kWh), conversion factor for kilowatt-hours to Btu's.

4.2 Conventional cooking top

4.2.1 Conventional cooking top cooking efficiency

4.2.1.1 Electric surface unit cooking efficiency. Calculate the cooking efficiency,
10 CFR Ch. II (1–1–08 Edition)

Pt. 430, Subpt. B, App. I

$\text{Eff}_{SU}$, of the electric surface unit under test, defined as:

$$\text{Eff}_{SU} = \frac{W \times C_p \times \left( \frac{T_{SU}}{K_p \times E_{CT}} \right)}{E}$$

Where:
- $W$ = measured weight of test block, $W_3$ or $W_1$, expressed in pounds (kg).
- $C_p$ = 0.23 Btu/lb·°F (0.96 kJ/kg·°C), specific heat of test block.
- $T_{SU}$ = temperature rise of the test block: final test block temperature, $T_f$, as determined in Section 3.2.2, minus the initial test block temperature, $T_i$, expressed in °F (°C) as determined in Section 2.7.5.
- $K_p$ = 3.412 Btu/Wh (3.6 kJ/Wh), conversion factor of watt-hours to Btu's.
- $E_{CT}$ = measured energy consumption, as determined according to Section 3.2.2, expressed in watt-hours (kJ).

The energy consumed by a continuously operating clock that cannot be disconnected during the cooktop test may be subtracted from the energy consumption, $E_{CT}$, as determined in Section 3.2.2.

4.2.1.2 Gas surface unit cooking efficiency. Calculate the cooking efficiency, $\text{Eff}_{SU}$, of the gas surface unit under test, defined as:

$$\text{Eff}_{SU} = \frac{W_3 \times C_p \times T_{SU}}{E}$$

Where:
- $W_3$ = measured weight of test block as measured in Section 3.3.2, expressed in pounds (kg).
- $C_p$ and $T_{SU}$ are the same as defined in Section 4.2.1.1.

and,

$$E = [V_{CT} - V_{CP} \times H] + (E_{PC} \times K_p).$$

Where:
- $V_{CT}$ = total gas consumption in standard cubic feet (L) for the gas surface unit test as measured in Section 3.2.2.
- $E_{PC}$ = electrical energy consumed in watt-hours (kJ) by an ignition device of a gas surface unit as measured in Section 3.2.2.

4.2.1.3 Conventional cooking top cooking efficiency. Calculate the conventional cooking top efficiency, $\text{Eff}_{CT}$, using the following equation:

$$\text{Eff}_{CT} = \frac{1}{n} \sum_{i=1}^{n} \left( \text{Eff}_{SU} \right)_{i},$$

Where:
- $n$ = number of surface units in the cooking top.
- $\text{Eff}_{SU}$ = the efficiency of each of the surface units, as determined according to Section 4.2.1.3.

4.2.2 Conventional gas cooking top annual energy consumption.

4.2.2.1 Conventional electric cooking top energy consumption. Calculate the annual energy consumption of an electric cooking top, $E_{CA}$, in kilowatt-hours (kJ) per year, defined as:

$$E_{CA} = \frac{O_{CT}}{\text{Eff}_{CT}}.$$
Calculate the microwave oven test energy component.

The annual useful cooking energy output is as determined according to Section 4.2.2.2.3. The average of the two or three \(P_T\)'s is used for a calculation in section 4.4.3.

For an electric cooking top, the energy factor is the same as the cooking efficiency as determined according to Section 4.2.1.3.

For gas cooking tops,

\[
R_{CT} = \frac{O_{CT}}{E_{CA}}
\]

Where:

\(O_{CT}\)= annual useful cooking energy output of cooking top.

\(E_{CA}\)= total annual energy consumption of cooking top determined according to Section 4.2.2.2.3.

4.3 Combined components. The annual energy consumption of a kitchen range, e.g., a cooktop and oven combined, shall be the sum of the annual energy consumption of each of its components. The annual energy consumption for other combinations of ovens, cooktops and microwaves will also be treated as the sum of the annual energy consumption of each of its components. The energy factor of a combined component is the sum of the annual useful cooking energy output of each component divided by the sum of the total annual energy consumption of each component.

4.4 Microwave oven.

4.4.1 Microwave oven test energy output. Calculate the microwave oven test energy output, \(E_T\), in watt-hour's (kJ). The calculation is repeated two or three times as required in section 3.2.3. The average of the \(E_T\)'s is used for a calculation in section 4.4.3. For calculations specified in units of energy (watt-hours (kJ)), use the equation below:

\[
E_T = \frac{C_p M_W (T_2 - T_1) + C_C M_C (T_2 - T_0)}{K_e}
\]

Where:

\(M_W\)= the measured mass of the test water load, in pounds (g).

\(M_C\)= the measured mass of the test container before filling with test water load, in pounds (g).

\(T_1\)= the initial test water load temperature, in °F (°C).

\(T_2\)= the final test water load temperature, in °F (°C).

\(T_0\)= the measured ambient room temperature, in °F (°C).

\(C_w\)= 0.210 Btu/lb-°F (0.88 kJ/kg · °C), specific heat of test container.

\(C_w\)= 1.0 Btu/lb-°F (4.187 kJ/kg · °C), specific heat of water.

\(K_e\)= 3.412 Btu/kWh (3,600 kJ/kWh) conversion factor of kilowatt-hours to Btu’s.

4.4.2 Microwave oven test power output. Calculate the microwave oven test power output, \(P_T\), in watts (J/s) as specified in Section four, paragraph 12.5 of IEC 705 Amendment 2 See Section 430.22. The calculation is repeated for each test as required in section 3.2.3. The average of the two or three \(P_T\)'s is used for calculations in section 4.4.4. (See 10 CFR 430.22)

4.4.3 Microwave oven annual energy consumption. Calculate the microwave oven annual energy consumption, \(E_{MO}\), in KWh’s per year, defined as:

\[
E_{MO} = \frac{E_M \times O_M}{E_T}
\]

Where:

\(E_M\)= the energy consumption as defined in Section 3.2.3.

\(O_M\)= 79.8 kWh (287,280 kJ) per year, the microwave oven annual useful cooking energy output.

\(E_T\)= the test energy as calculated in Section 4.4.1.

4.4.4 Microwave oven cooking efficiency. Calculate the microwave oven cooking efficiency, \(Eff_{MO}\), as specified in Section four, paragraph 14 of IEC 705.

4.4.5 Microwave oven energy factor. Calculate the energy factor or the ratio of the useful cooking energy output to total energy input on a yearly basis, \(R_{MO}\), defined as:

\[
R_{MO} = \frac{O_M}{E_{MO}}
\]

Where:

\(O_M\)= 79.8 kWh (287,280 kJ) per year, annual useful cooking energy output.
Appendix J to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of Automatic and Semi-Automatic Clothes Washers

The provisions of this Appendix J shall apply to products manufactured after April 13, 2001. The procedures and calculations in sections 3.3, 4.3, and 4.4 of this Appendix need not be performed to determine compliance with the energy conservation standards for clothes washers.

1. Definitions

1.1 Adaptive control system means a clothes washer control system, other than an adaptive water fill control system, which is capable of automatically adjusting washer operation or washing conditions based on characteristics of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions. The automatic adjustments may, for example, include automatic selection, modification, or control of any of the following: wash water temperature, agitation or tumble cycle time, number of rinse cycles, and spin speed. The characteristics of the clothes load, which could trigger such adjustments, could, for example, consist of or be indicated by the presence of either soil, soap, suds, or any other additive laundering substitute or complementary product.

NOTE: Appendix J does not provide a means for determining the energy consumption of a clothes washer with an adaptive control system. Therefore, pursuant to 10 CFR 430.27, a waiver must be obtained to establish an acceptable test procedure for such clothes washer.

1.2 Adaptive water fill control system means a clothes washer water fill control system which is capable of automatically adjusting the water fill level based on the size or weight of the clothes load placed in the clothes container, without allowing or requiring consumer intervention and/or actions.

1.3 Bone-dry means a condition of a load of test cloth which has been dried in a dryer at maximum temperature for a minimum of 10 minutes, removed and weighed before cool down, and then dried again for 10-minute periods until the final weight change of the load is 1 percent or less.

1.4 Clothes container means the compartment within the clothes washer that holds the clothes during operation of the machine.

1.5 Compact means a clothes washer which has a clothes container capacity of less than 1.6 ft³ (45 L).

1.6 Deep rinse cycle means a rinse cycle in which the clothes container is filled with water to a selected level and the clothes load is rinsed by agitating it or tumbling it through the water.

1.7 Front-loader clothes washer means a clothes washer which sequentially rotates or tumbles portions of the clothes load above the water level allowing the clothes load to fall freely back into the water. The principal axis of the clothes container is in a horizontal plane and the access to the clothes container is through the front of the machine.

1.8 Lockout means that at least one wash/rinse water temperature combination is not available in the normal cycle that is available in another cycle on the machine.

1.9 Make-up water means the amount of fresh water needed to supplement the amount of stored water pumped from the external laundry tub back into the clothes washer when the suds-return feature is activated in order to achieve the required water fill level in the clothes washer.

1.10 Modified energy factor means the quotient of the cubic foot (or liter) capacity of the clothes container divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load.

1.11 Most energy intensive cycle means the non-normal cycle that uses the most energy for a given wash/rinse temperature combination.

1.12 Non-normal cycle means a cycle other than the normal cycle, but does not include any manually selected pre-wash, pre-soak, and extra-rinse option.

1.13 Nonwater-heating clothes washer means a clothes washer which does not have an internal water heating device to generate hot water.

1.14 Normal cycle means the cycle recommended by the manufacturer for washing cotton and/or linen clothes.

1.15 Sensor filled means a water fill control which automatically terminates the fill when the water reaches an appropriate level in the tub.

1.16 Spray rinse cycle means a rinse cycle in which water is sprayed onto the clothes load for a definite period of time without maintaining any specific water level in the clothes container.

1.17 Standard means a clothes washer which has a clothes container capacity of 1.6 ft³ (45 L) or greater.

1.18 Suds-return means a feature or option on a clothes washer which causes the stored
wash water obtained by utilizing the suds-saver feature to be pumped from the external laundry tub back into the clothes washer.

1.19 Suds-saver means a feature or option on a clothes washer which allows the user to store used wash water in an external laundry tub for use with subsequent wash loads.

1.20 Temperature use factor means the percentage of the total number of washes a user would wash with a particular wash/rinse temperature setting.

1.21 Thermostatically controlled water valves means clothes washer controls that have the ability to sense and adjust the hot and cold supply water.

1.22 Time filled means a water fill control which uses a combination of water flow controls in conjunction with time to terminate the water fill cycle.

1.23 Top-loader-horizontal-axis clothes washer means a clothes washer which: rotates or tumblers portions of the clothes load above the water level allowing the clothes load to fall freely back into the water with the principal axis in a horizontal plane and has access to the clothes container through the top of the clothes washer.

1.24 Top-loader-vertical-axis clothes washer means a clothes washer that: flexes and oscillates the submerged clothes load through the water by means of mechanical agitation or other movement; has a clothes container with the principal axis in a vertical plane; and has access to the clothes container through the top of the clothes washer.

1.25 Water consumption factor means the quotient of the total weighted per-cycle water consumption divided by the capacity of the clothes washer.

1.26 Water-heating clothes washer means a clothes washer where some or all of the hot water for clothes washing is generated by a water heating device internal to the clothes washer.

2. Testing Conditions

2.1 Installation. Install the clothes washer in accordance with manufacturer’s instructions.

2.2 Electrical energy supply. Maintain the electrical support at the clothes washer terminal block within 2 percent of 120/240 or 120/208Y volts as applicable to the particular terminal block wiring system as specified by the manufacturer. If the clothes washer has a dual voltage conversion capability, conduct the test at the highest voltage specified by the manufacturer.

2.3 Supply water. For nonwater-heating clothes washers not equipped with thermostatically controlled water valves, the temperature of the hot and cold water supply shall be maintained at 100 °F ± 5 °F (60.0 °C ± 2.8 °C) and the cold water supply shall be maintained at 60 °F ± 5 °F (60.0 °C ± 2.8 °C). For water-heating clothes washers, the temperature of the hot water supply shall be maintained at 140 °F ± 5 °F (60.0 °C ± 2.8 °C) and the cold water supply shall not exceed 60 °F (15.6 °C). Water meters shall be installed in both the hot and cold water lines to measure water consumption.

2.3.1 Supply water requirements for water and energy consumption testing. For nonwater-heating clothes washers not equipped with thermostatically controlled water valves, the temperature of the hot and cold water supply shall be maintained at 100 °F ± 10 °F (37.8 °C ± 5.5 °C). For nonwater-heating clothes washers equipped with thermostatically controlled water valves, the temperature of the hot water supply shall be maintained at 140 °F ± 5 °F (60.0 °C ± 2.8 °C) and the cold water supply shall be maintained at 60 °F ± 5 °F (15.6 °C). Water meters shall be installed in both the hot and cold water lines to measure water consumption.

2.3.2 Supply water requirements for remaining moisture content testing. For nonwater-heating clothes washers not equipped with thermostatically controlled water valves, the temperature of the hot water supply shall be maintained at 140 °F ± 5 °F (60.0 °C ± 2.8 °C) and the cold water supply shall be maintained at 60 °F ± 5 °F. All other clothes washers shall be connected to water supply temperatures as stated in 2.3.1 of this appendix.

2.4 Water pressure. The static water pressure at the hot and cold water inlet connections of the machine shall be maintained during the test at 35 pounds per square inch gauge (psig) ± 2.5 psig (241.3 kPa ± 17.2 kPa). Water pressure gauges shall be installed in both the hot and cold water lines to measure water pressure.

2.5 Instrumentation. Perform all test measurements using the following instruments, as appropriate:

2.5.1 Weighing scales.

2.5.1.1 Weighing scale for test cloth. The scale shall have a resolution no larger than 0.2 oz (5.7 g) and a maximum error no greater than 0.3 percent of the measured value.

2.5.1.2 Weighing scale for clothes container capacity measurements. The scale should have a resolution no larger than 0.50 lbs (0.23 kg) and a maximum error no greater than 0.5 percent of the measured value.

2.5.2 Watt-hour meter. The watt-hour meter shall have a resolution no larger than 1 Wh (3.6 kJ) and a maximum error no greater than 2 percent of the measured value for any demand greater than 50 Wh (180.0 kJ).
2.5.3 Temperature measuring device. The device shall have an error no greater than ±1 °F (±0.6 °C) over the range being measured.

2.5.4 Water meter. The water meter shall have a resolution no larger than 0.1 gallons (0.4 liters) and a maximum error no greater than 2 percent for all water flow rates from 1 gal/min (3.8 L/min) to 5 gal/min (18.9 L/min).

2.5.5 Water pressure gauge. The water pressure gauge shall have a resolution no larger than 1 psig (6.9 kPa) and shall have an error no greater than 5 percent of any measured value over the range of 32.5 psig (224.1 kPa) to 37.5 psig (258.6 kPa).

2.5.6 Water meter. The water meter shall have a resolution no larger than 0.1 gallons (0.4 liters) to 5 gallons (18.9 L/min) and shall have an error no greater than 5 percent of any measured value over the range of 32.5 psig (224.1 kPa) to 37.5 psig (258.6 kPa).

2.6 Test cloths.

2.6.1 Energy test cloth. The energy test cloth shall be clean and consist of the following:

2.6.1.1 Pure finished bleached cloth, made with a momie or granite weave, which is 50 percent cotton and 50 percent polyester and weighs 5.75 oz/yd² (195.0 g/m²) and has 65 ends per inch on the warp and 57 picks on the fill.

2.6.1.2 Cloth material that is 24 in by 36 in (61.0 cm by 91.4 cm) and has been hemmed to 22 in by 34 in (55.9 cm by 86.4 cm) before washing. The maximum shrinkage after five washes shall not be more than four percent on the length and width.

2.6.1.3 The number of test runs on the same energy test cloth shall not exceed 60 test runs. All energy test cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washers.

2.6.2 Energy Stuffer Cloth. The energy stuffer cloth material shall be made from energy test cloth material and shall consist of pieces of material that are 12 inches by 12 inches (30.5 cm by 30.5 cm) and have been hemmed to 10 inches by 10 inches (25.4 cm by 25.4 cm) before washing. The maximum shrinkage after five washes shall not be more than four percent on the length and width. The number of test runs on the same energy stuffer cloth shall not exceed 60 test runs. All energy stuffer cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washers.

2.7 Composition of test loads.

2.7.1 Seven pound test load. The seven pound test load shall consist of bone-dry energy test cloths which weigh 7 lbs ±0.07 lbs (3.18 kg ±0.03 kg). Adjustments to the test load to achieve the proper weight can be made by the use of energy stuffer cloths.

2.7.2 Three pound test load. The three pound test load shall consist of bone-dry energy test cloths which weigh 3 lbs ±0.03 lbs (1.36 kg ±0.014 kg). Adjustments to the test load to achieve the proper weight can be made by the use of energy stuffer cloths.

2.8 Use of test loads.

2.8.1 For a standard size clothes washer, a seven pound load, as described in section 2.7.1, shall be used to test the maximum water fill and a three pound test load, as described in section 2.7.2, shall be used to test the minimum water fill.

2.8.2 For a compact size clothes washer, a three pound test load as described in section 2.7.2 shall be used to test the maximum and minimum water fill levels.

2.8.3 A vertical-axis clothes washer without adaptive water fill control system also shall be tested without a test load for purposes of calculating the energy factor.

2.8.4 The test load sizes to be used to measure remaining moisture content (RMC) are specified in section 3.3.2.

2.8.5 Load the energy test cloths by grasping them in the center, shaking them to hang loosely and then dropping them into the clothes container prior to activating the clothes washer.

2.9 Preconditioning. If the clothes washer has not been filled with water in the preceding 96 hours, pre-condition it by running it through a cold rinse cycle and then draining it to ensure that the hose, pump, and sump are filled with water.

2.10 Wash time (period of agitation or tumble) setting. If the maximum available wash time in the normal cycle is greater than 9.75 minutes, the wash time shall be not less than 9.75 minutes. If the maximum available wash time in the normal cycle is less than 9.75 minutes, the wash time shall be the maximum available wash time.

2.11 Agitation speed and spin speed settings. Where controls are provided for agitation speed and spin speed selections, set them as follows:

2.11.1 For energy and water consumption tests, set at the normal cycle settings. If settings at the normal cycle are not offered, set the control settings to the maximum speed permitted on the clothes washer.

2.11.2 For remaining moisture content tests, see section 3.3.

3. Test Measurements

3.1 Clothes container capacity. Measure the entire volume which a dry clothes load could occupy within the clothes container during washer operation according to sections 3.1.1 through 3.1.5.

3.1.1 Place the clothes washer in such a position that the uppermost edge of the clothes container opening is leveled horizontally, so that the container will hold the maximum amount of water.

3.1.2 Line the inside of the clothes container with 2 mil (0.051 mm) plastic sheet. All clothes washer components which occupy space within the clothes container and which are recommended for use with the energy test cycle shall be in place and shall be lined with 2 mil (0.051 mm) plastic sheet to prevent water from entering any void space.

3.1.3 Record the total weight of the machine before adding water.
3.1.4 Fill the clothes container manually with either 60 °F ±5 °F (15.6 °C ±2.8 °C) or 100 °F ±10 °F (37.8 °C ±5.5 °C) water to its uppermost edge. Measure and record the weight of water, W, in pounds.

3.1.5 The clothes container capacity is calculated as follows:

\[ C = \frac{W}{d} \]

where:

- \( C \) = Capacity in cubic feet (or liters).
- \( W \) = Mass of water in pounds (or kilograms).
- \( d \) = Density of water (62.0 lbs/ft³ for 100 °F (37.8 °C) or 62.3 lbs/ft³ for 60 °F (15.6 °C)).

3.2 Test cycle. Establish the test conditions set forth in section 2 of this Appendix.

3.2.1 A clothes washer that has infinite temperature selections shall be tested at the following temperature settings: hottest setting available on the machine, hot (a minimum of 140 °F (60.0 °C) and a maximum of 145 °F (62.8 °C)), warm (a minimum of 100 °F (37.8 °C) and a maximum of 105 °F (40.6 °C)), and coldest setting available on the machine. These temperatures must be confirmed by measurement using a temperature measuring device. If the measured final water temperature is not within the specified range, stop testing, adjust the temperature selector accordingly, and repeat the procedure.

3.2.2 Clothes washers with adaptive water fill control system and/or unique temperature selections.

3.2.2.1 Clothes washers with adaptive water fill control system. When testing a clothes washer that has adaptive water fill control, the maximum and the minimum test loads as specified in 2.8.1 and 2.8.2 shall be used. The amount of water fill shall be determined by the control system. If the clothes washer provides consumer selection of variable water fill amounts for the adaptive water fill control system, two complete sets of tests shall be conducted. The first set of tests shall be conducted with the adaptive water fill control system set in the setting that will use the greatest amount of energy. The second set of tests shall be conducted with the adaptive water fill control system set in the setting that will use the smallest amount of energy. Then, the results from these two tests shall be averaged to determine the adaptive water fill energy consumption value. If a clothes washer with an adaptive water fill control system allows consumer selection of manual controls as an alternative, both the manual and adaptive modes shall be tested and the energy consumption values, \( E_m \), \( E_a \), and \( D_a \) (if desired), calculated in section 4 for each mode, shall be averaged between the manual and adaptive modes.

3.2.2.2 Clothes washers with multiple warm wash temperature combination selections.

3.2.2.2.1 If a clothes washer’s temperature combination selections are such that the temperature of each warm wash setting that is above the mean warm wash temperature (the mean temperature of the coldest and warmest warm settings) is matched by a warm wash setting that is an equal distance below the mean, then the energy test shall be conducted at the mean warm wash temperature if such a selection is provided, or if there is no position on the control that permits selection of the mean temperature, the energy test shall be conducted with the temperature selection set at the next hotter temperature setting that is available above the mean.

3.2.2.2.2 If the multiple warm wash temperature combination selections do not meet criteria in section 3.2.2.2.1, the energy test shall be conducted with the temperature selection set at the warm wash temperature setting that gives the next higher water temperature than the mean temperature of the coldest and warmest warm settings.

3.2.3 Clothes washers with multiple temperature settings within a temperature combination selection. When a clothes washer is provided with a secondary control that can modify the wash or rinse temperature within a temperature combination selection, the secondary control shall be set to provide the hottest rinse temperature available and the hottest wash temperature available. For instance, when the temperature combination selection is set for the middle warm wash temperature and a secondary control exists which allows this temperature to be increased or decreased, the secondary control shall be set to provide the hottest warm wash temperature available for the middle warm wash setting.

3.2.3 Clothes washers that do not lockout any wash/rinse temperature combinations in the normal cycle. Test in the normal cycle all temperature combination selections that are required to be tested.

3.2.3.1 Hot water consumption, cold water consumption, and electrical energy consumption at maximum fill. Set the water level selector at maximum fill available on the clothes washer, if manually controlled, and insert the appropriate test load, if applicable. Activate the normal cycle of the clothes washer and also any suds-saver switch.

3.2.3.1.1 For automatic clothes washers, set the wash/rinse temperature selector to the hottest temperature combination setting. For semi-automatic clothes washers, open the hot water faucet valve completely and close the cold water faucet valve completely to achieve the hottest temperature combination setting.

3.2.3.1.2 Measure the electrical energy consumption of the clothes washer for the complete cycle.
3.2.3.1.3 Measure the respective number of gallons (or liters) of hot and cold water used to fill the tub for the wash cycle.
3.2.3.1.4 Measure the respective number of gallons (or liters) of hot and cold water used for all deep rinse cycles.
3.2.3.1.5 Measure the respective gallons (or liters) of hot and cold water used for all spray rinse cycles.
3.2.3.1.6 For non-water-heating automatic clothes washers repeat sections 3.2.3.1.3 through 3.2.3.1.5 for each of the other wash/rinse temperature selections available that uses heated water and is required to be tested. For water-heating clothes washers, repeat sections 3.2.3.1.2 through 3.2.3.1.5 for each of the other wash/rinse temperature selections available that uses heated water and is required to be tested. (When calculating water consumption under section 4.3 for any machine covered by the previous two sentences, also test the cold wash/cold rinse selection.) For semi-automatic clothes washers, repeat sections 3.2.3.1.3 through 3.2.3.1.5 for the other wash/rinse temperature settings in section 6 with the following water fill adjustments:

<table>
<thead>
<tr>
<th>Faucet position</th>
<th>Hot valve</th>
<th>Cold valve</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot</td>
<td>Completely open</td>
<td>Com- pletely open</td>
</tr>
<tr>
<td>Warm</td>
<td>Completely open</td>
<td>Com- pletely open</td>
</tr>
<tr>
<td>Cold</td>
<td>Closed</td>
<td>Com- pletely open</td>
</tr>
</tbody>
</table>

3.2.3.1.7 If the clothes washer is equipped with a suds-saver cycle, repeat sections 3.2.3.1.2 to 3.2.3.1.5 with suds-saver switch set to suds return for the Warm/Cold temperature setting.
3.2.3.2 Hot water consumption, cold water consumption, and electrical energy consumption with the water level selector at minimum fill. Set the water level selector at minimum fill, if manually controlled, and insert the appropriate test load, if applicable. Activate the normal cycle of the clothes washer and also any suds-saver switch. Repeat sections 3.2.3.1.1 through 3.2.3.1.7.
3.2.3.3 Hot and cold water consumption for clothes washers that incorporate a partial fill during the rinse cycle. For clothes washers that incorporate a partial fill during the rinse cycle, activate any suds-saver switch and operate the clothes washer for the complete normal cycle at both the maximum water fill level and the minimum water fill level for each of the wash/rinse temperature selections available. Measure the respective hot and cold water consumed during the complete normal cycle.

3.2.4 Clothes washers that lockout any wash/rinse temperature combinations in the normal cycle. In addition to the normal cycle tests in section 3.2.3, perform the following tests on non-normal cycles for each wash/rinse temperature combination selection that is locked out in the normal cycle.
3.2.4.1 Set the cycle selector to a non-normal cycle which has the wash/rinse temperature combination selection that is locked out. Set the water level selector at maximum fill and insert the appropriate test load, if applicable. Activate the cycle of the clothes washer and any suds-saver switch. Set the wash/rinse temperature selector to the temperature combination setting that is locked out in the normal cycle and repeat sections 3.2.3.1.2 through 3.2.3.1.5.
3.2.4.2 Repeat section 3.2.4.1 under the same temperature combination setting for all other untested non-normal cycles on the machine that have the wash/rinse temperature combination selection that is locked out.
3.2.4.3 Total the measured hot water consumption of the wash, deep rinse, and spray rinse of each non-normal cycle tested in sections 3.2.4.1 through 3.2.4.2 and compare the total for each cycle. The cycle that has the highest hot water consumption shall be the most energy intensive cycle for that particular wash/rinse temperature combination setting.
3.2.4.4 Set the water level selector at minimum fill and insert the appropriate test load, if applicable. Activate the most energy intensive cycle, as determined in section 3.2.4.3, of the clothes washer and also any suds-saver switch. Repeat tests as described in section 3.2.4.1.

3.3 Remaining Moisture Content (RMC).
3.3.1 The wash temperature shall be the same as the rinse temperature for all testing. Cold rinse is the coldest rinse temperature available on the machine. Warm rinse is the hottest rinse temperature available on the machine.
3.3.2 Determine the test load as shown in the following table:

<table>
<thead>
<tr>

Notes:
1. All test load weights are bone dry weights.
2. Allowable tolerance on the test load weights are ±0.10 lbs (0.05 kg).

3.3.3 For clothes washers with cold rinse only.
- 3.3.3.1 Record the actual bone dry weight of the test load (Wl), then place the test load in the clothes washer.
- 3.3.3.2 Set water level selector to maximum fill.
- 3.3.3.3 Run the normal cycle.
- 3.3.3.4 Record the weight of the test load immediately after completion of the normal cycle (WC).
- 3.3.3.5 Calculate the remaining moisture content of the test load, RMC, expressed as a percentage and defined as:

\[ RMC = \frac{(WC - Wl)}{Wl} \times 100\% \]

3.3.4 For clothes washers with cold and warm rinse options.
- 3.3.4.1 Complete steps 3.3.3.1 through 3.3.3.4 for the cold rinse. Calculate the remaining moisture content of the test load for cold rinse, RMC\_COLD, expressed as a percentage and defined as:

\[ RMC_{COLD} = \frac{(WC - Wl)}{Wl} \times 100\% \]

- 3.3.4.2 Complete steps 3.3.3.1 through 3.3.3.4 for the warm rinse. Calculate the remaining moisture content of the test load for warm rinse, RMC\_WARM, expressed as a percentage and defined as:

\[ RMC_{WARM} = \frac{(WC - Wl)}{Wl} \times 100\% \]

- 3.3.4.3 Calculate the remaining moisture content of the test load, RMC, expressed as a percentage and defined as:

\[ RMC = 0.73 \times RMC_{COLD} + 0.27 \times RMC_{WARM} \]

3.3.5 Clothes washers which have options that result in different RMC values, such as multiple selection of spin speeds or spin times that are available in the normal cycle, shall be tested at the maximum and minimum settings of the available options, excluding any "no spin" (zero spin speed) settings, in accordance with requirements in 3.3.3 or 3.3.4. The calculated RMC\_MAX, and RMC\_MIN, at the maximum and minimum settings, respectively, shall be combined as follows and the final RMC to be used in section 3.2 shall be:

\[ RMC = 0.75 \times RMC_{MAX} + 0.25 \times RMC_{MIN} \]

3.4 Data recording. Record for each test cycle in sections 3.2.1 through 3.3.5:
- 3.4.1 For non-water-heating clothes washers, record the kilowatt-hours of electrical energy, EH, consumed during the test to operate the clothes washer in section 3.2.3. For water-heating clothes washers record the kilowatt-hours of electrical energy, EH, consumed at maximum fill in sections 3.2.3.1 and 3.2.3.6, and EH, consumed at minimum fill in section 3.2.3.2.
- 3.4.2 Record the individual gallons (or liters) of hot and cold water consumption, VH and VC, measured at maximum fill level for each wash/rinse temperature combination setting tested in section 3.2.3, or in both 3.2.3 and 3.2.4, excluding any fresh make-up water required to complete the fill during a suds return cycle.
- 3.4.3 Record the individual gallons (or liters) of hot and cold water consumption, VH and VC, measured at minimum fill level for each wash/rinse temperature combination setting tested in section 3.2.3, or in both 3.2.3 and 3.2.4, excluding any fresh make-up water required to complete the fill during a suds return cycle.
- 3.4.4 Record the individual gallons (or liters) of hot and cold water, SH\_H and SC\_H, measured at maximum fill for the suds return cycle.
- 3.4.5 Record the individual gallons (or liters) of hot and cold water, SH\_C and SC\_C, measured at minimum fill for the suds return cycle.
- 3.4.6 Data recording requirements for RMC tests are listed in sections 3.3.3 through 3.3.5.

4. Calculation of Derived Results From Test Measurements:
- 4.1 Energy consumption.
  - 4.1.1 Per-cycle temperature-weighted hot water consumption for maximum and minimum water fill levels. Calculate for the cycle under test the per-cycle temperature weighted hot water consumption for the maximum water fill level, Vh\_MAX, and for the minimum water fill level, Vh\_MIN, expressed in gallons per cycle (or liters per cycle) and defined as:
where:

\[ \text{Vh}_{\text{max}} = \sum_{j=1}^{n} \left( (\text{Vh}_j \times L) \times \text{TUF}_j \right) \times X_1 \left[ \text{TUF}_W \times \text{Sh}_H \right] \]

\[ \text{Vh}_{\text{min}} = \sum_{j=1}^{n} \left( (\text{Vh}_j \times L) \times \text{TUF}_j \right) \times X_2 \left[ \text{TUF}_W \times \text{Sh}_L \right] \]

\( \text{Vh} \) = reported hot water consumption in gallons per cycle (or liters per cycle) at maximum fill for each wash/rinse temperature combination setting, as provided in section 3.4.3. If a clothes washer is equipped with two or more different wash/rinse temperature selections that have the same basic temperature combination selection label (for example, one of them has its water temperature controlled by thermostatically controlled valves and the other one does not), then the largest \( \text{Vh} \).’s for wash/rinse temperature combination settings in the most energy intensive cycle.

\( \text{Vh} \) = reported hot water consumption in gallons per cycle (or liters per cycle) at minimum fill for each wash/rinse temperature combination setting, as provided in section 3.4.3. If a clothes washer is equipped with two or more different wash/rinse temperature selections that have the same basic temperature combination selection label (for example, one of them has its water temperature controlled by thermostatically controlled valves and the other one does not), then the largest \( \text{Vh} \).’s for wash/rinse temperature combination settings in the most energy intensive cycle.

\( n \) = the number of wash/rinse temperature combination settings on the washers plus the number of wash/rinse temperature combination settings that lockout the temperature selections in the normal cycle.

\( \text{TUF} \) = temperature use factor for warm wash setting.

\( \text{Sh}_H \) = fresh hot make-up water measured during suds-return cycle at maximum water fill level.

\( \text{Sh}_L \) = fresh hot make-up water measured during suds-return cycle at minimum water fill level.

4.1.2 Total per-cycle hot water energy consumption for maximum and minimum water fill levels. Calculate the total per-cycle hot water energy consumption for the maximum water fill level, \( E_{\text{max}} \), and for the minimum water fill level, \( E_{\text{min}} \), expressed in kilowatt-hours per cycle and defined as:

\[ E_{\text{max}} = \text{Vh}_{\text{max}} \times T \times K \times M \]

\[ E_{\text{min}} = \text{Vh}_{\text{min}} \times T \times K \times M \]

where:

\( T \) = temperature rise=90°F (50°C).

\( K \) = water specific heat=0.00240 kWh/(gal–°F).

\( M \) = multiplying factor to account for absence of test load=0.94 for top-loader vertical axis clothes washers that are sensor filled, 1.0 for all other clothes washers.

4.1.3 Total weighted per-cycle hot water energy consumption expressed in kilowatt-hours. Calculate the total weighted per cycle hot water energy consumption, \( E_w \), expressed in kilowatt-hours per cycle and defined as:

\[ E_w = (E_{\text{max}} \times F_{\text{max}}) + (E_{\text{min}} \times F_{\text{min}}) \]

where:

\( F \) = frequency of use with the suds-saver feature.

\( E_{\text{max}} \times F_{\text{max}} \) = weighted per-cycle hot water energy consumption for the maximum water fill level.

\( E_{\text{min}} \times F_{\text{min}} \) = weighted per-cycle hot water energy consumption for the minimum water fill level.
4.1.4 Per-cycle water energy consumption using gas-heated or oil-heated water. Calculate for the normal cycle the per-cycle energy consumption, $E_{TC}$, using gas-heated or oil-heated water, expressed in Btu per cycle (or megajoules per cycle) and defined as:

$$E_{TC} = E_T \times \frac{1}{e} \left[ \frac{3412 \text{ Btu}}{\text{kWh}} \right]$$

or

$$E_{TC} = E_T \times \frac{1}{e} \left[ \frac{3.6 \text{ MJ}}{\text{kWh}} \right]$$

where:
- $e=$ nominal gas or oil water heater efficiency = 0.72.
- $E_T=$ as defined in section 4.1.2.

4.1.5 Per-cycle machine electrical energy consumption.

4.1.5.1 Non-water-heating clothes washers. The electrical energy value recorded for the maximum fill in section 3.4.1 is the per-cycle machine electrical energy consumption, $M_E$, expressed in kilowatt-hours per cycle.

4.1.5.2 Water-heating clothes washers.

4.1.5.2.1 Calculate for the cycle under test the per-cycle temperature weighted electrical energy consumption for the maximum water fill level, $E_{h\max}$, and for the minimum water fill level, $E_{h\min}$, expressed in kilowatt-hours per cycle and defined as:

$$E_{h\max} = \sum_{j=1}^{n} \left[ E_{h_j} \times TUF_i \right]$$

and

$$E_{h\min} = \sum_{j=1}^{n} \left[ E_{h_j} \times TUF_j \right]$$

where:
- $E_{h_j}=$ reported electrical energy consumption in kilowatt-hours per cycle at maximum fill for each wash/rinse temperature combination setting, as provided in section 3.4.1.
- $TUF_i=$ applicable temperature use factor in section 5 or 6.
- $n=$ number of wash/rinse temperature combination settings available to the user for the clothes washer under test.

4.1.5.2.2 Weighted per-cycle machine electrical energy consumption. Calculate the weighted per cycle machine energy consumption, $M_w$, expressed in kilowatt-hours per cycle and defined as:

$$M_w = (E_{h\max} \times F_{\max}) + (E_{h\min} \times F_{\min})$$

where:
- $F_{\max}=$ as defined in section 4.1.3.
- $F_{\min}=$ as defined in section 4.1.3.
- $E_{h\max}=$ as defined in section 4.1.5.2.1.
- $E_{h\min}=$ as defined in section 4.1.5.2.1.

4.1.6 Total per-cycle energy consumption when electrically heated water is used. Calculate for the normal cycle the total per-cycle energy consumption, $E_{TE}$, using electrically heated water, expressed in kilowatt-hours per cycle and defined as:

$$E_{TE} = E_T + M_E$$

where:
- $E_T=$ as defined in section 4.1.3.
- $M_E=$ as defined in section 4.1.5.1 or 4.1.5.2.2.

4.2 Per-cycle energy consumption for removal of RMC. Calculate the amount of energy per cycle required to remove RMC. Such amount is $D_e$, expressed in kilowatt-hours per cycle and defined as:

$$D_e = (LAF) \times (\text{test load weight}) \times (\text{RMC} - 4\%) \times (\text{DEF}) \times (\text{DUF})$$

where:
- $LAF=$ load adjustment factor = 0.52.
- Test load weight = as shown in test load table in 3.3.2 expressed in lbs/cycle.
- RMC = as defined in 3.3.5.
- DEF = nominal energy required for a clothes dryer to remove moisture from clothes = 0.5 kWh/lb (1.1 kWh/kg).
- DUF = dryer usage factor, percentage of washer loads dried in a clothes dryer = 0.84.

4.3 Water consumption.

4.3.1 Per-cycle temperature-weighted water consumption for maximum and minimum water fill levels. To determine these amounts, calculate for the cycle under test the per-cycle temperature-weighted total water consumption for the maximum water fill level, $Q_{max}$, and for the minimum water fill level, $Q_{min}$. 

where:
- $Q_{max}=$ as defined in section 3.4.1.
- $Q_{min}=$ as defined in section 3.4.1.
expressed in gallons per cycle (or liters per cycle) and defined as:

\[
Q_{\text{max}} = X_1 \sum_{i=1}^{n} \left( \left( Vh_i + Vc_i \right) \times TUF_i \right) + X_2 \left[ TUF_w \times \left( Sh_H + Sc_H \right) \right]
\]

where:
- \( Vh_i \) = hot water consumption in gallons per cycle at maximum fill for each wash/rinse temperature combination setting, as provided in section 3.4.2.
- \( Vc_i \) = total cold water consumption in gallons per cycle at maximum fill for each wash/rinse temperature combination setting, cold wash/cold rinse cycle, as provided in section 3.4.2.
- \( TUF_i \) = applicable temperature use factor in section 5 or 6.
- \( n \) = number of wash/rinse temperature combination settings available to the user for the clothes washer under test.
- \( TUF_w \) = temperature use factor for warm wash setting.

For clothes washers equipped with suds-saver feature:
- \( X_1 \) = frequency of use without suds-saver feature = 0.86
- \( X_2 \) = frequency of use with suds-saver feature = 0.14
- \( Sh_H \) = fresh hot water make-up measured during suds-return cycle at maximum water fill level.
- \( Sc_H \) = fresh cold water make-up measured during suds-return cycle at maximum water fill level.

For clothes washers not equipped with suds-saver feature:
- \( X_1 = 1.0 \)
- \( X_2 = 0.0 \)

and

\[
Q_{\text{min}} = X_1 \sum_{j=1}^{n} \left( \left( Vh_j + Vc_j \right) \times TUF_j \right) + X_2 \left[ TUF_w \times \left( Sh_L + Sc_L \right) \right]
\]

where:
- \( Vh_j \) = hot water consumption in gallons per cycle (or liters per cycle) at minimum fill for each wash/rinse temperature combination setting, as provided in section 3.4.3.
- \( Vc_j \) = cold water consumption in gallons per cycle (or liters per cycle) at minimum fill for each wash/rinse temperature combination setting, cold wash/cold rinse cycle, as provided in section 3.4.3.
- \( TUF_j \) = applicable temperature use factor in section 5 or 6.
- \( Sh_L \) = fresh hot make-up water measured during suds-return cycle at minimum water fill level.
- \( Sc_L \) = fresh cold make-up water measured during suds-return cycle at minimum water fill level.
- \( n \) = as defined above in this section.
- \( TUF_w \) = as defined above in this section.
- \( X_1 \) = as defined above in this section.

4.3.2 Total weighted per-cycle water consumption. To determine this amount, calculate the total weighted per cycle water consumption, \( Q_T \), expressed in gallons per cycle (or liters per cycle) and defined as:

\[
Q_T = [Q_{\text{max}} \times F_{\text{max}}] + [Q_{\text{min}} \times F_{\text{min}}]
\]

where:
- \( F_{\text{max}} \) = as defined in section 4.1.3.
- \( F_{\text{min}} \) = as defined in section 4.1.3.
- \( Q_{\text{max}} \) = as defined in section 3.4.1.
- \( Q_{\text{min}} \) = as defined in section 3.4.1.

4.3.3 Water consumption factor. The following calculates the water consumption factor, WCF, expressed in gallon per cycle per cubic foot (or liter per cycle per liter):

\[
WCF = Q_T / C
\]

where:
- \( C \) = as defined in section 3.1.5.
- \( Q_T \) = as defined in section 4.3.2.

4.4 Modified energy factor. The following calculates the modified energy factor, MEF, expressed in cubic feet per kilowatt-hours per cycle (or liters per kilowatt-hours per cycle):

\[
MEF = \frac{C}{(M_E + E_T + D_E)}
\]

where:
Department of Energy

C is defined in section 3.15.  
\( M_E \) is defined in section 4.1.5.1 or 4.1.5.2.2.  
\( E_T \) is defined in section 4.1.3.

4.5 Energy factor. Calculate the energy factor, \( E_F \), expressed in cubic feet per kilowatt-hours per cycle, as:

\[
E_F = \frac{C}{(M_E + E_T)}
\]

where:

C is defined in section 3.15.  
\( M_E \) is defined in section 4.1.5.1 or 4.1.5.2.2.  
\( E_T \) is defined in section 4.1.3.

5. Applicable Temperature Use Factors for Determining Hot Water Usage for Various Wash/Rinse Temperature Selections for All Automatic Clothes Washers

5.1 Clothes washers with discrete temperature selections.

7. Waivers and Field Testing

7.1 Waivers and Field Testing for Non-conventional Clothes Washers. Manufacturers of non-conventional clothes washers, such as clothes washers with adaptive control systems, must submit a petition for waiver pursuant to 10 CFR 430.27 to establish an acceptable test procedure for that clothes washer. For these and other clothes washers that have controls or systems such that the DOE test procedures yield results that are so unrepresentative of the clothes washer’s true energy consumption characteristics as to provide materially inaccurate comparative...
data, field testing may be appropriate for establishing an acceptable test procedure. The following are guidelines for field testing which may be used by manufacturers in support of petitions for waiver. These guidelines are not mandatory and the Department may determine that they do not apply to a particular model. Depending upon a manufacturer’s approach for conducting field testing, additional data may be required. Manufacturers are encouraged to communicate with the Department prior to the commencement of field tests which may be used to support a petition for waiver. Section 7.3 provides an example of field testing for a clothes washer with an adaptive water fill control system. Other features, such as the use of various spin speed selections, could be the subject of field tests.

7.2 Non-conventional Wash System Energy Consumption Test. The field test may consist of a minimum of 10 of the nonconventional clothes washers (“test clothes washers”) and 10 clothes washers already being distributed in commerce (“base clothes washers”). The tests should include a minimum of 50 normal test cycles per clothes washer. The test clothes washers and base clothes washers should be identical in construction except for the controls or systems being tested. Equal numbers of both the test clothes washer and the base clothes washer should be tested simultaneously in comparable settings to minimize seasonal and/or consumer laundering conditions and/or variations. The clothes washers should be monitored in such a way as to accurately record the total energy consumption per cycle. At a minimum, the following should be measured and recorded throughout the test period for each clothes washer: Hot water usage in gallons (or liters), electrical energy usage in kilowatt-hours, and the cycles of usage. The field test results would be used to determine the best method to correlate the rating of the test clothes washer to the rating of the base clothes washer. If the base clothes washer is rated at A kWh per year, but field tests at B kWh per year, and the test clothes washer, the metered kWh per year, the test unit would be rated as follows:

\[ A \times (D/B) = G \text{ kWh per year} \]

7.3 Adaptive water fill control system field test. Section 3.2.2.1 defines the method for measuring energy consumption for clothes washers which incorporate control systems having both adaptive and alternate manual selections. Energy consumption calculated by the method defined in section 3.2.2.1 assumes the adaptive cycle will be used 50 percent of the time. The field test data can be used to develop field test data in support of a petition for waiver when it is believed that the adaptive cycle will be used more than 50 percent of the time. The field test sample size should be a minimum of 10 test clothes washers. The test clothes washers should be totally representative of the design, construction, and control system that will be placed in commerce. The duration of field testing in the user’s house should be a minimum of 50 normal test cycles, for each unit. No special instructions as to cycle selection or product usage should be given to the field test participants, other than inclusion of the product literature pack which should be shipped with all units, and instructions regarding filling out data collection forms, use of data collection equipment, or basic procedural methods. Prior to the test clothes washers being installed in the field test locations, baseline data should be developed for all field test units by conducting laboratory tests as defined by section 1 through section 6 of these test procedures to determine the energy consumption values. The following data should be measured and recorded for each wash load during the test period: wash cycle selected, the mode of the clothes washer (adaptive or manual), clothes load dry weight (measured after the clothes washer and clothes dryer cycles are completed) in pounds, and type of articles in the clothes load (i.e., cottons, linens, permanent press, etc.). The wash loads used in calculating the in-home percentage split between adaptive and manual cycle usage should be only those wash loads which conform to the definition of the normal test cycle.

Calculate:

\[ T = \text{The total number of normal test cycles run during the field test} \]
\[ T_a = \text{The total number of adaptive control normal test cycles} \]
\[ T_m = \text{The total number of manual control normal test cycles} \]

The percentage weighting factors:

\[ P_a = \frac{T_a}{T} \times 100 \quad (\text{the percentage weighting for adaptive control selection}) \]
\[ P_m = \frac{T_m}{T} \times 100 \quad (\text{the percentage weighting for manual control selection}) \]

Energy consumption values, \( E_a, M_a, D_a \), (if desired) calculated in section 4 for the manual and adaptive modes, should be combined using \( P_a \) and \( P_m \) as the weighting factors.

8. Sunset

The provisions of this appendix J expire on December 31, 2003.
APPENDIX J1 TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF AUTOMATIC AND SEMI-AUTOMATIC CLOTHES WASHERS

The provisions of this appendix J1 shall apply to products manufactured beginning January 1, 2004.

1. Definitions and Symbols

1.1 Adaptive control system means a clothes washer control system, other than an adaptive water fill control system, which is capable of automatically adjusting washer operation or washing conditions based on characteristics of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions.

1.2 Adaptive water fill control system means a clothes washer water fill control system which is capable of automatically adjusting the water fill level based on the size or weight of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions.

1.3 Bone-dry means a condition of a load of test cloth which has been dried in a dryer at maximum temperature for a period of time, and then removed and weighed before cool down, and then dried again for 10 minutes.

1.4 Clothes container means the compartment within the clothes washer that holds the clothes during the operation of the machine.

1.5 Compact means a clothes washer which has a clothes container capacity of less than 1.6 ft³ (45 L).

1.6 Deep rinse cycle means a rinse cycle in which the clothes container is filled with water to a selected level and the clothes load is rinsed by agitating it or tumbler it through the water.

1.7 Energy test cycle for a basic model means (A) the cycle recommended by the manufacturer for washing cotton or linen clothes, and includes all wash/rinse temperature selections and water levels offered in that cycle, and (B) for each other wash/rinse temperature selection or water level available on that basic model, the portion(s) of other cycle(s) with that temperature selection or water level that, when tested pursuant to these test procedures, will contribute to an accurate representation of the energy consumption of the basic model as used by consumers. Any cycle under (A) or (B) shall include the agitation/tumble operation, spin speed(s), wash times, and rinse times applicable to that cycle, including water heating time for water heating clothes washers.

1.8 Load use factor means the percentage of the total number of wash loads that a user would wash a particular size (weight) load.

1.9 Manual control system means a clothes washer control system which requires that the consumer make the choices that determine washer operation or washing conditions, such as, for example, wash/rinse temperature selections, and wash time before starting the cycle.

1.10 Manual water fill control system means a clothes washer water fill control system which requires the consumer to determine or select the water fill level.

1.11 Modified energy factor means the quotient of the cubic foot (liters) capacity of the clothes container divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load.

1.12 Non-water-heating clothes washer means a clothes washer which does not have an internal water heating device to generate hot water.

1.13 Spray rinse cycle means a rinse cycle in which water is sprayed onto the clothes for a period of time without maintaining any specific water level in the clothes container.

1.14 Standard means a clothes washer which has a clothes container capacity of 1.6 ft³ (45 L) or greater.

1.15 Temperature use factor means, for a particular wash/rinse temperature setting, the percentage of the total number of wash loads that an average user would wash with that setting.

1.16 Thermostatically controlled water valves means clothes washer controls that have the ability to sense and adjust the hot and cold supply water.

1.17 Uniformly distributed warm wash temperature selection(s) means (A) multiple warm wash selections for which the warm wash water temperatures have a linear relationship with all discrete warm wash selections when the water temperatures are plotted against equally spaced consecutive warm wash selections between the hottest warm...
wash and the coldest warm wash. If the warm wash has infinite selections, the warm wash water temperature has a linear relationship with the distance on the selection device (e.g. dial angle or slide movement) between the hottest warm wash and the coldest warm wash. The criteria for a linear relationship as specified above is that the difference between the actual water temperature at any warm wash selection and the point where that temperature is depicted on the temperature selection line formed by connecting the warmest and the coldest warm wash selections is less than ±5 percent. In all cases, the mean water temperature of the warmest and the coldest warm selections must coincide with the mean of the “hot wash” (maximum wash temperature ≤135 °F (57.2 °C) and “cold wash” (minimum wash temperature) water temperatures within ±3.8 °F (±2.1 °C), or (B) on a clothes washer with only one warm wash temperature selection, a warm wash water temperature selection with a water temperature that coincides with the mean of the “hot wash” (maximum wash temperature ≤135 °F (57.2 °C)), and “cold wash” (minimum wash temperature) water temperatures within ±3.8 °F (±2.1 °C).

1.18 Warm wash means all wash temperature selections that are below the hottest hot, less than 135 °F (57.2 °C), and above the coldest cold temperature selection.

1.19 Water consumption factor means the quotient of the total weighted per-cycle water consumption divided by the cubic foot (or liter) capacity of the clothes washer.

1.20 Water-heating clothes washer means a clothes washer where some or all of the hot water for clothes washing is generated by a water heating device internal to the clothes washer.

1.21 Symbol usage. The following identity relationships are provided to help clarify the symbology used throughout this procedure.

E=Electrical Energy Consumption
H=Hot Water Consumption
C=Cold Water Consumption
R=Hot Water Consumed by Warm Rinse
ER=Electrical Energy Consumed by Warm Rinse
TUF=Temperature Use Factor
HE=Hot Water Energy Consumption
F=Load Usage Factor
Q=Total Water Consumption
ME=Machine Electrical Energy Consumption
RMC=Remaining Moisture Content
WI=Initial Weight of Dry Test Load
WG=Weight of Test Load After Extraction
H=Hot Wash (maximum wash temp. ≤135 °F (57.2 °C))
W=Warm Wash
C=Cold Wash (minimum wash temp.)
R=Warm Rinse (hottest rinse temp.)
x or min—Minimum Test Load
n or avg—Average Test Load

The following examples are provided to show how the above symbols can be used to define variables:

Em,n=”Electrical Energy Consumption” for the “Average Test Load”
Rm,n=”Hot Water Consumed by Warm Rinse” for the “Average Test Load”
TUF,n=”Temperature Use Factor” for an “Average Test Load”
HEn,n=”Hot Water Energy Consumption” for the “Average Test Load”

1.22 Cold rinse means the coldest rinse temperature available on the machine (and should be the same rinse temperature selection tested in 3.7 of this appendix).

1.23 Warm rinse means the hottest rinse temperature available on the machine (and should be the same rinse temperature selection tested in 3.7 of this appendix).

2. Testing Conditions

2.1 Installation. Install the clothes washer in accordance with manufacturer’s instructions.

2.2 Electrical energy supply. Maintain the electrical supply at the clothes washer terminal block within 2 percent of 120, 120/240, or 120/208 volts as applicable to the particular terminal block wiring system and within 2 percent of the nameplate frequency as specified by the manufacturer. If the clothes washer has a dual voltage conversion capability, conduct test at the highest voltage specified by the manufacturer.

2.3 Supply Water.

2.3.1 Clothes washers in which electrical energy consumption or water energy consumption are affected by the inlet water temperature. (For example, water heating clothes washers or clothes washers with thermostatically controlled water valves). The temperature of the hot water supply at the water inlets shall not exceed 135 °F (57.2 °C) and the cold water supply at the water inlets shall not exceed 60 °F (15.6 °C). A water meter shall be installed in both the hot and cold water lines to measure water consumption.

2.3.2 Clothes washers in which electrical energy consumption and water energy consumption are not affected by the inlet water temperature. The temperature of the hot water supply shall be maintained at 135 °F±5 °F (57.2 °C±2.8 °C) and the cold water supply shall be maintained at 60 °F±5 °F (15.6 °C±2.8 °C). A water meter shall be installed in both the hot and cold water lines to measure water consumption.

2.4 Water pressure. The static water pressure at the hot and cold water inlet connection of the clothes washer shall be maintained at 35 pounds per square inch gauge (psig) ±2.5 psig (24.1 kPa±17.2 kPa) during
the test. The static water pressure for a single water inlet connection shall be maintained at 35 psig±2.5 psig (241.3 kPa±17.2 kPa) during the test. A water pressure gauge shall be installed in both the hot and cold water lines to measure water pressure.

2.5 Instrumentation. Perform all test measurements using the following instruments, as appropriate:

2.5.1 Weighing scales.

2.5.1.1 Weighing scale for test cloth. The scale shall have a resolution of no larger than 0.2 oz (5.7 g) and a maximum error no greater than 0.3 percent of the measured value.

2.5.1.2 Weighing scale for clothes container capacity measurements. The scale should have a resolution no larger than 0.50 lbs (0.23 kg) and a maximum error no greater than 0.5 percent of the measured value.

2.5.2 Watt-hour meter. The watt-hour meter shall have a resolution no larger than 1 Wh (3.6 kWh) and a maximum error no greater than 2 percent of the measured value for any demand greater than 50 Wh (180.0 kJ).

2.5.3 Temperature measuring device. The device shall have an error no greater than ±1 °F (±0.6 °C) over the range being measured.

2.5.4 Water meter. The water meter shall have a resolution no larger than 0.1 gallons (0.4 liters) and a maximum error no greater than 2 percent for the water flow rates being measured.

2.5.5 Water pressure gauge. The water pressure gauge shall have a resolution of 1 pound per square inch gauge (psig) (6.9 kPa) and shall have an error no greater than 5 percent of any measured value.

2.6 Test cloths.

2.6.1 Energy Test Cloth. The energy test cloth shall be made from energ test cloth material, as specified in 2.6.4. It shall consist of pieces of material that are 12 inches by 18 inches (30.5 cm by 45.7 cm) before washing. The energy test cloth shall be clean and shall not be used for more than 60 test runs (after pre-conditioning as specified in 2.6.3 of this appendix). All energy test cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washer.

2.6.1.1 Energy Test Cloth Material. The new test cloths, including energy test cloths and energy stuffer cloths, shall be pre-conditioned in a clothes washer in the following manner:

2.6.1.1.1 Perform 5 complete normal wash-rinse-spin cycles, the first two with AHAM Standard detergent 2A and the last three without detergent. Place the new load to be conditioned in the washer. Wash the load for ten minutes in soft water (17 ppm hardness or less). Wash water is to be hot and controlled at 135 °F (57.2 °C). Rinse the load through a second rinse using the same water temperature (if an optional second rinse is available on the clothes washer, use it).

2.6.1.1.2 Dry the load.

2.6.1.1.3 A final cycle is to be hot water wash with no detergent followed by two cold water rinses.

2.6.1.1.4 Dry the load.

2.6.1.1.5 Dry the load.

2.6.2 Energy Stuffer Cloth. The energy stuffer cloth shall be made from energy test cloth material, as specified in 2.6.4, and shall consist of pieces of material that are 12 inches by 18 inches (30.5 cm by 45.7 cm) and have been hemmed to 10 inches by 10 inches (25.4 cm by 25.4 cm) before washing. The energy stuffer cloth shall be clean and shall not be used for more than 60 test runs (after pre-conditioning as specified in 2.6.3 of this appendix). All energy stuffer cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washer.

2.6.3 Preconditioning of Test Cloths. The new test cloths, including energy test cloths and energy stuffer cloths, shall be pre-conditioned in a clothes washer in the following manner:

2.6.3.1 Perform 5 complete normal wash-rinse-spin cycles, the first two with AHAM Standard detergent 2A and the last three without detergent. Place the test cloth in a clothes washer set at the maximum water level. Wash the load for ten minutes in soft water (17 ppm hardness or less) using 6.0 grams per gallon of water of AHAM Standard detergent 2A. The wash temperature is to be controlled to 135 °F ±5 °F (57.2 °C ±2.8 °C) and the rinse temperature is to be controlled to 60 °F ±5 °F (15.6 °C ±2.8 °C). Repeat the cycle with detergent and then repeat the cycle three additional times without detergent, bone drying the load between cycles (total of five wash and rinse cycles).

2.6.4 Energy Test Cloth Material. The energy test cloths and energy stuffer cloths shall be made from fabric meeting the following specifications. The material should come from a roll of material with a width of approximately 63 inches and approximately 300 rolls per lot.
yards per roll, however, other sizes may be used if they fall within the specifications.

2.6.4.1 Nominal fabric type. Pure finished bleached cloth, made with a momie or granite weave, which is nominally 50 percent cotton and 50 percent polyester.

2.6.4.2 The fabric weight shall be 5.60 ounces per square yard (190.0 g/m²), ±5 percent.

2.6.4.3 The thread count shall be 61 x 54 per inch (warp x fill), ±2 percent.

2.6.4.4 The warp yarn and filling yarn shall each have fiber content of 50 percent ±4 percent cotton, with the balance being polyester, and be open end spun, 15/1 ±5 percent cotton count blended yarn.

2.6.4.5 Water repellent finishes, such as fluoropolymer stain resistant finishes shall not be applied to the test cloth. The absence of such finishes shall be verified by

2.6.4.5.1 American Association of Textile Chemists and Colorists (AATCC) Test Method 79–2000, Oil Repellency: Hydrocarbon Resistance Test (reaffirmed 1997), of each new lot of test cloth (when purchased from the mill) to confirm the absence of Scotchguard™ or other water repellent finish (required scores of “D” across the board).

2.6.4.5.2 American Association of Textile Chemists and Colorists (AATCC) Test Method 118–1997, Absorbency of Bleached Textiles (reaffirmed 2000), of each new lot of test cloth (when purchased from the mill) to confirm the absence of Scotchguard™ or other water repellent finish (required scores of “D” across the board).

2.6.4.5.3 The standards listed in 2.6.4.5.1 and 2.6.4.5.2 of this appendix which are not otherwise set forth in this part 430 are incorporated by reference. The material listed in this paragraph has been approved for incorporation by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Any subsequent amendment to a standard by the standard-setting organization will not affect the DOE test procedures unless and until amended by DOE. Material is incorporated as it exists on the date of the approval and notice of any change in the material will be published in the Federal Register. The standards incorporated by reference are the American Association of Textile Chemists and Colorists Test Method 118–1997, Oil Repellency: Hydrocarbon Resistance Test (reaffirmed 1997) and Test Method 79–2000, Absorbency of Bleached Textiles (reaffirmed 2000).

(a) The above standards incorporated by reference are available for inspection at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(b) Copies of the above standards incorporated by reference can be obtained from the American Association of Textile Chemists and Colorists, P.O. Box 1215, Research Triangle Park, NC 27709, telephone (919) 549–8141, telefax (919) 549–8933, or electronic mail: orders@aatcc.org.

2.6.4.6 The moisture absorption and retention shall be evaluated for each new lot of test cloth by the Standard Extractor Remaining Moisture Content (RMC) Test specified in 2.6.5 of this appendix.

2.6.4.6.1 Repeat the Standard Extractor RMC Test in 2.6.5 of this appendix three times.

2.6.4.6.2 An RMC correction curve shall be calculated as specified in 2.6.6 of this appendix.

2.6.5 Standard Extractor RMC Test Procedure. The following procedure is used to evaluate the moisture absorption and retention characteristics of a lot of test cloth by measuring the RMC in a standard extractor at a specified set of conditions. Table 2.6.5 of this appendix is the matrix of test conditions. The 500g requirement will only be used if a clothes washer design can achieve spin speeds in the 500g range. When this matrix is repeated 3 times, a total of 48 extractor RMC test runs are required. For the purpose of the extractor RMC test, the test cloths may be used for up to 60 test runs (after preconditioning as specified in 2.6.3 of this appendix).

| Table 2.6.5—Matrix of Extractor RMC Test Conditions |
|-----------------------------------------------|--------|--------|
| “g Force” | Warm soak | Cold soak |
| 15 min spin | 4 min spin | 15 min spin | 4 min spin |
| 100 | | |
| 200 | | |
| 350 | | |
| 500 | | |

2.6.5.1 The standard extractor RMC tests shall be run in a Bock Model 215 extractor (having a basket diameter of 19.5 inches, length of 12 inches, and volume of 2.1 ft³), with a variable speed drive (Bock Engineered Products, P.O. Box 5127, Toledo, OH 43611) or an equivalent extractor with the same basket design (i.e. diameter, length, volume, and hole configuration) and variable speed drive.

2.6.5.2 Test Load. Test cloths shall be preconditioned in accordance with 2.6.3 of this appendix. The load size shall be 8.4 lbs., consistent with 3.8.1 of this appendix.

2.6.5.3 Procedure.
2.6.5.3.1 Record the "bone-dry" weight of the test load (WI).

2.6.5.3.2 Soak the test load for 20 minutes in 10 gallons of soft (<17 ppm) water. The entire test load shall be submerged. The water temperature shall be 100°F ±5°F.

2.6.5.3.3 Remove the test load and allow water to gravity drain off of the test cloths. Then manually place the test cloths in the basket of the extractor, distributing them evenly by eye. Spin the load at a fixed speed corresponding to the intended centripetal acceleration level (measured in units of the acceleration of gravity, g) ±1 g for the intended time period ±5 seconds.

2.6.5.3.4 Record the weight of the test load immediately after the completion of the extractor spin cycle (WC).

2.6.5.3.5 Calculate the RMC as (WC-WI)/WI.

2.6.5.3.6 The RMC of the test load shall be measured at three (3) g levels: 100g; 200g; 350g, using two different spin times at each g level: 4 minutes; and 15 minutes. If a clothes washer design can achieve spin speeds in the 500g range then the RMC of the test load shall be measured at four (4) g levels: 100g; 200g; 350g; and 500g, using two different spin times at each g level: 4 minutes; and 15 minutes.

2.6.5.4 Repeat 2.6.5.3 of this appendix using soft (<17 ppm) water at 60°F ±5°F.

2.6.6 Calculation of RMC correction curve.

2.6.6.1 Average the values of 3 test runs and fill in table 2.6.5 of this appendix. Perform a linear least-squares fit to relate the standard RMC (RMC

Where A and B are coefficients of the linear least-squares fit.

2.6.6.2. Perform an analysis of variance test using two factors, spin speed and lot, to check the interaction of speed and lot. Use the values from Table 2.6.5 and Table 2.6.6.1 in the calculation. The “P” value in the variance analysis shall be greater than or equal to 0.1. If the “P” value is less than 0.1 the test cloth is unacceptable. “P” is a theoretically based probability of interaction based on an analysis of variance.

2.6.7 Application of RMC correction curve. 2.6.7.1 Using the coefficients A and B calculated in 2.6.6.1 of this appendix: RMC

2.6.7.2 Substitute RMC corr values in calculations in 3.8 of this appendix.

2.6.8 Test Load Sizes. Maximum, minimum, and, when required, average test load sizes shall be determined using Table 5.1 and the clothes container capacity as measured in 3.1.1 through 3.1.5. Test loads shall consist of energy test cloths, except that adjustments to the test loads to achieve proper weight can be made by the use of energy stuffer cloths with no more than 5 stuffer clothes per load.

2.8 Use of Test Loads. Table 2.8 defines the test load sizes and corresponding water fill settings which are to be used when measuring water and energy consumptions. Adaptive water fill control system and manual water fill control system are defined in section 1 of this appendix:

<table>

2.8.1 The test load sizes to be used to measure RMC are specified in section 3.8.1. 2.8.2 Test loads for energy and water consumption measurements shall be bone dry prior to the first cycle of the test, and dried...
Pt. 430, Subpl. B, App. J1

10 CFR Ch. II (1–1–08 Edition)

2.9 Pre-conditioning.

2.9.1 Nonwater-heating clothes washer. If the clothes washer has not been filled with water in the preceding 96 hours, pre-condition it by running it through a cold rinse cycle and then draining it to ensure that the hose, pump, and sump are filled with water.

2.9.2 Water-heating clothes washer. If the clothes washer has not been filled with water in the preceding 96 hours, or if it has not been in the test room at the specified ambient conditions for 8 hours, pre-condition it by running it through a cold rinse cycle and then draining it to ensure that the hose, pump, and sump are filled with water.

2.10 Wash time setting. If one wash time is prescribed in the energy test cycle, that shall be the wash time setting; otherwise, the wash time setting shall be the higher of either the minimum, or 70 percent of the maximum wash time available in the energy test cycle.

2.11 Test room temperature for water-heating clothes washers. Maintain the test room ambient air temperature at 75 °F ± 5 °F (23.9 °C ± 2.8 °C).

3. Test Measurements

3.1 Clothes container capacity. Measure the entire volume which a dry clothes load could occupy within the clothes container during washer operation according to the following procedures:

3.1.1 Place the clothes washer in such a position that the uppermost edge of the clothes container opening is leveled horizontally, so that the container will hold the maximum amount of water.

3.1.2 Line the inside of the clothes container with 2 mil (0.051 mm) plastic sheet. All clothes washer components which occupy space within the clothes container and which are recommended for use with the energy test cycle shall be in place and shall be lined with 2 mil (0.051 mm) plastic sheet to prevent water from entering any void space.

3.1.3 Record the total weight of the machine before adding water.

3.1.4 Fill the clothes container manually with either 60 °F ± 5 °F (15.6 °C ± 2.8 °C) or 100 °F ± 10 °F (37.8 °C ± 5.5 °C) water to its uppermost edge. Measure and record the weight of water, W, in pounds.

3.1.5 The clothes container capacity is calculated as follows:

\[ C = \frac{W}{d} \]

where:

- C = Capacity in cubic feet (liters).
- W = Mass of water in pounds (kilograms).
- \( d = \text{Density of water (62.0 lbs/ft}^3\text{ for 100 °F (993 kg/m}^3\text{ for 37.8 °C) or 62.3 lbs/ft}^3\text{ for 60 °F (998 kg/m}^3\text{ for 15.6 °C))} \]

3.2 Procedure for measuring water and energy consumption values on all automatic and semi-automatic washers. All energy consumption tests shall be performed under the energy test cycle(s), unless otherwise specified. Table 3.2 defines the sections below which govern tests of particular clothes washers, based on the consumer selection of manual controls as an alternative, then both manual and adaptive water fill control systems.

3.2.1 Inlet water temperature and the wash/rinse temperature settings.

3.2.1.1 For automatic clothes washers set the wash/rinse temperature selection control to obtain the wash water temperature desired (extra hot, hot, warm, or cold) and cold rinse, and open both the hot and cold water faucets.

3.2.1.2 For semi-automatic washers: (1) For hot water temperature, open the hot water faucet completely and close the cold water faucet; (2) for warm inlet water temperature, open both hot and cold water faucets completely; (3) for cold water temperature, close the hot water faucet and open the cold water faucet completely.

3.2.1.3 Determination of warm wash water temperature(s) to decide whether a clothes washer has uniformly distributed warm wash temperature selections. The wash water temperature, T_w, of each warm water wash selection shall be calculated or measured. For non-water-heating clothes washers, calculate T_w as follows:

\[ T_w(°\text{F}) = \frac{(H_w×135 °\text{F})+(C_w×60 °\text{F})}{(H_w+C_w)} \]

or

\[ T_w(°\text{C}) = \frac{(H_w×57.2 °\text{C})+(C_w×15.6 °\text{C})}{(H_w+C_w)} \]

where:

- H_w = Hot water consumption of a warm wash
- C_w = Cold water consumption of a warm wash

For water-heating clothes washers, measure and record the temperature of each warm wash selection after fill.

3.2.2 Total water consumption during the energy test cycle shall be measured, including hot and cold water consumption during wash, deep rinse, and spray rinse.

3.2.3 Clothes washers with adaptive water fill/manual water fill control systems.

3.2.3.1 Clothes washers with adaptive water fill control system and alternate manual water fill control systems. If a clothes washer with an adaptive water fill control system allows consumer selection of manual controls as an alternative, then both manual and adaptive
modes shall be tested and, for each mode, the energy consumption \((HE_n, ME_n, \text{ and } De_n)\) and water consumption \((Q_n)\), values shall be calculated as set forth in section 4. Then the average of the two values (one from each mode, adaptive and manual) for each variable shall be used in section 4 for the clothes washer.

3.2.3.2 Clothes washers with adaptive water fill control system.

3.2.3.2.1 Not user adjustable. The maximum, minimum, and average water levels as defined in the following sections shall be interpreted to mean that amount of water fill which is selected by the control system when the respective test loads are used, as defined in Table 2.8. The load usage factors which shall be used when calculating energy consumption values are defined in Table 4.1.3.

3.2.3.2.2 User adjustable. Four tests shall be conducted on clothes washers with user adjustable adaptive water fill controls which affect the relative wash water levels. The first test shall be conducted with the maximum test load and with the adaptive water fill control system set in the setting that will give the least energy intensive result. The second test shall be conducted with the minimum test load and with the adaptive water fill control system set in the setting that will give the least energy intensive result for the given test load. The fourth test shall be conducted with the average test load and with the adaptive water fill control system set in the setting that will give the most energy intensive result for the given test load. The energy and water consumption for the average test load and water level, shall be the average of the third and fourth tests.

3.2.3.3 Clothes washers with manual water fill control system. In accordance with Table 28, the water fill selector shall be set to the maximum water level available on the clothes washer for the maximum test load size and set to the minimum water level for the minimum test load size. The load usage factors which shall be used when calculating energy consumption values are defined in Table 4.1.3.

### Table 3.2—Test Section Reference

</table>

1. Only applicable to machines with warm rinse in any cycle.
2. This only applies to water heating clothes washers on which the maximum wash temperature available exceeds 135 °F (57.2 °C).

3.3 “Extra Hot Wash” (Max Wash Temp >135 °F (57.2 °C)) for water heating clothes washers only. Water and electrical energy consumption shall be measured for each water fill level and/or test load size as specified in 3.3.1 through 3.3.3 for the hottest wash setting available.

3.3.1 Maximum test load and water fill. Hot water consumption (\(\text{Hm}_n\)), cold water consumption (\(\text{Cm}_n\)), and electrical energy consumption \((\text{Em}_n)\) shall be measured for an extra hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.3.2 Minimum test load and water fill. Hot water consumption (\(\text{Hm}_n\)), cold water consumption (\(\text{Cm}_n\)), and electrical energy consumption \((\text{Em}_n)\) shall be measured for an extra hot wash/cold rinse energy test cycle, with the controls set for the minimum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.3.3 Average test load and water fill. For clothes washers with an adaptive water fill control system, measure the values for hot water consumption (\(\text{Hm}_n\)), cold water consumption (\(\text{Cm}_n\)), and electrical energy consumption \((\text{Em}_n)\) for an extra hot wash/cold rinse energy test cycle, with an average test load size as determined per Table 5.1.

3.4 “Hot Wash” (Max Wash Temp ≤135 °F (57.2 °C)). Water and electrical energy consumption shall be measured for each water fill level or test load size as specified in 3.4.1 through 3.4.3 for a 135 °F (57.2 °C) wash, if available, or for the hottest selection less than 135 °F (57.2 °C).

3.4.1 Maximum test load and water fill. Hot water consumption (\(\text{H}_n\)), cold water consumption (\(\text{C}_n\)), and electrical energy consumption \((\text{E}_n)\) shall be measured for a hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level.
level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.4.2 Minimum test load and water fill. Hot water consumption (Hh), cold water consumption (Ch), and electrical energy consumption (Eh) shall be measured for a hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.4.3 Average test load and water fill. For clothes washers with an adaptive water fill control system, measure the values for hot water consumption (Hh), cold water consumption (Ch), and electrical energy consumption (Eh) for a hot wash/cold rinse energy test cycle, with an average test load size as determined per Table 5.1.

3.5 "Warm Wash." Water and electrical energy consumption shall be determined for each water fill level and/or test load size as specified in 3.5.1 through 3.5.2.3 for the applicable warm water wash temperature(s).

3.5.1 Clothes washers with uniformly distributed warm wash temperature selection(s). The reportable values to be used for the warm water wash setting shall be the arithmetic average of the measurements for the hot and cold wash selections. This is a calculation only, no testing is required.

3.5.2 Clothes washers that lack uniformly distributed warm water wash temperature selections. For a clothes washer with fewer than four discrete warm wash selections, test all warm wash temperature selections. For a clothes washer that offers four or more warm wash selections, test at all discrete selections, or the hottest hot (≤135 °F (57.2 °C)) for a hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The average test load size is to be used and shall be determined per Table 5.1.

3.5.2.1 Maximum test load and water fill. Hot water consumption (Hw), cold water consumption (Cw), and electrical energy consumption (Ew) shall be measured with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.5.2.2 Minimum test load and water fill. Hot water consumption (Hw), cold water consumption (Cw), and electrical energy consumption (Ew) shall be measured with the controls set for the minimum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.5.2.3 Average (R) test load sizes or water fill levels. The average test load size is to be used and shall be determined per Table 5.1.

3.6 "Cold Wash" (Minimum Wash Temperature Selection). Water and electrical energy consumption shall be measured for each water fill level or test load size as specified in 3.6.1 through 3.6.3 for the coldest wash temperature selection available.

3.6.1 Maximum test load and water fill. Hot water consumption (Hc), cold water consumption (Cc), and electrical energy consumption (Ec) shall be measured for a cold wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.6.2 Minimum test load and water fill. Hot water consumption (Hc), cold water consumption (Cc), and electrical energy consumption (Ec) shall be measured for a cold wash/cold rinse energy test cycle, with the controls set for the minimum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.6.3 Average test load and water fill. For clothes washers with the hottest rinse temperature available. If multiple wash temperatures are available with the hottest rinse temperature, any "warm wash" temperature may be selected to conduct the tests.

3.7 Warm Rinse. Tests in sections 3.7.1 and 3.7.2 shall be conducted with the hottest rinse temperature available. If multiple wash temperatures are available with the hottest rinse temperature, any "warm wash" temperature may be selected to conduct the tests.

3.7.1 For the rinse only, measure the amount of hot water consumed by the clothes washer, including all deep and spray rinses, for the maximum (R.), minimum (R.), and, if required by section 3.5.2.3, average (R.) test load sizes or water fill levels.

3.7.2 Measure the amount of electrical energy consumed by the clothes washer to heat the rinse water only, including all deep and spray rinses, for the maximum (ER.), minimum (ER.), and, if required by section 3.5.2.3, average (ER.) test load sizes or water fill levels.

3.8 Remaining Moisture Content:

3.8.1 The wash temperature will be the same as the rinse temperature for testings. Use the maximum test load as defined in Table 5.1 and section 3.1 for testing.

3.8.2 For clothes washers with cold rinse only:

3.8.2.1 Record the actual "bone dry" weight of the test load (Wb), then place the test load in the clothes washer.

3.8.2.2 Set water level selector to maximum fill.

3.8.2.3 Run the energy test cycle.
3.8.2.4 Record the weight of the test load immediately after completion of the energy test cycle (WCmax).

3.8.2.5 Calculate the remaining moisture content of the maximum test load, RMCmax, expressed as a percentage and defined as:

\[ \text{RMC}_{\text{max}} = \frac{(\text{WC}_{\text{max}} - \text{WI}_{\text{max}}) \times 100}{\text{WI}_{\text{max}}} \]

3.8.3 For clothes washers with cold and warm rinse options:

3.8.3.1 Complete steps 3.8.2.1 through 3.8.2.4 for cold rinse. Calculate the remaining moisture content of the maximum test load, RMCcold, expressed as a percentage and defined as:

\[ \text{RMC}_{\text{cold}} = \frac{(\text{WC}_{\text{max}} - \text{WI}_{\text{max}}) \times 100}{\text{WI}_{\text{max}}} \]

3.8.3.2 Complete steps 3.8.2.1 through 3.8.2.4 for warm rinse. Calculate the remaining moisture content of the maximum test load, RMCwarm, expressed as a percentage and defined as:

\[ \text{RMC}_{\text{warm}} = \frac{(\text{WC}_{\text{max}} - \text{WI}_{\text{max}}) \times 100}{\text{WI}_{\text{max}}} \]

3.8.3.3 Calculate the remaining moisture content of the maximum test load, RMCmax, expressed as a percentage and defined as:

\[ \text{RMC}_{\text{max}} = \frac{(\text{WC}_{\text{max}} - \text{WI}_{\text{max}}) \times 100}{\text{WI}_{\text{max}}} \]

\[ \text{RMC}_{\text{max}} = \text{RMC}_{\text{cold}}(1 - \text{TUF}) + \text{RMC}_{\text{warm}} \times \text{TUF}, \]

where:

\[ \text{TUF} = \text{TUF}_{\text{warm}} + \text{TUF}_{\text{cold}} + \text{TUF}_{\text{extra hot}} \]

3.8.4 Clothes washers which have options that result in different RMC values, such as multiple selection of spin speeds or spin times, that are available in the energy test cycle, shall be tested at the maximum and minimum extremes of the available options, excluding any “no spin” (zero spin speed) settings, in accordance with requirements in 3.8.2 or 3.8.3. The calculated RMCmax extraction and RMCmax connection at the maximum and minimum settings, respectively, shall be combined as follows and the final RMC to be used in section 4.3 shall be:

\[ \text{RMC} = 0.75 \times \text{RMC}_{\text{max}} + 0.25 \times \text{RMC}_{\text{max}} \]

4. Calculation of Derived Results From Test Measurements

4.1 Hot water and machine electrical energy consumption of clothes washers.

4.1.1 Per-cycle temperature-weighted hot water consumption for maximum, average, and minimum water fill levels using each appropriate load size as defined in section 2.8 and Table 5.1. Calculate the per-cycle temperature weighted hot water consumption for the maximum water fill level, Vhw, the average water fill level, Vhm, and the minimum water fill level, Vhn, expressed in gallons per cycle (or liters per cycle) and defined as:

\[ \text{V}_{\text{hw}} = \text{H}_{\text{h}} \times \text{TUF}_{\text{het}} \times \text{TUF}_{\text{hot}} \times \text{TUF}_{\text{warm}} \]

\[ \text{V}_{\text{hm}} = \text{H}_{\text{m}} \times \text{TUF}_{\text{het}} \times \text{TUF}_{\text{hot}} \times \text{TUF}_{\text{warm}} \]

\[ \text{V}_{\text{hn}} = \text{H}_{\text{n}} \times \text{TUF}_{\text{het}} \times \text{TUF}_{\text{hot}} \times \text{TUF}_{\text{warm}} \]

where:

Hhm, Hhm, and Hhn are reported hot water consumption values, in gallons per-cycle (or liters per cycle), at maximum, average, and minimum water fill, respectively, for the hot wash cycle with the appropriate test loads as defined in section 2.8.

Hhn, Hhn, and Hhn are reported hot water consumption values, in gallons per-cycle (or liters per cycle), at maximum, average, and minimum water fill, respectively, for the warm wash cycle with the appropriate test loads as defined in section 2.8.

Hhn, Hhn, and Hhn are reported hot water consumption values, in gallons per-cycle (or liters per cycle), at maximum, average, and minimum water fill, respectively, for the extra-hot wash cycle with the appropriate test loads as defined in section 2.8.

TUFw, TUFw, TUFw, and TUF are temperature use factors for extra hot wash, hot wash, warm wash, cold wash, and warm rinsing temperature factors, respectively, and are defined as in Table 4.1.

Table 4.1.1—Temperature Use Factors
4.1.2 Total per-cycle hot water energy consumption for all maximum, average, and minimum water fill levels tested. Calculate the total per-cycle hot water energy consumption for the maximum water fill level, HE\text{max}, the minimum water fill level, HE\text{min}, and the average water fill level, HE\text{avg}, expressed in kilowatt-hours per cycle and defined as:

(a) HE\text{max} = [Vh\times T\times X]\times KE\text{total per-cycle hot water energy consumption for the maximum water fill level, HE\text{max}, and the average water fill level, HE\text{avg}, expressed in kilowatt-hours per cycle and defined as:

(b) HE\text{avg} = [Vh\times T\times K]\times KE\text{total per-cycle hot water energy consumption for the average load is tested.}

(c) HE\text{min} = [Vh\times T\times K]\times KE\text{total per-cycle hot water energy consumption for a minimum load is tested.}

where:

T = Temperature rise=75 °F (41.7 °C),
K = Water specific heat in kilowatt-hours per gallon degree F = 0.00240 (0.00114 kWh/L °C),
Vh, Vh, and Vh, are as defined in 4.1.1.

4.1.3 Total weighted per-cycle hot water energy consumption. Calculate the total weighted per cycle hot water energy consumption, HE\text{r}, expressed in kilowatt-hours per cycle and defined as:

\[ \text{HE}_r = \text{HE}\text{max}\times F\text{max} + \text{HE}\text{avg}\times F\text{avg} + \text{HE}\text{min}\times F\text{min} \]

where:

HE\text{max}, HE\text{avg}, and HE\text{min} are as defined in 4.1.2.
F\text{max}, F\text{avg}, and F\text{min} are the load usage factors for the maximum, average, and minimum test loads based on the size and type of control system on the washer being tested. The values are as shown in Table 4.1.3.

4.14 Total per-cycle hot water energy consumption using gas-heated or oil-heated water. Calculate for the energy test cycle the per-cycle hot water consumption, HE\text{TC}, using gas heated or oil-heated water, expressed in Btu per cycle (or megajoules per cycle) and defined as:

\[ \text{HE}_{\text{TC}} = H_e\times e\times X\times 3412 \text{ Btu} / \text{kWh} \text{ or } \text{HE}_{\text{TC}} = HE\times e\times 3.6 \text{ MJ} / \text{kWh} \]

where:

e = Nominal gas or oil water heater efficiency = 0.75,
HE\text{y} is defined in 4.1.3.

4.1.5 Per-cycle machine electrical energy consumption for all maximum, average, and minimum test load sizes. Calculate the total per-cycle machine electrical energy consumption for the maximum water fill level, ME\text{max}, the minimum water fill level, ME\text{min}, and the average water fill level, ME\text{avg}, expressed in kilowatt-hours per cycle and defined as:

(a) ME\text{max} = [Ema\times TUF\text{max}]+[Eh\times TUF\text{max}]+[Ew\times TUF\text{max}]+[Ec\times TUF\text{max}]+[ER\times TUF\text{max}]

(b) ME\text{avg} = [Ema\times TUF\text{avg}]+[Eh\times TUF\text{avg}]+[Ew\times TUF\text{avg}]+[Ec\times TUF\text{avg}]+[ER\times TUF\text{avg}]

(c) ME\text{min} = [Ema\times TUF\text{min}]+[Eh\times TUF\text{min}]+[Ew\times TUF\text{min}]+[Ec\times TUF\text{min}]+[ER\times TUF\text{min}]

where:

Ema, Em, and Eh, are reported electrical energy consumption values, in kilowatt-hours per cycle, at maximum, average, and minimum test loads, respectively, for the extra-hot wash cycle.
Eh, Eh, and Eh, are reported electrical energy consumption values, in kilowatt-hours per cycle, at maximum, average, and minimum test loads, respectively, for the hot wash cycle.
Ew, Ew, and Ew, are reported electrical energy consumption values, in kilowatt-hours per cycle, at maximum, average, and minimum test loads, respectively, for the warm wash cycle.
Ec, Ec, and Ec, are reported electrical energy consumption values, in kilowatt-hours per cycle, at maximum, average, and minimum test loads, respectively, for the cold wash cycle.
ER, ER, and ER, are reported electrical energy consumption values, in kilowatt-hours per cycle, at maximum, average, and minimum test loads, respectively, for the warm rinse cycle per definitions in 3.7.2 of this appendix.
TUF\text{max}, TUF\text{avg}, TUF\text{min}, TUF\text{max}, are as defined in Table 4.1.1.

4.1.6 Total weighted per-cycle machine electrical energy consumption. Calculate the total per cycle load size weighted energy consumption, ME\text{r}, expressed in kilowatt-hours per cycle and defined as:

\[ \text{ME}_r = [\text{ME}\text{max}\times F\text{max}]+[\text{ME}\text{avg}\times F\text{avg}]+[\text{ME}\text{min}\times F\text{min}] \]

where:

ME\text{max}, ME\text{avg}, and ME\text{min} are as defined in 4.1.5.
F\text{max}, F\text{avg}, and F\text{min} are as defined in Table 4.1.3.

4.1.7 Total per-cycle energy consumption when electrically heated water is used. Calculate for the energy test cycle the total per-cycle energy consumption, E\text{TE}, using electrical heated water, expressed in kilowatt-hours per cycle and defined as:

\[ E\text{TE} = HE\times ME\text{r} \]

where:

ME\text{r} is as defined in 4.1.6.
HE\text{y} is as defined in 4.1.3.

4.2 Water consumption of clothes washers. (The calculations in this Section need not be performed to determine compliance with the

\textsuperscript{2} Reference 3.2.3.2.
Department of Energy

4.21 Per-cycle water consumption. Calculate the maximum, average, and minimum total water consumption, expressed in gallons per cycle (or liters per cycle), for the cold wash/cold rinse cycle and defined as:

\[ Q_{\text{max}} = [Hc + Cc] \]

\[ Q_{\text{avg}} = [Hc + Cc_\alpha] \]

\[ Q_{\text{min}} = [Hc + Cc] \]

where:

- \( Hc \) and \( Cc \), \( Hc_\alpha \) and \( Cc_\alpha \) are as defined in section 3.1.5.

4.2.2 Total weighted per-cycle water consumption. Calculate the total weighted per-cycle consumption, \( Q_T \), expressed in gallons per cycle (or liters per cycle) and defined as:

\[ Q_T = [Q_{\text{min}} + F_{\text{avg}}] + [Q_{\text{avg}} + F_{\text{avg}}] + [Q_{\text{max}} + F_{\text{avg}}] \]

where:

- \( Q_{\text{min}}, Q_{\text{avg}}, \) and \( Q_{\text{max}} \) are as defined in 4.2.1.
- \( F_{\text{min}}, F_{\text{avg}}, \) and \( F_{\text{max}} \) are as defined in table 4.1.3.

4.2.3 Water consumption factor. Calculate the water consumption factor, \( WCF \), expressed in gallon per cycle per cubic feet (or liter per cycle per liter), as:

\[ WCF = Q_T / C \]

where:

- \( Q_T \) as defined in section 4.2.2.
- \( C = \) as defined in section 3.1.5.

4.2 Per-cycle energy consumption for removal of moisture from test load. Calculate the per-cycle energy required to remove the moisture of the test load, \( D_m \), expressed in kilowatt-hours per cycle and defined as:

\[ D_m = (LAF) \times \text{Maximum test load weight} \times (RMC - 4%) \times (DEF) \times (DUF) \]

where:

- \( LAF = \) load adjustment factor = 0.52.
- Test load weight = As required in 3.8.1, expressed in lbs/cycle.
- RMC = As defined in 3.8.2.
- DEF = nominal energy required for a clothes dryer to remove moisture from clothes = 0.5 kWh/lb (1.1 kWh/kg).
- DUF = dryness usage factor, percentage of washer loads dried in a clothes dryer = 0.84.

4.4 Modified energy factor. Calculate the modified energy factor, \( MEF \), expressed in cubic feet per kilowatt-hour per cycle (or liters per kilowatt-hour per cycle) and defined as:

\[ MEF = C / (E_T) \]

where:

- \( C = \) as defined in 3.1.5.
- \( E_T = \) as defined in 4.1.7.
- \( D_C = \) as defined in 4.3.

4.5 Energy factor. Calculate the energy factor, \( EF \), expressed in cubic feet per kilowatt-hour per cycle (or liters per kilowatt-hour per cycle) and defined as:

\[ EF = C / (E_T) \]

where:

- \( C = \) as defined in 3.1.5.
- \( E_T = \) as defined in 4.1.7.

6. Waivers and Field Testing

6.1 Waivers and Field Testing for Non-conventional Clothes Washers. Manufacturers of nonconventional clothes washers, such as clothes washers with adaptive control systems, must submit a petition for waiver pursuant to 10 CFR 430.27 to establish an acceptable test procedure for that clothes washer. For these and other clothes washers that have controls or systems such that the DOE test procedures yield results that are not representative of the clothes washer’s true energy consumption characteristics as to provide materially inaccurate comparative data, field testing may be appropriate for establishing an acceptable test procedure. The following are guidelines for field testing which may be used by manufacturers in support of petitions for waiver. These guidelines are not mandatory and the Department may determine that they do not apply to a particular model. Depending upon a manufacturer’s approach for conducting field testing, additional data may be required. Manufacturers are encouraged to communicate with the Department prior to the commencement of field tests which may be used to support a petition for waiver. Section 6.3 provides an example of field testing for a clothes washer with an adaptive water fill control system. Other features, such as the use of various spin speed selections, could be the subject of field tests.

6.2 Nonconventional Wash System Energy Consumption Test. The field test may consist of a minimum of 10 of the nonconventional clothes washers (“test clothes washers”) and 10 clothes washers already being distributed in commerce (“base clothes washers”). The tests should include a minimum of 50 energy test cycles per clothes washer. The test clothes washers and base clothes washers should be identical in construction except for the controls or systems being tested. Equal numbers of both the test clothes washer and the base clothes washer should be tested simultaneously in comparable settings to minimize seasonal or consumer laundring conditions or variations. The clothes washers should be monitored in such a way as to accurately record the total energy consumption per cycle. At a minimum, the following should be measured and recorded throughout the test period for each clothes washer: Hot water usage in gallons (or liters), electrical energy usage in kilowatt-hours, and the cycles of usage. The field test results would be used to determine the best method to correlate the rating of the test clothes washer to the rating of the base clothes washer. If the base clothes washer is rated at A kWh per year, but field tests at B kWh per year, and the test clothes washer field tests at D kWh per year, the test unit would be rated as follows:

\[ A \times (D/B) = G \text{ kWh per year} \]

6.3 Adaptive water fill control system field test. Section 3.2.3.1 defines the test method for measuring energy consumption for clothes washers which incorporate control systems having both adaptive and alternate cycle selections. Energy consumption calculated by the method defined in section 3.2.3.1 assumes the adaptive cycle will be used 50 percent of the time. This section can be used to develop field test data in support of a petition for waiver when it is believed that the adaptive cycle will be used more than 50 percent of the time. The field test sample size should be a minimum of 10 test clothes washers. The test clothes washers should be totally representative of the design, construction, and control system that will be placed in commerce. The duration of field testing in the user’s house should be a minimum of 50 energy test cycles, for each unit. No special instructions as to cycle selection or product usage should be given to the field test participants, other than inclusion of the product literature pack which would be shipped with all units, and instructions regarding filling out data collection forms, use of data collection equipment, or basic procedural methods. Prior to the test clothes washers being installed in the field test locations, baseline data should be developed for all field test units by conducting laboratory tests as defined by section 1 through section 5 of these test procedures to determine the energy consumption, water
consumption, and remaining moisture content values. The following data should be measured and recorded for each wash load during the test period: wash cycle selected, the mode of the clothes washer (adaptive or manual), clothes load dry weight (measured after the clothes washer and clothes dryer cycles are completed) in pounds, and type of articles in the clothes load (e.g., cottons, linens, permanent press). The wash loads used in calculating the in-home percentage split between adaptive and manual cycle usage should be only those wash loads which conform to the definition of the energy test cycle.

Calculate:

\[ T = \text{The total number of energy test cycles run during the field test} \]
\[ T_a = \text{The total number of adaptive control energy test cycles} \]
\[ T_m = \text{The total number of manual control energy test cycles} \]

The percentage weighting factors:

\[ P_a = \left( \frac{T_a}{T} \right) \times 100 \text{ (the percentage weighting for adaptive control selection)} \]
\[ P_m = \left( \frac{T_m}{T} \right) \times 100 \text{ (the percentage weighting for manual control selection)} \]

Energy consumption \((H_{ET}, ME_T, \text{ and } D_E)\) and water consumption \((Q_T)\) values calculated in section 4 for the manual and adaptive modes, should be combined using \(P_a\) and \(P_m\) as the weighting factors.

APPENDIXES K–L TO SUBPART B OF PART 430 [RESERVED]

APPENDIX M TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF CENTRAL AIR CONDITIONERS AND HEAT PUMPS

1. DEFINITIONS

2. TESTING CONDITIONS

2.1 Test room requirements.
2.2 Test unit installation requirements.
2.2.1 Defrost control settings.
2.2.2 Special requirements for units having a multiple-speed outdoor fan.
2.2.3 Special requirements for multi-split air conditioners and heat pumps, and systems composed of multiple mini-split units (outdoor units located side-by-side) that would normally operate using two or more indoor thermostats.
2.2.4 Wet-bulb temperature requirements for the air entering the indoor and outdoor coils.

2.2.4.1 Cooling mode tests.
2.2.4.2 Heating mode tests.
2.2.5 Additional refrigerant charging requirements.
2.3 Indoor air volume rates.
2.3.1 Cooling tests.
2.3.2 Heating tests.
2.4 Indoor coil inlet and outlet duct connections.
2.4.1 Outlet plenum for the indoor unit.
2.4.2 Inlet plenum for the indoor unit.
2.5 Indoor coil air property measurements and air damper box applications.
2.5.1 Test set-up on the inlet side of the indoor coil: For cases where the inlet damper box is installed.
2.5.1.1 If the section 2.4.2 inlet plenum is installed.
2.5.1.2 If the section 2.4.2 inlet plenum is not installed.
2.5.2 Test set-up on the inlet side of the indoor unit: For cases where no inlet damper box is installed.
2.5.3 Indoor coil static pressure difference measurement.
2.5.4 Test set-up on the outlet side of the indoor coil.
2.5.4.1 Outlet air damper box placement and requirements.
2.5.4.2 Procedures to minimize temperature maldistribution.
2.5.5 Dry bulb temperature measurement.
2.5.6 Water vapor content measurement.
2.5.7 Air damper box performance requirements.
2.6 Airflow measuring apparatus.
2.7 Electrical voltage supply.
2.8 Electrical power and energy measurements.
2.9 Time measurements.
2.10 Test apparatus for the secondary space conditioning capacity measurement.

3. TESTING PROCEDURES

3.1 General Requirements.
3.1.1 Primary and secondary test methods.
3.1.2 Manufacturer-provided equipment overrides.
3.1.3 Airflow through the outdoor coil.
3.1.4 Airflow through the indoor coil.
3.1.4.1 Cooling Certified Air Volume Rate.
3.1.4.1.1 Cooling Certified Air Volume Rate for Ducted Units.
3.1.4.1.2 Cooling Certified Air Volume Rate for Non-Ducted Units.
3.1.4.2 Cooling Minimum Air Volume Rate.
3.1.4.3 Cooling Intermediate Air Volume Rate.
3.1.4.4 Heating Certified Air Volume Rate.
Pt. 430, Subpl. B, App. M

3.1.4.4.1 Ducted heat pumps where the Heating and Cooling Certified Air Volume Rates are the same.
3.1.4.4.2 Ducted heat pumps where the Heating and Cooling Certified Air Volume Rates are different due to indoor fan operation.
3.1.4.4.3 Ducted heating-only heat pumps.
3.1.4.4.4 Non-ducted heat pumps, including non-ducted heating-only heat pumps.
3.1.4.5 Heating Minimum Air Volume Rate.
3.1.4.6 Heating Intermediate Air Volume Rate.
3.1.4.7 Heating Nominal Air Volume Rate.
3.1.5 Indoor test room requirement when the air surrounding the indoor unit is not supplied from the same source as the air entering the indoor unit.
3.1.6 Air volume rate calculations.
3.1.7 Test sequence.
3.1.8 Requirement for the air temperature distribution leaving the indoor coil.
3.1.9 Control of auxiliary resistive heating elements.
3.2 Cooling mode tests for different types of air conditioners and heat pumps.
3.2.1 Tests for a unit having a single-speed compressor that is tested with a fixed-speed indoor fan installed, with a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.
3.2.2 Tests for a unit having a single-speed compressor and a variable-speed variable-air-volume-rate indoor fan installed.
3.2.2.1 Indoor fan capacity modulation that correlates with the outdoor dry bulb temperature.
3.2.2.2 Indoor fan capacity modulation based on adjusting the sensible to total (S/T) cooling capacity ratio.
3.2.3 Tests for a unit having a two-capacity compressor.
3.2.4 Tests for a unit having a variable-speed compressor.
3.3 Test procedures for steady-state wet coil cooling mode tests (the A, A1, A2, B1, B2, C, D, E, and F Tests).
3.4 Test procedures for the optional steady-state dry coil cooling mode tests (the C, C1, and G Tests).
3.5 Test procedures for the optional cyclic dry coil cooling mode tests (the D1, D2, and I Tests).
3.5.1 Procedures when testing ducted systems.
3.5.2 Procedures when testing non-ducted systems.
3.5.3 Cooling mode cyclic degradation coefficient calculation.
3.6 Heating mode tests for different types of heat pumps, including heating-only heat pumps.
3.6.1 Tests for a heat pump having a single-speed compressor that is tested with a single-speed indoor fan installed, with a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.
3.6.2 Tests for a heat pump having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan: capacity modulation correlates with outdoor dry bulb temperature.
3.6.3 Tests for a heat pump having a two-capacity compressor (see Definition 1.46), including two-capacity, northern heat pumps (see Definition 1.46).
3.6.4 Tests for a heat pump having a variable-speed compressor.
3.6.5 Additional test for a heat pump having a heat comfort controller.
3.7 Test procedures for steady-state Maximum Temperature and High Temperature heating mode tests (the H0C, H1C, H1, H1, and H2 Tests).
3.8 Test procedures for the optional cyclic heating mode tests (the HOC, HIC, and H1C Tests).
3.8.1 Heating mode cyclic degradation coefficient calculation.
3.9 Test procedures for Frost Accumulation heating mode tests (the H2, H2, H2, and H2 Tests).
3.9.1 Average space heating capacity and electrical power calculations.
3.9.2 Demand defrost credit.
3.10 Test procedures for steady-state Low Temperature heating mode tests (the H3, H3, and H3 Tests).
3.11 Additional requirements for the secondary test methods.
3.11.1 If using the Outdoor Air Enthalpy Method as the secondary test method.
3.11.2 If a preliminary test does not precede the official test.
3.11.3 Official test.
3.11.4 Test procedures for the Refrigerant Enthalpy Method as the secondary test method.
3.11.5 Rounding of space conditioning capacities for reporting purposes.

4. CALCULATIONS OF SEASONAL PERFORMANCE DESCRIPTORS

4.1 Seasonal Energy Efficiency Ratio (SEER) Calculations.
4.1.1 SEER calculations for an air conditioner or heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.
4.1.2 SEER calculations for an air conditioner or heat pump having a single-speed compressor and a variable-speed variable-air-volume-rate indoor fan.
4.1.2.1 Units covered by section 3.2.2.1 where indoor fan capacity modulation correlates with the outdoor dry bulb temperature.
4.1.2.2 Units covered by section 3.2.2.2 where indoor fan capacity modulation is used to adjust the sensible to total cooling capacity ratio.

4.1.3 SEER calculations for an air conditioner or heat pump having a two-capacity compressor.

4.1.3.1 Steady-state space cooling capacity at low compressor capacity is greater than or equal to the building cooling load at temperature \(T_j\), \(Q_{c,k}^{h}(T_j) \geq BL(T_j)\).

4.1.3.2 Unit alternates between high \((k=2)\) and low \((k=1)\) compressor capacity to satisfy the building cooling load at temperature \(T_j\), \(Q_{c,k}^{h}(T_j) < BL(T_j) < Q_{c,k}^{l}(T_j)\).

4.1.3.3 Unit only operates at high \((k=2)\) compressor capacity at temperature \(T_j\) and its capacity is greater than the building cooling load, \(BL(T_j) < Q_{c,k}^{h}(T_j)\).

4.1.3.4 Unit must operate continuously at high \((k=2)\) compressor capacity at temperature \(T_j\), \(BL(T_j) > Q_{c,k}^{h}(T_j)\).

4.1.4 SEER calculations for an air conditioner or heat pump having a variable-speed compressor.

4.1.4.1 Steady-state space cooling capacity when operating at minimum compressor speed is greater than or equal to the building cooling load at temperature \(T_j\), \(Q_{c,k}^{1}(T_j) \geq BL(T_j)\).

4.1.4.2 Unit operates at an intermediate compressor speed \((k=i)\) in order to match the building cooling load at a temperature \(T_j\), \(Q_{c,k}^{i}(T_j) < BL(T_j) < Q_{c,k}^{h}(T_j)\).

4.1.4.3 Unit must operate continuously at maximum \((k=2)\) compressor speed at temperature \(T_j\), \(BL(T_j) > Q_{c,k}^{h}(T_j)\).

4.2 Heating Seasonal Performance Factor (HSPF) Calculations.

4.2.1 Additional steps for calculating the HSPF of a heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.

4.2.2 Additional steps for calculating the HSPF of a heat pump having a single-speed, variable-air-volume-rate indoor fan.

4.2.3 Additional steps for calculating the HSPF of a heat pump having a two-capacity compressor.

4.2.3.1 Steady-state space heating capacity when operating at low compressor capacity is greater than or equal to the building heating load at temperature \(T_j\), \(Q_{h,k}^{l}(T_j) \geq BL(T_j)\).

4.2.3.2 Heat pump alternates between high \((k=2)\) and low \((k=1)\) compressor capacity to satisfy the building heating load at temperature \(T_j\), \(Q_{h,k}^{h}(T_j) < BL(T_j) < Q_{h,k}^{l}(T_j)\).

4.2.3.3 Heat pump only operates at high \((k=2)\) compressor capacity at temperature \(T_j\) and its capacity is greater than the building heating load, \(BL(T_j) < Q_{h,k}^{h}(T_j)\).

4.2.3.4 Heat pump must operate continuously at high \((k=2)\) compressor capacity at temperature \(T_j\), \(BL(T_j) > Q_{h,k}^{h}(T_j)\).

4.2.4 Additional steps for calculating the HSPF of a heat pump having a variable-speed compressor.

4.2.4.1 Steady-state space heating capacity when operating at minimum compressor speed is greater than or equal to the building heating load at temperature \(T_j\), \(Q_{h,k}^{1}(T_j) \geq BL(T_j)\).

4.2.4.2 Heat pump operates at an intermediate compressor speed \((k=i)\) in order to match the building heating load at a temperature \(T_j\), \(Q_{h,k}^{i}(T_j) < BL(T_j) < Q_{h,k}^{h}(T_j)\).

4.2.4.3 Heat pump must operate continuously at maximum \((k=2)\) compressor speed at temperature \(T_j\), \(BL(T_j) > Q_{h,k}^{h}(T_j)\).

4.2.5 Heat pumps having a heat comfort controller.

4.2.5.1 Heat pump having a heat comfort controller: Additional steps for calculating the HSPF of a heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.

4.2.5.2 Heat pump having a heat comfort controller: Additional steps for calculating the HSPF of a heat pump having a two-capacity compressor.

4.2.5.3 Heat pumps having a heat comfort controller: Additional steps for calculating the HSPF of a heat pump having a two-capacity compressor.

4.3 Calculations of the Actual and Representative Regional Annual Performance Factors for Heat Pumps.

4.3.1 Calculation of actual regional annual performance factors \((APF_{as})\) for a particular location and for each standardized design heating requirement.

4.3.2 Calculation of representative regional annual performance factors \((APF_{ar})\) for each generalized climatic region and for each standardized design heating requirement.

4.4 Rounding of SEER, HSPF, and APF for reporting purposes.

1. Definitions

1.1 Annual performance factor means the total heating and cooling done by a heat pump in a particular region in one year divided by the total electric energy used in one year. Paragraph \(m\)(3)(iii) of §430.22 of the Code of Federal Regulations states the calculation requirements for this rating descriptor.

1.2 ARI means Air-Conditioning and Refrigeration Institute.
humidity measurements, continuously re-
temperature, dew point temperature, or relative
ASHRAE Standard. Regarding wet bulb tem-
fied in section 4.3 part ''b'' of the same
that one samples at regular intervals equal
86 (RA 01). If such dry bulb temperatures are
tion 4.3 part ''a'' of ASHRAE Standard 41.1–
than the maximum intervals specified in sec-
the specified temperature must be sampled
ring to a dry bulb measurement, means that
ducted system.
means a fan that varies its operating speed
sensors and Condensing Units' published in 1993
ASHRAE.
ASHRAE Standard 37–88 means the test standard "Methods of Testing for Rating
Unitary Air-Conditioning and Heat Pump
Equipment" published in 1988 by ASHRAE.
ASHRAE Standard 41.1–86 (RA 01) means the test standard "Standard Method for
Temperature Measurement" published in 1986 and reaffirmed in 2001 by ASHRAE.
ASHRAE Standard 41.2–87 (RA 92) means the test standard "Standard Methods
for Laboratory Airflow Measurement" published in 1987 and reaffirmed in 1992 by
ASHRAE.
1.9 ASHRAE Standard 41.6–94 (RA 01) means the test standard "Method for Meas-
urement of Moist Air Properties" published in 1994 and reaffirmed in 2001 by ASHRAE.
1.10 ASHRAE Standard 41.9–00 means the test standard "Calorimeter Test Methods for
Mass Flow Measurements of Volatile Refrig-
erants" published in 2000 by ASHRAE.
1.11 ASHRAE Standard 51–99/AMCA
Standard 210-1999 means the test standard
"Laboratory Methods of Testing Fans for
Aerodynamic Performance Rating" published in 1999 by ASHRAE and the Air
Movement and Control Association International, Inc.
1.12 ASHRAE Standard 116–95 means the
test standard "Methods of Testing for Rating
for Seasonal Efficiency of Unitary Air Condi-
tioners and Heat Pumps" published in 1995
by ASHRAE.
1.13 CFR means Code of Federal Regula-
tions.
1.14 Constant-air-volume-rate indoor fan
means a fan that varies its operating speed
to provide a fixed air-volume-rate from a
ducted system.
1.15 Continuously recorded, when refer-
ing to a dry bulb measurement, means that
the specified temperature must be sampled
at regular intervals that are equal to or less
than the maximum intervals specified in sec-
tion 4.3 part ''a'' of ASHRAE Standard 41.1–
86 (RA 01). If such dry bulb temperatures are
used only for test room control, it means that
one samples at regular intervals equal
to or less than the maximum intervals speci-
fied in section 4.3 part ''b'' of the same
ASHRAE Standard. Regarding wet bulb
temperature, dew point temperature, or relative
humidity measurements, continuously re-
corded means that the measurements must
be made at regular intervals that are equal
to or less than 1 minute.
1.16 Cooling load factor (CLF) means the
ratio having as its numerator the total cool-
ing delivered during a cyclic operating inter-
val consisting of one ON period and one OFF
period. The denominator is the total cooling
that would be delivered, given the same am-
bitious operating conditions. The unit operate-
contensively at its steady-state space cooling
capacity for the same total time (ON + OFF)
interval.
1.17 Coefficient of Performance (COP)
means the ratio of the average rate of space
heating delivered to the average rate of elec-
trical energy consumed by the heat pump.
These rate quantities must be determined
from a single test or, if derived via interpola-
tion, must be tied to a single set of operating
conditions. COP is a dimensionless quantity.
When determined for a ducted unit tested
without an indoor fan installed, COP must
include the section 3.7, 3.8, and 3.9.1 default
values for the heat output and power input of
a fan motor.
1.18 Cyclic Test means a test where the
unit's compressor is cycled on and off for
specific time intervals. A cyclic test provides
half the information needed to calculate a
degradation coefficient.
1.19 Damper box means a short section of
duct having an air damper that meets the
performance requirements of section 2.5.7.
1.20 Degradation coefficient (C_{D}) means a
parameter used in calculating the part load
test. The degradation coefficient for cool-
ing is denoted by C_{D}. The degradation coeffi-
cient for heating is denoted by C_{D}^{h}.
1.21 Demand-defrost control system
means a system that defrosts the heat pump
outdoor coil only when measuring a pre-
determined degradation of performance. The
heat pump's controls monitor one or more
parameters that always vary with the
amount of frost accumulated on the outdoor
coil (e.g., coil to air differential temperature,
cold differential air pressure, outdoor fan
power or current, optical sensors, etc.) at
least once for every ten minutes of com-
pressor ON-time when space heating. One ac-
ceptable alternative to the criterion given in
the prior sentence is a feedback system that
measures the length of the defrost period and
adjusts defrost frequency accordingly. In all
cases, when the frost parameter(s) reaches a
predetermined value, the system initiates a
defrost. In a demand-defrost control system,
defrosts are terminated based on monitoring a
parameter(s) that indicates that frost has
been eliminated from the coil.
A demand-defrost control system, which
otherwise meets the above requirements,
may allow time-initiated defrosts if, and only if, such defrosts occur after 6 hours of compressor operating time.

1.22 Design heating requirement (DHR) predicts the space heating load of a residence when subjected to outdoor design conditions. Estimates for the minimum and maximum DHR are provided for six generalized U.S. climatic regions in section 4.2.

1.23 Dry-coil tests are cooling mode tests where the wet-bulb temperature of the air supplied to the indoor coil is maintained low enough that no condensate forms on this coil.

1.24 Ducted system means an air conditioner or heat pump that is designed to be permanently installed equipment and delivers conditioned air to the indoor space through a duct(s). The air conditioner or heat pump may be either a split system or a single-packaged unit.

1.25 Energy efficiency ratio (EER) means the ratio of the average rate of space cooling delivered to the average rate of electrical energy consumed by the air conditioner or heat pump. These rate quantities must be determined from a single test or, if derived via interpolation, must be tied to a single set of operating conditions. EER is expressed in units of

$$\frac{\text{Btu/h}}{\text{W}}$$

When determined for a ducted unit tested without an indoor fan installed, EER must include the section 3.3 and 3.5.1 default values for the heat output and power input of a fan motor.

1.26 Heating load factor (HLF) means the ratio having as its numerator the total heating delivered during a cyclic operating interval consisting of one ON period and one OFF period. The denominator is the total heating that would be delivered, given the same ambient conditions, if the unit operated continuously at its steady-state space heating capacity for the same total time (ON plus OFF) interval.

1.27 Heating seasonal performance factor (HSPF) means the total space heating required during the space heating season, expressed in Btu’s, divided by the total electrical energy consumed by the heat pump system during the same season, expressed in watt-hours. The HSPF used to evaluate compliance with the Energy Conservation Standards (see 10 CFR 430.32(c), Subpart C) is based on Region IV, the minimum standardized design heating requirement, and the sampling plan stated in 10 CFR 430.24(m), Subpart B.

1.28 Heat pump having a heat comfort controller means equipment that regulates the operation of the electric resistance elements to assure that the air temperature leaving the indoor section does not fall below a specified temperature. This specified temperature is usually field adjustable. Heat pumps that actively regulate the rate of electric resistance heating when operating below the balance point (as the result of a second stage call from the thermostat) but do not operate to maintain a minimum delivery temperature are not considered as having a heat comfort controller.

1.29 Mini-split air conditioners and heat pumps means systems that have a single outdoor section and one or more indoor sections. The indoor sections cycle on and off in unison in response to a single indoor thermostat.

1.30 Multiple-split air conditioners and heat pumps means systems that have two or more indoor sections. The indoor sections operate independently and can be used to condition multiple zones in response to multiple indoor thermostats.

1.31 Non-ducted system means an air conditioner or heat pump that is designed to be permanently installed equipment and directly heats or cools air within the conditioned space using one or more indoor coils that are mounted on room walls and/or ceilings. The unit may be of a modular design that allows for combining multiple outdoor coils and compressors to create one overall system. Non-ducted systems covered by this test procedure are all split systems.

1.32 Part-load factor (PLF) means the ratio of the cyclic energy efficiency ratio (coefficient of performance) to the steady-state energy efficiency ratio (coefficient of performance). Evaluate both energy efficiency ratios (coefficients of performance) based on operation at the same ambient conditions.

1.33 Seasonal energy efficiency ratio (SEER) means the total heat removed from the conditioned space during the annual cooling season, expressed in Btu’s, divided by the total electrical energy consumed by the air conditioner or heat pump during the same season, expressed in watt-hours. The SEER calculation in section 4.1 of this Appendix and the sampling plan stated in 10 CFR Subpart B, 430.24(m) are used to evaluate compliance with the Energy Conservation Standards. (See 10 CFR 430.32(c), Subpart C.)

1.34 Single-packaged unit means any central air conditioner or heat pump that has all major assemblies enclosed in one cabinet.

1.35 Small-duct, high-velocity system means a system that contains a blower and indoor coil combination that is designed for, and produces, at least 1.2 inches (of water) of external static pressure when operated at the certified air volume rate of 220-350 cfm per rated ton of cooling. When applied in the field, small-duct products use high-velocity room outlets (i.e., generally greater than 1000 fpm) having less than 6.0 square inches of free area.
1.36 Split system means any air conditioner or heat pump that has one or more of the major assemblies separated from the others.

1.37 Standard Air means dry air at 70 °F and 14.696 psia. Under these conditions, dry air has a mass density of 0.075 lb/ft³.

1.38 Steady-state test means a test where the test conditions are regulated to remain as constant as possible while the unit operates continuously in the same mode.

1.39 Temperature bin means the 5 °F increments that are used to partition the outdoor dry-bulb temperature ranges of the cooling (≥ 65 °F) and heating (< 65 °F) seasons.

1.40 Test condition tolerance means the maximum permissible difference between the average value of the measured test parameter and the specified test condition.

1.41 Test operating tolerance means the maximum permissible range that a measurement may vary over the specified test interval. The difference between the maximum and minimum sampled values must be less than or equal to the specified test operating tolerance.

1.42 Time adaptive defrost control system is a demand-defrost control system (see definition 1.21) that measures the length of the prior defrost period(s) and uses that information to automatically determine when to initiate the next defrost cycle.

1.43 Time-temperature defrost control systems initiate or evaluate initiating a defrost cycle only when a predetermined cumulative compressor ON-time is obtained. This predetermined ON-time is generally a fixed value (e.g., 30, 45, 90 minutes) although it may vary based on the measured outdoor dry-bulb temperature. The ON-time counter accumulates if controller measurements (e.g., outdoor temperature, evaporator temperature) indicate that frost formation conditions are present, and it is reset/remains at zero at all other times. In one application of the control scheme, a defrost is initiated whenever the counter time equals the predetermined ON-time. The counter is reset when the defrost cycle is completed.

1.44 Triple-split system means an air conditioner or heat pump that is composed of three separate components: An outdoor fan coil section, an indoor fan coil section, and an indoor compressor section.

1.45 Two-capacity (or two-stage) compressor means an air conditioner or heat pump that has one of the following:

(1) A two-speed compressor,

(2) Two compressors where only one compressor ever operates at a time,

(3) Two compressors where one compressor (Compressor #1) operates at low loads and both compressors (Compressors #1 and #2) operate at high loads but Compressor #2 never operates alone, or

(4) A compressor that is capable of cylinder or scroll unloading.

For such systems, low capacity means:

(1) Operating at low compressor speed,

(2) Operating the lower capacity compressor,

(3) Operating Compressor #1, or

(4) Operating with the compressor unloaded (e.g., operating one piston of a two-piston reciprocating compressor, using a fixed fractional volume of the full scroll, etc.).

For such systems, high capacity means:

(1) Operating at high compressor speed,

(2) Operating the higher capacity compressor,

(3) Operating Compressors #1 and #2, or

(4) Operating with the compressor unloaded (e.g., operating both pistons of a two-piston reciprocating compressor, using the full volume of the scroll).

1.46 Two-capacity, northern heat pump means a heat pump that has a factory or field-selectable lock-out feature to prevent space cooling at high-capacity. Two-capacity heat pumps having this feature will typically have two sets of ratings, one with the feature disabled and one with the feature enabled. The indoor coil model number should reflect whether the ratings pertain to the lockout enabled option via the inclusion of an extra identifier, such as “+LO.” When testing as a two-capacity, northern heat pump, the lock-out feature must remain enabled for all tests.

1.47 Wet-coil test means a test conducted at test conditions that typically cause water vapor to condense on the test unit evaporator coil.

2. Testing Conditions

This test procedure covers split-type and single-packaged ducted units and split-type non-ducted units. Except for units having a variable-speed compressor, ducted units tested without an indoor fan installed are covered.

a. Only a subset of the sections listed in this test procedure apply when testing and rating a particular unit. Tables 1-A through 1-C show which sections of the test procedure apply to each type of equipment. In each table, look at all four of the Roman numeral categories to see what test sections apply to the equipment being tested.
1. The first category, Rows I–1 through I–4 of the Tables, pertains to the compressor and indoor fan features of the equipment. After identifying the correct "I" row, find the table cells in the same row that list the type of equipment being tested: Air conditioner (AC), heat pump (HP), or heating-only heat pump (HH). Use the test section(s) listed above each noted table cell for testing and rating the unit.

2. The second category, Rows II–1 and II–2, pertains to the presence or absence of ducts. Row II–1 shows the test procedure sections that apply to ducted systems, and Row II–2 shows those that apply to non-ducted systems.

3. The third category is for special features that may be present in the equipment. When testing units that have one or more of the three (special) equipment features described by the Table legend for Category III, use Row III to find test sections that apply.

4. The fourth category is for the secondary test method to be used. If the secondary method for determining the unit’s cooling and/or heating capacity is known, use Row IV to find the appropriate test sections. Otherwise, include all of the test sections referenced by Row IV cell entries—i.e., sections 2.10 to 2.10.3 and 3.11 to 3.11.3—among those sections consulted for testing and rating information.

b. Obtain a complete listing of all pertinent test sections by recording those sections identified from the four categories above.

c. The user should note that, for many sections, only part of a section applies to the unit being tested. In a few cases, the entire section may not apply. For example, sections 3.4 to 3.5.3 (which describe optional dry coil tests), are not relevant if the allowed default value for the cooling mode cyclic degradation coefficient is used rather than determining it by testing.

Example for Using Tables 1–A to 1–C

Equipment Description: A ducted air conditioner having a single-speed compressor, a fixed-speed indoor fan, and a multi-speed outdoor fan.

Secondary Test Method: Refrigerant Enthalpy Method

Step 1. Determine which of four listed Row "I" options applies ==> Row I–2

Table 1–A: "AC" is listed in Row I–2 is found in the columns for sections 1.1 to 1.47, 2.1 to 2.2, 2.4 to 2.4.1, 2.5 to 2.3.1, 2.4 to 2.4.1, 2.5, 2.5.2 to 2.10, and 2.11 to 2.13.

Table 1–B: "AC" is listed in Row I–2 for sections 3 to 3.14, 3.15 to 3.1.8, 3.2.1, 3.3 to 3.5, 3.5.3, 3.11 and 3.12.

Table 1–C: "AC" is listed in Row I–2 for sections 4.1.1 and 4.4.

Step 2. Equipment is ducted ==> Row II–1

Table 1–A: "AC" is listed in Row II–1 for sections 2.4.2 and 2.5.1 to 2.5.1.2.

Table 1–B: "AC" is listed in Row II–1 for sections 3.1.4.1 to 3.1.4.1.1 and 3.5.1.

Table 1–C: no "AC" listings in Row II–1.

Step 3. Equipment Special Features include multi-speed outdoor fan ==> Row III, M

Table 1–A: "M" is listed in Row III for section 2.2.2

Table 1–B and 1–C: no "M" listings in Row III.

Step 4. Secondary Test Method is Refrigerant Enthalpy Method ==> Row IV, R

Table 1–A: "R" is listed in Row IV for section 2.10.3

Table 1–B: "R" is listed in Row IV for section 3.11.3

Table 1–C: no "R" listings in Row IV.

Step 5. Cumulative listing of applicable test procedure sections 1.1 to 1.47, 2.1 to 2.2, 2.2.2, 2.2.4 to 2.4.1, 2.2.5, 2.3 to 2.3.1, 2.4 to 2.4.1, 2.4.2, 2.5, 2.5.1 to 2.5.1.2, 2.5.2 to 2.10, 2.10.3, 2.11 to 2.13, 3. to 3.14, 3.14.1.1 to 3.14.1.11, 3.15 to 3.18, 3.2.1, 3.3 to 3.5, 3.5.1, 3.5.3, 3.11, 3.11.3, 3.12, 4.1.1, and 4.4.

2.1 Test room requirements. A test using two test rooms, an indoor test room and an outdoor test room. These rooms must comply with the requirements specified in sections 8.1.2 and 8.1.3 of ASHRAE Standard 37–88 (incorporated by reference, see § 430.22).

- Inside these test rooms, use artificial loads during cyclic tests and frost accumulation tests, if needed, to produce stabilized room air temperatures. For one room, select an electric resistance heater(s) having a heating capacity that is approximately equal to the heating capacity of the test unit's condenser. For the second room, select a heater(s) having a capacity that is close to the sensible cooling capacity of the test unit's evaporator. When applied, cycle the heater located in the same room as the test unit's evaporator ON and OFF when the test unit cycles ON and OFF. Cycle the heater located in the same room as the test unit's condensing coil ON and OFF when the test unit cycles OFF and ON.

**Legend for Table Entries:**

Categories I and II:  
- **AC** = applies for an Air Conditioner that meets the corresponding Column 1 “Key Equipment . . .” criterion
- **HP** = applies for a Heat Pump that meets the corresponding Column 1 “Key Equipment . . .” criterion
- **HH** = applies for a Heating-only Heat pump that meets the corresponding Column 1 “Key Equipment . . .” criterion

Category III:  
- **G** = ganged mini-splits or multi-splits;
- **H** = heat pump with a heat comfort controller;
- **M** = units with a multi-speed outdoor fan.

Category IV:  
- **O** = Outdoor Air Enthalpy Method; **C** = Compressor Calibration Method; **R** = Refrigerant Enthalpy Method
2.2 Test unit installation requirements. a. Install the unit according to section 8.6 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). With respect to interconnecting tubing used when testing split systems, however, follow the requirements given in section 6.1.3.5 of ARI Standard 210/240-2003 (incorporated by reference, see §430.22). Test all supplementary heating coils from operating compressor systems. For these systems, the test procedure references to a single indoor fan, outdoor fan, and compressor means all indoor fans, all outdoor fans, and all compressor systems. b. For units designed for both horizontal and vertical installation or for both up-flow and down-flow vertical installations, the manufacturer must specify the orientation used for testing. Conduct testing with the following installed:

(1) The most restrictive filter(s);
(2) Supplementary heating coils; and
(3) Other equipment specified as part of the unit, including all hardware used by a heat comfort controller if so equipped (see Definition 1.28).

b. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 2, note 3 (see section 3.1.4). As noted in §430.22, section 3.1.9, prevent the indoor air supplementary heating coils from operating during all tests. For coil-only indoor units that are supplied without an enclosure, create an enclosure using 1 inch fiberglass ductboard having a nominal thickness of 1/2 inch.
of the unit to meet the requirements of section 3.4.

2.2.4.2 Heating mode tests. For heating mode tests, regulate the water vapor content of the air entering the outdoor unit to the applicable wet-bulb temperature listed in Tables 9 to 12. The wet-bulb temperature entering the indoor side of the heat pump must not exceed 60 °F. Additionally, if the Outdoor Air Enthalpy test method is used while testing a single-packaged heat pump where all or part of the outdoor section is located in the indoor test room, adjust the wet-bulb temperature for the air entering the indoor side to yield an indoor-side dew point temperature that is as close as reasonably possible to the dew point temperature of the outdoor-side entering air.

2.2.5 Additional refrigerant charging requirements. Charging according to the “manufacturer’s instructions,” as stated in section 8.6 of ASHRAE Standard 37-88 (incorporated by reference, see § 430.22), means the manufacturer’s installation instructions that come packaged with the unit. If a unit requires charging but the installation instructions do not specify a charging procedure, then evacuate the unit and add the nameplate refrigerant charge. Where the manufacturer’s installation instructions contain two sets of refrigerant charging criteria, one for field installations and one for lab testing, use the field installation criteria. For third-party testing, the test laboratory may consult with the manufacturer about the refrigerant charging procedure and make any needed corrections so long as they do not contradict the published installation instructions. The manufacturer may specify an alternative charging criteria to the third-party laboratory so long as the manufacturer thereafter revises the published installation instructions accordingly.

2.3 Indoor air volume rates. If a unit’s controls allow for overspeeding the indoor fan (usually on a temporary basis), take the necessary steps to prevent overspeeding during all tests.

2.3.1 Cooling tests. a. Set indoor fan control options (e.g., fan motor pin settings, fan motor speed) according to the published installation instructions that are provided with the equipment while meeting the airflow requirements that are specified in sections 3.1.4.1 to 3.1.4.3.

b. Express the Cooling Certified Air Volume Rate, the Cooling Minimum Air Volume Rate, and the Cooling Intermediate Air Volume Rate in terms of standard air.

2.3.2 Heating tests. a. If needed, set the indoor fan control options (e.g., fan motor pin settings, fan motor speed) according to the published installation instructions that are provided with the equipment. Do this set-up while meeting all applicable airflow requirements specified in sections 3.1.4.4 to 3.1.4.7.

b. Express the Heating Certified Air Volume Rate, the Heating Minimum Air Volume Rate, the Heating Intermediate Air Volume Rate, and the Heating Nominal Air Volume Rate in terms of standard air.

2.4 Indoor coil inlet and outlet duct connections. Insulate and/or construct the outlet plenum described in section 2.4.1 and, if installed, the inlet plenum described in section 2.4.2 with thermal insulation having a nominal overall resistance (R-value) of at least 19 hr·ft²·°F/Btu.

2.4.1 Outlet plenum for the indoor unit. Attach a plenum to the outlet of the indoor coil. (Note: for some packaged systems, the indoor coil may be located in the outdoor test room.) For non-ducted systems having multiple indoor coils, attach a plenum to each indoor coil outlet. Add a static pressure tap to each face of the (each) outlet plenum, if rectangular, or at four evenly distributed locations along the circumference of an oval or round plenum. Create a manifold that connects the four static pressure taps. Figure 1 shows two of the three options allowed for the manifold configuration; the third option is the broken-ring, four-to-one manifold configuration that is shown in Figure 7 of ASHRAE Standard 37-88 (incorporated by reference, see § 430.22). See Figures 7 and 8 of ASHRAE Standard 37-88 (incorporated by reference, see § 430.22) for the cross-sectional dimensions and minimum length of the (each) plenum and the locations for adding the static pressure taps for units tested with and without an indoor fan installed. For a non-ducted system having multiple indoor coils, have all outlet plenums discharge air into a single common duct. At the plane where each plenum enters the common duct, install an adjustable airflow damper and use it to equalize the static pressure in each plenum.
2.4.2 Inlet plenum for the indoor unit. Install an inlet plenum when testing a coil-only indoor unit or a packaged system where the indoor coil is located in the outdoor test room. Add static pressure taps at the center of each face of this plenum, if rectangular, or at four evenly distributed locations along the circumference of an oval or round plenum. Make a manifold that connects the four static pressure taps using one of the three configurations specified in section 2.4.1. See Figure 8 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) for cross-sectional dimensions, the minimum length of the inlet plenum, and the locations of the static pressure taps. When testing a ducted unit having an indoor fan (and the indoor coil is in the indoor test room), the manufacturer has the option to test with or without an inlet plenum installed. Space limitations within the test room may dictate that the manufacturer choose the latter option. If used, construct the inlet plenum and add the four static pressure taps as shown in Figure 8 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). Manifold the four static pressure taps using one of the three configurations specified in section 2.4.1. Never use an inlet plenum when testing a non-ducted system.

Figure 1. Configurations for manifolding the static pressure taps. The top two diagrams show the complete ring, four-to-one configuration. The lower two diagrams show the triple-T configuration.
2.5 Indoor coil air property measurements and air damper box applications. a. Measure the dry-bulb temperature and water vapor content of the air entering and leaving the indoor coil. If needed, use an air sampling device to divert air to a sensor(s) that measures the water vapor content of the air. See Figure 2 of ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see § 430.22) for guidance on constructing an air sampling device. The sampling device may also divert air to a remotely located sensor(s) that measures dry bulb temperature. The air sampling device and the remotely located temperature sensor(s) may be used to determine the entering air dry bulb temperature during any test. The air sampling device and the remotely located leaving air dry bulb temperature sensor(s) may be used for all tests except:

1. Cyclic tests; and
2. Frost accumulation tests.

b. An acceptable alternative in all cases, including the two special cases noted above, is to install a grid of dry bulb temperature sensors within the outlet and inlet ducts. Use a temperature grid to get the average dry bulb temperature at one location, leaving or entering, or when two grids are applied as a thermopile, to directly obtain the temperature difference. A grid of temperature sensors (which may also be used for determining average leaving dry bulb temperature) is required to measure the temperature distribution within a cross-section of the leaving airstream.

c. Use an inlet and outlet air damper box when testing ducted systems if conducting one or both of the cyclic tests listed in sections 3.2 and 3.6. Otherwise, install an outlet air damper box when testing heat pumps, both ducted and non-ducted, that cycle off the indoor fan during defrost cycles if no other means is available for preventing natural or forced convection through the indoor unit when the indoor fan is off. Never use an inlet damper box when testing a non-ducted system.

2.5.1 Test set-up on the inlet side of the indoor coil: for cases where no inlet damper box is installed. a. Install the inlet side damper box as specified in section 2.5.11 or 2.5.1.2, whichever applies. Insulate or construct the ductwork between the point where the air damper is installed and where the connection is made to either the inlet plenum (section 2.5.11 units) or the indoor unit (section 2.5.12 units) with thermal insulation that has a nominal overall resistance (R-value) of at least 19 hr·ft²·°F/Btu.

b. Locate the grid of entering air dry-bulb temperature sensors, if used, at the inlet of the damper box. Locate the air sampling device, or the sensor used to measure the water vapor content of the inlet air, at a location immediately upstream of the damper box inlet.

2.5.1.1 If the section 2.4.2 inlet plenum is installed. Install the inlet damper box upstream of the inlet plenum. The cross-sectional flow area of the damper box must be equal to or greater than the flow area of the inlet plenum. If needed, use an adaptor plate or a transition duct section to connect the damper box with the inlet plenum.

2.5.1.2 If the section 2.4.2 inlet plenum is not installed. Install the damper box immediately upstream of the air inlet of the indoor unit. The cross-sectional dimensions of the damper box must be equal to or greater than the dimensions of the indoor unit inlet. If needed, use an adaptor plate or a short transition duct section to connect the damper box with the unit’s air inlet. Add static pressure taps at the center of each face of the damper box, if rectangular, or at four evenly distributed locations along the circumference, if oval or round. Locate the pressure taps between the inlet damper and the inlet of the indoor unit. Make a manifold that connects the four static pressure taps.

2.5.2 Test set-up on the inlet side of the indoor unit: for cases where no inlet damper box is installed. If using the section 2.4.2 inlet plenum and a grid of dry bulb temperature sensors, mount the grid at a location upstream of the static pressure taps described in section 2.4.2, preferably at the entrance plane of the inlet plenum. If the section 2.4.2 inlet plenum is not used, but a grid of dry bulb temperature sensors is used, locate the grid approximately 6 inches upstream from the inlet of the indoor unit. Or, in the case of non-ducted units having multiple indoor coils, locate a grid approximately 6 inches upstream from the inlet of each indoor coil. Position an air sampling device, or the sensor used to measure the water vapor content of the inlet air, immediately upstream of the (each) entering air dry-bulb temperature sensor grid. If a grid of sensors is not used, position the entering air sampling device (or the sensor used to measure the water vapor content of the inlet air) as if the grid were present.

2.5.3 Indoor coil static pressure difference measurement. Section 6.4.4.1 of ASHRAE Standard 37-88 (incorporated by reference, see § 430.22) describes the method for fabricating static pressure taps. Also refer to Figure 2A of ASHRAE Standard 51-99, AMCA Standard 210-99 (incorporated by reference, see § 430.22). Use a differential pressure measuring instrument that is accurate to within ±0.01 inches of water and has a resolution of at least 0.01 inches of water to measure the static pressure difference between the indoor coil air inlet and outlet. Connect one side of the differential pressure instrument to the manifolded pressure taps installed in the outlet plenum. Connect the other side of the instrument to the manifolded pressure taps located in either the inlet plenum or incorporated within the air damper box.
inlet plenum or inlet damper box are not used, leave the inlet side of the differential pressure instrument open to the surrounding atmosphere. For non-ducted systems that are tested with only outlet plenums, measure the static pressure within each outlet plenum relative to the surrounding atmosphere.

2.5.4 Test set-up on the outlet side of the indoor coil. a. Install an interconnecting duct between the outlet plenum described in section 2.4.1 and the airflow measuring apparatus described below in section 2.6. The cross-sectional flow area of the interconnecting duct must be equal to or greater than the flow area of the outlet plenum or the common duct used when testing non-ducted units having multiple indoor coils. If needed, use adaptor plates or transition duct sections to allow the connections. To minimize leakage, tape joints within the interconnecting duct (and the outlet plenum). Construct or insulate the entire flow section with thermal insulation having a nominal overall resistance (R-value) of at least 19 hr·ft²·°F/Btu.

b. Install a grid(s) of dry-bulb temperature sensors inside the interconnecting duct. Also, install an air sampling device, or the sensor(s) used to measure the water vapor content of the outlet air, inside the interconnecting duct. Locate the dry-bulb temperature grid(s) upstream of the air sampling device (or the in-duct sensor(s) used to measure the water vapor content of the outlet air). Air that circulates through an air sampling device and past a remote water-vapor-content sensor(s) must be returned to the interconnecting duct at a point:

(1) Downstream of the air sampling device;
(2) Upstream of the outlet air damper box, if installed; and
(3) Upstream of the section 2.6 airflow measuring apparatus.

2.5.4.1 Outlet air damper box placement and requirements. If using an outlet air damper box (see section 2.5), install it within the interconnecting duct at a location downstream of the location where air from the sampling device is reintroduced or downstream of the in-duct sensor that measures water vapor content of the outlet air. The leakage rate from the combination of the interconnecting duct, the closed damper, and the duct section that connects these two components must not exceed 20 cubic feet per minute when a negative pressure of 1 inch of water column is maintained at the plenum’s inlet.

2.5.4.2 Procedures to minimize temperature maldistribution. Use these procedures if necessary to correct temperature maldistributions. Install a mixing device(s) upstream of the outlet air, dry-bulb temperature grid (but downstream of the outlet plenum static pressure taps). Use a perforated screen located between the mixing device and the dry-bulb temperature grid, with a maximum open area of 40 percent. One or both items should help to meet the maximum outlet air temperature distribution specified in section 3.1.8. Mixing devices are described in sections 6.3–6.5 of ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see §430.22) and section 5.2.2 of ASHRAE Standard 41.2–87 (RA 92) (incorporated by reference, see §430.22).

2.5.5 Dry bulb temperature measurement. a. Measure dry bulb temperatures as specified in sections 4, 5, 6.1–6.10, 9, 10, and 11 of ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see §430.22). The transient testing requirements cited in section 4.3 of ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see §430.22) apply if conducting a cyclic or frost accumulation test.

b. Distribute the sensors of a dry-bulb temperature grid over the entire flow area. The required minimum is 9 sensors per grid.

2.5.6 Water vapor content measurement. Determine water vapor content by measuring dry-bulb temperature combined with the air wet-bulb temperature, dew point temperature, or relative humidity. If used, construct and apply wet-bulb temperature sensors as specified in sections 4, 5, 6, 9, 10, and 11 of ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see §430.22). As specified in ASHRAE Standard 41.1–86 (RA 01) (incorporated by reference, see §430.22), the temperature sensor (wick removed) must be accurate to within ±0.2°F. If used, apply dew point hygrometers as specified in sections 5 and 8 of ASHRAE Standard 41.6–94 (RA 01) (incorporated by reference, see §430.22). The dew point hygrometers must be accurate to within ±0.4°F when operated at conditions that result in the evaluation of dew points above 35°F. If used, a relative humidity (RH) meter must be accurate to within ±0.7% RH. Other means to determine the psychrometric state of air may be used as long as the measurement accuracy is equivalent to or better than the accuracy achieved from using a wet-bulb temperature sensor that meets the above specifications.

2.5.7 Air damper box performance requirements. If used (see section 2.5), the air damper box(es) must be capable of being completely opened or completely closed within 10 seconds for each action.

2.6 Airflow measuring apparatus. a. Fabricate and operate an Air Flow Measuring Apparatus as specified in section 6.1 of ASHRAE Standard 116-95 (incorporated by reference, see §430.22). Refer to Figure 12 of ASHRAE Standard 51–99/AMCA Standard 210–99 (incorporated by reference, see §430.22) for guidance on placing the static pressure taps and positioning the diffusion
baffle (settling means) relative to the chamber inlet.

b. Connect the airflow measuring apparatus to the interconnecting duct section described in section 2.5.4. See sections 6.1.1, 6.1.2, and 6.1.4, and Figures 1, 2, and 4 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22), and Figures D1, D2, and D4 of ARI Standard 210/240-2003 (incorporated by reference, see §430.22) for illustrative examples of how the test apparatus may be applied within a complete laboratory set-up. Instead of following one of these examples, an alternative set-up may be used to handle the air leaving the airflow measuring apparatus and to supply properly conditioned air to the test unit’s inlet. The alternative set-up, however, must not interfere with the prescribed means for measuring airflow rate, inlet and outlet air temperatures, inlet and outlet water vapor contents, and external static pressures, nor create abnormal conditions surrounding the test unit.

(Note: Do not use an enclosure as described in section 6.1.3 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) when testing triple-split units.)

2.7 Electrical voltage supply. Perform all tests at the voltage specified in section 6.1.3.2 of ARI Standard 210/240-2003 (incorporated by reference, see §430.22) for “Standard Rating Tests.” Measure the supply voltage at the terminals on the test unit using a volt meter that provides a reading that is accurate to within ±0.2 percent. If required cyclic tests on non-ducted units, provide instrumentation to determine the average electrical power consumption of the indoor fan motor to within ±1.0 percent. If required according to sections 3.3, 3.4, 3.7, 3.9.1, and/or 3.10, this same instrumentation requirement applies when testing air conditioners and heat pumps having a variable-speed constant-air-volume-rate indoor fan or a variable-speed, variable-air-volume-rate indoor fan.

2.9 Time measurements. Make elapsed time measurements using an instrument that yields readings accurate to within ±0.2 percent.

2.10 Test apparatus for the secondary space conditioning capacity measurement. For all tests, use the Indoor Air Enthalpy Method to measure the unit’s capacity. This method uses the test set-up specified in sections 2.4 to 2.6. In addition, for all steady-state tests, conduct a second, independent measurement of capacity as described in section 3.1.1. For split systems, use one of the following secondary measurement methods: Outdoor Air Enthalpy Method, Compressor Calibration Method, or Refrigerant Enthalpy Method. For single packaged units, use either the Outdoor Air Enthalpy Method or the Compressor Calibration Method, or Refrigerant Enthalpy Method, Compressor Calibration Method, or Refrigerant Enthalpy Method. For single packaged units, use either the Outdoor Air Enthalpy Method or the Compressor Calibration Method as the secondary measurement.

2.10.1 Outdoor Air Enthalpy Method. a. To make a secondary measurement of indoor space conditioning capacity using the Outdoor Air Enthalpy Method, do the following:

1. Measure the air-side capacity at the outdoor coil; and

2. Measure the electrical power consumption of the test unit; and

3. Calculate the air-flow rate of the test unit.

b. When performing section 3.5 and/or 3.8 cyclic tests on non-ducted units, provide instrumentation to determine the average electrical power consumption of the indoor fan motor to within ±1.0 percent. If required according to sections 3.3, 3.4, 3.7, 3.9.1, and/or 3.10, this same instrumentation requirement applies when testing air conditioners and heat pumps having a variable-speed constant-air-volume-rate indoor fan or a variable-speed, variable-air-volume-rate indoor fan.

2.10.2 Compressor Calibration Method. For single packaged units, use either the Compressor Calibration Method as the secondary measurement.
superheat or liquid subcooling. Alternatively, if the test unit is not sensitive to the refrigerant charge, connect pressure gages to the access valves or to ports created from tapping into the suction and discharge lines. Use this alternative approach when testing a unit charged with a zeotropic refrigerant having a temperature glide in excess of 1°F at the specified test conditions.

2.10.2 Compressor Calibration Method. Measure refrigerant pressures and temperatures to determine the evaporator superheat and the enthalpy of the refrigerant that enters and exits the indoor coil. Determine refrigerant flow rate or, when the superheat of the refrigerant leaving the evaporator is less than 5°F; total capacity from separate calibration tests conducted under identical operating conditions. When using this method, install instrumentation, measure refrigerant properties, and adjust the refrigerant charge according to section 7.4.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). Use refrigerant temperature and pressure measuring instruments that meet the specifications given in sections 5.1.1 and 5.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22).

2.10.3 Refrigerant Enthalpy Method. For this method, calculate space conditioning capacity by determining the refrigerant enthalpy change for the indoor coil and directly measuring the refrigerant flow rate. Use section 7.6.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) for the requirements for this method, including the additional instrumentation requirements, and information on placing the flow meter and a sight glass. Use refrigerant temperature, pressure, and flow measuring instruments that meet the specifications given in sections 5.1.1, 5.2, and 5.5.1 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22).

2.11 Measurement of test room ambient conditions. a. If using a test set-up where air is ducted directly from the conditioning apparatus to the indoor coil inlet (see Figure 2, Loop Air-Enthalpy Test Method Arrange- ment, of ASHRAE Standard 37-88 (incorporated by reference, see §430.22)), add instrumentation to permit measurement of the indoor test room dry-bulb temperature.

b. If the Outdoor Air Enthalpy Method is not used, add instrumentation to measure the dry-bulb temperature and the water vapor content of the air entering the outdoor coil. If an air sampling device is used, construct and apply the device as per section 6 of ASHRAE Standard 41.1-86 (RA 01) (incorporated by reference, see §430.22). Take steps (e.g., add or re-position a lab circulating fan), as needed, to minimize the magnitude of the temperature distribution non-uniformity. Position any fan in the outdoor test room while trying to keep air velocities in the vicinity of the test unit below 500 feet per minute.

c. Measure dry bulb temperatures as specified in sections 4, 5, 6.1-6.10, 9, 10, and 11 of ASHRAE Standard 41.1-86 (RA 01) (incorporated by reference, see §430.22). Measure water vapor content as stated above in section 2.5.6.

2.12 Measurement of indoor fan speed. When required, measure fan speed using a revolution counter, tachometer, or stroboscope that gives readings accurate to within ±1.0 percent.

2.13 Measurement of barometric pressure. Determine the average barometric pressure during each test. Use an instrument that meets the requirements specified in section 5.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22).

3. Testing Procedures

3.1 General Requirements. If, during the testing process, an equipment set-up adjustment is made that would alter the performance of the unit when conducting an already completed test, then repeat all tests affected by the adjustment. For cyclic tests, instead of maintaining an air volume rate, for each airflow nozzle, maintain the static pressure difference or velocity pressure during an ON period at the same pressure difference or velocity pressure as measured during the steady-state test conducted at the same test conditions.

3.1.1 Primary and secondary test methods. For all tests, use the Indoor Air Enthalpy Method test apparatus to determine the unit's space conditioning capacity. The procedure and data collected, however, differ slightly depending upon whether the test is a steady-state test, a cyclic test, or a frost accumulation test. The following sections describe these differences. For all steady-state tests (i.e., the A, A1, A2, B, B1, C, C1, EV, F, G, H0, H1, H11, H1h, H3, and H3 Tests), in addition, use one of the acceptable secondary methods specified in section 2.10 to determine indoor space conditioning capacity. Calculate this secondary check of capacity according to section 3.11. The two capacity measurements must agree to within 6 percent to constitute a valid test. For this capacity comparison, use the Indoor Air Enthalpy Method capacity that is calculated in section 7.3 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) (and do not make the after-test fan heat adjustments described in sections 3.3, 3.4, 3.7, and 3.10 of this Appendix). However, include the appropriate section 3.3 to 3.5 and 3.7 to 3.10 fan heat adjustments within the Indoor Air Enthalphy Method capacities used for the section 4 seasonal calculations.

3.1.2 Manufacturer-provided equipment overrides. Where needed, the manufacturer
must provide a means for overriding the controls of the test unit so that the compressor(s) operates at the specified speed or capacity and the indoor fan operates at the specified speed or delivers the specified air volume rate.

3.1.3 Airflow through the outdoor coil. For all tests, meet the requirements given in section 6.1.3.4 of ARI Standard 2020-2003 (incorporated by reference, see §430.22) when obtaining the airflow through the outdoor coil.

3.1.4 Airflow through the indoor coil.

3.1.4.1 Cooling Certified Air Volume Rate.

3.1.4.1.1 Cooling Certified Air Volume Rate for Ducted Units. The manufacturer must specify the Cooling Certified Air Volume Rate. Use this value as long as the following two requirements are satisfied. First, when conducting the A or A₂ Test (exclusively), the measured air volume rate, when divided by the measured indoor air-side total cooling capacity, must not exceed 37.5 cubic feet per minute of standard air (scfm) per 1000 Btu/h. If this ratio is exceeded, reduce the air volume rate until the correct Table 2 minimum external static pressure cited in published literature for the unit’s capacity when operated at the A or A₂ Test conditions.

3.1.4.1.2 Cooling Certified Air Volume Rate for Non-ducted Units. For non-ducted units, the Cooling Certified Air Volume Rate is the air volume rate that results during each test when the unit is operated at an external static pressure of zero inches of water. Cooling Minimum Air Volume Rate.

a. For ducted units that require the Cooling Certified Air Volume Rate.

b. For ducted units that are tested with a constant-air-volume-rate indoor fan installed. For all tests that specify the Cooling Certified Air Volume Rate, obtain an external static pressure as close to (but not less than) the applicable Table 2 value that does not cause instability or an automatic shutdown of the indoor blower.

c. For ducted units that are tested without an indoor fan installed. For the A or A₂ Test, (exclusively), the pressure drop across the indoor coil assembly must not exceed 0.30 inches of water. If this pressure drop is exceeded, reduce the air volume rate until the measured pressure drop equals the specified maximum. Use this reduced air volume rate for all tests that require the Cooling Certified Air Volume Rate.

1. For air conditioners and heat pumps, the value cited by the manufacturer in published literature for the unit’s capacity when operated at the A or A₂ Test conditions.

2. For heating-only heat pumps, the value the manufacturer cites in published literature for the unit’s capacity when operated at the H₁ or H₂ Test conditions.

3. For ducted units tested without an air filter installed, increase the applicable tabular value by 0.08 inches of water.

3.1.4.2 Cooling Minimum Air Volume Rate for Ducted Systems Tested With an Indoor Fan Installed.

a. For ducted units that regulate the speed (as opposed to the cfm) of the indoor fan,

where “Cooling Minimum Fan Speed” corresponds to the fan speed used when operating at low compressor capacity (two-capacity system), the fan speed used when operating at the minimum compressor speed (variable-speed system), or the lowest fan speed used when cooling (single-speed compressor and a variable-speed variable-air-volume-rate indoor fan). For such systems, obtain the Cooling Minimum Air Volume Rate regardless of the external static pressure.

b. For ducted units that regulate the air volume rate provided by the indoor fan, the manufacturer must specify the Cooling Minimum Air Volume Rate. For such systems, conduct all tests that specify the Cooling Minimum Air Volume Rate—(i.e., the A₁, B₁, C₁, F₁, and G₁ Tests)—at an external static pressure that does not cause instability or
an automatic shutdown of the indoor blower while being as close to, but not less than,

\[ A_1, B_1, C_1, F_1, & G_1 \text{ Test } \Delta P_{st} = \Delta P_{st,A_2} \times \frac{\text{Cooling Minimum Air Volume Rate}}{\text{Cooling Certified Air Volume Rate}} \],

where \( \Delta P_{st,A_2} \) is the applicable Table 2 minimum external static pressure that was targeted during the \( A_2 \) (and \( B_2 \)) Test.  

c. For ducted two-capacity units that are tested without an indoor fan installed, the Cooling Minimum Air Volume Rate is the higher of (1) the rate specified by the manufacturer or (2) 75 percent of the Cooling Certified Air Volume Rate. During the laboratory tests on a coil-only (fanless) unit, obtain this Cooling Minimum Air Volume Rate regardless of the pressure drop across the indoor coil assembly.

d. For non-ducted units, the Cooling Minimum Air Volume Rate is the air volume rate that results during each test when the unit operates at an external static pressure of zero inches of water and at the indoor fan setting used at low compressor capacity (two-capacity system) or minimum compressor speed (variable-speed system). For units having a single-speed compressor and a variable-speed variable-air-volume-rate indoor fan, use the lowest fan setting allowed for cooling.

3.1.4.3 Cooling Intermediate Air Volume Rate. a. For ducted units that regulate the speed of the indoor fan,

\[ \text{Cooling Intermediate Air Volume Rate} = \text{Cooling Certified Air Volume Rate} \times \frac{\text{E}_v \text{ Test Fan Speed}}{A_3 \text{ Test Fan Speed}}. \]

For such units, obtain the Cooling Intermediate Air Volume Rate regardless of the external static pressure.

b. For ducted units that regulate the air volume rate provided by the indoor fan, the manufacturer must specify the Cooling Intermediate Air Volume Rate. For such systems, conduct the \( E_v \) Test at an external static pressure that does not cause instability or an automatic shutdown of the indoor blower while being as close to, but not less than,

\[ \text{E}_v \text{ Test } \Delta P_{st} = \Delta P_{st,A_2} \times \frac{\text{Cooling Intermediate Air Volume Rate}}{\text{Cooling Certified Air Volume Rate}} \],

where \( \Delta P_{st,A_2} \) is the applicable Table 2 minimum external static pressure that was targeted during the \( A_2 \) (and \( B_2 \)) Test.  

c. For non-ducted units, the Cooling Intermediate Air Volume Rate is the air volume rate that results when the unit operates at an external static pressure of zero inches of water and at the fan speed selected by the controls of the unit for the \( E_v \) Test conditions.

3.1.4.4 Heating Certified Air Volume Rate. 
3.1.4.4.1 Ducted heat pumps where the Heating and Cooling Certified Air Volume Rates are the same. a. Use the Cooling Certified Air Volume Rate as the Heating Certified Air Volume Rate for:

1. Ducted heat pumps that operate at the same indoor fan speed during both the \( A \) (or \( A_3 \)) and the \( H_1 \) (or \( H_1 \)) Tests;  
2. Ducted heat pumps that regulate fan speed to deliver the same constant air volume rate during both the \( A \) (or \( A_3 \)) and the \( H_1 \) (or \( H_1 \)) Tests; and  
3. Ducted heat pumps that are tested without an indoor fan installed (except two-capacity northern heat pumps that are tested only at low capacity cooling—see 3.1.4.4.2).  

b. For heat pumps that meet the above criteria "1" and "3," no minimum requirements apply to the measured external or internal, respectively, static pressure. For heat pumps that meet the above criterion "2," test at an external static pressure that does not cause instability or an automatic shutdown of the
3.1.4.4.2 Ducted heat pumps where the Heating and Cooling Certified Air Volume Rates are different due to indoor fan operation. 

For ducted heat pumps that regulate the speed (as opposed to the cfm) of the indoor fan,

\[ \text{Heating Certified Air Volume Rate} = \text{Cooling Certified Air Volume Rate} \times \frac{H1 \text{ or } H1_2 \text{ Test Fan Speed}}{A \text{ or } A_2 \text{ Test Fan Speed}}. \]

For such heat pumps, conduct all tests that specify the Heating Certified Air Volume Rate at an external static pressure that does not cause instability or an automatic shutdown of the indoor blower while being as close to, but not less than,

\[ \text{Heating Certified } \Delta P_{st} = \text{Cooling Certified } \Delta P_{st} \times \left( \frac{\text{Heating Certified Air Volume Rate}}{\text{Cooling Certified Air Volume Rate}} \right)^2 \]

where the Cooling Certified \( \Delta P_{st} \) is the applicable Table 2 minimum external static pressure that was specified for the \( A \) or \( A_2 \) Test.

For such heat pumps, obtain the Heating Certified Air Volume Rate without regard to the external static pressure.

b. For ducted heat pumps that regulate the air volume rate delivered by the indoor fan, the manufacturer must specify the Heating Certified Air Volume Rate. For such heat pumps, conduct all tests that specify the Heating Certified Air Volume Rate at an external static pressure that does not cause instability or an automatic shutdown of the indoor blower while being as close to, but not less than,
that results during each test when the unit operates at an external static pressure of zero inches of water.

3.1.4.5 Heating Minimum Air Volume Rate.

a. For ducted heat pumps that regulate the speed (as opposed to the cfm) of the indoor fan,

\[
\text{Heating Minimum Air Volume Rate} = \text{Heating Certified Air Volume Rate} \times \frac{\text{Heating Minimum Fan Speed}}{H_{1\text{ Test Fan Speed}}}.
\]

b. For ducted heat pumps that regulate the air volume rate delivered by the indoor fan, the manufacturer must specify the Heating Minimum Air Volume Rate. For such heat pumps, conduct all tests that specify the Heating Minimum Air Volume Rate (i.e., the H0, H1, H2, and H3 Tests)—at an external static pressure that does not cause instability or an automatic shutdown of the indoor blower while being as close to, but not less than,

\[
\text{H0} = \Delta P_{sl} \times \left[ \frac{\text{Htg Minimum Air Vol. Rate}}{\text{Htg Certified Air Vol. Rate}} \right]^2,
\]

where \( \Delta P_{sl} \) is the minimum external static pressure that was targeted during the H3 Test.

c. For ducted two-capacity northern heat pumps that are tested with an indoor fan installed, use the appropriate approach of the above two cases.

d. For ducted two-capacity heat pumps that are tested without an indoor fan installed, the Heating Minimum Air Volume Rate is the higher of the rate specified by the manufacturer or 75 percent of the Heating Certified Air Volume Rate. During the laboratory tests on a coil-only (fanless) unit, obtain the Heating Minimum Air Volume Rate without regard to the pressure drop across the indoor coil assembly.

e. For non-ducted heat pumps, the Heating Minimum Air Volume Rate is the air volume rate that results during each test when the unit operates at an external static pressure of zero inches of water and at the indoor fan setting used at low compressor capacity (two-capacity system) or minimum compressor speed (variable-speed system). For units having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan, use the lowest fan setting allowed for heating.

3.1.4.6 Heating Intermediate Air Volume Rate.

a. For ducted heat pumps that regulate the speed of the indoor fan,

\[
\text{Heating Intermediate Air Volume Rate} = \text{Heating Certified Air Volume Rate} \times \frac{H_{2\text{ Test Fan Speed}}}{H_{1\text{ Test Fan Speed}}}.
\]

b. For ducted heat pumps that regulate the air volume rate delivered by the indoor fan, the manufacturer must specify the Heating Intermediate Air Volume Rate. For such heat pumps, obtain the Heating Intermediate Air Volume Rate without regard to the external static pressure.
heat pumps, conduct the H2_v Test at an external static pressure that does not cause instability or an automatic shutdown of the indoor blower while being as close to, but not less than,

\[
\Delta P_{\text{st,H12}} = \Delta P_{\text{st,H12}} \times \left( \frac{\text{Heating Intermediate Air Volume Rate}}{\text{Heating Certified Air Volume Rate}} \right)^2
\]

where \(\Delta P_{\text{st,H12}}\) is the minimum external static pressure that was specified for the H1_v Test.

c. For non-ducted heat pumps, the Heating Intermediate Air Volume Rate is the air volume rate that results when the heat pump operates at an external static pressure of zero inches of water and at the fan speed selected by the controls of the unit for the H2_v Test conditions.

3.1.4.7 Heating Nominal Air Volume Rate. Except for the noted changes, determine the Heating Nominal Air Volume Rate using the approach described in section 3.1.4.6. Required changes include substituting “H1_v Test” for H2_v Test within the first section 3.1.4.6 equation, substituting “H1_v Test \(\Delta P_{\text{st}}\)” for “H2_v Test \(\Delta P_{\text{st}}\)” in the second section 3.1.4.6 equation, substituting “H1_v Test” for each “H2_v Test”, and substituting “Heating Nominal Air Volume Rate” for each “Heating Intermediate Air Volume Rate.”

Heating Nominal Air Volume Rate = Heating Certified Air Volume Rate \(\times\) \(\frac{\text{H1_v Test Fan Speed}}{\text{H1_v Test Fan Speed}}\).

\[
\Delta P_{\text{st,H12}} = \Delta P_{\text{st,H12}} \times \left( \frac{\text{Heating Nominal Air Volume Rate}}{\text{Heating Certified Air Volume Rate}} \right)^2
\]

3.1.5 Indoor test room requirement when the air surrounding the indoor unit is not supplied from the same source as the air entering the indoor unit. If using a test set-up where air is ducted directly from the air-reconditioning apparatus to the indoor coil inlet (see Figure 2, Loop Air-Enthalpy Test Method Arrangement, of ASHRAE Standard 37-88 (incorporated by reference, see §430.22)), maintain the dry bulb temperature within the test room within ±5.0 °F of the applicable sections 3.2 and 3.6 dry bulb temperature test condition for the air entering the indoor unit.

3.1.6 Air volume rate calculations. For all steady-state tests and for frost accumulation (H2, H2_v, H2_m, H2_o) tests, calculate the air volume rate through the coil as specified in sections 7.8.3.1 and 7.8.3.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). When using the Outdoor Air Enthalpy Method, follow sections 7.8.3.1 and 7.8.3.2 to calculate the air volume rate through the outdoor coil. To express air volume rates in terms of standard air, use:

\[
V_s = V_{\text{mx}} \times \frac{0.075 \text{ lbm}_{\text{dry}}}{\text{ft}^3} \cdot v_n \cdot [1 + W_n] = V_{\text{mx}} \times \frac{0.075 \text{ lbm}_{\text{dry}}}{\text{ft}^3} \cdot v_n
\]

where,

- \(V_s\) = air volume rate of standard (dry) air, \((\text{ft}^3/\text{min})_s\)
- \(V_{\text{mx}}\) = air volume rate of the air-water vapor mixture, \((\text{ft}^3/\text{min})_{\text{mix}}\)
- \(v_{\text{mx}}\) = specific volume of air-water vapor mixture at the nozzle, \(\text{ft}^3\) per lbm of the air-water vapor mixture
- \(W_n\) = humidity ratio at the nozzle, lbm of water vapor per lbm of dry air
- 0.075 = the density associated with standard (dry) air, \((\text{lbm/ft}^3)\)
The specified test condition only applies if the unit rejects condensate to the outdoor coil.

2 Defined in section 3.1.4.1.

3 The entering air must have a low enough moisture content so no condensate forms on the indoor coil. (It is recommended that an indoor wet-bulb temperature of 57°F or less be used.)

4 Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the C Test.
3.2.2 Tests for a unit having a single-speed compressor and a variable-speed variable-air-volume-rate indoor fan installed.

3.2.2.1 Indoor fan capacity modulation that correlates with the outdoor dry bulb temperature. Conduct four steady-state wet coil tests: The \( A_2 \), \( A_1 \), \( B_2 \), and \( B_1 \) Tests. Use the two optional dry-coil tests, the steady-state \( C \) Test and the cyclic \( D \) Test, to determine the cooling mode cyclic degradation coefficient, \( C_{DC} \). If the two optional tests are not conducted, assign \( C_{DC} \) the default value of 0.25. Table 4 specifies test conditions for these six tests.

3.2.2.2 Indoor fan capacity modulation based on adjusting the sensible to total (S/T) cooling capacity ratio. The testing requirements are the same as specified in section 3.2.1 and Table 3. Use a Cooling Certified Air Volume Rate that represents a normal residential installation. If performed, conduct the steady-state \( C \) Test and the cyclic \( D \) Test with the unit operating in the same S/T capacity control mode as used for the \( B \) Test.

### Table 4—Cooling Mode Test Conditions for Units Having a Single-Speed Compressor and a Variable Air Volume Rate Indoor Fan That Correlates with the Outdoor Dry Bulb Temperature (Sec. 3.2.2.1)

</table>

¹ The specified test condition only applies if the unit rejects condensate to the outdoor coil.
² Defined in section 3.1.4.1.
³ Defined in section 3.1.4.2.
⁴ The entering air must have a low enough moisture content so no condensate forms on the indoor coil. (It is recommended that an indoor wet-bulb temperature of 57°F or less be used.)
⁵ Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the \( C \) Test.

3.2.3 Tests for a unit having a two-capacity compressor. (See Definition 1.45.) Conduct four steady-state wet coil tests: The \( A_i \), \( A_1 \), \( B_2 \), and \( B_1 \) Tests. Use the two optional dry-coil tests, the steady-state \( C \) Test and the cyclic \( D \) Test, to determine the cooling mode cyclic degradation coefficient, \( C_{DC} \). If the two optional tests are not conducted, assign \( C_{DC} \) the default value of 0.25. Table 5 specifies test conditions for these six tests.

b. For units having a variable-speed indoor fan that is modulated to adjust the sensible to total (S/T) cooling capacity ratio, use Cooling Certified and Cooling Minimum Air Volume Rates that represent a normal residential installation. Additionally, if conducting the optional dry-coil tests, operate the unit in the same S/T capacity control mode as used for the \( B_1 \) Test.

c. Test two-capacity, northern heat pumps (see Definition 1.46) in the same way as a single-speed heat pump with the unit operating exclusively at low compressor capacity (see section 3.2.1 and Table 3).

d. If a two-capacity air conditioner or heat pump locks out low capacity operation at outdoor temperatures that are less than 95 °F, conduct the \( A_1 \) Test using the outdoor temperature conditions listed for the \( F_1 \) Test in Table 6 rather than using the outdoor temperature conditions listed in Table 5 for the \( A_1 \) Test.

1 The specified test condition only applies if the unit rejects condensate to the outdoor coil.
2 Defined in section 3.1.4.1.
3 Defined in section 3.1.4.2.
4 The entering air must have a low enough moisture content so no condensate forms on the indoor coil. It is recommended that an indoor wet-bulb temperature of 57°F or less be used.
5 Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the C₁ Test.

3.2.4 Tests for a unit having a variable-speed compressor. a. Conduct five steady-state wet coil tests: The A₂, Eᵥ, B₂, B₁, and F₁ Tests. Use the two optional dry-coil tests, the steady-state G₁ Test and the cyclic I₁ Test, to determine the cooling mode cyclic degradation coefficient, Cᵥ. If the two optional tests are not conducted, assign Cᵥ the default value of 0.25. Table 6 specifies test conditions for these seven tests. Determine the intermediate compressor speed cited in Table 6 using:

\[
\text{Intermediate speed} = \frac{\text{Minimum speed} + \frac{\text{Maximum speed}}{3} - \text{Minimum speed}}{3}
\]

where a tolerance of plus 5 percent or the next higher inverter frequency step from that calculated is allowed.

b. For units that modulate the indoor fan speed to adjust the sensible to total (S/T) cooling capacity ratio, use Cooling Certified, Cooling Intermediate, and Cooling Minimum Air Volume Rates that represent a normal residential installation. Additionally, if conducting the optional dry-coil tests, operate the unit in the same S/T capacity control mode as used for the F₁ Test.

1. The specified test condition only applies if the unit rejects condensate to the outdoor coil.
2. Defined in section 3.1.4.1.
3. Defined in section 3.1.4.3.
4. Defined in section 3.1.4.2.
5. The entering air must have a low enough moisture content so no condensate forms on the indoor coil. (It is recommended that an indoor wet-bulb temperature of 57°F or less be used.)
6. Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the G Test.

3.3 Test procedures for steady-state wet coil cooling mode tests (the A, A₂, A₁, B, B₁, Eᵥ, and F₁ Tests). a. For the pretest interval, operate the test room reconditioning apparatus and the unit to be tested until maintaining equilibrium conditions for at least 30 minutes at the specified section 3.2 test conditions. Use the exhaust fan of the airflow measuring apparatus and, if installed, the indoor fan of the test unit to obtain and then maintain the indoor air volume rate and/or external static pressure specified for the particular test. Continuously record (see Definition 1.15):

1) The dry-bulb temperature of the air entering the indoor coil,
2) The water vapor content of the air entering the indoor coil,
3) The dry-bulb temperature of the air entering the outdoor coil, and
4) For the section 2.2.4 cases where its control is required, the water vapor content of the air entering the outdoor coil.

Refer to section 3.11 for additional requirements that depend on the selected secondary test method.

b. After satisfying the pretest equilibrium requirements, make the measurements specified in Table 5 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) for the Indoor Air Enthalpy method and the user-selected secondary method. Except for external static pressure, make the Table 5 measurements at equal intervals that span 10 minutes or less. Measure external static pressure every 5 minutes or less. Continue data sampling until reaching a 30-minute period (e.g., four consecutive 10-minute samples) where the test tolerances specified in Table 7 are satisfied. For those continuously recorded parameters, use the entire data set from the 30-minute interval to evaluate Table 7 compliance. Determine the average electrical power consumption of the air conditioner or heat pump over the same 30-minute interval.

c. Calculate indoor-side total cooling capacity as specified in section 7.3.3.1 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). Do not adjust the parameters used in calculating capacity for the permitted variations in test conditions. Evaluate air enthalpies based on the measured barometric pressure. Assign the average total space cooling capacity and electrical power consumption over the 30-minute data collection interval to the variables \( \dot{Q}_c(T) \) and \( \dot{E}_c(T) \), respectively. For these two variables, replace the "T" with the nominal outdoor temperature at which the test was conducted. The superscript \( k \) is used only when testing multi-capacity units. Use the superscript \( k=2 \) to denote a test with the unit operating at high capacity or maximum speed, \( k=1 \) to denote low capacity or minimum speed, and \( k=v \) to denote the intermediate speed.

d. For units tested without an indoor fan installed, decrease \( \dot{Q}_c(T) \) by

\[ \frac{1250 \text{ Btu/h}}{1000 \text{ scfm}} \cdot \frac{1}{V_i}, \]

and increase \( \dot{E}_c(T) \) by,

\[ \frac{365 \text{ W}}{1000 \text{ scfm}} \cdot \frac{1}{V_i}, \]

where \( V_i \) is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).
For air conditioners and heat pumps having a constant-air-volume-rate indoor fan, the five additional steps listed below are required if the average of the measured external static pressures exceeds the applicable sections 3.4 minimum (or target) external static pressure (ΔPmin) by 0.03 inches of water or more.

1. Measure the average power consumption of the indoor fan motor (E˙ fan,1) and record the corresponding external static pressure (ΔP1) during or immediately following the 30-minute interval used for determining capacity.

2. After completing the 30-minute interval and while maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately \( \Delta P_1 + (\Delta P_2 - \Delta P_{\text{min}}) \).

3. After re-establishing steady readings of the fan motor power and external static pressure, determine average values for the indoor fan power (E˙ fan,2) and the external static pressure (ΔP2) by making measurements over a 5-minute interval.

4. Approximate the average power consumption of the indoor fan motor at ΔPmin using linear extrapolation:

\[
\dot{E}_{\text{fan, min}} = \frac{\dot{E}_{\text{fan,2}} - \dot{E}_{\text{fan,1}}}{\Delta P_2 - \Delta P_1} (\Delta P_{\text{min}} - \Delta P_1) + \dot{E}_{\text{fan,1}}. 
\]

5. Increase the total space cooling capacity, Qc(T), by the quantity (E˙ fan,1 – E˙ fan, min), when expressed on a Btu/h basis. Decrease the total electrical power, Ec(T), by the same fan power difference, now expressed in watts.

3.4 Test procedures for the optional steady-state dry coil cooling mode tests (the C, C1, and G1 Tests). a. Except for the modifications noted in this section, conduct the steady-state dry coil cooling mode tests as specified in section 3.3 for wet coil tests. Prior to recording data during the steady-state dry coil test, operate the unit at least one hour after achieving dry coil conditions. Drain the drain pan and plug the drain opening. Thereafter, the drain pan should remain completely dry.

b. Denote the resulting total space cooling capacity and electrical power derived from the test as Qc, dry and Ec, dry(T). In preparing for the section 3.5 cyclic test, record the average indoor-side air volume rate, V, specific heat of the air, Cp, (expressed on dry air basis), specific volume of the air at the nozzles, \( V_n \), humidity ratio at the nozzles, Wn, and either pressure difference or velocity pressure for the flow nozzles. For units having a variable-speed indoor fan (that pro-

3 Only applies during wet coil tests; does not apply during steady-state, dry coil cooling mode tests.
4 Only applies when using the Outdoor Air Enthalpy Method.
5 Only applies during wet coil cooling mode tests where the unit rejects condensate to the outdoor coil.
6 Only applies when testing non-ducted units.
the indoor fan turned off (see section 3.5), include the electrical power used by the indoor fan motor among the recorded parameters from the 30-minute test.

3. Test procedures for the optional cyclic dry coil cooling mode tests (the D, D, and I Tests). a. After completing the steady-state dry-coil test, remove the Outdoor Air Enthalpy method test apparatus, if connected, and begin manual OFF/ON cycling of the unit’s compressor. The test set-up should otherwise be identical to the set-up used during the steady-state dry coil test. When testing heat pumps, leave the reversing valve during the compressor OFF cycles in the same position as used for the compressor ON cycles, unless automatically changed by the controls of the unit. For units having a variable-speed indoor fan, the manufacturer has the option of electing at the outset whether to conduct the cyclic test with the indoor fan enabled or disabled. Always revert to testing with the indoor fan disabled if cyclic testing with the fan enabled is unsuccessful.

b. For units having a single-speed or two-capacity compressor, cycle the compressor OFF for 24 minutes and then ON for 6 minutes (Δt(\text{cyc,dry}) = 0.5 hours). For units having a variable-speed compressor, cycle the compressor OFF for 48 minutes and then ON for 12 minutes (Δt(\text{cyc,dry}) = 1.0 hours). Repeat the OFF/ON compressor cycling pattern until the test is completed. Allow the controls of the unit to regulate cycling of the outdoor fan.

c. Sections 3.5.1 and 3.5.2 specify airflow requirements through the indoor coil of ducted and non-ducted systems, respectively. In all cases, use the exhaust fan of the airflow measuring apparatus (covered under section 2.6) along with the indoor fan of the unit, if installed and operating, to approximate a step response in the indoor coil airflow. Regulate the exhaust fan to quickly obtain and then maintain the flow nozzle static pressure difference or velocity pressure at the same value as was measured during the steady-state dry coil test. The pressure difference or velocity pressure should be within 2 percent of the value from the steady-state dry coil test within 15 seconds after airflow initiation. For units having a variable-speed indoor fan that ramps when cycling on and/or off, use the exhaust fan of the airflow measuring apparatus to impose a step response that begins at the initiation of ramp up and ends at the termination of ramp down.

d. For units having a variable-speed indoor fan, conduct the cyclic dry coil test using the pull-thru approach described below if any of the following occur when testing with the fan operating:

(1) The test unit automatically cycles off;
(2) Its blower motor reverses; or
(3) The unit operates for more than 30 seconds at an external static pressure that is 0.1 inches of water or more higher than the value measured during the prior steady-state test.

For the pull-thru approach, disable the indoor fan and use the exhaust fan of the airflow measuring apparatus to generate the specified flow nozzle static pressure difference or velocity pressure. If the exhaust fan cannot deliver the required pressure difference because of resistance created by the unpowered blower, temporarily remove the blower.

e. After completing a minimum of two complete compressor OFF/ON cycles, determine the overall cooling delivered and total electrical energy consumption during any subsequent data collection interval where the test tolerances given in Table 8 are satisfied. If available, use electric resistance heaters (see section 2.1) to minimize the variation in the inlet air temperature.

f. With regard to the Table 8 parameters, continuously record the dry-bulb temperature of the air entering the indoor and outdoor coils during periods when air flows through the respective coils. Sample the water vapor content of the indoor coil inlet air at least every 2 minutes during periods when air flows through the coil. Record external static pressure and the air volume rate indicator (either nozzle pressure difference or velocity pressure) at least every minute during the interval that air flows through the indoor coil. (These regular measurements of the airflow rate indicator are in addition to the required measurement at 15 seconds after flow initiation.) Sample the electrical voltage at least every 2 minutes beginning 30 seconds after compressor start-up. Continue until the compressor, the outdoor fan, and the indoor fan (if it is installed and operating) cycle off.

g. For ducted units, continuously record the dry-bulb temperature of the air entering (as noted above) and leaving the indoor coil. Or if using a thermopile, continuously record the difference between these two temperatures during the interval that air flows through the indoor coil. For non-ducted units, make the same dry-bulb temperature measurements beginning when the compressor cycles on and ending when indoor coil airflow ceases.

h. Integrate the electrical power over complete cycles of length Δt(\text{cyc,dry}). For ducted units tested with an indoor fan installed and operating, integrate electrical power from indoor fan OFF to indoor fan OFF. For all other ducted units and for non-ducted units, integrate electrical power from compressor OFF to compressor OFF. (Some cyclic tests will use the same data collection intervals to determine the electrical energy and the total space cooling. For other units, terminate data collection used to determine the electrical energy before terminating data collection used to determine total space cooling.)

1. See Definition 1.41.
2. See Definition 1.40.
3. Applies during the interval that air flows through the indoor (outdoor) coil except for the first 30 seconds after airflow is initiated through the indoor coil.
4. Shall at no time exceed a wet-bulb temperature that results in condensate forming on the indoor coil.
5. The test condition shall be the average nozzle pressure difference or velocity pressure measured during the steady-state dry coil test.
6. Applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor fan—are operating except for the first 30 seconds after compressor start-up.

i. If the Table 8 tolerances are satisfied over the complete cycle, record the measured electrical energy consumption in units of watt-hours. Calculate the total space cooling delivered, $Q_{cyc, dry}$, in units of Btu using:

$$q_{v,cyc} = \frac{60}{V_c} C_{v,cyc} \Gamma \left( \frac{V_i}{V_c} \right)^{1.5}$$

(3.5 - 1)

where $V_c$, $V_{v,cyc}$, $V_i$ (or $V_a$), and $W_i$ are the values recorded during the section 3.4 dry coil steady-state test and,

$$\tau_2 - \tau_1$$

is the elapsed time when indoor coil airflow ceases, hr.

3.5.1 Procedures when testing ducted systems. The automatic controls that are normally installed with the test unit may govern the OFF/ON cycling of the air moving equipment on the indoor side (exhaust fan of the airflow measuring apparatus and, if installed, the indoor fan of the test unit). For example, for ducted units tested without an indoor fan installed but rated based on using a fan time delay relay, control the indoor coil airflow according to the rated ON and/or OFF delays provided by the relay. For ducted units having a variable-speed indoor fan that has been disabled (and possibly removed), start and stop the indoor airflow at the same instances as if the fan were enabled. For all other ducted units tested without an indoor fan installed, cycle the indoor coil airflow in unison with the cycling of the compressor. Close air dampers on the inlet (section 2.5.1) and outlet side (sections 2.5 and 2.5.4) during the OFF period. Airflow through the indoor coil should stop within 3 seconds after the automatic controls of the test unit (act to) de-energize the indoor fan.

For ducted units tested without an indoor fan installed (excluding the special case where a variable-speed fan is temporarily removed), increase $q_{v,cyc}$ by the quantity,$$
\frac{365 W}{1000 \text{ scfm}} \cdot V_c \left[ \tau_2 - \tau_1 \right].$$

(3.5 - 2)

and decrease $q_{v,cyc, dry}$ by,$$
\frac{1250 \text{ Btu/h}}{1000 \text{ scfm}} \cdot V_c \left[ \tau_2 - \tau_1 \right].$$

(3.5 - 3)

where $V_c$ is the average indoor air volume rate from the section 3.4 dry coil steady-state test and is expressed in units of cubic feet per minute of standard air (scfm). For units having a variable-speed indoor fan that is disabled during the cyclic test, increase $q_{v,cyc, dry}$ and decrease $q_{v,cyc}$ based on:

a. The product of $[\tau_2 - \tau_1]$ and the indoor fan power measured during or following the dry coil steady-state test; or,

b. The following algorithm if the indoor fan ramps its speed when cycling.

1. Measure the electrical power consumed by the variable-speed indoor fan at a minimum of three operating conditions: at the speed/air volume rate/external static pressure that was measured during the steady-state test, at operating conditions associated with the midpoint of the ramp-up interval, and at conditions associated with the midpoint of the ramp-down interval. For these measurements, the tolerances on the airflow volume or the external static pressure are the same as required for the section 3.4 steady-state test.

2. For each case, determine the fan power from measurements made over a minimum of 5 minutes.

3. Approximate the electrical energy consumption of the indoor fan if it had operated during the cyclic test using all three power measurements. Assume a linear profile during the ramp intervals. The manufacturer
must provide the durations of the ramp-up and ramp-down intervals. If a manufacturer-supplied ramp interval exceeds 45 seconds, use a 45-second ramp interval nonetheless when estimating the fan energy.

The manufacturer is allowed to choose option a, and forego the extra testing burden of option b, even if the unit ramps indoor fan speed when cycling.

3.5.2 Procedures when testing non-ducted systems. Do not use air dampers when conducting cyclic tests on non-ducted units. Until the last OFF/ON compressor cycle, airflow through the indoor coil must cycle off and on in unison with the compressor. For the last OFF/ON compressor cycle—the one used to determine $e_{cyc,dry}$ and $q_{cyc,dry}$—use the exhaust fan of the airflow measuring apparatus and the indoor fan of the test unit to have indoor airflow start 3 minutes prior to compressor cut-on and end three minutes after compressor cutoff. Subtract the electrical energy used by the indoor fan during the 3 minutes prior to compressor cut-on from the integrated electrical energy, $e_{cyc,dry}$. Add the electrical energy used by the indoor fan during the 3 minutes after compressor cutoff to the integrated cooling capacity, $q_{cyc,dry}$. For the case where the non-ducted unit uses a variable-speed indoor fan which is disabled during the cyclic test, correct $e_{cyc,dry}$ and $q_{cyc,dry}$ using the same approach as prescribed in section 3.5.1 for ducted units having a disabled variable-speed indoor fan.

3.5.3 Cooling mode cyclic degradation coefficient calculation. Use two optional dry-coil tests to determine the cooling mode cyclic degradation coefficient, $C_{D_c}$. If the two optional tests are not conducted, assign $C_{D_c}$ the default value of 0.25. Evaluate $C_{D_c}$ using the above results and those from the section 3.4 dry coil steady-state test.

$$C_{D_c} = 1 - \frac{EER_{cyc,dry}}{EER_{ss,dry} - CLF \cdot \Delta t_{cyc,dry}}$$

where,

$$EER_{cyc,dry} = \frac{q_{cyc,dry}}{e_{cyc,dry}}$$

the average energy efficiency ratio during the cyclic dry coil cooling mode test, Btu/W-h

$$EER_{ss,dry} = \frac{Q_{ss,dry}}{E_{ss,dry}}$$

the average energy efficiency ratio during the steady-state dry coil cooling mode test, Btu/W-h

$$CLF = \frac{q_{cyc,dry}}{Q_{ss,dry} - \Delta t_{cyc,dry}}$$

the cooling load factor dimensionless.

Round the calculated value for $C_{D_c}$ to the nearest 0.01. If $C_{D_c}$ is negative, then set it equal to zero.

3.6 Heating mode tests for different types of heat pumps, including heating-only heat pumps.

3.6.1 Tests for a heat pump having a single-speed compressor that is tested with a fixed speed indoor fan installed, with a constant-air-volume-rate indoor fan installed, or with no indoor fan installed. Conduct three tests: The High Temperature (H1) Test, the Frost Accumulation (H2) Test, and the Low Temperature (H3) Test. Conduct the optional High Temperature Cyclic (H1C) Test to determine the heating mode cyclic degradation coefficient, $C_{D_h}$. If this optional test is not conducted, assign $C_{D_h}$ the default value of 0.25. Test conditions for these four tests are specified in Table 9.

1. Defined in section 3.1.4.4.
2. Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the H1 Test.

3.6.2 Tests for a heat pump having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan: capacity modulation correlates with outdoor dry bulb...
temperature. Conduct five tests: two High Temperature Tests (H1 and H1), one Frost Accumulation Test (H2), and two Low Temperature Tests (H3 and H3). Conducting an additional Frost Accumulation Test (H2) is optional. Conduct the optional High Temperature Cyclic (H1C) Test to determine the heating mode cyclic degradation coefficient, \( C_{dh} \). If this optional test is not conducted, assign \( C_{dh} \) the default value of 0.25. Table 10 specifies test conditions for these seven tests. If the optional H2 Test is not done, use the following equations to approximate the capacity and electrical power of the heat pump at the H2 test conditions:

\[
\dot{Q}_{h}^{k=1}(35) = QR_{h}^{k=2}(35) \cdot \left\{ \dot{Q}_{h}^{k=1}(17) + 0.6 \cdot \left[ \dot{Q}_{h}^{k=1}(47) - \dot{Q}_{h}^{k=1}(17) \right] \right\}
\]

\[
\dot{E}_{h}^{k=1}(35) = PR_{h}^{k=2}(35) \cdot \left\{ \dot{E}_{h}^{k=1}(17) + 0.6 \cdot \left[ \dot{E}_{h}^{k=1}(47) - \dot{E}_{h}^{k=1}(17) \right] \right\}
\]

where,

\[
QR_{h}^{k=2}(35) = \frac{\dot{Q}_{h}^{k=2}(35)}{\dot{Q}_{h}^{k=2}(17) + 0.6 \cdot \left[ \dot{Q}_{h}^{k=2}(47) - \dot{Q}_{h}^{k=2}(17) \right]}
\]

\[
PR_{h}^{k=2}(35) = \frac{\dot{E}_{h}^{k=2}(35)}{\dot{E}_{h}^{k=2}(17) + 0.6 \cdot \left[ \dot{E}_{h}^{k=2}(47) - \dot{E}_{h}^{k=2}(17) \right]}
\]

The quantities \( \dot{Q}_{h}^{k=2}(47) \), \( \dot{E}_{h}^{k=2}(47) \), \( \dot{Q}_{h}^{k=1}(47) \), and \( \dot{E}_{h}^{k=1}(47) \) are determined from the H3 Tests and evaluated as specified in section 3.9; and the quantities \( \dot{Q}_{h}^{k=1}(17) \), \( \dot{E}_{h}^{k=1}(17) \), \( \dot{Q}_{h}^{k=2}(17) \), and \( \dot{E}_{h}^{k=2}(17) \), are determined from the H3 Tests and evaluated as specified in section 3.10.

2 Defined in section 3.1.4.5.  
3 Maintain the airflow static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the H1 Test.

3.6.3 Tests for a heat pump having a two-capacity compressor (see Definition 1.46), including two-capacity, northern heat pumps (see Definition 1.46), a. Conduct one Maximum Temperature Test (H0), two High Temperature Tests (H1 and H1), one Frost Accumulation Test (H2), and one Low Temperature Test (H3). Conduct an additional Frost Accumulation Test (H2) and Low Temperature Test (H3) if both of the following conditions exist:  
1. Knowledge of the heat pump’s capacity and electrical power at low compressor capacity for outdoor temperatures of 37 °F and less is needed to complete the section 4.2.3 seasonal performance calculations, and
2. The heat pump's controls allow low capacity operation at outdoor temperatures of 37 °F and less.

b. Conduct the optional Maximum Temperature Cyclic Test (HOC) to determine the heating mode cyclic degradation coefficient, \( C_{pH} \). If this optional test is not conducted, assign \( C_{pH} \) the default value of 0.25. Table 11 specifies test conditions for these eight tests.

</tbody>
</table>

1 Defined in section 3.1.4.5.
2 Maintain the airflow nozzle static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the H0 Test.
3 Defined in section 3.1.4.4.
4 Required only if the heat pump's performance when operating at low compressor capacity and outdoor temperatures less than 37 °F is needed to complete the section 4.2.3 HSPF calculations.

3.6.4 Tests for a heat pump having a variable-speed compressor. a. Conduct one Maximum Temperature Test (H0), two High Temperature Tests (H1, and H1), one Frost Accumulation Test (H2), and one Low Temperature Test (H3). Conducting one or both of the following tests is optional: An additional High Temperature Test (H1) and an additional Frost Accumulation Test (H2). Conduct the optional Maximum Temperature Cyclic (HOC) Test to determine the heating mode cyclic degradation coefficient, \( C_{pH} \). If this optional test is not conducted, assign \( C_{pH} \) the default value of 0.25. Table 12 specifies test conditions for these eight tests. Determine the intermediate compressor speed cited in Table 12 using the heating mode maximum and minimum compressors speeds and:

\[
\text{Intermediate speed} = \text{Minimum speed} + \frac{(\text{Maximum speed} - \text{Minimum speed})}{3}
\]

where a tolerance of plus 5 percent or the next higher inverter frequency step from that calculated is allowed. If the H2 Test is not done, use the following equations to approximate the capacity and electrical power at the H2 test conditions:

\[
\dot{Q}_h^{k=2}(35) = 0.90 \{ \dot{Q}_h^{k=2}(17) + 0.6 \left[ \dot{Q}_h^{k=2}(47) - \dot{Q}_h^{k=2}(17) \right] \}
\]

\[
\dot{E}_h^{k=2}(35) = 0.985 \{ \dot{E}_h^{k=2}(17) + 0.6 \left[ \dot{E}_h^{k=2}(47) - \dot{E}_h^{k=2}(17) \right] \}
\]

b. Determine the quantities \( \dot{Q}_h^{k=2}(47) \) and \( \dot{E}_h^{k=2}(47) \) from the H1 Test and evaluate them according to section 3.7. Determine the quantities \( \dot{Q}_h^{k=2}(17) \) and \( \dot{E}_h^{k=2}(17) \) from the H3 Test and evaluate them according to section 3.10. For heat pumps where the heating mode maximum compressor speed exceeds its cooling mode maximum compressor speed, conduct the H3 Test if the manufacturer requests it. If the H3 Test is done, operate the heat pump's compressor at the same speed as the speed used for the cooling mode A1 Test. Refer to the last sentence of section 4.2 to see how the results of the H3 Test may be used in calculating the heating seasonal performance factor.
3.6.5 Additional test for a heat pump having a heat comfort controller. Test any heat pump that has a heat comfort controller (see Definition 1.28) according to section 3.6.1, 3.6.2, or 3.6.3, whichever applies, with the heat comfort controller disabled. Additionally, conduct the abbreviated test described in section 3.1.9 with the heat comfort controller active to determine the system’s maximum supply air temperature. (Note: heat pumps having a variable speed compressor and a heat comfort controller are not covered in the test procedure at this time.)

3.7 Test procedures for steady-state Maximum Temperature and High Temperature heating mode tests (the H0, H1, H1s, H1, and H3 Tests). a. For the pretest interval, operate the test room reconditioning apparatus and the heat pump until equilibrium conditions are maintained for at least 30 minutes at the specified section 3.6 test conditions. Use the exhaust fan of the airflow measuring apparatus and, if installed, the indoor fan of the heat pump to obtain and then maintain the indoor air volume rate and/or the external static pressure specified for the particular test. Continuously record the dry-bulb temperature of the air entering the indoor coil, and the dry-bulb temperature and water vapor content of the air entering the outdoor coil. Refer to section 3.11 for additional requirements that depend on the selected secondary test method. After satisfying the pretest equilibrium requirements, make the measurements specified in Table 5 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) for the Indoor Air Enthalpy method and the user-selected secondary method. Except for external static pressure, make the Table 5 measurements at equal intervals that span 10 minutes or less. Measure external static pressure every 5 minutes or less. Continue data sampling until a 30-minute period (e.g., four consecutive 10-minute samples) is reached where the test tolerances specified in Table 13 are satisfied. For those continuously recorded parameters, use the entire data set for the 30-minute interval when evaluating Table 13 compliance. Determine the average electrical power consumption of the heat pump over the same 30-minute interval.

b. Calculate indoor-side total heating capacity as specified in section 7.3.4.1 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22). Do not adjust the parameters used in calculating capacity for the permitted variations in test conditions. Assign the average space heating capacity and electrical power over the 30-minute data collection interval to the variables \(Q^h\) and \(E^h(T)\) respectively. The "T" and superscripted "k" are the same as described in section 3.3. Additionally, for the heating test, use the superscript to denote results from the optional \(H_1\) or test, if conducted.

c. For heat pumps tested without an indoor fan installed, increase \(Q^h(T)\) by

\[
\frac{1250}{1000} \frac{\text{Btu}}{\text{h}} \cdot \frac{V_s}{\text{scfm}},
\]

and increase \(E^h(T)\) by,

\[
\frac{365}{1000} \frac{\text{W}}{\text{scfm}} \cdot \frac{V_s}{\text{scfm}},
\]

where \(V_s\) is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm). During the 30-minute data collection interval of a High Temperature Test, pay attention to preventing a defrost cycle. Prior to this time, allow the heat pump to perform a defrost cycle if automatically initiated by its own controls. As in all cases, wait for the heat pump’s defrost controls to automatically terminate the defrost cycle. Heat pumps that undergo a defrost should operate in the heating mode for at least 10 minutes after defrost termination prior to beginning the 30-minute data collection interval. For some heat pumps, frost may accumulate on the outdoor coil during a High Temperature test. If the outdoor coil leaving air temperature or the difference between the leaving and entering air temperatures decreases by more than 1.5 °F over the 30-minute data collection interval, then do not use the collected data to determine capacity. Instead, initiate a defrost cycle. Begin collecting data no sooner than 10 minutes after defrost termination. Collect 30 minutes of new data during which the Table 13 test tolerances are satisfied. In this case, use only the results from the second 30-minute data collection interval to evaluate \(Q^h(T)\) and \(E^h(T)\).

d. If conducting the optional cyclic heating mode test, which is described in section 3.8, record the average indoor-side air volume rate, \(V\), specific heat of the air, \(C_p\), (expressed on dry air basis), specific volume of the air at the nozzles, \(v_n\) (or \(v_s\)), humidity ratio at the nozzles, \(W_n\), and either pressure difference or velocity pressure for the flow nozzles. If either or both of the below criteria apply, determine the average, steady-state, electrical power consumption of the indoor fan motor (\(E_{\text{fan}}\)):

1. The section 3.8 cyclic test will be conducted and the heat pump has a variable-speed indoor fan that is expected to be disabled during the cyclic test, or

2. The heat pump has a (variable-speed) constant-air volume-rate indoor fan and during the steady-state test the average external static pressure (\(\Delta P\)) exceeds the applicable section 3.1.4.4 minimum (or targeted) external static pressure (\(\Delta P_{\text{min}}\)) by 0.03 inches of water or more.

Determine \(E_{\text{fan}}\), by making measurements during the 30-minute data collection interval, or immediately following the test and prior to changing the test conditions. When the above “2” criteria applies, conduct the following four steps after determining \(E_{\text{fan}}\) (which corresponds to \(\Delta P\)):

i. While maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately \(\Delta P + (\Delta P_{\text{min}} - \Delta P_{\text{fan}})\).

ii. After re-establishing steady readings for fan motor power and external static pressure, determine average values for the indoor fan power (\(E_{\text{fan}}\)) and the external static pressure (\(\Delta P\)) by making measurements over a 5-minute interval.

iii. Approximate the average power consumption of the indoor fan motor if the 30-minute test had been conducted at \(\Delta P_{\text{min}}\) using linear extrapolation.
3.8.1 Heating mode cyclic degradation coefficient calculation. Use the results from the optional cyclic test and the required steady-state test that were conducted at the same test conditions to determine the heating mode cyclic degradation coefficient, \( C_h \).

If the optional test is not conducted, assign \( C_h \) the default value of 0.25.

\[
C_D = \frac{C_{\text{op}}} {1 - \text{HLF}}
\]

where,

\[
\text{COP}_{\text{cyc}} = \frac{q_{\text{cycl}}}{3.413 \times W_{\text{e}}} \text{Btu/h}^{-1}
\]

the average coefficient of performance during the cyclic heating mode test, dimensionless.

\[
\text{COP}_{\text{ss}}\left(T_{\text{cycl}}\right) = \frac{Q^\text{h}(T_{\text{cycl}})}{3.413 \times W_{\text{e}}} E_k(T_{\text{cycl}})
\]

the average coefficient of performance during the steady-state heating mode test conducted at the same test conditions—i.e., same outdoor dry bulb temperature, \( T_{\text{cycl}} \), and speed/capacity, \( k \), if applicable—as specified for the cyclic heating mode test, dimensionless.

\[
\text{HLF} = \frac{q_{\text{cycl}}}{Q^\text{h}(T_{\text{cycl}}) \cdot \Delta t_{\text{cycl}}}
\]

the heating load factor, dimensionless. \( T_{\text{cycl}} \) = the nominal outdoor temperature at which the cyclic heating mode test is conducted, 62 or 47 °F. \( \Delta t_{\text{cycl}} \) = the duration of the OFF/ON intervals; 0.5 hours when testing a heat pump having a single-speed or two-capacity compressor and 1.0 hour when testing a heat pump having a variable-speed compressor.

Round the calculated value for \( C_h \) to the nearest 0.01. If \( C_h \) is negative, then set it equal to zero.

For heat pumps that cycle off the indoor fan during a defrost cycle, make no effort here to restrict the air movement through the indoor coil while the fan is off. Resume the OFF/ON cycling while conducting a minimum of two complete compressor OFF/ON cycles before determining \( q_{\text{cycl}} \) and \( e_{\text{cycl}} \).

(2) Calculate \( \Gamma \) using,

\[
\Gamma = \int \left[ T_{e_2}(\tau) - T_{e_1}(\tau) \right] d\tau, \text{ hr} \cdot °F.
\]

3.8.2 Calculations of the total electrical power used by the indoor fan during the cyclic heating test, \( E_k(T_{\text{cycl}}) \).

\[
E_{\text{fan}, \text{min}} = \bar{E}_{\text{fan}, 2} - \bar{E}_{\text{fan}, 1} + \Delta P_{\text{min}} - \Delta P_{\text{max}}
\]

iv. Decrease the total space heating capacity, \( Q^\text{h} \), by the amount \( E_{\text{fan}, \text{min}} \), when expressed on a Btu/h basis. Decrease the total electrical power, \( E_{\text{fan}} \), by the same fan power difference, now expressed in watts.
c. The official test period begins when the preliminary test period ends, at defrost termination. The official test period ends at the termination of the next occurring automatic defrost cycle. When testing a heat pump that uses a time-adaptive defrost control system (see Definition 1.42), however, manually initiate the defrost cycle that ends the official test period at the instant indicated by instructions provided by the manufacturer. If the heat pump has not undergone a defrost after 12 hours, immediately conclude the test and use the results from the full 12-hour period to calculate the average space heating capacity and average electrical power consumption. For heat pumps that turn the indoor fan off during the defrost cycle, take steps to cease forced airflow through the indoor coil and block the outlet duct whenever the heat pump’s controls cycle off the indoor fan. If it is installed, use the outlet damper box described in section 2.5.4.1 to affect the blocked outlet duct.

d. Defrost termination occurs when the controls of the heat pump actuate the first change in converting from defrost operation to normal heating operation. Defrost initiation occurs when the controls of the heat pump first alter its normal heating operation in order to eliminate possible accumulations of frost on the outdoor coil.

e. To constitute a valid Frost Accumulation test, satisfy the test tolerances specified in Table 15 during both the preliminary and official test periods. As noted in Table 15, test operating tolerances are specified for two sub-intervals: (1) When heating, except for the first 10 minutes after the termination of a defrost cycle (Sub-interval H, as described in Table 15) and (2) when defrosting, plus these same first 10 minutes after defrost termination (Sub-interval D, as described in Table 15) and (2) when defrosting, plus these same first 10 minutes after defrost termination (Sub-interval D, as described in Table 15). Evaluate compliance with Table 15 test operating tolerances and the majority of the test operating tolerances using the averages from measurements recorded only during Sub-interval H. Continuously record the dry bulb temperature of the air entering the indoor coil, and the dry bulb temperature and water vapor content of the air entering the outdoor coil. Sample the remaining parameters listed in Table 15 at equal intervals that span 10 minutes or less.

f. For the official test period, collect and use the following data to calculate average space heating capacity and electrical power consumption. During heating and defrosting into coils when the controls of the heat pump have the indoor fan on, continuously record the dry-bulb temperature of the air entering (as noted above) and leaving the indoor coil. If using a thermopile, continuously record the difference between the leaving and entering dry-bulb temperatures during the interval(s) that air flows through the indoor coil. For heat pumps tested without an indoor fan installed, determine the corresponding cumulative time (in hours) of indoor coil airflow, \( \tau_c \). Sample measurements used in calculating the air volume rate (refer to sections 7.8.3.1 and 7.8.3.2 of ASHRAE Standard 37-88 (incorporated by reference, see §430.22) at equal intervals that span 10 minutes or less.

\(^3\) Applies during the interval that air flows through the indoor (outdoor) coil except for the first 30 seconds after flow initiation. For units having a variable-speed indoor fan that ramps, the tolerances listed for the external resistance to airflow shall apply from 30 seconds after achieving full speed after ramp down begins.

---

**3.9 Test procedures for Frost Accumulation heating mode tests (the H2, H2\(_v\), H2, and H2 Test). a. Confirm that the defrost controls of the heat pump are set as specified in section 2.2.1. Operate the test room reconditioning apparatus and the heat pump for at least 30 minutes at the specified section 3.6 test conditions before starting the 'preliminary' test period. The preliminary test period must immediately precede the 'official' test period, which is the heating and defrost interval over which data are collected for evaluating average space heating capacity and average electrical power consumption.**
Record the electrical energy consumed, expressed in watt-hours, from defrost termination to defrost termination, $e_{\text{def}}(35)$, as well as the corresponding elapsed time in hours, $\Delta t_{fr}$.

1 See Definition 1.41.
2 See Definition 1.40.
3 Applies when the heat pump is in the heating mode, except for the first 10 minutes after termination of a defrost cycle.
4 Applies during a defrost cycle and during the first 10 minutes after the termination of a defrost cycle when the heat pump is operating in the heating mode.
5 For heat pumps that turn off the indoor fan during the defrost cycle, the noted tolerance only applies during the 10 minute interval that follows defrost termination.
6 Only applies when testing non-ducted heat pumps.

3.9.1 Average space heating capacity and electrical power calculations. a. Evaluate average space heating capacity, $Q_{\text{he}}(35)$, when expressed in units of Btu per hour, using:

$$Q_{\text{he}}(35) = \frac{60 \cdot \bar{V} \cdot C_{p,a} \cdot \Gamma}{\Delta t_{fr} \cdot \bar{V}_{n} \cdot (1 + W_{n})}$$

where,

- $\bar{V}$ = the average indoor air volume rate measured during Sub-interval $H$, cfm.
- $C_{p,a} = 0.24 + 0.444 \cdot W_{n}$, the constant pressure specific heat of the air-water vapor mixture that flows through the indoor coil and is expressed on a dry air basis, Btu / lbm of dry air.
- $\bar{V}_{n}$ = specific volume of the air-water vapor mixture at the nozzle, ft$^3$ / lbm of dry air.
- $W_{n}$ = humidity ratio of the air-water vapor mixture at the nozzle, lbm of water vapor per lbm of dry air.
- $\Delta t_{fr}$ = $t_2 - t_1$, the elapsed time from defrost termination to defrost termination, hr.
- $\Gamma = \int_{t_1}^{t_2} \left[ T_{a2}(\tau) - T_{a1}(\tau) \right] d\tau$, hr · °F.
- $T_{a1}(\tau)$ = dry bulb temperature of the air entering the indoor coil at elapsed time $\tau$, °F; only recorded when indoor coil airflow occurs; assigned the value of zero during periods (if any) where the indoor fan cycles off.
- $T_{a2}(\tau)$ = dry bulb temperature of the air leaving the indoor coil at elapsed time $\tau$, °F; only recorded when indoor coil airflow occurs; assigned the value of zero during periods (if any) where the indoor fan cycles off.

b. Evaluate average electrical power, $E_{\text{he}}(35)$, when expressed in units of watts, using:

$$E_{\text{he}}(35) = \frac{e_{\text{def}}(35)}{\Delta t_{fr}}$$

For heat pumps tested without an indoor fan installed, increase $Q_{\text{he}}(35)$ by, $1250 \text{ Btu/h} \cdot \frac{\bar{V}_{n}}{1000 \text{ scfm}} \cdot \frac{\Delta t_{fr}}{\Delta t_{fr}}$ and increase $E_{\text{he}}(35)$ by.
Temperature heating mode test using the test apparatus described in section 2.10.1 is connected to the outdoor unit. To help compensate for any effect that the addition of indoor space conditioning capacity that is determined using the secondary test method. Prior to evaluating if the energy balance specified in section 3.7 for the Maximum and High Temperature tests. If using the Outdoor Air Enthalpy Method, make an adjustment to account for the energy loss within the air duct that connects the indoor coil and the location where the outlet dry-bulb temperature is measured. In all cases, apply the correction to the indoor space conditioning capacity that is determined using the secondary test method.

3.11 Additional requirements for the secondary test methods. Prior to evaluating if the energy balance specified in section 3.7 for the Maximum and High Temperature tests. If using the Outdoor Air Enthalpy Method, make an adjustment to account for the energy loss within the air duct that connects the indoor coil and the location where the outlet dry-bulb temperature is measured. In all cases, apply the correction to the indoor space conditioning capacity that is determined using the secondary test method.

3.11.1 If using the Outdoor Air Enthalpy Method as the secondary test method. During the "official" test, the outdoor air-side test apparatus described in section 2.10.1 is connected to the outdoor unit. To help compensate for any effect that the addition of indoor space conditioning capacity that is determined using the secondary test method.

3.11.2 Demand defrost credit. a. Assign the demand defrost credit, \( F_{\text{def}} \), that is used in section 4.2 to the value of 1 in all cases except for heat pumps having a demand-defrost control system (Definition 121). For such qualifying heat pumps, evaluate \( F_{\text{def}} \) using:

\[
F_{\text{def}} = 1 + 0.03 \cdot \left( 1 - \frac{\Delta t_{\text{def}} - 1.5}{\Delta t_{\text{max}} - 1.5} \right),
\]

where, \( \Delta t_{\text{def}} \) = the time between defrost terminations (in hours) or 1.5, whichever is greater.
\( \Delta t_{\text{max}} \) = maximum time between defrosts as allowed by the controls (in hours) or 12, whichever is less.

b. For two-capacity heat pumps and for section 3.6.2 units, evaluate the above equation using the \( \Delta t_{\text{def}} \) that applies based on the Frost Accumulation Test conducted at high capacity and/or at the Heating Certified Air Volume Rate. For variable-speed heat pumps, evaluate \( \Delta t_{\text{def}} \) based on the required Frost Accumulation Test conducted at the intermediate compressor speed.

3.10 Test procedures for steady-state Low Temperature heating mode tests (the H3, H3, and H3 Tests). Except for the modifications noted in this section, conduct the Low Temperature heating mode test using the same approach as specified in section 3.7 for the Maximum and High Temperature tests. After satisfying the section 3.7 requirements for the pretest interval but before beginning to collect data to determine \( Q_h(17) \) and \( E_h(17) \), conduct a defrost cycle. This defrost cycle may be manually or automatically initiated. The defrost sequence must be terminated by the action of the heat pump's defrost control system. Begin the 30-minute data collection interval described in section 3.7 from which \( Q_h(17) \) and \( E_h(17) \) are determined, no sooner than 10 minutes after defrost termination. Defrosts should be prevented over the 30-minute data collection interval.

3.11.3 Frost Accumulation heating mode test. Make the measurement at a time when the heat pump is heating, except for the first 10 minutes after the termination of a defrost cycle.

2. After the Frost Accumulation heating mode test is completed and while maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately \( \Delta P_1 + (\Delta P_2 - \Delta P_{\text{min}}) \).

3. After re-establishing steady readings for the fan motor power and external static pressure, determine average values for the indoor fan power (\( E_{\text{fan},1} \)) and the external static pressure (\( \Delta P \)) by making measurements over a 5-minute interval.

4. Approximate the average power consumption of the indoor fan motor had the Frost Accumulation heating mode test been conducted at \( \Delta P_{\text{min}} \) using linear extrapolation:

\[
\dot{E}_{\text{fan},1} = \frac{\dot{E}_{\text{fan},2} - \dot{E}_{\text{fan},1}}{\Delta P_2 - \Delta P_1} (\Delta P_{\text{min}} - \Delta P_1) + \dot{E}_{\text{fan},1}
\]
this test apparatus may have on the unit's performance, conduct a "preliminary" test where the outdoor air-side test apparatus is disconnected. Conduct a preliminary test prior to the first section 3.2 steady-state cooling mode test and prior to the first section 3.6 steady-state heating mode test. No other preliminary tests are required so long as the same outdoor fan speed is used during all cooling mode steady-state tests at the same speed and all heating mode steady-state tests at the same speed. If using more than one outdoor fan speed for the cooling mode steady-state tests, however, conduct a preliminary test prior to each cooling mode test where a different fan speed is first used. This same requirement applies for the heating mode tests.

3.11.1 If a preliminary test precedes the official test. a. The test conditions for the preliminary test are the same as specified for the official test. Connect the indoor air-side test apparatus to the indoor coil; disconnect the outdoor air-side test apparatus. Allow the test room reconditioning apparatus and the unit being tested to operate for at least one hour. After attaining equilibrium conditions, measure the following quantities at equal intervals that span 10 minutes or less:

1. The section 2.10.1 evaporator and condenser temperatures or pressures;
2. Parameters required according to the Indoor Air Enthalpy Method.

Continue these measurements until a 30-minute period (e.g., four consecutive 10-minute samples) is obtained where the Table 7 or Table 13, whichever applies, test tolerances are satisfied.

b. After collecting 30 minutes of steady-state data, reconnect the outdoor air-side test apparatus to the unit. Adjust the exhaust fan of the outdoor airflow measuring apparatus until averages for the evaporator and condenser temperatures, or the saturated temperatures corresponding to the measured pressures, agree within ±0.5 °F of the averages achieved when the outdoor air-side test apparatus was disconnected. Calculate the averages for the reconnected case using five or more consecutive readings taken at one minute intervals. Make these consecutive readings after re-establishing equilibrium conditions and before initiating the official test.

3.11.1.2 If a preliminary test does not precede the official test. Connect the outdoor-side test apparatus to the unit. Adjust the exhaust fan of the outdoor airflow measuring apparatus to achieve the same external static pressure as measured during the prior preliminary test conducted with the unit operating in the same cooling or heating mode at the same outdoor fan speed.

3.11.1.3 Official test. a. Continue (preliminary test was conducted) or begin (no preliminary test) the official test by making measurements for both the Indoor and Outdoor Air Enthalpy Methods at equal intervals that span 10 minutes or less. Discontinue these measurement only after obtaining a 30-minute period where the specified test condition and test operating tolerances are satisfied. To constitute a valid official test:

(1) Achieve the energy balance specified in section 3.11; and,

(2) For cases where a preliminary test is conducted, the capacities determined using the Indoor Air Enthalpy Method from the official and preliminary test periods must agree within 2.0 percent.

b. For space cooling tests, calculate capacity from the outdoor air enthalpy measurements as specified in section 7.3.3.2 of ASHRAE Standard 37–88 (incorporated by reference, see §430.22). Calculate heating capacity based on outdoor air enthalpy measurements as specified in section 7.3.4.2 of the same ASHRAE Standard. Adjust outdoor side capacities according to section 7.3.3.3 of ASHRAE Standard 37–88 (incorporated by reference, see §430.22) to account for line losses when testing split systems. Do not correct the average electrical power measurement as described in section 8.5.3 of ASHRAE Standard 37–88 (incorporated by reference, see §430.22).

3.11.2 If using the Compressor Calibration Method as the secondary test method.

a. Conduct separate calibration tests using a calorimeter to determine the refrigerant flow rate. Or for cases where the superheat of the refrigerant leaving the evaporator is less than 5 °F, use the calorimeter to measure total capacity rather than refrigerant flow rate. Conduct these calibration tests at the same test conditions as specified for the tests in this Appendix. Operate the unit for at least one hour or until obtaining equilibrium conditions before collecting data that will be used in determining the average refrigerant flow rate or total capacity. Sample the data at equal intervals that span 10 minutes or less. Determine average flow rate or average capacity from data sampled over a 30-minute period where the Table 7 (cooling) or the Table 13 (heating) tolerances are satisfied. Otherwise, conduct the calibration tests according to ASHRAE Standard 23–93 (incorporated by reference, see §430.22), ASHRAE Standard 41.9–00 (incorporated by reference, see §430.22), and section 7.5 of ASHRAE Standard 37–88 (incorporated by reference, see §430.22).

b. Calculate space cooling and space heating capacities using the compressor calibration method measurements as specified in sections 7.5.7 and 7.5.8, respectively, of ASHRAE Standard 37–88 (incorporated by reference, see §430.22).
3.11.3 If using the Refrigerant Enthalpy Method as the secondary test method. Conduct this secondary method according to section 7.6 of ASHRAE Standard 37-88 (incorporated by reference, see § 430.22). Calculate space cooling and space heating capacities using the refrigerant enthalpy method measurements as specified in sections 7.6.4 and 7.6.5, respectively, of the same ASHRAE Standard.

3.12 Rounding of space conditioning capacities for reporting purposes.

a. When reporting rated capacities, round them off as follows:
   1. For capacities less than 20,000 Btu/h, round to the nearest 100 Btu/h.
   2. For capacities between 20,000 and 37,999 Btu/h, round to the nearest 200 Btu/h.
   3. For capacities between 38,000 and 64,999 Btu/h, round to the nearest 500 Btu/h.

b. For the capacities used to perform the section 4 calculations, however, round only to the nearest integer.

4. CALCULATIONS OF SEASONAL PERFORMANCE DESCRIPTORS

4.1 Seasonal Energy Efficiency Ratio (SEER) Calculations. SEER must be calculated as follows: For equipment covered under sections 4.1.2, 4.1.3, and 4.1.4, evaluate the seasonal energy efficiency ratio,

\[ SEER = \frac{\sum_{j=1}^{8} q_c(T_j)}{\sum_{j=1}^{8} e_c(T_j)} \]  

(4.1-1)

where,

\[ q_c(T_j) = \frac{q_{c(T_j)}}{N} \]

the ratio of the total space cooling provided during periods of the space cooling season when the outdoor temperature fell within the range represented by bin temperature \( T_j \) to the total number of hours in the cooling season (N), Btu/h.

\[ e_c(T_j) = \frac{e_c(T_j)}{N} \]

the electrical energy consumed by the test unit during periods of the space cooling season when the outdoor temperature fell within the range represented by bin temperature \( T_j \) to the total number of hours in the cooling season (N), Wh.

\( T_j \) = the outdoor bin temperature, °F. Outdoor temperatures are grouped or “binned.” Use bins of 5°F with the 8 cooling season bin temperatures being 67, 72, 77, 82, 87, 92, 97, and 102°F.

\( j \) = the bin number. For cooling season calculations, \( j \) ranges from 1 to 8.

Additionally, for sections 4.1.2, 4.1.3, and 4.1.4, use a building cooling load, \( BL(T_j) \). When referenced, evaluate \( BL(T_j) \) for cooling using,

\[ BL(T_j) = \left( \frac{T_j - 65}{95 - 65} \right) \cdot \frac{Q_{c(T_j)}(95)}{1.1} \]  

(4.1-2)

where,

\( Q_{c(T_j)}(95) \) = the space cooling capacity determined from the A2 Test and calculated as specified in section 3.3, Btu/h.

1.1 = sizing factor, dimensionless.

The temperatures 95°F and 65°F in the building load equation represent the selected outdoor design temperature and the zero-load base temperature, respectively.

4.1.1 SEER calculations for an air conditioner or heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed. a. Evaluate the seasonal energy efficiency ratio, expressed in units of Btu/watt-hour, using:

\[ SEER = PLF(0.5) \cdot EER_a \]
where,

\[ EER_B = \frac{\dot{Q}_c(T_j)}{E_c(82)}, \]

the energy efficiency ratio determined from the B Test described in sections 3.2.1, 3.1.4.1, and 3.3, Btu/h per watt.

PLF(0.5) = 1 – 0.5 · C_{Dc^82}, the part-load performance factor evaluated at a cooling load factor of 0.5, dimensionless.

b. Refer to section 3.3 regarding the definition and calculation of \( \dot{Q}_c(T_j) \) and \( E_c(82) \). If the optional tests described in section 3.2.1 are not conducted, set the cooling mode cyclic degradation coefficient, \( C_{Dc^82} \), to the default value specified in section 3.5.3. If these optional tests are conducted, set \( C_{Dc^82} \) to the lower of:

1. The value calculated as per section 3.5.3; or
2. The section 3.5.3 default value of 0.25.

4.1.2 SEER calculations for an air conditioner or heat pump having a single-speed compressor and a variable-speed variable-air-volume-rate indoor fan.

4.1.2.1 Units covered by section 3.2.2.1 where indoor fan capacity modulation correlates with the outdoor dry bulb temperature. The manufacturer must provide information on how the indoor air volume rate or the indoor fan speed varies over the outdoor temperature range of 67 °F to 102 °F. Calculate SEER using Equation 4.1–1. Evaluate the quantity \( q(T_j)_N \) in Equation 4.1–1 using,

\[ \frac{q_c(T_j)}{N} = X(T_j) \cdot \dot{Q}_c(T_j) \cdot \frac{n_j}{N} \quad (4.1.2-1) \]

where,

\[ X(T_j) = \begin{cases} \frac{BL(T_j)}{Q_c(T_j)} & \text{if } \frac{BL(T_j)}{Q_c(T_j)} \leq \frac{1}{n_j/N} \\ \frac{1}{n_j/N} & \text{if } \frac{BL(T_j)}{Q_c(T_j)} > \frac{1}{n_j/N} \end{cases} \]

whichever is less; the cooling mode load factor for temperature bin \( j \), dimensionless. \( Q_c(T_j) \) = the space cooling capacity of the test unit when operating at outdoor temperature, \( T_j \), Btu/h.

\( n_j/N \) = fractional bin hours for the cooling season; the ratio of the number of hours during the cooling season when the outdoor temperature fell within the range represented by bin temperature \( T_j \) to the total number of hours in the cooling season, dimensionless.

a. For the space cooling season, assign \( n_j/N \) as specified in Table 16. Use Equation 4.1–2 to calculate the building load, \( BL(T_j) \). Evaluate \( Q_c(T_j) \) using,

\[ \dot{Q}_c(T_j) = \dot{Q}_c^{k=1}(T_j) + \frac{\dot{Q}_c^{k=2}(T_j)}{FP_c^{k=2}} - \frac{\dot{Q}_c^{k=1}(T_j)}{FP_c^{k=1}} \cdot \left[ FP_c(T_j) - FP_c^{k=1} \right] \quad (4.1.2-2) \]

where,

\[ \dot{Q}_c^{k=1}(T_j) = \dot{Q}_c^{k=1}(82) + \frac{\dot{Q}_c^{k=1}(95) - \dot{Q}_c^{k=1}(82)}{95 - 82} \cdot (T_j - 82), \]

the space cooling capacity of the test unit at outdoor temperature \( T_j \), if operated at the Cooling Minimum Air Volume Rate, Btu/h.
Department of Energy
Pt. 430, Subpt. B, App. M

\[ \dot{Q}^{k=2}(T_j) = \dot{Q}^{k=2}_c(82) + \frac{\dot{Q}^{k=2}_c(95) - \dot{Q}^{k=2}_c(82)}{95 - 82} \cdot (T_j - 82), \]

the space cooling capacity of the test unit at outdoor temperature \( T_j \), if operated at the Cooling Certified Air Volume Rate, Btu/h.

b. For units where indoor fan speed is the primary control variable, \( FP^{k=1} \) denotes the fan speed used during the required \( A_1 \) and \( B_1 \) Tests (see section 3.2.2.1), \( FP^{k=2} \) denotes the fan speed used during the required \( A_2 \) and \( B_2 \) Tests, and \( FP_c(T_j) \) denotes the fan speed used by the unit when the outdoor temperature equals \( T_j \). For units where indoor air volume rate is the primary control variable, the three \( FP \)'s are similarly defined only now being expressed in terms of air volume rates rather than fan speeds. Refer to sections 3.2.2.1, 3.1.4 to 3.1.4.2, and 3.3 regarding the definitions and calculations of \( Q^{k=1}(82) \), \( Q^{k=1}(95) \), \( Q^{k=2}(82) \), and \( Q^{k=2}(95) \).

Calculate \( e_c(T_j)/N \) in Equation 4.1-1 using,

\[ \frac{e_c(T_j)}{N} = \frac{X(T_j) \cdot \dot{E}_c(T_j)}{PLF_j} \cdot \frac{n_j}{N} \quad (4.1.2-3) \]

where, \( PLF_j = 1 - C_D c \cdot [1 - X(T_j)] \), the part load factor, dimensionless. \( \dot{E}_c(T_j) \) is the electrical power consumption of the test unit when operating at outdoor temperature \( T_j \), W.

c. The quantities \( X(T_j) \) and \( n_j/N \) are the same quantities as used in Equation 4.1.2-1. If the optional tests described in section 3.2.2.1 and Table 4 are not conducted, set the cooling mode cyclic degradation coefficient, \( C_D c \), to the default value specified in section 3.5.3. If these optional tests are conducted, set \( C_D c \) to the lower of:

1. The value calculated as per section 3.5.3; or
2. The section 3.5.3 default value of 0.25.

d. Evaluate \( \dot{E}_c(T_j) \) using,

\[ \dot{E}_c(T_j) = \dot{E}^{k=1}_c(T_j) + \frac{\dot{E}^{k=2}_c(T_j) - \dot{E}^{k=1}_c(T_j)}{FP^{k=2}_c - FP^{k=1}_c} \cdot \left[ FP_c(T_j) - FP^{k=1}_c \right] \quad (4.1.2-4) \]

where

\[ \dot{E}^{k=1}_c(T_j) = \dot{E}^{k=1}_c(82) + \frac{\dot{E}^{k=1}_c(95) - \dot{E}^{k=1}_c(82)}{95 - 82} \cdot (T_j - 82), \]

the electrical power consumption of the test unit at outdoor temperature \( T_j \), if operated at the Cooling Minimum Air Volume Rate, W.

\[ \dot{E}^{k=2}_c(T_j) = \dot{E}^{k=2}_c(82) + \frac{\dot{E}^{k=2}_c(95) - \dot{E}^{k=2}_c(82)}{95 - 82} \cdot (T_j - 82), \]
the electrical power consumption of the test unit at outdoor temperature $T_j$ if operated at the Cooling Certified Air Volume Rate, W.

The parameters $FP_{c,k}$ and $FP_{j,k}$, and $FP_{k}(T_j)$ are the same quantities that are used when evaluating Equation 4.1.2. Refer to sections 3.2.2.1, 3.1.4 to 3.1.4.2, and 3.3 regarding the definitions and calculations of $E_{j,k}(82)$, $E_{j,k}(95)$, $E_{c,k}(82)$, and $E_{c,k}(95)$.

4.1.2.2 Units covered by section 3.2.2.2 where indoor fan capacity modulation is used to adjust the sensible to total cooling capacity ratio. Calculate SEER as specified in section 4.1.1.

4.1.3 SEER calculations for an air conditioner or heat pump having a two-capacity compressor. Calculate SEER using Equation 4.1–1. Evaluate the space cooling capacity, $Q_{c,k}(T_j)$, and electrical power consumption, $E_{c,k}(T_j)$, of the test unit when operating at low compressor capacity and outdoor temperature $T_j$.

\[
\dot{Q}_{c,k} = Q_{c,k}(82) + \frac{\dot{Q}_{c,k}(95) - \dot{Q}_{c,k}(82)}{95 - 82} \cdot (T_j - 82) \tag{4.1.3-1}
\]
\[
\dot{E}_{c,k} = \dot{E}_{c,k}(82) + \frac{\dot{E}_{c,k}(95) - \dot{E}_{c,k}(82)}{95 - 82} \cdot (T_j - 82) \tag{4.1.3-2}
\]

where $\dot{Q}_{c,k}(95)$ and $\dot{E}_{c,k}(95)$ are determined from the A1 Test, $Q_{c,k}(82)$ and $E_{c,k}(82)$ are determined from the B1 Test, and all are calculated as specified in section 3.3. For two-capacity units that lock out low capacity operation at outdoor temperatures less than 95°F (but greater than 82°F), use Equations 4.1.4–1 and 4.1.4–2 rather than Equations 4.1.3–1 and 4.1.3–2 for estimating performance at low compressor capacity. Evaluate the space cooling capacity, $Q_{c,k}(T_j)$, and electrical power consumption, $E_{c,k}(T_j)$, of the test unit when operating at high compressor capacity and outdoor temperature $T_j$.

\[
\dot{Q}_{c,k} = Q_{c,k}(82) + \frac{\dot{Q}_{c,k}(95) - \dot{Q}_{c,k}(82)}{95 - 82} \cdot (T_j - 82) \tag{4.1.3-3}
\]
\[
\dot{E}_{c,k} = \dot{E}_{c,k}(82) + \frac{\dot{E}_{c,k}(95) - \dot{E}_{c,k}(82)}{95 - 82} \cdot (T_j - 82) \tag{4.1.3-4}
\]

where $\dot{Q}_{c,k}(95)$ and $\dot{E}_{c,k}(95)$ are determined from the A1 Test, $Q_{c,k}(82)$, and $E_{c,k}(82)$, are determined from the B1 Test, and all are calculated as specified in section 3.3.

The calculation of Equation 4.1–1 quantities $q_i(T_j)/N$ and $e_i(T_j)/N$ differs depending on whether the test unit would operate at low capacity (section 4.1.3), cycle between low and high capacity (section 4.1.3.2), or operate at high capacity (sections 4.1.3.3 and 4.1.3.4) in responding to the building load. For units that lock out low capacity operation at higher outdoor temperatures, the manufacturer must supply information regarding this temperature so that the appropriate equations are used. Use Equation 4.1–2 to calculate the building load, $BL(T_j)$, for each temperature bin.

4.1.3.1 Steady-state space cooling capacity at low compressor capacity is greater than or equal to the building cooling load at temperature $T_j$, $Q_{c,k}(T_j) \geq BL(T_j)$.

\[
q_i(T_j) = \frac{X_k(T_j)}{N} \cdot \frac{Q_{c,k}(T_j) - Q_{c,k}(T_j)}{n_j} \tag{4.1.3-4}
\]
\[
e_i(T_j) = \frac{X_k(T_j)}{N} \cdot \frac{E_{c,k}(T_j) - E_{c,k}(T_j)}{PLF_j} \tag{4.1.3-5}
\]

where, $X_k(T_j) = BL(T_j) \cdot Q_{c,k}(T_j)$, the cooling mode low capacity load factor for temperature bin $j$, dimensionless. $PLF_j = 1 - C_{off} \cdot (1 - X_k(T_j))$, the part load factor, dimensionless.

\[
\frac{n_j}{N} = \frac{\text{fractional bin hours for the cooling season}}{\text{the ratio of the number of hours during the}}
\]

Pt. 430, Subpt. B, App. M
cooling season when the outdoor temperature fell within the range represented by bin temperature \( T_j \), to the total number of hours in the cooling season, dimensionless.

Obtain the fractional bin hours for the cooling season, \( n/N \), from Table 16. Use Equations 4.1.3-1 and 4.1.3-2, respectively, to evaluate \( Q_{c,k=1}(T_j) \) and \( E_{c,k=1}(T_j) \). If the optional tests described in section 3.2.3 and Table 5 are not conducted, set the cooling mode cyclic degradation coefficient, \( C_{D,c} \), to the default value specified in section 3.5.3. If these optional tests are conducted, set \( C_{D,c} \) to the lower of:

a. The value calculated according to section 3.5.3 or
b. The section 3.5.3 default value of 0.25.

4.1.3.2 Unit alternates between high \((k=2)\) and low \((k=1)\) compressor capacity to satisfy the building cooling load at temperature \( T_j \), \( Q_{c,k=1}(T_j) < BL(T_j) < Q_{c,k=2}(T_j) \).

\[
\frac{q_c(T_j)}{N} = \left[ X^{k=1}(T_j) \cdot \dot{Q}_{c,k=1}(T_j) + X^{k=2}(T_j) \cdot \dot{Q}_{c,k=2}(T_j) \right] \frac{n_j}{N}
\]

\[
\frac{e_c(T_j)}{N} = \left[ X^{k=1}(T_j) \cdot \dot{E}_{c,k=1}(T_j) + X^{k=2}(T_j) \cdot \dot{E}_{c,k=2}(T_j) \right] \frac{n_j}{N}
\]

where,

\[
X^{k=1}(T_j) = \frac{\dot{Q}_{c,k=2}(T_j) - BL(T_j)}{\dot{Q}_{c,k=2}(T_j) - \dot{Q}_{c,k=1}(T_j)}
\]

the cooling mode, low capacity load factor for temperature bin \( j \), dimensionless.

\[
X^{k=2}(T_j) = 1 - X^{k=1}(T_j)
\]

the cooling mode, high capacity load factor for temperature bin \( j \), dimensionless.

Obtain the fractional bin hours for the cooling season, \( n/N \), from Table 16. Use Equations 4.1.3-1 and 4.1.3-2, respectively, to evaluate \( Q_{c,k=1}(T_j) \) and \( E_{c,k=1}(T_j) \). Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate \( Q_{c,k=2}(T_j) \) and \( E_{c,k=2}(T_j) \).

4.1.3.3 Unit only operates at high \((k=2)\) compressor capacity at temperature \( T_j \) and its capacity is greater than the building cooling load, \( BL(T_j) < Q_{c,k=2}(T_j) \). This section applies to units that lock out low compressor capacity operation at higher outdoor temperatures.

\[
\frac{q_c(T_j)}{N} = X^{k=2}(T_j) \cdot \dot{Q}_{c,k=2}(T_j) \frac{n_j}{N}
\]

\[
\frac{e_c(T_j)}{N} = X^{k=2}(T_j) \cdot \dot{E}_{c,k=2}(T_j) \frac{n_j}{N}
\]

where,

\[
X^{k=2}(T_j) = BL(T_j)/\dot{Q}_{c,k=2}(T_j)
\]

the cooling mode, high capacity load factor for temperature bin \( j \), dimensionless.

\[
PLF_j = 1 - C_{D,c} \cdot [1 - X^{k=2}(T_j)], \text{ the part load factor, dimensionless.}
\]

Obtain the fractional bin hours for the cooling season, \( n/N \), from Table 16. Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate \( Q_{c,k=2}(T_j) \) and \( E_{c,k=2}(T_j) \). When evaluating the above equation for part load factor at high capacity, use the same value of \( C_{D,c} \) as used in the section 4.1.3.1 calculations.

4.1.3.4 Unit must operate continuously at high \((k=2)\) compressor capacity at temperature \( T_j \), \( BL(T_j) > Q_{c,k=2}(T_j) \).
 Obtain the fractional bin hours for the cooling season, \( n/N \), from Table 16. Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate \( \dot{Q}_c(T_j) \) and \( \dot{E}_c(T_j) \).  

4.1.4 SEER calculations for an air conditioner or heat pump having a variable-speed compressor. Calculate SEER using Equation 4.1–1. Evaluate the space cooling capacity, \( \dot{Q}_c = \frac{1}{(T_j)} \), and electrical power consumption, \( \dot{E}_c = \frac{1}{(T_j)} \), of the test unit when operating at minimum compressor speed and outdoor temperature \( T_j \). Use, 

where \( \dot{Q}_{c,k=1}(82) \) and \( \dot{E}_{c,k=1}(82) \) are determined from the B1 Test, \( \dot{Q}_{c,k=1}(67) \) and \( \dot{E}_{c,k=1}(67) \) are determined from the F1 Test, and all four quantities are calculated as specified in section 3.3. Evaluate the space cooling capacity, \( \dot{Q}_{c,k=1}(T_j) \), and electrical power consumption, \( \dot{E}_{c,k=1}(T_j) \), of the test unit when operating at maximum compressor speed and outdoor temperature \( T_j \). Use Equations 4.1.3-3 and 4.1.3-4, respectively, where \( \dot{Q}_{c,k=1}(95) \) and \( \dot{E}_{c,k=1}(95) \) are determined from the A2 Test, \( \dot{Q}_{c,k=1}(82) \) and \( \dot{E}_{c,k=1}(82) \) are determined from the B2 Test, and all four quantities are calculated as specified in section 3.3. Calculate the space cooling capacity, \( \dot{Q}_{c,k=1}(T_j) \), and electrical power consumption, \( \dot{E}_{c,k=1}(T_j) \), of the test unit when operating at outdoor temperature \( T_j \) and the intermediate compressor speed used during the section 3.2.4 (and Table 6) E1 Test using, 

where \( \dot{Q}_{c,k=1}(87) \) and \( \dot{E}_{c,k=1}(87) \) are determined from the E1 Test and calculated as specified in section 3.3. Approximate the slopes of the \( k = v \) intermediate speed cooling capacity and electrical power input curves, \( M_Q \) and \( M_E \), as follows: 

\[
M_Q = \left[ \frac{\dot{Q}_{c,k=1}(82) - \dot{Q}_{c,k=1}(67)}{82 - 67} (1 - N_Q) \right] + \left[ N_Q \cdot \frac{\dot{Q}_{c,k=2}(95) - \dot{Q}_{c,k=2}(82)}{95 - 82} \right]
\]

\[
M_E = \left[ \frac{\dot{E}_{c,k=1}(82) - \dot{E}_{c,k=1}(67)}{82 - 67} (1 - N_E) \right] + \left[ N_E \cdot \frac{\dot{E}_{c,k=2}(95) - \dot{E}_{c,k=2}(82)}{95 - 82} \right]
\]
where,
\[ N_Q = \frac{\dot{Q}_{\text{c,k=1}}^k(87) - \dot{Q}_{\text{c,k=2}}^k(87)}{\dot{Q}_{\text{c}}^k(87) - \dot{Q}_{\text{c,k=1}}^k(87)} \]
and
\[ N_E = \frac{\dot{E}_{\text{c,k=1}}^k(87) - \dot{E}_{\text{c,k=2}}^k(87)}{\dot{E}_{\text{c}}^k(87) - \dot{E}_{\text{c,k=1}}^k(87)} \]
Calculating Equation 4.1–1 quantities
\[ q_c(T_j) = \frac{X_{k=1}(T_j) \cdot \dot{Q}_{c,k=1}^k(T_j)}{N} \]
\[ c_c(T_j) = \frac{X_{k=1}(T_j) \cdot \dot{E}_{c,k=1}^k(T_j)}{N} \]
differs depending upon whether the test unit would operate at minimum speed (section 4.1.4.1), operate at an intermediate speed (section 4.1.4.2), or operate at maximum speed (section 4.1.4.3) in responding to the building load. Use Equation 4.1–2 to calculate the building load, \( \text{BL}(T_i) \), for each temperature bin.

4.1.4.1 Steady-state space cooling capacity
when operating at minimum compressor speed is greater than or equal to the building cooling load at temperature \( T_j \) when \( \dot{Q}_{\text{c,k=1}}^k(T_j) \geq \text{BL}(T_j) \).

\[ q_c(T_j) = \frac{X_{k=1}(T_j) \cdot \dot{Q}_{c,k=1}^k(T_j)}{N} \]
\[ c_c(T_j) = \frac{X_{k=1}(T_j) \cdot \dot{E}_{c,k=1}^k(T_j)}{N} \]

where,
\[ X_{k=1}(T_j) = \text{BL}(T_j) / \dot{Q}_{c,k=1}^k(T_j) \]
the cooling mode minimum speed load factor for temperature bin \( j \), dimensionless.
\[ \text{PLF}_j = 1 - C_{\text{dk}} \cdot [1 - X_{k=1}(T_j)] \]
the part load factor, dimensionless.
\[ n_j/N = \text{fractional bin hours for the cooling season} \]
the ratio of the number of hours during the cooling season when the outdoor temperature fell within the range represented by bin temperature \( T_j \) to the total number of hours in the cooling season, dimensionless.
Obtain the fractional bin hours for the cooling season, \( n_j/N \), from Table 16. Use

Equations 4.1.4–1 and 4.1.4–2, respectively, to evaluate \( \dot{Q}_{c,k=1}^k(T_j) \) and \( \dot{E}_{c,k=1}^k(T_j) \). If the optional tests described in section 3.2.4 and Table 6 are not conducted, set the cooling mode cyclic degradation coefficient, \( C_{\text{dk}} \), to the default value specified in section 3.5.3. If these optional tests are conducted, set \( C_{\text{dk}} \) to the lower of:

a. The value calculated according to section 3.5.3
b. The section 3.5.3 default value of 0.25

4.1.4.2 Unit operates at an intermediate compressor speed \( (k = i) \) in order to match the building cooling load at temperature \( T_j \), \( \dot{Q}_{c,k=i}^k(T_j) < \text{BL}(T_j) < \dot{Q}_{c,k=1}^k(T_j) \).

\[ q_c(T_j) = \frac{\dot{Q}_{c,k=i}^k(T_j) \cdot n_j}{N} \]
\[ c_c(T_j) = \frac{\dot{E}_{c,k=i}^k(T_j) \cdot n_j}{N} \]
the electrical power input required by the test unit when operating at a compressor speed of \( k = i \) and temperature \( T_j \), W.

\[ \text{EER}_{k=i}(T_j) = \frac{\dot{Q}_{c,k=i}^k(T_j)}{\dot{E}_{c,k=i}^k(T_j)} \]

Obtain the fractional bin hours for the cooling season, \( n_j/N \), from Table 16. For each temperature bin where the unit operates at an intermediate compressor speed, determine the energy efficiency ratio \( \text{EER}_{k=i}(T_j) \) using,

\[ \text{EER}_{k=i}(T_j) = A + B \cdot T_j + C \cdot T_j^2 \]
for each unit, determine the coefficients \( A, B, \) and \( C \) by conducting the following calculations once:
where,

\( T_l \) = the outdoor temperature at which the unit, when operating at minimum compressor speed, provides a space cooling capacity that is equal to the building load \( (\dot{Q}_c) \text{k}(T_1) = BL(T_1), °\text{F} \). Determine \( T_1 \) by equating Equations 4.1.4-1 and 4.1-2 and solving for outdoor temperature.

\( T_v \) = the outdoor temperature at which the unit, when operating at the intermediate compressor speed used during the section 3.2.4 E \text{ Test}, provides a space cooling capacity that is equal to the building load \( (\dot{Q}_c) \text{k}(T_v) = BL(T_v), °\text{F} \). Determine \( T_v \) by equating Equations 4.1.4-3 and 4.1-2 and solving for outdoor temperature.

\( T_2 \) = the outdoor temperature at which the unit, when operating at maximum compressor speed, provides a space cooling capacity that is equal to the building load \( (\dot{Q}_c) \text{k}(T_2) = BL(T_2), °\text{F} \). Determine \( T_2 \) by equating Equations 4.1.4-4, substituting \( T_2 \) for \( T_1 \) and solving for outdoor temperature.

3.2.4 E \text{ Test}, provides a space cooling capacity that is equal to the building load \( (\dot{Q}_c) \text{k}(T_1) = BL(T_1), °\text{F} \). Determine \( T_1 \) by equating Equations 4.1.4-1 and 4.1-2 and solving for outdoor temperature.

\[ D = \frac{T_2 - T_1}{T_v - T_1} \]

\[ B = \frac{EER^{k=1}(T_1) - EER^{k=2}(T_1) - D \left[ EER^{k=1}(T_v) - EER^{k=2}(T_v) \right]}{T_1 - T_v - D \left( T_1 - T_v \right)} \]

\[ C = \frac{EER^{k=1}(T_v) - EER^{k=2}(T_v) - B \left( T_1 - T_v \right)}{T_v - T_2} \]

\[ A = EER^{k=2}(T_2) - B \cdot T_2 - C \cdot T_2^2 \]

4.1.4.3 Unit must operate continuously at maximum \((k=2)\) compressor speed at temperature \( T_j, BL(T_j) \geq Q_{\text{c k}}^{k=2}(T_j) \). Evaluate the Equation 4.1-1 quantities

\( \frac{\dot{Q}_c(T_j)}{E_{\text{c k}}^{k=1}(T_j)} \left( \text{Eqn. 4.1.4-1, substituting } T_i \text{ for } T_j \right) \) Btu/h per W.

\( \frac{\dot{Q}_c(T_j)}{E_{\text{c k}}^{k=2}(T_j)} \left( \text{Eqn. 4.1.4-2, substituting } T_i \text{ for } T_j \right) \) Btu/h per W.

\( \frac{\dot{Q}_c(T_j)}{E_{\text{c k}}^{k=2}(T_j)} \left( \text{Eqn. 4.1.4-3, substituting } T_i \text{ for } T_j \right) \) Btu/h per W.

\( \frac{\dot{Q}_c(T_j)}{E_{\text{c k}}^{k=2}(T_j)} \left( \text{Eqn. 4.1.4-4, substituting } T_i \text{ for } T_j \right) \) Btu/h per W.

4.2 Heating Seasonal Performance Factor (HSPF) Calculations. Unless an approved alternative rating method is used, as set forth in 10 CFR 430.24(m), Subpart B, HSPF must be calculated as follows: Six generalized climatic regions are depicted in Figure 2 and otherwise defined in Table 17. For each of these regions and for each applicable standardized design heating requirement, evaluate the heating seasonal performance factor using.
where,

\[ e_{h}(T_j)/N = \text{The ratio of the electrical energy consumed by the heat pump during periods of the space heating season when the outdoor temperature fell within the range represented by bin temperature } T_j \text{ to the total number of hours in the heating season (N), W. For heat pumps having a heat comfort controller, this ratio may also include electrical energy used by resistive elements to maintain a minimum air delivery temperature (see 4.2.5).} \]

\[ n_j/N = \text{Fractional bin hours for the heating season; the ratio of the number of hours during the heating season when the outdoor temperature fell within the range represented by bin temperature } T_j \text{ to the total number of hours in the heating season, dimensionless. Obtain } n_j/N \text{ values from Table 17.} \]

\[ J = \text{for each generalized climatic region, the total number of temperature bins, dimensionless. Referring to Table 17, } J \text{ is the highest bin number (j) having a nonzero entry for the fractional bin hours for the generalized climatic region of interest.} \]

\[ F_{\text{def}} = \text{the demand defrost credit described in section 3.9.2, dimensionless.} \]

\[ BL(T_j) = \text{the building space conditioning load corresponding to an outdoor temperature of } T_j; \text{the heating season building load also depends on the generalized climatic region's outdoor design temperature and the design heating requirement, Btu/h.} \]

**Table 17—Generalized Climatic Region Information**

</table>
Evaluate the building heating load using

\[
BL(T_1) = \frac{(65 - T_1)}{65 - T_{OD}} \cdot C \cdot DHR
\]  

where,

- \(T_{OD}\) = the outdoor design temperature, °F.
- C = 0.77, a correction factor which tends to improve the agreement between calculated and measured building loads, dimensionless.
- DHR = the design heating requirement (see Definition 1.22), Btu/h.

Calculate the minimum and maximum design heating requirements for each generalized climatic region as follows:

\[
DHR_{\text{min}} = \begin{cases} 
Q_{h}^{k}(47) \cdot \left[ \frac{65 - T_{OD}}{60} \right], & \text{for Regions I, II, III, IV, & VI} \\
Q_{h}^{k}(47), & \text{for Region V}
\end{cases}
\]

and

\[
DHR_{\text{max}} = \begin{cases} 
2 \cdot Q_{h}^{k}(47) \cdot \left[ \frac{65 - T_{OD}}{60} \right], & \text{for Regions I, II, III, IV, & VI} \\
2.2 \cdot Q_{h}^{k}(47), & \text{for Region V}
\end{cases}
\]

where \(Q_{h}^{k}(47)\) is expressed in units of Btu/h and otherwise defined as follows:

1. For a single-speed heat pump tested as per section 3.6.1, \(Q_{h}^{k}(47) = Q_{h}(47)\), the space heating capacity determined from the H1 Test.
2. For a variable-speed heat pump, a section 3.6.2 single-speed heat pump, or a two-capacity heat pump not covered by item 3, \(Q_{h}^{k}(47) = Q_{h}^{k}(47)\), the space heating capacity determined from the H1 Test.
3. For two-capacity, northern heat pumps (see Definition 1.46), \(Q_{h}(47) = Q_{h}(47)\), the space heating capacity determined from the H1 Test.

If the optional H1N Test is conducted on a variable-speed heat pump, the manufacturer has the option of defining \(Q_{h}^{k}(47)\) as specified above in item 2 or as \(Q_{h}^{k}(47) = Q_{h}^{k}(47)\), the space heating capacity determined from the H1N Test.

For all heat pumps, HSPF accounts for the heating delivered and the energy consumed by auxiliary resistive elements when operating below the balance point. This condition occurs when the building load exceeds the space heating capacity of the heat pump.
condenser. For HSPF calculations for all heat pumps, see either section 4.2.1, 4.2.2, 4.2.3, or 4.2.4, whichever applies.

For heat pumps with heat comfort controllers (see Definition 1.28), HSPF also accounts for resistive heating contributed when operating above the heat-pump-plus-comfort-controller balance point as a result of maintaining a minimum supply temperature. For heat pumps having a heat comfort controller, see section 4.2.5 for the additional steps required for calculating the HSPF.

### Table 18—Standardized Design Heating Requirements (BTU/h)

| BTU/h     | 5,000 | 10,000 | 15,000 | 20,000 | 25,000 | 30,000 | 35,000 | 40,000 | 45,000 | 50,000 | 60,000 | 70,000 | 80,000 | 90,000 | 100,000 | 110,000 | 120,000 | 130,000 |
|-----------|-------|--------|--------|--------|-------|--------|--------|-------|--------|-------|--------|--------|-------|--------|----------|----------|---------|

#### 4.2.1 Additional steps for calculating the HSPF of a heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed.

\[
e_h(T_j) = \frac{X(T_j) \cdot \dot{E}_h(T_j) \cdot \delta(T_j)}{N \cdot \text{PLF}_j} \cdot \frac{n_j}{N} \quad (4.2.1-1)
\]

\[
\frac{\text{RH}(T_j)}{N} = \frac{\text{BL}(T_j) \cdot \left[ X(T_j) \cdot \dot{Q}_h(T_j) \cdot \delta(T_j) \right]}{3.413 \frac{\text{Btu}}{\text{h}}} \cdot \frac{n_j}{N} \quad (4.2.1-2)
\]

where,

\[X(T_j) = \begin{cases} \frac{\text{BL}(T_j)}{\dot{Q}_h(T_j)} & \text{or} \\ 1 & \text{whichever is less} \end{cases} \]

\[\delta(T_j) = \begin{cases} 0, \text{if } T_j \leq T_{\text{off}} & \text{or} \\ \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} < 1 \end{cases} \]

\[\delta(T_j) = \begin{cases} 1/2, \text{if } T_{\text{off}} < T_j \leq T_{\text{on}} \text{ and} \\ \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} \geq 1 \end{cases} \]

\[\delta(T_j) = \begin{cases} 1, \text{if } T_j > T_{\text{on}} \text{ and} \\ \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} \geq 1 \end{cases} \]
where, $T_{\text{off}}$ = the outdoor temperature when the compressor is automatically shut off, °F. (If no such temperature exists, $T_{j}$ is always greater than $T_{\text{on}}$ and $T_{\text{off}}$).

$T_{\text{on}}$ = the outdoor temperature when the compressor is automatically turned back on, if applicable, following an automatic shut-off, °F.

Calculate $\dot{Q}_{h}(T_{j})$ and $\dot{E}_{h}(T_{j})$ using,

\[ \dot{Q}_{h}(T_{j}) = \begin{cases} \dot{Q}_{h}(17) + \frac{[\dot{Q}_{h}(47) - \dot{Q}_{h}(17)](T_{j} - 17)}{47 - 17}, & \text{if} \ T_{j} \geq 45 \ ^{\circ}\text{F or} \ T_{j} \leq 17 \ ^{\circ}\text{F} \\ \dot{Q}_{h}(17) + \frac{[\dot{Q}_{h}(35) - \dot{Q}_{h}(17)](T_{j} - 17)}{35 - 17}, & \text{if} \ 17 \ ^{\circ}\text{F} < T_{j} < 45 \ ^{\circ}\text{F} \end{cases} \tag{4.2.1-4} \]

\[ \dot{E}_{h}(T_{j}) = \begin{cases} \dot{E}_{h}(17) + \frac{[\dot{E}_{h}(47) - \dot{E}_{h}(17)](T_{j} - 17)}{47 - 17}, & \text{if} \ T_{j} \geq 45 \ ^{\circ}\text{F or} \ T_{j} \leq 17 \ ^{\circ}\text{F} \\ \dot{E}_{h}(17) + \frac{[\dot{E}_{h}(35) - \dot{E}_{h}(17)](T_{j} - 17)}{35 - 17}, & \text{if} \ 17 \ ^{\circ}\text{F} < T_{j} < 45 \ ^{\circ}\text{F} \end{cases} \tag{4.2.1-5} \]

where $\dot{Q}_{h}(47)$ and $\dot{E}_{h}(47)$ are determined from the H1 Test and calculated as specified in section 3.7. $\dot{Q}_{h}(35)$ and $\dot{E}_{h}(35)$ are determined from the H2 Test and calculated as specified in section 3.9.1 and $\dot{Q}_{h}(17)$ and $\dot{E}_{h}(17)$ are determined from the H3 Test and calculated as specified in section 3.10.

4.2.2 Additional steps for calculating the HSPF of a heat pump having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan. The manufacturer must provide information about how the indoor air volume rate or the indoor fan speed varies over the outdoor temperature range of 65 °F to −23 °F. Calculate the quantities $\mathcal{e}_{h}(T_{j})$ and $\mathcal{R}_{h}(T_{j})$ in Equation 4.2-1 as specified in section 4.2.1 with the exception of replacing references to the HIC Test and section 3.6.1 with the HIC, Test and section 3.6.2. In addition, evaluate the space heating capacity and electrical power consumption of the heat pump $\dot{Q}_{h}(T_{j})$ and $\dot{E}_{h}(T_{j})$ using

\[ \dot{Q}_{h}(T_{j}) = \dot{Q}_{h}^{k=1}(T_{j}) + \frac{\dot{Q}_{h}^{k=2}(T_{j}) - \dot{Q}_{h}^{k=1}(T_{j})}{\mathcal{F}_{h}^{k=2} - \mathcal{F}_{h}^{k=1}} \left[ \mathcal{F}_{h}(T_{j}) - \mathcal{F}_{h}^{k=1} \right] \tag{4.2.2-1} \]

\[ \dot{E}_{h}(T_{j}) = \dot{E}_{h}^{k=1}(T_{j}) + \frac{\dot{E}_{h}^{k=2}(T_{j}) - \dot{E}_{h}^{k=1}(T_{j})}{\mathcal{F}_{h}^{k=2} - \mathcal{F}_{h}^{k=1}} \left[ \mathcal{F}_{h}(T_{j}) - \mathcal{F}_{h}^{k=1} \right] \tag{4.2.2-2} \]

where the space heating capacity and electrical power consumption at both low capacity ($k=1$) and high capacity ($k=2$) at outdoor temperature $T_{j}$ are determined using
For units where indoor fan speed is the primary control variable, $F_{P_{h}}^{k=1}$ denotes the fan speed used during the required $H_1$ and $H_3$ Tests (see Table 10), $F_{P_{h}}^{k=2}$ denotes the fan speed used during the required $H_2$, $H_3$, and $H_5$ Tests, and $F_{P_{h}}(T_j)$ denotes the fan speed used by the unit when the outdoor temperature equals $T_j$. For units where indoor air volume rate is the primary control variable, the three $F_{P_{h}}$'s are similarly defined only now being expressed in terms of air volume rates rather than fan speeds. Determine $Q_{h}^{k=1}$ (47) and $Q_{h}^{k=2}$ (47) and $E_{h}^{k=1}$ (47) from the $H_1$ Test. Calculate all four quantities as specified in section 3.7. Determine $Q_{h}^{k=1}$ (35) and $E_{h}^{k=1}$ (35) as specified in section 3.6.2; determine $Q_{h}^{k=2}$ (35) and $E_{h}^{k=2}$ (35) and from the $H_2$ Test and the calculation specified in section 3.9. Determine $Q_{h}^{k=1}$ (17) and $E_{h}^{k=1}$ (17) from the $H_3$ Test, and $Q_{h}^{k=2}$ (17) and $E_{h}^{k=2}$ (17) from the $H_3$ Test. Calculate all four quantities as specified in section 3.10.

### 4.2.3 Additional steps for calculating the HSPF of a heat pump having a two-capacity compressor

The calculation of the Equation 4.2-1 quantities

$$\frac{e_{h}(T_j)}{N} \text{ and } \frac{RH(T_j)}{N}$$

differs depending upon whether the heat pump would operate at low capacity (section 4.2.3.1), cycle between low and high capacity (Section 4.2.3.2), or operate at high capacity (sections 4.2.3.3 and 4.2.3.4) in responding to the building load. For heat pumps that lock out low capacity operation at low outdoor temperatures, the manufacturer must supply information regarding the cutoff temperature(s) so that the appropriate equations can be selected.

a. Evaluate the space heating capacity and electrical power consumption of the heat pump when operating at low compressor capacity and outdoor temperature $T_j$ using

\[
Q_{h}^{k=1}(T_j) = \begin{cases} 
\dot{Q}_{h}^{k=1}(47) + \left[ \frac{\dot{Q}_{h}^{k=1}(47) - \dot{Q}_{h}^{k=1}(17)}{47 - 17} \right] (T_j - 47), & \text{if } T_j \geq 40 \, ^\circ F \text{ or } T_j \leq 17 \, ^\circ F \\
\dot{Q}_{h}^{k=1}(17) + \left[ \frac{\dot{Q}_{h}^{k=1}(17) - \dot{Q}_{h}^{k=1}(17)}{35 - 17} \right] (T_j - 17), & \text{if } 17 \, ^\circ F < T_j < 45 \, ^\circ F \\
\dot{Q}_{h}^{k=1}(17) + \left[ \frac{\dot{Q}_{h}^{k=1}(47) - \dot{Q}_{h}^{k=1}(17)}{47 - 17} \right] (T_j - 17), & \text{if } 17 \, ^\circ F < T_j < 45 \, ^\circ F 
\end{cases}
\]

b. Evaluate the space heating capacity and electrical power consumption of the heat pump when operating at high compressor capacity and outdoor temperature $T_j$ using

\[
Q_{h}^{k=2}(T_j) = \begin{cases} 
\dot{Q}_{h}^{k=2}(47) + \left[ \frac{\dot{Q}_{h}^{k=2}(47) - \dot{Q}_{h}^{k=2}(17)}{47 - 17} \right] (T_j - 47), & \text{if } T_j \geq 40 \, ^\circ F \\
\dot{Q}_{h}^{k=2}(17) + \left[ \frac{\dot{Q}_{h}^{k=2}(47) - \dot{Q}_{h}^{k=2}(17)}{47 - 17} \right] (T_j - 17), & \text{if } 17 \, ^\circ F \leq T_j < 40 \, ^\circ F \\
\dot{Q}_{h}^{k=2}(17) + \left[ \frac{\dot{Q}_{h}^{k=2}(47) - \dot{Q}_{h}^{k=2}(17)}{47 - 17} \right] (T_j - 17), & \text{if } T_j < 17 \, ^\circ F 
\end{cases}
\]
b. Evaluate the space heating capacity and electrical power consumption \(\dot{Q}_{h}^{k=1}(T_j)\) and \(\dot{E}_{h}^{k=2}(T_j)\) of the heat pump when operating at high compressor capacity and outdoor temperature \(T_j\) by solving Equations 4.2.2–3 and 4.2.2–4, respectively, for \(k=2\). Determine \(\dot{Q}_{h}^{k=1}(62)\) and \(\dot{E}_{h}^{k=2}(62)\) from the H0 Test, \(\dot{Q}_{h}^{k=1}(47)\) and \(\dot{E}_{h}^{k=2}(47)\) from the H1 Test, and \(\dot{Q}_{h}^{k=2}(47)\) and \(\dot{E}_{h}^{k=2}(47)\) from the H12 Test. Calculate all six quantities as specified in section 3.7. Determine \(\dot{Q}_{h}^{k=1}(35)\) and \(\dot{E}_{h}^{k=2}(35)\) from the H2 Test and, if required as described in section 3.6.3, determine \(\dot{Q}_{h}^{k=1}(35)\) and \(\dot{E}_{h}^{k=2}(35)\) from the H21 Test. Calculate the required 35 °F quantities as specified in section 3.9. Determine \(\dot{Q}_{h}^{k=1}(17)\) and \(\dot{E}_{h}^{k=2}(17)\) from the H3 Test and, if required as described in section 3.6.3, determine \(\dot{Q}_{h}^{k=1}(17)\) and \(\dot{E}_{h}^{k=2}(17)\) from the H31 Test. Calculate the required 17 °F quantities as specified in section 3.10.

4.2.3.1 Steady-state space heating capacity when operating at low compressor capacity is greater than or equal to the building heating load at temperature \(T_j\), \(\dot{Q}_{h}^{k=1}(T_j)\geq BL(T_j)\).

\[
\begin{align*}
\hat{E}_{h}^{k=1}(T_j) &= \begin{cases} 
\dot{E}_{h}^{k=1}(47) + \frac{\dot{E}_{h}^{k=1}(62) - \dot{E}_{h}^{k=1}(47)}{62 - 47} (T_j - 47), & \text{if } T_j \geq 40 \text{ °F} \\
\dot{E}_{h}^{k=1}(17) + \frac{\dot{E}_{h}^{k=1}(35) - \dot{E}_{h}^{k=1}(17)}{35 - 17} (T_j - 17), & \text{if } 17 \text{ °F} \leq T_j < 40 \text{ °F} \\
\dot{E}_{h}^{k=1}(17) + \frac{\dot{E}_{h}^{k=1}(47) - \dot{E}_{h}^{k=1}(17)}{47 - 17} (T_j - 17), & \text{if } T_j < 17 \text{ °F}
\end{cases}
\end{align*}
\]

where,

\(X^{k=1}(T_j) = BL(T_j) / \dot{Q}_{h}^{k=1}(T_j)\), the heating mode low capacity load factor for temperature bin \(j\), dimensionless.

\(PLF_j = 1 - C_{Dh} \cdot \{ 1 - X^{k=1}(T_j) \}\), the part load factor, dimensionless.

\(\delta(T_j)\) = the low temperature cutoff factor, dimensionless.

If the optional H0C Test described in section 3.6.3 is not conducted, set the heating mode cyclic degradation coefficient, \(C_{Dh}\), to the default value specified in section 3.8.1. If this optional test is conducted, set \(C_{Dh}\) to the lower of:

a. The value calculated according to section 3.8.1; or

b. The section 3.8.1 default value of 0.25.

Determine the low temperature cut-out factor using
\[ \delta(T_j) = \begin{cases} 
0, & \text{if } T_j \leq T_{off} \\
1/2, & \text{if } T_{off} < T_j \leq T_{on} \\
1, & \text{if } T_j > T_{on} 
\end{cases} \quad (4.2.3 - 3) \]

where \( T_{off} \) and \( T_{on} \) are defined in section 4.2.1. Use the calculations given in section 4.2.3.3, and not the above, if:

(a) The heat pump locks out low capacity operation at low outdoor temperatures and
(b) \( T_j \) is below this lockout threshold temperature.

4.2.3.2 Heat pump alternates between high \((k=2)\) and low \((k=1)\) compressor capacity to satisfy the building heating load at a temperature \( T_j \),

\[ Q_{h2} = \hat{Q}_{h2}(T_j) < BL(T_j) < Q_{h1}(T_j). \]

Calculate \( e_{T_{nj}}(T_j) \) using Equation 4.2.3-2. Evaluate \( e_{T_{nj}}(T_j) \) using

\[ e_{T_{nj}}(T_j) = (X^{k=2}(T_j) \cdot \hat{E}_{h2}^{k=2}(T_j) + X^{k=2}(T_j) \cdot \hat{E}_{h2}^{k=2}(T_j)) \cdot \delta(T_j) \cdot \frac{N}{N} \]

where,

\[ X^{k=2}(T_j) = 1 - X^{k=1}(T_j) \]

\( X^{k=1}(T_j) \) the heating mode, high capacity load factor for temperature bin \( j \) dimensionless.

Determine the low temperature cut-out factor, \( \delta(T_j) \), using Equation 4.2.3-3.

4.2.3.3 Heat pump only operates at high \((k=2)\) compressor capacity at temperature \( T_j \), and its capacity is greater than the building heating load, \( BL(T_j) < Q_{h2}(T_j) \). This section applies to units that lock out low compressor capacity operation at low outdoor temperatures. Calculate

\[ \frac{RH(T_j)}{N} \]

using Equation 4.2.3-2. Evaluate

\[ \frac{e_{T_{nj}}(T_j)}{N} \]

using

\[ \frac{e_{T_{nj}}(T_j)}{N} = \frac{X^{k=2}(T_j) \cdot \hat{E}_{h2}^{k=2}(T_j) \cdot \delta(T_j) \cdot n_j}{N} \]

where,

\[ X^{k=2}(T_j) = BL(T_j) \cdot \hat{Q}_{h2}(T_j) \]

\( PLF_j = 1 - C_{D\ h} \cdot [1 - X^{k=2}(T_j)] \).

When evaluating the above equation for part load factor at high capacity, use the same value of \( C_{D\ h} \) as used in the section 4.2.3.1 calculations. Determine the low temperature cut-out factor, \( \delta(T_j) \), using Equation 4.2.3-3.

4.2.3.4 Heat pump must operate continuously at high \((k=2)\) compressor capacity at temperature \( T_j \), \( BL(T_j) \geq Q_{h2}(T_j) \).

Calculate

\[ \frac{RH(T_j)}{N} \]

using Equation 4.2.3-2. Evaluate

\[ \frac{e_{T_{nj}}(T_j)}{N} \]

using

\[ \frac{e_{T_{nj}}(T_j)}{N} = \frac{\hat{E}_{h2}^{k=2}(T_j) \cdot \delta(T_j) \cdot n_j}{N} \]

\[ \frac{RH(T_j)}{N} = \frac{BL(T_j) - \hat{Q}_{h2}^{k=2}(T_j) \cdot \delta(T_j)}{3.413 \frac{Btu/h}{W}} \cdot \frac{n_j}{N} \]

Where
4.2.4 Additional steps for calculating the HSPF of a heat pump having a variable-speed compressor. Calculate HSPF using Equation 4.2–1. Evaluate the space heating capacity, $Q_{h}^{k=1}(T_j)$, and electrical power consumption, $E_{h}^{k=1}(T_j)$, of the heat pump when operating at minimum compressor speed and outdoor temperature $T_j$ using

$$
\delta^1(T_j) = \begin{cases} 
0, & \text{if } T_j \leq T_{\text{eff}} \text{ or } \frac{Q_h^{k=2}(T_j)}{3.413 \cdot E_h^{k=2}(T_j)} < 1 \\
1/2, & \text{if } T_{\text{eff}} < T_j \leq T_{\text{on}} \text{ and } \frac{Q_h^{k=2}(T_j)}{3.413 \cdot E_h^{k=2}(T_j)} \geq 1 \\
1, & \text{if } T_j > T_{\text{on}} \text{ and } \frac{Q_h^{k=2}(T_j)}{3.413 \cdot E_h^{k=2}(T_j)} \geq 1 
\end{cases}
$$

$$
\dot{Q}_h^{k=1}(T_j) = \dot{Q}_h^{k=1}(47) + \frac{\dot{Q}_h^{k=1}(62) - \dot{Q}_h^{k=1}(47)}{62 - 47} \cdot (T_j - 47) \quad (4.2.4-1)
$$

$$
\dot{E}_h^{k=1}(T_j) = \dot{E}_h^{k=1}(47) + \frac{\dot{E}_h^{k=1}(62) - \dot{E}_h^{k=1}(47)}{62 - 47} \cdot (T_j - 47) \quad (4.2.4-2)
$$

where $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ are determined from the H0 Test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ are determined from the H1 Test, and all four quantities are calculated as specified in section 3.7. Evaluate the space heating capacity, $Q_{h}^{k=v}(T_j)$, and electrical power consumption, $E_{h}^{k=v}(T_j)$, of the heat pump when operating at maximum compressor speed and outdoor temperature $T_j$, by solving Equations 4.2.2–3 and 4.2.2–4, respectively, for $k=2$. Determine the Equation 4.2.2–3 and 4.2.2–4 quantities $Q_h^{k=2}(47)$ and $E_h^{k=2}(47)$ from the H1 Test and the calculations specified in section 3.7. Determine $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ from the H2 Test and the calculations specified in section 3.9 or, if the H2 Test is not conducted, by conducting the calculations specified in section 3.9. Approximate the slopes of the intermediate speed heating capacity and electrical power input curves, $M_Q$ and $M_E$, as follows:

$$
\dot{Q}_h^{k=v}(T_j) = \dot{Q}_h^{k=v}(35) + M_Q \cdot (T_j - 35) \quad (4.2.4-3)
$$

$$
\dot{E}_h^{k=v}(T_j) = \dot{E}_h^{k=v}(35) + M_E \cdot (T_j - 35) \quad (4.2.4-4)
$$

where $\dot{Q}_h^{k=v}(35)$ and $\dot{E}_h^{k=v}(35)$ are determined from the H2 Test and calculated as specified in section 3.9.
where,

\[ N_Q = \frac{\dot{Q}_h^{k=1}(35) - \dot{Q}_h^{k=1}(35)}{Q_h^{k=1}(35) - Q_h^{k=1}(35)} \]

\[ N_E = \frac{E_h^{k=1}(35) - E_h^{k=1}(35)}{E_h^{k=1}(35) - E_h^{k=1}(35)} \]

Use Equations 4.2.4-1 and 4.2.4-2, respectively, to calculate \( Q_h^{k=1}(T_j) \) and \( E_h^{k=1}(T_j) \). The calculation of Equation 4.2-1 quantities

\[ e_h(T_j) \quad \text{and} \quad RH(T_j) \]

differs depending upon whether the heat pump would operate at minimum speed (section 4.2.4.1), operate at an intermediate speed (section 4.2.4.2), or operate at maximum speed (section 4.2.4.3) in responding to the building load.

4.2.4.1 Steady-state space heating capacity when operating at minimum compressor speed is greater than or equal to the building heating load at temperature \( T_j \), \( Q_h^{k=1}(T_j) \geq BL(T_j) \). Evaluate the Equation 4.2-1 quantities

\[ e_h(T_j) \quad \text{and} \quad RH(T_j) \]

as specified in section 4.2.3.1. Except now use Equations 4.2.4-1 and 4.2.4-2 to evaluate \( Q_h^{k=1}(T_j) \) and \( E_h^{k=1}(T_j) \), respectively, and replace section 4.2.3.1 references to "low capacity" and section 3.6.3 with 'minimum speed" and section 3.6.4. Also, the last sentence of section 4.2.3.1 does not apply.

4.2.4.2 Heat pump operates at an intermediate compressor speed \( (k=i) \) in order to match the building heating load at a temperature \( T_j \), \( Q_h^{k=i}(T_j) < BL(T_j) < Q_h^{k=2}(T_j) \). Calculate

\[ RH(T_j) \]

using Equation 4.2.3-2 while evaluating

\[ e_h(T_j) \]

using,

\[ e_h(T_j) = E_h^{k=1}(T_j) \cdot \delta(T_j) \cdot \frac{n_i}{N} \]

where,

\[ E_h^{k=i}(T_j) = \frac{\dot{Q}_h^{k=i}(T_j)}{3.413 \text{ Btu/h}} \cdot \text{COP}^{k=i}(T_j) \]

and \( \delta(T_j) \) is evaluated using Equation 4.2.3-3 while,

\[ Q_h^{k=i}(T_j) \quad \text{BL}(T_j) \]

The matching occurs with the heat pump operating at compressor speed \( k=i \).

\[ \text{COP}^{k=i}(T_j) = \text{the steady-state coefficient of performance of the heat pump when operating at compressor speed } k=i \]

\[ \text{and temperature } T_i, \text{ dimensionless} \]

For each temperature bin where the heat pump operates at an intermediate compressor speed, determine \( \text{COP}^{k=i}(T_j) \) using,

\[ \text{COP}^{k=i}(T_j) = A + B \cdot T_j + C \cdot T_j^2 \]

For each heat pump, determine the coefficients A, B, and C by conducting the following calculations once:
\[ D = \frac{T_3^2 - T_4^2}{T_{vh} - T_4} \]

\[ B = \frac{\text{COP}_{k=2}^1(T_3) - \text{COP}_{k=1}^1(T_3) - D \cdot \left[ \text{COP}_{k=2}^1(T_4) - \text{COP}_{k=2}^1(T_{vh}) \right]}{T_4 - T_3 - D \cdot (T_4 - T_{vh})} \]

where, \( T_3 \) = the outdoor temperature at which the heat pump, when operating at minimum compressor speed, provides a space heating capacity that is equal to the building load \( (Q_{k=1}^h(T_3) = BL(T_3)) \), °F. Determine \( T_3 \) by equating Equations 4.2.4-1 and 4.2-2 and solving for:

\[ C = \frac{\text{COP}_{k=2}^1(T_4) - \text{COP}_{k=2}^1(T_3) - B \cdot (T_4 - T_3)}{T_4^2 - T_3^2} \]

\[ A = \text{COP}_{k=2}^1(T_4) - B \cdot T_4 - C \cdot T_4^2. \]

\( T_{vh} \) = the outdoor temperature at which the heat pump, when operating at the intermediate compressor speed used during the section 3.6.4 H2 Test, provides a space heating capacity that is equal to the building load \( (Q_{k=2}^h(T_{vh}) = BL(T_{vh})) \), °F. Determine \( T_{vh} \) by equating Equations 4.2.4-3 and 4.2-2 and solving for outdoor temperature.

\( T_4 \) = the outdoor temperature at which the heat pump, when operating at maximum compressor speed, provides a space heating capacity that is equal to the building load \( (Q_{k=2}^h(T_4) = BL(T_4)) \), °F. Determine \( T_4 \) by equating Equations 4.2.2-3 \( (k=2) \) and 4.2-2 and solving for outdoor temperature.

\[ \text{COP}_{k=1}^1(T_3) = \frac{\dot{Q}_{h=1}^k(T_3)}{3.413 \, \text{Btu/h} / \text{W}} \cdot \dot{E}_{h=1}^k(T_3) \quad \text{[Eqn. 4.2.4-1, substituting } T_3 \text{ for } T_j] \]

\[ \text{COP}_{k=2}^1(T_{vh}) = \frac{\dot{Q}_{h=2}^k(T_{vh})}{3.413 \, \text{Btu/h} / \text{W}} \cdot \dot{E}_{h=2}^k(T_{vh}) \quad \text{[Eqn. 4.2.4-3, substituting } T_{vh} \text{ for } T_j] \]

\[ \text{COP}_{k=2}^1(T_4) = \frac{\dot{Q}_{h=2}^k(T_4)}{3.413 \, \text{Btu/h} / \text{W}} \cdot \dot{E}_{h=2}^k(T_4) \quad \text{[Eqn. 4.2.4-4, substituting } T_4 \text{ for } T_j] \]
4.2.4.3 Heat pump must operate continuously at maximum (k=2) compressor speed at temperature \( T_{h} \). Evaluate the Equation 4.2-1 quantities

\[
\frac{e_h(T_j)}{N} \quad \text{and} \quad \frac{RH(T_j)}{N}
\]

as specified in section 4.2.3.4 with the understanding that \( Q_{h=2}(T_j) \) and \( E_{h=2}(T_j) \) correspond to maximum compressor speed operation and are derived from the results of the specified section 3.6.4 tests.

4.2.5 Heat pumps having a heat comfort controller. Heat pumps having heat comfort controllers, when set to maintain a typical minimum air delivery temperature, will cause the heat pump condenser to operate less because of a greater contribution from the resistive elements. With a conventional heat pump, resistive heating is only initiated if the heat pump condenser cannot meet the building load (i.e., is delayed until a second stage call from the indoor thermostat). With a heat comfort controller, resistive heating can occur even though the heat pump condenser has adequate capacity to meet the building load (i.e., both on during a first stage call from the indoor thermostat). As a result, the outdoor temperature where the heat pump compressor no longer cycles (i.e., starts to run continuously), will be lower than if the heat pump did not have the heat comfort controller.

4.2.5.2 Heat pump having a heat comfort controller: additional steps for calculating the HPF of a heat pump having a single-speed compressor that was tested with a fixed-speed indoor fan installed, a constant-air-volume-rate indoor fan installed, or with no indoor fan installed. Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.1 (Equations 4.2.1-4 and 4.2.1-5) for each outdoor bin temperature, \( T_{o} \), that is listed in Table 17. Denote these capacities and electrical powers by using the subscript "hp" instead of "h." Calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm \( \cdot { }^\circ \text{F} \)) from the results of the H1T test using:

\[
\dot{m}_{da} = \bar{V}_i \cdot 0.075 \frac{\text{lbm}_{da}}{\text{ft}^3 \cdot \text{hr}} \quad \text{min} = \frac{\bar{V}_{max} - 60}{\bar{V}_n \cdot (1 + W_n)} \quad \text{min} = \frac{\bar{V}_{max}}{\bar{V}_n} \quad 60 \quad \text{min} = \frac{60}{\bar{V}_n} \quad \text{hr}
\]

where \( \bar{V}_n, \bar{V}_{max}, \bar{V}_a \) (or \( \bar{v}_n \)), and \( W_n \) are defined following Equation 3-1. For each outdoor bin temperature listed in Table 17, calculate the nominal temperature of the air leaving the heat pump condenser coil using,

\[
T_o(T_j) = 70 \circ \text{F} + \frac{\dot{Q}_{hp}(T_j)}{\dot{m}_{da} \cdot C_{p,da}}.
\]

Evaluate \( e_h(T_j), RH(T_j), X(T_j), PLF, \) and \( \delta(T_j) \) as specified in section 4.2.1. For each bin calculation, use the space heating capacity and electrical power from Case 1 or Case 2, whichever applies.

Case 1. For outdoor bin temperatures where \( T_o(T_j) \) is equal to or greater than \( T_{cc} \) (the maximum supply temperature determined according to section 3.1.9), determine \( Q_{h}(T_j) \) and \( E_{h}(T_j) \) as specified in section 4.2.1 (i.e., \( Q_{h}(T_j) = Q_{o}(T_j) \) and \( E_{h}(T_j) = E_{o}(T_j) \)).

Note: Even though \( T_o(T_j) \) is equal to or greater than \( T_{cc} \), additional resistive heating may be required; evaluate Equation 4.2.1-2 for all bins.

Case 2. For outdoor bin temperatures where \( T_o(T_j) > T_{cc} \), determine \( Q_{h}(T_j) \) and \( E_{h}(T_j) \) using,

\[
\dot{Q}_{h}(T_j) = Q_{hp}(T_j) + \dot{Q}_{CC}(T_j)
\]

\[
\dot{E}_{h}(T_j) = E_{hp}(T_j) + \dot{E}_{CC}(T_j)
\]

where,

\[
\dot{Q}_{CC}(T_j) = \dot{m}_{da} \cdot C_{p,da} \left[T_{cc} - T_o(T_j)\right]
\]

\[
\dot{E}_{CC}(T_j) = \frac{\dot{Q}_{CC}(T_j)}{3.413} \frac{\text{Btu}}{\text{W} \cdot \text{hr}}
\]

Note: Even though \( T_o(T_j) < T_{cc} \), additional resistive heating may be required; evaluate Equation 4.2.1-2 for all bins.

4.2.5.2 Heat pump having a heat comfort controller: additional steps for calculating the HPF of a heat pump having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan. Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.2 (Equations 4.2.2-1 and 4.2.2-2).
for each outdoor bin temperature, \( T_o \), that is listed in Table 17. Denote these capacities and electrical powers by using the subscript “hp” instead of “h.” Calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm \( \cdot ^\circ \text{F} \)) from the results of the H1 Test using:

\[
\dot{m}_{da} = \frac{\overline{V}_d}{v_d} \cdot 0.075 \frac{\text{lbm}_d}{\text{ft}^3} \cdot \frac{\text{hr}}{60 \text{ min}} \quad \frac{\text{lbm}_d}{\text{hr}} = \frac{\overline{V}_{mx}}{v_n} \cdot \left[ 1 + \frac{W_n}{V_n} \right] \quad \frac{\text{hr}}{60 \text{ min}} = \frac{\overline{V}_{mx}}{v_n} \cdot \frac{\text{hr}}{60 \text{ min}}
\]

where \( \overline{V}_d, \overline{V}_{mx}, \text{ or } v_n \), and \( W_n \) are defined following Equation 3.1. For each outdoor bin temperature listed in Table 17, calculate the nominal temperature of the air leaving the heat pump condenser coil using,

\[
T_o(T_j) = 70 \, ^\circ \text{F} + \frac{Q_{hp}(T_j)}{\dot{m}_{da} \cdot C_{p,da}}.
\]

Evaluate \( e_o(T_j) / N \), \( R(T_i) / N \), \( X(T_j) \), \( \text{PLF}_j \), and \( \delta(T_j) \) as specified in section 4.2.1 with the exception of replacing references to the HIC Test and section 3.6.1 with the HIC Test section 3.6.2. For each bin calculation, use the space heating capacity and electrical power from Case 1 or Case 2, whichever applies.

Case 1. For outdoor bin temperatures where \( T_o(T_j) \) is equal to or greater than \( T_{cc} \) (the maximum supply temperature determined according to section 3.1.9), determine \( Q_{hp}(T_j) \) and \( E_{cc}(T_j) \) as specified in section 4.2.2 (i.e. \( Q_o(T_j) = Q_{hp}(T_j) \) and \( E_{cc}(T_j) = E_{hp}(T_j) \)). Note: Even though \( T_o(T_j) > T_{cc} \), resistive heating may be required; evaluate Equation 4.2.1-2 for all bins.

Case 2. For outdoor bin temperatures where \( T_o(T_j) < T_{cc} \), determine \( Q_{hp}(T_j) \) and \( E_{cc}(T_j) \) using,

\[
Q_{cc}(T_j) = \dot{m}_{da} \cdot C_{p,da} \cdot \left[ T_{cc} - T_o(T_j) \right]
\]

\[
E_{cc}(T_j) = \frac{Q_{cc}(T_j)}{3.41 \, \text{Btu} / \text{W} \cdot \text{h}}.
\]

\textbf{NOTE:} Even though \( T_o(T_j) < T_{cc} \), additional resistive heating may be required; evaluate Equation 4.2.1-2 for all bins.

4.2.5.3 Heat pumps having a heat comfort controller: additional steps for calculating the HSPF of a heat pump having a two-capacity compressor. Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.3 for both high and low capacity and at each outdoor bin temperature, \( T_o \), that is listed in Table 17. Denote these capacities and electrical powers by using the subscript “hp” instead of “h.” For the low capacity case, calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm \( \cdot ^\circ \text{F} \)) from the results of the H1 Test using:

\[
\dot{m}_{da}^{k=1} = \frac{\overline{V}_d}{v_d} \cdot 0.075 \frac{\text{lbm}_d}{\text{ft}^3} \cdot \frac{\text{hr}}{60 \text{ min}} \quad \frac{\text{lbm}_d}{\text{hr}} = \frac{\overline{V}_{mx}}{v_n} \cdot \frac{\text{hr}}{60 \text{ min}} \quad \frac{\text{hr}}{60 \text{ min}} = \frac{\overline{V}_{mx}}{v_n} \cdot \frac{\text{hr}}{60 \text{ min}}
\]

where \( \overline{V}_d, \overline{V}_{mx}, \text{ or } v_n \), and \( W_n \) are defined following Equation 3.1. For each outdoor bin temperature listed in Table 17, calculate the nominal temperature of the air leaving the heat pump condenser coil when operating at low capacity using,

\[
T_o^{k=1}(T_j) = 70 \, ^\circ \text{F} + \frac{Q_{hp}^{k=1}(T_j)}{\dot{m}_{da}^{k=1} \cdot C_{p,da}^{k=1}}
\]
Repeat the above calculations to determine the mass flow rate ($m_{\text{air}}$) and the specific heat of the indoor air ($C_{\text{p, da}}^k=2$) when operating at high capacity by using the results of the H1 Test. For each outdoor bin temperature listed in Table 17, calculate the nominal temperature of the air leaving the heat pump condenser coil when operating at high capacity using,

$$T_o^k=2(T_j) = 70 \, ^\circ\text{F} + \frac{\dot{Q}_{\text{hp}}^k(T_j)}{m_{\text{da}}^k} \cdot C_{\text{p, da}}^k.$$ 

Evaluate $o_k(T_j)N$, $R(T_j)N$, $X^k=1(T_j)$, and/or $X^k=2(T_j)$, $PLF_x$, and $\delta(T_j)$ or $\delta(T_j)$ as specified in section 4.2.3.1, 4.2.3.2, 4.2.3.3, or 4.2.3.4, whichever applies, for each temperature bin. To evaluate these quantities, use the low-capacity electrical power from Case 1 or Case 2, whichever applies; use the high-capacity space heating capacity and the high-capacity electrical power from Case 3 or Case 4, whichever applies.

Case 1. For outdoor bin temperatures where $T_k=1(T_j)$ is equal to or greater than $T_{\text{cc}}$ (the maximum supply temperature determined according to section 3.1.9), determine $Q_h^{k=1}(T_j)$ and $E_h^{k=1}(T_j)$ as specified in section 4.2.3 (i.e., $Q_h^{k=1}(T_j) = Q_{\text{hp}}^{k=1}(T_j)$ and $E_h^{k=1}(T_j) = E_{\text{hp}}^{k=1}(T_j)$).

**NOTE:** Even though $T_k=1(T_j) \geq T_{\text{cc}}$, resistive heating may be required; evaluate $R(T_j)N$ for all bins.

Case 2. For outdoor bin temperatures where $T_k=2(T_j) < T_{\text{cc}}$, determine $Q_h^{k=2}(T_j)$ and $E_h^{k=2}(T_j)$ using,

$$Q_h^{k=2}(T_j) = \dot{Q}_{\text{hp}}^{k=2}(T_j) + \dot{Q}_{\text{cc}}^{k=2}(T_j)$$

$$E_h^{k=2}(T_j) = \dot{E}_{\text{hp}}^{k=2}(T_j) + \dot{E}_{\text{cc}}^{k=2}(T_j)$$

where,

$$\dot{Q}_{\text{cc}}^{k=1}(T_j) = m_{\text{da}}^k \cdot C_{\text{p, da}}^k \cdot \left[T_{\text{cc}} - T_o^{k=1}(T_j)\right]$$

$$E_{\text{cc}}^{k=1}(T_j) = \frac{\dot{Q}_{\text{cc}}^{k=1}(T_j)}{3413 \, \text{Btu} / \text{W} \cdot \text{h}}.$$ 

**NOTE:** Even though $T_k=1(T_j) < T_{\text{cc}}$, resistive heating may be required; evaluate $R(T_j)N$ for all bins.

Case 3. For outdoor bin temperatures where $T_k=2(T_j)$ is equal to or greater than $T_{\text{cc}}$, determine $Q_h^{k=2}(T_j)$ and $E_h^{k=2}(T_j)$ as specified in section 4.2.3 (i.e., $Q_h^{k=2}(T_j) = Q_{\text{hp}}^{k=2}(T_j)$ and $E_h^{k=2}(T_j) = E_{\text{hp}}^{k=2}(T_j)$).

Case 4. For outdoor bin temperatures where $T_k=2(T_j) < T_{\text{cc}}$, determine $Q_h^{k=2}(T_j)$ and $E_h^{k=2}(T_j)$ using,

$$Q_h^{k=2}(T_j) = \dot{Q}_{\text{hp}}^{k=2}(T_j) + \dot{Q}_{\text{cc}}^{k=2}(T_j)$$

$$E_h^{k=2}(T_j) = \dot{E}_{\text{hp}}^{k=2}(T_j) + \dot{E}_{\text{cc}}^{k=2}(T_j)$$

where,
4.2.5.4 Heat pumps having a heat comfort controller: additional steps for calculating the HSPF of a heat pump having a variable-speed compressor. [Reserved]

4.3 Calculations of the Actual and Representative Regional Annual Performance Factors for Heat Pumps.

4.3.1 Calculation of actual regional annual performance factors (APF<sub>A</sub>) for a particular location and for each standardized design heating requirement.

\[
\text{APF}_A = \frac{\text{CLH}_A \cdot \dot{Q}^k_r(95) + \text{HLH}_A \cdot \text{DHR} \cdot C}{\text{SEER} \cdot \text{HSPF}}
\]

where,

\( \text{CLH}_A \) = the actual cooling hours for a particular location as determined using the map given in Figure 3 hr.

\( \dot{Q}^k_r(95) \) = the space cooling capacity of the unit as determined from the A or A<sub>2</sub> Test, whichever applies, Btu/h.

\( \text{HLH}_A \) = the actual heating hours for a particular location as determined using the map given in Figure 2 hr.

\( \text{DHR} \) = the design heating requirement used in determining the HSPF; refer to section 4.2 and Definition 1.22, Btu/h.

\( C \) = defined in section 4.2 following Equation 4.2-2, dimensionless.

\( \text{SEER} \) = the seasonal energy efficiency ratio calculated as specified in section 4.1, Btu/W·h.

\( \text{HSPF} \) = the heating seasonal performance factor calculated as specified in section 4.2 for the generalized climatic region that includes the particular location of interest (see Figure 2), Btu/W·h. The HSPF should correspond to the actual design heating requirement (DHR), if known. If it does not, it may correspond to one of the standardized design heating requirements referenced in section 4.2.

4.3.2 Calculation of representative regional annual performance factors (APF<sub>R</sub>) for each generalized climatic region and for each standardized design heating requirement.

\[
\text{APF}_R = \frac{\text{CLH}_R \cdot \dot{Q}^k_r(95) + \text{HLH}_R \cdot \text{DHR} \cdot C}{\text{SEER} \cdot \text{HSPF}}
\]

where,

\( \text{CLH}_R \) = the representative cooling hours for each generalized climatic region, Table 19 hr.

\( \dot{Q}^k_r(95) \) = the space cooling capacity of the unit as determined from the A or A<sub>2</sub> Test, whichever applies, Btu/h.

\( \text{HLH}_R \) = the representative heating hours for each generalized climatic region, Table 19 hr.

\( \text{DHR} \) = the design heating requirement used in determining the HSPF; refer to section 4.2 and Definition 1.22, Btu/h.

\( \text{SEER} \) = the seasonal energy efficiency ratio calculated as specified in section 4.1, Btu/W·h.

\( \text{HSPF} \) = the heating seasonal performance factor calculated as specified in section 4.2 for the each generalized climatic region and for each standardized design heating requirement within each region, Btu/W·h.

\( \text{C} \) = defined in section 4.2 following Equation 4.2-2, dimensionless.

The SEER, \( \dot{Q}^k_r(95) \), DHR, and \( C \) are the same quantities as defined in section 4.3.1.

Figure 2 shows the generalized climatic regions. Table 18 lists standardized design heating requirements.

4.4. Rounding of SEER, HSPF, and APF for reporting purposes. After calculating SEER according to section 4.1, round it off as specified in subpart B 430.23(m)(3)(i) of Title 10 of the Code of Federal Regulations. Round section 4.2 HSPF values and section 4.3 APF values as per §430.23(m)(3)(ii) and (iii) of Title 10 of the Code of Federal Regulations.

Figure 2 Heating Load Hours (HLHₜₜ) for the United States
EFFECTIVE DATE NOTE: At 72 FR 59922, Oct. 22, 2007, appendix M to subpart B of part 430 was amended as follows, effective Apr. 21, 2008.

a. In section 1. Definitions:
1. Section 1.3 is amended by removing ’’210/240–2003’’ and adding in its place ’’210/240–2006’’; and by removing ’’2003’’ and adding in its place ’’2006.’’
2. Section 1.5 is amended by removing ’’23–93’’ and adding in its place ’’23–2005’’; and by removing ’’1993’’ and adding in its place ’’2005.’’
3. Section 1.6 is amended by removing ’’37–88’’ and adding in its place ’’37–2005’’; and by removing ’’1988’’ and adding in its place ’’2005.’’
4. Section 1.12 is amended by adding ’’RA(05)’’ after ’’116–95.’’ and adding ’’and reaffirmed in 2005’’ after ’’1995.’’
5. Section 1.35 is amended by removing ’’certified’’ and adding in its place ’’full-load.’’
6. Section 1.37 is revised to read as set forth below.

b. In section 2, Testing Conditions:
1. Sections 2.1a, 2.2a, 2.2b, 2.2.3, 2.2.5, 2.4.1, and 2.4.2 are revised to read as set forth below.
2. Section 2.3.1b is amended by removing ’’Certified’’ and adding in its place ’’Full-load.’’
3. Section 2.5.3 is amended by revising the first sentence to read as set forth below.
4. New section 2.5.4.3 is added to read as set forth below.
5. Section 2.6a is amended by adding in the first sentence ’’(RA05)’’ after ’’116-95.’’
7. Section 2.7 is amended by removing ’’ARI Standard 210/240–2003’’ and adding in its place ’’ARI Standard 210/240–2006.’’
8. Section 2.10.2 is amended in the third and fourth sentences, by removing ’’37–88’’ and adding in its place ’’37–2005’’.
9. Section 2.10.3 is amended in the second sentence, by removing ’’7.6.2.’’ and adding in its place ’’7.5.2.’’ and by removing ’’37–88’’ and adding in its place ’’37–2005’’ in the second and third sentences.
10. Section 2.11a is amended in the first sentence, by removing ’’37–88’’ and adding in its place ’’37–2005’’.
11. Section 2.13 is amended in the second sentence, by removing ’’37–88’’ and adding in its place ’’37–2005’’.

3. Section 2.13 is amended in the second sentence, by removing ’’37–88’’ and adding in its place ’’37–2005’’.

b. In section 3, Testing Procedures:
1. Section 3.1.1 is amended by revising the seventh sentence to read as set forth below.

298
2. Section 3.1.3 is amended by removing "ARI Standard 210/240-2003" and adding in its place "ARI Standard 210/240-2006."

3. Section 3.1.4.1 is amended by removing "Certified" and adding in its place "Full-load."

4. Section 3.1.4.1.1, from its title to the end of paragraph a., and Table 2, are revised to read as set forth below.

4a. Section 3.1.4.1.1b is amended by revising the first sentence to read as set forth below.

5. Amend sections 3.1.4.1.1b and 3.1.4.1c by removing "Certified" and adding in its place "Full-load."

6. Section 3.1.4.1.2 is amended by removing "Certified" and adding in its place "Full-load" in two locations.

7. Section 3.1.4.2a is amended by revising the "Cooling Minimum Air Vol. Rate" equation to read as set forth below.

8. Section 3.1.4.2b is amended by revising the equation for minimum external static pressure to read as set forth below.

9. Section 3.1.4.2c is amended by removing "Certified" and adding in its place "Full-load."

10. Section 3.1.4.3a is amended by revising the "Cooling Intermediate Air Volume Rate" equation to read as set forth below.

11. Section 3.1.4.3b is amended by revising the "E, Test ΔP„" equation to read as set forth below.

12. Section 3.1.4.4 is amended by removing "Certified" and adding in its place "Full-load."

13. Section 3.1.4.4.1 is amended by removing "Certified" and adding in its place "Full-load" in three locations.

14. Section 3.1.4.4.2 is amended by removing "Certified" and adding in its place "Full-load" and revising the "Heating Certified Air Volume Rate" equation to read as set forth below.

14a. Section 3.1.4.4.2a is amended by removing "Certified" and adding in its place "Full-load."

15. Section 3.1.4.4.2b is amended by removing "Certified" and adding in its place "Full-load" in three locations, and revising the "Heating Certified ΔP„" equation to read as set forth below.

16. Section 3.1.4.4.2c is amended by removing "Certified" and adding in its place "Full-load" in three locations.

17. Sections 3.1.4.4.3 and 3.1.4.4.3a are revised to read as set forth below.

17a. Sections 3.1.4.4.3b is amended by revising the first sentence to read as set forth below.

18. Amend sections 3.1.4.4.3b, 3.1.4.4.3c and 3.1.4.4.4 by removing "Certified" and adding in its place "Full-load."

19. Section 3.1.4.5a is amended by revising the "Heating Minimum Air Volume Rate" equation to read as set forth below.

20. Section 3.1.4.5b is amended by revising the "H0, H1, H2, H3, Test ΔP„" equation to read as set forth below.

21. Section 3.1.4.5c is amended by removing Certified and adding in its place Full-load in two locations.

22. Section 3.1.4.6a is amended by revising the "Heating Intermediate Air Volume Rate" equation to read as set forth below.

23. Section 3.1.4.6b is amended by revising the "H2, Test ΔP„" equation to read as set forth below.

24. Section 3.1.4.7 is amended by revising the "Heating Nominal Air Volume Rate" equation and the "H1, Test ΔP„" equation to read as set forth below.

25. Section 3.1.5 is amended in the first sentence by removing "37-88" and adding in its place "37-2005."

26. Section 3.1.6 is amended in the first and second sentences, by removing "7.8.3.1 and 7.8.3.2.2" and adding in its place "7.7.2.1 and 7.7.2.2." and in the first sentence, by removing "37-88" and adding in its place "37-2005."

27. Section 3.1.7 is amended by removing "certified" and adding in its place "Full-load" in four locations.

28. Section 3.1.8 is amended by removing "Certified" and adding in its place "Full-load."

29. Section 3.1.9 is amended by revising the fourth sentence to read as set forth below.

29a. Section 3.2.1 is amended by removing "certified" and adding in its place "Full-load" in three locations in the last column.

29a. Section 3.2.2.1 is amended by revising the third sentence to read as set forth below.

30. Table 4 to Section 3.2.2.1 is amended by removing "certified" and adding in its place "Full-load" in two locations in the last column.

30a. Section 3.2.2.2 is amended by removing "Certified" and adding in its place "Full-load."

31. Section 3.2.3a is revised as set forth below.

32. Section 3.2.3b is amended by removing "Certified" and adding in its place "Full-load."

33. Section 3.2.3d is revised as set forth below.

34. Section 3.2.4 is amended by revising the "Ian Test ΔP„" equation to read as set forth below.

35. Table 5 to section 3.2.3 is revised as set forth below.

36. Section 3.2.4a is amended by revising the third sentence to read as set forth below.

37. Section 3.2.4b is amended by removing "Certified" and adding in its place "Full-load."

38. Table 6 to section 3.2.4 is revised as set forth below.

39. Section 3.2.4 is amended by adding a new paragraph (c) as set forth below.
Pt. 430, Subpl. B, App. M

10 CFR Ch. II (1–1–08 Edition)

40. Section 3.3b is amended in both the first and second sentences, by removing "Table 5," and adding in its place "Table 3." and in the first sentence by removing "37–88" and adding in its place "37–2005."
41. Section 3.3c is amended in the first sentence by removing "sections 7.3.3.1 of ASHRAE Standard 37–88," and adding in its place "sections 7.3.3.1 and 7.3.3.3 of ASHRAE Standard 37–2005."
42. The titles of sections 3.4 and 3.5 are revised as set forth below.
43. Section 3.4b is revised to read as set forth below.
44. Section 3.5.3 is amended by revising the introductory text to read as set forth below.
45. Section 3.6.1 is amended by revising the second, third, and fourth sentences to read as set forth below.
46. Table 9 to Section 3.6.1 is amended by removing "Certified" and adding in its place "Full-load" in three locations.
47. Section 3.6.2 is amended by revising the introductory text to read as set forth below.
48. Table 10 to Section 3.6.2 is amended by removing "Certified" and adding in its place "Full-load" in three locations.
49. Section 3.6.3 is revised as set forth below.
50. Table 11 to section 3.6.3 is revised as set forth below.
51. Section 3.6.4 is amended by revising the third, fourth, and fifth sentences of paragraph a. and adding a new paragraph c. to read as set forth below.
52. Table 12 to section 3.6.4 is revised to read as set forth below.
53. Section 3.7a is amended in the fifth sentence by removing "Table 5 of ASHRAE Standard 37–88" and adding in its place "Table 3 of ASHRAE Standard 37–2005," and in the sixth sentence, by removing "Table 5" and adding in its place "Table 3."
54. Section 3.7b is amended by revising the first sentence to read as set forth below.
55. The title of section 3.8 is revised to read as set forth below.
56. The introductory text and the first equation of section 3.8.1 are revised to read as set forth below.
57. Section 3.9c is revised to read as set forth below.
58. Section 3.9f is amended by revising the fifth sentence and adding a parenthetical immediately following it to read as set forth below.
59. Section 3.9.1a is amended by adding a new sentence at the end of the section directly before section 3.9.1b to read as set forth below.
60. Section 3.9.2b is amended by replacing "Certified" with "Full-load."
61. Section 3.11 is amended by removing the introductory text following the paragraph heading, which is republished below.
62. Section 3.11.1.3b is revised to read as set forth below.

APPENDIX M TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF CENTRAL AIR CONDITIONERS AND HEAT PUMPS

1. Definitions

2. Testing Conditions
2.1 Test room requirements. a. Test using two side-by-side rooms, an indoor test room and an outdoor test room. For multiple-split air conditioners and heat pumps (see Definition 1.30), however, use as many available indoor test rooms as needed to accommodate the total number of indoor units. These rooms must comply with the requirements specified in sections 8.1.2 and 8.1.3 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22).

2.2 Test unit installation requirements. a. Install the unit according to section 8.2 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22). With respect to interconnecting tubing used when testing split systems, however, follow the requirements given in section 6.1.3.5 of ARI Standard 210/240-2006 (incorporated by reference, see §430.22). When testing triple-split systems (see Definition 1.44), use the tubing length specified in section 6.1.3.5 of ARI Standard 210/240-2006 (incorporated by reference, see §430.22) to connect the outdoor coil, indoor compressor section, and indoor coil while still meeting the requirement of exposing 10 feet of the tubing to outside conditions. When testing split systems having multiple indoor coils, connect each indoor fan-coil to the outdoor unit using: (a) 25 feet of tubing, or (b) tubing furnished by the manufacturer, whichever is longer. If they are needed to make a secondary measurement of capacity, install refrigerant pressure measuring instruments as described in section 8.2.5 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22). Refer to section 2.10 of this Appendix to learn which secondary methods require refrigerant pressure measurements. At a minimum, insulate the low-pressure line(s) of a split-system with insulation having an inside diameter that matches the refrigerant tubing and a nominal thickness of 0.5 inch.

b. For units designed for both horizontal and vertical installation or for both up-flow and down-flow vertical installations, the manufacturer must specify the orientation used for testing. Conduct testing with the following installed:
   (1) the most restrictive filter(s);
   (2) supplementary heating coils; and
   (3) other equipment specified as part of the unit, including all hardware used by a heat comfort controller if so equipped (see Definition 1.28). For small-duct, high-velocity systems, configure all balance dampers or restrictor devices on or inside the unit to fully open or lowest restriction.

2.2.3 Special requirements for multi-split air conditioners and heat pumps, and systems composed of multiple mini-split units (outdoor units located side-by-side) that would normally operate using two or more indoor thermostats. For any test where the system is operated at part load (i.e., one or more compressors "off", operating at the intermediate or minimum compressor speed, or at low compressor capacity), the manufacturer shall designate the particular indoor coils that are turned off during the test. For variable-speed systems, the manufacturer must designate at least one indoor unit that is turned off for all tests conducted at minimum compressor speed. For all other part-load tests, the manufacturer shall choose to turn off zero, one, two, or more indoor units. The chosen configuration shall remain unchanged for all tests conducted at the same compressor speed/capacity. For any indoor coil that is turned off during a test, take steps to cease forced airflow through this indoor coil and block its outlet duct. Because these types of systems will have more than one indoor fan and possibly multiple outdoor fans and compressor systems, references in this test procedure to a single indoor fan, outdoor fan, and compressor means all indoor fans, all outdoor fans, and all compressor systems that are turned on during the test.

2.2.5 Additional refrigerant charging requirements. Charging according to the "manufacturer’s published instructions," as stated in section 8.2 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22), means the manufacturer’s installation instructions that come packaged with the unit.

2.4.1 Outlet plenum for the indoor unit. a. Attach a plenum to the outlet of the indoor coil. (Note: for some packaged systems, the indoor coil may be located in the outdoor test room.)

b. For systems having multiple indoor coils, attach a plenum to each indoor coil outlet. Connect two or more outlet plenums to a single common duct so that each indoor coil ultimately connects to an airflow measuring apparatus (section 2.6). If using more than one indoor test room, do likewise, creating one or more common ducts within each test room that contains multiple indoor coils. At the plane where each plenum enters a common duct, install an adjustable airflow damper and use it to equalize the static pressure in each plenum. Each outlet air temperature grid (section 2.5.4) and airflow measuring apparatus as described in section 8.2.5 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22), however, use as many available indoor test rooms as needed to accommodate the total number of indoor units. These rooms must comply with the requirements specified in sections 8.1.2 and 8.1.3 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22).
that is equal to or less than the value listed below. The limit depends only on the cooling
Full-Load Air Volume Rate (see section 3.1.4.1.1) and is effective regardless of the
flange dimensions of the outlet of the unit
(or an air supply plenum adapter accessory,
if installed in accordance with the manufac-
turer’s installation instructions).

2.4.2 Inlet plenum for the indoor unit. In-
stall an inlet plenum when testing a coil-
only indoor unit or a packaged system where
the indoor coil is located in the outdoor test
room. Add static pressure taps at the center
of each face of this plenum, if rectangular, or
at four evenly distributed locations along
the circumference of an oval or round ple-
num. Make a manifold that connects the
four static pressure taps. Figure 1 shows two
of the three options allowed for the manifold
configuration; the third option is the bro-
ken-ring, four-to-one manifold configuration
that is shown in Figure 7a of ASHRAE
Standard 37-2005 (incorporated by reference,
see §430.22). See Figures 7a, 7b, 7c, and 8 of
ASHRAE Standard 37-2005 (incorporated by
reference, see §430.22) for the cross-sectional
dimensions and minimum length of the
(outlet) plenum, and the locations for adding
the static pressure taps for units tested with
and without an indoor fan installed.

*If the outlet plenum is rectangular, calculate its equivalent diameter using $(4A)/P$, where $A$ is the area and $P$ is the perimeter
of the rectangular plenum, and compare it to the listed maximum diameter.

2.5.4.3 Minimizing air leakage. For small-
duct, high-velocity systems, install an air
damper near the end of the interconnecting
duct, just prior to the transition to the air-
flow measuring apparatus of section 2.6. To
minimize air leakage, adjust this damper
such that the pressure in the receiving
chamber of the airflow measuring apparatus
is no more than 0.5 inch of water higher than
the surrounding test room ambient. In lieu
of installing a separate damper, use the out-
let air damper box of sections 2.5 and 2.5.4.1
if it allows variable positioning. Also apply
these steps to any conventional indoor blow-
er unit that creates a static pressure within
the receiving chamber of the airflow meas-
uring apparatus that exceeds the test room
ambient pressure by more than 0.5 inches of
water column.

3. Testing Procedures

3.11 Primary and secondary test meth-
ods.**

For this capacity comparison, use the In-
door Air Enthalpy Method capacity that is
calculated in section 7.3 of ASHRAE Stan-
dard 37-2005 (incorporated by reference,
see §430.22) (and, if testing a coil-only unit, do
not make the after-test fan heat adjustments
described in section 3.3, 3.4, 3.7, and 3.10 of
this Appendix).**

31.4.11 Cooling Full-Load Air Volume
Rate for Ducted Units. The manufacturer
must specify the Cooling Full-load Air Volume Rate. Use this value as long as the following two requirements are satisfied. First, when conducting the A or A₁ Test (exclusively), the measured air volume rate, when divided by the measured indoor air-side total cooling capacity must not exceed 37.5 cubic feet per minute of standard air (scfm) per 1000 Btu/h. If this ratio is exceeded, reduce the air volume rate until this ratio is equalized. Use this reduced air volume rate for all tests that call for using the Cooling Full-load Air Volume Rate. The second requirement is as follows:

1. Achieve the Cooling Full-load Air Volume Rate, determined in accordance with the previous paragraph;
2. Measure the external static pressure;
3. If this pressure is equal to or greater than the applicable minimum external static pressure cited in Table 2, this second requirement is satisfied. Use the current air volume rate for all tests that require the Cooling Full-load Air Volume Rate.
4. If the Table 2 minimum is not equalled or exceeded:
4a. reduce the air volume rate until the applicable Table 2 minimum is equalled or exceed;
4b. until the measured air volume rate equals 95 percent of the air volume rate from step 1, whichever occurs first.
5. If the conditions of step 4a occur first, this second requirement is satisfied. Use the step 4a reduced air volume rate for all tests that require the Cooling Full-load Air Volume Rate.
6. If the conditions of step 4b occur first, make an incremental change to the set-up of the indoor fan (e.g., next highest fan motor pin setting, next highest fan motor speed) and repeat the evaluation process beginning at above step 1. If the indoor fan set-up cannot be further changed, reduce the air volume rate until the applicable Table 2 minimum is equalled. Use this reduced air volume rate for all tests that require the Cooling Full-load Air Volume Rate.

b. For ducted units that are tested with a variable-speed, constant-air-volume-rate indoor fan installed.

¹For air conditioners and heat pumps, the value cited by the manufacturer in published literature for the unit’s capacity when operated at the A or A₁ Test conditions.
²For heating-only heat pumps, the value the manufacturer cites in published literature for the unit’s capacity when operated at the H₁ or H₁₂ Test conditions.
³For ducted units tested without an air filter installed, increase the applicable tabular value by 0.08 inch of water.
⁴See Definition 1.35 to determine if the equipment qualifies as a small-duct, high-velocity system.
⁵If a closed-loop, air-enthalpy test apparatus is used on the indoor side, limit the resistance to airflow on the inlet side of the indoor blower coil to a maximum value of 0.08 inch of water. Impose the balance of the airflow resistance on the outlet side of the indoor blower.

### 31.4.2 Cooling Minimum Air Volume Rate.

\[
\text{Cooling Minimum Air Volume Rate} = \text{Cooling Full-load Air Vol. Rate} \times \left( \frac{\text{Cooling Minimum Fan Speed}}{A₁, \text{Test Fan Speed}} \right) \times \left( \frac{\text{Cooling Minimum Air Volume Rate}}{\text{Cooling Full-load Air Volume Rate}} \right)^2
\]

a. * * *

b. * * *

\[
A₁, B₁, C₁, F₁, & G₁ \text{ Test } \Delta P_{\text{st}} = \Delta P_{\text{st}, A₁} \times \left[ \frac{\text{Cooling Minimum Air Volume Rate}^2}{\text{Cooling Full-load Air Volume Rate}} \right],
\]

### 31.4.3 Cooling Intermediate Air Volume Rate.

a. * * *
Cooling Intermediate Air Vol. Rate = Cooling Full-load Air Vol. Rate \times \frac{E_v \text{Test Fan Speed}}{A_v \text{Test Fan Speed}}

\begin{equation}
E_v \text{Test } \Delta P_u = \Delta P_{H1 \text{ or } H1} \times \left( \frac{\text{Cooling Intermediate Air Volume Rate}}{\text{Cooling Full-load Air Volume Rate}} \right)^2,
\end{equation}

3.1.4.4.2 Ducted heat pumps where the Heating and Cooling Full-load Air Volume Rates are different due to indoor fan operation.

Heating Full-load Air Volume Rate = \frac{\text{Cooling Full-load Air Volume Rate}}{A_v \text{ or } A_H \text{Test Fan Speed}} \times \frac{H1 \text{ or } H1}.

3.1.4.4.3 Ducted heating-only heat pumps. The manufacturer must specify the Heating Full-load Air Volume Rate.

a. For all ducted heating-only heat pumps tested with an indoor fan installed, except those having a variable-speed, constant-air-volume-rate indoor fan. Conduct the following steps only during the first test, the \(H1 \text{ or } H1\) Test.

1. Achieve the Heating Full-load Air Volume Rate.
2. Measure the external static pressure.
3. If this pressure is equal to or greater than the Table 2 minimum external static pressure that applies given the heating-only heat pump’s rated heating capacity, use the current air volume rate for all tests that require the Heating Full-load Air Volume Rate.
4. If the Table 2 minimum is not reached or exceeded,
   4a. reduce the air volume rate until the applicable Table 2 minimum is equaled or exceeded,
   4b. until the measured air volume rate equals 95 percent of the manufacturer-specified Full-load Air Volume Rate, whichever occurs first.
5. If the conditions of step 4a occurs first, use the step 4a reduced air volume rate for all tests that require the Heating Full-load Air Volume Rate.
6. If the conditions of step 4b occur first, make an incremental change to the set-up of the indoor fan (e.g., next highest fan motor pin setting, next highest fan motor speed) and repeat the evaluation process beginning at above step 1. If the indoor fan set-up cannot be further changed, reduce the air volume rate until the applicable Table 2 minimum is equaled. Use this reduced air volume rate for all tests that require the Heating Full-load Air Volume Rate.

b. For ducted heating-only heat pumps that are tested with a variable-speed, constant-air-volume-rate indoor fan installed.

3.1.4.5 Heating Minimum Air Volume Rate.

a. * * *
Heating Minimum Air Vol. Rate = Heating Full-load Air Vol. Rate x Heating Minimum Fan Speed / H1 Test Fan Speed

* * *  
b. * * *

H0, H1, H2, H3, Test ΔP_{\text{H}} = ΔP_{\text{H}, \text{H1}} x \left( \frac{\text{Htg Minimum Air Vol. Rate}}{\text{Htg Full-load Air Vol. Rate}} \right)^2,

* * * * *  3.1.4.6 Heating Intermediate Air Volume Rate. a. * * *

Heating Intermediate Air Volume Rate = Heating Full-load Air Volume Rate x H2 Test Fan Speed / H1 Test Fan Speed

* * *
b. * * *

H2v Test ΔP_{\text{H}}ΔP_{\text{H}, \text{H2}} x \left( \frac{\text{Heating Intermediate Air Volume Rate}}{\text{Heating Full-load Air Volume Rate}} \right)^2,

* * * * *  3.1.4.7 Heating Nominal Air Volume Rate.

* * *

Heating Nominal Air Volume Rate = Heating Full-load Air Volume Rate x H1 Test Fan Speed / H1 Test Fan Speed

H1 v Test ΔP_{\text{H}} = ΔP_{\text{H}, \text{H1}} x \left( \frac{\text{Heating Nominal Air Volume Rate}}{\text{Heating Full-load Air Volume Rate}} \right)^2,

* * * * *  3.1.6 * * * (Note: In the first printing of ASHRAE Standard 37-2005, the second IP equation for Q_{\text{in}} should read,

1097CA_\text{v} \sqrt{P_{\text{v}}, \nu_{\text{v}}^3})***
3.2.1 * * * If the two optional tests are conducted but yield a tested $C_{D(k=2)}$ that exceeds the default $C_{D(k=2)}$ or if the two optional tests are not conducted, assign $C_{D(k=1)}$ the default value of 0.25. * * *

3.2.2 * * * If the two optional tests are conducted but yield a tested $C_{D(k=2)}$ that exceeds the default $C_{D(k=2)}$ or if the two optional tests are not conducted, assign $C_{D(k=1)}$ the default value of 0.25. * * *

3.2.2.1 * * * If the two optional tests are conducted but yield a tested $C_{D(k=2)}$ that exceeds the default $C_{D(k=2)}$ or if the two optional tests are not conducted, assign $C_{D(k=1)}$ the default value of 0.25. * * *

3.2.3 Tests for a unit having a two-capacity compressor. (See Definition 1.45.)

a. Conduct four steady-state wet coil tests: the $A$, $B$, $C$, and $F$ Tests. Use the two optional dry-coil tests, the steady-state $C_1$ Test, and the cyclic $D_1$ Test, to determine the cooling-mode cyclic-degradation coefficient, $C_{D(k=2)}$. If the two optional tests are conducted but yield a tested $C_{D(k=2)}$ that exceeds the default $C_{D(k=2)}$ or if the two optional tests are not conducted, assign $C_{D(k=2)}$ the default value. The default $C_{D(k=2)}$ is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, $C_{D(k=1)}$ (or equivalently, $C_{D(k=1)}$).

</table>

1. The specified test condition only applies if the unit rejects condensate to the outdoor coil.
2. Defined in section 3.1.4.1.
3. Defined in section 3.1.4.2.
4. The entering air must have a low enough moisture content so no condensate forms on the indoor coil. DOE recommends using an indoor air wet bulb temperature of 57°F or less.
5. Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the $C_1$ Test.
6. Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the $C_1$ Test.

3.2.4 Tests for a unit having a variable-speed compressor. * * * If the two optional tests are conducted but yield a tested $C_{D(k=2)}$ that exceeds the default $C_{D(k=2)}$ or if the two optional tests are not conducted, assign $C_{D(k=2)}$ the default value of 0.25. * * *

b. For multiple-split air conditioners and heat pumps (except where noted), the following procedures supersede the above requirements: For all Table 6 tests specified for a minimum compressor speed, at least one indoor unit must be turned off. The manufacturer shall designate the particular indoor unit(s) that is turned off. The manufacturer must also specify the compressor speed used for the Table 6 $E_Y$ Test, a cooling-mode intermediate compressor speed that falls within $\frac{1}{4}$ and $\frac{3}{4}$ of the difference between the maximum and minimum cooling-mode speeds. The manufacturer should prescribe
an intermediate speed that is expected to yield the highest EER for the given EV Test conditions and bracketed compressor speed range. The manufacturer can designate that one or more indoor units are turned off for the EV Test.

</table>

1 The specified test condition only applies if the unit rejects condensate to the outdoor coil.
2 Defined in section 3.1.4.1.
3 Defined in section 3.1.4.3.
4 Defined in section 3.1.4.2.
5 The entering air must have a low enough moisture content so no condensate forms on the indoor coil. DOE recommends using an indoor air wet bulb temperature of 57 °F or less.
6 Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the G₁ Test.

### 3.4 Test procedures for the optional steady-state dry-coil cooling-mode tests (the C₁, C₂, and G₁ Tests).

#### b. Denote the resulting total space cooling capacity and electrical power derived from the test as Q_{c, dry} and E_{c, dry}. With regard to a section 3.3 deviation, do not adjust Q_{c, dry} for duct losses (i.e., do not apply section 7.3.3.3 of ASHRAE Standard 37-2005 (incorporated by reference, see § 430.22)). In preparing for the section 3.5 cyclic tests, record the average indoor-side air volume rate, V, specific heat of the air, C_p,a (expressed on dry air basis), specific volume of the air at the nozzles, v_n, humidity ratio at the nozzles, W_n, and either pressure difference or velocity pressure for the flow nozzles. For units having a variable-speed indoor fan (that provides either a constant or variable air volume rate) that will or may be tested during the cyclic dry coil cooling mode test with the indoor fan turned off (see section 3.5), include the electrical power used by the indoor fan motor among the recorded parameters from the 30-minute test.

### 3.5 Test procedures for the optional cyclic dry-coil cooling-mode tests (the D₁, D₂, and I₁ Tests).

#### 3.5.3 Cooling-mode cyclic-degradation coefficient calculation. Use the two optional dry-coil tests to determine the cooling-mode cyclic-degradation coefficient, C_{Dc}. Append "(k=2)" to the coefficient if it corresponds to a two-capacity unit cycling at high capacity. If the two optional tests are conducted but yield a tested C_{Dc} that exceeds the default C_{Dc} or if the two optional tests are not conducted, assign C_{Dc} the default value of 0.25. The default value for two-capacity units cycling at high capacity, however, is the low-capacity coefficient, i.e., C_{Dc}^{(k=2)}=C_{Dc}. Evaluate C_{Dc} using the above results and those from the section 3.4 dry-coil steady-state test.

#### 3.6.1 Conduct the optional High Temperature Cyclic (HIC) Test to determine the heating mode cyclic-degradation coefficient, C_{Dch}. If this optional test is conducted but yields a tested C_{Dch} that exceeds the default C_{Dch} or if the optional test is not conducted, assign C_{Dch} the default value of 0.25.
Test conditions for the four tests are specified in Table 9.

3.6.2 Tests for a heat pump having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor fan: capacity modulation correlates with outdoor dry bulb temperature. Conduct five tests: two High Temperature Tests (H1; and H11), one Frost Accumulation Test (H2), and two Low Temperature Tests (H3; and H3). Conducting an additional Frost Accumulation Test (H2) is optional. Conduct the optional High Temperature Cyclic (H1C) Test to determine the heating mode cyclic-degradation coefficient, $C_{Dh}$. If this optional test is conducted but yields a tested $C_{Dh}$ that exceeds the default $C_{Dh}$, assign $C_{Dh}$ the default value of 0.25. Test conditions for the seven tests are specified in Table 10. If the optional H2 Test is not performed, use the following equations to approximate the capacity and electrical power of the heat pump at the H2 test conditions:

$$\dot{Q}_h^{k=1} (35) = 0.90 \cdot \left(\dot{Q}_h^{k=1} (17) + 0.6 \cdot \dot{Q}_h^{k=1} (47) - \dot{Q}_h^{k=1} (17)\right)$$

$$E_h^{k=1} (35) = 0.985 \cdot \left(E_h^{k=1} (17) + 0.6 \cdot E_h^{k=1} (47) - E_h^{k=1} (17)\right)$$

Determine the quantities $\dot{Q}_h^{k=1} (47)$ and $E_h^{k=1} (17)$ from the H1 Test and evaluate them according to Section 3.7. Determine the quantities $\dot{Q}_h^{k=1} (17)$ and $E_h^{k=1} (17)$ from the H3 Test and evaluate them according to Section 3.10.

b. Conduct the optional High Temperature Cyclic Test (H1C) to determine the heating-mode cyclic-degradation coefficient, $C_{Dh}$. If this optional test is conducted but yields a tested $C_{Dh}$ that exceeds the default $C_{Dh}$ or if the optional test is not conducted, assign $C_{Dh}$ the default value of 0.25. If a two-capacity heat pump locks out low capacity operation at lower outdoor temperatures, conduct the optional High Temperature Cyclic Test (H1C) to determine the high-capacity heating-mode cyclic-degradation coefficient, $C_{Dh}$ (k=2). If this optional test at high capacity is conducted but yields a tested $C_{Dh}$ (k=2) that exceeds the default $C_{Dh}$ (k=2) or if the optional test is not conducted, assign $C_{Dh}$ the default value. The default $C_{Dh}$ (k=2) is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, $C_{Dh}$ (k=1). Table 11 specifies test conditions for these nine tests.

1 Defined in section 3.1.4.5.
2 Defined in section 3.1.4.4.
3 Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1 Test.
4 Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1 Test.
5 Required only if the heat pump's performance when operating at low compressor capacity and outdoor temperatures less than 37 °F is needed to complete the section 4.2.3 HSPF calculations.
6 Required if Table note #5 applies, the section 3.6.3 equations for \( Q_{\text{h}} \) (35) and \( E_{\text{k}} = (17) \) may be used in lieu of conducting the H2, Test.

3.6.4 Tests for a heat pump having a variable-speed compressor. a, * * * Conduct the optional Maximum Temperature Cyclic (H0C) Test to determine the heating mode cyclic-degradation coefficient, \( C_{\text{h}} \). If this optional test is conducted but yields a tested \( C_{\text{h}} \) that exceeds the default \( C_{\text{h}} \) or if the optional test is not conducted, assign \( C_{\text{h}} \) the default value of 0.25. Test conditions for the eight tests are specified in Table 12.

b. For multiple-split heat pumps (only), the following procedures supersede the above requirements. For all Table 12 tests specified for a minimum compressor speed, at least one indoor unit must be turned off. The manufacturer shall designate the particular indoor unit(s) that is turned off. The manufacturer must also specify the compressor speed used for the Table 12 H2, Test, a heating-mode intermediate compressor speed that falls within \( 1/4 \) and \( 3/4 \) of the difference between the maximum and minimum heating-mode speeds. The manufacturer should prescribe an intermediate speed that is expected to yield the highest COP for the given H2, Test conditions and bracketed compressor speed range. The manufacturer can designate that one or more specific indoor units are turned off for the H2, Test.

</table>

1 Defined in section 3.1.4.5.
2 Maintain the airflow nozzle(s) static pressure difference or velocity pressure during an ON period at the same pressure or velocity as measured during the H0, Test.
3 Defined in section 3.1.4.4.
3.7 Test procedures for steady-state Maximum and High Temperature heating mode tests (the H0, H1, H2, H1, and H1 Tests). a. 

b. Calculate indoor-side total heating capacity as specified in sections 7.3.4.1 and 7.3.4.3 of ASHRAE Standard 37–2005 (incorporated by reference, see §430.22).

3.8 Test procedures for the optional cyclic heating mode tests (the H0C, H1C, H1C, and H1C Tests).

3.8.1 Heating mode cyclic-degradation coefficient calculation. Use the results from the optional cyclic test and the required steady-state test that were conducted at the same test conditions to determine the heating-mode cyclic-degradation coefficient \( C_{Dh} \). Add "(k=2)" to the coefficient if it corresponds to a two-capacity unit cycling at high capacity. For the below calculation of the heating mode cyclic degradation coefficient, do not include the duct loss correction from section 7.3.4.3 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22) in determining \( Q_{h}^{*}(T_{cyc}) \) or \( q_{cyc}^{*} \). If the optional cyclic test is conducted but yields a tested \( C_{Dh} \) that exceeds the default \( C_{Dh} \) or if the optional test is not conducted, assign \( C_{Dh} \) the default value of 0.25. The default value for two-capacity units cycling at high capacity, however, is the low-capacity coefficient, i.e., \( C_{Dh}^{(k=2)} = C_{Dh} \). The tested \( C_{Dh} \) is calculated as follows:

\[
C_{Dh} = \frac{1 - \frac{\text{COP}_{DN}}{\text{COP}_{h}(T_{DV})}}{1 - \text{HLF}}
\]

3.9 Average space heating capacity and electrical power calculations.

a. 

To account for the effect of duct losses between the outlet of the indoor unit and the section 2.5.4 dry-bulb temperature grid, adjust \( Q_{h}^{*}(35) \) in accordance with section 7.3.4.3 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22).

3.11 Additional requirements for the secondary test methods.

3.11.1 If using the Outdoor Air Enthalpy Method as the secondary test method.

b. For space cooling tests, calculate capacity from the outdoor air-enthalpy measurements as specified in sections 7.3.3.2 and 7.3.3.3 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22). Calculate heating capacity based on outdoor air-enthalpy measurements as specified in sections 7.3.4.2 and 7.3.4.3 of the same ASHRAE.
Department of Energy

Standard. Adjust the outdoor-side capacity according to section 7.3.3.4 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22) to account for line losses when testing split systems. Use the outdoor unit fan power as measured during the official test and not the value measured during the preliminary test, as described in section 8.6.2 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22), when calculating the capacity.

3.11.2 If using the Compressor Calibration Method as the secondary test method.

a. * * * Otherwise, conduct the calibration tests according to ASHRAE Standard 23-05 (incorporated by reference, see §430.22), ASHRAE Standard 41.9-2000 (incorporated by reference, see §430.22), and section 7.4 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22).

b. Calculate space cooling and space heating capacities using the compressor calibration method measurements as specified in section 7.4.5 and 7.4.6 respectively, of ASHRAE Standard 37–2005 (incorporated by reference, see §430.22).

3.11.3 If using the Refrigerant-Enthalpy Method as the secondary test method. Conduct this secondary method according to section 7.5 of ASHRAE Standard 37-2005 (incorporated by reference, see §430.22). Calculate space cooling and heating capacities using the refrigerant-enthalpy method measurements as specified in sections 7.5.4 and 7.5.5, respectively, of the same ASHRAE Standard.

4. CALCULATIONS OF SEASONAL PERFORMANCE DESCRIPTORS

4.1.3 SEER calculations for an air conditioner or heat pump having a two-capacity compressor. Calculate SEER using Equation 4.1–1. Evaluate the space cooling capacity, \( \dot{Q}_{c}^{k=1}(T_j) \), and electrical power consumption, \( \dot{E}_{c}^{k=1}(T_j) \), of the test unit when operating at low compressor capacity and outdoor temperature \( T_j \), using,

\[
\dot{Q}_{c}^{k=1}(T_j) = \frac{\dot{Q}_{c}^{k=1}(67) - \dot{Q}_{c}^{k=1}(82)}{82 - 67} \cdot (T_j - 67) \quad (4.1.3-1)
\]

\[
\dot{E}_{c}^{k=1}(T_j) = \frac{\dot{E}_{c}^{k=1}(67) - \dot{E}_{c}^{k=1}(82)}{82 - 67} \cdot (T_j - 67) \quad (4.1.3-2)
\]

where \( \dot{Q}_{c}^{k=1}(82) \) and \( \dot{E}_{c}^{k=1}(82) \) are determined from the F, Test, \( \dot{Q}_{c}^{k=1}(67) \) and \( \dot{E}_{c}^{k=1}(67) \) are determined from the F, Test, and all four quantities are calculated as specified in section 3.3. Evaluate the space cooling capacity, \( \dot{Q}_{c}^{k=2}(T_j) \), and electrical power consumption, \( \dot{E}_{c}^{k=2}(T_j) \), of the test unit when operating at high compressor capacity and outdoor temperature \( T_j \), using,

\[
\dot{Q}_{c}^{k=2}(T_j) = \frac{\dot{Q}_{c}^{k=2}(82) - \dot{Q}_{c}^{k=2}(95)}{95 - 82} \cdot (T_j - 82) \quad (4.1.3-3)
\]

4.1.3.3 * * * PLF, \( = 1 - C_{D}^{k=2} = 2 \cdot \left[ 1 - X^{k=2}(T_j) \right] \), the part load factor, dimensionless.

Obtain the fraction bin hours for the cooling season,

\[
\frac{n_{j}}{N},
\]

from Table 16. Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate \( \dot{Q}_{c}^{k=2}(T_j) \) and \( \dot{E}_{c}^{k=2}(T_j) \). If the optional C, and D, Tests described in section 3.2.3 and Table 5 are not conducted, set \( C_{D}^{k=2} \) equal to the default value specified in section 3.5.3. If these optional tests are conducted, set \( C_{D}^{k=2} \) to the lower of:

a. the \( C_{D}^{k=2} \) value calculated as per section 3.5.3 or

b. the section 3.5.3 default value for \( C_{D}^{k=2} \).

* * *
4.1.4 SEER calculations for an air conditioner or heat pump having a variable-speed compressor. Calculate SEER using Equation 4.1. Evaluate the space cooling capacity, \( Q_{c,k}^{\text{v}}(T_j) \), and electrical power consumption \( E_{c,k}^{\text{v}}(T_j) \), of the test unit when operating at minimum compressor speed and outdoor temperature \( T_j \). Use Equations 4.1.3–1 and 4.1.3–2, respectively, where \( Q_{c,k}^{\text{v}}(82) \) and \( E_{c,k}^{\text{v}}(82) \) are determined from the \( A_1 \) Test, \( Q_{c,k}^{\text{v}}(67) \) and \( E_{c,k}^{\text{v}}(67) \) are determined from the \( F_1 \) Test, and all four quantities are calculated as specified in section 3.3. Evaluate the space cooling capacity, \( Q_{c,k}^{\text{v}}(T_j) \), and electrical power consumption, \( E_{c,k}^{\text{v}}(T_j) \), of the test unit when operating at maximum compressor speed and outdoor temperature \( T_j \). Use Equations 4.1.3–3 and 4.1.3–4, respectively, where \( Q_{c,k}^{\text{v}}(95) \) and \( E_{c,k}^{\text{v}}(95) \) are determined from the \( A_2 \) Test, \( Q_{c,k}^{\text{v}}(82) \) and \( E_{c,k}^{\text{v}}(82) \) are determined from the \( B_2 \) Test, and all four quantities are calculated as specified in section 3.3. Calculate the space cooling capacity, \( Q_{c,k}^{\text{v}}(T_j) \), and electrical power consumption, \( E_{c,k}^{\text{v}}(T_j) \), of the test unit when operating at outdoor temperature \( T_j \) and the intermediate compressor speed used during the section 3.2.4 (and Table 6) \( E \) Test using, where \( Q_{c,k}^{\text{v}}(87) \) and \( E_{c,k}^{\text{v}}(87) \) are determined from the \( E \) Test and calculated as specified in section 3.3. Approximate the slopes of the \( k = v \) intermediate speed cooling capacity and electrical power input curves, \( M_Q \) and \( M_E \), as follows: * * *

\[
\dot{Q}_{c,k}^{\text{v-v}}(T_j) = \dot{Q}_{c,k}^{\text{v}}(87) + M_Q \cdot (T_j - 87) \quad (4.1.4-1)
\]

\[
\dot{E}_{c,k}^{\text{v-v}}(T_j) = \dot{E}_{c,k}^{\text{v}}(87) + M_E \cdot (T_j - 87) \quad (4.1.4-2)
\]

where \( \dot{Q}_{c,k}^{\text{v}}(87) \) and \( \dot{E}_{c,k}^{\text{v}}(87) \) are determined from the \( E \) Test and calculated as specified in section 3.3. Approximate the slopes of the \( k = v \) intermediate speed cooling capacity and electrical power input curves, \( M_Q \) and \( M_E \), as follows: * * *

\[
N_Q = \frac{\dot{Q}_{c,k}^{\text{v}}(87) - \dot{Q}_{c,k}^{\text{v}}(87)}{\dot{Q}_{c,k}^{\text{v}}(87) - \dot{Q}_{c,k}^{\text{v}}(87)}, \quad \text{and} \quad N_E = \frac{\dot{E}_{c,k}^{\text{v}}(87) - \dot{E}_{c,k}^{\text{v}}(87)}{\dot{E}_{c,k}^{\text{v}}(87) - \dot{E}_{c,k}^{\text{v}}(87)}.
\]

Use Equations 4.1.3–1 and 4.1.3–2 for \( T_j = 87 \) °F to determine \( Q_{c,k}^{\text{v}}(87) \) and \( E_{c,k}^{\text{v}}(87) \), respectively. Use Equations 4.1.3–3 and 4.1.3–4 for \( T_j = 87 \) °F to determine \( Q_{c,k}^{\text{v}}(87) \) and \( E_{c,k}^{\text{v}}(87) \), respectively.

Calculating Equation 4.1.1 quantities

\[
\frac{q_c(T_j)}{N} \quad \text{and} \quad \frac{e_c(T_j)}{N}
\]
differs depending upon whether the test unit would operate at minimum speed (section 4.1.4.1), operate at an intermediate speed (section 4.1.4.2), or operate at maximum speed (section 4.1.4.3) in responding to the building load. Use Equation 4.1.2 to calculate the building load, \( BL(T_j) \), for each temperature bin.

4.1.4.1 * * * Use Equations 4.1.3–1 and 4.1.3–2, respectively, to evaluate \( Q_{c,k}^{\text{v}}(T_j) \) and \( E_{c,k}^{\text{v}}(T_j) \).
For multiple-split air conditioners and heat pumps (only), the following procedures supersede the above requirements for calculating $EER_{k-1}(T_j)$. For each temperature bin where $T_l < T_j < T_v$,

$$EER_{k-1}(T_j) = \frac{\hat{Q}_{c-1}^{k-1}(T_j)}{\hat{E}_{c-1}^{k-1}(T_j)} \text{ Btu/h per W.}$$

$$EER_{k-2}(T_j) = \frac{\hat{Q}_{c-2}^{k-2}(T_j)}{\hat{E}_{c-2}^{k-2}(T_j)} \text{ Btu/h per W.}$$

For each temperature bin where $T_l < T_j < T_v$,

$$EER_{k-1}(T_j) = EER_{k-1}(T_j) + \frac{EER_{k-2}(T_j) - EER_{k-1}(T_j)}{T_v - T_l} \cdot (T_j - T_l).$$

$\text{PLF}_j = 1 - C_{Dh}^{k=2} \cdot \left[ 1 - X^{k-2}(T_j) \right]$. If the optional HJC Test described in section 3.6.3 and Table 11 is not conducted, set $C_{Dh}^{k=2}$ equal to the default value specified in section 3.8.1. If this optional test is conducted, set $C_{Dh}^{k=2}$ to the lower of:

- a. the $C_{Dh}^{k=2}$ value calculated as per section 3.8.1;
- b. the section 3.8.1 default value for $C_{Dh}^{k=2}$.

Determine the low temperature cut-out factor, $\delta(T_j)$, using Equation 4.2.3-3.

For multiple-split heat pumps (only), the following procedures supersede the above requirements for calculating $COP_{h,k-1}(T_j)$. For each temperature bin where $T_3 > T_j > T_{sh}$,

$$COP_{h,k-1}(T_j) = COP_{h,k-1}(T_j) + \frac{COP_{h,k-1}(T_{sh}) - COP_{h,k-1}(T_j)}{T_{sh} - T_3} \cdot (T_j - T_l).$$

For each temperature bin where $T_{sh} > T_j > T_a$. 

313
APPENDIX N TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF FURNACES AND BOILERS

1.0 Scope. The scope of this appendix is as specified in section 2.0 of ANSI/ASHRAE Standard 103-1993.

2.0 Definitions. Definitions include the definitions specified in section 3 of ANSI/ASHRAE Standard 103-1993 and the following additional and modified definitions:

2.2 ASHRAE means the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc.

2.3 Thermal stack damper means a type of stack damper which is dependent for operation exclusively upon the direct conversion of thermal energy of the stack gases to open the damper.

2.4 Isolated combustion system. The definition of isolation combustion system in section 3 of ANSI/ASHRAE Standard 103-1993 is incorporated with the addition of the following: “The unit is installed in an un-conditioned indoor space isolated from the heated space.”

3.0 Classifications. Classifications are as specified in section 4 of ANSI/ASHRAE Standard 103-1993.

4.0 Requirements. Requirements are as specified in section 5 of ANSI/ASHRAE Standard 103-1993.

6.0 Apparatus. The apparatus used in conjunction with the furnace or boiler during the testing shall be as specified in section 7 of ANSI/ASHRAE Standard 103-1993 except for the second paragraph of section 7.2.2.2 and except for section 7.2.2.5, and as specified in section 6.1 of this appendix.

6.1 Downflow furnaces. Install the internal section of vent pipe the same size as the flue collar for connecting the flue collar to the top of the unit, if not supplied by the manufacturer. Do not insulate the internal vent pipe during the jacket loss test (if conducted) described in section 8.6 of ANSI/ASHRAE Standard 103-1993 or the steady-state test described in section 9.1 of ANSI/ASHRAE Standard 103-1993. Do not insulate the internal vent pipe before the cool-down and heat-up tests described in sections 9.5 and 9.6, respectively, of ANSI/ASHRAE Standard 103-1993. If the vent pipe is surrounded by a metal jacket, do not insulate the metal jacket. Install a 5-ft test stack of the same cross sectional area or perimeter as the vent pipe above the top of the furnace. Tape or seal around the junction connecting the vent pipe and the 5-ft test stack. Insulate the 5-ft test stack with insulation having an R-value not less than 7 and an outer layer of aluminum foil. (See Figure 3–E of ANSI/ASHRAE Standard 103-1993.)

7.0 Testing conditions. The testing conditions shall be as specified in section 8 of ANSI/ASHRAE Standard 103-1993 with errata of October 24, 1996, except for section 8.6.1.1; and as specified in section 7.1 of this appendix.

7.1 Measurement of jacket surface temperature. The jacket of the furnace or boiler shall be subdivided into 6-inch squares when practical, and otherwise into 36-square-inch regions comprising 4 in. × 9 in. or 3 in. × 12 in. sections, and the surface temperature at the center of each square or section shall be determined with a surface thermocouple. The 36-square-inch areas shall be recorded in groups where the temperature differential of the 36-square-inch area is less than 10 °F for temperature up to 100 °F above room temperature and less than 20 °F for temperature more than 100 °F above room temperature. For forced air central furnaces, the circulating air blower compartment is considered as part of the duct system and no surface temperature measurement of the blower compartment needs to be recorded for the purpose of this test. For downflow furnaces, measure all cabinet surface temperatures of the heat exchanger and combustion section, including the bottom around the outlet duct, and the burner door, using the 36 square-inch thermocouple grid. The cabinet surface temperatures around the blower section do not need to be measured (See figure 3–E of ANSI/ASHRAE Standard 103-1993.)

8.0 Test procedure. Testing and measurements shall be as specified in section 9 of ANSI/ASHRAE Standard 103-1993 except for sections 9.5.1.1, 9.5.1.2, 9.5.2.2, 9.5.2.1, and section 9.7.1; and as specified in sections 8.1, 8.2, 8.3, 8.4, and 8.5 of this appendix.
8.1 Input to interrupted ignition device. For burners equipped with an interrupted ignition device, record the nameplate electric power used by the ignition device, $P_{E,\text{ign}}$, or use $P_{E,\text{ign}}=0$. If no nameplate power input is provided, record the nameplate ignition device on-time interval, $t_{\text{on},\text{ign}}$, or measure the on-time period at the end of the post-purge period, $T_{\text{p}}$ of ANSI/ASHRAE 103–1993. During this off-period, for units that do not have pump delay after shutoff, no water shall be allowed to circulate through the hot water boilers. For units that have pump delay on shutoff, except those having pump controls sensing water temperature, the pump shall be stopped by the unit control and the time $t_{\text{p}}$, between burner shutoff and pump shutoff shall be measured within one-second accuracy. For units having pump delay controls that sense water temperature, the pump shall be operated for 15 minutes and $t_{\text{p}}$ shall be 15 minutes. Where the pump is operating, the inlet water temperature and flow rate shall be maintained at the same values as used during the steady-state test as specified in sections 9.1 and 8.4.2.3 of ANSI/ASHRAE 103-1993.

8.2 Gas- and oil-fueled gravity and forced air circulation furnaces without stack dampers cool-down test. Turn off the main burner after steady-state testing is completed, and measure the flue gas temperature by means of the thermocouple grid described in section 7.6 of ANSI/ASHRAE 103-1993 at 1.5 minutes ($T_{\text{p,CO}}$) and 9 minutes ($T_{\text{p,OFF}}$) after the burner shuts off. An integral draft diverter shall remain blocked and insulated, and the stack restriction shall remain in place. On atmospheric systems with an integral draft diverter or draft hood, equipped with either an electromechanical inlet damper or an electro-mechanical flue damper that closes within 10 seconds after the burner shuts off to restrict the flow through the heat exchanger in the off-cycle, bypass or adjust the control for the electromechanical damper so that the damper remains open during the cool-down test. For furnaces that employ post purge, measure the length of the post-purge period with a stopwatch. The time from burner OFF to combustion blower OFF (electrically de-energized) shall be recorded as $t_{\text{p}}$. For the case where $t_{\text{p}}$ is intended to be greater than 180 seconds, stop the combustion blower at 180 seconds and use that value for $t_{\text{p}}$. Measure the flue gas temperature by means of the thermocouple grid described in section 7.6 of ANSI/ASHRAE 103-1993 at the end of the post-purge period $t_{\text{p}}$ ($T_{\text{p,CO}}$), and at the time (1.5 + $t_{\text{p}}$) minutes ($T_{\text{p,OFF}}$) after the main burner shuts off. For the case where the measured $T_{\text{p}}$ is less or equal to 30 seconds, it shall be tested as if there is no post purge and $t_{\text{p}}$ shall be set to equal 0.

8.3 Gas- and oil-fueled gravity and forced air central furnaces without stack dampers cool-down test. For a furnace with adjustable fan control, this time delay will be 3.0 minutes for non-condensing furnaces or 1.5 minutes for condensing furnaces or until the supply air temperature drops to a value of 40 °F above the inlet air temperature, whichever results in the longest fan on-time. For a furnace without adjustable fan control or with the type of adjustable fan control whose range of adjustment does not allow for the delay time specified above, the control shall be bypassed and the fan manually controlled to give the delay times specified above. For a furnace which employs a single motor to drive the power burner and the indoor air circulating blower, the power burner and indoor air circulating blower shall be stopped together.

8.4 Gas- and oil-fueled boilers without stack dampers cool-down test. After steady-state testing has been completed, turn the main burner(s) OFF and measure the flue gas temperature at 3.75 ($T_{\text{p,OFF}}$) and 22.5 ($T_{\text{p,OFF}}$) minutes after the burner shut off, using the thermocouple grid described in section 7.6 of ANSI/ASHRAE 103-1993. During this off-period, for units that do not have pump delay after shutoff, no water shall be allowed to circulate through the hot water boilers. For units that have pump delay on shutoff, except those having pump controls sensing water temperature, the pump shall be stopped by the unit control and the time $t_{\text{p}}$, between burner shutoff and pump shutoff shall be measured within one-second accuracy. For units having pump delay controls that sense water temperature, the pump shall be operated for 15 minutes and $t_{\text{p}}$ shall be 15 minutes. While the pump is operating, the inlet water temperature and flow rate shall be maintained at the same values as used during the steady-state test as specified in sections 9.1 and 8.4.2.3 of ANSI/ASHRAE 103-1993.

For boilers that employ post purge, measure the length of the post-purge period with a stopwatch. The time from burner OFF to combustion blower OFF (electrically de-energized) shall be recorded as $t_{\text{p}}$. For the case where $t_{\text{p}}$ is intended to be greater than 180 seconds, stop the combustion blower at 180 seconds and use that value for $t_{\text{p}}$. Measure the flue gas temperature by means of the thermocouple grid described in section 7.6 of ANSI/ASHRAE 103-1993 at the end of the post-purge period $t_{\text{p}}$ ($T_{\text{p,CO}}$), and at the time (3.75 + $t_{\text{p}}$) minutes ($T_{\text{p,OFF}}$) and (22.5 + $t_{\text{p}}$) minutes ($T_{\text{p,OFF}}$) after the main burner shuts off. For the case where the measured $t_{\text{p}}$ is less or equal to 30 seconds, it shall be tested as if there is no post purge and $t_{\text{p}}$ shall be set to equal 0.

8.5 Direct measurement of off-cycle losses testing method. [Reserved.]

9.0 Nomenclature. Nomenclature shall include the nomenclature specified in section 10 of ANSI/ASHRAE Standard 103-1993 and the following additional variables:

- $\text{Eff}_{\text{min}}$: Efficiency of power burner motor
- $P_{E,\text{ign}}$: Electrical power to the interrupted ignition device, kW
- $R_{\text{f,OFF}}$: Ratio of combustion air mass flow rate to stoichiometric air mass flow rate
- $R_{\text{a,OFF}}$: Ratio of the sum of oncoming air and relief air mass flow rate to stoichiometric air mass flow rate
- $t_{\text{p,OFF}}$: Electrical interrupted ignition device on-time, min.
Where:

\[ T_{x,xx}=T_{x,xx}, \text{ if flue gas temperature is measured, \degree F} \]

\[ =T_{x,xx}, \text{ if stack gas temperature is measured, \degree F} \]

\[ y_r = \text{ratio of electrical interrupted ignition device on-time to average burner on-time} \]

\[ y_s = \text{ratio of power burner combustion blower on-time to average burner on-time} \]

10.0 Calculation of derived results from test measurements. Calculations shall be as specified in sections 11 of ANSI/ASHRAE Standard 103-1993 and the October 24, 1996, Errata Sheet for ASHRAE Standard 103-1993, except for appendices B and C, and as specified in sections 10.1 through 10.8 and Figure 1 of this appendix.

11. Annual fuel utilization efficiency. The annual fuel utilization efficiency (AFUE) is as defined in sections 11.2.12 (non-condensing systems), 11.3.12 (condensing systems), 11.4.12 (non-condensing modulating systems) and 11.5.12 (condensing modulating systems) of ANSI/ASHRAE Standard 103-1993, except for the definition for the term \( \text{Effy}_s \) in the defining equation for AFUE. \( \text{Effy}_s \) is defined as:

\[ \text{Effy}_s = \frac{100,000}{150,000 \times y_r \times \text{Eff}}, \text{ for forced draft unit, indoors, and} \]

\[ \text{Effy}_s = \frac{1}{150,000 \times y_s}, \text{ for induced draft unit, ICS} \]

where:

\[ \text{Eff} = \text{Annual fuel utilization efficiency.} \]

11.5.8 Measurement of system parameters. Parameters shall be measured as follows:

- For boilers:
  - \( y_r \), as defined in 11.2.8.
  - \( y_s \), as defined in 8.1 of this appendix.

- For furnaces:
  - \( y_r \), as defined in 11.2.8.
  - \( y_s \), as defined in 8.1 of this appendix.

11.5.9 Reporting of system components. System components shall be reported as follows:

- For boilers:
  - \( \text{Eff} \), as defined in 9.1.2.2.
  - \( T_{x,xx} \), as defined in 11.2.8.

- For furnaces:
  - \( \text{Eff} \), as defined in 9.1.2.2.
  - \( T_{x,xx} \), as defined in 11.2.8.

11.5.10 Reporting of system performance. System performance shall be reported as follows:

- For boilers:
  - \( \text{Effy}_s \), as defined in 11.2.8.
  - \( \text{Eff} \), as defined in 9.1.2.2.

- For furnaces:
  - \( \text{Effy}_s \), as defined in 11.2.8.
  - \( \text{Eff} \), as defined in 9.1.2.2.
\[ Q_{N,M} = \text{as defined in 11.2.8.1 of ANSI/ASHRAE Standard 103-1993} \]
\[ Q_{R} = \text{as defined in 11.2.11 of ANSI/ASHRAE Standard 103-1993} \]
\[ \text{Effy}_{R} = \text{as defined in 11.2.11 (non-condensing systems) or 11.3.11.3 (condensing systems) of ANSI/ASHRAE Standard 103-1993, percent, and calculated on the basis of:} \]
\[ \text{ICS installation, for non-weatherized warm air furnaces; indoor installation, for non-weatherized boilers; or outdoor installation, for non-weatherized boilers that are weatherized.} \]
\[ 2r = \text{ratio of the average length of the heating season in hours to the average heating load hours} \]
\[ t_{a} = \text{as defined in 9.5.1.2 of ANSI/ASHRAE Standard 103-1993 or 8.4 of this appendix} \]
\[ t_{m} = \text{as defined in 9.6.1 of ANSI/ASHRAE Standard 103-1993} \]

10.2.1.1 For furnaces and boilers equipped with two stage or step modulating controls the national average energy used during the heating season, \( E_{N} \), is defined as:

\[ E_{N} = (Q_{N} - Q_{O}) \text{BOH}_{EC} \times (8,760 - 4,600)Q_{R} \]

where:
\[ Q_{N} = \text{as defined in 11.4.8.11.1 of ANSI/ASHRAE Standard 103-1993} \]
\[ Q_{R} = \text{as defined in 11.4.12 of ANSI/ASHRAE Standard 103-1993} \]
\[ \text{BOH}_{EC} = \text{as defined in section 10.2.1.1 of this appendix}, in which the weighted \text{Effy}_{R} as defined in 11.4.11.3 or 11.5.11.3 of ANSI/ASHRAE Standard 103-1993 is used for calculating the values of \( A \) and \( B \), the term \( \text{DHR} \) is based on the value of \( Q_{OUT} \) defined in 11.4.8.11.1 or 11.5.8.1.1 of ANSI/ASHRAE Standard 103-1993, and the term \( (y_{P}E + y_{E}PE_{EC} + y_{BE}) \) in the factor \( A \) is increased by the factor \( R \), which is defined as:
\[ R = \begin{cases} 2 & \text{for two stage controls} \\ 3 & \text{for step modulating controls when the ratio of minimum-to-maximum output is greater than or equal to 0.5} \\ 4 & \text{for step modulating controls when the ratio of minimum-to-maximum output is less than 0.5} \end{cases} \]
\[ A = 100 \times \left[ 341,300 \times y_{P}E + y_{E}PE_{EC} + y_{BE} \right] \times R \times (Q_{N} - Q_{O}) \text{Effy}_{R}, \] for forced draft unit, indoors
\[ = 100 \times \left[ 341,300 \times y_{P}E \text{Effy}_{R}(1 - \text{Eff}_{ME}) + y_{E}PE_{EC} + y_{BE} \right] \times R \times (Q_{N} - Q_{O}) \text{Effy}_{R}, \] for induced draft unit, ICs
\[ = 100 \times \left[ 341,300 \times y_{P}E \text{Effy}_{R}(1 - \text{Eff}_{ME}) + y_{E}PE_{EC} + y_{BE} \right] \times R \times (Q_{N} - Q_{O}) \text{Effy}_{R}, \] for induced draft unit, ICS

where:
\[ \text{Eff}_{ME} = \text{Power burner motor efficiency provided by manufacturer}, \]
\[ = 0.50, \text{an assumed default power burner efficiency if none provided by manufacturer.} \]
\[ \text{Effy}_{R} = \text{as defined in 11.4.11.3 or 11.5.11.3 of ANSI/ASHRAE Standard 103-1993, and calculated on the basis of:} \]
\[ - \text{ICS installation, for non-weatherized warm air furnaces} \]
\[ - \text{indoor installation, for non-weatherized boilers} \]
\[ - \text{outdoor installation, for furnaces and boilers that are weatherized} \]
\[ 8,760 = \text{total number of hours per year} \]
\[ 4,600 = \text{specified in 11.4.12 of ANSI/ASHRAE Standard 103-1993} \]

10.2.1.2 For furnaces and boilers equipped with two stage or step modulating controls the national average number of burner operating hours at the reduced operating mode is defined as:
\[ \text{BOH}_{R} = \text{as specified in 11.4.8.12 of ANSI/ASHRAE Standard 103-1993} \]

10.2.1.3 For furnaces and boilers equipped with two stage controls the national average number of burner operating hours at the maximum operating mode (\( \text{BOH}_{M} \)) is defined as:
\[ \text{BOH}_{M} = \text{as defined in 11.4.8.6 of ANSI/ASHRAE Standard 103-1993} \]
\[ E_{M} = \text{as defined in section 10.2.1.1 of this appendix} \]
\[ Q_{NM} = \text{as defined in 11.4.8.11.1 of ANSI/ASHRAE Standard 103-1993} \]

10.2.1.4 For furnaces and boilers equipped with step modulating controls the national average number of burner operating hours at the modulating operating mode (\( \text{BOH}_{M} \)) is defined as:
\[ \text{BOH}_{M} = \text{as specified in 11.4.8.8 of ANSI/ASHRAE Standard 103-1993, as appropriate} \]
\[ \text{Effy}_{SM} = \text{as defined in 11.4.8.8 or 11.5.8.8 of ANSI/ASHRAE Standard 103-1993, as appropriate, in percent} \]
\[ 100 = \text{factor that accounts for percent} \]
Pt. 430, Subp. B, App. N

10.2.2 Average annual fuel energy consumption for gas or oil fired furnaces or boilers. For furnaces or boilers equipped with single stage controls the average annual fuel energy consumption \( E_{\text{f}} \) is expressed in Btu per year and defined as:

\[
E_{\text{f}} = 8 \text{BOH}_{\text{R}}(Q_{\text{N}} - Q_{\text{R}}) + 4,760 Q_{\text{F}}
\]

where:
- \( \text{BOH}_{\text{R}} \): as defined in 10.2.1 of this appendix
- \( Q_{\text{N}} \): as specified in 11.2.11 of ANSI/ASHRAE Standard 103-1993
- \( Q_{\text{R}} \): as specified in 10.2.1 of this appendix

10.2.2.1 For furnaces or boilers equipped with either two stage or step modulating controls \( E_{\text{f}} \) is defined as:

\[
E_{\text{f}} = E_{\text{AE}} + 4,600 Q_{\text{F}}
\]

where:
- \( E_{\text{AE}} \): as defined in 10.2.1.1 of this appendix
- \( Q_{\text{F}} \): as specified in 11.4.2 of ANSI/ASHRAE Standard 103-1993

10.2.3 Average annual auxiliary electrical energy consumption for gas or oil fired furnaces or boilers. For furnaces or boilers equipped with single stage controls the average annual auxiliary electrical consumption \( (E_{\text{AE}}) \) is expressed in kilowatt-hours and defined as:

\[
E_{\text{AE}} = \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{SS}}] + \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{IN}}]
\]

where:
- \( \text{BOH}_{\text{AE}} \): as defined in 10.2.1 of this appendix
- \( y_{\text{PE}} \): as defined in 10.2.1.1 of this appendix
- \( P_{\text{SS}} \): as specified in 10.2.1 of this appendix
- \( P_{\text{IN}} \): as defined in 10.2.1 of this appendix

10.2.3.1 For furnaces or boilers equipped with two stage controls \( E_{\text{AE}} \) is defined as:

\[
E_{\text{AE}} = \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{SS}}] + \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{IN}}]
\]

where:
- \( \text{BOH}_{\text{AE}} \): as defined in 10.2.1 of this appendix
- \( y_{\text{PE}} \): as defined in 10.2.1.1 of this appendix
- \( P_{\text{SS}} \): as defined in 10.2.1 of this appendix
- \( P_{\text{IN}} \): as defined in 10.2.1.3 of this appendix

10.2.3.2 For furnaces or boilers equipped with step modulating controls \( E_{\text{AE}} \) is defined as:

\[
E_{\text{AE}} = \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{SS}}] + \text{BOH}_{\text{AE}}[y_{\text{PE}} + y_{\text{IG}} P_{\text{IN}}]
\]

where:
- \( \text{BOH}_{\text{AE}} \): as defined in 10.2.2 of this appendix
- \( y_{\text{PE}} \): as defined in 10.2.1 of this appendix
- \( y_{\text{IG}} \): as defined in 10.2.1.2 of this appendix

10.2.4 Average annual electric energy consumption for gas or oil furnaces or boilers. The minimum fuel input rate for gas or oil furnaces and boilers defined as, per 10 CFR Ch. II (1–1–08 Edition): 10.3.1 Average annual electric energy consumption for gas or oil furnaces or boilers. For electric furnaces and boilers the average annual energy consumption \( (E_{\text{E}}) \) is expressed in kilowatt-hours and defined as:

\[
E_{\text{E}} = 100[2,080(0.77)\text{DHR}(3.412 \text{AFUE})]
\]

where:
- \( 100 \) to express a percent as a decimal
- \( 2,080 \) is specified in 10.2.1 of this appendix
- \( 0.77 \) is specified in 10.2.1 of this appendix
- \( \text{DHR} \) is conversion to express energy in terms of watt-hours instead of Btu
- \( 3.412 \) is conversion to express energy in terms of watt-hours instead of Btu
- \( \text{AFUE} \) is defined in 10.1 of ANSI/ASHRAE Standard 103-1993, in percent, and calculated on the basis of:
  - ICS installation, for non-weatherized warm air furnaces;
  - indoor installation, for non-weatherized boilers;
  - outdoor installation, for furnaces and boilers that are weatherized.

10.4 Energy factor. 10.4.1 Energy factor for gas or oil furnaces and boilers. Calculate the energy factor, \( EF \), for gas or oil furnaces and boilers defined as, in percent:

\[
EF = \frac{(E_{\text{f}} - 4,600 Q_{\text{F}}) \text{Eff}_{\text{HS}}}{E_{\text{f}} + 3,412 \text{E}_{\text{AE}}}
\]

where:
- \( E_{\text{f}} \): average annual fuel consumption as defined in 10.2.2 of this appendix
- \( \text{Eff}_{\text{HS}} \): energy factor for gas or oil furnaces and boilers.
Department of Energy

Effy\textsubscript{eff}=Annual Fuel Utilization Efficiency as defined in 11.2.11, 11.3.11, 11.4.11 or 11.5.11 of ANSI/ASHRAE Standard 103-1993, in percent, and calculated on the basis of:

- indoor installation, for non-weatherized boilers; or
- outdoor installation, for furnaces and boilers that are weatherized.

\begin{align*}
3.412 \text{= conversion factor from kilowatt to Btu/h} \\
2,080 \text{= as specified in 10.2.1 of this appendix}
\end{align*}

10.4.2 Energy factor for electric furnaces and boilers. The energy factor, \( E \), for electric furnaces and boilers is defined as:

\[ E = \frac{AFUE}{DHR} \]

where:

- \( AFUE \) = Annual Fuel Utilization Efficiency as defined in section 10.3 of this appendix, in percent
- \( DHR \) = Heating Load Hours for a specific geographic region determined from the heating load hour map in Figure 1 of this appendix

10.5 Average annual energy consumption for furnaces and boilers located in a different geographic region of the United States and in buildings with different design heating requirements.

10.5.1 Average annual fuel energy consumption for gas or oil-fueled furnaces and boilers located in a different geographic region of the United States and in buildings with different design heating requirements. For gas or oil-fueled furnaces and boilers, the average annual fuel energy consumption (\( E_{\text{ GAS}} \)) is expressed in Btu per year and defined as:

\[ E_{\text{ GAS}} = \frac{E_F - 8,760 Q_D}{2,080} + 8,760 Q_D \]

where:

- \( E_F \) = as defined in 10.2.2 of this appendix
- \( 8,760 Q_D \) = as specified in 10.2.1 of this appendix
- \( 2,080 \) = as defined in 10.2.1 of this appendix

10.5.2 Average annual auxiliary electrical energy consumption for gas or oil-fueled furnaces and boilers located in a different geographic region of the United States and in buildings with different design heating requirements. For gas or oil-fueled furnaces and boilers, the average annual auxiliary electrical energy consumption (\( E_{\text{ AUX}} \)) is expressed in kilowatt-hours and defined as:

\[ E_{\text{ AUX}} = E_{\text{ AE}} \times (HLH/2,080) \]

where:

- \( E_{\text{ AE}} \) = as defined in 10.2.3 of this appendix
- \( HLH \) = Heating Load Hours for a specific geographic region and a specific typical design heating requirement (\( E_{\text{ AE}} \)) is expressed in kilowatt-hours and defined as:

\[ E_{\text{ AE}} = 1880, \text{sales weighted average heating load hours for mobile home furnaces (SS)} \]

10.5.3 Average annual electric energy consumption for electric furnaces and boilers located in a different geographic region of the United States and in buildings with different design heating requirements. For electric furnaces and boilers, the average annual electric energy consumption for a specific geographic region and a specific typical design heating requirement (\( E_{\text{ ES}} \)) is expressed in kilowatt-hours and defined as:

\[ E_{\text{ ES}} = 100(0.77) DHR \times HLH/(3.412 AFUE) \]

where:

- 100 = as specified in 10.3 of this appendix
- 0.77 = as specified in 10.2.1 of this appendix
- \( DHR \) = as defined in 10.2.1 of this appendix
- \( HLH \) = as defined in 10.5.1 of this appendix
- 3.412 = as specified in 10.3 of this appendix
- \( AFUE \) = as defined in 10.3 of this appendix, in percent

10.6 Average annual energy consumption for mobile home furnaces.

10.6.1 National average number of burner operating hours for mobile home furnaces (\( BOH_{\text{ NA}} \)). \( BOH_{\text{ NA}} \) is the same as in 10.2.1 of this appendix except that the value of \( Effy_{\text{ eff}} \) in the calculation of the burner operating hours, \( BOH_{\text{ NA}} \), is calculated on the basis of a direct vent unit with system number 9 or 10.

10.6.2 Average annual fuel energy for mobile home furnaces (\( E_{\text{ F}} \)). \( E_{\text{ F}} \) is the same as in 10.5.1 of this appendix except that the burner operating hours, \( BOH_{\text{ NA}} \), is calculated as specified in 10.6.1 of this appendix.

10.6.3 Average annual auxiliary electrical energy consumption for mobile home furnaces (\( E_{\text{ AUX}} \)). \( E_{\text{ AE}} \) is the same as in 10.2.3 of this appendix, except that the burner operating hours, \( BOH_{\text{ NA}} \), is calculated as specified in 10.6.1 of this appendix.

10.7 Calculation of sales weighted average annual energy consumption for mobile home furnaces. In order to reflect the distribution of mobile homes to geographical regions with average \( HLH_{\text{ MNB}} \) value different from 2,080, adjust the annual fossil fuel and auxiliary electrical energy consumption values for mobile home furnaces using the following adjustment calculations.

10.7.1 For mobile home furnaces the sales weighted average annual fossil fuel energy consumption is expressed in Btu per year and defined as:

\[ E_{\text{ F,MNB}} = 2,080(0.77) DHR \times HLH_{\text{ MNB}}/(8,760) \]

where:

- \( 2,080(0.77) \) = as specified in 10.2.1 of this appendix
- \( HLH_{\text{ MNB}} \) = as defined in 11.2.11 of ANSI/ASHRAE Standard 103-1993

10.7.2 For mobile home furnaces the sales weighted average annual auxiliary electrical energy consumption is expressed in Btu per year and defined as:

\[ E_{\text{ AUX,MNB}} = (E_{\text{ AE}} - 8,760 Q_D)/2,080 + 8,760 Q_D \]

where:

- \( E_{\text{ AE}} \) = as defined in 10.2.3 of this appendix
- \( HLH_{\text{ MNB}} \) = as defined in 10.5.1 of this appendix
- \( 2,080 \) = as specified in 10.2.1 of this appendix

319
energy consumption is expressed in kilowatt-hours and defined as:

\[ E_{AE,MHF} = \frac{E_{AEHLH}}{2,080} \]

where:

- \( E_{AE} \) is defined in 10.6.3 of this appendix
- \( HLH \) is defined in 10.7.1 of this appendix
- 2,080 is specified in 10.2.1 of this appendix

10.8 Direct determination of off-cycle losses for furnaces and boilers equipped with thermal stack dampers. [Reserved.]
APPENDIX O TO SUBPART B OF PART 430-
UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF VENTED HOME HEATING EQUIPMENT

1.0 Definitions

1.1 “Air shutter” means an adjustable device for varying the size of the primary air inlet(s) to the combustion chamber power burner.

1.2 “Air tube” means a tube which carries combustion air from the burner nozzle to the burner nozzle for combustion.

1.3 “Barometric draft regulator or barometric damper” means a mechanical device designed to maintain a constant draft in a vented heater.

1.4 “Draft hood” means an external device which performs the same function as an integral draft diverter, as defined in section 1.17 of this appendix.

1.5 “Electro-mechanical stack damper” means a type of stack damper which is operated by electrical and/or mechanical means.

1.6 “Excess air” means air which passes through the combustion chamber and the vented heater flues in excess of that which is theoretically required for complete combustion.

1.7 “Flue” means a conduit between the flue outlet of a vented heater and the integral draft diverter, draft hood, barometric draft regulator, or vent terminal through which the flue gases pass prior to the point of draft relief.

1.8 “Flue damper” means a device installed between the furnace and the integral draft diverter, draft hood, barometric draft regulator, or vent terminal which is not equipped with a draft control device, designed to open the venting system when the appliance is in operation and to close the venting system when the appliance is in a standby condition.

1.9 “Flue gases” means reaction products resulting from the combustion of a fuel with the oxygen of the air, including the inerts and any excess air.

1.10 “Flue losses” means the sum of sensible and latent heat losses above room temperature of the flue gases leaving a vented heater.

1.11 “Flue outlet” means the opening provided in a vented heater for the exhaust of the flue gases from the combustion chamber.

1.12 “Heat input” \( (Q_{in}) \) means the rate of energy supplied in a fuel to a vented heater operating under steady-state conditions, expressed in Btu’s per hour. It includes any input energy to the pilot light and is obtained by multiplying the measured rate of fuel consumption by the measured higher heating value of the fuel.

1.13 “Heating capacity” \( (Q_{out}) \) means the rate of useful heat output from a vented heater, operating under steady-state conditions, expressed in Btu’s per hour. For room and wall heaters, it is obtained by multiplying the “heat input” \( (Q_{in}) \) by the steady-state efficiency \( (\eta_{ss}) \) divided by 100. For floor furnaces, it is obtained by multiplying \( (A) \) the “heat input” \( (Q_{in}) \) by \( (B) \) the steady-state efficiency divided by 100, minus the quantity \( (L_{j}) \) divided by 100, where \( L_{j} \) is the jacket loss as determined in section 3.2 of this appendix.

1.14 “Higher heating value” \( (HHV) \) means the heat produced per unit of fuel when complete combustion takes place at constant pressure and the products of combustion are cooled to the initial temperature of the fuel and air and when the water vapor formed during combustion is condensed. The higher heating value is usually expressed in Btu’s per pound, Btu’s per cubic foot for gaseous fuel, or Btu’s per gallon for liquid fuel.

1.15 “Induced draft” means a method of drawing air into the combustion chamber by mechanical means.

1.16 “Infiltration parameter” means that portion of unconditioned outside air drawn into the heated space as a consequence of loss of conditioned air through the exhaust system of a vented heater.

1.17 “Integral draft diverter” means a device which is an integral part of a vented heater, designed to: (1) Provide for the exhaust of the products of combustion in the event of no draft, back draft, or stoppage beyond the draft diverter, (2) prevent a back draft from entering the vented heater, and (3) neutralize the stack action of the chimney or gas vent upon the operation of the vented heater.

1.18 “Manually controlled vented heaters” means either gas or oil fueled vented heaters equipped without thermostats.

1.19 “Modulating control” means either a step-modulating or two-stage control.

1.20 “Power burner” means a vented heater burner which supplies air for combustion at a pressure exceeding atmospheric pressure, or a burner which depends on the draft induced by a fan incorporated in the furnace for proper operation.

1.21 “Reduced heat input rate” means the factory adjusted lowest reduced heat input rate for vented home heating equipment equipped with either two stage thermostats or step-modulating thermostats.

1.22 “Single stage thermostat” means a thermostat that cycles a burner at the maximum heat input rate and off.

1.23 “Stack” means the portion of the exhaust system downstream of the integral draft diverter, draft hood or barometric draft regulator.

1.24 “Stack damper” means a device installed downstream of the integral draft diverter, draft hood, or barometric draft regulator, designed to open the venting system when the appliance is in operation and to
close off the venting system when the appliance is in the standby condition.

1.25 “Stack gases” means the flue gases combined with dilution air that enters at the draft diverter, draft hood or barometric draft regulator.

1.26 “Steady-state conditions for vented home heating equipment” means equilibrium conditions as indicated by temperature variations of not more than 5 °F (2.8°C) in the flue gas temperature for units equipped with draft hoods, barometric draft regulators or direct vent systems, in three successive readings taken 15 minutes apart or not more than 3 °F (1.7°C) in the stack gas temperature for units equipped with integral draft diverters in three successive readings taken 15 minutes apart.

1.27 “Step-modulating control” means a control that either cycles on and off at the low input if the heating load is light, or gradually, increases the heat input to meet any higher heating load that cannot be met with the low firing rate.

1.28 “Thermal stack damper” means a type of stack damper which is dependent for operation exclusively upon the direct conversion of thermal energy of the stack gases into movement of the damper plate.

1.29 “Two stage control” means a control that either cycles a burner at the reduced heat input rate and off or cycles a burner at the maximum heat input rate and off.

1.30 “Vaporizing-type oil burner” means a device with an oil vaporizing bowl or other receptacle designed to operate by vaporizing liquid fuel oil by the heat of combustion and mixing the vaporized fuel with air.

1.31 “Vent/air intake terminal” means a device which is located on the outside of a building and is connected to a vented heater by a system of conduits. It is composed of an air intake terminal through which the air for combustion is taken from the outside atmosphere and a vent terminal from which flue gases are discharged.

1.32 “Vent limiter” means a device which limits the flow of air from the atmospheric diaphragm chamber of a gas pressure regulator to the atmosphere. A vent limiter may be a limiting orifice or other limiting device.

1.33 “Vent pipe” means the passages and conduits in a direct vent system through which gases pass from the combustion chamber to the outdoor air.

2.0 Testing conditions.

2.1 Installation of test unit.

2.1.2 Vented floor furnaces. Install vented floor furnaces for test as specified in sections 35.1 through 35.5 of UL–729–1976.

2.1.3 Vented room heaters. Install in accordance with manufacturer’s instructions.

2.1.4 Flue and stack requirements.

2.2.1 Gas fueled vented home heating equipment employing integral draft diverters and draft hoods (excluding direct vent systems). Attach to, and vertically above the outlet of gas fueled vented home heating equipment employing draft diverters or draft hoods with vertically discharging outlets, a five (5) foot long test stack having a cross sectional area the same size as the draft diverter outlet.

Attach to the outlet of vented heaters having a horizontally discharging draft diverter or draft hood outlet a 90 degree elbow, and a five (5) foot long vertical test stack. A horizontal section of pipe may be used on the floor furnace between the diverter and the elbow if necessary to clear any framing used in the installation. Use the minimum length of pipe possible for this section. Use stack, elbow, and horizontal section with same cross sectional area as the diverter outlet.

2.2.2 Oil fueled vented home heating equipment (excluding direct vent systems). Use flue connections for oil fueled vented floor furnaces as specified in section 35 of UL 729–1976, sections 34.10 through 34.18 of UL 730–1974 for oil fueled vented wall furnaces and sections 36.2 and 36.3 of UL 896–1973 for oil fueled vented room heaters.

2.2.3 Direct vent systems. Have the exhaust/air intake system supplied by the manufacturer in place during all tests. Test units intended for installation with a variety of vent pipe lengths with the minimum length recommended by the manufacturer. Do not connect a heater employing a direct vent system to a chimney or induced draft source. Vent the gas solely on the provision for venting incorporated in the heater and the vent/air intake system supplied with it.

2.3 Fuel supply.

2.3.1 Natural gas. For a vented heater utilizing natural gas, maintain the gas supply to the unit under test at a normal inlet test pressure immediately ahead of all controls at 7 to 10 inches water column. Maintain the regulator outlet pressure at normal test pressure approximately at that recommended by the manufacturer. Use natural gas having a specific gravity of approximately 0.65 and a higher heating value within ±5 percent of 1,025 Btu’s per standard cubic foot. Determine the actual higher heating value in Btu’s per standard cubic foot for the natural gas to be used in the test with an error no greater than one percent.

2.3.2 Propane gas. For a vented heater utilizing propane gas, maintain the gas supply
Department of Energy
Pt. 430, Subpt. B, App. O

For gas fueled heaters with modulating controls adjust the controls to operate the heater at the maximum fuel input rate. Set the thermostat control to the maximum setting. Start the heater by turning the safety control valve to the "on" position. In order to prevent modulation of the burner at maximum input, place the thermostat sensing element in a temperature control bath which is held at a temperature below the maximum set point temperature of the control. For gas fueled heaters with modulating controls adjust the controls to operate the heater at the reduced fuel input rate. Set the thermostat control to the minimum setting. Start the heater by turning the safety control valve to the "on" position. If ambient test room temperature is above the lowest control set point temperature, initiate burner operation by placing the thermostat sensing element in a temperature control bath that is held at a temperature below the minimum set point temperature of the control.

2.4.2 Oil burner adjustments. Adjust the burners of oil fueled vented heaters to give the CO reading recommended by the manufacturer and an hourly Btu input, during the steady-state performance test described below, which is within ±2 percent of the heater manufacturer's specified normal hourly Btu input rating. On units employing a power burner, the smoke in the flue shall be class No. 1 smoke during the steady-state performance test as measured by the procedure in ANSI Standard Z21.182-1965 (R1971) (ASTM D 2156–65 (1970)). If, on units employing a power burner, the smoke in the flue exceeds a No. 1 smoke during the steady-state performance test, readjust the burner to give a lower smoke reading, and, if necessary a lower CO reading, and start all tests over. Maintain the average draft over the fire and in the flue during the steady-state performance test at that recommended by the manufacturer within ±0.005 inches of water gauge. Do not make additional adjustments to the burner during the required series of performance tests. The instruments and measuring apparatus for this test are described in section 6.3 of ANSI standard Z91.1–1972.

2.5 Circulating air adjustments.

2.5.1 Forced air vented wall furnaces (including direct vent systems). During tests maintain the air flow through the heater as specified by the manufacturer and operate the vented heater with the outlet air temperature between 80°F and 130°F above room temperature. If adjustable air discharge registers are provided, adjust them so as to provide the maximum possible air restriction. Measure air discharge temperature as specified in section 2.14 of ANSI Z21.49–1975.

2.5.2 Fan type vented room heaters and floor furnaces. During tests on fan type furnaces and heaters, adjust the air flow through the heater as specified by the manufacturer. If adjustable air discharge registers are provided, adjust them to provide the maximum possible air restriction.

2.6 Location of temperature measuring instrumentation.
2.6.1 Gas fueled vented home heating equipment (including direct vent systems). For units employing an integral draft diverter, install nine thermocouples, wired in parallel, in a horizontal plane located one foot from the test stack inlet. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple in the center of the pipe and eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the pipe and the pipe wall.

For units which employ a draft hood or units which employ a direct vent system which does not significantly preheat the incoming combustion air, install nine thermocouples, wired in parallel, in a horizontal plane located within 12 inches (304.8 mm) of the heater outlet and upstream of the draft hood on units so equipped. Locate one thermocouple in the center of the pipe and eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the pipe and the pipe wall.

Use bead-type thermocouples having a wire size not greater than No. 24 AWG. If there is a possibility that the thermocouples could receive direct radiation from the fire, install radiation shields on the fire side of the thermocouples only and position the shields so that they do not touch the thermocouple junctions.

Install thermocouples for measuring the conditioned warm air temperature as described in sections 35.12 through 35.17 of UL 730–1974. Establish the temperature of the inlet air by means of a single No. 24 AWG bead-type thermocouple, suitably shielded from direct radiation and located in the center of the plane of each inlet air opening.

2.7 Combustion measurement instrumentation. Analyze the samples of stack and flue gases for vented heaters to determine the concentration by volume of carbon dioxide present in the dry gas with instrumentation which will result in a reading having an accuracy of ±0.1 percentage points.

2.8 Energy flow instrumentation. Install one or more instruments, which measure the rate of gas flow or fuel oil supplied to the vented heater, and if appropriate, the electrical energy with an error no greater than one percent.

2.9 Room ambient temperature. During the time period required to perform all the testing and measurement procedures specified in section 3.0 of this appendix, maintain the room temperature within ±5 °F (±2.8°C) of the value T_{R.A.} measured during the steady-state performance test. At no time during these tests shall the room temperature exceed 100 °F (37.8°C) or fall below 65 °F (18.3°C).

Temperature (T_{R.A.}) shall be the arithmetic average temperature of the test area, determined by measurement with four No. 24 AWG bead-type thermocouples with junctions shielded against radiation, located approximately at 90-degree positions on a circle circumscribing the heater or heater enclosure under test, in a horizontal plane approximately at the vertical midpoint of the appliance or test enclosure, and with the junctions approximately 24 inches from sides of the heater or test enclosure and located so as not to be affected by other than room air. Locate a thermocouple at each elevation of draft relief inlet opening and combustion air.

dicular to the axis of the flue pipe. Locate this plane at the position shown in Figure 34.4 of UL 730-1974, or Figures 35.1 and 35.2 of UL 729-1976 for a single thermocouple, except that on direct vent systems which significantly preheat the incoming combustion air, it shall be located within 6 inches (152.5 mm) of the outlet of the vent/air intake terminal. Locate one thermocouple in the center of the flue pipe and eight thermocouples along imaginary lines intersecting at right angles in this plane at points one third and two thirds of the distance between the center of the pipe and pipe wall.

For units which employ a draft hood or units which employ a direct vent system which does not significantly preheat the incoming combustion air, install nine thermocouples, wired in parallel, in a horizontal plane parallel to and located one foot from the test stack inlet. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane located within 12 inches (304.8 mm) of the outlet of the vent/air intake terminal. Locate one thermocouple in the center of the stack. Locate at least one thermocouple at the center of each flue way exiting the heat exchanger.

Install one thermocouple in the center of the pipe and eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at the position shown in Figure 730-1976 for a single thermocouple, except that on direct vent systems which significantly preheat the incoming combustion air, it shall be located within 6 inches (152.5 mm) of the outlet of the vent/air intake terminal. Locate one thermocouple in the center of the flue pipe and eight thermocouples along imaginary lines intersecting at right angles in this plane at points one third and two thirds of the distance between the center of the pipe and pipe wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.

For units which employ a direct vent system, locate at least one thermocouple at the center of each flue way exiting the test stack. Equalize the length of all thermocouple leads before paralleling. Locate one thermocouple at the center of the stack. Locate eight thermocouples along imaginary lines intersecting at right angles in this horizontal plane at points one third and two thirds of the distance between the center of the stack and the stack wall.
inlet opening at a distance of approximately 24 inches from the inlet openings. The temperature of the air for combustion and the air for draft relief shall not differ more than \( \pm 5 ^\circ F \) from room temperature as measured above.

2.10 Equipment used to measure mass flow rate in flue and stack. The tracer gas chosen for this task should have a density which is less than or approximately equal to the density of air. Use a gas unreactive with the environment to be encountered. Using instrumentation of either the batch or continuous type, measure the concentration of tracer gas with an error no greater than 2 percent of the value of the concentration measured.

3.0 Testing and measurements.

3.1 Steady-state testing.

3.1.1 Gas fueled vented home heating equipment (including direct vent systems). Set up the vented heater as specified in sections 2.1, 2.2, and 2.3 of this appendix. The draft diverter shall be in the normal open condition and the stack shall not be insulated. (Insulation of the stack is no longer required for the vented heater test.) Begin the steady-state performance test by operating the burner and the circulating air blower, on units so equipped, with the adjustments specified by sections 2.4.1 and 2.5 of this appendix, until steady-state conditions are attained as indicated by a temperature variation of not more than 3 °F (1.7 °C) in the stack gas temperature for vented heaters equipped with draft diverters or 5 °F (2.8 °C) in the flue gas temperature for vented heaters equipped with either draft hoods or direct vent systems; in three successive readings taken 15 minutes apart.

On units employing draft diverters, measure the room temperature \( T_{\text{RA}} \) as described in section 2.9 of this appendix and measure the steady-state stack gas temperature \( T_{\text{SS}} \) using the nine thermocouples located in the 5-foot test stack as specified in section 2.6.1 of this appendix. Secure a sample of the stack gases in the plane where \( T_{\text{SS}} \) is measured or within 3.5 feet downstream of this plane. Determine the concentration by volume of carbon dioxide \( X_{\text{CO}_2} \) present in the dry stack gas. If the location of the gas sampling differs from the temperature measurement plane, there shall be no air leaks through the stack between these two locations.

On units employing draft hoods or direct vent systems, measure the room temperature \( T_{\text{RH}} \) as described in section 2.9 of this appendix and measure the steady-state flue gas temperature \( T_{\text{SS}} \), using the nine thermocouples located in the flue pipe as described in section 2.6.1 of this appendix. Secure a sample of the flue gas in the plane of temperature measurement and determine the concentration by volume of CO\(_2\) \( X_{\text{CO}_2} \) present in dry flue gas. In addition, for units employing draft hoods, secure a sample of the stack gas in a horizontal plane in the five test stack located one foot from the test stack inlet; and determine the concentration by volume of CO\(_2\) \( X_{\text{CO}_2} \) present in dry stack gas.

Determine the steady-state heat input rate \( Q_{\text{in}} \) including pilot gas by multiplying the measured higher heating value of the test gas by the steady-state gas input rate corrected to standard conditions of 60 °F and 30 inches of mercury. Use measured values of gas temperature and pressure at the meter and the barometric pressure to correct the metered gas flow rate to standard conditions.

After the above test measurements have been completed on units employing draft diverters, secure a sample of the flue gases at the exit of the heat exchanger(s) and determine the concentration of CO\(_2\) \( X_{\text{CO}_2} \) present. In obtaining this sample of flue gas, move the sampling probe around or use a sample probe with multiple sampling ports in order to assure that an average value is obtained for the CO\(_2\) concentration. For units with multiple heat exchanger outlets, measure the CO\(_2\) concentration in a sample from each outlet to obtain the average CO\(_2\) concentration for the unit. A manifold (parallel connected sampling tubes) may be used to obtain this sample.

For manually controlled gas fueled vented heaters equipped with either two stage thermostats or step-modulating thermostats, determine the steady-state efficiency at the maximum fuel input rate, as specified in section 2.4.1 of this appendix, and at the reduced fuel input rate, as specified in section 2.4.1 of this appendix.

For gas fueled vented heaters, with various input rates determine the steady-state efficiency at a fuel input rate that is within ±5 percent of 50 percent of the maximum fuel input rate. If the heater is designed to use a control that precludes operation at other than maximum output (single firing rate) determine the steady state efficiency at the maximum input rate only.

3.1.2 Oil fueled vented home heating equipment (including direct vent systems). Set up and adjust the vented heater as specified in sections 2.1, 2.2, and 2.3.4 of this appendix. Begin the steady-state performance test by operating the burner and the circulating air blower, on units so equipped, with the adjustments specified by sections 2.4.2 and 2.5 of this appendix until steady-state conditions are attained as indicated by a temperature variation of not more than 5 °F (2.8 °C) in the flue gas temperature in three successive readings taken 15 minutes apart.

325
Do not allow smoke in the flue, for units equipped with power burners, to exceed a No. 1 smoke during the steady-state performance test as measured by the procedure described in 10 CFR Part 430, Appendix O (ASTM D 2156-65 (1970)). Maintain the average draft over the fire and in the breeching during the steady-state performance test at that recommended by the manufacturer ±0.005 inches of water gauge.

Measure the room temperature (T<sub>r</sub>) as described in section 2.9 of this appendix and measure the steady-state flue gas temperature (T<sub>exit</sub>) using nine thermocouples located in the flue pipe as described in section 2.6.2 of this appendix. Secure a sample of the flue gas in the plane of temperature measurement and determine the concentration by volume of CO<sub>2</sub> present in dry flue gas. Measure and record the steady-state heat input rate (Q<sub>s</sub>).

For manually controlled oil fueled vented heaters, determine the steady-state efficiency at a fuel input rate that is within 15 percent of 50 percent of the maximum fuel input rate.

3.1.3 Auxiliary Electric Power Measurement.

Allow the auxiliary electrical system of a gas or oil vented heater to operate for at least five minutes before recording the maximum auxiliary electric power measurement from the wattmeter. Record the maximum electric power (P<sub>a</sub>) expressed in kilowatts. For vented heaters with modulating controls, the recorded (P<sub>a</sub>) shall be maximum measured electric power multiplied by the following factor (R). For two stage controls, R=1.3. For step modulating controls, R=1.4 when the ratio of minimum-to-maximum fuel input is greater than or equal to 0.7, R=1.7 when the ratio of minimum-to-maximum fuel input is less than 0.7 and greater than or equal to 0.5, and R=2.2 when the ratio of minimum-to-maximum fuel input is less than 0.5.

3.2 Jacket Loss Measurement. Conduct a jacket loss test for vented floor furnaces. Measure the jacket loss (L<sub>j</sub>) in accordance with the ANSI standard 22.48-1976 section 2.12.

3.3 Measurement of the off-cycle losses for vented heaters equipped with thermal stack dampers. Install the thermal stack damper according to the manufacturer’s instructions. Unless specified otherwise, the thermal stack damper should be at the draft diverter exit collar. Attach a five foot length of bare stack to the outlet of the damper. Install thermocouples as specified in section 2.6.1 of this appendix.

For vented heaters equipped with single stage thermostats, measure the off-cycle losses in the maximum fuel input rate. For vented heaters equipped with two stage thermostats, measure the off-cycle losses at the maximum fuel input rate and at the reduced fuel input rate. For vented heaters equipped with step-modulating thermostats, measure the off-cycle losses at the reduced fuel input rate.

Let the vented heater heat up to a steady-state condition. Feed a tracer gas at a constant metered rate into the stack directly above and within one foot above the stack damper. Record tracer gas flow rate and temperature. Measure the tracer gas concentration in the stack at several locations in a horizontal plane through a cross section of the stack at a point sufficiently above the stack damper to ensure that the tracer gas is well mixed in the stack.

Continuously measure the tracer gas concentration and temperature during a 10 minute cool down period. Shut the burner off and immediately begin measuring tracer gas concentration in the stack, stack temperature, room temperature, and barometric pressure. Record these values as the mid-point of each one-minute interval between burner shut down and ten minutes after burner shut down. Meter response time and sampling delay time shall be considered in timing these measurements.

3.4 Measurement of the effectiveness of electro-mechanical stack dampers. For vented heaters equipped with electro-mechanical stack dampers, measure the cross sectional area of the stack (A<sub>s</sub>), the net area of the damper plate (A<sub>d</sub>), and the angle that the damper plate makes when closed with a plane perpendicular to the axis of the stack (θ). The net area of the damper plate means the area of the damper plate minus the area of any holes through the damper plate.

3.5 Pilot light measurement.

3.5.1 Measure the energy input rate to the pilot light (Q<sub>p</sub>) with an error no greater than 3 percent for vented heaters so equipped.

3.5.2 For manually controlled heaters where the pilot light is designed to be turned off by the user when the heater is not in use, that is, turning the control to the OFF position will shut off the gas supply to the burner(s) and to the pilot light, the measurement of Q<sub>p</sub> is not needed. This provision applies only if an instruction to turn off the unit is provided on the heater near the gas control valve (e.g. by label) by the manufacturer.

3.6 Optional procedure for determining D<sub>r</sub>, D<sub>f</sub> and D<sub>s</sub> for systems for all types of vented heaters. For all types of vented heaters, D<sub>r</sub>, D<sub>f</sub> and D<sub>s</sub> can be measured by the following optional cool down test.

Conduct a cool down test by letting the unit heat up until steady-state conditions are reached, as indicated by temperature variation of not more than 5°F (2.8°C) in the flue gas temperature in three successive readings taken 10 minutes apart, and then shutting the unit off with the stack or flue damper controls by-passed or adjusted so that the stack or flue damper remains open during the resulting cool down period. If a
The steady-state flue gas temperature (T\text{F,SS}) using the procedure described below. Within one minute after the unit is shut off to start the cool down test for determining D\text{F,Off}, begin feeding a tracer gas into the combustion chamber at a constant flow rate of V\text{F,Off}, and at a point which will allow for the best possible mixing with the air flowing through the chamber. (On units equipped with an oil fired power burner, the best location for injecting this tracer gas appears to be through a hole drilled in the air tube.) Periodically measure the value of V\text{F,Off} with an instantaneously reading flow meter having an accuracy of ±3 percent of the quantity measured. Maintain V\text{F,Off} at less than 1 percent of the air flow rate through the furnace. If a combustible tracer gas is used, there should be a delay period between the time the burner gas is shut off and the time the tracer gas is first injected to prevent ignition of the tracer gas.

Between 5 and 6 minutes after the unit is shut off to start the cool down test, measure at the exit of the heat exchanger the average flue gas temperature, T\text{F,Off}. At the same instant, the flue gas temperature is measured, also measure the percent volumetric concentration of tracer gas C\text{F,Off} in the flue gas in the same plane where T\text{F,Off} is determined. Obtain the concentration of tracer gas using an instrument which will result in an accuracy of ±2 percent in the value of C\text{F,Off} measured. If use of a continuous reading type instrument results in a delay time between the drawing of a sample and its analysis, this delay should be taken into account so that the temperature measurement and the measurement of tracer gas concentration coincide. In addition, determine the temperature of the tracer gas entering the flow meter (T\text{F}) and the barometric pressure (P\text{B}). The rate of the flue gas mass flow through the vented heater and the factors D\text{F,Off}, D\text{F,On}, and D\text{F,Off} are calculated by the equations in sections 4.5.1 through 4.5.3 of this appendix.

### 4.1 Calculations

#### 4.1.1 System number

Determine the system number from Table 1 of this section. 4.1.2 Obtained the system number, determine the off-cycle flue gas draft factor (D\text{F}) from Table 1 of this section. 4.1.3 Obtain the system number, determine the off-cycle stack gas draft factor (D\text{S}) from Table 1 of this section. 4.1.4 Pilot fraction. Calculate the pilot fraction (P\text{p}) expressed as a decimal and defined as:

\[
P\text{p} = \frac{Q\text{p}}{Q\text{m}}
\]

where:

\[
Q\text{p} = \text{as defined in 3.5 of this appendix}
\]

\[
Q\text{m} = \text{as defined in 3.1 of this appendix at the maximum fuel input rate}
\]

#### 4.1.5 Jacket loss for floor furnaces

Determine the jacket loss (L\text{J}) expressed as a percent and measured in accordance with section 3.2 of this appendix. For other vented heaters L\text{J} = 0.0.

#### 4.1.6 Latent heat loss

Based on the fuel, obtain the latent heat loss (L\text{CO2}) from Table 2 of this appendix.

#### 4.1.7 Ratio of combustion air mass flow rate to stoichiometric air mass flow rate

Determine the ratio of combustion air mass flow rate to stoichiometric air mass flow rate (R\text{CO2}) and defined as:

\[
R\text{CO2} = \frac{A + B}{X}\n\]

where:

\[
A = \text{as determined from Table 2 of this appendix}
\]

\[
B = \text{as determined from Table 2 of this appendix}
\]

\[
X = \text{as defined in 3.1 of this appendix}
\]

#### 4.1.8 Ratio of combustion and relief air mass flow rate to stoichiometric air mass flow rate

For vented heaters equipped with either an integral draft diverter or a drafthood, determine the ratio of combustion and relief air mass flow rate to stoichiometric air mass flow rate (R\text{CO2}) and defined as:

\[
R\text{CO2} = \frac{A + B}{X}\n\]

where:

\[
A = \text{as determined from Table 2 of this appendix}
\]

\[
B = \text{as determined from Table 2 of this appendix}
\]

\[
X = \text{as defined in 3.1 of this appendix}
\]

#### 4.1.9 Sensible heat loss at steady-state operation

Determine the sensible heat loss at steady-state operation (L\text{SS,SS}) expressed as a percent and defined as:

\[
L\text{SS,SS} = C(R\text{CO2})(T\text{SS,SS} - T\text{RA})
\]
For vented heaters equipped with either two stage thermostats or with step-modulating thermostats, calculate the steady-state efficiency at the reduced fuel input rate, $\eta_{SS,L}$, expressed in percent and defined as:

$$\eta_{SS,L} = 100 - L_{LA} - L_{SS,A}$$

where:

$L_{LA}$ as defined in 4.1.6 of this appendix
$L_{SS,A}$ as defined in 4.1.9 of this appendix
$L_{SS,H}$ is determined at the reduced fuel input rate

For vented heaters equipped with two stage thermostats, calculate the steady-state efficiency at the maximum fuel input rate, $\eta_{SS,H}$, expressed in percent and defined as:

$$\eta_{SS,H} = 100 - L_{LA} - L_{SS,A}$$

where:

$L_{LA}$ as defined in 4.1.6 of this appendix
$L_{SS,A}$ as defined in 4.1.9 of this appendix
$L_{SS,H}$ is measured at the maximum fuel input rate

For vented heaters equipped with step-modulating thermostats, calculate the weighted-average steady-state efficiency in the modulating mode, $\eta_{SS-MOD}$, expressed in percent and defined as:

$$\eta_{SS-MOD} = \left[ \eta_{SS-H} - \eta_{SS-L} \right] \left[ \frac{T_{C} - T_{OA*}}{T_{C} - 15} \right] + \eta_{SS-L}$$

where:

$\eta_{SS-H}$ as defined in 4.1.10 of this appendix
$\eta_{SS-L}$ as defined in 4.1.10 of this appendix
$T_{OA*}$ is the maximum heat output rate
$T_{C}$ is the balance point temperature which represents a temperature used to apportion the annual heating load between the reduced input cycling mode and either the modulating mode or maximum input cycling mode and is obtained either from Table 3 of this appendix or calculated by the following equation:

$$T_{C} = 65 - ([65 - 15]R)$$

where:

$65$ average outdoor temperature at which a vented heater starts operating
$15$ national average outdoor design temperature for vented heaters
$R$ ratio of reduced to maximum heat output rates, as defined in 4.1.13 of this appendix

4.1.11 Reduced heat output rate. For vented heaters equipped with either two stage thermostats or step-modulating thermostats, calculate the reduced heat output rate ($Q_{red-out}$) defined as:

$$Q_{red-out} = \eta_{SS-L} Q_{red-in}$$

where:

$\eta_{SS-L}$ as defined in 4.1.10 of this appendix
$Q_{red-in}$ is the reduced fuel input rate
$Q_{max-in}$ is the maximum fuel input rate

4.1.12 Maximum heat output rate. For vented heaters equipped with either two stage thermostats or step-modulating thermostats, calculate the maximum heat output rate ($Q_{max-out}$) defined as:

$$Q_{max-out} = \eta_{SS-H} Q_{max-in}$$

where:

$\eta_{SS-H}$ as defined in 4.1.10 of this appendix
$Q_{max-in}$ is the maximum fuel input rate

4.1.13 Ratio of reduced to maximum heat output rates. For vented heaters equipped with
either two stage thermostats or step-modulating thermostats, calculate the ratio of reduced to maximum heat output rates (R) expressed as a decimal and defined as:

\[ R = \frac{Q_{\text{out}}} {Q_{\text{max-out}}} \]

where:

- \( Q_{\text{out}} \) is defined in 4.1.11 of this appendix
- \( Q_{\text{max-out}} \) is defined in 4.1.12 of this appendix

4.1.14 Fraction of heating load at reduced operating mode. For vented heaters equipped with either two stage thermostats or step-modulating thermostats, determine the fraction of heating load at the reduced operating mode (\( X_h \)) expressed as a decimal and listed in Table 3 of this appendix or obtained from Figure 2 of this appendix.

4.1.15 Fraction of heating load at maximum operating mode or noncycling mode. For vented heaters equipped with either two stage thermostats or step-modulating thermostats, determine the fraction of heating load at the maximum operating mode or noncycling mode (\( X_h \)) expressed as a decimal and listed in Table 3 of this appendix or obtained from Figure 2 of this appendix.

4.1.16 Weighted-average steady-state efficiency. For vented heaters equipped with single stage thermostats, the weighted-average steady-state efficiency (\( \eta_{\text{SS-WT}} \)) is equal to \( \eta_{\text{SS}} \), as defined in section 4.1.10 of this appendix. For vented heaters equipped with two stage thermostats, \( \eta_{\text{SS-WT}} \) is defined as:

\[ \eta_{\text{SS-WT}} = X_i \eta_{\text{SS-L}} + X_2 \eta_{\text{SS-H}} \]

where:

- \( X_i \) is defined in 4.1.14 of this appendix
- \( \eta_{\text{SS-L}} \) is defined in 4.1.10 of this appendix
- \( \eta_{\text{SS-H}} \) is defined in 4.1.10 of this appendix

For vented heaters equipped with step-modulating thermostats, \( \eta_{\text{SS-WT}} \) is defined as:

\[ \eta_{\text{SS-WT}} = X_i \eta_{\text{SS-L}} + X_2 \eta_{\text{SS-MOD}} \]

where:

- \( X_i \) is defined in 4.1.14 of this appendix
- \( \eta_{\text{SS-L}} \) is defined in 4.1.10 of this appendix
- \( \eta_{\text{SS-MOD}} \) is defined in 4.1.10 of this appendix

4.1.17 Annual fuel utilization efficiency. Calculate the annual fuel utilization efficiency (AFUE) expressed as percent and defined as:

\[ \text{AFUE} = 0.98 \times \frac{\eta_{\text{SS-WT}} - 1.807 \phi - 1.89 L - 1.29 P - 2.8 I + 1.61} {\text{HHV}} \]

where:

- \( \eta_{\text{SS-WT}} \) is defined in 4.1.16 of this appendix
- \( \phi \) is defined in 4.1.13 of this appendix
- \( L \) is defined in 4.1.14 of this appendix
- \( P \) is defined in 4.1.13 of this appendix
- \( I \) is defined in 4.1.15 of this appendix

4.2 Annual fuel utilization efficiency for gas or oil fueled vented home heating equipment equipped with manual controls. The following procedure determines the annual fuel utilization efficiency for gas or oil fueled vented home heating equipment equipped with manual controls.

4.2.1 Average ratio of stack gas mass flow rate to flue gas mass flow rate at steady-state operation. For vented heaters equipped with either direct vents or direct exhaust or are outdoor units, the average ratio of stack gas mass flow rate to flue gas mass flow rate at steady-state operation (\( S/F \)) shall be equal to unity. (\( S/F = 1 \)) For all other types of vented heaters, calculate (\( S/F \)) defined as:

\[ S/F = 1.3 R_T X_f / R_T F \]

where:

- \( R_T \) is defined in 4.1.18 of this appendix with \( X_f \) measured at 50% fuel input rate
- \( R_T F \) is defined in 4.1.17 of this appendix with \( X_f \) measured at 50% fuel input rate

4.2.2 Multiplication factor for infiltration loss during burner on-cycle. Calculate the multiplication factor for infiltration loss during burner on-cycle (\( K_{\text{LON}} \)) defined as:

\[ K_{\text{LON}} = 100 \times (S/F) \times (0.7/1 + R_T X_f / R_T F) / \text{HHV} \]

where:

- 100 converts a decimal fraction into a percent
- 0.24 = specific heat of air
- \( A/F \) = stoichiometric air/fuel ratio, determined in accordance with Table 2 of this appendix
- \( S/F \) is defined in 4.2.1 of this appendix at 50 percent of rated maximum fuel input
- 0.7 = infiltration parameter
- \( R_T \) is defined in 4.1.18 of this appendix
- \( X_f \) is defined in 4.1.17 of this appendix
- \( \text{HHV} \) = average higher heating value of the test fuel, determined in accordance with Table 2 of this appendix

4.2.3 On-cycle infiltration heat loss. Calculate the on-cycle infiltration heat loss (\( L_{\text{LON}} \)) expressed as a percent and defined as:

\[ L_{\text{LON}} = K_{\text{LON}} (70-45) \]

where:

- \( K_{\text{LON}} \) is defined in 4.2.2 of this appendix
- 70 = average indoor temperature
- 45 = average outdoor temperature

4.2.4 Weighted-average steady-state efficiency. 4.2.4.1 For manually controlled heaters with various input rates the weighted average steady-state efficiency (\( \eta_{\text{SS-WR}} \)) is determined as follows:

1. At 50 percent of the maximum fuel input rate as measured in either section 3.1.1 of this appendix for manually controlled gas vented heaters or section 3.1.2 of this appendix for manually controlled oil vented heaters, or
2. At the minimum fuel input rate as measured in either section 3.1.1 to this appendix for manually controlled gas vented heaters or section 3.1.2 to this appendix for...
manually controlled oil vented heaters if the design of the heater is such that the ±5 percent of 50 percent of the maximum fuel input rate cannot be set, provided this minimum rate is no greater than 2/3 of maximum input rate of the heater.

4.2.4.2 For manually controlled heater with one single firing rate the weighted average steady-state efficiency is the steady-state efficiency measured at the single firing rate.

4.2.5 Part-load fuel utilization efficiency. Calculate the part-load fuel utilization efficiency ($h_u$) expressed as a percent and defined as:

$$ h_u = \frac{h_{SS-WT}}{L_{I,ON}} $$

where:

- $h_{SS-WT}$ as defined in 4.2.4 of this appendix
- $L_{I,ON}$ as defined in 4.2.3 of this appendix

4.2.6 Annual Fuel Utilization Efficiency.

4.2.6.1 For manually controlled vented heaters, calculate the AFUE expressed as a percent and defined as:

$$ \text{AFUE} = \frac{2.950 \eta_{SS} \eta_u Q_{in-max}}{2.950 \eta_{SS} + 2.083(4,600) \eta_u Q_P} $$

where:

- 2,950 = average number of heating degree days
- $\eta_{SS}$ as defined as $\eta_{SS-WT}$ in 4.2.4 of this appendix
- $Q_{in-max}$ as defined as $Q_{in}$ at the maximum fuel input rate, as defined in 3.1 of this appendix
- 4,600 = average number of non-heating season hours per year
- $Q_P$ as defined in 3.5 of this appendix
- 65 = degree day base temperature, °F
- 15 = national average outdoor design temperature for vented heaters as defined in section 4.1.10 of this appendix
- 24 = number of hours in a day

4.2.6.2 For manually controlled vented heaters where the pilot light can be turned off by the user when the heater is not in use as described in section 3.5.2, calculate the AFUE expressed as a percent and defined as:

$$ \text{AFUE} = \frac{2.950 \eta_{SS} \eta_u Q_{in-max}}{2.950 \eta_{SS} + 2.083(4,600) \eta_u Q_P} $$

where:

- $\eta_u$ as defined in section 4.2.5 of this appendix
- $\eta_{SS}$ as defined as $\eta_{SS-WT}$ in 4.2.4 of this appendix

4.3 Annual fuel utilization efficiency by the tracer gas method. The annual fuel utilization efficiency shall be determined by the following tracer gas method for all vented heaters equipped with thermal stack dampers. All other types of vented heaters can elect to use the following tracer gas method, as an optional procedure.

4.3.1 On-cycle sensible heat loss. For vented heaters equipped with single stage thermostats, calculate the on-cycle sensible heat loss ($L_{S,SS,A}$) as defined as:

$$ L_{S,SS,A} = X_1 L_{S,SS,A-red} + X_2 L_{S,SS,A-max} $$

where:

- $X_1$ as defined in 4.1.14 of this appendix
- $L_{S,SS,A-red}$ as defined in 4.3.1 of this appendix
- $L_{S,SS,A-max}$ as defined as $L_{S,SS,A}$ in 4.19 of this appendix

For vented heaters with step-modulating thermostats, calculate $L_{S,SS,A}$ as defined as:

$$ L_{S,SS,A} = X_1 L_{S,SS,A-red} + X_2 L_{S,SS,A-avg} $$

where:

- $X_1$ as defined in 4.1.14 of this appendix
- $X_2$ as defined in 4.1.15 of this appendix
- $L_{S,SS,A-avg}$ average sensible heat loss for step-modulating vented heaters operating in the modulating mode

$$ L_{S,SS,A-avg} = \left[ L_{S,SS,A-max} - L_{S,SS,A-red} \right] \left[ \frac{T_C - T_{OA}}{TC - 15} \right] + L_{S,SS,A-red} $$
where:

\( L_{S,SS,A-avg} \) = as defined in 4.3.1 of this appendix

\( T_{c} \) = as defined in 4.1.10 of this appendix

\( T_{OA*} \) = as defined in 4.1.10 of this appendix

\( T \) = as defined in 4.2.3 of this appendix

\( 15 = as defined in 4.2.3 of this appendix

4.3.2 On-cycle infiltration heat loss. For vented heaters equipped with single stage thermostats, calculate the on-cycle infiltration heat loss \( L_{I,ON} \) expressed as a percent and defined as:

\[ L_{I,ON} = K_{I,ON}(70 - 45) \]

where:

\( K_{I,ON} \) = as defined in 4.2.2 of this appendix

\( 70 = as defined in 4.2.3 of this appendix

\( 45 = as defined in 4.2.3 of this appendix

For vented heaters equipped with two stage thermostats, calculate \( L_{I,ON} \) defined as:

\[ L_{I,ON} = X_{1}K_{I,ON\text{-max}}(70 - T_{OA*}) + X_{2}K_{I,ON\text{-red}}(70 - T_{OA}) \]

where:

\( X_{1} = as defined in 4.1.14 of this appendix

\( K_{I,ON\text{-max}} = as defined as K_{I,ON} in 4.2.2 of this appendix at the maximum heat input rate

\( 70 = as defined in 4.2.3 of this appendix

\( T_{OA*} = as defined in 4.3.4 of this appendix

\( K_{I,ON\text{-red}} = as defined as K_{I,ON} in 4.2.2 of this appendix at the minimum heat input rate

\( T_{OA} = as defined in 4.3.4 of this appendix

\( X_{2} = as defined in 4.1.15 of this appendix

4.3.3 Off-cycle sensible heat loss. For vented heaters equipped with single stage thermostats, calculate the off-cycle sensible heat loss \( L_{S,OFF} \) at the maximum fuel input rate. For vented heaters equipped with step-modulating thermostats, calculate \( L_{S,OFF} \) defined as:

\[ L_{S,OFF} = X_{1}L_{S,OFF\text{-red}} \]

where:

\( X_{1} = as defined in 4.1.14 of this appendix

\( L_{S,OFF\text{-red}} = as defined as L_{S,OFF} in 4.3.3 of this appendix at the reduced fuel input rate

For vented heaters equipped with two stage thermostats, calculate \( L_{S,OFF} \) defined as:

\[ L_{S,OFF} = X_{1}L_{S,OFF\text{-red}} + X_{2}L_{S,OFF\text{-max}} \]

where:

\( X_{1} = as defined in 4.1.14 of this appendix

\( L_{S,OFF\text{-red}} = as defined as L_{S,OFF} in 4.3.3 of this appendix at the reduced fuel input rate

\( X_{2} = as defined in 4.1.15 of this appendix

\( L_{S,OFF\text{-max}} = as defined as L_{S,OFF} in 4.3.3 of this appendix at the maximum fuel input rate

Calculate the off-cycle sensible heat loss \( L_{S,OFF} \) expressed as a percent and defined as:

\[ L_{S,OFF} = \frac{100(0.24)}{Q_{in}t_{on}} \sum m_{S,OFF}(T_{S,OFF} - T_{RA}) \]

where:

\( 100 = \) conversion factor for percent

\( 0.24 = \) specific heat of air in Btu per pound – °F

\( Q_{in} = \) fuel input rate, as defined in 3.1 of this appendix in Btu per minute (as appropriate for the firing rate)

\( t_{on} = \) average burner on-time per cycle and is 20 minutes

\( \sum m_{S,OFF}(T_{S,OFF} - T_{RA}) = \) summation of the twenty values of the quantity.

\( m_{S,OFF}(T_{S,OFF} - T_{RA}), measured in accordance with 3.3 of this appendix

\( m_{S,OFF} = stack gas mass flow rate pounds per minute

\( m_{S,OFF} = \frac{1.325P_{B}V_{L}(100 - C_{L})}{C_{T}(T_{L} + 460)} \)

\( T_{S,OFF} = stack gas temperature measured in accordance with 3.3 of this appendix
332

4.3.4 Average outdoor temperature. For vented heaters equipped with single stage thermostats, the average outdoor temperature \( T_{OA} \) is 45°F. For vented heaters equipped with either two stage thermostats or step-modulating thermostats, \( T_{OA} \) during the reduced operating mode is obtained from Table 3 or Figure 1 of this appendix. For vented heaters equipped with two stage thermostats, \( T_{OA} \) during the maximum operating mode is obtained from Table 3 or Figure 1 of this appendix.

4.3.5 Off-cycle infiltration heat loss. For vented heaters equipped with single stage thermostats, calculate the off-cycle infiltration heat loss \( L_{I,OFF} \) at the maximum fuel input rate. For vented heaters equipped with step-modulating thermostats, calculate \( L_{I,OFF} \) defined as:

\[
L_{I,OFF} = X_1 L_{I,OFF,red} + X_2 L_{I,OFF,max}
\]

where:

- \( X_1 \) as defined in 4.1.14 of this appendix
- \( X_2 \) as defined in 4.1.15 of this appendix
- \( L_{I,OFF,red} \) as defined in 4.3.3 of this appendix at the reduced fuel input rate
- \( L_{I,OFF,max} \) as defined as \( L_{I,OFF} \) in 4.3.3 of this appendix at the maximum fuel input rate

Calculate the off-cycle infiltration heat loss \( L_{I,OFF} \) expressed as a percent and defined as:

\[
\text{Percent} = \left( \frac{100}{T_{OA}} \right) \left( 0.24 \right) \left( 0.7 \right) \left( 70 - T_{OA} \right) \sum m_{S,OFF}
\]

where:

- 100 = conversion factor for percent
- 0.24 = specific heat of air in Btu per pound °F
- 1.3 = dimensionless factor for converting laboratory measured stack flow to typical field conditions
- 0.7 = infiltration parameter
- 70 = assumed average indoor air temperature, °F
- \( T_{OA} \) = average outdoor temperature as defined in 4.3.4 of this appendix
- \( Q_{in} \) = fuel input rate, as defined in 3.1 of this appendix in Btu per minute (as appropriate for the firing rate)
- \( t_{on} \) = average burner on-time per cycle and is 20 minutes
- \( \Sigma m_{S,OFF} \) = summation of the twenty values of the quantity, \( m_{S,OFF} \), measured in accordance with 3.3 of this appendix

4.3.6 Part-load fuel utilization efficiency. Calculate the part-load fuel utilization efficiency \( \eta_u \) expressed as a percent and defined as:

\[
\eta_u = 100 - L_{L,A} - C_j L_j \left[ \frac{t_{on}}{t_{on} + P_{F,off}} \right] + \left[ L_{S,ON} + L_{S,OFF} + L_{L,ON} + L_{L,OFF} \right]
\]

where:

- \( C_j = 2.8 \) adjustment factor
- \( L_{L,A} \) = jacket loss as defined in 4.1.5
- \( L_{L,ON} \) = as defined in 4.1.6 of this appendix
- \( L_{L,OFF} \) = as defined in 4.3.3 of this appendix
- \( P_{F,off} \) = as defined in 4.1.4 of this appendix

332
4.37 Annual Fuel Utilization Efficiency.

\[ \text{AFUE} = \frac{2.950 \eta_{SS-WT} \eta_u Q_{in-max}}{2.950 \eta_{SS-WT} Q_{in-max} + 2.083(4.600)\eta_u Q_p} \]

where:

- \( \eta_{SS-WT} \): average number of heating degree days as defined in 4.1.6 of this appendix
- \( \eta_u \): as defined in 4.3.6 of this appendix
- \( Q_{in-max} \): as specified in 4.2.6 of this appendix
- \( Q_p \): as defined in 3.5 of this appendix

4.4 Stack damper effectiveness for vented heaters equipped with electro-mechanical stack dampers. Determine the stack damper effectiveness for vented heaters equipped with electro-mechanical stack dampers (\( D_s \)), defined as:

\[ D_s = 1.62 [1 - A_D \cos \Omega A_s] \]

where:

- \( A_D \): as defined in 3.4 of this appendix
- \( \Omega \): as defined in 3.4 of this appendix
- \( A_s \): as defined in 3.4 of this appendix

4.5 Addition requirements for vented home heating equipment using indoor air for combustion and draft control. For vented home heating equipment using indoor air for combustion and draft control, \( D_s \), as described in section 4.1.2 of this appendix, and \( D_u \), as described in section 4.1.3 of this appendix, shall be determined from Table 1 of this appendix.

4.5.1 Optional procedure for determining \( D_s \) for vented home heating equipment. Calculate the ratio (\( D_o \)) of the rate of flue gas mass flow through the vented heater during the off-period, \( M_{F,off}(T_{F,SS}) \), to the rate of flue gas mass flow during the on-period, \( M_{F,SS}(T_{F,SS}) \), and defined as:

\[ D_o = \frac{M_{F,off}(T_{F,SS})}{M_{F,SS}(T_{F,SS})} \]

For vented heaters in which no draft is maintained during the steady-state or cold down tests, \( M_{F,off}(T_{F,SS}) \) is defined as:

\[ M_{F,off}(T_{F,SS}) = M_{F,off}(T^*_{F,off}) \left[ \frac{T_{F,SS} - T_{RA}}{T^*_{F,off} - T_{RA}} \right]^{0.56} \left[ \frac{T^*_{F,off} + 460}{T_{F,SS} + 460} \right]^{1.19} \]

For oil fueled vented heaters in which an imposed draft is maintained, as described in section 3.6 of this appendix, \( M_{F,off}(T_{F,SS}) \) is defined as:

\[ M_{F,off}(T_{F,SS}) = M_{F,off}(T^*_{F,SS}) \]

where:

- \( T^*_{F,SS} \): as defined in 3.1.1 of this appendix
- \( T_{F,SS} \): flue gas temperature during the off-period measured in accordance with 3.6 of this appendix in degrees Fahrenheit
- \( T_{RA} \): as defined in 2.9 of this appendix

\[ M_{F,off}(T_{F,SS}) = 1.325 P_B V_T \left( 100 - C_T \right) \]

\[ \frac{C_T}{C_T \left( T_T + 460 \right)} \]

where:

- \( P_B \): barometric pressure measured in accordance with 3.6 of this appendix in inches of mercury
- \( V_T \): flow rate of tracer gas through the vented heater measured in accordance with 3.6 of this appendix in cubic feet per minute
- \( C_T \): concentration by volume of tracer gas present in the flue gas sample measured in accordance with 3.6 of this appendix in percent
- \( C_T^* \): concentration by volume of the active tracer gas in the mixture in percent and is 100 when the tracer gas is a single component gas
- \( T_T^* \): the temperature of the tracer gas entering the flow meter measured in accordance with 3.6 of this appendix in degrees Fahrenheit
- \( T_T + 460 \): absolute temperature of the tracer gas entering the flow meter in degrees Rankine
- \( M_{F,SS}(T_{F,SS}) = Q_u [R_T \times (A/F) + 1][60HHV_A] \)
- \( Q_u \): as defined in 3.1 of this appendix
- \( R_T \): as defined in 4.1.7 of this appendix
- \( A/F \): as defined in 4.2.2 of this appendix
- \( HHV_A \): as defined in 4.2.2 of this appendix

4.5.2 Optional procedure for determining off-cycle draft factor for flue gas flow for vented
heaters. For systems numbered 1 thru 10, calculate the off-cycle draft factor for flue gas flow (D_o) defined as:

\[ D_o = D_r = \frac{100,000}{8,760 \times P \times \eta_m} \]

where:

\[ D_r \] as defined in 4.5.1 of this appendix

In this Appendix

4.5.3 Optional procedure for determining off-cycle draft factor for stack gas flow for vented heaters. Calculate the off-cycle draft factor for stack gas flow (D_o) defined as:

\[ D_o = D_r = \frac{100,000}{8,760 \times P \times \eta_m} \]

For systems numbered 11 or 12: D_o = D_r

where:

\[ D_o \] as defined in 4.5.1 of this appendix

For systems numbered 13 or 4: D_o = (D_r + 0.79)/1.4

For systems numbered 7 or 8 and if D_o(S/F) < 0:

\[ D_o = D_r = D_o \times 0.85 \times D_r \]

For systems numbered 7 or 8 and if D_o(S/F) > 1:

\[ D_o = D_r = D_o \times 0.85 \times D_r \]

where:

\[ D_o \] as defined in 4.4 of this appendix

4.6 Annual energy consumption

4.6.1 National average number of burner operating hours. For vented heaters equipped with single stage controls or manual controls, the national average number of burner operating hours (BOH) is defined as:

\[ \text{BOH} = 1,416A \times (DHR - 1,416) \]

where:

1,416 = national average heating load hours for vented heaters based on 2,950 degree days and 15 °F outdoor design temperature

A = 0.0707, adjustment factor to adjust the calculated design heating requirement and heating load hours to the actual heating load experienced by the heating system

DHR = typical design heating requirements based on Q_{inr}, from Table 4 of this appendix

\[ Q_{inr} = \frac{\eta_m}{200} - C_{L/100} \times Q_m \]

L, \text{watt loss as defined in 4.1.5 of this appendix}

C = 0.28, adjustment factor as defined in 4.3.6 of this appendix

\[ \eta_m = \text{steady-state efficiency as defined in 4.11.0 of this appendix} \]

Q_m = as defined in 3.1 of this appendix at the maximum fuel input rate

A = 1.0,000[1.334,300P + (Q_m - Q_v)h_v] + 2,980(Q_v) \cdot A/100,000

100,000 = factor that accounts for per cent and k Btu

P_r = as defined in 3.5 of this appendix

Q_v = as defined in 3.13 of this appendix

\[ \eta_m = \text{as defined in 4.3.6 of this appendix for vented heaters using the tracer gas method, percent} \]

\[ \eta_m = \text{as defined in 4.2.5 of this appendix for manually controlled vented heaters, percent} \]

Two stage or step modulating controls the reduced operating mode is defined:

\[ \text{BOH} = X \times E_{av} \times Q_{red-in} \]

where:

X = as defined in 4.1.14 of this appendix

E_{av} = as defined in 4.11.1 of this appendix

Q_{red-in} = as defined in 3.1 of this appendix at the maximum fuel input rate

Q_v = as defined in 3.5 of this appendix

BOH = as defined in 4.6.1 of this appendix, in which the term P_r, in the factor A is increased by the factor R, which is defined in 3.1.3 of this appendix as:

R = 1.3 for two stage controls

= 1.4 for step modulating controls when the ratio of minimum-to-maximum fuel input is greater than or equal to 0.7

= 1.7 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.7 and greater than or equal to 0.5

= 2.2 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.5

A = 100,000[1.334,300P + (Q_m - Q_v)h_v] + 2,980(Q_v) \cdot A/100,000

8,760 = total number of hours per year

4,600 = as specified in 4.2.6 of this appendix

4.6.2 For vented heaters equipped with two stage or step modulating controls, the national average number of burner operating hours at the maximum operating mode (BOH_{max}) is defined as:

\[ \text{BOH}_{max} = X \times E_{av} \times Q_{in} \]

where:

X = as defined in 4.1.15 of this appendix

E_{av} = as defined in 4.6.1 of this appendix at the maximum fuel input rate

\[ = 2,950 \times \text{AFUE} \times Q_m/(2,950 \times \text{AFUE}(2.083)(4,600)Q_m) \]

For vented heaters equipped without manual controls and without thermal stack dampers and not using the optional tracer gas method, where:

AFUE = as defined in 4.1.17 of this appendix, percent

Q_m = average number of heating degree days as defined in 4.2.6 of this appendix

4,600 = average number of non-heating season hours per year as defined in 4.2.6 of this appendix

2.980(4,160/1,416) = ratio of the average length of the heating season in hours to the average heating load hours

0.075 = as specified in 4.2.6 of this appendix

4.6.1.1 For vented heaters equipped with two stage or step modulating controls, the national average number of burner operating hours at the reduced operating mode is defined as:

\[ \text{BOH}_{red-in} = X \times E_{av} \times Q_{red-in} \]

where:

X = as defined in 4.1.14 of this appendix

E_{av} = as defined in 4.11.1 of this appendix

Q_{red-in} = as defined in 3.1 of this appendix at the maximum fuel input rate

Q_v = as defined in 3.5 of this appendix

BOH = as defined in 4.6.1 of this appendix, in which the term P_r, in the factor A is increased by the factor R, which is defined in 3.1.3 of this appendix as:

R = 1.3 for two stage controls

= 1.4 for step modulating controls when the ratio of minimum-to-maximum fuel input is greater than or equal to 0.7

= 1.7 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.7 and greater than or equal to 0.5

= 2.2 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.5

A = 100,000[1.334,300P + (Q_m - Q_v)h_v] + 2,980(Q_v) \cdot A/100,000

8,760 = total number of hours per year

4,600 = as specified in 4.2.6 of this appendix

4.6.1.2 For vented heaters equipped with

\[ = 2,950 \times \text{AFUE} \times Q_m/(2,950 \times \text{AFUE}(2.083)(4,600)Q_m) \]

For vented heaters equipped without manual controls and without thermal stack dampers and not using the optional tracer gas method, where:

AFUE = as defined in 4.1.17 of this appendix, percent

Q_m = average number of heating degree days as defined in 4.2.6 of this appendix

4,600 = average number of non-heating season hours per year as defined in 4.2.6 of this appendix

2.980(4,160/1,416) = ratio of the average length of the heating season in hours to the average heating load hours

0.075 = as specified in 4.2.6 of this appendix

4.6.1.1 For vented heaters equipped with two stage or step modulating controls, the national average number of burner operating hours at the reduced operating mode is defined as:

\[ \text{BOH}_{red-in} = X \times E_{av} \times Q_{red-in} \]

where:

X = as defined in 4.1.14 of this appendix

E_{av} = as defined in 4.11.1 of this appendix

Q_{red-in} = as defined in 3.1 of this appendix at the maximum fuel input rate

Q_v = as defined in 3.5 of this appendix

BOH = as defined in 4.6.1 of this appendix, in which the term P_r, in the factor A is increased by the factor R, which is defined in 3.1.3 of this appendix as:

R = 1.3 for two stage controls

= 1.4 for step modulating controls when the ratio of minimum-to-maximum fuel input is greater than or equal to 0.7

= 1.7 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.7 and greater than or equal to 0.5

= 2.2 for step modulating controls when the ratio of minimum-to-maximum fuel input is less than 0.5

A = 100,000[1.334,300P + (Q_m - Q_v)h_v] + 2,980(Q_v) \cdot A/100,000

8,760 = total number of hours per year

4,600 = as specified in 4.2.6 of this appendix

4.6.1.2 For vented heaters equipped with two stage or step modulating controls, the national average number of burner operating hours at the maximum operating mode (BOH_{max}) is defined as:

\[ \text{BOH}_{max} = X \times E_{av} \times Q_v \]

where:

X = as defined in 4.1.15 of this appendix

E_{av} = as defined in 4.6.1 of this appendix at the maximum fuel input rate

\[ = 2,950 \times \text{AFUE} \times Q_m/(2,950 \times \text{AFUE}(2.083)(4,600)Q_m) \]

For vented heaters equipped without manual controls and without thermal stack dampers and not using the optional tracer gas method, where:

AFUE = as defined in 4.1.17 of this appendix, percent

Q_m = average number of heating degree days as defined in 4.2.6 of this appendix

4,600 = average number of non-heating season hours per year as defined in 4.2.6 of this appendix

2.980(4,160/1,416) = ratio of the average length of the heating season in hours to the average heating load hours

0.075 = as specified in 4.2.6 of this appendix
Department of Energy  

4.6.2 Average annual fuel energy for gas or oil fueled vented heaters. For vented heaters equipped with single stage controls or manual controls, the average annual fuel energy consumption \( E_F \) is expressed in Btu per year and defined as:

\[
E_F = BOH_{AS} (Q_{AI} - Q_F) + 8,760 Q_F
\]

where:
- \( BOH_{AS} \) = as defined in 4.6.1 of this appendix
- \( Q_{AI} \) = as defined in 3.5 of this appendix
- \( Q_F \) = as defined in 4.6.1 of this appendix

4.6.2.1 For vented heaters equipped with either two stage or step modulating controls \( E_F \) is defined as:

\[
E_F = E_{AE} + 4,600Q_F
\]

where:
- \( E_{AE} \) = as defined in 4.6.1.2 of this appendix
- \( 4,600 \) = as specified 4.2.6 of this appendix
- \( Q_F \) = as defined in 3.5 of this appendix

4.6.3 Average annual auxiliary electrical energy consumption for vented heaters. For vented heaters with single stage controls or manual controls the average annual auxiliary energy consumption \( E_{AE} \) is expressed in kilowatt-hours and defined as:

\[
E_{AE} = BOH_{AS} P_F
\]

where:
- \( BOH_{AS} \) = as defined in 4.6.1 of this appendix
- \( P_F \) = as defined in 3.1.3 of this appendix

4.6.3.1 For vented heaters equipped with two stage or modulating controls \( E_{AE} \) is defined as:

\[
E_{AE} = BOH_{AS} + BOH_{AI} P_F
\]

where:
- \( BOH_{AS} \) = as defined in 4.6.1 of this appendix
- \( BOH_{AI} \) = as defined in 4.6.1 of this appendix
- \( P_F \) = as defined in 3.1.3 of this appendix

4.6.4 Average annual energy consumption for vented heaters located in a different geographic region of the United States and in buildings with different design heating requirements.\( E_{AE} \) is expressed in Btu per year and defined as:

\[
E_{AE} = E_F - 8,760 Q_F (HLH/1,416) + 8,760Q_F
\]

where:
- \( E_F \) = as defined in 4.6.2 of this appendix
- \( 8,760 \) = as specified in 4.6.1 of this appendix
- \( Q_F \) = as defined in 3.5 of this appendix
- \( HLH \) = heating load hours for a specific geographic region determined from the heating load hour map in Figure 3 of this appendix
- \( 1,416 \) = as specified in 4.6.1 of this appendix

4.6.4.1 Average annual fuel energy consumption for gas or oil fueled vented home heaters located in a different geographic region of the United States and in buildings with different design heating requirements. For gas or oil fueled vented heaters the average annual fuel energy consumption for a specific geographic region and a specific typical design heating requirement \( E_{FR} \) is expressed in Btu per year and defined as:

\[
E_{FR} = E_F - 8,760 Q_F (HLH/1,416) + 8,760Q_F
\]

where:
- \( E_F \) = as defined in 4.6.2 of this appendix
- \( 8,760 \) = as specified in 4.6.1 of this appendix
- \( Q_F \) = as defined in 3.5 of this appendix
- \( HLH \) = heating load hours for a specific geographic region determined from the heating load hour map in Figure 3 of this appendix
- \( 1,416 \) = as specified in 4.6.1 of this appendix

4.6.4.2 Average annual auxiliary electrical energy consumption for gas or oil fueled vented home heaters located in a different geographic region of the United States and in buildings with different design heating requirements. For gas or oil fueled vented home heaters the average annual auxiliary electrical energy consumption for a specific geographic region and a specific typical design heating requirement \( E_{AR} \) is expressed in kilowatt-hours and defined as:

\[
E_{AR} = E_{AE} - HLH / 1,416
\]

where:
- \( E_{AE} \) = as defined in 4.6.3 of this appendix
- \( HLH \) = as defined in 4.6.4.1 of this appendix
- \( 1,416 \) = as specified in 4.6.1 of this appendix

*The heat output ratio means the ratio of minimum to maximum heat output rates as defined in 4.1.13.
FIGURE 1
Average Outdoor Air Temperature vs. Balance Point Temperature for Modulating Vented Heaters

This figure is based on 4500 degree-days and 15°F outdoor design temperature.
FIGURE 2
Fraction of Total Annual Heating Load Applicable to Reduced Operating Mode ($X_1$) and to Maximum Operating Mode or Modulating Mode ($X_2$) vs Balance Point Temperature for Modulating Vented Heaters

This figure is based on 4500 degree-days and 15°F outdoor design temperature.
This map is reasonably accurate for most parts of the United States but is necessarily generalized, and consequently not too accurate in mountainous regions, particularly in the rockies.

FIGURE 3- HEATING LOAD HOURS (HLH) FOR THE UNITED STATES
APPENDIX P TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF POOL HEATERS

The measurement of energy consumption for oil-fired pool heaters in Btu is to be carried out in appropriate units, e.g., gallons.

4. Calculations

4.1 Thermal efficiency. Calculate the thermal efficiency, Eₜ, (expressed as a percent), as specified in section 2.9 of ANSI Z21.56–1994.

4.2 Average annual fossil fuel energy for pool heaters. The average annual fossil fuel consumption for pool heater, Eᵢ, is defined as:

\[ Eᵢ = \frac{BOH \times IN \times PE}{100} \]

where:
- BOH = average number of burner operating hours = 4464 h
- POH = average number of pool operating hours = 4614 h
- IN = rated fuel energy input as defined according to 2.9.1 or 2.9.2 of ANSI Z21.56–1994, in Btu/h
- PE = as defined in 4.3 of this appendix

4.3 Average annual auxiliary electrical energy consumption for pool heaters. The average annual auxiliary electrical energy consumption for pool heaters, Eₐₑₐₙ, is expressed in Btu and defined as:

\[ Eₐₑₐₙ = BOH \times PE \]

where:
- PE = nameplate rating of auxiliary electrical equipment of heater, in Watts
- BOH = as defined in 4.2 of this appendix

4.4 Heating seasonal efficiency.

4.4.1 Calculate the seasonal useful output of the pool heater as:

\[ Eₜₛₜₜ = \frac{SOH \times POH \times PE}{100} \]

where:
- SOH = as defined in 4.2 of this appendix
- POH = as defined in 4.3 of this appendix
- PE = as defined in 4.2 of this appendix

4.4.2 Calculate the seasonal input to the pool heater as:

\[ Eᵢₛₜₜ = \frac{SOH \times POH \times PE}{100} \]

4.4.3 Calculate the pool heater heating seasonal efficiency (in percent).

4.4.3.1 For pool heaters employing a continuous pilot light:

\[ EFFYₛₜₜ = \frac{Eᵢₛₜₜ}{Eᵢₜₛₜₜ} \]

where:
- Eᵢₛₜₜ = as defined in 4.4.1 of this appendix
- Eᵢₜₛₜₜ = as defined in 4.4.2 of this appendix

4.4.3.2 For pool heaters without a continuous pilot light:

\[ EFFYₛₜₜ = Eₜₛₜₜ \]

where:
- Eₜₛₜₜ = as defined in 4.1 of this appendix.

APPENDIX Q TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF FLUORESCENT LAMP BALLASTS

1. Definitions

1.1 ANSI Standard means a standard developed by a committee accredited by the American National Standards Institute.

1.2 Ballast input voltage means the rated input voltage of a fluorescent lamp ballast.

1.3 F40T12 lamp means a nominal 40 watt tubular fluorescent lamp which is 48 inches in length and one and a half inches in diameter, and conforms to ANSI Standard C78.81–2003 (Data Sheet 7881–ANSI–1010–1).

1.4 F40T12 lamp means a nominal 110 watt tubular fluorescent lamp that is 96 inches in length and one and a half inches in diameter.
Department of Energy

and conforms to ANSI standard C78.81–2003 (Data Sheet 7881–ANSI–1006–1).

1. F34T12 lamp (also known as a ‘‘F40T12/ES lamp’’) means a nominal 34 watt tubular fluorescent lamp that is 48 inches in length and 1½ inches in diameter, and conforms to ANSI standard C78.81–2003 (Data Sheet 7881–ANSI–1006–1).

1. F9T12/ES lamp means a nominal 60 watt tubular fluorescent lamp that is 96 inches in length and 1½ inches in diameter, and conforms to ANSI standard C78.81–2003 (Data Sheet 7881–ANSI–3006–1).

1.9 Input current means the root-mean-square (RMS) current in amperes delivered to a fluorescent lamp ballast.

1.10 Luminaire means a complete lighting unit consisting of a fluorescent lamp or lamps, together with parts designed to distribute the light, to position and protect such lamps, and to connect such lamps to the power supply through the ballast.

1.11 Nominal lamp watts means the wattage at which a fluorescent lamp is designed to operate.

1.12 Power factor means the power input divided by the product of ballast input voltage and input current of a fluorescent lamp ballast, as measured under test conditions specified in ANSI Standard C–82.2–1984.

1.13 Power input means the power consumption in watts of a ballast and fluorescent lamp or lamps, as determined in accordance with the test procedures specified in ANSI Standard C82.2–1984.

1.14 Relative light output means the light output delivered through the use of a ballast divided by the light output delivered through the use of a reference ballast, expressed as a percent, as determined in accordance with the test procedures specified in ANSI Standard C82.2–1984.

1.15 Residential building means a structure or portion of a structure which provides facilities or shelter for human residency, except that such term does not include any multifamily residential structure of more than three stories above grade.

This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 5. Copies may be obtained from ANSI Publication Sales, 1430 Broadway, New York, NY 10018. Copies may be inspected at the Department of Energy, Freedom of Information Reading Room, Room 1E–100, Fluorescent Lamp Ballasts, Docket No. CE–RM–89–102, 1000 Independence Avenue, SW, Washington DC 20545, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html. Any subsequent amendment to this standard by the standard-setting organization will not affect the DOE test procedures unless and until amended by DOE. The test conditions are described in sections 4, 5, 6, 7, and 21 of ANSI Standard C82.2–1984.

3. Test Method and Measurements.

3.1 The test method for testing fluorescent lamp ballasts shall be done in accordance with ANSI Standard C82.2–1984.

3.2 Instrumentation. The instrumentation shall be as specified by sections 8, 9, 10, 11, 12, 19.1, and 23.2 of ANSI Standard C82.2–1984.

3.3 Electric Supply.

3.3.1 Input Power. Measure the input power (watts) to the ballast in accordance with ANSI Standard C82.2–1984, section 3.2.1(3) and section 4.

3.3.2 Input Voltage. Measure the input voltage (volts) (RMS) to the ballast in accordance with ANSI Standard C82.2–1984, section 3.2.1(1) and section 4.

3.3.3 Input Current. Measure the input current (amps) (RMS) to the ballast in accordance with ANSI Standard C82.2–1984, section 3.2.1(2) and section 4.

3.4 Light Output.

3.4.1 Measure the light output of the reference lamp with the reference ballast in accordance with ANSI Standard C82.2–1984, section 16.

3.4.2 Measure the light output of the reference lamp with the test ballast in accordance with ANSI Standard C82.2–1984, section 16.

4.1 Calculate relative light output:

\[
\text{Photocell output of lamp on test ballast} \times \frac{100}{\text{Photocell output of lamp on ref. ballast}} = \text{relative light output}
\]

Where:

photocell output of lamp on test ballast is determined in accordance with section 3.4.2, expressed in watts, and photocell output of lamp on ref. ballast is determined in
accordance with section 3.4.1, expressed in watts.

4.2 Determine the Ballast Efficacy Factor (BEF) using the following equations:
(a) Single lamp ballast

\[
BEF = \frac{relative \ light \ output}{input \ power}
\]

(b) Multiple lamp ballast

\[
BEF = \frac{average \ relative \ light \ output}{input \ power}
\]

Where:
- Input power is determined in accordance with section 3.3.1, relative light output as defined in section 4.1, and average relative light output is the relative light output, as defined in section 4.1, for all lamps, divided by the total number of lamps.

4.3 Determine Ballast Power Factor (PF):

\[
PF = \frac{Input \ power}{Input \ voltage \times \ input \ current}
\]

Where:
- Input power is as defined in section 3.3.1, input voltage is determined in accordance with section 3.3.2, expressed in volts, and input current is determined in accordance with section 3.3.3, expressed in amps.

APPENDIX R TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING AVERAGE LAMP EFFICIENCY (LE) AND COLOR RENDERING INDEX (CRI) OF ELECTRIC LAMPS

1. Scope: This appendix applies to the measurement of lamp lumens, electrical characteristics and CRI for general service fluorescent lamps, and to the measurement of lamp lumens and electrical characteristics for general service incandescent lamps, incandescent reflector lamps and medium base compact fluorescent lamps.

2. Definitions

2.1 To the extent that definitions in the IESNA and CIE standards do not conflict with the DOE definitions, the definitions specified in §12 of IESNA LM–9, §3.0 of IESNA LM–20, §2 of IESNA LM–45, §2 of IESNA LM–58, §1.2 of IESNA LM–66 and §IV of CIE Publication No. 13.2 shall be included.

2.2 ANSI Standard means a standard developed by a committee accredited by the American National Standards Institute (ANSI).

2.3 CIE means the International Commission on Illumination.

2.4 CRI means Color Rendering Index as defined in §430.2.

2.5 IESNA means the Illuminating Engineering Society of North America.

2.6 Lamp efficacy means the ratio of measured lamp lumen output in lumens to the measured lamp electrical power input in watts, rounded to the nearest whole number, in units of lumens per watt.

2.7 Lamp lumen output means the total luminous flux produced by the lamp, at the reference condition, in units of lumens.

2.8 Lamp electrical power means the total electrical power input to the lamp, including both arc and cathode power where appropriate, at the reference condition, in units of watts.

3. Test Conditions

3.1 General Service Fluorescent Lamps: For general service fluorescent lamps, the ambient conditions of the test and the electrical circuits, reference ballasts, stabilization requirements, instruments, detectors, and photometric test procedure and test report shall be as described in the relevant sections of IESNA LM–9 (see 10 CFR 430.22).

3.2 General Service Incandescent Lamps: For general service incandescent lamps, the selection and seasoning (initial burn-in) of the test lamps, the equipment and instrumentation, and the test conditions shall be as described in IESNA LM–45 (see 10 CFR 430.22).

3.3 Incandescent Reflector Lamps: For incandescent reflector lamps, the selection and seasoning (initial burn-in) of the test lamps, the equipment and instrumentation, and the test conditions shall conform to sections 4.2 and 5.0 of IESNA LM–20 (see 10 CFR 430.22).

3.4 Medium Base Compact Fluorescent Lamps: For medium base compact fluorescent lamps, the selection, seasoning and stabilization of the test lamps, and the test conditions, shall be as described in Sections 1, 2, 3, and 7 of IESNA LM–66 (see 10 CFR 430.22).

4. Test Methods and Measurements

All lumen measurements made with instruments calibrated to the devalued NIST lumen after January 1, 1996, shall be multiplied by 1.011.

4.1 General Service Fluorescent Lamps

4.1.1 The measurement procedure shall be as described in IESNA LM–9, except that
lamps shall be operated at the appropriate voltage and current conditions as described in ANSI C78.375 and in ANSI C78.1, C78.2 or C78.3, and lamps shall be operated using the appropriate reference ballast as described in ANSI C82.3 (see 10 CFR 430.22).

4.1.2 Lamp lumen output (lumens) and lamp electrical power input (watts), at the reference condition, shall be measured and recorded. Lamp efficacy shall be determined by computing the ratio of the measured lamp lumen output and lamp electrical power input at equilibrium for the reference condition.

4.2 General Service Incandescent Lamps

4.2.1 The measurement procedure shall be as described in IESNA LM–45 (see 10 CFR 430.22). Lamps shall be operated at the rated voltage as defined in §430.2.

4.2.2 The test procedure shall conform with section 7 of IESNA LM–45 and the lumen output of the lamp shall be determined in accordance with Sections 4.2a or 4.2b of IESNA LM–45 at the reference condition. Lamp electrical power input in watts shall be measured and recorded. Lamp efficacy shall be determined by computing the ratio of the measured lamp lumen output and lamp electrical power input at equilibrium for the reference condition. The test report shall conform to §8 of IESNA LM–45 (see 10 CFR §430.22).

4.3 Incandescent Reflector Lamps

4.3.1 The measurement procedure shall be as described in IESNA LM–20 (see 10 CFR 430.22). Lamps shall be operated at the rated voltage as defined in §430.2.

4.3.2. Lamp lumen output shall be determined as total forward lumens, and may be measured in an integrating sphere at the reference condition in accordance with §7.2 of IESNA LM–20 (see 10 CFR 430.22) or from an average intensity distribution curve measured at the reference condition specified in §6.0 of IESNA LM–20. Lamp electrical power input in watts shall be measured and recorded.

4.3.3 Lamp efficacy shall be determined by computing the ratio of the measured lamp lumen output and lamp electrical power input at equilibrium for the reference condition. The test report shall conform to section 10.0 of IES LM–20 (see §430.22).

4.4 Medium Base Compact Fluorescent Lamps

4.4.1 The measurement procedure shall be as described in IESNA LM–66 (see 10 CFR 430.22) except that the provisions of IESNA LM–66 which refer to operation of the lamp using a reference ballast do not apply to the testing of integrally ballasted compact fluorescent lamps. Lamps shall be operated at 120 V and 60 Hertz. Lamp lumen output shall be measured with the integral ballast according to section 11.3 of IESNA LM–66. Lamp electrical power input in watts shall be measured and recorded.

4.4.2 Lamp efficacy shall be determined by computing the ratio of the measured lamp lumen output and lamp electrical power input at equilibrium for the reference condition. The test report shall conform to section 13 of IESNA LM–66 (see 10 CFR 430.22).

4.5 Determination of Color Rendering Index

4.5.1 The CRI shall be determined in accordance with the method specified in CIE Publication 13.2 for general service fluorescent lamps. The required spectroradiometric measurement and characterization shall be conducted in accordance with the methods given in IESNA LM–58 and IESNA LM–16 (see 10 CFR 430.22).

4.5.2 The test report shall include a description of the test conditions, equipment, measured lamps, spectroradiometric measurement results and CRI determination.

430—Uniform Test Method for Measuring the Water Consumption of Faucets and Showerheads

APPENDIX S TO SUBPART B OF PART 430—Uniform Test Method for Measuring the Water Consumption of Faucets and Showerheads

1. Scope: This Appendix covers the test requirements used to measure the hydraulic performance of faucets and showerheads.

2. Flow Capacity Requirements:

a. Faucets—The test procedures to measure the flow rate for faucets, expressed in gallons per minute (gpm) and liters per minute (L/min), or gallons per cycle (gal/cycle) and liters per cycle (L/cycle), shall be conducted in accordance with the test requirements used to measure the hydraulic performance of faucets and showerheads.

b. Showerheads—The test conditions to measure the water flow rate for showerheads, expressed in gallons per minute (gpm) and liters per minute (L/min), shall be conducted in accordance with the test requirements specified in section 6.5, Flow Capacity Test, of the ASME/ANSI Standard A112.18.1M–1996 (see §430.22). Measurements shall be recorded at the resolution of the test instrumentation. Calculations shall be rounded off to the same number of significant digits as the previous step. The final water consumption value shall be rounded to one decimal place for non-metered faucets, or two decimal places for metered faucets.

APPENDIX T TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE WATER CONSUMPTION OF WATER CLOSETS AND URINALS

1. Scope: This Appendix covers the test requirements used to measure the hydraulic performances of water closets and urinals.

2. Test Apparatus and General Instructions:

a. The test apparatus and instructions for testing water closets shall conform to the requirements specified in section 7.1.2, Test Apparatus and General Requirements, subsections 7.1.2.1, 7.1.2.2, and 7.1.2.3 of the ASME/ANSI Standard A112.19.6–1995 (see § 430.22). Measurements shall be recorded at the resolution of the test instrumentation. Calculations shall be rounded off to the same number of significant digits as the previous step. The final water consumption value shall be rounded to one decimal place.

b. The test apparatus and instructions for testing urinals shall conform to the requirements specified in section 8.2, Test Apparatus and General Requirements, subsections 8.2.1, 8.2.2, and 8.2.3 of the ASME/ANSI Standard A112.19.6–1995 (see § 430.22). Measurements shall be recorded at the resolution of the test instrumentation. Calculations shall be rounded off to the same number of significant digits as the previous step. The final water consumption value shall be rounded to one decimal place.

3. Test Measurement:

a. Water closets—The measurement of the water flush volume for water closets, expressed in gallons per flush (gpf) and liters per flush (Lpf), shall be conducted in accordance with the test requirements specified in section 7.1.6, Water Consumption and Hydraulic Characteristics, of the ASME/ANSI Standard A112.19.6–1995 (see § 430.22). Measure the airflow of the two whole numbers; or

(i) A fractional number at or above the midpoint between the two consecutive whole numbers shall be rounded up to the higher of the two whole numbers; or

(ii) A fractional number below the midpoint between the two consecutive whole numbers shall be rounded down to the lower of the two whole numbers.

b. Urinals—The measurement of water flush volume for urinals, expressed in gallons per flush (gpf) and liters per flush (Lpf), shall be conducted in accordance with the test requirements specified in section 8.5, Water Consumption, of the ASME/ANSI Standard A112.19.6–1995 (see § 430.22).

10 CFR Ch. II (1–1–08 Edition)

APPENDIX U TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF CEILING FANS

1. Scope: This appendix covers the test requirements used to measure the energy performance of ceiling fans.

2. Definitions:

a. Airflow means the rate of air movement at a specific fan-speed setting expressed in cubic feet per minute (CFM).

b. Airflow efficiency means the ratio of airflow divided by power at a specific ceiling fan-speed setting expressed in CFM per watt (CFM/watt).

3. Test Apparatus and General Instructions: The test apparatus and instructions for testing ceiling fans shall conform to the requirements specified in Chapter 3, “Air-Delivery Room Construction and Preparation,” Chapter 4, “Equipment Set-up and Test Procedure,” and Chapter 6, “Definitions and Acronyms,” of the EPA’s “ENERGY STAR Testing Facility Guidance Manual: Building a Testing Facility and Performing the Solid State Test Method for ENERGY STAR Qualified Ceiling Fans,” Version 1.1, December 9, 2002 (incorporated by reference, see § 430.22). Record measurements at the resolution of the test instrumentation. Round off calculations to the same number of significant digits as the previous step. Round the final energy consumption value to the nearest whole number as follows:

(i) A fractional number at or above the midpoint between the two consecutive whole numbers shall be rounded up to the higher of the two whole numbers; or

(ii) A fractional number below the midpoint between the two consecutive whole numbers shall be rounded down to the lower of the two whole numbers.

4. Test Measurement: Measure the airflow and airflow efficiency for ceiling fans, expressed in cubic feet per minute (CFM) and CFM per watt (CFM/watt), in accordance with the test requirements specified in Chapter 3, “Air-Delivery Room Construction and Preparation,” Chapter 4, “Equipment Set-up and Test Procedure,” of the EPA’s “ENERGY STAR Testing Facility Guidance Manual: Building a Testing Facility and Performing the Solid State Test Method for ENERGY STAR Qualified Ceiling Fans,” Version 1.1, December 9, 2002 (incorporated by reference, see § 430.22). In performing the airflow test, measure ceiling fan power using a RMS sensor capable of measuring power with an accuracy of ±1%. Prior to using the sensor and sensor software it has selected, the test laboratory shall verify performance of the sensor and sensor software. Measure power input at a point that includes all power consuming components of the ceiling fan (but without any attached light kit energized). Measure power at the rated voltage that represents normal operation continuously over the time period for which the airflow test is conducted, and report the average value of the power measurement in watts (W). Use the average value of power input to calculate the airflow efficiency in CFM/W.

63 FR 13337, Mar. 18, 1998

[63 FR 71366, Dec. 8, 2006]
APPENDIX V TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF CEILING FAN LIGHT KITS

1. Scope: This appendix covers the test requirements used to measure the energy performance of ceiling fan light kits.

2. Definitions:
   a. Input power means the actual total power used by all lamp(s) and ballast(s) of the light kit during operation, expressed in watts (W) and measured using the lamp and ballast packaged with the kit.
   b. Lamp ballast platform means a pairing of one ballast with one or more lamps that can operate simultaneously on that ballast. A unique platform is defined by the manufacturer and model number of the ballast and lamp(s) and the quantity of lamps that operate on the ballast.
   c. Lamp lumens means a measurement of luminous flux expressed in lumens and measured using the lamp and ballast shipped with the fixture.
   d. System efficacy per lamp ballast platform means the ratio of measured lamp lumens expressed in lumens and measured input power expressed in watts (W).

3. Test Apparatus and General Instructions:
   a. The test apparatus and instruction for testing screw base lamps packaged with ceiling fan light kits that have medium screw base sockets shall conform to the requirements specified in section 2, “Definitions,” section 3, “Referenced Standards,” and section 4, “CFL Requirements for Testing,” of DOE’s “ENERGY STAR Program Requirements for Compact Fluorescent Lamps,” Version 3.0 (Incorporated by reference, see §430.22).
   b. For pin-based compact fluorescent lamps packaged with ceiling fan light kits that have pin-based sockets, measure the efficacy, expressed in lumens per watt, in accordance with the test requirements specified in section 4, “CFL Requirements for Testing,” of the “ENERGY STAR Program Requirements for Compact Fluorescent Lamps,” Version 4.0 (Incorporated by reference, see §430.22).

4. Test Measurement:
   a. For screw base compact fluorescent lamps packaged with ceiling fan light kits that have medium screw base sockets, measure the efficacy, expressed in lumens per watt, in accordance with the test requirements specified in section 3, “Energy-Efficiency Specifications for Qualifying Products” and Table 3 in section 4, “Qualification Process, Testing Facilities, Standards, and Documentation,” of the “ENERGY STAR Program Requirements for Residential Light Fixtures,” Version 4.0 (Incorporated by reference, see §430.22).

APPENDIX W TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF MEDIUM BASE COMPACT FLUORESCENT LAMPS

1. Scope: This appendix covers the test requirements used to measure the initial efficacy, lumen maintenance at 1,000 hours, lumen maintenance at 40 percent of rated life, rapid cycle stress, and lamp life of medium base compact fluorescent lamps.

2. Definitions:
   a. Average rated life means the length of time declared by the manufacturer at which 50 percent of any large number of units of a lamp reaches the end of their individual lives.
   b. Initial performance values means the photometric and electrical characteristics of the lamp at the end of 100 hours of operation. Such values include the initial efficacy, the rated luminous flux and the rated lumen output.
   c. Lumen maintenance means the luminous flux or lumen output at a given time in the life of the lamp and expressed as a percentage of the rated luminous flux or rated lumen output, respectively.
d. Rated luminous flux or rated lumen output means the initial lumen rating (100 hour) declared by the manufacturer, which consists of the lumen rating of a lamp at the end of 100 hours of operation.

e. Rated supply frequency means the frequency marked on the lamp.

f. Rated voltage means the voltage marked on the lamp.

g. Rated wattage means the wattage marked on the lamp.

h. Self-ballasted compact fluorescent lamp means a compact fluorescent lamp unit that incorporates, permanently enclosed, all elements that are necessary for the starting and stable operation of the lamp, and does not include any replaceable or interchangeable parts.

4. Test Measurement: Measure the initial efficacy expressed in lumens per watt; lumen maintenance at 1,000 hours expressed in lumens; lumen maintenance at 40 percent of rated life expressed in lumens; rapid cycle stress expressed in the number of lamps that meet or exceed the minimum number of cycles; and lamp life expressed in hours in accordance with the test requirements specified in section 4, “CFL Requirements for Testing” of DOE’s “ENERGY STAR Program Requirements for [Compact Fluorescent Lamps] CFLs,” Version dated August 9, 2001 (Incorporated by reference, see §430.22).

APPENDIX X TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF DEHUMIDIFIERS

1. Scope: This appendix covers the test requirements used to measure the energy performance of dehumidifiers.

2. Definitions:
   a. Product capacity for dehumidifiers means a measure of the ability of a dehumidifier to remove moisture from its surrounding atmosphere, measured in pints collected per 24 hours of continuous operation.
   b. Energy factor for dehumidifiers means a measure of energy efficiency of a dehumidifier calculated by dividing the water removed from the air by the energy consumed, measured in liters per kilowatt hour (L/kWh).

3. Test Apparatus and General Instructions: The test apparatus and instructions for testing dehumidifiers shall conform to the requirements specified in section 1, “Definitions,” section 2, “Qualifying Products,” and section 4, “Test Criteria,” of the EPA’s “ENERGY STAR Program Requirements for Dehumidifiers,” effective January 1, 2001 (Incorporated by reference, see §430.22). Record measurements at the resolution of the test instrumentation. Round off calculations to the same number of significant digits as the previous step. Round the final energy consumption value, as applicable, to the nearest decimal place or whole number as follows:
   (i) A fractional number at or above the midpoint between two consecutive decimal places or whole numbers shall be rounded up to the higher of the two decimal places or whole numbers; or
   (ii) A fractional number below the midpoint between two consecutive decimal places or whole numbers shall be rounded down to the lower of the two decimal places or whole numbers. Round the final initial efficacy to one decimal place. Round the final lumen maintenance at 1,000 hours to a whole number. Round the final lumen maintenance at 40 percent of rated life, the final rapid cycle stress, and the final lamp life for medium base compact fluorescent lamps to whole numbers.

4. Test Measurement: Measure the energy factor for dehumidifiers, expressed in liters per kilowatt hour (L/kWh) and product capacity in pints per day (pints/day). In accordance with the test requirements specified in section 4, “Test Criteria,” of EPA’s “ENERGY STAR Program Requirements for Dehumidifiers,” effective January 1, 2003 (Incorporated by reference, see §430.22).

APPENDIX Y TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF BATTERY CHARGERS

1. Scope: This appendix covers the test requirements used to measure battery charger energy consumption.
2. Definitions: The following definitions are for the purposes of understanding terminology associated with the test method for measuring battery charger energy consumption.

a. Accumulated nonactive energy is the sum of the energy, in watt-hours, consumed by the battery charger in battery-maintenance mode and standby mode over time periods defined in the test procedure.

b. Active mode is the condition in which the battery is receiving the main charge, equalizing cells, and performing other one-time or limited-time functions necessary for bringing the battery to the fully charged state.

c. Battery or battery pack is an assembly of one or more rechargeable cells intended to provide electrical energy to a consumer product, and may be in one of the following forms: (a) detachable battery: a battery that is contained in a separate enclosure from the consumer product and is intended to be removed or disconnected from the consumer product for recharging; or (b) integral battery: a battery that is contained within the consumer product and is not removed from the consumer product for charging purposes.

d. Battery energy is the energy, in watt-hours, delivered by the battery under the specified discharge conditions in the test procedure.

e. Battery maintenance mode or maintenance mode is the mode of operation when the battery charger is connected to the main electricity supply and the battery is fully charged, but is still connected to the charger.

f. Energy ratio or nonactive energy ratio means the ratio of the accumulated nonactive energy divided by the battery energy.

g. Multi-port charger means a battery charger that is capable of simultaneously charging two or more batteries. These chargers also may have multi-voltage capability, allowing two or more batteries of different voltages to charge simultaneously.

h. Multi-voltage a la carte charger means a separate battery charger that is individually packaged without batteries, and is able to charge a variety of batteries of different nominal voltages.

i. Standby mode or no-load mode means the mode of operation when the battery charger is connected to the main electricity supply and the battery is not connected to the charger.

3. Test Apparatus and General Instructions: The test apparatus, standard testing conditions, and instructions for testing battery chargers shall conform to the requirements specified in section 4. "Standard Testing Conditions," of the EPA's "Test Methodology for Determining the Energy Performance of Battery Charging Systems," December 2005 Incorporated by reference, see §430.22. The test voltage specified in section 4.1.1, "Voltage," shall be 115 volts, 60 Hz. The battery charger should be tested using the full test methodology, which has a test duration of 48 hours. In section 4.3.1, "Precision Requirements," append this sentence to the end: "The test equipment must be capable of accounting for crest factor and frequency spectrum in its measurement of the UUT input current." 1

4. Test Measurement:

(a) Inactive Mode Energy Consumption Measurement. The measurement of the battery charger energy ratio shall conform to the requirements specified in section 5, "Determining BCS Energy Ratio," of the EPA's "Test Methodology for Determining the Energy Performance of Battery Charging Systems," December 2005" (Incorporated by reference, see §430.22).

(b) Active Mode Energy Consumption Measurement. [Reserved]

71 FR 71366, Dec. 8, 2006

Appendix Z to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of External Power Supplies

1 Scope: This appendix covers the test requirements used to measure the active mode efficiency and the no-load energy consumption of external power supplies.

2 Definitions: The following definitions are for the purposes of understanding terminology associated with the test method for measuring external power supply energy consumption. 1

a. Active mode is the mode of operation when the external power supply is connected to the main electricity supply and the output is connected to a load.

b. Active mode efficiency is the ratio, expressed as a percentage, of the total real output power produced by a power supply to the real input power required to produce it.

c. No load mode means the mode of operation when the external power supply is connected to the main electricity supply and the output is not connected to a load.

d. Single voltage external AC-AC power supply means an external power supply that is designed to convert line voltage AC input into lower voltage AC output and is able to convert to only one AC output voltage at a time.

e. Single voltage external AC-DC power supply means an external power supply that is designed to convert line voltage AC input into lower voltage DC output and is able to convert to only one DC output voltage at a time.

---

1 For clarity on any other terminology used in the test method, please refer to IEEE Standard 1515-2000.
f. Total harmonic distortion, expressed as a percent, is the RMS value of an AC signal after the fundamental component is removed and interharmonic components are ignored, divided by the RMS value of the fundamental component.

g. True power factor is the ratio of the active (also referred to as real) power consumed in watts to the apparent power, drawn in volt-amperes.

Subpart C—Energy and Water Conservation Standards

§ 430.31 Purpose and scope.

This subpart contains energy conservation standards and water conservation standards (in the case of faucets, showerheads, water closets, and urinals) for classes of covered products that are required to be administered by the Department of Energy pursuant to the Energy Conservation Program for Consumer Products Other Than Automobiles under the Energy Policy and Conservation Act, as amended (42 U.S.C. 6291 et seq.). Basic models of covered products manufactured before the date on which an amended energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) becomes effective (or revisions of such models that are manufactured after such date and have the same energy efficiency, energy use characteristics, or water use characteristics (in the case of faucets, showerheads, water closets, and urinals), that comply with the energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) applicable to such covered products on the day before such date shall be deemed to comply with the amended energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals).

[71 FR 71366, Dec. 8, 2006]

§ 430.32 Energy conservation standards and effective dates.

The energy and water (in the case of faucets, showerheads, water closets, and urinals) conservation standards for the covered product classes are:

(a) Refrigerators/refrigerator-freezers/freezers. These standards do not apply to refrigerators and refrigerator-freezers with total refrigerated volume exceeding 39 cubic feet (1104 liters) or freezers with total refrigerated volume exceeding 30 cubic feet (850 liters).

*(j) Cooking Products. Gas cooking products with an electrical supply cord shall not be equipped with a constant burning pilot light. This standard is effective on January 1, 1990.

(k) Pool heaters. The thermal efficiency of pool heaters must be no less than 78%. The standard is effective on January 1, 1990.

(l) Television sets. [Reserved]

(m)(1) Fluorescent lamp ballasts. Except as provided in paragraphs (m)(2), (m)(3), (m)(4), (m)(5), (m)(6) and (m)(7) of this section, each fluorescent lamp ballast—

(i) (A) Manufactured on or after January 1, 1990;

(B) Sold by the manufacturer on or after April 1, 1990; or

(C) Incorporated into a luminaire by a luminaire manufacturer on or after April 1, 1991; and

(ii) Designed—

(A) To operate at nominal input voltages of 120 or 277 volts;

(B) To operate with an input current frequency of 60 Hertz; and

(C) For use in connection with an F40T12, F96T12, or F96T12HO lamps
shall have a power factor of 0.90 or greater and shall have a ballast efficacy factor not less than the following:

<table>

(2) The standards described in paragraph (m)(1) of this section do not apply to—

(i) A ballast that is designed for dimming or for use in ambient temperatures of 0°F or less, or

(ii) A ballast that has a power factor of less than 0.90 and is designed for use only in residential building applications.

(3) Except as provided in paragraph (m)(4) of this section, each fluorescent lamp ballast—

(i) (A) Manufactured on or after April 1, 2005; 
(B) Sold by the manufacturer on or after July 1, 2005; or
(C) Incorporated into a luminaire by a luminaire manufacturer on or after April 1, 2006; and

(ii) Designed—

(A) To operate at nominal input voltages of 120 or 277 volts; 
(B) To operate with an input current frequency of 60 Hertz; and

(C) For use in connection with an F40T12, F96T12, or F96T12HO lamps; shall have a power factor of 0.90 or greater and shall have a ballast efficacy factor not less than the following:

<table>
<thead>

</table>

(4) (i) The standards described in paragraph (m)(3) do not apply to:

(A) A ballast that is designed for dimming to 50 percent or less of its maximum output;

(B) A ballast that is designed for use with two F96T12HO lamps at ambient temperatures of −20°F or less and for use in an outdoor sign; 

(C) A ballast that has a power factor of less than 0.90 and is designed and labeled for use only in residential building applications; or

(D) A replacement ballast as defined in paragraph (m)(4)(ii) of this section.

(ii) For purposes of this paragraph (m), a replacement ballast is defined as a ballast that:

(A) Is manufactured on or before June 30, 2010; 
(B) Is designed for use to replace an existing ballast in a previously installed luminaire; 
(C) Is marked "FOR REPLACEMENT USE ONLY"; 
(D) Is shipped by the manufacturer in packages containing not more than 10 ballasts; 
(E) Has output leads that when fully extended are a total length that is less than the length of the lamp with which it is intended to be operated; and

(F) Meets or exceeds the ballast efficacy factor in the following table:

<table>
<thead>
<tr>
<th>Application for operation of</th>
<th>Ballast input voltage</th>
<th>Total nominal lamp watts</th>
<th>Ballast efficacy factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>One F40 T12 lamp ........</td>

<td>220</td>
<td>0.390</td>
</tr>
</tbody>
</table>

(5) Except as provided in paragraph (m)(7) of this section, each fluorescent lamp ballast (other than replacement ballasts defined in §430.2)—

(i) Manufactured on or after July 1, 2009; 
(ii) Sold by the manufacturer on or after October 1, 2009; or
(iii) Incorporated into a luminaire by a luminaire manufacturer on or after July 1, 2010; and

(ii) Designed—

(A) To operate at nominal input voltages of 120 or 277 volts; 
(B) To operate with an input current frequency of 60 Hertz; and
(C) For use in connection with F34T12 lamps, F96T12/ES lamps, or F96T12HO/ES lamps; shall have a power factor of 0.90 or greater and shall have a ballast efficacy factor of not less than the following:

<table>
<thead>
<tr>
<th>Application for operation of</th>
<th>Ballast input voltage</th>
<th>Total nominal lamp watts</th>
<th>Ballast efficacy factor</th>

</tr>
</tbody>
</table>

(6) The standards in paragraph (m)(5) shall apply to all ballasts covered by paragraph (m)(5)(ii), including replacement ballasts and ballasts described in paragraph (m)(7) of this section, that are manufactured on or after July 1, 2010, or sold by the manufacturer on or after October 1, 2010.

(7) The standards in paragraph (m)(5) do not apply to:

(i) A ballast that is designed for dimming to 50 percent or less of the maximum output of the ballast;
(ii) A ballast that is designed for use with 2 F96T12HO lamps at ambient temperatures of 20 degrees F or less and for use in an outdoor sign; or
(iii) A ballast that has a power factor of less than 0.90 and is designed and labeled for use only in residential applications.

(n) General service fluorescent lamps and incandescent reflector lamps. (1) Each of the following general service fluorescent lamps manufactured after the effective dates specified in the table shall meet or exceed the lamp efficacy and CRI standards shown in the table below:

<table>
<thead>
<tr>
<th>FLUORESCENT LAMPS</th>

§ 430.32

(2) The maximum water use allowed for flushometer valve toilets, other than blowout toilets, manufactured after January 1, 1997, shall be 1.6 gallons per flush (6.0 liters per flush).

(r) Urinals. The maximum water use allowed for any urinals manufactured after January 1, 1994, shall be 1.0 gallons per flush (3.8 liters per flush). The maximum water use allowed for a trough-type urinal shall be the product of:

(1) The maximum flow rate for a urinal and

(2) The length of the trough-type urinal in inches (millimeters) divided by 16 inches (406 millimeters).

(s) Ceiling fans and ceiling fan light kits.

(1) All ceiling fans manufactured on or after January 1, 2007, shall have the following features:

(i) Fan speed controls separate from any lighting controls;

(ii) Adjustable speed controls (either more than 1 speed or variable speed);

(iii) The capability of reversible fan action, except for—

(A) Fans sold for industrial applications;

(B) Outdoor applications; and

(C) Cases in which safety standards would be violated by the use of the reversible mode.

(2)(i) Ceiling fan light kits with medium screw base sockets manufactured on or after January 1, 2007, shall be packaged with screw-based lamps to fill all screw base sockets.

(ii) The screw-based lamps required under paragraph (2)(i) of this section shall—

(A) Meet the ENERGY STAR Program requirements for Compact Fluorescent Lamps, version 3 or

(B) Use light sources other than compact fluorescent lamps that have lumens per watt performance at least equivalent to comparable configured compact fluorescent lamps meeting the energy conservation standards described in paragraph (2)(ii)(A) of this section.

(3) Ceiling fan light kits with pin-based sockets for fluorescent lamps manufactured on or after January 1, 2007 shall—

(i) Meet the ENERGY STAR Program Requirements for Residential Light Fixtures version 4.0 issued by the Environmental Protection Agency; and

(ii) Be packaged with lamps to fill all sockets.

(4) Ceiling fan light kits with socket types other than those covered in paragraphs (2) and (3) of this section, including candelabra screw base sockets, manufactured on or after January 1, 2009—

(i) Shall not be capable of operating with lamps that total more than 190 watts; and

(ii) Shall be packaged to include the lamps described in clause (i) with the ceiling fan light kits.

(t) Torchieres. A torchiere manufactured on or after January 1, 2006 shall:
(1) Consume not more than 190 watts of power; and
(2) Not be capable of operating with lamps that total more than 190 watts.

(u) Medium Base Compact Fluorescent Lamps. A bare lamp and covered lamp (no reflector) medium base compact fluorescent lamp manufactured on or after January 1, 2006, shall meet the following requirements:

<table>
<thead>
<tr>

</tr>
<tr>
<td>Average Rated Lamp Life</td>
<td>≥6,000 hours as declared by the manufacturer on packaging. At 80% of rated life, statistical methods may be used to confirm lifetime claims based on sampling performance.</td>
</tr>
</tbody>
</table>

1 Take performance and electrical requirements at the end of the 100-hour aging period according to ANSI Standard C78.5. The lamp efficacy shall be the average of the lesser of the lumens per watt measured in the base up and/or other specified positions. Use wattages placed on packaging to select proper specification efficacy in this table, not measured wattage. Labeled wattages are for reference only.

2 Efficacies are based on measured values for lumens and wattages from pertinent test data. Wattages and lumens placed on packages may not be used in calculation and are not governed by this specification. For multi-level or dimmable systems, measurements shall be at the highest setting. Acceptable measurement error is ±3%.

(v) Dehumidifiers. Dehumidifiers manufactured on or after October 1, 2007, shall have an energy factor that meets or exceeds the following values:

<table>

[54 FR 6077, Feb. 7, 1989]

EDITORIAL NOTE: For Federal Register citations affecting §430.32, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.

EFFECTIVE DATE NOTE: At 72 FR 65169, Nov. 19, 2007, §430.32 was amended by revising the section heading and paragraph (e), effective Jan. 18, 2008. For the convenience of the user, the revised text is set forth as follows:

§430.32 Energy and water conservation standards and their effective dates.

(e) Furnaces. (1) Non-weatherized and weatherized gas furnaces, mobile home gas furnaces, oil-fired furnaces, and gas- and oil-fired boilers, manufactured before November 19, 2015 and all other types of furnaces, shall have an efficiency no less than:

<table>
<thead>
<tr>
<th>Product class</th>
<th>AFUE 1 (percent)</th>

§ 430.33  Preemption of State regulations.

Any State regulation providing for any energy conservation standard, or water conservation standard (in the case of faucets, showerheads, water closets, and urinals), or other requirement with respect to the energy efficiency, energy use, or water use (in the case of faucets, showerheads, water closets, or urinals) of a covered product that is not identical to a Federal standard in effect under this subpart is preempted by that standard, except as provided for in sections 327 (b) and (c) of the Act.

[63 FR 13318, Mar. 18, 1998]

§ 430.34  Energy and water conservation standards amendments

The Department of Energy may not prescribe any amended standard which increases the maximum allowable energy use or, in the case of showerheads, faucets, water closets or urinals, the maximum allowable water use, or which decreases the minimum required energy efficiency of a covered product.

[67 FR 36406, May 23, 2002]
Department of Energy

standards development activities, and to announce these prioritization decisions so that all interested parties have a common expectation about the timing of different rulemaking activities. The guidelines in this Appendix provide for setting priorities and timetables for standards development and test procedure modification and reflect these priorities in the Regulatory Agenda.

(c) Increase use of outside technical expertise. The Department seeks to expand its use of outside technical experts in evaluating product-specific engineering issues to ensure that decisions on technical issues are fully informed. The guidelines in this Appendix provide for increased use of outside technical experts in developing, performing and reviewing the analyses. Draft analytical results will be distributed for peer and stakeholder review.

(d) Eliminate problematic design options early in the process. The Department seeks to eliminate from consideration, early in the process, any design options that present unacceptable problems with respect to manufacturability, consumer utility, or safety, so that the detailed analysis can focus only on viable design options. Under the guidelines in this Appendix, DOE will eliminate from consideration design options if it concludes that manufacture, installation or service of the design will be impractical, or that the design option will adversely affect the utility of the product, or if the design has adverse safety or health impacts. This screening will be done at the outset of a rulemaking.

(e) Fully consider non-regulatory approaches. The Department seeks to understand the effects of market forces and voluntary programs on encouraging the purchase of energy efficient products so that the incremental impacts of a new or revised standard can be accurately assessed and the Department can make informed decisions about where standards and voluntary "market pull" programs can be used most effectively. Under the guidelines in this Appendix, DOE will solicit information on the effectiveness of market forces and non-regulatory approaches for encouraging the purchase of energy efficient products, and will carefully consider this information in assessing the benefits of standards. In addition, DOE will continue to support voluntary efforts by manufacturers, retailers, utilities and others to increase product efficiency.

(f) Conduct thorough analysis of impacts. In addition to understanding the aggregate costs and benefits of standards, the Department seeks to understand the distribution of those costs and benefits among consumers, manufacturers and others, and the uncertainty associated with these analyses of costs and benefits, so that any adverse impacts on significant subgroups and uncertainty concerning any adverse impacts can be fully considered in selecting a standard.

Under the guidelines in this Appendix, the analyses will consider the variability of impacts on significant groups of manufacturers and consumers in addition to aggregate costs and benefits, report the range of uncertainty associated with these impacts, and take into account cumulative impacts of regulation on manufacturers.

(g) Use transparent and robust analytical methods. The Department seeks to use qualitative and quantitative analytical methods that are fully documented for the public and that produce results that can be explained and reproduced, so that the analytical underpinnings for policy decisions on standards are as sound and well-accepted as possible. Under the guidelines in this Appendix, DOE will solicit input from interested parties in identifying analysis, data, and modeling needs with respect to measurement of impacts on manufacturers and consumers.

(h) Articulate policies to guide selection of standards. The Department seeks to adopt policies elaborating on the statutory criteria for selecting standards, so that interested parties are aware of the policies that will guide these decisions. Under the guidelines in this Appendix, policies for screening design options, selecting candidate standard levels, selecting a proposed standard level, and establishing the final standard are established.

(i) Support efforts to build consensus on standards. The Department seeks to encourage development of consensus proposals for new or revised standards because standards with such broad-based support are likely to balance effectively the economic, energy, and environmental interests affected by standards. Under the guidelines in this Appendix, DOE will support the development and submission of consensus recommendations for standards by representative groups of interested parties to the fullest extent possible.

(j) Reduce time and cost of developing standards. The Department seeks to establish a clear protocol for initiating and conducting standards rulemakings in order to eliminate time-consuming and costly missteps. Under the guidelines in this Appendix, increased and earlier involvement by interested parties and increased use of technical experts should minimize the need for re-analysis. This process should reduce the period between the publication of an Advance Notice of Proposed Rulemaking (ANOPR) and the publication of a final rule to not more than 18 months, and should decrease the government and private sector resources required to complete the standard development process.
2. Scope

(a) The procedures, interpretations and policies described in this Appendix will be fully applicable to:

(1) Rulemakings concerning new or revised Federal energy conservation standards for consumer products initiated after August 14, 1996, and

(2) Rulemakings concerning new or revised Federal energy conservation standards for consumer products that have been initiated but for which a Notice of Proposed Rulemaking (NOPR) has not been published as of August 14, 1996.

(b) For rulemakings described in paragraph (a)(2) of this section, to the extent analytical work has already been done or public comment on an ANOPR has already been provided, such analyses and comment will be considered, as appropriate, in proceeding under the new process.

(c) With respect to incomplete rulemakings concerning new or revised Federal energy conservation standards for consumer products for which a NOPR was published prior to August 14, 1996, the Department will conduct a case-by-case review to decide whether any of the analytical or procedural steps already completed should be repeated. In any case, the approach described in this Appendix will be used to the extent possible to conduct any analytical or procedural steps that have not been completed.

3. Setting Priorities for Rulemaking Activity

(a) Priority-setting analysis and development of list of priorities. At least once a year, the Department will prepare an analysis of each of the factors identified in paragraph (d) of this section based on existing literature, direct communications with interested parties and other experts, and other available information. The results of this analysis will be used to develop rulemaking priorities and proposed schedules for the development and issuance of all rulemakings. The DOE analysis, priorities and proposed rulemaking schedules will be documented and distributed for review and comment.

(b) Public review and comment. Each year, DOE will invite public input to review and comment on the priority analysis.

(c) Issuance of final listing of rulemaking priorities. Each fall, the Department will issue, simultaneously with the issuance of the Administration’s Regulatory Agenda, a final set of rulemaking priorities, the accompanying analysis, and the schedules for all priority rulemakings that it anticipates within the next two years.

(d) Factors for priority-setting. The factors to be considered by DOE in developing priorities and establishing schedules for conducting rulemakings will include:

(1) Potential energy savings.
(2) Potential economic benefits.

(3) Potential environmental or energy security benefits.
(4) Applicable deadlines for rulemakings.
(5) Incremental DOE resources required to complete rulemaking process.
(6) Other relevant regulatory actions affecting products.
(7) Stakeholder recommendations.
(8) Evidence of energy efficiency gains in the market absent new or revised standards.
(9) Status of required changes to test procedures.

(10) Other relevant factors.

4. Process for Developing Efficiency Standards and Factors to be Considered

This section describes the process to be used in developing efficiency standards and the factors to be considered in the process. The policies of the Department to guide the selection of standards and the decisions preliminary thereto are described in section 5.

(a) Identifying and screening design options. Once the Department has initiated a rulemaking for a specific product but before publishing an ANOPR, DOE will identify the product categories and design options to be analyzed in detail, and identify those design options eliminated from further consideration. Interested parties will be consulted to identify key issues, develop a list of design options, and to help the Department identify the expertise necessary to conduct the analysis.

(1) Identification of issues for analysis. The Department, in consultation with interested parties, will identify issues that will be examined in the standards development process.

(2) Identification of experts and other interested parties for peer review. DOE, in consultation with interested parties, will identify a group of independent experts and other interested parties who can provide expert review of the results of the engineering analysis and the subsequent impact analysis.

(3) Identification and screening of design options. In consultation with interested parties, the Department will develop a list of design options for consideration. Initially, the candidate design options will encompass all those technologies considered to be technologically feasible. Following the development of this initial list of design options, DOE will review each design option based on the factors described in paragraph (a)(4) of this section and the policies stated in section 5(b).

The reasons for eliminating any design option at this stage of the process will be fully documented and published as part of the ANOPR. The technologically feasible design options that are not eliminated in this screening will be considered further in the Engineering Analysis described in paragraph (b) of this section.
(4) Factors for screening of design options. The factors for screening design options include:

(i) Technological feasibility. Technologies incorporated in commercial products or in working prototypes will be considered technologically feasible.

(ii) Practicability to manufacture, install and service. If mass production of a technology in commercial products and reliable installation and servicing of the technology could be achieved on the scale necessary to serve the relevant market at the time of the effective date of the standard, then that technology will be considered practicable to manufacture, install and service.

(iii) Adverse Impacts on Product Utility or Product Availability.

(iv) Adverse Impacts on Health or Safety.

(5) Selection of contractors. Using the specifications of necessary contractor expertise developed in consultation with interested parties, DOE will select appropriate contractors, subcontractors, and as necessary, expert consultants to perform the engineering analysis and the impact analysis.

(b) Engineering analysis of design options and selection of candidate standard levels. After design options are identified and screened, DOE will perform the engineering analysis and the benefit/cost analysis and select the candidate standard levels based on these analyses. The results of the analyses will be published in a Technical Support Document (TSD) to accompany the ANOPR.

(1) Identification of engineering analytical methods and tools. DOE, in consultation with outside experts, will select the specific engineering analysis tools (or multiple tools, if necessary to address uncertainty) to be used in the analysis of the design options identified as a result of the screening analysis.

(2) Engineering and life-cycle cost analysis of design options. The DOE and its contractor will perform engineering and life-cycle cost analyses of the design options.

(3) Review by expert group and stakeholders. The results of the engineering and life-cycle cost analyses will be distributed for review by experts and interested parties. If appropriate, a public workshop will be conducted to review these results. The analyses will be revised as appropriate on the basis of this input.

(4) New information relating to the factors used for screening design options. If further information or analysis leads to a determination that a design option, or a combination of design options, has unacceptable impacts based on the policies stated in section 5(b), that design option or combination of design options will not be included in a candidate standard level.

(5) Selection of candidate standard levels. Based on the results of the engineering and life-cycle cost analysis of design options and the policies stated in section 5(c), DOE will select the candidate standard levels for further analysis.

(c) Advance Notice of Proposed Rulemaking—

(1) Documentation of decisions on candidate standard selection. (i) If the screening analysis indicates that continued development of a standard is appropriate, the Department will publish an ANOPR in the Federal Register and will distribute a draft TSD containing the analyses performed to this point. The ANOPR will specify candidate standard levels but will not propose a particular standard. The ANOPR will also include the preliminary analysis of consumer life-cycle costs, national net present value, and energy impacts for the candidate standard levels based on the engineering analysis.

(ii) If the preliminary analysis indicates that no candidate standard level is likely to meet the criteria specified in law, that conclusion will be announced. In such cases, the Department may decide to proceed with a rulemaking that proposes not to adopt new or amended standards, or it may suspend the rulemaking and conclude that further action on such standards should be assigned a low priority under section 3.

(2) Public comment and hearing. There will be 75 days for public comment on the ANOPR with at least one public hearing or workshop.

(3) Revisions based on comments. Based on consideration of the comments received, any necessary changes to the engineering analysis or the candidate standard levels will be made.

If major changes are required at this stage, interested parties and experts will be given an opportunity to review the revised analysis.

(d) Analysis of impacts and selection of proposed standard level. After the ANOPR, economic analyses of the impacts of the candidate standard levels will be conducted. The Department will propose updated standards based on the results of the impact analysis.

(1) Identification of issues for analysis. The Department, in consultation with interested parties, will identify issues that will be examined in the impacts analysis.

(2) Identification of analytical methods and tools. DOE, in consultation with outside experts, will select the specific economic analysis tools (or multiple tools if necessary to address uncertainty) to be used in the analysis of the candidate standard levels.

(3) Analysis of impacts. DOE will conduct the analysis of the impacts of candidate standard levels including analysis of the factors described in paragraphs (d)(7)(ii)-(viii) of this section.

(4) Review by expert group and stakeholders. The results of the analysis of impacts will be
distributed for review by experts and interested parties. If appropriate, a public workshop will be conducted to review these results. The analysis will be revised as appropriate on the basis of this input.

(5) Efforts to develop consensus among stakeholders. If a representative group of interested parties undertakes to develop joint recommendations to the Department on standards, DOE will consider deferring its impact analysis until these discussions are completed or until participants in the efforts indicate that they are unable to reach a timely agreement.

(6) Selection of proposed standard level based on analysis of impacts. On the basis of the analysis of the factors described in paragraph (d)(7) of this section and the policies stated in section 5(e), DOE will select a proposed standard level.

(7) Factors to be considered in selecting a proposed standard. The factors to be considered in selection of a proposed standard include:

(i) Consensus stakeholder recommendations.

(ii) Impacts on manufacturers. The analysis of manufacturer impacts will include: Estimated impacts on cash flow; assessment of impacts on manufacturers of specific categories of products and small manufacturers; assessment of impacts on manufacturers of multiple product-specific Federal regulatory requirements, including efficiency standards for other products and regulations of other agencies; and impact on manufacturing capacity, plant closures, and loss of capital investment.

(iii) Impacts on consumers. The analysis of consumer impacts will include: Estimated impacts on consumers based on national average energy prices and energy usage; assessments of impacts on subgroups of consumers based on major regional differences in usage or energy prices and significant variations in installation costs or performance; sensitivity analyses using high and low discount rates and high and low energy price forecasts; consideration of changes to product utility and other impacts of likely concern to all or some consumers, based to the extent practicable on direct input from consumers; estimated life-cycle cost with sensitivity analysis; and consideration of the increased first cost to consumers and the time required for energy cost savings to pay back these first costs.

(iv) Impacts on competition.

(v) Impacts on utilities. The analysis of utility impacts will include estimated marginal impacts on electric and gas utility costs and revenues.

(vi) National energy, economic and employment impacts. The analysis of national energy, economic and employment impacts will include: Estimated energy savings by fuel type; estimated net present value of benefits to all consumers; and estimates of the direct and indirect impacts on employment by appliance manufacturers, relevant service industries, energy suppliers and the economy in general.

(vii) Impacts on the environment and energy security. The analysis of environmental and energy security impacts will include estimated impacts on emissions of carbon and relevant criteria pollutants, impacts on pollution control costs, and impacts on oil use.

(viii) Impacts of non-regulatory approaches. The analysis of energy savings and consumer impacts will incorporate an assessment of the impacts of market forces and existing voluntary programs in promoting product efficiency, usage and related characteristics in the absence of updated efficiency standards.

(ix) New information relating to the factors used for screening design options.

(e) Notice of Proposed Rulemaking—(1) Documentation of decisions on proposed standard selection. The Department will publish a NOPR in the FEDERAL REGISTER that proposes standard levels and explains the basis for the selection of those proposed levels, and will distribute a draft TSD documenting the analysis of impacts. As required by §325(p)(2) of EPCA, the NOPR also will describe the maximum improvement in energy efficiency or maximum reduction in energy use that is technologically feasible and, if the proposed standards would not achieve these levels, the reasons for proposing different standards.

(2) Public comment and hearing. There will be 75 days for public comment on the NOPR, with at least one public hearing or workshop.

(3) Revisions to impact analyses and selection of final standard. Based on the public comments received and the policies stated in section 5(f), DOE will review the proposed standard and impact analyses, and make modifications as necessary. If major changes to the analyses are required at this stage, interested parties and experts will be given an opportunity to review the revised analyses.

(f) Notice of Final Rulemaking. The Department will publish a Notice of Final Rulemaking in the FEDERAL REGISTER that promulgates standard levels and explains the basis for the selection of those standards, accompanied by a final TSD.

5. Policies on Selection of Standards.

(a) Purpose. (1) Section 4 describes the process that will be used to consider new or revised energy efficiency standards and lists a number of factors and analyses that will be considered at specified points in the process. Department policies concerning the selection of new or revised standards, and decisions preliminary thereto, are described in this section.

These policies are intended to elaborate on the statutory criteria provided in section 325 of the EPCA, 42 U.S.C. 6295.
(2) The policies described below are intended to provide guidance for making the determinations required by EPCA. This statement of policy is not intended to preclude impacts analysis of any information pertinent to the statutory criteria. The Department will consider all pertinent information in determining whether a new or revised standard is consistent with the statutory criteria. Moreover, the Department will not be guided by a policy in this section if, in the particular circumstances presented, such a policy would lead to a result inconsistent with the criteria in section 325 of EPCA.

(b) Screening design options. Section 4(a)(4)
lists factors to be considered in screening design options. These factors will be considered as follows in determining whether a design option will receive any further consideration:

(1) Technological feasibility. Technologies that are not incorporated in commercial products or in working prototypes will not be considered further.

(2) Practicability to manufacture, install and service. If it is determined that mass production of a technology in commercial products and reliable installation and servicing of the technology could not be achieved on the scale necessary to serve the relevant market at the time of the effective date of the standard, then that technology will not be considered further.

(3) Impacts on product utility to consumers. If a technology is determined to have significant adverse impact on the utility of the product to significant subgroups of consumers, or result in the unavailability of any covered product type with performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as products generally available in the U.S. at the time, it will not be considered further.

(4) Safety of technologies. If it is determined that a technology will have significant adverse impacts on health or safety, it will not be considered further.

(c) Identification of candidate standard levels. Based on the results of the engineering and cost analysis of design options, DOE will identify the candidate standard levels for further analysis. Candidate standard levels will be selected as follows:

(1) Costs and savings of design options. Design options which have payback periods that exceed the average life of the product or which increase life-cycle cost in comparison to the base case, using typical fuel costs, usage and discount rates, will not be used as the basis for candidate standard levels.

(2) Further information on factors used for screening design options. If further information or analysis leads to a determination that a design option, or a combination of design options, has unacceptable impacts under the policies stated in paragraph (b) of this section, that design option or combination of design options will not be included in a candidate standard level.

(3) Selection of candidate standard levels. Candidate standard levels, which will be identified in the ANOPR and on which impact analyses will be conducted, will be based on the remaining design options.

(i) The range of candidate standard levels will typically include:
   (A) The most energy efficient combination of design options;
   (B) The combination of design options with the lowest life-cycle cost; and
   (C) A combination of design options with a payback period of not more than three years.

(ii) Candidate standard levels that incorporate technologies or fill in large gaps between efficiency levels of other candidate standard levels also may be selected.

(d) Advance notice of proposed rulemaking. New information provided in public comments on the ANOPR will be considered to determine whether any changes to the candidate standard levels are needed before proceeding to the analysis of impacts. This review, and any appropriate adjustments, will be based on the policies in paragraph (c) of this section.

(e) Selection of proposed standard. Based on the results of the analysis of impacts, DOE will select a standard level to be proposed for public comment in the ANOPR. Section 4(d)(7) lists the factors to be considered in selecting a proposed standard level. Section 325(o)(2)(A) of EPCA provides that any new or revised standard must be designed to achieve the maximum improvement in energy efficiency that is determined to be technologically feasible and economically justified.

(1) Statutory policies. The fundamental policies concerning selection of standards are established in the EPCA, including the following:

(i) A candidate standard level will not be proposed or promulgated if the Department determines that it is not technologically feasible and economically justified. See EPCA section 325(o)(3)(B). A standard level is economically justified if the benefits exceed the burdens. See EPCA section 325(o)(2)(B)(i). A standard level is rebuttably presumed to be economically justified if the payback period is three years or less. See EPCA section 325(o)(2)(B)(iii).

(ii) If the Department determines that a standard level is likely to result in the unavailability of any covered product type with performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as products generally available in the U.S. at the time, that standard level will not be proposed. See EPCA section 325(o)(4).
(iii) If the Department determines that a standard level would not result in significant conservation of energy, that standard level will not be proposed. See EPCA section 325(o)(3)(B).

(2) Selection of proposed standard on the basis of consensus stakeholder recommendations. Development of consensus proposals for new or revised standards is an effective mechanism for balancing the economic, energy, and environmental interests affected by standards. Thus, notwithstanding any other policy on selection of proposed standards, a consensus recommendation on an updated efficiency level submitted by a group that represents all interested parties will be proposed by the Department if it is determined to meet the statutory criteria.

(3) Considerations in assessing economic justification

(i) The following policies will guide the application of the economic justification criterion in selecting a proposed standard:

(A) If the Department determines that a candidate standard level would result in a negative return on investment for the industry, would significantly reduce the value of the firm, or would cause significant adverse impacts to a significant subgroup of manufacturers (including small manufacturing businesses), that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(B) If the Department determines that a candidate standard level would be the direct cause of plant closures, significant losses in domestic manufacturer employment, or significant losses of capital investment by domestic manufacturers, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(C) If the Department determines that a candidate standard level would have a significant adverse impact on the environment or energy security, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(D) If the Department determines that a candidate standard level would not result in significant energy conservation relative to non-regulatory approaches, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh the expected adverse effects.

(E) If the Department determines that a candidate standard level is not consistent with the policies relating to practicability to manufacture, consumer utility, or safety in paragraphs (b) (2), (3) and (4) of this section, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(F) If the Department determines that a candidate standard level is not consistent with the policies relating to consumer costs in paragraph (c)(1) of this section, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(G) If the Department determines that a candidate standard level will have significant adverse impacts on a significant subgroup of consumers (including low-income consumers), that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(H) If the Department or the Department of Justice determines that a candidate standard level would have significant anti-competitive effects, that standard level will be presumed not to be economically justified unless the Department determines that specifically identified expected benefits of the standard would outweigh this and any other expected adverse effects.

(ii) The basis for a determination that triggers any presumption in paragraph (e)(3)(i) of this section and the basis for a determination that an applicable presumption has been rebutted will be supported by substantial evidence in the record and the evidence and rationale for making these determinations will be explained in the NOPR.

(iii) If none of the policies in paragraph (e)(3)(i) of this section is found to be dispositive, the Department will determine whether the benefits of a candidate standard level exceed the burdens considering all the pertinent information in the record.

(f) Selection of a final standard. New information provided in the public comments on the NOPR and any analysis by the Department of Justice concerning impacts on competition of the proposed standard will be considered to determine whether any change to the proposed standard level is needed before proceeding to the final rule. The same policies used to select the proposed standard level, as described in section 5(e) above, will be used to guide the selection of the final standard level.
6. Effective Date of a Standard

The effective date for new or revised standards will be established so that the period between the publication of the final rule and the effective date is not less than any period between the dates for publication and effective date provided for in EPCA. The effective date of any revised standard will be established so that the period between the effective date of the prior standard and the effective date of such revised standard is not less than period between the two effective dates provided for in EPCA.

7. Test Procedures

(a) Identifying the need to modify test procedures. DOE, in consultation with interested parties, experts, and the National Institute of Standards and Technology, will attempt to identify any necessary modifications to established test procedures when initiating the standards development process.

(b) Developing and proposing revised test procedures. Needed modifications to test procedures will be identified in consultation with experts and interested parties early in the screening stage of the standards development process. Any necessary modifications will be proposed before issuance of an ANOPR in the standards development process.

(c) Issuing final test procedure modification. Final, modified test procedures will be issued prior to the NOPR on proposed standards.

(d) Effective date of modified test procedures. If required only for the evaluation and issuance of updated efficiency standards, modified test procedures typically will not go into effect until the effective date of updated standards.

8. Joint Stakeholder Recommendations

(a) Joint recommendations. Consensus recommendations, and supporting analyses, submitted by a representative group of interested parties will be given substantial weight by DOE in the development of a proposed rule. See section 5(e)(2). If the supporting analyses provided by the group addresses all of the statutory criteria and uses valid economic assumptions and analytical methods, DOE expects to use this supporting analyses as the basis of a proposed rule. The proposed rule will explain any deviations from the consensus recommendations from interested parties.

(b) Breadth of participation. Joint recommendations will be of most value to the Department if the participants are reasonably representative of those interested in the outcome of the standards development process, including manufacturers, consumers, utilities, states and representatives of environmental or energy efficiency interest groups.

(c) DOE support of consensus development, including impact analyses. In order to facilitate such consensus development, DOE will make available, upon request, appropriate technical and legal support to the group, and will provide copies of all relevant public documents and analyses. The Department also will consider any requests for its active participation in such discussions that the procedural requirements of the Federal Advisory Committee Act may apply to such participation.

9. Principles for the Conduct of Engineering Analysis

(a) The purpose of the engineering analysis is to develop the relationship between efficiency and cost of the subject product. The Department will use the most appropriate means available to determine the efficiency/cost relationship, including an overall system approach or engineering modeling to predict the improvement in efficiency that can be expected from individual design options as discussed in the paragraphs below. From this efficiency/cost relationship, measures such as payback, life cycle cost, and energy savings can be developed. The Department, in consultation with interested parties, will identify issues that will be examined in the engineering analysis and the types of specialized expertise that may be required. With these specifications, DOE will select appropriate contractors, subcontractors, and expert consultants, as necessary, to perform the engineering analysis and the impact analysis. Also, the Department will consider data, information and analyses received from interested parties for use in the analysis wherever feasible.

(b) The engineering analysis begins with the list of design options developed in consultation with the interested parties as a result of the screening process. In consultation with the technology/industry expert peer review group, the Department will establish the likely cost and performance improvement of each design option. Ranges and uncertainties of cost and performance will be established, although efforts will be made to minimize uncertainties by using measures such as test data or component or material supplier information where available. Estimated uncertainties will be carried forward in subsequent analyses. The use of quantitative models will be supplemented by qualitative assessments as appropriate.

(c) The next step includes identifying, modifying or developing any engineering models necessary to predict the efficiency impact of any one or combination of design options on the product. A base case configuration or starting point will be established as well as the order and combination/blend of the design options to be evaluated. The DOE, utilizing expert consultants, will
then perform the engineering analysis and develop the cost efficiency curve for the product. The cost efficiency curve and any necessary models will be subject to peer review before being issued with the ANOPR.

10. Principles for the Analysis of Impacts on Manufacturers

(a) Purpose. The purpose of the manufacturer analysis is to identify the likely impacts of efficiency standards on manufacturers. The Department will analyze the impact of standards on manufacturers with substantial input from manufacturers and other interested parties. The use of quantitative models will be supplemented by qualitative assessments by industry experts. This section describes the principles that will be used in conducting future manufacturing impact analysis.

(b) Issue identification. In the impact analysis stage (section 4(d)), the Department, in consultation with interested parties, will identify issues that will require greater consideration in the detailed manufacturer impact analysis. Possible issues may include identification of specific types or groups of manufacturers and concerns over access to technology. Specialized contractor expertise, empirical data requirements, and analytical tools required to perform the manufacturer impact analysis also would be identified at this stage.

(c) Industry characterization. Prior to initiating detailed impact studies, the Department will seek input on the present and past industry structure and market characteristics. Input on the following issues will be sought:

(1) Manufacturers and their relative market shares;
(2) Manufacturer characteristics, such as whether manufacturers make a full line of models or serve a niche market;
(3) Trends in the number of manufacturers;
(4) Financial situation of manufacturers;
(5) Trends in product characteristics and retail markets; and
(6) Identification of other relevant regulatory actions and a description of the nature and timing of any likely impacts.

(d) Cost impacts on manufacturers. The costs of labor, material, engineering, tooling, and capital are difficult to estimate, manufacturer-specific, and usually proprietary. The Department will seek input from interested parties on the treatment of cost issues. Manufacturers will be encouraged to offer suggestions as to possible sources of data and appropriate data collection methodologies. Costing issues to be addressed include:

(1) Estimates of total cost impacts, including product-specific costs (based on cost impacts estimated for the engineering analysis) and front-end investment/conversion costs for the full range of product models.

(2) Range of uncertainties in estimates of average cost, considering alternative designs and technologies which may vary cost impacts and changes in costs of material, labor and other inputs which may vary costs.

(3) Variable cost impacts on particular types of manufacturers, considering factors such as atypical sunk costs or characteristics of specific models which may increase or decrease costs.

(e) Impacts on product sales, features, prices and cost recovery. In order to make manufacturer cash flow calculations, it is necessary to predict the number of products sold and their sale price. This requires an assessment of the likely impacts of price changes on the number of products sold and on typical features of models sold. Past analyses have relied on price and shipment data generated by economic models. The Department will develop additional estimates of prices and shipments by drawing on multiple sources of data and experience including: actual shipment and pricing experience, data from manufacturers, retailers and other market experts, financial models, and sensitivity analyses. The possible impacts of candidate standard levels on consumer choices among competing fuels will be explicitly considered where relevant.

(f) Measures of impact. The manufacturer impact analysis will estimate the impacts of candidate standard levels on the net cash flow of manufacturers. Computations will be performed for the industry as a whole and for typical and atypical manufacturers. The exact nature and the process by which the analysis will be conducted will be determined by DOE, in conjunction with interested parties. Impacts to be analyzed include:

(1) Industry net present value, with sensitivity analyses based on uncertainty of costs, sales prices and sales volumes;
(2) Cash flows, by year;
(3) Other measures of impact, such as revenue, net income and return on equity, as appropriate;

The characteristics of atypical manufacturers worthy of special consideration will be determined in consultation with manufacturers and other interested parties and may include: manufacturers incurring higher or lower than average costs; and manufacturers experiencing greater or fewer adverse impacts on sales. Alternative scenarios based on other methods of estimating cost or sales impacts also will be performed, as needed.

(g) Cumulative impacts of other Federal regulatory actions. (1) The Department will recognize and seek to mitigate the overlapping effects on manufacturers of new or revised DOE standards and other regulatory actions affecting the same products. DOE will analyze and consider the impact on manufacturers of multiple product-specific regulatory actions. These factors will be considered in
setting rulemaking priorities, assessing manufacturing impacts of a particular standard, and establishing the effective date for a new or revised standard. In particular, DOE will seek to propose effective dates for new or revised standards that are appropriately coordinated with other regulatory actions to mitigate any cumulative burden.

(2) If the Department determines that a proposed standard would impose a significant impact on product manufacturers within three years of the effective date, it will work with the Department of the Treasury to arm manufacturers with the necessary tools to comply with a standard. The Department will, in addition to evaluating the impact on manufacturers of the proposed standard, assess the joint impacts of both standards on manufacturers.

(3) If the Department is directed to establish or revise standards for products that are components of other products subject to standards, the Department will consider the interaction between such standards in setting rulemaking priorities and assessing manufacturing impacts of a particular standard. The Department will assess, as part of the engineering and impact analyses, the cost of components subject to efficiency standards.

(h) Summary of quantitative and qualitative assessments. The summary of quantitative and qualitative assessments will contain a description and discussion of uncertainties. Alternative estimates of impacts, resulting from the different potential scenarios developed throughout the analysis, will be explicitly presented in the final analysis results. Key modeling and analytical tools. In its assessment of the likely impacts of standards on manufacturers, the Department will use models which are clear and understandable, feature accessible calculations, and have assumptions that are clearly explained. As a starting point, the Department will use the Government Regulatory Impact Model (GRIM). The Department will consider any enhancements to the GRIM that are suggested by interested parties. Changes are made to the GRIM methodology, DOE will provide notice and seek public input. The Department will also support the development of economic models for price and volume forecasting. Research required to update key economic data will be considered.

11. Principles for the Analysis of Impacts on Consumers

(a) Early consideration of impacts on consumer utility. The Department will consider at the earliest stages of the development of a standard whether particular design options will lessen the utility of the covered products to the consumer. See section 4(a).

(b) Impacts on product availability. The Department will determine, based on consideration of information submitted during the standard development process, whether a proposed standard is likely to result in the unavailability of any covered product type with performance characteristics (including reliability, features, sizes, capacities, and volumes that are substantially the same as products generally available in the U.S. at the time. DOE will not promulgate a standard if it concludes that it would result in such unavailability.

(c) Department of justice review. As required by law, the Department will consult with the Department of Justice Department on any lessening of competition that is likely to result from the imposition of a proposed standard and will give the views provided full consideration in assessing economic justification of a proposed standard. In addition, DOE may consult with the Department of Justice at earlier stages in the standards development process to seek to obtain preliminary views on competitive impacts.

(d) Variation in consumer impacts. The Department will use regional analysis and sensitivity analysis tools, as appropriate, to evaluate the potential distribution of impacts of candidate standards levels among different subgroups of consumers. The Department will consider impacts on significant segments of consumers in determining standards levels. Where there are significant negative impacts on identifiable subgroups, DOE will consider the efficacy of voluntary approaches as a means to achieve potential energy savings.

(e) Payback period and first cost. (1) In the assessment of consumer impacts of standards, the Department will consider Life-Cycle Cost, Payback Period and Cost of Conserved Energy to evaluate the savings in operating expenses relative to increases in purchase price. The Department intends to increase the level of sensitivity analysis and scenario analysis for future rulemakings. The results of these analyses will be carried throughout the analysis and the ensuing uncertainty described. (2) If, in the analysis of consumer impacts, the Department determines that a candidate standard level would result in a substantial increase in the product first costs to consumers or would not pay back such additional first costs through energy cost savings in less than three years, Department will specifically assess the likely impacts of such a standard on low-income households, product sales and fuel switching.

12. Consideration of Non-Regulatory Approaches

(a) The Department recognizes that voluntary or other non-regulatory efforts by manufacturers, utilities and other interested parties can result in substantial efficiency improvements. The Department intends to consider fully the likely effects of non-regulatory initiatives on product energy use.
consumer utility and life cycle costs, manufacturers, competition, utilities and the environment, as well as the distribution of these impacts among different regions, consumers, manufacturers and utilities. DOE will attempt to base its assessment on the actual impacts of such initiatives to date, but also will consider information presented regarding the impacts that any existing initiative might have in the future. Such information is likely to include a demonstration of the strong commitment of manufacturers, distribution channels, utilities or others to such voluntary efficiency improvements. This information will be used in assessing the likely incremental impacts of establishing or revising standards, in assessing appropriate effective dates for new or revised standards and in considering DOE support of non-regulatory initiatives.

(b) DOE believes that non-regulatory approaches are valuable complements to the standards program. In particular, DOE will consider pursuing voluntary programs where it appears that highly efficient products can obtain a significant market share but less efficient products cannot be eliminated altogether because, for instance, of unacceptable adverse impacts on a significant subgroup of consumers. In making this assessment, the Department will consider the success more efficient designs have had in the market, their acceptance to date, and their potential market penetration.

13. Crosscutting Analytical Assumptions

In selecting values for certain crosscutting analytical assumptions, DOE expects to continue relying upon the following sources and general principles:

(a) Underlying economic assumptions. The appliance standards analyses will generally use the same economic growth and development assumptions that underlie the most current Annual Energy Outlook (AEO) published by the Energy Information Administration (EIA).

(b) Energy price and demand trends. Analyses of the likely impact of appliance standards on typical users will generally adopt the mid-range energy price and demand scenario of the EIA’s most current AEO. The sensitivity of such estimated impacts to possible variations in future energy prices is likely to be examined using the EIA’s high and low energy price scenarios.

(c) Product-specific energy-efficiency trends, without updated standards. Product-specific energy-efficiency trends will be based on a combination of the efficiency trends forecast by the EIA’s residential and commercial demand model of the National Energy Modeling System (NEMS) and product-specific assessments by DOE and its contractors with input from interested parties.

(d) Discount rates. For residential and commercial consumers, ranges of three different real discount rates will be used. For residential consumers, the mid-range discount rate will represent DOE’s approximation of the average financing cost (or opportunity costs of reduced savings) experienced by typical consumers. Sensitivity analyses will be performed using discount rates reflecting the costs more likely to be experienced by residential consumers with little or no savings and credit card financing and consumers with substantial savings. For commercial users, a mid-range discount rate reflecting the DOE’s approximation of the average real rate of return on commercial investment will be used, with sensitivity analyses being performed using values indicative of the range of real rates of return likely to be experienced by typical commercial businesses. For national net present value calculations, DOE would use the Administration’s approximation of the average real rate of return on private investment in the U.S. economy. For manufacturer impacts, DOE plans to use a range of real discount rates which are representative of the real rates of return experienced by typical U.S. manufacturers affected by the program.

(e) Environmental impacts. The emission rates of carbon, sulfur oxides and nitrogen oxides used by DOE to calculate the physical quantities of emissions likely to be avoided by candidate standard levels will be based on the current average carbon emissions of the U.S. electric utilities and on the projected rates of emissions of sulfur and nitrogen oxides. Projected rates of emissions, if available, will be used for the estimation of any other environmental impacts. The Department will consider the effects of the proposed standards on these emissions in reaching a decision about whether the benefits of the proposed standards exceed their burdens but will not determine the monetary value of these environmental externalities.

14. Deviations, Revisions, and Judicial Review

(a) Deviations. This Appendix specifies procedures, interpretations and policies for the development of new or revised energy efficiency standards in considerable detail. As the approach described in this Appendix is applied to the development of particular standards, the Department may find it necessary or appropriate to deviate from these procedures, interpretations or policies. If the Department concludes that such deviations are necessary or appropriate in a particular situation, DOE will provide interested parties with notice of the deviation and an explanation.
Department of Energy

§ 430.41

(b) Revisions. If the Department concludes that changes to the procedures, interpretations or policies in this Appendix are necessary or appropriate, DOE will provide notice in the Federal Register of modifications to this Appendix with an accompanying explanation. DOE expects to consult with interested parties prior to any such modification.

(c) Judicial review. The procedures, interpretations, and policies stated in this Appendix are not intended to establish any new cause of action or right to judicial review.

[61 FR 36981, July 15, 1996]

Subpart D—Petitions To Exempt State Regulation From Preemption; Petitions To Withdraw Exemption of State Regulation

Source: 54 FR 6078, Feb. 7, 1989, unless otherwise noted.

§ 430.40 Purpose and scope.

(a) This subpart prescribes the procedures to be followed in connection with petitions requesting a rule that a State regulation prescribing an energy conservation standard, water conservation standard (in the case of faucets, showerheads, water closets, and urinals), or other requirement respecting energy efficiency, energy use, or water use (in the case of faucets, showerheads, water closets, and urinals) of a type or class of covered product not be preempted.

(b) This subpart also prescribes the procedures to be followed in connection with petitions to withdraw a rule exempting a State regulation prescribing an energy conservation standard, water conservation standard (in the case of faucets, showerheads, water closets, and urinals), or other requirement respecting energy efficiency, energy use, or water use (in the case of faucets, showerheads, water closets, and urinals) of a type or class of covered product.

[63 FR 13318, Mar. 18, 1998]

§ 430.41 Prescriptions of a rule.

(a) Criteria for exemption from preemption. Upon petition by a State which has prescribed an energy conservation standard, water conservation standard (in the case of faucets, showerheads, water closets, and urinals), or other requirement for a type or class of covered equipment for which a Federal energy conservation standard or water conservation standard is applicable, the Secretary shall prescribe a rule that such standard not be preempted if he determines that the State has established by a preponderance of evidence that such requirement is needed to meet unusual and compelling State or local energy interests or water interests. For the purposes of this section, the term "unusual and compelling State or local energy interests or water interests" means interests which are substantially different in nature or magnitude than those prevailing in the U.S. generally, and are such that when evaluated within the context of the State's energy plan and forecast, or water plan and forecast the costs, benefits, burdens, and reliability of energy savings or water savings resulting from the State regulation make such regulation preferable or necessary when measured against the costs, benefits, burdens, and reliability of alternative approaches to energy savings or water savings or production, including reliance on reasonably predictable market-induced improvements in efficiency of all equipment subject to the State regulation. The Secretary may not prescribe such a rule if he finds that interested persons have established, by a preponderance of the evidence, that the State's regulation will significantly burden manufacturing, marketing, distribution, sale or servicing of the covered equipment on a national basis. In determining whether to make such a finding, the Secretary shall evaluate all relevant factors including: the extent to which the State regulation will increase manufacturing or distribution costs of manufacturers, distributors, and others; the extent to which the State regulation will increase manufacturing or distribution costs of manufacturers, distributors, and others; the extent to which the State regulation will increase manufacturing or distribution costs of all equipment subject to the State regulation; the extent to which the State regulation would cause a burden to manufacturers to redesign and produce the covered product type or class; or other factors taken into consideration the extent to which the regulation would result in a reduction in the current
models, or in the projected availability of models, that could be shipped on the effective date of the regulation to the State and within the U.S., or in the current or projected sales volume of the covered product type (or class) in the State and the U.S.; and the extent to which the State regulation is likely to contribute significantly to a proliferation of State appliance efficiency requirements and the cumulative impact such requirements would have. The Secretary may not prescribe such a rule if he finds that such a rule will result in the unavailability in the State of any covered product (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the State at the time of the Secretary’s finding. The failure of some classes (or types) to meet this criterion shall not affect the Secretary’s determination of whether to prescribe a rule for other classes (or types).

(1) Requirements of petition for exemption from preemption. A petition from a State for a rule for exemption from preemption shall include the information listed in paragraphs (a)(1)(i) through (a)(1)(vi) of this section. A petition for a rule and correspondence relating to such petition shall be available for public review except for confidential or proprietary information submitted in accordance with the Department of Energy’s Freedom of Information Regulations set forth in 10 CFR part 1004:

(i) The name, address, and telephone number of the petitioner;
(ii) A copy of the State standard for which a rule exempting such standard is sought;
(iii) A copy of the State’s energy plan or water plan and forecast;
(iv) Specification of each type or class of covered product for which a rule exempting a standard is sought;
(v) Other information, if any, believed to be pertinent by the petitioner; and
(vi) Such other information as the Secretary may require.

(2) [Reserved]

(b) Criteria for exemption from preemption when energy emergency conditions or water emergency conditions (in the case of faucets, showerheads, water closets, and urinals) exist within State. Upon petition by a State which has prescribed an energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) or other requirement for a type or class of covered product for which a Federal energy conservation standard or water conservation standard is applicable, the Secretary may prescribe a rule, effective upon publication in the Federal Register, that such State regulation not be preempted if he determines that in addition to meeting the requirements of paragraph (a) of this section the State has established that: an energy emergency condition or water emergency condition exists within the State that imperils the health, safety, and welfare of its residents because of the inability of the State or utilities within the State to provide adequate quantities of gas, electric energy, or water to its residents at less than prohibitive costs; and cannot be substantially alleviated by the importation of energy or water or the use of interconnection agreements; and the State regulation is necessary to alleviate substantially such condition.

(1) Requirements of petition for exemption from preemption when energy emergency conditions or water emergency conditions (in the case of faucets, showerheads, water closets, and urinals) exist within a State. A petition from a State for a rule for exemption from preemption when energy emergency conditions or water emergency conditions exist within a State shall include the information listed in paragraphs (a)(1)(i) through (a)(1)(vi) of this section. A petition shall also include the information prescribed in paragraphs (b)(1)(i) through (b)(1)(iv) of this section, and shall be available for public review except for confidential or proprietary information submitted in accordance with the Department of Energy’s Freedom of Information Regulations set forth in 10 CFR part 1004:

(i) A description of the energy emergency condition or water emergency condition (in the case of faucets,
Department of Energy

§ 430.42

(i) The name, address and telephone number of the petitioner;
(ii) A statement of the interest of the petitioner for which a rule withdrawing an exemption is sought;
(iii) A copy of the State standard for which a rule withdrawing an exemption is sought;
(iv) Specification of each type or class of covered product for which a rule withdrawing an exemption is sought;
(v) A discussion of the factors contained in paragraph (a) of this section;
(vi) Such other information, if any, believed to be pertinent by the petitioner; and
(vii) Such other information as the Secretary may require.

(2) [Reserved]

[63 FR 13318, Mar. 18, 1998]

§ 430.42 Filing requirements.

(a) Service. All documents required to be served under this subpart shall, if mailed, be served by first class mail. Service upon a person’s duly authorized representative shall constitute service upon that person.

(b) Obligation to supply information. A person or State submitting a petition is under a continuing obligation to provide any new or newly discovered information relevant to that petition. Such information includes, but is not limited to, information regarding any other petition or request for action subsequently submitted by that person or State.

(c) The same or related matters. A person or State submitting a petition or other request for action shall state whether to the best knowledge of that petitioner the same or related issue, act, or transaction has been or presently is being considered or investigated by any State agency, department, or instrumentality.

(d) Computation of time. (1) Computing any period of time prescribed by or allowed under this subpart, the day of the action from which the designated period of time begins to run is not to be included. If the last day of the period is Saturday, or Sunday, or Federal legal holiday, the period runs until the end of the next day that is neither a Saturday, or Sunday or Federal legal holiday.
§ 430.43 Notice of petition.

(a) Promptly after receipt of a petition and its acceptance for filing, notice of such petition shall be published in the Federal Register. The notice shall set forth the availability for public review of all data and information available, and shall solicit comments, data and information with respect to the determination on the petition. Except as may otherwise be specified, the period for public comment shall be 60 days after the notice appears in the Federal Register.

(b) In addition to the material required under paragraph (a) of this section, each notice shall contain a summary of the State regulation at issue and the petitioner’s reasons for the rule sought.

§ 430.44 Consolidation.

DOE may consolidate any or all matters at issue in two or more proceedings docketed where there exist common parties, common questions of fact and law, and where such consolidation would expedite or simplify consideration of the issues. Consolidation shall not affect the right of any party to raise issues that could have been raised if consolidation had not occurred.

§ 430.45 Hearing.

The Secretary may hold a public hearing, and publish notice in the Federal Register of the date and location of the hearing, when he determines that such a hearing is necessary and
likely to result in a timely and effective resolution of the issues. A transcript shall be kept of any such hearing.

§ 430.46 Disposition of petitions.

(a) After the submission of public comments under § 430.42(a), the Secretary shall prescribe a final rule or deny the petition within 6 months after the date the petition is filed.

(b) The final rule issued by the Secretary or a determination by the Secretary to deny the petition shall include a written statement setting forth his findings and conclusions, and the reasons and basis therefor. A copy of the Secretary's decision shall be sent to the petitioner and the affected State agency. The Secretary shall publish in the Federal Register a notice of the final rule granting or denying the petition and the reasons and basis therefor.

(c) If the Secretary finds that he cannot issue a final rule within the 6-month period pursuant to paragraph (a) of this section, he shall publish a notice in the Federal Register extending such period to a date certain, but no longer than one year after the date on which the petition was filed. Such notice shall include the reasons for the delay.

§ 430.47 Effective dates of final rules.

(a) A final rule exempting a State standard from Federal preemption will be effective:

(1) Upon publication in the Federal Register if the Secretary determines that such rule is needed to meet an “energy emergency condition or water emergency condition (in the case of faucets, showerheads, water closets, and urinals)” within the State.

(2) Three years after such rule is published in the Federal Register;

(3) Five years after such rule is published in the Federal Register if the Secretary determines that such additional time is necessary due to the burdens of retooling, redesign or distribution.

(b) A final rule withdrawing a rule exempting a State standard will be effective upon publication in the Federal Register.

§ 430.48 Request for reconsideration.

(a) Any petitioner whose petition for a rule has been denied may request reconsideration within 30 days of denial. The request shall contain a statement of facts and reasons supporting reconsideration and shall be submitted in writing to the Secretary.

(b) The denial of a petition will be reconsidered only where it is alleged and demonstrated that the denial was based on error in law or fact and that evidence of the error is found in the record of the proceedings.

(c) If the Secretary fails to take action on the request for reconsideration within 30 days, the request is deemed denied, and the petitioner may seek such judicial review as may be appropriate and available.

(d) A petitioner has not exhausted other administrative remedies until a request for reconsideration has been filed and acted upon or deemed denied.

§ 430.49 Finality of decision.

(a) A decision to prescribe a rule that a State energy conservation standard, water conservation standard (in the case of faucets, showerheads, water closets, and urinals) or other requirement not be preempted is final on the date the rule is issued, i.e., signed by the Secretary. A decision to prescribe such a rule has no effect on other regulations of a covered product of any other State.

(b) A decision to prescribe a rule withdrawing a rule exempting a State standard or other requirement is final on the date the rule is issued, i.e., signed by the Secretary. A decision to deny such a petition is final on the day a denial of a request for reconsideration is issued, i.e., signed by the Secretary.

Subpart E—Small Business Exemptions

SOURCE: 54 FR 6080, Feb. 7, 1989, unless otherwise noted.
§ 430.50 Purpose and scope.

(a) This subpart establishes procedures for the submission and disposition of applications filed by manufacturers of covered consumer products with annual gross revenues that do not exceed $8 million to exempt them temporarily from all or part of energy conservation standards or water conservation standards (in the case of faucets, showerheads, water closets, and urinals) established by this part.

(b) The purpose of this subpart is to provide content and format requirements for manufacturers of covered consumer products with low annual gross revenues who desire to apply for temporary exemptions from applicable energy conservation standards or water conservation standards (in the case of faucets, showerheads, water closets, and urinals).

§ 430.51 Eligibility.

Any manufacturer of a covered product with annual gross revenues that do not exceed $8,000,000 from all its operations (including the manufacture and sale of covered products) for the 12-month period preceding the date of application may apply for an exemption. In determining the annual gross revenues of any manufacturer under this subpart, the annual gross revenue of any other person who controls, is controlled by, or is under common control with, such manufacturer shall be taken into account.

§ 430.52 Requirements for applications.

(b) An application shall be in writing and shall include the following:

(1) Name and mailing address of applicant;

(2) Whether the applicant controls, is controlled by, or is under common control with another manufacturer, and if so, the nature of that control relationship;

(3) The text or substance of the standard or portion thereof for which the exemption is sought and the length of time desired for the exemption;

(4) Information showing the annual gross revenue of the applicant for the preceding 12-month period from all of its operations (including the manufacture and sale of covered products);

(5) Information to show that failure to grant an exemption is likely to result in a lessening of competition;

(6) Such other information, if any, believed to be pertinent by the petitioner; and

(7) Such other information as the Secretary may require.

§ 430.53 Processing of applications.

(a) The applicant shall serve a copy of the application, all supporting documents and all subsequent submissions, or a copy from which confidential information has been deleted pursuant to 10 CFR 1004.11, to the Secretary, which may be made available for public review.

(b) Within fifteen (15) days of the receipt of an application, the Secretary will either accept it for filing or reject it, and the applicant will be so notified in writing. Only such applications which conform to the requirements of this subpart and which contain sufficient information for the purposes of a substantive decision will be accepted for filing. Applications which do not so conform will be rejected and an explanation provided to the applicant in writing.

(c) For the purpose of this subpart, an application is deemed to be filed on the date it is accepted for filing.

(d) Promptly after receipt of an application and its acceptance for filing, notice of such application shall be published in the Federal Register. The notice shall set forth the availability for public review of data and information available, and shall solicit comments, data and information with respect to the determination on the application. Except as may otherwise be specified, the period for public comment shall be 60 days after the notice appears in the Federal Register.
§ 430.61 Prohibited acts.

(a) Each of the following is a prohibited act pursuant to section 332 of the Act:

(1) Failure to permit access to, or copying of records required to be supplied under the Act and this rule or failure to make reports or provide other information required to be supplied under this Act and this rule;

(2) Failure of a manufacturer to supply at his expense a reasonable number of covered products to a test laboratory designated by the Secretary;

(3) Failure of a manufacturer to permit a representative designated by the Secretary to observe any testing required by the Act and this rule and inspect the results of such testing; and

(4) Distribution in commerce by a manufacturer or private labeler of any new covered product which is not in compliance with an applicable energy efficiency standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) prescribed under the Act and this rule.

(b) In accordance with section 333 of the Act, any person who knowingly violates any provision of paragraph (a) of this section may be subject to assessment of a civil penalty of no more than $110 for each violation. Each violation of paragraph (a) of this section shall constitute a separate violation.
§ 430.62 Submission of data.

(a) Certification. (1) Except as provided in paragraph (a)(2) of this section, each manufacturer or private labeler before distributing in commerce any basic model of a covered product subject to the applicable energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) set forth in subpart C of this part shall certify by means of a compliance statement and a certification report that each basic model(s) meets the applicable energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals) as prescribed in section 325 of the Act. The compliance statement, signed by the company official submitting the statement, and the certification report(s) shall be sent by certified mail to: Department of Energy, Office of Energy Efficiency and Renewable Energy, Office of Codes and Standards, Forrestal Building, 1000 Independence Avenue, SW, Washington, DC 20585–0121.

(2) Each manufacturer or private labeler of a basic model of a covered clothes washer, clothes dryer, dishwasher, faucet, showerhead, water closet, or urinal shall file a compliance statement and a certification report to DOE before [date 1 year after publication of the Final Rule].

(3) The compliance statement shall include all information specified in the format set forth in appendix A of this subpart and shall certify that:

(i) The basic model(s) complies with the applicable energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals);

(ii) All required testing has been conducted in conformance with the applicable test requirements prescribed in subpart B of this part;

(iii) All information reported in the certification report(s) is true, accurate, and complete; and

(iv) The manufacturer or private labeler is aware of the penalties associated with violations of the Act, the regulations thereunder, and 18 U.S.C. 1001 which prohibits knowingly making false statements to the Federal Government.

(4) A certification report for all basic models of a covered product (a suggested format is set forth in appendix A of this subpart) shall be submitted to DOE. The certification report shall include for each basic model the product type, product class (as denoted in § 430.32), manufacturer’s name, private labeler’s name(s) (if applicable), the manufacturer’s model number(s), and for:

(i) Central air conditioners, the seasonal energy efficiency ratio.

(ii) Central air conditioning heat pumps, the seasonal energy efficiency ratio and heating seasonal performance factor.

(iii) Clothes washers, the energy factor in ft³/kWh/cycle and capacity in ft³.

(iv) Clothes dryers, the energy factor in lbs/kWh, capacity in ft³, and voltage.

(v) Direct heating equipment, the annual fuel utilization efficiency in percent and capacity in Btu/hour.

(vi) Dishwashers, the energy factor expressed in cycles per kilowatt-hour.

(vii) Faucets, the maximum water use in gpm (L/min) or gal/cycle (L/cycle) for each faucet; or the maximum water use in gpm (L/min) or gal/cycle (L/cycle) for each flow control mechanism, with a listing of accompanied faucets by manufacturer’s model numbers.

(viii) Furnaces, the annual fuel utilization efficiency in percent.

(ix) General service fluorescent lamps, the testing laboratory’s National Voluntary Laboratory Accreditation Program (NVLAP) identification number or other NVLAP-approved accreditation identification, production date codes (and accompanying decoding scheme), the 12-month average lamp efficacy in lumens per watt, lamp wattage, and the 12-month average Color Rendering Index.
(x) Incandescent reflector lamps, the laboratory's National Voluntary Accreditation Program (NVLAP) identification number or other NVLAP-approved accreditation identification, production date codes (and accompanying decoding scheme), the 12-month average lamp efficacy in lumens per watt, and lamp wattage.

(xi) Pool heaters, the thermal efficiency in percent.

(xii) Refrigerators, refrigerator-freezers, and freezers, the annual energy use in kWh/yr and total adjusted volume in ft3.

(xiii) Room air conditioners, the energy efficiency ratio and capacity in Btu/hour.

(xiv) Showerheads, the maximum water use in gpm (L/min) with a listing of accompanied showerheads by manufacturer's model numbers.

(xv) Urinals, the maximum water use in gpf (Lpf).

(xvi) Water closets, the maximum water use in gpf (Lpf).

(xvii) Water heaters, the energy factor and rated storage volume in gallons.

(5) Copies of reports to the Federal Trade Commission which include the information specified in paragraph (a)(4) could serve in lieu of the certification report.

(b) Model Modifications. (1) Any change to a basic model which affects energy consumption or water consumption (in the case of faucets, showerheads, water closets, and urinals) constitutes the addition of a new basic model. If such change increases consumption, the new model shall be considered in compliance with the standard without any additional testing. If, however, such change reduces consumption, the new model shall be considered in compliance with the standard without any additional testing. If the reporting of discontinued models coincides with the submittal of a certification report, such information can be included in the certification report.

(c) Discontinued model. When production of a basic model has ceased and it is no longer being distributed, this shall be reported, by certified mail, to: Department of Energy, Office of Energy Efficiency and Renewable Energy, Office of Codes and Standards, Forrestal Building, 1000 Independence Avenue SW, Washington, DC 20585–0121. For each basic model, the report shall include: product type, product class, the manufacturer's name, the private labeler name(s), if applicable, and the manufacturer's model number. If the reporting of discontinued models coincides with the submittal of a certification report, such information can be included in the certification report.

(d) Maintenance of records. The manufacturer or private labeler of any covered product subject to any of the energy performance standards, water performance standards (in the case of faucets, showerheads, water closets, and urinals), or procedures prescribed in this part shall establish, maintain, and retain the records of the underlying test data for all certification testing. Such records shall be organized and indexed in a fashion which makes them readily accessible for review by DOE upon request. The records shall include the supporting test data associated with tests performed on any test units to satisfy the requirements of this subpart. The records shall be retained by the manufacturer (private labeler) for a period of two years from the date that production of the applicable model has ceased.
376

§ 430.63 10 CFR Ch. II (1–1–08 Edition)

(e) Third party representation. A manufacturer or private labeler may elect to use a third party to submit the certification report to DOE (for example a trade association or other authorized representative). Such certification reports shall include all the information specified in paragraph (a)(4) of this section. Third parties submitting certification reports shall include the names of the manufacturers or private labelers who authorized the submittal of the certification reports to DOE on their behalf. The third party representative also may submit discontinued model information on behalf of an authorizing manufacturer.

EFFECTIVE DATE NOTE: At 72 FR 59934, Oct. 22, 2007, §430.62 was amended by revising paragraphs (a)(4)(i) and (ii), effective Apr. 21, 2008. For the convenience of the user, the revised text is set forth as follows:

§ 430.62 Submission of data.

(a) * * *

(4) * * *

(i) Central air conditioners, the seasonal energy efficiency ratio. For central air conditioners whose seasonal energy efficiency ratio is based on an installation that includes a particular model of ducted air mover (e.g., furnace, air handler, blower kit, etc.), the model number of this ducted air mover must be included among the model numbers listed on the certification report.

(ii) Central air conditioning heat pumps, the seasonal energy efficiency ratio and heating seasonal performance factor. For central air conditioning heat pumps whose seasonal energy efficiency ratio and heating seasonal performance factor are based on an installation that includes a particular model of ducted air mover (e.g., furnace, air handler, blower kit, etc.), the model number of this ducted air mover must be included among the model numbers listed on the certification report.

§ 430.63 Sampling.

(a) For purposes of a certification of compliance, the determination that a basic model complies with the applicable design standard shall be based upon the incorporation of specific design requirements for clothes dryers, dishwashers, clothes washers and kitchen ranges and ovens specified in section 325 of the Act.

(b) A basic model which meets the following requirements may qualify as an “other than tested model” for purposes of the certification testing and sampling requirements:

(1) Central air conditioners: The condenser-evaporator coil combinations manufactured by the condensing unit manufacturer other than the combination likely to have the largest volume of retail sales or the condenser-coil combinations manufactured in part by a component manufacturer using the same condensing unit.

(2) For purposes of certification of “other than tested models,” as defined in paragraph (b)(1) of this section, a manufacturer may certify the basic model on the basis of computer simulation or engineering analysis as set forth in §430.23(m) of this part.

§ 430.64 Imported products.

(a) Pursuant to section 331 of the Act, any person importing any covered product into the United States shall comply with the provisions of the Act and of this part, and is subject to the remedies of this part.

(b) Any covered product offered for importation in violation of the Act and of this part shall be refused admission into the customs territory of the United States under rules issued by the Secretary of the Treasury, except that the Secretary of the Treasury may, by such rules, authorize the importation of such covered product upon such terms and conditions (including the furnishing of a bond) as may appear to the Secretary of Treasury appropriate to ensure that such covered product will not violate the Act and this part, or will be exported or abandoned to the United States.
§ 430.65 Exported products.

Pursuant to section 330 of the Act, this part shall not apply to any covered product if (a) such covered product is manufactured, sold, or held for sale for export from the United States (or such product was imported for export), unless such product is, in fact, distributed in commerce for use in the United States, and (b) such covered product, when distributed in commerce, or any container in which it is enclosed when so distributed, bears a stamp or label stating that such covered product is intended for export.

§ 430.70 Enforcement.

(a) Performance standard—(1) Test notice. Upon receiving information in writing concerning the energy performance or water performance (in the case of faucets, showerheads, water closets, and urinals) of a particular covered product of a particular manufacturer or private labeler which indicates that the covered product may not be in compliance with the applicable energy performance standard or water performance standard (in the case of faucets, showerheads, water closets, and urinals), the Secretary may conduct testing of that covered product under this subpart by means of a test notice addressed to the manufacturer in accordance with the following requirements:

(i) Such a procedure will only be followed after the Secretary or his designated representative has examined the underlying test data provided by the manufacturer and after the manufacturer has been offered the opportunity to meet with DOE to verify compliance with the applicable performance standard. A representative designated by the Secretary shall be permitted to observe any reverification procedures by this subpart, and to inspect the results of such reverification.

(ii) The test notice will be signed by the Secretary or his designee. The test notice will be mailed or delivered by DOE to the plant manager or other responsible official, as designated by the manufacturer.

(iii) The test notice will specify the model or basic model to be selected for testing, the method of selecting the test sample, the time at which testing shall be initiated, the date by which testing is scheduled to be completed and the facility at which testing will be conducted. The test notice may also provide for situations in which the selected basic model is unavailable for testing, and may include alternative basic models.

(iv) The Secretary may require in the test notice that the manufacturer of a covered product shall ship at his expense a reasonable number of units of a basic model specified in such test notice to a testing laboratory designated by the Secretary. The number of units of a basic model specified in a test notice shall not exceed twenty (20).

(v) Within 5 working days of the time units are selected, the manufacturer shall ship the specified test units of a basic model to the testing laboratory.

(2) Testing Laboratory. Whenever DOE conducts enforcement testing at a designated laboratory in accordance with a test notice under this section, the resulting test data shall constitute official test data for that basic model. Such test data will be used by DOE to make a determination of compliance or noncompliance if a sufficient number of tests have been conducted to satisfy the requirements of appendix B of this subpart.

(3) Sampling. The determination that a manufacturer's basic model complies with the applicable energy performance standard or water performance standard (in the case of faucets, showerheads, water closets, and urinals) shall be based on the testing conducted in accordance with the statistical sampling procedures set forth in appendix B of this part and the test procedures set forth in subpart B of this part.

(4) Test unit selection. A DOE inspector shall select a batch, a batch sample, and test units from the batch sample in accordance with the provisions of this paragraph and the conditions specified in the test notice.

(i) The batch may be subdivided by DOE utilizing criteria specified in the test notice, e.g., date of manufacture, component-supplier, location of manufacturing facility, or other criteria which may differentiate one unit from another within a basic model.
(ii) A batch sample of up to 20 units will then be randomly selected from one or more subdivided groups within the batch. The manufacturer shall keep on hand all units in the batch sample until such time as the basic model is determined to be in compliance or non-compliance.

(iii) Individual test units comprising the test sample shall be randomly selected from the batch sample.

(iv) All random selection shall be achieved by sequentially numbering all of the units in a batch sample and then using a table of random numbers to select the units to be tested.

(5) Test unit preparation. (i) Prior to and during testing, a test unit selected in accordance with paragraph (a)(4) of this section shall not be prepared, modified, or adjusted in any manner unless such preparation, modification, or adjustment is allowed by the applicable DOE test procedure. One test shall be conducted for each test unit in accordance with the applicable test procedures prescribed in subpart B.

(ii) No quality control, testing or assembly procedures shall be performed on a test unit, or any parts and sub-assemblies thereof, that is not performed during the production and assembly of all other units included in the basic model.

(iii) A test unit shall be considered defective if such unit is inoperative or is found to be in noncompliance due to failure of the unit to operate according to the manufacturer's design and operating instructions. Defective units, including those damaged due to shipping or handling, shall be reported immediately to DOE. DOE shall authorize testing of an additional unit on a case-by-case basis.

(6) Testing at manufacturer's option. (i) If a manufacturer's basic model is determined to be in noncompliance with the applicable energy performance standard or water performance standard (in the case of faucets, showerheads, water closets, and urinals) at the conclusion of DOE testing in accordance with the double sampling plan specified in appendix B of this subpart, the manufacturer may request that DOE conduct additional testing of the model according to procedures set forth in appendix B of this subpart. All units tested under paragraph (a)(6) of this section shall be selected and tested in accordance with the provisions given in paragraphs (a)(1) through (5) of this section.

(ii) The manufacturer shall bear the cost of all testing conducted under paragraph (a)(6) of this section.

(iv) The manufacturer shall cease distribution of the basic model being tested under the provisions of paragraph (a)(6) of this section from the time the manufacturer elects to exercise the option provided in this paragraph until the basic model is determined to be in compliance. DOE may seek civil penalties for all units distributed during such period.

(v) If the additional testing results in a determination of compliance, a notice of allowance to resume distribution shall be issued by the Department.

(b) Design standard. In the case of a design standard, a model is determined noncompliant by DOE after the Secretary or his designated representative has examined the underlying design information provided by the manufacturer and after the manufacturer has been offered the opportunity to verify compliance with the applicable design standard.

acquisition, ordering, storage, shipment, or sale of a basic model determined to be in noncompliance.

(4) The manufacturer may modify the noncompliant basic model in such manner as to make it comply with the applicable performance standard. Such modified basic model shall then be treated as a new basic model and must be certified in accordance with the provisions of this subpart; except that in addition satisfying all requirements of this subpart, the manufacturer shall also maintain records that demonstrate that modifications have been made to all units of the new basic model prior to distribution in commerce.

(b) If a basic model is not properly certified in accordance with the requirements of this subpart, the Secretary may seek, among other remedies, injunctive action to prohibit distribution in commerce of such basic model.

§ 430.72 Subpoena.

Pursuant to section 329(a) of the Act, for purposes of carrying out this part, the Secretary or the Secretary’s designee, may sign and issue subpoenas for the attendance and testimony of witnesses and the production of relevant books, records, papers, and other documents, and administer the oaths. Witnesses summoned under the provisions of this section shall be paid the same fees and mileage as are paid to witnesses in the courts of the United States. In case of contumacy by, or refusal to obey a subpoena served, upon any persons subject to this part, the Secretary may seek an order from the District Court of the United States for any District in which such person is found or resides or transacts business requiring such person to appear and give testimony, or to appear and produce documents. Failure to obey such order is punishable by such court as a contempt thereof.

§ 430.73 Remedies.

If DOE determines that a basic model of a covered product does not comply with an applicable energy conservation standard or water conservation standard (in the case of faucets, showerheads, water closets, and urinals):

(a) DOE will notify the manufacturer, private labeler or any other person as required, of this finding and of the Secretary’s intent to seek a judicial order restraining further distribution in commerce of such basic model unless the manufacturer, private labeler or any other person as required, delivers to DOE within 15 calendar days a statement, satisfactory to DOE, of the steps he will take to insure that the noncompliant model will no longer be distributed in commerce. DOE will monitor the implementation of such statement.

(b) If the manufacturer, private labeler or any other person as required, fails to stop distribution of the noncompliant model, the Secretary may seek to restrain such violation in accordance with section 334 of the Act.

(c) The Secretary shall determine whether the facts of the case warrant the assessment of civil penalties for knowing violations in accordance with section 333 of the Act.

§ 430.74 Hearings and appeals.

(a) Pursuant to section 333(d) of the Act, before issuing an order assessing a civil penalty against any person under this section, the Secretary shall provide to such person notice of the proposed penalty. Such notice shall inform such person of that person’s opportunity to elect in writing within 30 days after the date of receipt of such notice to have the procedures of paragraph (c) of this section (in lieu of those in paragraph (b) of this section) apply with respect to such assessment.

(b)(1) Unless an election is made within 30 calendar days after receipt of notice under paragraph (a) of this section, to have paragraph (c) of this section apply with respect to such penalty, the Secretary shall assess the penalty, by order, after a determination of violation has been made on the record after an opportunity for an agency hearing pursuant to section 554 of title 5, United States Code, before an administrative law judge appointed under section 3105 of such title 5. Such
§ 430.75 Confidentiality.

Pursuant to the provisions of 10 CFR 1004.11, any person submitting information or data which the person believes to be confidential and exempt law from public disclosure should submit one complete copy, and fifteen copies from which the information believed to be confidential has been deleted. In accordance with the procedures established at 10 CFR 1004.11, DOE shall make its own determination with respect to any claim that information submitted be exempt from public disclosure.

OMB Control No. 1910–1400
APPENDIX A TO SUBPART F OF PART 430—COMPLIANCE STATEMENT AND CERTIFICATION REPORT

COMPLIANCE STATEMENT

Product:
Manufacturer’s or Private Labeler’s Name and Address:

This compliance statement and all certification reports submitted are in accordance with 10 CFR Part 430 (Energy or Water Conservation Program for Consumer Products) and the Energy Policy and Conservation Act, as amended. The compliance statement is signed by a responsible official of the above named company. The basic model(s) listed in certification reports comply with the applicable energy conservation standard or water (in the case of faucets, showerheads, water closets, and urinals) conservation standard. All testing on which the certification reports are based was conducted in conformance with applicable test requirements prescribed in 10 CFR part 430 subpart B. All information reported in the certification report(s) is true, accurate, and complete. The company is aware of the penalties associated with violations of the Act, the regulations thereunder, and is also aware of the provisions contained in 18 U.S.C. 1001, which prohibits knowingly making false statements to the Federal Government.

Name of Company Official: __________________________
Signature: ______________________________________
Title: __________________________________________
Firm or Organization: ______________________________
Address: _________________________________________

For Discontinued Models:

[63 FR 13321, Mar. 18, 1998]

APPENDIX B TO SUBPART F OF PART 430—SAMPLING PLAN FOR ENFORCEMENT TESTING

Double Sampling

Step 1. The first sample size (N₁) must be four or more units.
Step 2. Compute the mean (X̄₁) of the measured energy performance or water performance (in the case of faucets, showerheads, water closets, and urinals) of the N₁ units in the first sample as follows:

\[ X̄₁ = \frac{1}{N₁} \sum_{i=1}^{N₁} x_i \]  \hspace{1cm} (1)

where (X̄₁) is the measured energy efficiency, energy or water (in the case of faucets, showerheads, water closets, and urinals) consumption of unit i.

Step 3. Compute the standard deviation (S₁) of the measured energy or water performance of the (N₁) units in the first sample as follows:

\[ S₁ = \sqrt{\frac{1}{N₁-1} \sum_{i=1}^{N₁} (x_i - X̄₁)^2} \]  \hspace{1cm} (2)

Step 4. Compute the standard error (Sₓ₁) of the measured energy or water performance of the N₁ units in the first sample as follows:

\[ Sₓ₁ = \frac{S₁}{\sqrt{N₁}} \]  \hspace{1cm} (3)

Step 5. Compute the upper control limit (UCL₁) and lower control limit (LCL₁) for the mean of the first sample using the applicable

1 Provide specific product information including, for each basic model, the manufacturer’s model numbers and the information required in §430.62(a)(4)(i) through (a)(4)(xvii)).
2 Provide manufacturer’s model number.
Determination of compliance or noncompliance can be made and a second sample size is determined by Step 7(b).

(1) If the mean of the first sample is below the lower control limit, then the basic model is in noncompliance and testing is at an end. (Do not go on to any of the steps below.)

(2) If the mean of the first sample is equal to or greater than the upper control limit, then the basic model is in compliance and testing is at an end. (Do not go on to any of the steps below.)

(3) If the sample mean is equal to or greater than the lower control limit but less than the upper control limit, then no determination of compliance or noncompliance can be made and a second sample size is determined by Step 7(a).

Step 6(b). For an Energy or Water Consumption Standard, compare the mean of the first sample ($X_{1}$) with the upper and lower control limits (UCL and LCL) to determine one of the following:

(1) If the mean of the first sample is above the upper control limit, then the basic model is in compliance and testing is at an end. (Do not go on to any of the steps below.)

(2) If the mean of the first sample is equal to or less than the lower control limit, then the basic model is in compliance and testing is at an end. (Do not go on to any of the steps below.)

(3) If the mean of the first sample is below the lower control limit but greater than the lower control limit, then no determination of compliance or noncompliance can be made and a second sample size is determined by Step 7(b).

Step 7(a). For an Energy Efficiency Standard, determine the second sample size ($N_2$) as follows:

$$n_2 = \left( \frac{ts_1}{0.05 \text{ EPS}} \right)^2 - n_1$$

where $s_1$ and $t$ have the values used in Steps 4 and 5, respectively. The term "0.05 EPS" is the difference between the applicable energy efficiency standard and 95 percent of the standard, where 95 percent of the standard is taken as the lower control limit.

Step 7(b). For an Energy or Water Consumption Standard, determine the second sample size ($N_2$) as follows:

$$n_2 = \left( \frac{ts_1}{0.05 \text{ EPS}} \right)^2 - n_1$$

where $s_1$ and $t$ have the values used in Steps 4 and 5, respectively. The term "0.05 EPS" is the difference between the applicable energy efficiency standard and 95 percent of the standard, where 95 percent of the standard is taken as the lower control limit.

This procedure yields a sufficient combined sample size ($N_1 + N_2$) to give an estimated 97.5 percent probability of obtaining a determination of compliance when the true mean is equal to the applicable standard. Given the solution value of $N_2$, determine one of the following:

(1) If the value of $N_2$ is less than or equal to zero and if the mean energy efficiency of the first sample ($X_{1}$) is either equal to or greater than the lower control limit (LCL) or equal to or greater than 95 percent of the applicable energy efficiency standard (EES), whichever is greater, i.e., if $N_2 \leq 0$ and $X_{1} \geq \text{min} (LCL, 0.95 \text{ EES})$, the basic model is in compliance and testing is at an end.

(2) If the value of $N_2$ is less than or equal to zero and the mean energy efficiency of the first sample ($X_{1}$) is less than the lower control limit (LCL) or less than 95 percent of the applicable energy efficiency standard (EES), whichever is greater, i.e., if $N_2 \leq 0$ and $X_{1} < \text{min} (LCL, 0.95 \text{ EES})$, the basic model is in noncompliance and testing is at an end.

This procedure yields a sufficient combined sample size ($N_1 + N_2$) to give an estimated 97.5 percent probability of obtaining a determination of compliance when the true mean consumption is equal to the applicable standard. Given the solution value of $N_2$, determine one of the following:

(1) If the value of $N_2$ is less than or equal to zero and the mean energy or water consumption of the first sample ($X_{1}$) is either equal to or less than the upper control limit (UCL) or equal to or less than 105 percent of the applicable energy or water performance standard (EPS), whichever is less, i.e., if $N_2 \leq 0$ and $X_{1} \leq \text{min} (UCL, 1.05 \text{ EPS})$, the basic model is in compliance and testing is at an end.

(2) If the value of $N_2$ is less than or equal to zero and the mean energy or water consumption of the first sample ($X_{1}$) is greater than the upper control limit (UCL) or more than 105 percent of the applicable energy or water performance standard (EPS), whichever is
Department of Energy

less, i.e., if \( N_2 < 0 \) and \( x_2 > \min \{UCL_{EPS}, 1.05 \ EES\} \), the basic model is in noncompliance and testing is at an end.

(3) If the value of \( N_2 \) is greater than zero, then the value of the second sample size is determined to be the smallest integer equal to or greater than the solution value of \( N_2 \) for equation (6b). If the value of \( N_2 \) so computed is greater than \( 20 - n_1 \), set \( N_2 \) equal to \( 20 - n_1 \).

Step 8. Compute the combined mean \( x_2 \) of the measured energy or water performance of the \( n_1 \) and \( n_2 \) units of the combined first and second samples as follows:

\[
\bar{x}_2 = \frac{1}{n_1 + n_2} \left( \sum_{i=1}^{n_1} x_i + n_2 \right)
\]

(7)

Step 9. Compute the standard error \( s_2 \) of the measured energy or water performance of the \( n_1 \) and \( n_2 \) units in the combined first and second samples as follows:

\[
s_2 = \frac{s_1}{\sqrt{n_1 + n_2}}
\]

NOTE: \( s_1 \) is the value obtained in Step 3.

Step 10(a). For an Energy Efficiency Standard, compute the lower control limit \( LCL_{EES} \) for the mean of the combined first and second samples using the DOE energy efficiency standard \( (EES) \) as the desired mean and a one-tailed probability level of 97.5 percent (equivalent to the two-tailed probability level of 95 percent used in Step 5) as follows:

\[
LCL_{EES} = EES - t_{s_2}
\]

(9a)

where the t-statistic has the value obtained in Step 5.

Step 10(b). For an Energy or Water Consumption Standard, compute the upper control limit \( UCL_{EPS} \) for the mean of the combined first and second samples using the DOE energy or water performance standard \( (EPS) \) as the desired mean and a one-tailed probability level of 97.5 percent (equivalent to the two-tailed probability level of 95 percent used in Step 5) as follows:

\[
UCL_{EPS} = EPS + t_{s_2}
\]

(9b)

where the t-statistic has the value obtained in Step 5.

Step 11(a). For an Energy Efficiency Standard, compare the combined sample mean \( x_2 \) to the lower control limit \( LCL_{EES} \) to find one of the following:

(1) If the mean of the combined sample \( x_2 \) is less than the lower control limit \( LCL_{EES} \) or 95 percent of the applicable energy efficiency standard \( (EES) \), whichever is greater, i.e., if \( x_2 < \min \{LCL_{EES}, 0.95 \ EES\} \), the basic model is in noncompliance and testing is at an end.

(2) If the mean of the combined sample \( x_2 \) is equal to or greater than the lower control limit \( LCL_{EES} \) or 95 percent of the applicable energy efficiency standard \( (EES) \), whichever is greater, the basic model is in compliance and testing is at an end.

Step 11(b). For an Energy or Water Consumption Standard, compare the combined sample mean \( x_2 \) to the upper control limit \( UCL_{EPS} \) to find one of the following:

(1) If the mean of the combined sample \( x_2 \) is greater than the upper control limit \( UCL_{EPS} \) or 105 percent of the applicable energy or water performance standard \( (EPS) \), whichever is less, i.e., if \( x_2 > \min \{UCL_{EPS}, 1.05 \ EPS\} \), the basic model is in noncompliance and testing is at an end.

(2) If the mean of the combined sample \( x_2 \) is equal to or less than the upper control limit \( UCL_{EPS} \) or 105 percent of the applicable energy or water performance standard \( (EPS) \), whichever is less, i.e., if \( x_2 < \min \{UCL_{EPS}, 1.05 \ EPS\} \), the basic model is in compliance and testing is at an end.

Manufacturer-Option Testing

If a determination of non-compliance is made in Steps 6, 7 or 11, the manufacturer may request that additional testing be conducted, in accordance with the following procedures.

Step A. The manufacturer requests that an additional number, \( N_3 \), of units be tested, with \( N_3 \) chosen such that \( n_1 + n_2 + N_3 \), does not exceed 20.

Step B. Compute the mean energy or water performance, standard error, and lower or upper control limit of the new combined sample in accordance with the procedures prescribed in Steps 8, 9, and 10, above.

Step C. Compare the mean performance of the new combined sample to the revised lower or upper control limit to determine one of the following:

a.1 For an Energy Efficiency Standard, if the mean of the new combined sample is equal to or greater than the lower control limit or 95 percent of the applicable energy efficiency standard, whichever is greater, the basic model is in compliance and testing is at an end.

a.2 For an Energy or Water Consumption Standard, if the new combined sample mean is equal to or less than the lower control limit or 95 percent of the applicable energy or water consumption standard, whichever is less, the basic model is in compliance and testing is at an end.

b.1 For an Energy Efficiency Standard, if the new combined sample mean is less than the lower control limit or 95 percent of the applicable energy efficiency standard, whichever is greater, and the value of \( N_1 n_1 + N_2 n_2 + N_3 \), is less than 20, the manufacturer may request that additional units be tested. The total of all units tested may not exceed 20. Steps A, B, and C are then repeated.
b.2. For an Energy or Water Consumption Standard, if the new combined sample mean is greater than the upper control limit or 105 percent of the applicable energy or water consumption standard, whichever is less, and the value of \(N_1 + N_2 + N_3\) is less than 20, the manufacturer may request that additional units be tested. The total of all units tested may not exceed 20. Steps A, B, and C are then repeated.

c. Otherwise, the basic model is determined to be in noncompliance.

PART 431—ENERGY EFFICIENCY PROGRAM FOR CERTAIN COMMERCIAL AND INDUSTRIAL EQUIPMENT

Subpart A—General Provisions

Sec.
431.1 Purpose and scope.
431.2 Definitions.

Subpart B—Electric Motors

431.11 Purpose and scope.
431.12 Definitions.

test procedures, materials incorporated by reference.
431.15 Materials incorporated by reference.
431.16 Test procedures for the measurement of energy efficiency.
431.17 Determination of efficiency.
431.18 Testing laboratories.
431.19 Department of Energy recognition of accreditation bodies.
431.20 Department of Energy recognition of nationally recognized certification programs.
431.21 Procedures for recognition and withdrawal of recognition of accreditation bodies and certification programs.

Energy Conservation Standards

431.25 Energy conservation standards and effective dates.
431.26 Preemption of State regulations.
Labeling

431.30 Applicability of labeling requirements.
431.31 Labeling requirements.
431.32 Preemption of State regulations.

Certification

431.35 Applicability of certification requirements.
431.36 Compliance Certification.

Subpart C—Commercial Refrigerators, Freezers and Refrigerator-Freezers

431.61 Purpose and scope.
431.62 Definitions concerning commercial refrigerators, freezers and refrigerator-freezers.

test procedures.
431.63 Materials incorporated by reference.
431.64 Uniform test method for the measurement of energy consumption of commercial refrigerators, freezers, and refrigerator-freezers.

Energy Conservation Standards

431.66 Energy conservation standards and their effective dates.

Subpart D—Commercial Warm Air Furnaces

431.71 Purpose and scope.
431.72 Definitions concerning commercial warm air furnaces.

test procedures.
431.73 Materials incorporated by reference.
431.74 Uniform test method for the measurement of energy efficiency of commercial warm air furnaces.

Energy Conservation Standards

431.77 Energy conservation standards and their effective dates.

Subpart E—Commercial Packaged Boilers

431.81 Purpose and scope.
431.82 Definitions concerning commercial packaged boilers.

test procedures.
431.83 Materials incorporated by reference.
431.84 Uniform test method for the measurement of energy efficiency of commercial packaged boilers.

Energy Conservation Standards

431.87 Energy conservation standards and their effective dates.

Subpart F—Commercial Air Conditioners and Heat Pumps

431.91 Purpose and scope.

384
Department of Energy

Pt. 431

431.92 Definitions concerning commercial air conditioners and heat pumps.

TEST PROCEDURES

431.95 Materials incorporated by reference.

431.96 Uniform test method for the measurement of energy efficiency of small, large, and very large commercial package air conditioning and heating equipment, packaged terminal air conditioners, and packaged terminal heat pumps.

431.97 Energy efficiency standards and their effective dates.

Subpart G—Commercial Water Heaters, Hot Water Supply Boilers and Unfired Hot Water Storage Tanks

431.101 Purpose and scope.

431.102 Definitions concerning commercial water heaters, hot water supply boilers, and unfired hot water storage tanks.

TEST PROCEDURES

431.106 Uniform test method for the measurement of energy efficiency of commercial water heaters and hot water supply boilers (other than commercial heat pump water heaters).

431.107 Uniform test method for the measurement of energy efficiency of commercial heat pump water heaters [Reserved]

ENERGY CONSERVATION STANDARDS

431.110 Energy conservation standards and their effective dates.

Subpart H—Automatic Commercial Ice Makers

431.131 Purpose and scope.

431.132 Definitions concerning automatic commercial ice makers.

TEST PROCEDURES

431.133 Materials incorporated by reference.

431.134 Uniform test methods for the measurement of energy consumption and water consumption of automatic commercial ice makers.

ENERGY CONSERVATION STANDARDS

431.136 Energy conservation standards and their effective dates.

Subpart I—Commercial Clothes Washers

431.151 Purpose and scope.

431.152 Definitions concerning commercial clothes washers.

TEST PROCEDURES

431.154 Test procedures.
§ 431.1 Purpose and scope.

This part establishes the regulations for the implementation of provisions relating to commercial and industrial equipment in Part B of Title III of the Energy Policy and Conservation Act (42 U.S.C. 6291–6309) and in Part C of Title III of the Energy Policy and Conservation Act (42 U.S.C. 6311–6317), which establishes an energy conservation program for certain commercial and industrial equipment.

[70 FR 60414, Oct. 18, 2005]

§ 431.2 Definitions.

The following definitions apply for purposes of this part. Any words or terms not defined in this Section or elsewhere in this Part shall be defined as provided in Section 340 of the Act.
§ 431.11 Purpose and scope.

This subpart contains energy conservation requirements for electric motors. It contains test procedures that EPCA requires DOE to prescribe, related requirements, energy conservation standards prescribed by EPCA, labeling rules, and compliance procedures. It also identifies materials incorporated by reference in this part.

§ 431.12 Definitions.

The following definitions apply for purposes of this subpart, and of subparts K through M of this part. Any words or terms not defined in this Section or elsewhere in this Part shall be defined as provided in Section 340 of the Act.

Accreditation means recognition by an accreditation body that a laboratory is competent to test the efficiency of electric motors according to the scope and procedures given in Test Method B of Institute of Electrical and Electronics Engineers (IEEE) Standard 112–1996, Test Procedure for Polyphase Induction Motors and Generators, and Test Method (1) of CSA Standard C390–93, Energy Efficient Test Methods for Three-Phase Induction Motors. (Incorporated by reference, see §431.15)

Accreditation body means an organization or entity that conducts and administers an accreditation system and grants accreditation.

Accreditation system means a set of requirements to be fulfilled by a testing laboratory, as well as rules of procedure and management, that are used to accredit laboratories.

Accredited laboratory means a testing laboratory to which accreditation has been granted.

Alternative efficiency determination method or AEDM means, with respect to an electric motor, a method of calculating the total power loss and average full load efficiency.

Average full load efficiency means the arithmetic mean of the full load efficiencies of a population of electric motors of duplicate design, where the full load efficiency of each motor in the population is the ratio (expressed as a percentage) of the motor’s useful power output to its total power input when the motor is operated at its full rated
§ 431.12

Electric motor load, rated voltage, and rated frequency.

Basic model means, with respect to an electric motor, all units of a given type of electric motor (or class thereof) manufactured by a single manufacturer, and which have the same rating, have electrical characteristics that are essentially identical, and do not have any differing physical or functional characteristics which affect energy consumption or efficiency. For the purpose of this definition, “rating” means one of the 113 combinations of an electric motor’s horsepower (or standard kilowatt equivalent), number of poles, and open or enclosed construction, with respect to which § 431.25 prescribes nominal full load efficiency standards.

Certificate of conformity means a document that is issued by a certification program, and that gives written assurance that an electric motor complies with the energy efficiency standard applicable to that motor, as specified in § 431.25.

Certification program means a certification system that determines conformity by electric motors with the energy efficiency standards prescribed by and pursuant to the Act.

Certification system means a system, that has its own rules of procedure and management, for giving written assurance that an electric motor complies with the energy efficiency standard applicable to that motor.

CSA means CSA International.

Definite purpose motor means any motor designed in standard ratings with standard operating characteristics or standard mechanical construction for use under service conditions other than usual, such as those specified in National Electrical Manufacturers Association (NEMA) Standards Publication MG1-1993 (MG1), Motors and Generators, with Revisions 1, 2, 3, and 4, (Incorporated by reference, see § 431.15) pertaining to the terms “induction motor,” “squirrel-cage,” “NEMA Design A,” “NEMA Design B,” and “continuous duty” respectively.

(1) “Electric motor” means a machine which converts electrical power into rotational mechanical power and which:

(i) Is a general purpose motor, including but not limited to motors with explosion-proof construction;

(ii) Is a single speed, induction motor (MG1);

(iii) Is rated for continuous duty (MG1) operation, or is rated duty type S1 (International Electrotechnical Commission (IEC));

(iv) Contains a squirrel-cage (MG1) or cage (IEC) rotor, and has foot-mounting, including foot-mounting with flanges or detachable feet;

(v) Is built in accordance with NEMA T-frame dimensions (MG1), or IEC metric equivalents (IEC);

(vi) Has performance in accordance with NEMA Design A (MG1) or B (MG1) characteristics, or equivalent designs such as IEC Design N (IEC); and

(vii) Operates on polyphase alternating current 60-Hertz sinusoidal power, and:

(A) Is rated 230 volts or 460 volts, or both, including any motor that is rated at multi-voltages that include 230 volts or 460 volts, or

(B) Can be operated on 230 volts or 460 volts, or both.

(2) Terms in this definition followed by the parenthetical “MG1” must be construed with reference to provisions in NEMA Standards Publication MG1-1993, Motors and Generators, with Revisions 1, 2, 3 and 4, (Incorporated by reference, see § 431.15) as follows:

(i) Section I, General Standards Applying to All Machines, Part 1, Referenced Standards and Definitions, paragraphs 1.16.1, 1.16.1.1, 1.17.1.1, 1.17.1.2, and 1.40.1 (Incorporated by reference, see § 431.15) pertain to the terms “induction motor,” “squirrel-cage,” “NEMA Design A,” “NEMA Design B,” and “continuous duty” respectively.

(ii) Section I, General Standards Applying to All Machines, Part 4, Dimensions, Tolerances, and Mounting, paragraph 4.01 and Figures 4-1, 4-2, 4-3, and 4-4 (Incorporated by reference, see § 431.15) pertain to “NEMA T-frame dimensions;”

(iii) Section II, Small (Fractional) and Medium (Integral) Machines, Part 11, Dimensions—AC and DC Small and Medium
Machines, paragraphs 11.01.2, 11.31 (except the lines for frames 447T, 447TS, 449T and 449TS), 11.32, 11.34 (except the line for frames 447TC and 449TC, and the line for frames 447SC and 449SC), 11.35, and 11.36 (except the line for frames 447TD and 449TD, and the line for frames 447TSD and 449TSD), and Table 11–1, (Incorporated by reference, see §431.15) pertain to “NEMA T-frame dimensions;” and

(iv) Section II, Small (Fractional) and Medium (Integral) Machines, Part 12, Tests and Performance—AC and DC Motors, paragraphs 12.35.1, 12.35.5, 12.38.1, 12.39.1, and 12.40.1, and Table 12–2, (Incorporated by reference, see §431.15) pertain both to “NEMA Design A” and “NEMA Design B.”

(3) Terms in this definition followed by the parenthetical “IEC” must be construed with reference to provisions in IEC Standards as follows:

(i) IEC Standard 60034–1 (1996), Rotating electrical machines, Part 1: Rating and performance, with Amendment 1 (1997), Section 3: Duty, clause 3.2.1 and figure 1 (Incorporated by reference, see §431.15) pertain to “duty type S1”;

(iii) IEC Standard 60072–1 (1991), Dimensions and output series for rotating electrical machines—Part 1: Frame numbers 56 to 400 and flange numbers 55 to 1080, clauses 2, 3, 4.1, 6.1, 7, and 10, and Tables 1, 2 and 4, (Incorporated by reference, see §431.15) pertain to “IEC metric equivalents” to “T-frame” dimensions; and

(iv) IEC Standard 60034–12 (1980), Rotating electrical machines, Part 12: Starting performance of single-speed three-phase cage induction motors for voltages up to and including 660 V, with Amendment 1 (1992) and Amendment 2 (1995), clauses 1, 2, 3.1, 4.5, and 6, and Tables 1, 2, and 3, (Incorporated by reference, see §431.15) pertain to “IEC Design N.”

Enclosed motor means an electric motor so constructed as to prevent the free exchange of air between the inside and outside of the case but not sufficiently enclosed to be termed airtight.

General purpose motor means any motor which is designed in standard ratings with either:

(1) Standard operating characteristics and standard mechanical construction for use under usual service conditions, such as those specified NEMA Standards Publication MG1–1993, paragraph 14.02, “Usual Service Conditions,” (Incorporated by reference, see §431.15) and without restriction to a particular application or type of application; or

(2) Standard operating characteristics or standard mechanical construction for use under unusual service conditions, such as those specified in NEMA Standards Publication MG1–1993, paragraph 14.03, “Unusual Service Conditions,” (Incorporated by reference, see §431.15) or for a particular type of application, and which can be used in most general purpose applications.

IEC means the International Electrotechnical Commission.

IEEE means the Institute of Electrical and Electronics Engineers, Inc.

NEMA means the National Electrical Manufacturers Association.

Nominal full load efficiency means, with respect to an electric motor, a representative value of efficiency selected from Column A of Table 12–8, NEMA Standards Publication MG1–1993, (Incorporated by reference, see §431.15), that is not greater than the average full load efficiency of a population of motors of the same design.

Open motor means an electric motor having ventilating openings which permit passage of external cooling air over and around the windings of the machine.

Special purpose motor means any motor, other than a general purpose motor or definite purpose motor, which has special operating characteristics or special mechanical construction, or both, designed for a particular application.

Total power loss means that portion of the energy used by an electric motor not converted to rotational mechanical power, expressed in percent.
§ 431.15 Materials incorporated by reference.

(a) General. We incorporate by reference the following test procedures into Subpart B of Part 431. The material listed in paragraph (b) of this section has been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR 51. Any subsequent amendment to a standard by the standard-setting organization will not affect the DOE test procedures unless and until amended by DOE. Material is incorporated as it exists on the date of the approval and a notice of any change in the material will be published in the Federal Register.

(b) List of standards incorporated by reference.

(1) The following provisions of National Electrical Manufacturers Association Standards Publication MG1–1993, Motors and Generators, with Revisions 1, 2, 3 and 4, IBR approved for §§ 431.12; 431.31 and appendix B to subpart B of Part 431:

(i) Section I, General Standards Applying to All Machines, Part 1, Referenced Standards and Definitions, paragraphs 1.16.1, 1.16.1.1, 1.17.1.1, 1.17.1.2, and 1.40.1, IBR approved for §431.12; 431.31 and appendix B to subpart B of Part 431;

(ii) Section I, General Standards Applying to All Machines, Part 4, Dimensions, Tolerances, and Mounting, paragraphs 4.01 and Figures 4–1, 4–2, 4–3, and 4-4, IBR approved for §431.12;

(iii) Section II, Small (Fractional) and Medium (Integral) Machines, Part 11, Dimensions—AC and DC Small and Medium Machines, paragraphs 11.01.2, 11.31 (except the lines for frames 447T, 447TS, 449T and 449TS), 11.32, 11.34 (except the line for frames 447TC and 449TC, and the line for frames 447TC and 449TC SC), 11.35, and 11.36 (except the line for frames 447TD and 449TD, and the line for frames 447SD and 449SD), and Table 11–1, IBR approved for §431.12;

(iv) Section II, Small (Fractional) and Medium (Integral) Machines, Part 12, Tests and Performance—AC and DC Motors, paragraphs 12.35.1, 12.35.5, 12.38.1, 12.39.1, and 12.40.1, 12.38.1, and Tables 12–2 and 12–8, IBR approved for §431.12; and

(v) Section II, Small (Fractional) and Medium (Integral) Machines, Part 14, Application Data—AC and DC Small and Medium Machines, paragraphs 14.02 and 14.03, IBR approved for §431.12.

(2) Institute of Electrical and Electronics Engineers, Inc., Standard 112–1996, Test Procedure for Polyphase Induction Motors and Generators, Test Method B, Input-Output with Loss Segregation, and the correction to the calculation at item (28) in Section 10.2 Form B–Test Method B issued by IEEE on January 20, 1998. (Note: Paragraph 2 of appendix A to subpart B of Part 431 sets forth modifications to this Standard when it is used for purposes of Part 431 and EPAct, IBR approved for §§431.12; 431.19; 431.20; appendix B to subpart B of Part 431.

(7) International Electrotechnical Commission Standard 60034–12 (1980), Rotating Electrical Machines, Part 12: Starting performance of single-speed three-phase cage induction motors for voltages up to and including 660 V, with Amendment 1 (1992) and Amendment 2 (1995), clauses 1, 2, 3, 1, 4, 5, and 6,
Tables I, II, and III, IBR approved for § 431.12.

(c) Inspection of standards. The standards incorporated by reference are available for inspection at:

(1) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html;

(d) Availability of standards. Standards incorporated by reference may be obtained from the following sources:

(1) Copies of IEEE Standard 112–1996 can be obtained from the Institute of Electrical and Electronics Engineers, Inc., 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855–1331, 1–800–678-IEEE (4333);

(2) Copies of NEMA Standards Publication MG1–1993 with Revisions 1, 2, 3, and 4, and copies of International Electrotechnical Commission standards can be obtained from Global Engineering Documents, 15 Inverness Way East, Englewood, Colorado 80112–5776, 1–800–854–7179 (within the U.S.) or (303) 397–7956 (international).

(e) Reference standards—(1) General. The standards listed in this paragraph are referred to in the DOE procedures for testing laboratories, and recognition of accreditation bodies and certification programs but are not incorporated by reference. These sources are given here for information and guidance.

(ii) ISO/IEC Guide 25, “General requirements for the competence of calibration and testing laboratories.”

(iii) ISO Guide 27, “Guidelines for corrective action to be taken by a certification body in the event of either misapplication of its mark of conformity to a product, or products which bear the mark of the certification body being found to subject persons or property to risk.”

(v) ISO/IEC Guide 58, “Calibration and testing laboratory accreditation systems—General requirements for operation and recognition.”

(vi) ISO/IEC Guide 65, “General requirements for bodies operating product certification systems.”

§ 431.16 Test procedures for the measurement of energy efficiency.

For purposes of 10 CFR Part 431 and EPCA, the test procedures for measuring the energy efficiency of an electric motor shall be the test procedures specified in appendix B to this subpart B.

§ 431.17 Determination of efficiency.

When a party determines the energy efficiency of an electric motor in order to comply with an obligation imposed on it by or pursuant to Part C of Title III of EPCA, 42 U.S.C. 6311–6316, this Section applies. This section does not apply to enforcement testing conducted pursuant to § 431.192.

(a) Provisions applicable to all electric motors—(1) General requirements. The average full load efficiency of each basic model of electric motor must be determined either by testing in accordance with § 431.16 of this subpart, or by application of an alternative efficiency determination method (AEDM) that meets the requirements of paragraphs (a)(2) and (3) of this section, provided, however, that an AEDM may be used to determine the average full load efficiency of one or more of a manufacturer’s basic models only if the average full load efficiency of at least five of its
In identifying these five basic models, any electric motor that does not comply with § 431.25 shall be excluded from consideration.

(2) Alternative efficiency determination method. An AEDM applied to a basic model must be:

(i) Derived from a mathematical model that represents the mechanical and electrical characteristics of that basic model, and

(ii) Based on engineering or statistical analysis, computer simulation or modeling, or other analytic evaluation of performance data.

(3) Substantiation of an alternative efficiency determination method. Before an AEDM is used, its accuracy and reliability must be substantiated as follows:

(i) The AEDM must be applied to at least five basic models that have been tested in accordance with § 431.16, and

(ii) The predicted total power loss for each such basic model, calculated by applying the AEDM, must be within plus or minus ten percent of the mean total power loss determined from the testing of that basic model.

(4) Subsequent verification of an AEDM. (i) Each manufacturer shall periodically select basic models representative of those to which it has applied an AEDM, and for each basic model selected shall either:

(A) Subject a sample of units to testing in accordance with § 431.16 and § 431.17(b)(2) by an accredited laboratory that meets the requirements of § 431.18;

(B) Have a certification body recognized under § 431.20 certify its nominal full load efficiency; or

(C) Have an independent state-registered professional engineer, who is qualified to perform an evaluation of electric motor efficiency in a highly competent manner and who is not an employee of the manufacturer, review the manufacturer’s representations and certify that the results of the AEDM accurately represent the total power loss and nominal full load efficiency of the basic model.

(ii) Each manufacturer that has used an AEDM under this section shall have available for inspection by the Department of Energy records showing: the method or methods used; the mathematical model, the engineering or statistical analysis, computer simulation or modeling, and other analytic evaluation of performance data on which the AEDM is based; complete test data, product information, and related information that the manufacturer has generated or acquired pursuant to paragraphs (a)(3) and (a)(4)(i) of this section; and the calculations used to determine the average full load efficiency and total power losses of each basic model to which the AEDM was applied.

(iii) If requested by the Department, the manufacturer shall conduct simulations to predict the performance of particular basic models of electric motors specified by the Department, analyses of previous simulations conducted by the manufacturer, sample testing of basic models selected by the Department, or a combination of the foregoing.

(5) Use of a certification program or accredited laboratory. (i) A manufacturer may have a certification program, that DOE has classified as nationally recognized under § 431.20, certify the nominal full load efficiency of a basic model of electric motor, and issue a certificate of conformity for the motor.

(ii) For each basic model for which a certification program is not used as described in paragraph (a)(5)(i) of this section, any testing of the motor pursuant to paragraphs (a)(1) through (3) of this section to determine its energy efficiency must be carried out in accordance with paragraph (b) of this section, in an accredited laboratory that meets the requirements of § 431.18. (This includes testing of the basic model, pursuant to paragraph (a)(3)(i) of this section, to substantiate an AEDM.)

(b) Additional testing requirements applicable when a certification program is not used—(1) Selection of basic models for testing. (i) Basic models must be selected for testing in accordance with the following criteria:

(A) Two of the basic models must be among the five basic models with the highest unit volumes of production by the manufacturer in the prior year, or during the prior 12 calendar month period beginning in 1997, whichever is later;
(B) The basic models should be of different horsepowers without duplication;
(C) The basic models should be of different frame number series without duplication; and
(D) Each basic model should be expected to have the lowest nominal full load efficiency among the basic models with the same rating ("rating" as used here has the same meaning as it has in the definition of "basic model").

(ii) In any instance where it is impossible for a manufacturer to select basic models for testing in accordance with all of these criteria, the criteria shall be given priority in the order in which they are listed. Within the limits imposed by the criteria, basic models shall be selected randomly.

(2) Selection of units for testing. For each basic model selected for testing, a sample of units shall be selected at random and tested. The sample shall be comprised of production units of the basic model, or units that are representative of such production units. The sample size shall be not fewer than five units, except that when fewer than five units of a basic model would be produced over a reasonable period of time (approximately 180 days), then each unit shall be tested. In a test of compliance with a represented average or nominal efficiency:

(i) The average full-load efficiency of the sample \( \bar{X} \) which is defined by

\[
\bar{X} = \frac{1}{n} \sum_{i=1}^{n} X_i,
\]

where \( X_i \) is the measured full-load efficiency of unit \( i \) and \( n \) is the number of units tested, shall satisfy the condition:

\[
\bar{X} \geq \frac{100}{1 + 1.5 \left( \frac{100}{RE} - 1 \right)}
\]

where \( RE \) is the represented nominal full-load efficiency, and

(ii) The lowest full-load efficiency in the sample \( X_{\min} \), which is defined by

\[
X_{\min} = \min (X_i)
\]

shall satisfy the condition

\[
X_{\min} \geq \frac{100}{1 + 1.15 \left( \frac{100}{RE} - 1 \right)}
\]

(3) Substantiation of an alternative efficiency determination method. The basic models tested under §431.17(a)(3)(i) must be selected for testing in accordance with paragraph (b)(1) of this section, and units of each such basic model must be tested in accordance with paragraph (b)(2) of this section by an accredited laboratory that meets the requirements of §431.18.

§ 431.18 Testing laboratories.

(a) Testing pursuant to §431.17(a)(5)(ii) must be conducted in an accredited laboratory for which the accreditation body was:

(1) The National Institute of Standards and Technology/National Voluntary Laboratory Accreditation Program (NIST/NVLAP); or
(2) A laboratory accreditation body having a mutual recognition arrangement with NIST/NVLAP; or
(3) An organization classified by the Department, pursuant to §431.19, as an accreditation body.

(b) NIST/NVLAP is under the auspices of the National Institute of Standards and Technology (NIST) which is part of the U.S. Department of Commerce. NIST/NVLAP accreditation is granted on the basis of conformance with criteria published in 15 CFR Part 285, The National Voluntary Laboratory Accreditation Program Procedures and General Requirements. NIST Handbook 150-10, August 1995, presents the technical requirements of the National Voluntary Laboratory Accreditation Program for the Efficiency of Electric Motors field of accreditation. This handbook supplements NIST Handbook 150, National Voluntary Laboratory Accreditation Program Procedures and General Requirements, which contains 15 CFR Part 285 plus all general NIST/NVLAP procedures, criteria, and policies. Changes in NIST/NVLAP’s criteria, procedures, policies, standards or other bases for granting accreditation, occurring subsequent to the initial effective
§ 431.19 Department of Energy recognition of accreditation bodies.

(a) Petition. To be classified by the Department of Energy as an accreditation body, an organization must submit a petition to the Department requesting such classification, in accordance with paragraph (c) of this section and § 431.21. The petition must demonstrate that the organization meets the criteria in paragraph (b) of this section.

(b) Evaluation criteria. To be classified as an accreditation body by the Department, the organization must meet the following criteria:

(1) It must have satisfactory standards and procedures for conducting and administering an accreditation system and for granting accreditation. This must include provisions for periodic audits to verify that the laboratories receiving its accreditation continue to conform to the criteria by which they were initially accredited, and for withdrawal of accreditation where such conformance does not occur, including failure to provide accurate test results.

(2) It must be independent of electric motor manufacturers, importers, distributors, private labelers or vendors. It cannot be affiliated with, have financial ties with, be controlled by, or be under common control with any such entity.

(3) It must be qualified to perform the accrediting function in a highly competent manner.

(4) It must be expert in the content and application of the test procedures and methodologies in IEEE Standard 112–1996 Test Method B and CSA Standard C390–93 Test Method (1), (Incorporated by reference, see § 431.15) and with similar procedures and methodologies for determining the energy efficiency of electric motors.

(c) Petition format. Each petition requesting classification as an accreditation body must contain a narrative statement as to why the organization meets the criteria set forth in paragraph (b) of this section, must be signed on behalf of the organization by an authorized representative, and must be accompanied by documentation that supports the narrative statement. The following provides additional guidance:

(1) Standards and procedures. A copy of the organization’s standards and procedures for operating an accreditation system and for granting accreditation should accompany the petition.

(2) Independent status. The petitioning organization should identify and describe any relationship, direct or indirect, that it has with an electric motor manufacturer, importer, distributor, private labeler, vendor, trade association or other such entity, as well as any other relationship it believes might appear to create a conflict of interest for it in performing as an accreditation body for electric motor testing laboratories. It should explain why it believes such relationship(s) would not compromise its independence as an accreditation body.

(3) Qualifications to do accrediting. Experience in accrediting should be discussed and substantiated by supporting documents. Of particular relevance would be documentary evidence that establishes experience in the application of guidelines contained in the ISO/IEC Guide 58, Calibration and testing laboratory accreditation systems—General requirements for operation and recognition, as well as experience in overseeing compliance with the guidelines contained in the ISO/IEC Guide 25, General Requirements for the Competence of Calibration and Testing Laboratories.

(4) Expertise in electric motor test procedures. The petition should set forth the organization’s experience with the test procedures and methodologies in IEEE Standard 112–1996 Test Method B and CSA Standard C390–93 Test Method (1), (Incorporated by reference, see § 431.15) and with similar procedures and methodologies. This part of the petition should include description of prior projects, qualifications of staff members, and the like. Of particular relevance would be documentary evidence
that establishes experience in applying the guidelines contained in the ISO/IEC Guide 25, General Requirements for the Competence of Calibration and Testing Laboratories, to energy efficiency testing for electric motors.

(d) Disposition. The Department will evaluate the petition in accordance with §431.21, and will determine whether the applicant meets the criteria in paragraph (b) of this section to be classified as an accrediting body.

§ 431.20 Department of Energy recognition of nationally recognized certification programs.

(a) Petition. For a certification program to be classified by the Department of Energy as being nationally recognized in the United States for the purposes of Section 345(c) of EPCA ("nationally recognized"), the organization operating the program must submit a petition to the Department requesting such classification, in accordance with paragraph (c) of this Section and §431.21. The petition must demonstrate that the program meets the criteria in paragraph (b) of this section.

(b) Evaluation criteria. For a certification program to be classified by the Department as nationally recognized, it must meet the following criteria:

(1) It must have satisfactory standards and procedures for conducting and administering a certification system, including periodic follow up activities to assure that basic models of electric motor continue to conform to the efficiency levels for which they were certified, and for granting a certificate of conformity.

(2) It must be independent of electric motor manufacturers, importers, distributors, private labelers, vendor, trade association or other such entity, as well as any other relationship it believes might appear to create a conflict of interest for the certification program in operating a certification system for compliance by electric motors with energy efficiency standards. It should explain why it believes such relationship would not compromise its independence in operating a certification program.

(3) Qualifications to operate a certification system. Experience in operating a certification system should be discussed and substantiated by supporting documents. Of particular relevance would be documentary evidence that establishes experience in the application of guidelines contained in the ISO/IEC Guide 65, General requirements for bodies operating product certification systems, ISO/IEC Guide 27, Guidelines for corrective action to be taken by a certification body in the event of either misapplication of its mark of conformity to a product, or products which bear the mark of the certification body being found to subject persons or property to risk, and similar procedures and methodologies for determining the energy efficiency of electric motors. It must have satisfactory criteria and procedures for the selection and sampling of electric motors tested for energy efficiency.

(c) Petition format. Each petition requesting classification as a nationally recognized certification program must contain a narrative statement as to why the program meets the criteria listed in paragraph (b) of this section, must be signed on behalf of the organization operating the program by an authorized representative, and must be accompanied by documentation that supports the narrative statement. The following provides additional guidance as to the specific criteria:

(1) Standards and procedures. A copy of the standards and procedures for operating a certification system and for granting a certificate of conformity should accompany the petition.

(2) Independent status. The petitioning organization should identify and describe any relationship, direct or indirect, that it or the certification program has with an electric motor manufacturer, importer, distributor, private labeler, vendor, trade association or other such entity, as well as any other relationship it believes might appear to create a conflict of interest for the certification program in operating a certification system for compliance by electric motors with energy efficiency standards. It should explain why it believes such relationship would not compromise its independence in operating a certification program.

(3) Qualifications to operate a certification system. Experience in operating a certification system should be discussed and substantiated by supporting documents. Of particular relevance would be documentary evidence that establishes experience in the application of guidelines contained in the ISO/IEC Guide 65, General requirements for bodies operating product certification systems, ISO/IEC Guide 27, Guidelines for corrective action to be taken by a certification body in the event of either misapplication of its mark of conformity to a product, or products which bear the mark of the certification body being found to subject persons or property to risk, and

(4) Expertise in electric motor test procedures. The petition should set forth the program's experience with the test procedures and methodologies in IEEE Standard 112-1996 Test Method B and CSA Standard C390-93 Test Method (1), (Incorporated by reference, see § 431.15) and with similar procedures and methodologies. This part of the petition should include description of prior projects, qualifications of staff members, and the like. Of particular relevance would be documentary evidence that establishes experience in applying guidelines contained in the ISO/IEC Guide 25, General requirements for the competence of calibration and testing laboratories, to energy efficiency testing for electric motors.

(d) Disposition. The Department will evaluate the petition in accordance with § 431.21, and will determine whether the applicant meets the criteria in paragraph (b) of this section for classification as a nationally recognized certification program.

§ 431.21 Procedures for recognition and withdrawal of recognition of accreditation bodies and certification programs.

(a) Filing of petition. Any petition submitted to the Department pursuant to §§ 431.19(a) or 431.20(a), shall be entitled "Petition for Recognition" ("Petition") and must be submitted, in triplicate to the Assistant Secretary for Energy Efficiency and Renewable Energy, U.S. Department of Energy, Forrestal Building, 1000 Independence Avenue, SW., Washington, DC 20585–0121. In accordance with the provisions set forth in 10 CFR 1004.11, any request for confidential treatment of any information contained in such a Petition or in supporting documentation must be accompanied by a copy of the Petition or supporting documentation from which the information claimed to be confidential has been deleted.

(b) Public notice and solicitation of comments. DOE shall publish in the Federal Register the Petition from which confidential information, as determined by DOE, has been deleted in accordance with 10 CFR 1004.11 and shall solicit comments, data and information on whether the Petition should be granted. The Department shall also make available for inspection and copying the Petition's supporting documentation from which confidential information, as determined by DOE, has been deleted in accordance with 10 CFR 1004.11. Any person submitting written comments to DOE with respect to a Petition shall also send a copy of such comments to the petitioner.

(c) Responsive statement by the petitioner. A petitioner may, within 10 working days of receipt of a copy of any comments submitted in accordance with paragraph (b) of this section, respond to such comments in a written statement submitted to the Assistant Secretary for Energy Efficiency and Renewable Energy. A petitioner may address more than one set of comments in a single responsive statement.

(d) Public announcement of interim determination and solicitation of comments. The Assistant Secretary for Energy Efficiency and Renewable Energy shall issue an interim determination on the Petition as soon as is practicable following receipt and review of the Petition and other applicable documents, including, but not limited to, comments and responses to comments. The petitioner shall be notified in writing of the interim determination. DOE shall also publish in the Federal Register a notice of final determination on the Petition.

(e) Public announcement of final determination. The Assistant Secretary for Energy Efficiency and Renewable Energy shall issue an interim determination on the Petition as soon as is practicable following receipt and review of the Petition and other applicable documents, including, but not limited to, comments and responses to comments. The petitioner shall be notified in writing of the interim determination. DOE shall also publish in the Federal Register a notice of final determination on the Petition.

(f) Additional information. The Department may, at any time during the recognition process, request additional information.
Department of Energy § 431.25

relevant information or conduct an investigation concerning the Petition. The Department’s determination on a Petition may be based solely on the Petition and supporting documents, or may also be based on such additional information as the Department deems appropriate.

(g) Withdrawal of recognition—(1) Withdrawal by the Department. If the Department believes that an accreditation body or certification program that has been recognized under §§431.19 or 431.20, respectively, is failing to meet the criteria of paragraph (b) of the section under which it is recognized, the Department will so advise such entity and request that it take appropriate corrective action. The Department will give the entity an opportunity to respond. If after receiving such response, or no response, the Department believes satisfactory correction has not been made, the Department will withdraw its recognition from that entity.

(2) Voluntary withdrawal. An accreditation body or certification program may withdraw itself from recognition by the Department by advising the Department in writing of such withdrawal. It must also advise those that use it (for an accreditation body, the testing laboratories, and for a certification organization, the manufacturers) of such withdrawal.

(3) Notice of withdrawal of recognition. The Department will publish in the FEDERAL REGISTER a notice of any withdrawal of recognition that occurs pursuant to this paragraph.

ENERGY CONSERVATION STANDARDS

§ 431.25 Energy conservation standards and effective dates.

(a) Each electric motor manufactured (alone or as a component of another piece of equipment) after October 24, 1997, or in the case of an electric motor which requires listing or certification by a nationally recognized safety testing laboratory, after October 24, 1999, shall have a nominal full load efficiency of not less than the following:

<table>
<thead>
<tr>
<th>Motor horsepower/standard kilowatt equivalent</th>
<th>Nominal full load efficiency</th>
</tr>

(b) For purposes of determining the required minimum nominal full load efficiency of an electric motor that has a horsepower or kilowatt rating between two horsepower or kilowattages listed consecutively in paragraph (a) of this section, each such motor shall be deemed to have a horsepower or kilowatt rating that is listed in paragraph (a) of this section. The rating that the motor is deemed to have shall be determined as follows:

(1) A horsepower or above the midpoint between the two consecutive horsepower shall be rounded up to the higher of the two horsepower;

(2) A horsepower below the midpoint between the two consecutive horsepower shall be rounded down to the lower of the two horsepower,
§ 431.26  Preemption of State regulations.

Any State regulation providing for any energy conservation standard, or other requirement with respect to the energy efficiency or energy use, of an electric motor that is not identical to a Federal standard in effect under this subpart is preempted by that standard, except as provided for in Section 345(a) and 327(b) and (c) of the Act.

§ 431.30  Applicability of labeling requirements.

The labeling rules in §431.31, established pursuant to Section 344 of EPCA, 42 U.S.C. 6315, apply only to electric motors manufactured after October 5, 2000.

§ 431.31  Labeling requirements.

(a) Electric motor nameplate—(1) Required information. The permanent nameplate of an electric motor for which standards are prescribed in §431.25 must be marked clearly with the following information:

(i) The motor's nominal full load efficiency (as of the date of manufacture), derived from the motor's average full load efficiency as determined pursuant to this subpart; and

(ii) A Compliance Certification number ("CC number") supplied by DOE to the manufacturer or private labeler, pursuant to §431.36(f), and applicable to that motor. Such CC number must be on the nameplate of a motor beginning 90 days after either:

(A) The manufacturer or private labeler has received the number upon submitting a Compliance Certification covering that motor, or

(B) The expiration of 21 days from DOE's receipt of a Compliance Certification covering that motor, if the manufacturer or private labeler has not been advised by DOE that the Compliance Certification fails to satisfy §431.36.

(2) Display of required information. All orientation, spacing, type sizes, type faces, and line widths to display this required information shall be the same as or similar to the display of the other performance data on the motor's permanent nameplate. The nominal full load efficiency shall be identified either by the term "Nominal Efficiency" or "Nom. Eff." or by the terms specified in paragraph 12.58.2 of NEMA MG1-1993, (Incorporated by reference, see §431.15) as for example "NEMA Nom. Eff. ____ ." The DOE number shall be in the form "CC____ ."

(3) Optional display. The permanent nameplate of an electric motor, a separate plate, or decalcomania, may be marked with the encircled lower case letters "ee", for example, or with some comparable designation or logo, if the motor meets the applicable standard prescribed in §431.25, as determined pursuant to this subpart, and is covered by a Compliance Certification that satisfies §431.36.

(b) Disclosure of efficiency information in marketing materials. (1) The same information that must appear on an electric motor's permanent nameplate pursuant to paragraph (a)(1) of this section, shall be prominently displayed:

(i) On each page of a catalog that lists the motor; and

(ii) In other materials used to market the motor.

(2) The "ee" logo, or other similar logo or designations, may also be used in catalogs and other materials to the same extent they may be used on labels under paragraph (a)(3) of this section.

§ 431.32  Preemption of State regulations.

The provisions of §431.31 supersede any State regulation to the extent required by Section 327 of the Act. Pursuant to the Act, all State regulations that require the disclosure for any
electric motor of information with respect to energy consumption, other than the information required to be disclosed in accordance with this part, are superseded.

CERTIFICATION

§ 431.35 Applicability of certification requirements.

Section 431.36 sets forth the procedures for manufacturers to certify that electric motors comply with the applicable energy efficiency standards set forth in this subpart.

§ 431.36 Compliance Certification.

(a) General. Beginning April 26, 2003, a manufacturer or private labeler shall not distribute in commerce any basic model of an electric motor which is subject to an energy efficiency standard set forth in this subpart unless it has submitted to the Department a Compliance Certification certifying, in accordance with the provisions of this section, that the basic model meets the requirements of the applicable standard. The representations in the Compliance Certification must be based upon the basic model's energy efficiency as determined in accordance with the applicable requirements of this subpart. This means, in part, that either:

(1) The representations as to the basic model must be based on use of a certification organization; or

(2) Any testing of the basic model on which the representations are based must be conducted at an accredited laboratory.

(b) Required contents—(1) General representations. Each Compliance Certification must certify that:

(i) The nominal full load efficiency for each basic model of electric motor distributed is not less than the minimum nominal full load efficiency required for that motor by §431.25;

(ii) All required determinations on which the Compliance Certification is based were made in compliance with the applicable requirements prescribed in this subpart;

(iii) All information reported in the Compliance Certification is true, accurate, and complete; and

(iv) The manufacturer or private labeler is aware of the penalties associated with violations of the Act and the regulations thereunder, and of 18 U.S.C. 1001 which prohibits knowingly making false statements to the Federal Government.

(2) Specific data. (i) For each rating of electric motor (as the term “rating” is defined in the definition of basic model) which a manufacturer or private labeler distributes, the Compliance Certification must report the nominal full load efficiency, determined pursuant to §§431.16 and 431.17, of the least efficient basic model within that rating.

(ii) The Compliance Certification must identify the basic models on which actual testing has been performed to meet the requirements of §431.17.

(iii) The format for a Compliance Certification is set forth in appendix C of this subpart.

(c) Optional contents. In any Compliance Certification, a manufacturer or private labeler may at its option request that DOE provide it with a unique Compliance Certification number (“CC number”) for any brand name, trademark or other label name under which the manufacturer or private labeler distributes electric motors covered by the Certification. Such a Compliance Certification must also identify all other names, if any, under which the manufacturer or private labeler distributes electric motors, and to which the request does not apply.

(d) Signature and submission. A manufacturer or private labeler must submit the Compliance Certification either on its own behalf, signed by a corporate officer of the company, or through a third party (for example, a trade association or other authorized representative) acting on its behalf. Where a third party is used, the Compliance Certification must identify the official of the manufacturer or private labeler who authorized the third party to make representations on the company's behalf, and must be signed by a corporate official of the third party. The Compliance Certification must be submitted to the Department by certified mail, to Department of Energy, Assistant Secretary for Energy Efficiency and Renewable Energy, Building Technologies.
(e) New basic models. For electric motors, a Compliance Certification must be submitted for a new basic model only if the manufacturer or private labeler has not previously submitted to DOE a Compliance Certification, that meets the requirements of this section, for a basic model that has the same rating as the new basic model, and that has a lower nominal full load efficiency than the new basic model.

(f) Response to Compliance Certification; Compliance Certification Number (CC number)—(1) DOE processing of Certification. Promptly upon receipt of a Compliance Certification, the Department will determine whether the document contains all of the elements required by this section, and may, in its discretion, determine whether all or part of the information provided in the document is accurate. The Department will then advise the submitting party in writing either that the Compliance Certification does not satisfy the requirements of this section, in which case the document will be returned, or that the Compliance Certification satisfies this section. The Department will also advise the submitting party of the basis for its determination.

(2) Issuance of CC number(s). (i) Initial Compliance Certification. When DOE advises that the initial Compliance Certification submitted by or on behalf of a manufacturer or private labeler is acceptable, either:

(A) DOE will provide a single unique CC number, “CC_____,” to the manufacturer or private labeler, and such CC number shall be applicable to all electric motors distributed by the manufacturer or private labeler, or

(B) When required by paragraph (f)(3) of this section, DOE will provide more than one CC number to the manufacturer or private labeler.

(ii) Subsequent Compliance Certification. When DOE advises that any other Compliance Certification is acceptable, it will provide a unique CC number for any brand name, trademark or other name when required by paragraph (f)(3) of this section.

(iii) When DOE declines to provide a CC number as requested by a manufacturer or private labeler in accordance with §431.36(c), DOE will advise the requester of the reasons for such refusal.

(3) Issuance of two or more CC numbers.

(i) DOE will provide a unique CC number for each brand name, trademark or other label name for which a manufacturer or private labeler requests such a number in accordance with §431.36(c), except as follows. DOE will not provide a CC number for any brand name, trademark or other label name

(A) For which DOE has previously provided a CC number, or

(B) That duplicates or overlaps with other names under which the manufacturer or private labeler sells electric motors.

(ii) Once DOE has provided a CC number for a particular name, that shall be the only CC number applicable to all electric motors distributed by the manufacturer or private labeler under that name.

(iii) If the Compliance Certification in which a manufacturer or private labeler requests a CC number is the initial Compliance Certification submitted by it or on its behalf, and it distributes electric motors not covered by the CC number(s) DOE provides in response to the request(s), DOE will also provide a unique CC number that shall be applicable to all of these other motors.

APPENDIX A TO SUBPART B OF 10 CFR PART 431, POLICY STATEMENT FOR ELECTRIC MOTORS COVERED UNDER THE ENERGY POLICY AND CONSERVATION ACT

This is a reprint of a policy statement which was published on November 5, 1997 at 62 FR 59978.

Policy Statement for Electric Motors Covered Under the Energy Policy and Conservation Act

I. INTRODUCTION

The Energy Policy and Conservation Act (EPCA), 42 U.S.C. 6311, et seq., establishes energy efficiency standards and test procedures for certain commercial and industrial electric motors manufactured (alone or as a component of another piece of equipment) after October 24, 1997, or, in the case of an electric motor which requires listing or certification by a nationally recognized safety
testing laboratory, after October 24, 1999. EPCA also directs the Department of Energy (DOE or Department) to implement the statutory test procedures prescribed for motors, and to require efficiency labeling of motors and certification that covered motors comply with the standards.

Section 340.13(b)(1) of EPCA defines the term “electric motor” based essentially on the construction and rating system in the National Electrical Manufacturers Association (NEMA) Standards Publication MG1 and Institute of Electrical and Electronics Engineers, Inc. (IEEE) Standard 112. In DOE’s view, as stated in Assistant Secretary Ervin’s letter of May 9, 1996, to NEMA’s Malcolm O’Hagan, until DOE’s regulations become effective, manufacturers may conduct required testing in their own laboratories or in independent laboratories, and may employ alternative correlation methods (in lieu of actual testing) for some motors. Manufacturers may also establish compliance with EPCA standards and test procedures through use of third party certification or verification programs such as those recognized by Natural Resources Canada. Labeling and certification requirements will become effective only after DOE has promulgated a final rule prescribing such requirements.

Notwithstanding the clarification provided in the proposed rule, there still appears to be uncertainty as to which motors EPCA covers. It is widely understood that the statute covers “general purpose” motors that are manufactured for a variety of applications, and that meet EPCA’s definition of “electric motor.” Many modifications, however, can be made to such generic motors. Motor manufacturers have expressed concern as to precisely which motors with such modifications are covered under the statute, and as to whether manufacturers will be able to comply with the statute by October 25, 1997 with respect to all of these covered motors. Consequently, motor manufacturers have requested that the Department provide additional guidance as to which types of motors are “electric motors,” “definite purpose motors,” and “special purpose motors” under EPCA. The policy statement that follows is based upon input from motor manufacturers and energy efficiency advocates, and provides such guidance.

II. GUIDELINES FOR DETERMINING WHETHER A MOTOR IS COVERED BY EPCA

A. General

EPCA specifies minimum nominal full-load energy efficiency standards for 1 to 200 horsepower electric motors, and, to measure compliance with those standards, prescribes use of the test procedures in NEMA Standard MG1 and Institute of Electrical and Electronics Engineers, Inc. (IEEE) Standard 112. In DOE’s view, as stated in Assistant Secretary Ervin’s letter of May 9, 1996, to NEMA’s Malcolm O’Hagan, until DOE’s regulations become effective, manufacturers can establish compliance with these EPCA requirements through use of competent and reliable procedures or methods that give reasonable assurance of such compliance. So long as these criteria are met, manufacturers may conduct required testing in their own laboratories or in independent laboratories, and may employ alternative correlation methods (in lieu of actual testing) for some motors. Manufacturers may also establish their compliance with EPCA standards and test procedures through use of third party certification or verification programs such as those recognized by Natural Resources Canada. Labeling and certification requirements will become effective only after DOE has promulgated a final rule prescribing such requirements.

Motors with features or characteristics that do not meet the statutory definition of “electric motor” are not covered, and therefore are not required to meet EPCA requirements. Examples include motors without feet and without provisions for feet, and variable speed motors operated on a variable...
frequency power supply. Similarly, multi-speed motors and variable speed motors, such as inverter duty motors, are not covered equipment, based on their intrinsic design for use at variable speeds. However, NEMA Design A or B motors that are single speed, meet all other criteria under the definitions in EPCA for covered equipment, and can be used with an inverter in variable speed applications as an additional feature, are covered equipment under EPCA. In other words, being suitable for use on an inverter by itself does not exempt a motor from EPCA requirements.

Section 340(13)(F) of EPCA, defines a "small electric motor" as "a NEMA general purpose alternating current single-speed induction motor, built in a two-digit frame number series in accordance with NEMA Standards Publication MG1–1984 (R1990), Frame Assignments 1.2 and 1.3 of NEMA Standards Publication MG1–1984 (R1990)." Section 346 of EPCA requires DOE to prescribe testing requirements and efficiency standards only for those small electric motors for which the Secretary determines that standards are warranted. The Department has not yet made such a determination.

### B. Electrical Features

As noted above, the Department's proposed definition of "electric motor" provides in part that it is a motor that "operates on polyphase alternating current 60-Hertz sinusoidal power, and * * * can be operated on 230 volts or 460 volts, or both." In DOE's view, "can be operated" implicitly means that the motor can be operated successfully. According to NEMA Standards Publication MG1–1993, paragraph 12.44, "Variations from Rated Voltage and Rated Frequency," alternating-current motors must operate successfully under running conditions at rated load with a variation in the voltage or the frequency up to the following: Plus or minus 10 percent of rated voltage, with rated frequency for induction motors; 4 plus or minus 5 percent of rated frequency, with rated voltage; and a combined variation in voltage and frequency of 10 percent (sum of absolute values) of the rated values, provided the frequency variation does not exceed plus or minus 5 percent of rated frequency. DOE believes that, for purposes of determining whether a motor meets EPCA's definition of "electric motor," these criteria should be used to determine when a motor that is not rated at 230 or 460 volts or 60 Hertz can be operated at such voltage and frequency.5

4 For example, a motor that is rated at 220 volts should operate successfully on 230 volts, since 220 + 10(220) = 242 volts. A 208 volt motor, however, would not be expected to operate successfully on 230 volts, since 208 + 10(208) = 228.8 volts.

5 The Department understands that a motor that can operate at such voltage and frequency, based on variations defined for successful operation, will not necessarily perform in accordance with the industry standards established for operation at the motor's rated voltage and frequency. In addition, under the test procedures prescribed by EPCA, motors are to be tested at their rated values. Therefore, in DOE's view a motor that is not rated for 230 or 460 volts, or 60 Hertz, but that can be successfully operated at these levels, must meet the energy efficiency requirements at its rated voltage(s) and frequency. DOE also notes that when a motor is rated to include a wider voltage range that includes 230/460 volts, the motor should meet the energy efficiency requirements at 230 volts or 460 volts.
Department of Energy

Pt. 431, Subpt. B, App. A

D. Motors With Seals

Some electric motors have seals to prevent ingress of water, dust, oil, and other foreign materials into the motor. DOE understands that, typically, a manufacturer will add seals to a motor that it manufactures, so that it will sell two motors that are identical except that one has seals and the other does not. In such a situation, if the motor without seals is "general purpose" and covered by EPCA’s efficiency requirements, then the motor with seals will also be covered because it can still be used in most general purpose applications. DOE understands, however, that manufacturers previously believed motors with seals were not covered under EPCA, in part because IEEE Standard 112, "Test Procedure for Polyphase Induction Motors and Generators," prescribed by EPCA, does not address how to test a motor with seals installed.

The efficiency rating of such a motor, if determined with seals installed and when the motor is new, apparently would significantly underestimate the efficiency of the motor as operated. New seals are stiff, and provide friction that is absent after their initial break-in period. DOE understands that, after this initial period, the efficiency ratings determined for the same motor with and without seals would be virtually identical. To construe EPCA, therefore, as requiring such separate efficiency determinations would impose an unnecessary burden on manufacturers.

In light of the foregoing, the Department believes that EPCA generally permits the efficiency of a motor with seals to be determined without the seals installed. Furthermore, notwithstanding the prior belief that such motors are not covered by EPCA, use of this approach to determining efficiency will enable manufacturers to meet EPCA’s standards with respect to covered motors with seals by the date the standards go into effect on October 25, 1997.

III. DISCUSSION OF HOW DOE WOULD APPLY EPCA DEFINITIONS, USING THE FOREGOING GUIDELINES

Using the foregoing guidelines, the attached matrix provides DOE’s view as to which motors with common features are covered by EPCA. Because manufacturers produce many basic models that have many modifications of generic general purpose motors, the Department does not represent that the matrix is all-inclusive. Rather it is a set of examples demonstrating how DOE would apply EPCA definitions, as construed by the above guidelines, to various motor types. By extension of these examples, most motors currently in production, or to be designed in the future, could probably be classified. The matrix classifies motors into five categories, which are discussed in the following passages.

Category I—For "electric motors" (manufactured alone or as a component of another piece of equipment) in Category I, DOE will enforce EPCA efficiency standards and test procedures beginning on October 25, 1997.

The Department understands that some motors essentially are relatively simple modifications of generic general purpose motors. Modifications could consist, for example, of minor changes such as the addition of temperature sensors or a heater, the addition of a shaft extension and a brake disk from a kit, or changes in exterior features such as the motor housing. Such motors can still be used for most general purpose applications, and the modifications have little or no effect on motor performance. Nor do the modifications affect energy efficiency.

Category II—For certain motors that are "definite purpose" according to present industry practice, but that can be used in most general purpose applications, DOE will generally enforce EPCA efficiency standards and test procedures beginning no later than October 25, 1999.

General Statement

EPCA does not prescribe standards and test procedures for "definite purpose motors." Section 340(13)(B) of EPCA defines the term "definite purpose motor" as "any motor designed in standard ratings with standard operating characteristics or standard mechanical construction for use under service conditions other than usual or for use on a particular type of application and which cannot be used in most general purpose applications." [Emphasis added.] Except, significantly, for exclusion of the italicized language, the industry definition of "definite purpose motor," set forth in NEMA MG1, is identical to the foregoing.
Category II consists of electric motors with horsepower ratings that fall between the horsepower ratings in Section 342(b)(1) of EPCA, thermally protected motors, and motors with roller bearings. As with motors in Category I, these motors are essentially modifications of generic general purpose motors. Generally, however, the modifications contained in these motors are more extensive and complex than the modifications in Category I motors. These Category II motors have been considered “definite purpose” in common industry parlance, but are covered equipment under EPCA because they can be used in most general purpose applications.

According to statements provided during the January 15, 1997, Public Hearing, tr. pps. 238-239, Category II motors were, until recently, viewed by most manufacturers as definite purpose motors, consistent with the industry definition that did not contain the phrase “which cannot be used in most general purpose applications.” Hence, DOE understands that many manufacturers assumed these motors were not subject to EPCA’s efficiency standards. During the period prior to and subsequent to the hearing, discussions among manufacturers resulted in a new understanding that such motors are general purpose under EPCA, since they can be used in most general purpose applications. Thus, the industry only recently recognized that such motors are covered under EPCA. Although the statutory definition adopted in 1992 contained the above-quoted definition of “definite purpose,” the delay in issuing regulations which embody this definition may have contributed to industry’s delay in recognizing that these motors are covered.

The Department understands that redesign and testing these motors in order to meet the efficiency standards in the statute may require a substantial amount of time. Given the recent recognition that they are covered, it is not realistic to expect these motors will be able to comply by October 25, 1997. A substantial period beyond that will be required. Moreover, the Department believes different manufacturers will need to take different approaches to achieving compliance with respect to these motors. And that, for a particular type of motor, some manufacturers will be able to comply sooner than others. Thus, the Department intends to refrain from taking enforcement action for two years, until October 25, 1999, with respect to motors with horsepower ratings that fall between the horsepower ratings in Section 342(b)(1) of EPCA, thermally protected motors, and motors with roller bearings. Manufacturers are encouraged, however, to manufacture these motors in compliance with EPCA at the earliest possible date.

The following sets forth in greater detail, for each of these types of motors, the basis for the Department’s policy to refrain from enforcement for two years. Also set forth is additional explanation of the Department’s understanding as to why manufacturers previously believed intermediate horsepower motors were not covered by EPCA.

Intermediate Horsepower Ratings

Section 342(b)(1) of EPCA specifies efficiency standards for electric motors with 19 specific horsepower ratings, ranging from one through 200 horsepower. Each is a preferred or standardized horsepower rating as reflected in the table in NEMA Standards Publication MG1-1993, paragraph 10.32.4, Polyphase Medium Induction Motors. However, an “electric motor,” as defined by EPCA, can be built at other horsepower ratings, such as 6 horsepower, 65 horsepower, or 175 horsepower. Such motors, rated at horsepower levels between any two adjacent horsepower ratings identified in Section 342(b)(1) of EPCA will be referred to as “intermediate horsepower motors.” In the Department’s view, efficiency standards apply to every motor that has a rating from one through 200 horsepower (or kilowatt equivalents), and that otherwise meets the criteria for an “electric motor” under EPCA, including an electric motor with an intermediate horsepower (or kW) rating.

To date, these motors have typically been designed in conjunction with and supplied to a specific customer to fulfill certain performance and design requirements of a particular application, as for example to run a certain type of equipment. See the discussion in Section IV below on “original equipment” and “original equipment manufacturers.” In large part for these reasons, manufacturers believed intermediate horsepower motors to be “definite purpose motors” that were not covered by EPCA. Despite their specific uses, however, these motors are electric motors under EPCA when they are capable of being used in most general purpose applications.

Features of a motor that are directly related to its horsepower rating include its physical size, and the ratings of its controller and protective devices. These aspects of a 175 horsepower motor, for example, which is an intermediate horsepower motor, must be appropriate to that horsepower, and would generally differ from the same aspects of 150 and 200 horsepower motors. The two standard horsepower ratings closest to 175 are 150 and 200 horsepower motors, so that compliance with EPCA could involve all of these elements of a motor’s design. For example, the addition of material necessary to achieve EPCA’s prescribed level of efficiency could cause the size of the motor to increase. The addition of magnetic material would invite higher inrush current that could cause an incorrectly sized motor controller to malfunction, or the circuit breaker with a standard
rating to trip unnecessarily, or both. The Department believes motor manufacturers will require a substantial amount of time to redesign and retest each intermediate horsepower electric motor they manufacture.

To the extent such intermediate horsepower electric motors become unavailable because motor manufacturers have recognized only recently that they are covered by EPCA, equipment in which they are incorporated would temporarily become unavailable also. Moreover, re-design of such a motor to comply with EPCA could cause changes in the motor that require re-design of the equipment in which the motor is used. For example, if an intermediate horsepower electric motor becomes larger, it might no longer fit in the equipment for which it was designed. In such instances, the equipment would have to be re-designed. Because these motors were previously thought not to be covered, equipment manufacturers may not have had sufficient lead time to make the necessary changes to the equipment without interrupting its production.

With respect to intermediate horsepower motors, the Department intends to refrain from enforcing EPCA for a period of 24 months only as to such motor designs that were being manufactured prior to the date this Policy Statement was issued. The Department is concerned that small adjustments could be made to the horsepower rating of an existing electric motor, in an effort to delay compliance with EPCA, if it delayed enforcement as to all intermediate horsepower motors produced during the 24 month period. For example, a 50 horsepower motor that has a service factor of 1.15 could be renamed as a 57½ horsepower motor that has a 1.0 service factor. By making this delay in enforcement applicable only to pre-existing designs of intermediate horsepower motors, the Department believes it has made adequate provision for the manufacture of bona fide intermediate horsepower motor designs that cannot be changed to be in compliance with EPCA by October 25, 1997.

Thermally Protected Motors

The Department understands that in order to redesign a thermally protected motor to improve its efficiency so that it complies with EPCA, substantial changes in the windings must be made which will require the thermal protector to be re-selected. Such devices sense the inrush and running current of the motor as well as the overall motor temperature. Any changes to a motor that affect these characteristics will prevent the protector from operating correctly. When a new protector is selected, the motor must be tested to verify proper operation of the device in the motor. The motor manufacturer would test the locked rotor and overload conditions, which could take several days, and the results may dictate that a second selection is needed with additional testing. When the manufacturer has finished testing, typically the manufacturer will have a third party conduct additional testing. This testing may include cycling the motor in a locked-rotor condition to verify that the protector functions properly. This testing may take days or even weeks to perform for a particular model of motor.

Since it was only recently recognized by industry that these motors are covered by EPCA, in the Department’s view the total testing program makes it impossible for manufacturers to comply with the EPCA efficiency levels in thermally protected motors by October 25, 1997, especially since each different motor winding must be tested and motor winding/thermal protector combinations number in the thousands.

Motors With Roller Bearings

Motors with roller bearings fit within the definition of electric motor under the statute. However, because the IEEE Standard 112 Test Method B does not provide measures to test motors with roller bearings installed, manufacturers mistakenly believed such motors were not covered. Under IEEE Standard 112, a motor with roller bearings could only be tested for efficiency with the roller bearings removed and standard ball bearings installed as temporary substitutes. Then on the basis of the energy efficiency information gained from that test, the manufacturer may need to redesign the motor in order to comply with the statute. In this situation, the Department understands that testing, re-designing, and retesting lines of motors with roller bearings, to establish compliance, would be difficult and time consuming.

Categories III, IV and V—Motors not within EPCA’s definition of “electric motor,” and not covered by EPCA.

Close-Coupled Pump Motors

NEMA Standards Publication MG1-1993, with revisions one through three, Part 18, “Definite-Purpose Machines,” defines “a face-mounting close-coupled pump motor” as “a medium alternating-current squirrel-cage induction open or totally enclosed motor, with or without feet, having a shaft suitable for mounting an impeller’s or seal’s driving device.” Paragraphs MG1-18.601-18.614 specify its performance, face and shaft mounting dimensions, and frame assignments that replace the suffix letters T and TS with the suffix letters JM and JP.

The Department understands that such motors are designed in standard ratings with standard operating characteristics for use in certain close-coupled pumps and pumping applications, but cannot be used in non-pumping applications, such as, for example, conveyors. Consequently, the Department
Part 5 and Part 6, respectively.

Methods of cooling (IC) are defined in MG1 Standards. Details of protection (IP) and the TENV and TEAO motors conform to IEC Suggested Standard for Future Design, since "Classification According to Environmental TENV and TEAO motors in MG1–1993 Part 1, referenced in the NEMA designations for rotating machinery. The IP and IC codes are to the IEC Standard 34–6: Methods of cooling enclosures for rotating machines. IC refers to the IEC Standard 34–5: Classification of degrees of protection provided by enclosures for rotating machines. IC refers to the IEC Standard 34–6: Methods of cooling rotating machinery. The IP and IC codes are referenced in the NEMA designations for TENV and TEAO motors in MG1–1993 Part 1, "Classification According to Environmental Protection and Methods of Cooling," as a Suggested Standard for Future Design, since the TENV and TEAO motors conform to IEC Standards. Details of protection (IP) and methods of cooling (IC) are defined in MG1 Part 5 and Part 6, respectively.

Totally-Enclosed Non-Ventilated (TENV) and Totally-Enclosed Air-Over (TEAO) Motors

A motor designated in NEMA MG1–1993, paragraph MG1–1.26.1, as "totally-enclosed non-ventilated (IP54, IC410)" is "not equipped for cooling by means external to the enclosing parts." This means that the motor, when properly applied, does not require the use of any additional means of cooling installed external to the motor enclosure. The TENV motor is cooled by natural conduction and natural convection of the motor heat into the surrounding environment. As stated in NEMA MG1–1993, Suggested Standard for Future Design, paragraph MG1–1.26.1a, a TENV motor "is only equipped for cooling by free convection." The general requirement for the installation of the TENV motor is that it not be placed in a restricted space that would inhibit this natural dissipation of the motor heat. Most general purpose applications use motors which include a means for forcing air flow through or around the motor and usually through the enclosed space and, therefore, can be used in spaces that are more restrictive than those required for TENV motors. Placing a TENV motor in such common restricted areas is likely to cause the motor to overheat. The TENV motor may also be larger than the motors used in most general purpose applications, and would take up more of the available space, thus reducing the size of the open area surrounding the motor. Installation of a TENV motor might require, therefore, an additional means of ventilation to continually exchange the ambient around the motor.

A motor designated in NEMA MG1–1993 as "totally-enclosed air-over (IP54, IC417)" is intended to be cooled by ventilation means external to (i.e., separate and independent from) the motor, such as a fan. The motor must be provided with the additional ventilation to prevent it from overheating.

Consequently, neither the TENV motor nor the TEAO motor would be suitable for most general purpose applications, and, DOE believes they are definite-purpose motors not covered by EPCA.

Integral Gearmotors

An "integral gearmotor" is an assembly of a motor and a specific gear drive or assembly of gears, such as a gear reducer, as a unified package. The motor portion of an integral gearmotor is not necessarily a complete motor, since the end bracket or mounting flange of the motor portion is also part of the gear assembly and cannot be operated when separated from the complete gear assembly. Typically, an integral gearmotor is not manufactured to standard T-frame dimensions specified in NEMA MG1. Moreover, neither the motor portion, not the entire integral gearmotor, are capable of being used in most general purpose applications without significant modifications. An integral gearmotor is also designed for a specific purpose and can have unique performance characteristics, physical dimensions, and casing, flange and shafting configurations. Consequently, integral gearmotors are outside the scope of the EPCA definition of "electric motor" and are not covered under EPCA.

However, an "electric motor," as defined by EPCA, which is connected to a stand alone mechanical gear drive or an assembly of gears, such as a gear reducer connected by direct coupling, belts, bolts, a kit, or other means, is covered equipment under EPCA.

IV. Electric Motors That Are Components in Certain Equipment

The primary function of an electric motor is to convert electrical energy to mechanical energy which then directly drives machinery such as pumps, fans, or compressors. Thus, an electric motor is always connected to a driven machine or apparatus. Typically the motor is incorporated into a finished product such as an air conditioner, a refrigerator, a machine tool, food processing equipment, or other commercial or industrial machinery. These products are commonly known as "original equipment" or "end-use equipment," and are manufactured by firms known as "original equipment manufacturers" (OEMs).

Many types of motors used in original equipment are covered under EPCA. As noted above, EPCA prescribes efficiency standards to be met by all covered electric motors manufactured after October 24, 1997, except that covered motors which require
listing or certification by a nationally recognized safety testing laboratory need not meet the standards until after October 24, 1999. Thus, for motors that must comply after October 24, 1997, inspection of motors manufactured before the deadline have been exhausted, only complying motors would be available for purchase and use by OEMs in the marketplace. Any non-complying motors previously included in such equipment would no longer be available.

The physical, and sometimes operational, characteristics of motors that meet EPCA efficiency standards normally differ from the characteristics of comparable existing motors that do not meet those standards. In part because of such differences, the Department is aware of two types of situations where strict application of the October 24, 1997, deadline could temporarily prevent the manufacture of, and remove from the marketplace, currently available original equipment. One such situation is where an original equipment manufacturer uses an electric motor as a component in end-use equipment that requires listing or certification by a nationally recognized safety testing laboratory, even though the motor itself does not meet the applicable efficiency standard in EPCA. These changes are subject to substantial variation from one piece of original equipment to the next. For some equipment, it could be a simple paperwork transaction between the safety listing or certification organization and the OEM, taking approximately four to eight weeks to complete. But the process could raise more complex system issues involving redesign of the motor or piece of equipment, or both, and actual testing to assure that safety and performance criteria are met, and could take several months to complete. The completion time could also vary depending on the response time of the particular safety approval agency. Moreover, in the period immediately after October 24, the Department believes wholesale changes could occur in equipment lines when OEMs must begin using motors that comply with EPCA. These changes are likely to be concentrated in the period immediately after EPCA goes into effect on October 24, and if many OEMs seek to re-list or re-certify equipment at the same time, substantial delays in the review and approval process at the safety approval agencies could occur. For these reasons, the Department is concerned that certain end-user equipment that requires safety listing or certification could become unavailable in the marketplace, because an electric motor specifically identified in a listing or certification is covered by EPCA and will become unavailable, and the steps have not been completed to obtain safety approval of the equipment when manufactured with original equipment.

Second, a situation could exist where an electric motor covered by EPCA is constructed in a T-frame series or T-frame size that is smaller (but still standard) than that assigned by NEMA Standards Publication MG 13-1984 (R1990), sections 1.2 and 1.3, in order to fit into a restricted mounting space that is within certain end-use equipment. Motors in IEC metric frame sizes and kilowatt ratings could also be involved in this type of situation. In such cases, the manufacturer of the end-use equipment might need to redesign the equipment containing the motor does not meet the applicable efficiency standard, which need not comply until October 25, 1999, with motors that, while not subject to such requirements, are included in original equipment that requires safety listing or certification. Consequently, motor manufacturers and original equipment manufacturers, are included in original equipment involved, and that the equipment could accommodate such motors. OEMs involved in such situations may often be unable to switch to motors that meet EPCA standards in the period immediately following October 24. To mitigate any hardship to purchasers of the original equipment, the Department intends to refrain from enforcing EPCA in certain limited circumstances, under the conditions described below. Where a particular electric motor is specified in an approved safety listing or certification for a piece of original equipment, and the motor does not meet the applicable efficiency standard in EPCA, the Department's
policy will be as follows: For the period of time necessary for the OEM to obtain a revised safety listing or certification for that piece of equipment, with a motor specified that complies with EPCA, but in no event beyond October 24, 1999, the Department would refrain from taking enforcement action under EPCA with respect to manufacture of the motor for installation in such original equipment. This policy would apply only where the motor has been manufactured and specified in the approved safety listing or certification prior to October 25, 1997.

Where a particular electric motor is used in a piece of original equipment and manufactured in a smaller than assigned frame size or series, and the motor does not meet the applicable efficiency standard in EPCA, the Department’s policy will be as follows: For the period of time necessary for the OEM to re-design the piece of equipment to accommodate a motor that complies with EPCA, but in no event beyond October 24, 1999, the Department would refrain from enforcing the standard with respect to manufacture of the motor for installation in such original equipment. This policy would apply only to a model of motor that has been manufactured and included in the original equipment prior to October 25, 1997.

To allow the Department to monitor application of the policy set forth in the prior two paragraphs, the Department needs to be informed as to the motors being manufactured under the policy. Therefore, each motor manufacturer and OEM should jointly notify the Department as to each motor they will be manufacturing and using, respectively, after October 24, 1997, in the belief that it is covered by the policy. The notification should set forth: (1) the name of the motor manufacturer, and a description of the motor by type, model number, and date of design or production; (2) the name of the original equipment manufacturer, and a description of the application where the motor is to be used; (3) the safety listing or safety certification organization and the existing listing or certification file or document number for which re-listing or re-certification will be requested, if applicable; (4) the reason and amount of time required for continued production of the motor, with a statement that a substitute electric motor that complies with EPCA could not be obtained by an earlier date; and (5) the name, address, and telephone number of the person to contact for further information. The joint request should be signed by a responsible official of each requesting company, and sent to: U.S. Department of Energy, Assistant Secretary for Energy Efficiency and Renewable Energy, Office of Building Research and Standards, EE–41, Forrestal Building, 1000 Independence Avenue, SW., Room 1J–018, Washington, DC 20585–0121. The Department does not intend to apply this policy to any motor for which it does not receive such a notification. Moreover, the Department may use the notification, and make further inquiries, to be sure motors listed in the notification meet the criteria for application of the policy.

This part of the Policy Statement will not apply to a motor in Category II, discussed above in Section III. Because up to 24 months is contemplated for compliance by Category II motors, the Department believes any issues that might warrant a delay of enforcement for such motors can be addressed during that time period.

V. Further Information

The Department intends to incorporate this Policy Statement into an appendix to its final rule to implement the EPCA provisions that apply to motors. Any comments or suggestions with respect to this Policy Statement, as well as requests for further information, should be addressed to the Director, Building Technologies, EE–2, U.S. Department of Energy, Forrestal Building, 1000 Independence Avenue, SW., Washington, DC 20585–0121.

¹ Category I—General purpose electric motors as defined in EPCA.
Category II—Definite purpose electric motors that can be used in most general purpose applications as defined in EPCA.
Category III—Definite purpose motors as defined in EPCA.
Category IV—Special purpose motors as defined in EPCA.
Category V—Outside the scope of “electric motor” as defined in EPCA.

### Appendix B to Subpart B of Part 431—Uniform Test Method for Measuring Nominal Full Load Efficiency of Electric Motors

1. Definitions.
   Definitions contained in §§431.2 and 431.12 are applicable to this appendix.

2. Test Procedures.
   Efficiency and losses shall be determined in accordance with NEMA MG1–1993 with Revisions 1 through 4, paragraph 12.81.1, “Determination of Motor Efficiency and Losses,” (incorporated by reference, see §431.15) and either:

      (i) Page 8, subclause 5.1.1. Specified temperature, the introductory clause does not apply. Instead the following applies:

         The specified temperature used in making resistance corrections should be determined by one of the following (Test Method B only allows the use of preference (a) or (b)), which are listed in order of preference.

         (ii) Page 17, subclause 6.4.1.3. No-load test, the text does not apply. Instead, the following applies:

         See 5.3 including 5.3.3, the separation of core loss from friction and windage loss. Prior to making this test, the machine shall be operated at no-load until the input has stabilized.

         (iii) Page 40, subclause 8.6.3. Termination of test, the third sentence does not apply. Instead, the following applies:

         For continuous rated machines, the temperature test shall continue until there is 1 °C or less change in temperature rise over a 30-minute time period.

         (iv) Page 47, at the top of 10.2 Form B, immediately after the line that reads “Rated Load Heat Run Stator Winding Resistance Between Terminals,” the following additional line applies:

         Temperature for Resistance Correction (tₚ) = – °C (See 6.4.3.2).

         (v) Page 47, at the bottom of 10.2 Form B, after the first sentence to footnote t, the following additional sentence applies:

         The values for t₁ and t₂ shall be based on the same method of temperature measurement, selected from the four methods in subclause 8.3.

         (vi) Page 47, at the bottom of 10.2 Form B, below the footnotes and above “Summary of Characteristics,” the following additional note applies:

         Note: The temperature for resistance correction (t₂) is equal to [t₁ – (5) + 25 °C].

         (vii) Page 48, item 22, the torque constants “k₂ = 9.549 for torque, in N·m” and “k₂ = 7.043 for torque, in lbf·ft” do not apply. Instead, the following applies:

         “k₂ = 9.549 for torque, in N·m” and “k₂ = 7.043 for torque, in lbf·ft”.

         (viii) Page 48, at the end of item 27, the following additional reference applies:
Department of Energy
Pt. 431, Subpt. B, App. C

“See 6.4.3.2.”
(ix) Page 48, item (29). “See 4.3.2.2, Eq. 4.”
does not apply. Instead the following applies:
and Industrial Equipment) and Part C of the
Energy Policy and Conservation Act (Pub. L.
94–163), and amendments thereto. It is signed
by a responsible official of the above named
company. Attached and incorporated as part
of this Compliance Certification is a Listing
of Electric Motor Efficiencies. For each rat-
ing of electric motor* for which the Listing
specifies the nominal full load efficiency of a
basic model, the company distributes no less
efficient basic model with that rating and all
basic models with that rating comply with
the applicable energy efficiency standard.
*For this purpose, the term “rating” means
one of the 113 combinations of an electric
motor’s horsepower (or standard kilowatt
equivalent), number of poles, and open or
closed construction, with respect to which
§431.25 of 10 CFR Part 431 prescribes nominal
full load efficiency standards.

A. List each brand name, trademark, or
other label name for which the company re-
quests a Compliance Certification number:

2. Name(s) to be Marked on Electric Mo-
tors to Which this Compliance Certification
Applies:

3. If manufacturer or private labeler wishes
to receive a unique Compliance Certification
number for use with any particular brand
name, trademark, or other label name, fill
out the following two items:
A. List each brand name, trademark, or
other label name for which the company
requests a Compliance Certification number:

B. List other name(s), if any, under which
the company sells electric motors (if not
listed in item 2 above):

Submit by Certified Mail to: U.S. Department
of Energy, Office of Energy Efficiency and
Renewable Energy, Building Technologies
(EE–2), Forrestal Building, 1000 Independence
 Avenue, SW., Washington, DC 20585-
0121.

This Compliance Certification reports on
and certifies compliance with requirements
contained in 10 CFR Part 431 (Energy Con-
servation Program for Certain Commercial
§ 431.61 Purpose and scope.

This subpart contains energy conservation requirements for commercial refrigerators, freezers and refrigerator-freezers, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311-6317.

§ 431.62 Definitions concerning commercial refrigerators, freezers and refrigerator-freezers.

Basic model means, with respect to commercial refrigerators, freezers, and refrigerator-freezers, all units of a given type of commercial refrigerator, freezer, or refrigerator-freezer (or class thereof) manufactured by one manufacturer that have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing electrical, physical, or functional characteristics that affect energy consumption.
Commercial refrigerator, freezer, and refrigerator-freezer means refrigeration equipment that—
(1) Is not a consumer product (as defined in §430.2 of part 430);
(2) Is not designed and marketed exclusively for medical, scientific, or research purposes;
(3) Operates at a chilled, frozen, combination chilled and frozen, or variable temperature;
(4) Displays or stores merchandise and other perishable materials horizontally, semi-vertically, or vertically;
(5) Has transparent or solid doors, sliding or hinged doors, a combination of hinged, sliding, transparent, or solid doors, or no doors;
(6) Is designed for pull-down temperature applications or holding temperature applications; and
(7) Is connected to a self-contained condensing unit or to a remote condensing unit.

Holding temperature application means a use of commercial refrigeration equipment other than a pull-down temperature application, except a blast chiller or freezer.

Ice-cream freezer means a commercial freezer that is designed to operate at or below −5 °F (−21 °C) and that the manufacturer designs, markets, or intends for the storing, displaying, or dispensing of ice cream.

Integrated average temperature means the average temperature of all test package measurements taken during the test.

Pull-down temperature application means a commercial refrigerator with doors that, when fully loaded with 12 ounce beverage cans at 90 degrees F, can cool those beverages to an average static temperature of 38 degrees F in 12 hours or less.

Remote condensing unit means a factory-made assembly of refrigerating components designed to compress and liquefy a specific refrigerant that is an integral part of the refrigerated equipment and consists of 1 or more refrigerant compressors, refrigerant condensers, condenser fans and motors, and factory supplied accessories.

The test package means a packaged material that is used as a standard product temperature-measuring device.

Test procedures

Materials incorporated by reference.

(a) General. The Department incorporates by reference the following test procedures into subpart C of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the Federal Register.

(b) Test procedures incorporated by reference.

(c) Availability of references.
(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:
(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.
§ 431.64 Uniform test method for the measurement of energy consumption of commercial refrigerators, freezers, and refrigerator-freezers.

(a) Scope. This section provides the test procedures for measuring, pursuant to EPCA, the daily energy consumption in kilowatt hours per day (kWh/day) for a given product category and volume or total display area of commercial refrigerators, freezers, and refrigerator-freezers.

(2) Conduct the testing required in paragraphs (b)(1) of this section, and determine the daily energy consumption, at the applicable integrated average temperature in the following table. The integrated average temperature is determined using the required test method.

<table>
<thead>

</table>

(A) For low temperature applications, the integrated average temperature of all test package averages shall be 0 °F (±2 °F).
(B) For medium temperature applications, the integrated average temperature of all test package averages shall be 38.0 °F (±2 °F).

### Energy Conservation Standards

#### §431.66 Energy conservation standards and their effective dates.

(a) In this section—

(1) The term “AV” means the adjusted volume (ft³) (defined as 1.63 × frozen temperature compartment volume (ft³) + chilled temperature compartment volume (ft³)) with compartment volumes measured in accordance with the Association of Home Appliance Manufacturers Standard HRF 1-1979.

(2) The term “V” means the chilled or frozen compartment volume (ft³) (as defined in the Association of Home Appliance Manufacturers Standard HRF 1-1979).

(b) Each commercial refrigerator, freezer, and refrigerator-freezer with a self-contained condensing unit designed for holding temperature applications manufactured on or after January 1, 2010, shall have a daily energy consumption (in kilowatt hours per day) that does not exceed the following:

<table>
<thead>
<tr>
<th>Category</th>
<th>Maximum daily energy consumption (kilowatt hours per day)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refrigerators with solid doors</td>
<td>0.10V + 2.04.</td>
</tr>

</tr>
<tr>
<td>Refrigerator/freezers with solid doors</td>
<td>the greater of 0.27AV–0.71 or 0.70.</td>
</tr>
</tbody>
</table>

(c) Each commercial refrigerator with a self-contained condensing unit designed for pull-down temperature applications and transparent doors manufactured on or after January 1, 2010, shall have a daily energy consumption (in kilowatt hours per day) of not more than 0.126V + 3.51.

#### Subpart D—Commercial Warm Air Furnaces

**SOURCE:** 69 FR 61939, Oct. 21, 2004, unless otherwise noted.

#### §431.71 Purpose and scope.

This subpart contains energy conservation requirements for commercial warm air furnaces, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311–6317.

#### §431.72 Definitions concerning commercial warm air furnaces.

The following definitions apply for purposes of this subpart D, and of subparts J through M of this part. Any words or terms not defined in this Section or elsewhere in this Part shall be defined as provided in Section 340 of the Act.

Commercial warm air furnace means a warm air furnace that is industrial equipment, and that has a capacity...
§ 431.75  Materials incorporated by reference.

(a) We incorporate by reference the following test procedures into subpart D of Part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless and until DOE amends its test procedures. We incorporate the material as it exists on the date of the approval and a notice of any change in the material will be published in the Federal Register.

(c) Availability of references—(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(2) Obtaining copies of Standards. Anyone can purchase a copy of standards incorporated by reference from the following sources:

(iv) The HI Standard from the Hydronics Institute Division of GAMA, P.O. Box 218, Berkeley Heights, NJ 07922, or http://www.gamanet.org/publist/hydroordr.htm.

§ 431.76  Uniform test method for the measurement of energy efficiency of commercial warm air furnaces.

(a) This Section covers the test procedures you must follow if, pursuant to EPCA, you are measuring the steady state thermal efficiency of a gas-fired warm air furnace means a self-contained oil-fired or gas-fired furnace designed to supply heated air through ducts to spaces that require it and includes combination warm air furnace/electric air conditioning units but does not include unit heaters and duct furnaces.

TEST PROCEDURES

§ 431.75  Materials incorporated by reference.

(a) We incorporate by reference the following test procedures into subpart D of Part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless and until DOE amends its test procedures. We incorporate the material as it exists on the date of the approval and a notice of any change in the material will be published in the Federal Register.

(c) Availability of references—(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(2) Obtaining copies of Standards. Anyone can purchase a copy of standards incorporated by reference from the following sources:

(iv) The HI Standard from the Hydronics Institute Division of GAMA, P.O. Box 218, Berkeley Heights, NJ 07922, or http://www.gamanet.org/publist/hydroordr.htm.
or oil-fired commercial warm air furnace with a rated maximum input of 225,000 Btu per hour or more. Where this Section prescribes use of ANSI standard Z21.47-1998 or UL standard 727-1994, (Incorporated by reference, see § 431.75), perform only the procedures pertinent to the measurement of the steady-state efficiency.

(b) Test setup—(1) Test setup for gas-fired commercial warm air furnaces. The test setup, including flue requirement, instrumentation, test conditions, and measurements for determining thermal efficiency is as specified in sections 1.1 (Scope), 2.1 (General), 2.2 (Basic Test Arrangements), 2.3 (Test Ducts and Plenums), 2.4 (Test Gases), 2.5 (Test Pressures and Burner Adjustments), 2.6 (Static Pressure and Air Flow Adjustments), 2.38 (Thermal Efficiency), and 4.2.1 (Basic Test Arrangements for Direct Vent Control Furnaces) of the ANSI Standard Z21.47-1998. The thermal efficiency test must be conducted only at the normal inlet test pressure, as specified in Section 2.5.1 of ANSI Standard Z21.47-1998, (Incorporated by reference, see § 431.75), and at the maximum hourly Btu input rating specified by the manufacturer for the product being tested.

(2) Test setup for oil-fired commercial warm air furnaces. The test setup, including flue requirement, instrumentation, test condition, and measurement for measuring thermal efficiency is as specified in sections 1 (Scope), 2 (Units of Measurement), 3 (Glossary), 37 (General), 38 and 39 (Test Installation), 40 (Instrumentation, except 40.4 and 40.6.2 through 40.6.7, which are not required for the thermal efficiency test), 41 (Initial Test Conditions), 42 (Combustion Test—Burner and Furnace), 43.2 (Operation Tests), 44 (Limit Control Cutout Test), 45 (Continuity of Operation Test), and 46 (Air Flow, Downflow or Horizontal Furnace Test), of the UL Standard 727-1994. You must conduct a fuel oil analysis for heating value, hydrogen content, carbon content, pounds per gallon, and American Petroleum Institute (API) gravity as specified in Section 8.2.2 of the HI BTS-2000 (Incorporated by reference, see § 431.75). The steady-state combustion conditions, specified in Section 42.1 of UL Standard 727-1994, (Incorporated by reference, see § 431.75), are attained when variations of not more than 5° in the measured flue gas temperature occur for three consecutive readings taken 15 minutes apart.

(c) Additional test measurements—(1) Measurement of flue CO₂ (carbon dioxide) for oil-fired commercial warm air furnaces. In addition to the flue temperature measurement specified in Section 40.6.8 of UL Standard 727-1994, (Incorporated by reference, see § 431.75) you must locate one or two sampling tubes within six inches downstream from the flue temperature probe (as indicated on Figure 40.3 of UL Standard 727-1994) (Incorporated by reference, see § 431.75). If you use an open end tube, it must project into the flue one-third of the chimney connector diameter. If you use other methods of sampling CO₂, you must place the sampling tube so as to obtain an average sample. There must be no air leak between the temperature probe and the sampling tube location. You must collect the flue gas sample at the same time the flue gas temperature is recorded. The CO₂ concentration of the flue gas must be as specified by the manufacturer for the product being tested, with a tolerance of ±0.1 percent. You must determine the flue CO₂ using an instrument with a reading error no greater than ±0.1 percent.

(2) Procedure for the measurement of condensate for a gas-fired condensing commercial warm air furnace. The test procedure for the measurement of the condensate from the flue gas under steady state operation must be conducted as specified in sections 7.2.2.4, 7.8 and 9.2 of the ASHRAE Standard 103-1993 (Incorporated by reference, see § 431.75) under the maximum input conditions. You must conduct this condensate measurement for an additional 30 minutes of steady state operation after completion of the steady state thermal efficiency test specified in paragraph (b) of this section.

(2) Oil-fired commercial warm air furnaces. You must calculate the percent flue loss (in percent of heat input rate) by following the procedure specified in sections 11.1.4, 11.1.5, and 11.1.6.2 of the HI BTS–2000 (Incorporated by reference, see §431.75). The thermal efficiency must be calculated as:

\[ \text{Thermal Efficiency (percent)} = 100 \text{ percent} - \text{flue loss (in percent)} \]

(e) Procedure for the calculation of the additional heat gain and heat loss, and adjustment to the thermal efficiency, for a condensing commercial warm air furnace.

(1) You must calculate the latent heat gain from the condensation of the water vapor in the flue gas, and calculate heat loss due to the flue condensate down the drain, as specified in sections 11.3.7.1 and 11.3.7.2 of ASHRAE Standard 103-1993, (Incorporated by reference, see §431.75), with the exception that in the equation for the heat loss due to hot condensate flowing down the drain in Section 11.3.7.2, the assumed indoor temperature of 70 °F and the temperature term \( T_{OA} \) must be replaced by the measured room temperature as specified in Section 2.2.8 of ANSI Standard Z21.47-1998 (Incorporated by reference, see §431.75).

(2) Adjustment to the Thermal Efficiency for Condensing Furnace. You must adjust the thermal efficiency as calculated in paragraph (d)(1) of this section by adding the latent gain, expressed in percent, from the condensation of the water vapor in the flue gas, and subtracting the heat loss (due to the flue condensate down the drain), also expressed in percent, both as calculated in paragraph (e)(1) of this section, to obtain the thermal efficiency of a condensing furnace.

Energy Conservation Standards

§431.77 Energy conservation standards and their effective dates.

Each commercial warm air furnace manufactured on or after January 1, 1994, must meet the following energy efficiency standard levels:

(a) For a gas-fired commercial warm air furnace with capacity of 225,000 Btu per hour or more, the thermal efficiency at the maximum rated capacity (rated maximum input) must be not less than 80 percent.

(b) For an oil-fired commercial warm air furnace with capacity of 225,000 Btu per hour or more, the thermal efficiency at the maximum rated capacity (rated maximum input) must be not less than 81 percent.

Subpart E—Commercial Packaged Boilers

Source: 69 FR 61960, Oct. 21, 2004, unless otherwise noted.

§431.81 Purpose and scope.

This subpart contains energy conservation requirements for certain commercial packaged boilers, pursuant to Part C of Title III of the Energy Policy and Conservation Act. (42 U.S.C. 6311–6317)

§431.82 Definitions concerning commercial packaged boilers.

The following definitions apply for purposes of this subpart E, and of subparts A and J through M of this part. Any words or terms not defined in this section or elsewhere in this part shall be defined as provided in 42 U.S.C. 6311.

Combustion efficiency for a commercial packaged boiler means the efficiency descriptor for packaged boilers, determined using test procedures prescribed under §431.86 and equals to 100 percent minus percent flue loss (percent flue loss is based on input fuel energy).

Commercial packaged boiler means a type of packaged low pressure boiler that is industrial equipment with a capacity, (rated maximum input) of 300,000 Btu per hour (Btu/hr) or more which, to any significant extent, is distributed in commerce:

(1) For heating or space conditioning applications in buildings; or

(2) For service water heating in buildings but does not meet the definition of “hot water supply boiler” in this part.

Condensing boiler means a commercial packaged boiler that condenses part of the water vapor in the flue gases, and that includes a means of collecting and draining this condensate from its heat exchanger section.
Flue condensate means liquid formed by the condensation of moisture in the flue gases.

Manufacturer of a commercial packaged boiler means any person who manufactures, produces, assembles or imports such a boiler, including any person who:
(1) Manufactures, produces, assembles or imports a commercial packaged boiler in its entirety;
(2) Manufactures, produces, assembles or imports a commercial packaged boiler in part, and specifies or approves the boiler’s components, including burners or other components produced by others, as for example by specifying such components in a catalogue by make and model number or parts number; or
(3) Is any vendor or installer who sells a commercial packaged boiler that consists of a combination of components that is not specified or approved by a person described in paragraph (1) or (2) of this definition.

Packaged boiler means a boiler that is shipped complete with heating equipment, mechanical draft equipment and automatic controls; usually shipped in one or more sections and does not include a boiler that is custom designed and field constructed. If the boiler is shipped in more than one section, the sections may be produced by more than one manufacturer, and may be originated or shipped at different times and from more than one location.

Packaged high pressure boiler means a packaged boiler that is:
(1) A steam boiler designed to operate at a steam pressure higher than 15 psi gauge (psig); or
(2) A hot water boiler designed to operate at or below a water pressure of 160 psig and a temperature of 250 °F; or
(3) A boiler that is designed to be capable of supplying either steam or hot water, and designed to operate under the conditions in paragraphs (1) and (2) of this definition.

Packaged low pressure boiler means a packaged boiler that is:
(1) A steam boiler designed to operate at or below a steam pressure of 15 psig; or
(2) A hot water boiler designed to operate at or below a water pressure of 160 psig and a temperature of 250 °F; or
(3) A boiler that is designed to be capable of supplying either steam or hot water, and designed to operate under the conditions in paragraphs (1) and (2) of this definition.

Test Procedures

§ 431.85 Materials incorporated by reference.

(a) The Department incorporates by reference the following test procedures into subpart E of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless and until DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of references—(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:
(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.
(ii) U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Hearings and Dockets,
§ 431.86 Uniform test method for the measurement of energy efficiency of commercial packaged boilers.

(a) Scope. This section provides test procedures that must be followed for measuring, pursuant to EPCA, the steady state combustion efficiency of a gas-fired or oil-fired commercial packaged boiler. These test procedures apply to packaged low pressure boilers that have rated input capacities of 300,000 Btu/hr or more and are “commercial packaged boilers, but do not apply under EPCA to “packaged high pressure boilers.”

(b) Definitions. For purposes of this section, the Department incorporates by reference the definitions specified in Section 3.0 of the HI BTS–2000 (Incorporated by reference, see § 431.85), with the exception of the definition for the terms “packaged boiler”, “condensing boilers”, and “packaged low pressure steam” and “hot water boiler”.

(c) Test Method for Commercial Packaged Boilers—General. After October 23, 2006, follow the provisions in this paragraph (c) for all testing of packaged low pressure boilers that are commercial packaged boilers. Prior to that date, follow either the provisions of this paragraph (c) or of paragraph (d) of this section to test steel boilers, but follow the provisions of this paragraph for all other commercial packaged boilers.

(1) Test Setup—(i) Classifications: If employing boiler classification, you must classify boilers as given in Section 4.0 of the HI BTS–2000 (Incorporated by reference, see § 431.85).

(ii) Requirements: Conduct the combustion efficiency test as given in Section 5.2 (Combustion Efficiency Test) of the HI BTS–2000 (Incorporated by reference, see § 431.85).

(iii) Instruments and Apparatus:
(A) Follow the requirements for instruments and apparatus in sections 6 (Instruments) and 7 (Apparatus), of the HI BTS–2000 (Incorporated by reference, see § 431.85), with the exception of section 7.2.5 (flue connection for outdoor boilers) which is replaced with paragraph (c)(1)(iii)(B) of this section:
(B) Flue Connection for Outdoor Boilers: For oil-fired and power gas outdoor boilers, the integral venting means may have to be revised to permit connecting the test flue apparatus described in section 7.2.1 of BTS–2000. A gas-fired boiler for outdoor installation with a venting system provided as part of the boiler must be tested with the venting system in place.

(iv) Test Conditions: Use test conditions from Section B.0 (excluding B.5.2, B.5.3, and B.6.2) of HI BTS–2000 (Incorporated by reference, see § 431.85) for the combustion efficiency testing, and use paragraph (c)(1)(iv)(A) of this section when testing a condensing boiler:
(A) Water Temperatures for Condensing Boilers—For condensing boilers the outlet temperature shall be 180 °F ±2 °F and the inlet temperature shall be 80 °F ±5 °F at all times during the test. (See also paragraphs (c)(2)(i) and (ii) of this section for condensing boilers).
(B) [Reserved]

(2) Test Measurements. (i) Measure for combustion efficiency according to sections 9.1 (excluding sections 9.1.1.2.3 and 9.1.2.2.3), 9.2 and 10.2 of the HI BTS–2000, except that for condensing boilers, replace the boiler water inlet temperature in section 9.1.2.1.4 of the HI BTS–2000 standard with the inlet temperature specified in paragraph (c)(3)(iv)(A) of this section.

(ii) Procedure for the Measurement of Condensate for a Condensing Boiler. Collect flue condensate as specified in Section 9.2.2 of HI BTS–2000. Measure the condensate from the flue gas under steady state operation for the 30 minute collection period during the 30 minute steady state combustion efficiency test. Flue condensate mass shall
be measured immediately at the end of the 30 minute collection period to prevent evaporation loss from the sample. The humidity of the room shall at no time exceed 80 percent. Determine the mass of flue condensate for the steady state period by subtracting the tare container weight from the total container and flue condensate weight measured at the end of the test period.

(iii) A Boiler That is Capable of Supplying Either Steam or Hot Water—(A) Testing. For purposes of EPCA, measure the combustion efficiency of a commercial packaged boiler capable of supplying either steam or hot water either by testing the boiler in the steam mode or by testing it in both the steam and hot water modes.

(B) Rating. If testing the boiler only in the steam mode, use the efficiency determined from such testing to rate the boiler for both the steam and water modes. If testing the boiler in both modes, rate the boiler’s efficiency for each mode based on the testing in that mode.

(3) Calculation of Combustion Efficiency. Use the calculation procedure for the combustion efficiency test specified in Section 11.2 (including the specified subsections of 11.1) of the HI BTS–2000 (Incorporated by reference, see §431.85).

(d) Steel Commercial Packaged Boilers—Alternative Test Method. Until October 23, 2006, follow either the provisions of this paragraph (d), or of paragraph (c) of this section, to test steel commercial packaged boilers.

(1) Test setup. Instead of using HI BTS–2000 as specified in paragraph (c)(1) of this section, conduct the combustion efficiency test for steel packaged boilers using the Abbreviated Efficiency Test (Simplified Efficiency Test or The Short Form) as specified in ASME PTC 4.1 (Incorporated by reference, see §431.85). If selecting the ASME PTC 4.1 procedure for conducting the required combustion efficiency test for steel boilers, conduct the test under conditions as specified in paragraphs (d)(1)(i) and (ii) of this section.

(i) Use the test procedure for the efficiency test from ASME PTC 4.1 (Incorporated by reference, see §431.85). Conduct the combustion efficiency test with the Abbreviated Efficiency Test (Simplified Efficiency Test or The Short Form) for gas and oil fuels described in Section 1.07 of ASME PTC 4.1 (Incorporated by reference, see §431.85).

(ii) Test Conditions for the Combustion Efficiency.

(A) Steam pressure for steam boilers—Test must be made at atmospheric pressure or at a pressure not exceeding 2 psig.

(B) Water temperature for hot water boilers—The inlet temperature must be 35°F to 80°F, except that when a boiler is tested in the field after installation the inlet temperature may be as recommended by the manufacturer, but must not exceed 140°F. The outlet temperature shall be 180°F ± 2°F.

(C) After steady state operation is achieved, the minimum duration of a test run shall be 30 minutes.

(2) Test Measurements. Use the test procedure from Section 5, Efficiency by Heat Loss Method, of ASME PTC 4.1 (Incorporated by reference, see §431.85). Use the test conditions as specified in paragraph (d)(1) of this section. For a boiler that is capable of supplying either steam or hot water, follow paragraph (c)(2)(iii) of this section.

(3) Calculation of Combustion Efficiency. Use the heat loss method for gas or oil fuel as specified in Section 7.3 and the Test Forms for the Abbreviated Efficiency Test, PTC 4.1–a (Summary Sheet) and PTC 4.1–b (Calculation Sheet), of ASME PTC 4.1 to determine the combustion efficiency, except that the following specific heat loss terms (as listed in Section 7.3 of ASME PTC 4.1) to 0: sections 7.3.2.03 (moisture in fuel), 7.3.2.01 (combustible in dry refuse), 7.3.2.10 (radiation to surroundings), 7.3.2.05 through 7.3.2.09 and 7.3.2.11 through 7.3.2.14 (unmeasured losses) must be set. (Incorporated by reference, see §431.85)

ENERGY EFFICIENCY STANDARDS

§431.87 Energy conservation standards and their effective dates.

Each manufacturer of a commercial packaged boiler manufactured on or after January 1, 1994, must meet the following energy efficiency standard levels:
§ 431.91 Purpose and scope.

This subpart specifies test procedures and energy conservation standards for certain commercial air conditioners and heat pumps, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311-6317.

§ 431.92 Definitions concerning commercial air conditioners and heat pumps.

The following definitions apply for purposes of this subpart F, and of subparts J through M of this part. Any words or terms not defined in this section or elsewhere in this part shall be defined as provided in 42 U.S.C. 6311.

Coefficient of Performance, or COP means the ratio of the produced cooling effect of an air conditioner or heat pump (or its produced heating effect, depending on the mode of operation) to its net work input, when both the cooling (or heating) effect and the net work input are expressed in identical units of measurement.

Commercial package air-conditioning and heating equipment means air-cooled, water-cooled, evaporatively-cooled, or water source (not including ground water source) electrically operated, unitary central air conditioners and central air-conditioning heat pumps for commercial application.

Energy Efficiency Ratio, or EER means the ratio of the produced cooling effect of an air conditioner or heat pump to its net work input, expressed in Btu/watt-hour.

Heating seasonal performance factor, or HSPF means the total heating output of a central air-conditioning heat pump during its normal annual usage period for heating, expressed in Btu's and divided by the total electric power input, expressed in watt-hours, during the same period.

Large commercial package air-conditioning and heating equipment means commercial package air-conditioning and heating equipment that is rated—

(1) At or above 135,000 Btu per hour; and

(2) Below 240,000 Btu per hour (cooling capacity).

Packaged terminal air conditioner means a wall sleeve and a separate unencased combination of heating and cooling assemblies specified by the builder and intended for mounting through the wall, and that is industrial equipment. It includes a prime source of refrigeration, separable outdoor louvers, forced ventilation, and heating availability by builder's choice of hot water, steam, or electricity.

Packaged terminal heat pump means a packaged terminal air conditioner that utilizes reverse cycle refrigeration as its prime heat source, that has a supplementary heat source available, with the choice of hot water, steam, or electric resistant heat, and that is industrial equipment.

Seasonal energy efficiency ratio or SEER means the total cooling output of a central air conditioner or central air-conditioning heat pump, expressed in Btu's, during its normal annual usage period for cooling and divided by the total electric power input, expressed in watt-hours, during the same period.

Single package unit means any central air conditioner or central air-conditioning heat pump in which all the major assemblies are enclosed in one cabinet.

Small commercial package air-conditioning and heating equipment means commercial package air-conditioning and heating equipment that is rated below 135,000 Btu per hour (cooling capacity).

Split system means any central air conditioner or central air conditioning...
heat pump in which one or more of the major assemblies are separate from the others.

Very large commercial package air-conditioning and heating equipment means commercial package air-conditioning and heating equipment that is rated—

(1) At or above 240,000 Btu per hour; and

(2) Below 760,000 Btu per hour (cooling capacity).

TEST PROCEDURES

§ 431.95 Materials incorporated by reference.

(a) The Department incorporates by reference the following test procedures into subpart F of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the Department test procedures unless and until the Department amends its test procedures. The Department incorporates the material as it exists on the date of the approval and a notice of any change in the material will be published in the Federal Register.

(c) Availability of references—(1) Inspection of test procedures. You may inspect the test procedures incorporated by reference at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to:

§ 431.96 Uniform test method for the measurement of energy efficiency of small, large, and very large commercial package air conditioning and heating equipment, packaged terminal air conditioners, and packaged terminal heat pumps.

(a) Scope. This section contains test procedures for measuring, pursuant to EPCA, the energy efficiency of any small, large, or very large commercial package air-conditioning and heating equipment, packaged terminal air conditioner, or packaged terminal heat pump.

(b) Testing and calculations. Determine the energy efficiency of each covered product by conducting the test procedure(s) listed in the rightmost column of Table 1 of this section, that apply to the energy efficiency descriptor for that product, category, and cooling capacity.
Table 1 to § 431.96—Test Procedures for All Small Commercial Package Air-Conditioning and Heating Equipment, for Large Commercial Package Air-Conditioning and Heating Equipment, for Very Large Commercial Package Air-Conditioning and Heating Equipment, and for Packaged Terminal Air-Conditioners, and Packaged Terminal Heat Pumps

<td></td>
</tr>
</tbody>
</table>

| Large Commercial Packaged Air Conditioning and Heating Equipment. | ≥135,000 Btu/h and <240,000 Btu/h. | All | EER = 8.5 | EER = 8.5. |
| Water-Cooled and Evaporatively Cooled. | ≥135,000 and <240,000 Btu/h. | All | EER = 9.6 | EER = 9.6.³ |

| Packaged Terminal Air Conditioners and Heat Pumps. | ≤7,000 Btu/h | All | EER = 8.88 | EER = 8.88. |
| | >7,000 Btu/h and ≤15,000 Btu/h. | | EER = 10.0 − (0.16 × capacity) (in kBtu/h at 95 °F outdoor dry-bulb temperature) | EER = 10.0 − (0.16 × capacity) (in kBtu/h at 95 °F outdoor dry-bulb temperature) |
| | >15,000 Btu/h | | EER = 7.6 | EER = 7.6. |

¹ For equipment rated according to the ARI standards, all EER values must be rated at 95 °F outdoor dry-bulb temperature for air-cooled products and evaporatively-cooled products and at 85 °F entering water temperature for water-cooled products. For water-source heat pumps rated according to the ISO standard, EER must be rated at 90 °C (194 °F) entering water temperature.

² Deduct 0.2 from the required EER for units with heating sections other than electric resistance heat.

³ Effective 10/29/2004, the minimum value becomes EER = 11.0.

</table>

* This EER level applies to equipment that has electric resistance heat or no heating.
** This EER level applies to equipment with all other heating-system types that are integrated into the unitary equipment.
†EER at a standard temperature rating of 95 °F dry-bulb and COP at a high temperature rating of 47 °F dry-bulb.

§431.101 Purpose and scope.

This subpart contains energy conservation requirements for certain commercial water heaters, hot water supply boilers and unfired hot water storage tanks, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311–6317.

Subpart G—Commercial Water Heaters, Hot Water Supply Boilers and Unfired Hot Water Storage Tanks

Source: 69 FR 61983, Oct. 21, 2004, unless otherwise noted.
§ 431.102 Definitions concerning commercial water heaters, hot water supply boilers, and unfired hot water storage tanks.

The following definitions apply for purposes of this subpart G, and of subparts J through M of this part. Any words or terms not defined in this section or elsewhere in this part shall be defined as provided in section 340 of the Act, 42 U.S.C. 6311.

Hot water supply boiler means a packaged boiler that is industrial equipment and that,

(1) Has an input rating from 300,000 Btu/hr to 12,500,000 Btu/hr and of at least 4,000 Btu/hr per gallon of stored water,

(2) Is suitable for heating potable water, and

(3) Meets either or both of the following conditions:

(i) It has the temperature and pressure controls necessary for heating potable water for purposes other than space heating, or

(ii) The manufacturer’s product literature, product markings, product marketing, or product installation and operation instructions indicate that the boiler’s intended uses include heating potable water for purposes other than space heating.

Instantaneous water heater means a water heater that has an input rating not less than 4,000 Btu/hr per gallon of stored water, and that is industrial equipment, including products meeting this description that are designed to heat water to temperatures of 180 °F or higher.

Packaged boiler means a boiler that is shipped complete with heating equipment, mechanical draft equipment and automatic controls; usually shipped in one or more sections and does not include a boiler that is custom designed and field constructed. If the boiler is shipped in more than one section, the sections may be produced by more than one manufacturer, and may be originated or shipped at different times and from more than one location.

R-value means the thermal resistance of insulating material as determined based on ASTM Standard Test Method C177–97 or C518–91 and expressed in (°F·ft²·h/Btu).

Standby loss means the average hourly energy required to maintain the stored water temperature, expressed as applicable either (1) as a percentage (per hour) of the heat content of the stored water and determined by the formula for S given in Section 2.10 of ANSI Z21.10.3–1998, denoted by the term “S,” or (2) in Btu per hour based on a 70 °F temperature differential between stored water and the ambient temperature, denoted by the term “SL.”

Storage water heater means a water heater that heats and stores water within the appliance at a thermostatically controlled temperature for delivery on demand and that is industrial equipment. Such term does not include units with an input rating of 4,000 Btu/hr or more per gallon of stored water.

Tank surface area means, for the purpose of determining portions of a tank requiring insulation, those areas of a storage tank, including hand holes and manholes, in its uninsulated or pre-insulated state, that do not have pipe penetrations or tank supports attached.

Thermal efficiency for an instantaneous water heater, a storage water heater or a hot water supply boiler means the ratio of the heat transferred to the water flowing through the water heater to the amount of energy consumed by the water heater as measured during the thermal efficiency test procedure prescribed in this subpart.

Unfired hot water storage tank means a tank used to store water that is heated externally, and that is industrial equipment.

Test Procedures

(a) The Department incorporates by reference the following test procedures into Subpart G of Part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C.
§ 431.106 Uniform test method for the measurement of energy efficiency of commercial water heaters and hot water supply boilers (other than commercial heat pump water heaters).

(a) Scope. This section covers the test procedures you must follow if, pursuant to EPCA, you are measuring the thermal efficiency or standby loss, or both, of a storage or instantaneous water heater or hot water supply boiler (other than a commercial heat pump water heater).

(b) Testing and Calculations. Determine the energy efficiency of each covered product by conducting the test procedure(s), set forth in the two right-most columns of the following table, that apply to the energy efficiency descriptor(s) for that product:
Any packaged boiler that provides service water, that meets the definition of "commercial packaged boiler" in subpart E of this part, but does not meet the definition of "hot water supply boiler" in subpart G, must meet the requirements that apply to it under subpart E.
§431.131 Energy conservation standard \( a \) (products manufactured on and after October 29, 2003) \( b \)

</tbody>
</table>

\( V_m \) is the measured storage volume and \( V_r \) is the rated volume, both in gallons. \( Q \) is the nameplate input rate in Btu/hr.

\( a \) For hot water supply boilers with a capacity of less than 10 gallons: (1) the standards are mandatory for products manufactured on and after October 21, 2005, and (2) products manufactured prior to that date, and on or after October 23, 2003, must meet either the standards listed in this table or the applicable standards in Subpart E of this Part for a “commercial package boiler.”

\( b \) Water heaters and hot water supply boilers having more than 140 gallons of storage capacity need not meet the standby loss requirement if (1) the tank surface area is thermally insulated to R–12.5 or more, (2) a standing pilot light is not used, and (3) for gas or oil-fired storage water heaters, they have a line damper or fan assisted combustion.

Subpart H—Automatic Commercial Ice Makers

SOURCE: 70 FR 60415, Oct. 18, 2005, unless otherwise noted.

§431.131 Purpose and scope.

This subpart contains energy conservation requirements for commercial ice makers, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311-6317.

§431.132 Definitions concerning automatic commercial ice makers.

Automatic commercial ice maker means a factory-made assembly (not necessarily shipped in one package) that—

(1) Consists of a condensing unit and ice-making section operating as an integrated unit, with means for making and harvesting ice; and

(2) May include means for storing ice, dispensing ice, or storing and dispensing ice.

Basic model means, with respect to automatic commercial ice makers, all units of a given type of automatic commercial ice maker (or class thereof) manufactured by one manufacturer and which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing electrical, physical, or functional characteristics that affect energy consumption.

Cube type ice means ice that is fairly uniform, hard, solid, usually clear, and generally weighs less than two ounces (60 grams) per piece, as distinguished from flake, crushed, or fragmented ice.

Energy use means the total energy consumed, stated in kilowatt hours per one-hundred pounds (kWh/100 lb) of ice and stated in multiples of 0.1. For remote condensing automatic commercial ice makers, total energy consumed shall include condenser fan power.

Harvest rate means the amount of ice (at 32 degrees F) in pounds produced per 24 hours.

Ice-making head means automatic commercial ice makers that do not contain integral storage bins, but are generally designed to accommodate a variety of bin capacities. Storage bins entail additional energy use not included in the reported energy consumption figures for these units.

Maximum condenser water use means the maximum amount of water used by the condensing unit (if water-cooled), stated in gallons per one hundred pounds (gal/100 lb) of ice, in multiples of 1.

Remote compressor means a type of automatic commercial ice maker in
which the ice-making mechanism and compressor are in separate sections.

Remote condensing means a type of automatic commercial ice maker in which the ice-making mechanism and condenser or condensing unit are in separate sections.

Self-contained means a type of automatic commercial ice maker in which the ice-making mechanism and storage compartment are in an integral cabinet.

TEST PROCEDURES
§ 431.133 Materials incorporated by reference.

(a) General. The Department incorporates by reference the following test procedures into subpart H of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the FEDERAL REGISTER.

(2) U.S. Department of Energy, Forestal Building, Room 1J–018 (Resource Room of the Building Technologies Program), 1000 Independence Avenue, SW., Washington, DC 20585–0121, (202) 586–9127, between 9 a.m. and 4 p.m., Monday through Friday, except Federal holidays.

[71 FR 71372, Dec. 8, 2006]

§ 431.134 Uniform test methods for the measurement of energy consumption and water consumption of automatic commercial ice makers.

(a) Scope. This section provides the test procedures for measuring, pursuant to EPCA, the energy use in kilowatt hours per 100 pounds of ice (kWh/100 lbs ice) and the condenser water use in gallons per 100 pounds of ice (gal/100 lbs ice).

(b) Testing and Calculations. Determine the energy consumed and the condenser water use rate of each covered product by conducting the test procedures, set forth in the Air-Conditioning and Refrigeration Institute’s Standard 810–2003, “Performance Rating of Automatic Commercial Ice-Makers,” section 4, “Test Requirements,” and section 5, “Rating Requirements.” (Incorporated by reference, see §431.133) Do not use the formula in section 8.3 of ANSI/ASHRAE Standard 29–1988 (RA 2005) for calculating the power consumption, but instead calculate the energy use rate (kWh/100 lbs ice) by dividing the energy consumed during testing by the total mass of the ice produced during the time period over
which energy consumption is measured, normalized to 100 pounds of ice as follows:

\[
\text{Energy Consumption Rate (per 100 lbs ice)} = \frac{\text{Energy Consumed During Testing (kWh)}}{\text{Mass of Ice Collected During Testing (lbs)}} \times 100\%.
\]

[71 FR 71372, Dec. 8, 2006]

**ENERGY CONSERVATION STANDARDS**

§ 431.136 Energy conservation standards and their effective dates.

Each automatic commercial ice maker that produces cube type ice with capacities between 50 and 2500 pounds per 24-hour period when tested according to the test standard established in accordance with section 343 of EPCA (42 U.S.C. 6314) and is manufactured on or after January 1, 2010, shall meet the following standard levels:

<table>
<thead>
<tr>
<th>Equipment type</th>
<th>Type of cooling</th>

**Subpart I—Commercial Clothes Washers**

SOURCE: 70 FR 60416, Oct. 18, 2005, unless otherwise noted.

§ 431.151 Purpose and scope.

This subpart contains energy conservation requirements for commercial clothes washers, pursuant to Part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311-6317.

§ 431.152 Definitions concerning commercial clothes washers.

Commercial clothes washer means a soft-mounted front-loading or soft-mounted top-loading clothes washer that—

1. Has a clothes container compartment that—
   i. For horizontal-axis clothes washers, is not more than 3.5 cubic feet; and
   ii. For vertical-axis clothes washers, is not more than 4.0 cubic feet; and
2. Is designed for use in—
   i. Applications in which the occupants of more than one household will be using the clothes washer, such as multi-family housing common areas and coin laundries; or
   ii. Other commercial applications.

432
TEST PROCEDURES

§ 431.154 Test procedures.

The test procedures for residential clothes washers in Appendix J to subpart B of part 430 of this title shall be used to test commercial clothes washers.

ENERGY CONSERVATION STANDARDS

§ 431.156 Energy and water conservation standards and effective dates.

Each commercial clothes washer manufactured on or after January 1, 2007, shall have—

(1) A modified energy factor of at least 1.26; and

(2) A water consumption factor of not more than 9.5.

Subpart J—Provisions for Commercial HVAC & Water Heating Products

SOURCE: 69 FR 61941, Oct. 21, 2004, unless otherwise noted.

§ 431.171 Purpose and scope. [Reserved]

§ 431.172 Definitions.

The following definitions apply for purposes of subparts D through G and J through M of this part. Other terms in these subparts shall be as defined elsewhere in this part and, if not defined in this part, shall have the meaning set forth in Section 340 of the Act.

Basic model means, with respect to a commercial HVAC & WH product, all units of such product, manufactured by one manufacturer, which have the same primary energy source and which do not have any differing electrical, physical, or functional characteristics that affect energy consumption.

Commercial HVAC & WH product means any small or large commercial package air-conditioning and heating equipment, packaged terminal air conditioner, packaged terminal heat pump, commercial packaged boiler, hot water supply boiler, commercial warm air furnace, instantaneous water heater, storage water heater, or unfired hot water storage tank.

Flue loss means the sum of the sensible heat and latent heat above room temperature of the flue gases leaving the appliance.

Industrial equipment means an article of equipment, regardless of whether it is in fact distributed in commerce for industrial or commercial use, of a type which:

(1) In operation consumes, or is designed to consume energy;

(2) To any significant extent, is distributed in commerce for industrial or commercial use; and

(3) Is not a “covered product” as defined in Section 321(2) of EPCA, 42 U.S.C. 6291(2), other than a component of a covered product with respect to which there is in effect a determination under Section 341(c) of EPCA, 42 U.S.C. 6312(c).

Private labeler means, with respect to a commercial HVAC & WH product, an owner of a brand or trade mark on the label of a product which bears a private label. A commercial HVAC & WH product bears a private label if:

(1) Such product (or its container) is labeled with the brand or trademark of a person other than a manufacturer of such product;

(2) The person with whose brand or trademark such product (or container) is labeled has authorized or caused such product to be so labeled; and

(3) The brand or trademark of a manufacturer of such product does not appear on such label.

Subpart K—Distribution Transformers

SOURCE: 70 FR 60416, Oct. 18, 2005, unless otherwise noted.

§ 431.191 Purpose and scope.

This subpart contains energy conservation requirements for distribution transformers, pursuant to Parts B and C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6291–6317.

[71 FR 24995, Apr. 27, 2006]

§ 431.192 Definitions.

The following definitions apply for purposes of this subpart:

Auto transformer means a transformer that:
§ 431.192

(1) Has one physical winding that consists of a series winding part and a common winding part;
(2) Has no isolation between its primary and secondary circuits; and
(3) During step-down operation, has a primary voltage that is equal to the total of the series and common winding voltages, and a secondary voltage that is equal to the common winding voltage.

Basic model means a group of models of distribution transformers manufactured by a single manufacturer, that have the same insulation type (i.e., liquid-immersed or dry-type), have the same number of phases (i.e., single or three), have the same standard kVA rating, and do not have any differentiating electrical, physical or functional features that affect energy consumption. Differences in voltage and differences in basic impulse insulation level (BIL) rating are examples of differentiating electrical features that affect energy consumption.

Distribution transformer means a transformer that—
(1) Has an input voltage of 34.5 kV or less;
(2) Has an output voltage of 600 V or less;
(3) Is rated for operation at a frequency of 60 Hz; and
(4) Has a capacity of 10 kVA to 2500 kVA for liquid-immersed units and 15 kVA to 2500 kVA for dry-type units; but
(5) The term “distribution transformer” does not include a transformer that is an—
(i) Autotransformer;
(ii) Rectifier transformer;
(iii) Machine-tool (control) transformer;
(iv) Nonventilated transformer;
(v) Sealed transformer;
(vi) Special-impedance transformer;
(vii) Transformer with tap range of 20 percent or more;
(viii) Uninterruptible power supply transformer; or
(ix) Welding transformer.

(6) Isolates an electric motor from the line;
(7) Accommodates the added loads of drive-created harmonics; and
(8) Is designed to withstand the additional mechanical stresses resulting from an alternating current adjustable frequency motor drive or a direct current motor drive.

Efficiency means the ratio of the useful power output to the total power input.

Excitation current or no-load current means the current that flows in any winding used to excite the transformer when all other windings are open-circuited.

Grounding transformer means a three-phase transformer intended primarily to provide a neutral point for system-grounding purposes, either by means of:
(1) A grounded wye primary winding and a delta secondary winding; or
(2) A transformer with its primary winding in a zig-zag winding arrangement, and with no secondary winding.

Liquid-immersed distribution transformer means a distribution transformer in which the core and coil assembly is immersed in an insulating liquid.

Load loss means, for a distribution transformer, those losses incident to a specified load carried by the transformer, including losses in the windings as well as stray losses in the conducting parts of the transformer.

Medium-voltage dry-type distribution transformer means a distribution transformer in which the core and coil assembly is immersed in a gaseous or dry-compound insulating medium, and which has a rated primary voltage between 601 V and 34.5 kV.
Department of Energy § 431.192

No-load loss means those losses that are incident to the excitation of the transformer.

Nonventilated transformer means a transformer constructed so as to prevent external air circulation through the coils of the transformer while operating at zero gauge pressure.

Phase angle means the angle between two phasors, where the two phasors represent progressions of periodic waves of either:

1. Two voltages;
2. Two currents; or
3. A voltage and a current of an alternating current circuit.

Phase angle correction means the adjustment (correction) of measurement data to negate the effects of phase angle error.

Phase angle error means incorrect displacement of the phase angle, introduced by the components of the test equipment.

Rectifier transformer means a transformer that operates at the fundamental frequency of an alternating-current system and that is designed to have one or more output windings connected to a rectifier.

Reference temperature means 20 °C for no-load loss, 55 °C for load loss of liquid-immersed distribution transformers at 50 percent load, and 75 °C for load loss of both low-voltage and medium-voltage dry-type distribution transformers, at 35 percent load and 50 percent load, respectively. It is the temperature at which the transformer losses must be determined, and to which such losses must be corrected if testing is done at a different point. (These temperatures are specified in the test method in Appendix A to this part.)

Regulating transformer means a transformer that varies the voltage, the phase angle, or both voltage and phase angle, of an output circuit and compensates for fluctuation of load and input voltage, phase angle or both voltage and phase angle.

Sealed transformer means a transformer designed to remain hermetically sealed under specified conditions of temperature and pressure.

Special-impedance transformer means any transformer built to operate at an impedance outside of the normal impedance range for that transformer's kVA rating. The normal impedance range for each kVA rating for liquid-immersed and dry-type transformers is shown in Tables 1 and 2, respectively.

Temperature correction means the mathematical correction(s) of measurement data, obtained when a transformer is tested at a temperature that is different from the reference temperature, to the value(s) that would have been obtained if the transformer had been tested at the reference temperature.

Test current means the current of the electrical power supplied to the transformer under test.

Test frequency means the frequency of the electrical power supplied to the transformer under test.
§ 431.193 Test procedures for measuring energy consumption of distribution transformers.

The test procedures for measuring the energy efficiency of distribution transformers for purposes of EPCA are specified in Appendix A to this subpart.

[71 FR 24997, Apr. 27, 2006]

ENERGY CONSERVATION STANDARDS

§ 431.196 Energy conservation standards and their effective dates.

(a) Low-Voltage Dry-Type Distribution Transformers. The efficiency of a low-voltage dry-type distribution transformer manufactured on or after January 1, 2007, shall be no less than that required for their kVA rating in the table below. Low-voltage dry-type distribution transformers with kVA ratings not appearing in the table shall have their minimum efficiency level determined by linear interpolation of the kVA and efficiency values immediately above and below that kVA rating.

<table>
<thead>

</tbody>
</table>

Efficiencies are determined at the following reference conditions: (1) for no-load losses, at the temperature of 20 °C, and (2) for load-losses, at the temperature of 75 °C and 35 percent of nameplate load.

(b) Liquid-Immersed Distribution Transformers. The efficiency of a liquid-immersed distribution transformer manufactured on or after January 1, 2010, shall be no less than that required for their kVA rating in the table below. Liquid-immersed distribution transformers with kVA ratings not appearing in the table shall have their minimum efficiency level determined by...
linear interpolation of the kVA and efficiency values immediately above and below that kVA rating.

Note: BIL means basic impulse insulation level.

(d) Underground Mining Distribution Transformers. [Reserved]

§431.197 Manufacturer's determination of efficiency for distribution transformers.

When a manufacturer or other party (both of which this section refers to as a “manufacturer”) determines the efficiency of a distribution transformer in order to comply with an obligation imposed on it by or pursuant to Part C of Title III of EPCA, 42 U.S.C. 6311–6317, this section applies. This section does not apply to enforcement testing conducted pursuant to §431.190 of this part.

437
§431.197

(a) Methods used to determine efficiency—(1) General requirements. A manufacturer must determine the efficiency of each basic model of distribution transformer either by testing, in accordance with §431.193 of this part and paragraphs (b)(2) and (b)(3) of this section, or by application of an alternative efficiency determination method (AEDM) that meets the requirements of paragraphs (a)(2) and (a)(3) of this section; provided, however, that a manufacturer may use an AEDM to determine the efficiency of one or more of its untested basic models only if it determines the efficiency of at least five of its other basic models (selected in accordance with paragraph (b)(1) of this section) through actual testing. For each basic model of distribution transformer that has a configuration of windings which allows for more than one nominal rated voltage, the manufacturer must determine the basic model’s efficiency either at the voltage at which the highest losses occur or at each voltage at which the transformer is rated to operate.

(2) Alternative efficiency determination method. A manufacturer may apply an AEDM to a basic model pursuant to paragraph (a)(1) of this section only if:
   (i) The AEDM has been derived from a mathematical model that represents the electrical characteristics of that basic model;
   (ii) The AEDM is based on engineering and statistical analysis, computer simulation or modeling, or other analytic evaluation of performance data; and
   (iii) The manufacturer has substantiated the AEDM, in accordance with paragraph (a)(3) of this section, by applying it to, and testing, at least five other basic models of the same type, i.e., low-voltage dry-type distribution transformers, medium-voltage dry-type distribution transformers, or liquid-immersed distribution transformers.

(3) Substantiation of an alternative efficiency determination method. Before using an AEDM, the manufacturer must substantiate the AEDM’s accuracy and reliability as follows:
   (i) Apply the AEDM to at least five of the manufacturer’s basic models that have been selected for testing in accordance with paragraph (b)(1) of this section, and calculate the power loss for each of these basic models;
   (ii) Test at least five units of each of these basic models in accordance with the applicable test procedure and paragraph (b)(2) of this section, and determine the power loss for each of these basic models;
   (iii) The predicted total power loss for each of these basic models, calculated by applying the AEDM pursuant to paragraph (a)(3)(i) of this section, must be within plus or minus five percent of the mean total power loss determined from the testing of that basic model pursuant to paragraph (a)(3)(ii) of this section; and
   (iv) Calculate for each of these basic models the percentage that its power loss calculated pursuant to paragraph (a)(3)(i) is of its power loss determined from testing pursuant to paragraph (a)(3)(ii), compute the average of these percentages, and that calculated average power loss, expressed as a percentage of the average power loss determined from testing, must be no less than 97 percent and no greater than 103 percent.

(4) Subsequent verification of an AEDM. (i) Each manufacturer that has used an AEDM under this section shall have available for inspection by the Department of Energy records showing:
   (I) The method or methods used; the mathematical model, the engineering or statistical analysis, computer simulation or modeling, and other analytic evaluation of performance data on which the AEDM is based; complete test data, product information, and related information that the manufacturer has generated or acquired pursuant to paragraph (a)(3) of this section; and the calculations used to determine the efficiency and total power losses of each basic model to which the AEDM was applied.
   (ii) If requested by the Department, the manufacturer shall conduct simulations to predict the performance of particular basic models of distribution transformers specified by the Department, analyses of previous simulations conducted by the manufacturer, sample testing of basic models selected by the Department, or a combination of the foregoing.
When identifying these five basic models, any basic model that does not comply with Federal energy conservation standards for distribution transformers that may be in effect shall be excluded from consideration.

(b) Additional testing requirements—(1) Selection of basic models for testing if an AEDM is to be applied. (i) A manufacturer must select basic models for testing in accordance with the following criteria:

(A) Two of the basic models must be among the five basic models with the highest unit volumes of production by the manufacturer in the prior year, or during the prior 12-calendar-month period beginning in 2003, whichever is later;

(B) No two basic models should have the same combination of power and voltage ratings; and

(C) At least one basic model should be single-phase and at least one should be three-phase.

(ii) In any instance where it is impossible for a manufacturer to select basic models for testing in accordance with all of these criteria, the criteria shall be given priority in the order in which they are listed. Within the limits imposed by the criteria, basic models shall be selected randomly.

(2) Selection of units for testing within a basic model. For each basic model a manufacturer selects for testing, it shall select and test units as follows:

(i) If the manufacturer would produce five or fewer units of a basic model over a reasonable period of time (approximately 180 days), then it must test each unit. However, a manufacturer may not use a basic model with a sample size of fewer than five units to substantiate an AEDM pursuant to paragraph (a)(3) of this section.

(ii) If the manufacturer produces more than five units over such period of time, it must either test all such units or select a sample of at least five units at random and test them. Any such sample shall be comprised of production units of the basic model, or units that are representative of such production units.

(3) Applying results of testing. In a test of compliance with a represented efficiency, the average efficiency of the sample, $\bar{X}$, which is defined by

$$\bar{X} = \frac{1}{n} \sum_{i=1}^{n} X_i$$

where $X_i$ is the measured efficiency of unit $i$ and $n$ is the number of units tested, must satisfy the condition:

$$\bar{X} \geq \frac{100}{1 + \frac{0.08}{\sqrt{n}} \left(\frac{100 - RE}{RE}\right)}$$

where $RE$ is the represented efficiency.

Effective Date Note: At 71 FR 24997, Apr. 27, 2006, § 431.197 was added, effective May 30, 2006, except for paragraph (a)(4)(i) which contains information collection requirements and will not become effective until approval has been given by the Office of Management and Budget.

§ 431.198 Enforcement testing for distribution transformers.

(a) Test notice. Upon receiving information in writing, concerning the energy performance of a particular distribution transformer sold by a particular manufacturer or private labeler, which indicates that the transformer may not be in compliance with the applicable energy efficiency standard, or upon undertaking to ascertain the accuracy of the efficiency rating on the nameplate or in marketing materials for a distribution transformer, disclosed pursuant to this part, the Department may conduct testing of that equipment under this subpart by means of a test notice addressed to the manufacturer in accordance with the following requirements:

(1) The test notice procedure will only be followed after the Department has examined the underlying test data (or, where appropriate, data as to use of an AEDM) provided by the manufacturer and after the manufacturer has been offered the opportunity to meet with the Department to verify, as applicable, compliance with the applicable efficiency standard, or the accuracy of labeling information, or both. In addition, where compliance of a basic model was certified based on an AEDM, the Department shall have the discretion to pursue the provisions of § 431.197(a)(4)(ii) prior to invoking the test notice procedure. The Department
shall be permitted to observe any reverification procedures undertaken pursuant to this subpart, and to inspect the results of such reverification.

(2) The Department will mail or deliver the test notice to the plant manager or other responsible official, as designated by the manufacturer.

(3) The test notice will specify the basic model(s) to be selected for testing, the method of selecting the test sample, the date and time at which testing shall be initiated, the date by which testing is scheduled to be completed and the facility at which testing will be conducted. The test notice may also provide for situations in which a specified basic model is unavailable for testing, and may include alternative basic models. The specified basic model may be one either that the manufacturer has rated by actual testing or that it has rated by the use of an AEDM.

(4) The Department may require in the test notice that the manufacturer shall ship at its expense a reasonable number of units of each basic model specified in such test notice to a testing laboratory designated by the Department. The number of units of each basic model specified in a test notice shall not exceed twenty (20).

(5) Except as required or provided in paragraphs (a)(6) or (a)(7) of this section, initially the Department will test five units.

(6) Except as provided in paragraph (a)(7) of this section, if fewer than five units of a basic model are available for testing when the manufacturer receives the test notice, then

(i) DOE will test the available unit(s); or

(ii) If one or more other units of the basic model are expected to become available within six months, DOE may instead, at its discretion, test either:

(A) The available unit(s) and one or more of the other units that subsequently become available (up to a maximum of twenty); or

(B) Up to twenty of the other units that subsequently become available.

(7) Notwithstanding paragraphs (a)(5) and (a)(6) of this section, if testing of the available or subsequently available units of a basic model would be impractical, as for example where a basic model is very large, has unusual testing requirements, or has limited production, the Department may in its discretion decide to base the determination of compliance on the testing of fewer than the available number of units, if the manufacturer so requests and demonstrates that the criteria of this paragraph are met.

(8) When testing units under paragraphs (a)(5), (a)(6), or (a)(7) of this section, DOE shall perform the following number of tests:

(i) If DOE tests four or more units, it will test each unit once;

(ii) If DOE tests two or three units, it will test each unit twice; or

(iii) If DOE tests one unit, it will test that unit four times.

(9) Within five working days of the time the units are selected, the manufacturer shall ship the specified test units of the basic model to the testing laboratory.

(b) Testing laboratory. Whenever the Department conducts enforcement testing at a designated laboratory in accordance with a test notice under this section, the resulting test data shall constitute official test data for that basic model. Such test data will be used by the Department to make a determination of compliance or non-compliance.

(c) Sampling. The determination that a manufacturer's basic model complies with its labeled efficiency, or the applicable energy efficiency standard, shall be based on the testing conducted in accordance with the statistical sampling procedures set forth in Appendix B of this subpart and the test procedures specified for distribution transformers.

(d) Test unit selection. The Department shall select a batch, a batch sample, and test units from the batch sample in accordance with the following provisions of this paragraph and the conditions specified in the test notice.

(1) The batch may be subdivided by the Department utilizing criteria specified in the test notice.

(2) The Department will then randomly select a batch sample of up to 20 units from one or more subdivided groups within the batch. The manufacturer shall keep on hand all units in the batch sample until such time as...
the basic model is determined to be in compliance or non-compliance.
(3) The Department will randomly select individual test units comprising the test sample from the batch sample.
(4) All random selection shall be achieved by sequentially numbering all of the units in a batch sample and then using a table of random numbers to select the units to be tested.
(e) Test unit preparation. (1) Prior to and during the testing, a test unit selected in accordance with paragraph (d) of this section shall not be prepared, modified, or adjusted in any manner unless such preparation, modification, or adjustment is allowed by the applicable Department of Energy test procedure.
(2) No quality control, testing, or assembly procedures shall be performed on a test unit, or any parts and sub-assemblies thereof, that is not performed during the production and assembly of all other units included in the basic model.
(3) A test unit shall be considered defective if such unit is inoperative or is found to be in noncompliance due to failure of the unit to operate according to the manufacturer’s design and operating instructions. Defective units, including those damaged due to shipping or handling, shall be reported immediately to the Department. The Department shall authorize testing of an additional unit on a case-by-case basis.
(f) Testing at manufacturer’s option. (1) If a manufacturer’s basic model is determined to be in noncompliance with the applicable energy performance standard at the conclusion of Department testing in accordance with the sampling plan specified in Appendix B of this subpart, the manufacturer may request that the Department conduct additional testing of the basic model according to procedures set forth in Appendix B of this subpart and the test procedures specified for distribution transformers.
(2) All units tested under this paragraph (f) shall be selected and tested in accordance with the provisions given in paragraphs (a)(9), (b), (d) and (e) of this section.
(3) The manufacturer shall bear the cost of all testing conducted under this paragraph (f).

APPENDIX A TO SUBPART K OF PART 431—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF DISTRIBUTION TRANSFORMERS

1.0 Definitions.
The definitions contained in §§431.2 and 431.192 are applicable to this Appendix A.

2.0 Accuracy Requirements.
(a) Equipment and methods for loss measurement shall be sufficiently accurate that measurement error will be limited to the values shown in Table 2.1.

<table>

(b) Only instrument transformers meeting the 0.3 metering accuracy class, or better, may be used under this test method.

3.0 Resistance Measurements
3.1 General Considerations
(a) Measure or establish the winding temperature at the time of the winding resistance measurement.
(b) Measure the direct current resistance (R_{dc}) of transformer windings by one of the methods outlined in section 3.3. The methods of section 3.5 must be used to correct load losses to the applicable reference temperature from the temperature at which they are measured. Observe precautions while taking measurements, such as those in section 3.4, in order to maintain measurement uncertainty limits specified in Table 2.1.

3.2 Temperature Determination of Windings and Pre-conditions for Resistance Measurement.
Make temperature measurements in protected areas where the air temperature is stable and there are no drafts. Determine the winding temperature \( T_{dc} \) for liquid-immersed and dry-type distribution transformers by the methods described in sections 3.2.1 and 3.2.2, respectively.

### 3.2.1 Liquid-Immersed Distribution Transformers

**3.2.1.1 Methods**

Record the winding temperature \( T_{dc} \) of liquid-immersed transformers as the average of either of the following:

(a) The measurements from two temperature sensing devices (for example, thermocouples) applied to the outside of the transformer tank and thermally insulated from the surrounding environment, with one located at the level of the oil and the other located near the tank bottom or at the lower radiator header if applicable; or

(b) The measurements from two temperature sensing devices immersed in the transformer liquid, with one located directly above the winding and other located directly below the winding.

**3.2.1.2 Conditions**

Make this determination under either of the following conditions:

(a) The windings have been under insulating liquid with no excitation and no current in the windings for four hours before the \( T_{dc} \) is measured; or

(b) The temperature of the insulating liquid has stabilized, and the difference between the top and bottom temperature does not exceed 5°C.

### 3.2.2 Dry-Type Distribution Transformers

Record the winding temperature \( T_{dc} \) of dry-type transformers as either of the following:

(a) For ventilated dry-type units, use the average of readings of four or more thermometers, thermocouples, or other suitable temperature sensors inserted within the coils. Place the sensing points of the measuring devices as close as possible to the winding conductors. For sealed units, such as epoxy-coated or epoxy-encapsulated units, use the average of four or more temperature sensors located on the enclosure and/or cover, as close to different parts of the winding assemblies as possible; or

(b) For both ventilated and sealed units, use the ambient temperature of the test area, under the following conditions:

1. All internal temperatures measured by the internal temperature sensors must not differ from the test area ambient temperature by more than 2°C.

2. Enclosure surface temperatures for sealed units must not differ from the test area ambient temperature by more than 2°C.

3. Test area ambient temperature should not have changed by more than 3°C for 3 hours before the test.

4. Neither voltage nor current has been applied to the unit under test for 24 hours. In addition, increase this initial 24 hour period by any added amount of time necessary for the temperature of the transformer windings to stabilize at the level of the ambient temperature. However, this additional amount of time need not exceed 24 hours.

### 3.3 Resistance Measurement Methods

Make resistance measurements using either the resistance bridge method, the voltmeter-ammeter method or a resistance meter. In each instance when this Uniform Test Method is used to test more than one unit of a basic model to determine the efficiency of that basic model, the resistance of the units being tested may be determined from making resistance measurements on only one of the units.

#### 3.3.1 Resistance Bridge Methods

If the resistance bridge method is selected, use either the Wheatstone or Kelvin bridge circuit (or the equivalent of either).

---

**3.3.1 Wheatstone Bridge**

(a) This bridge is best suited for measuring resistances larger than ten ohms. A schematic diagram of a Wheatstone bridge with a representative transformer under test is shown in Figure 3.1.
Where:

- $R_{dc}$ is the resistance of the transformer winding being measured,
- $R_s$ is a standard resistor having the resistance $R_s$,
- $R_a$, $R_b$ are two precision resistors with resistance values $R_a$ and $R_b$, respectively; at least one resistor must have a provision for resistance adjustment,
- $R_t$ is a resistor for reducing the time constant of the circuit,
- $D$ is a null detector, which may be either a micro ammeter or microvoltmeter or equivalent instrument for observing that no signal is present when the bridge is balanced, and
- $V_{dc}$ is a source of dc voltage for supplying the power to the Wheatstone Bridge.

(b) In the measurement process, turn on the source ($V_{dc}$), and adjust the resistance ratio ($R_a/R_b$) to produce zero signal at the detector ($D$). Determine the winding resistance by using equation 3-1 as follows:

$$R_{dc} = R_s \left( \frac{R_a}{R_b} \right) \quad (3-1)$$

3.3.1.2 Kelvin Bridge

(a) This bridge separates the resistance of the connecting conductors to the transformer winding being measured from the resistance of the winding, and therefore is best suited for measuring resistances of ten ohms and smaller. A schematic diagram of a Kelvin bridge with a representative transformer under test is shown in Figure 3.2.
(b) The Kelvin Bridge has seven of the same type of components as in the Wheatstone Bridge. It has two more resistors than the Wheatstone bridge, R_a1 and R_b1. At least one of these resistors must have adjustable resistance. In the measurement process, the source is turned on, two resistance ratios \( \frac{R_a}{R_b} \) and \( \frac{R_a1}{R_b1} \) are adjusted to be equal, and then the two ratios are adjusted together to balance the bridge producing zero signal at the detector. Determine the winding resistance by using equation 3-2 as follows:

\[
R_{dc} = R_i \left( \frac{R_a}{R_b} \right) \quad (3-2)
\]
as with the Wheatstone bridge, with an additional condition that:

\[
\frac{R_a}{R_b} = \frac{R_a1}{R_b1} \quad (3-3)
\]

(c) The Kelvin bridge provides two sets of leads, current-carrying and voltage-sensing, to the transformer terminals and the standard resistor, thus eliminating voltage drops from the measurement in the current-carrying leads as represented by \( R_d \).

3.3.2 Voltmeter-Ammeter Method.
(a) Employ the voltmeter-ammeter method only if the rated current of the winding is greater than one ampere and the test current is limited to 15 percent of the winding current. Connect the transformer winding under test to the circuit shown in Figure 3.3.
Where:

- A is an ammeter or a voltmeter-shunt combination for measuring the current \( I_{mdc} \) in the transformer winding,
- \( V \) is a voltmeter with sensitivity in the millivolt range for measuring the voltage \( V_{mdc} \) applied to the transformer winding,
- \( R_{dc} \) is the resistance of the transformer winding being measured,
- \( R_t \) is a resistor for reducing the time constant of the circuit, and
- \( V_{dc} \) is a source of dc voltage for supplying power to the measuring circuit.

(b) To perform the measurement, turn on the source to produce current no larger than 15 percent of the rated current for the winding. Wait until the current and voltage readings have stabilized and then take simultaneous readings of voltage and current. Determine the winding resistance \( R_{dc} \) by using equation 3–4 as follows:

\[
R_{dc} = \frac{V_{mdc}}{I_{mdc}} \quad (3-4)
\]

Where:

- \( V_{mdc} \) is the voltage measured by the voltmeter \( V \), and
- \( I_{mdc} \) is the current measured by the ammeter \( A \).

(c) As shown in Figure 3.3, separate current and voltage leads must be brought to the transformer terminals. (This eliminates the errors due to lead and contact resistance.)

3.3.3 Resistance Meters

Resistance meters may be based on voltmeter-ammeter, or resistance bridge, or some other operating principle. Any meter used to measure a transformer's winding resistance must have specifications for resistance range, current range, and ability to measure highly inductive resistors that cover the characteristics of the transformer being tested. Also the meter's specifications for accuracy must meet the applicable criteria of Table 2.1 in section 2.0.

3.4 Precautions in Measuring Winding Resistance

3.4.1 Required actions.

The following guidelines must be observed when making resistance measurements:

(a) Use separate current and voltage leads when measuring small (< 10 ohms) resistance.

(b) Use null detectors in bridge circuits, and measuring instruments in voltmeter-ammeter circuits, that have sensitivity and resolution sufficient to enable observation of at least 0.1 percent change in the measured resistance.

(c) Maintain the dc test current at or below 15 percent of the rated winding current.

(d) Inclusion of a stabilizing resistor \( R_t \) (see section 3.4.2) will require higher source voltage.

(e) Disconnect the null detector (if a bridge circuit is used) and voltmeter from the circuit before the current is switched off, and switch off current by a suitable insulated switch.

3.4.2 Guideline for Time Constant.

(a) The following guideline is suggested for the tester as a means to facilitate the measurement of resistance in accordance with the accuracy requirements of section 2.0:

(b) The accurate reading of resistance \( R_{dc} \) may be facilitated by shortening the time constant. This is done by introducing a resistor \( R_t \) in series with the winding under test in both the bridge and voltmeter-ammeter circuits as shown in Figures 3.1 to 3.3. The relationship for the time constant is:

\[
T = \left( \frac{L_u}{R_u} \right) \quad (3-5)
\]
Pt. 431, Subpl. K, App. A

Where:

- \( T_c \) is the time constant in seconds.
- \( L_w \) is the total magnetizing and leakage inductance of the winding under test, in henries.
- \( R_w \) is the total resistance in ohms, consisting of \( R_0 \) in series with the winding resistance \( R_{dc} \) and the resistance \( R_{tc} \) of the standard resistor in the bridge circuit.

(c) Because \( R_{tc} \) is in the denominator of the expression for the time constant, increasing the resistance \( R_{tc} \) will decrease the time constant. If the time constant in a given test circuit is too long for the resistance readings to be stable, then a higher resistance can be substituted for the existing \( R_{tc} \) and successive replacements can be made until adequate stability is reached.

3.5 Conversion of Resistance Measurements.

(a) Resistance measurements must be corrected, from the temperature at which the winding resistance measurements were made, to the reference temperature. As specified in these test procedures, the reference temperature for liquid-immersed transformers loaded at 50 percent of the rated load is 55°C. For medium-voltage, dry-type transformers loaded at 50 percent of the rated load, and for low-voltage, dry-type transformers loaded at 35 percent of the rated load, the reference temperature is 75°C.

(b) Correct the measured resistance to the resistance at the reference temperature using equation 3-6 as follows:

\[
R_{tc} = R_{dc} \left[ \frac{(T_c + T_s)}{(T_{dc} + T_s)} \right] 
\]

Where:

- \( R_{tc} \) is the resistance at the reference temperature.
- \( R_{dc} \) is the measured resistance at temperature \( T_{dc} \).
- \( T_{dc} \) is the reference temperature in °C.
- \( T_s \) is the temperature at which resistance was measured in °C, and \( T_s \) is 234.5 °C for copper or 225 °C for aluminum.

4.0 LOSS MEASUREMENT

4.1 General Considerations.

The efficiency of a transformer is computed from the total transformer losses, which are determined from the measured value of the no-load loss and load loss power components. Each of these two power loss components is measured separately using test sets that are identical, except that shorting straps are added for the load-loss test. The measured quantities will need correction for instrumentation losses and may need corrections for known phase angle errors in measuring equipment and for the waveform distortion in the test voltage. Any power loss not measured at the applicable reference temperature must be adjusted to that reference temperature. The measured load loss must also be adjusted to a specified output loading level if not measured at the specified output loading level. Test distribution transformers designed for harmonic currents using a sinusoidal waveform (k=1).

4.2 Measurement of Power Losses.

4.2.1 No-Load Loss.

Measure the no-load loss and apply corrections as described in section 4.4, using the appropriate test set as described in section 4.3.

4.2.2 Load Loss.

Measure the load loss and apply corrections as described in section 4.5, using the appropriate test set as described in section 4.3.

4.3 Test Sets.

(a) The same test set may be used for both the no-load loss and load loss measurements provided the range of the test set encompasses the test requirements of both tests. Calibrate the test set to national standards to meet the tolerances in Table 2.1 in section 2.0. In addition, the wattmeter, current measuring system and voltage measuring system must be calibrated separately if the overall test set calibration is outside the tolerance as specified in section 2.0 or the individual phase angle error exceeds the values specified in section 4.5.3.

(b) A test set based on the wattmeter-voltmeter-ammeter principle may be used to measure the power loss and the applied voltage and current of a transformer where the transformer’s test current and voltage are within the measurement capability of the measuring instruments. Current and voltage transformers, known collectively as instrument transformers, or other scaling devices such as resistive or capacitive dividers for voltage, may be used in the above circumstance, and must be used together with instruments to measure current, voltage, or power where the current or voltage of the transformer under test exceeds the measurement capability of such instruments. Thus, a test set may include a combination of measuring instruments and instrument transformers (or other scaling devices), so long as the current or voltage of the transformer under test does not exceed the measurement capability of any of the instruments.

4.3.1 Single-Phase Test Sets.

Use these for testing single-phase distribution transformers.

4.3.11 Without Instrument Transformers.

(a) A single-phase test set without an instrument transformer is shown in Figure 4.1.
Where:

- $W$ is a wattmeter used to measure $P_{nm}$ and $P_{lm}$, the no-load and load loss power, respectively.
- $V_{rms}$ is a true root-mean-square (rms) voltmeter used to measure $V_{rms,n}$ and $V_{rms,l}$, the rms test voltages in no-load and load loss measurements, respectively.
- $V_{av}$ is an average sensing voltmeter, calibrated to indicate rms voltage for sinusoidal waveforms and used to measure $V_{av,n}$, the average voltage in no-load loss measurements.
- $A$ is an rms ammeter used to measure test current, especially $I_{lm}$, the load loss current, and
- (SC) is a conductor for providing a short-circuit across the output windings for the load loss measurements.

(b) Either the primary or the secondary winding can be connected to the test set. However, more compatible voltage and current levels for the measuring instruments are available if for no-load loss measurements the secondary (low voltage) winding is connected to the test set, and for load loss measurements the primary winding is connected to the test set. Use the average-sensing voltmeter, $V_{av}$, only in no-load loss measurements.

4.3.1.2 With Instrument Transformers.

A single-phase test set with instrument transformers is shown in Figure 4.2. This circuit has the same four measuring instruments as that in Figure 4.1. The current and voltage transformers, designated as (CT) and (VT), respectively, are added.

Figure 4.1 Single-Phase Test Set Without Instrument Transformers

Figure 4.2 Single-Phase Test Set With Instrument Transformers

4.3.2 Three-Phase Test Sets.

Use these for testing three-phase distribution transformers. Use in a four-wire, three-wattmeter test circuit.

4.3.2.1 Without Instrument Transformers.

(a) A three-phase test set without instrument transformers is shown in Figure 4.3. This test set is essentially the same circuit.
shown in Figure 4.1 repeated three times, and the instruments are individual devices as shown. As an alternative, the entire instrumentation system of a three-phase test set without transformers may consist of a multi-function analyzer.

(b) Either group of windings, the primary or the secondary, can be connected in wye or delta configuration. If both groups of windings are connected in the wye configuration for the no-load test, the neutral of the winding connected to the test set must be connected to the neutral of the source to provide a return path for the neutral current.

(c) In the no-load loss measurement, the voltage on the winding must be measured. Therefore a provision must be made to switch the voltmeters for line-to-neutral measurements for wye-connected windings and for line-to-line measurements for delta-connected windings.

4.3.2.2 With Instrument Transformers.

A three-phase test set with instrument transformers is shown in Figure 4.4. This test set is essentially the same circuit shown in Figure 4.2 repeated three times. Provision must be made to switch the voltmeters for line-to-neutral and line-to-line measurements as in section 4.3.2.1. The voltage sensors ("coils") of the wattmeters must always be connected in the line-to-neutral configuration.
4.3.2.3 Test Set Neutrals.
If the power source in the test circuit is wye-connected, ground the neutral. If the power source in the test circuit is delta-connected, use a grounding transformer to obtain neutral and ground for the test.

4.4 No-Load Losses: Measurement and Calculations.

4.4.1 General Considerations.
Measurement corrections are permitted but not required for instrumentation losses and for losses from auxiliary devices. Measurement corrections are required:
(a) When the waveform of the applied voltage is non-sinusoidal; and
(b) When the core temperature or liquid temperature is outside the 20°C ± 10°C range.

4.4.2 No-Load Loss Test.
(a) The purpose of the no-load loss test is to measure no-load losses at a specified excitation voltage and a specified frequency. The no-load loss determination must be based on a sine-wave voltage corrected to the reference temperature. Connect either of the transformer windings, primary or secondary, to the appropriate test set of Figures 4.1 to 4.4, giving consideration to section 4.4.2(a)(2). Leave the unconnected winding(s) open circuited. Apply the rated voltage at rated frequency, as measured by the average-sensing voltmeter, to the transformer. Take the readings of the wattmeter(s) and the average-sensing and true rms voltmeters. Observe the following precautions:
(1) Voltmeter connections. When correcting to a sine-wave basis using the average-voltmeter method, the voltmeter connections must be such that the waveform applied to the voltmeters is the same as the waveform across the energized windings.
(2) Energized windings. Energize either the high voltage or the low voltage winding of the transformer under test.
(3) Voltage and frequency. The no-load loss test must be conducted with rated voltage impressed across the transformer terminals using a voltage source at a frequency equal to the rated frequency of the transformer under test.
(b) Adjust the voltage to the specified value as indicated by the average-sensing voltmeter. Record the values of rms voltage, rms current, electrical power, and average voltage as close to simultaneously as possible. For a three-phase transformer, take all of the readings on one phase before proceeding to the next, and record the average of the three rms voltmeter readings as the rms voltage value.

NOTE: When the tester uses a power supply that is not synchronized with an electric
utility grid, such as a dc/ac motor-generator set, check the frequency and maintain it within ±0.5 percent of the rated frequency of the transformer under test. A power source that is directly connected to, or synchronized with, an electric utility grid need not be monitored for frequency.

4.3 Corrections.

4.4.3.1 Correction for Instrumentation Losses.

Measured losses attributable to the voltimeters and wattmeter voltage circuit, and to voltage transformers if they are used, may be deducted from the total no-load losses measured during testing.

4.4.3.2 Correction for Non-Sinusoidal Applied Voltage.

(a) The measured value of no-load loss must be corrected to a sinusoidal voltage, except when waveform distortion in the test voltage causes the magnitude of the correction to be less than 1 percent. In such a case, no correction is required.

(b) To make a correction where the distortion requires a correction of 5 percent or less, use equation 4–1. If the distortion requires a correction to be greater than 5 percent, improve the test voltage and re-test. Repeat until the distortion requires a correction of 5 percent or less.

(c) Determine the no-load losses of the transformer corrected for sine-wave basis from the measured value by using equation 4-1 as follows:

\[
P_{\text{nc}} = \frac{P_{\text{nm}}}{P_1 + kP_2} \quad (4-1)
\]

Where:

\(P_{\text{nm}}\) is the measured no-load loss at temperature \(T_{\text{nm}}\) at which no-load loss is measured,

\(P_{\text{nc}}\) is the measured no-load loss at temperature \(T_{\text{nc}}\),

\(P_1\) is the per unit hysteresis loss,

\(P_2\) is the per unit eddy-current loss,

\(P_1 + P_2 = 1\),

\[k = \frac{V_{(\text{rms})}}{V_{(\text{av})}},\]

\(V_{(\text{rms})}\) is the test voltage measured by rms voltmeter, and

\(V_{(\text{av})}\) is the test voltage measured by average-voltage voltmeter.

(d) The two loss components \((P_1\) and \(P_2\)) are assumed equal in value, each assigned a value of 0.5 per unit, unless the actual measurement-based values of hysteresis and eddy-current losses are available (in per unit form), in which case the actual measurements apply.

4.4.3.3 Correction of No-Load Loss to Reference Temperature.

After correcting the measured no-load loss for waveform distortion, correct the loss to the reference temperature of 20 °C. If the no-load loss measurements were made between 10 °C and 30 °C, this correction is not required. If the correction to reference temperature is applied, then the core temperature of the transformer during no-load loss measurement \((T_{\text{nm}})\) must be determined within ± 10 °C of the true average core temperature. Correct the no-load loss to the reference temperature by using equation 4-2 as follows:

\[
P_{\text{nc}} = P_{\text{nm}} \left[1 + 0.00065(T_{\text{nm}} - T_{\text{nc}})\right] \quad (4-2)
\]

Where:

\(P_{\text{nm}}\) is the no-load losses corrected for waveform distortion and then to the reference temperature of 20 °C,

\(P_{\text{nc}}\) is the no-load losses, corrected for waveform distortion, at temperature \(T_{\text{nc}}\),

\(T_{\text{nm}}\) is the core temperature during the measurement of no-load losses, and

\(T_{\text{nc}}\) is the reference temperature, 20 °C.

4.5 Load Losses: Measurement and Calculations.

4.5.1 General Considerations.

(a) The load losses of a transformer are those losses incident to a specified load carried by the transformer. Load losses consist of ohmic loss in the windings due to the load current and stray losses due to the eddy currents induced by the leakage flux in the windings, core clamps, magnetic shields, tank walls, and other conducting parts. The ohmic loss of a transformer varies directly with temperature, whereas the stray losses vary inversely with temperature.

(b) For a transformer with a tap changer, conduct the test at the rated current and rated-voltage tap position. For a transformer that has a configuration of windings which allows for more than one nominal rated voltage, determine its load losses either in the winding configuration in which the highest losses occur or in each winding configuration in which the transformer can operate.

4.5.2 Tests for Measuring Load Losses.

(a) Connect the transformer with either the high-voltage or low-voltage windings to the appropriate test set. Then short-circuit the winding that was not connected to the test set. Apply a voltage at the rated frequency (of the transformer under test) to the connected windings to produce the rated current in the transformer. Take the readings of the wattmeter(s), the ammeters(s), and rms voltmeter(s).

(b) Regardless of the test set selected, the following preparatory requirements must be satisfied for accurate test results:

(1) Determine the temperature of the windings using the applicable method in section 3.2.1 or section 3.2.2.
(2) The conductors used to short-circuit the windings must have a cross-sectional area equal to, or greater than, the corresponding transformer leads, or, if the tester uses a different method to short-circuit the windings, the losses in the short-circuiting conductor assembly must be less than 10 percent of the transformer's load losses.

(3) When the tester uses a power supply that is not synchronized with an electric utility grid, such as a dc/ac motor-generator set, follow the provisions of the "Note" in section 4.4.2.

4.5.3 Corrections.

4.5.3.1 Correction for Losses from Instrumentation and Auxiliary Devices.

4.5.3.1.1 Instrumentation Losses. Measured losses attributable to the voltmeters, wattmeter voltage circuit and short-circuiting conductor (SC), and to the voltage transformers if they are used, may be deducted from the total load losses measured during testing.

4.5.3.1.2 Losses from Auxiliary Devices. Measured losses attributable to auxiliary devices (e.g., circuit breakers, fuses, switches) installed in the transformer, if any, that are not part of the winding and core assembly, may be excluded from load losses measured during testing. To exclude these losses, either (1) measure transformer losses without the auxiliary devices by removing or by-passing them, or (2) measure transformer losses with the auxiliary devices connected, determine the losses associated with the auxiliary devices, and deduct these losses from the load losses measured during testing.

4.5.3.2 Correction for Phase Angle Errors.

(a) Corrections for phase angle errors are not required if the instrumentation is calibrated over the entire range of power factors and phase angle errors. Otherwise, determine whether to correct for phase angle errors from the magnitude of the normalized per unit correction, \( \beta_n \), obtained by using equation 4-3 as follows:

\[
\beta_n = \frac{V_{lm} I_{lm} (\beta_v - \beta_i + \beta_b) \sin \phi}{P_{lm}} \tag{4-3}
\]

(b) The correction must be applied if \( \beta_n \) is outside the limits of ±0.01. If \( \beta_n \) is within the limits of ±0.01, the correction is permitted but not required.

(c) If the correction for phase angle errors is to be applied, first examine the total system phase angle (\( \beta_s \)) to correct the measured load loss power for phase angle errors, and where the total system phase angle exceeds ±12 milliradians (±41 minutes) use either equation 4-4 or 4-5 to correct the measured load loss power for phase angle errors, as follows:

\[
P_{cl} = P_{lm} - V_{lm} I_{lm} (\beta_v - \beta_i + \beta_b) \sin \phi \tag{4-4}
\]

\[
P_{ot} = V_{lm} I_{lm} \cos (\phi + \beta_w - \beta_i + \beta_b) \tag{4-5}
\]

(d) The symbols in this section (4.5.3.2) have the following meanings:

- \( P_{w,cl} \) is the corrected wattmeter reading for phase angle errors,
- \( P_{lm} \) is the actual wattmeter reading,
- \( V_{lm} \) is the measured voltage at the transformer winding,
- \( I_{lm} \) is the measured rms current in the transformer winding,
- \( \phi = \cos^{-1} \frac{P_{lm}}{V_{lm} I_{lm}} \) is the measured phase angle between \( V_{lm} \) and \( I_{lm} \),
- \( \beta_w \) is the phase angle error (in radians) of the wattmeter; the error is positive if the phase angle between the voltage and current phasors as sensed by the wattmeter is smaller than the true phase angle, thus effectively increasing the measured power,
- \( \beta_v \) is the phase angle error (in radians) of the voltage transformer; the error is positive if the secondary voltage leads the primary voltage, and
- \( \beta_i \) is the phase angle error (in radians) of the current transformer; the error is positive if the secondary current leads the primary current.

(e) The instrumentation phase angle errors used in the correction equations must be specific for the test conditions involved.

4.5.3.3 Temperature Correction of Load Loss. (a) When the measurement of load loss is made at a temperature \( T_m \) that is different from the reference temperature, use the procedure summarized in the equations 4-6 to 4-10 to correct the measured load loss to the reference temperature. The symbols used in these equations are defined at the end of this section.

(b) Calculate the ohmic loss (\( P_o \)) by using equation 4-6 as follows:
(c) Obtain the stray loss by subtracting the calculated ohmic loss from the measured load loss, by using equation 4–7 as follows:

\[ P_s = P_{cl} - P_e \quad (4-7) \]

(d) Correct the ohmic and stray losses to the reference temperature for the load loss by using equations 4–8 and 4–9, respectively, as follows:

\[ P_e = P_{e(p)} + P_{e(s)} \]

\[ = I_{lm}^2 R_{dc(p)} \frac{T_{k(p)} + T_{lm}}{T_{k(p)} + T_{dc}} + I_{lm}^2 R_{dc(s)} \frac{T_{k(s)} + T_{lm}}{T_{k(s)} + T_{dc}} \]

\[ = I_{lm}^2 \left[ R_{dc(p)} \frac{T_{k(p)} + T_{lm}}{T_{k(p)} + T_{dc}} + \frac{N_1^2}{N_2^2} R_{dc(s)} \frac{T_{k(s)} + T_{lm}}{T_{k(s)} + T_{dc}} \right] \quad (4-8) \]

\[ P_{st} = P_{st} \frac{T_k + T_{lm}}{T_k + T_u} \quad (4-9) \]

\[ P_{st} = P_{st} + P_{st} \]

\[ = I_{lm}^2 \left[ R_{dc(p)} \frac{T_{k(p)} + T_{lm}}{T_{k(p)} + T_{dc}} + \frac{N_1^2}{N_2^2} R_{dc(s)} \frac{T_{k(s)} + T_{lm}}{T_{k(s)} + T_{dc}} \right] \]

\[ + P_{st} \left[ R_{dc(p)} \frac{T_{k(p)} + T_{lm}}{T_{k(p)} + T_{dc}} + \frac{N_1^2}{N_2^2} R_{dc(s)} \frac{T_{k(s)} + T_{lm}}{T_{k(s)} + T_{dc}} \right] \frac{T_k + T_{lm}}{T_k + T_u} \quad (4-10) \]

(f) The symbols in this section (4.5.3.3) have the following meanings:

- \( I_{lm} \) is the primary current in amperes,
- \( P_e \) is the ohmic loss in watts at the temperature \( T_{lm} \),
- \( P_{st} \) is the ohmic loss in watts in the primary winding at the temperature \( T_{lm} \).
Energy Efficiency is different from the level at which the transformer is rated to operate.

The highest losses occur or at each voltage at which the transformer is rated to operate.

5.1 Output Loading Level Adjustment.

If the output loading level for energy efficiency is different from the level at which the load loss power measurements were made, then adjust the corrected load loss power, \( P_{lc2} \), by using equation 5-1 as follows:

\[
P_{lc} = P_{lc2} \left( \frac{P_{os}}{P_{oe}} \right)^2 = P_{lc2} L^2 \quad (5-1)
\]

Where:
- \( P_{lc} \) is the adjusted load loss power to the specified energy efficiency load level,
- \( P_{lc2} \) is as calculated in section 4.5.3.3,
- \( P_{oe} \) is the rated transformer apparent power (name plate),
- \( P_{os} \) is the specified energy efficiency load level, where \( P_{os} = P_{oe} \cdot L \), and
- \( L \) is the per unit load level, e.g., if the load level is 50 percent then “L” will be 0.5.

5.2 Total Loss Power Calculation.

Calculate the corrected total loss power by using equation 5-2 as follows:

\[
P_{ts} = P_{tc} + P_{lc} \quad (5-2)
\]

Where:
- \( P_{ts} \) is the corrected total loss power adjusted for the transformer output loading specified by the standard,
- \( P_{tc} \) is as calculated in section 4.4.3.3, and
- \( P_{tc} \) is as calculated in section 5.1.

5.3 Energy Efficiency Calculation.

Calculate efficiency (\( \eta \)) in percent at specified energy efficiency load level, \( P_{os} \), by using equation 5-3 as follows:

\[
\eta = 100 \left( \frac{P_{os}}{P_{tc} + P_{lc}} \right) \quad (5-3)
\]

Where:
- \( P_{os} \) is as described and calculated in section 5.1, and
- \( P_{os} \) is as described and calculated in section 5.2.

5.4 Significant Figures in Power Loss and Efficiency Data.

In measured and calculated data, retain enough significant figures to provide at least 1 percent resolution in power loss data and 0.01 percent resolution in efficiency data.

6.0 Test Equipment Calibration and Certification

Maintain and calibrate test equipment and measuring instruments, maintain calibration records, and perform other test and measurement quality assurance procedures according to the following sections. The calibration of the test set must confirm the accuracy of the test set to that specified in section 2.0, Table 2.1.

6.1 Test Equipment.

The party performing the tests shall control, calibrate and maintain measuring and test equipment, whether or not it owns the...
APPENDIX B TO SUBPART K OF PART 431—SAMPLING PLAN FOR ENFORCEMENT TESTING

Step 1. The number of units in the sample \( m_1 \) shall be in accordance with \( \S\S 431.198(a)(2), 431.198(a)(3) \) and shall not be less than twenty. The number of tests in the first sample \( n_1 \) shall be in accordance with \( \S 431.198(a)(8) \) and shall not be fewer than four.

Step 2. Compute the mean \( \bar{X}_1 \) of the measured energy performance of the \( n_1 \) tests in the first sample by using equation 1 as follows:

\[
\bar{X}_1 = \frac{1}{n_1} \sum_{i=1}^{n_1} X_i \quad (1)
\]

where \( X_i \) is the measured efficiency of test \( i \).

Step 3. Compute the sample standard deviation \( S_1 \) of the measured efficiency of the \( n_1 \) tests in the first sample by using equation 2 as follows:

\[
S_1 = \sqrt{\frac{\sum_{i=1}^{n_1} (X_i - \bar{X}_1)^2}{n_1 - 1}} \quad (2)
\]

Step 4. Compute the standard error \( SE(\bar{X}_1) \) of the mean efficiency of the first sample by using equation 3 as follows:

\[
SE(\bar{X}_1) = \frac{S_1}{\sqrt{n_1}} \quad (3)
\]

Step 5. Compute the sample size discount \( SSD(m_1) \) by using equation 4 as follows:

\[
SSD(m_1) = \frac{100}{1 + \left[ 1 + \left( \frac{0.08}{\sqrt{m_1}} \right) \left( \frac{100}{RE} - 1 \right) \right]} \quad (4)
\]

where \( m_1 \) is the number of units in the sample, and \( RE \) is the applicable EPCA efficiency when the test is to determine compliance with the applicable statutory standard, or is the labeled efficiency when the test is to determine compliance with the labeled efficiency value.

Step 6. Compute the lower control limit \( LCL \) for the mean of the first sample by using equation 5 as follows:

\[
LCL_1 = SSD(m_1) - t \times SE(\bar{X}_1) \quad (5)
\]

where \( t \) is the 2.5th percentile of a \( t \)-distribution for a sample size of \( n_1 \), which yields a
Department of Energy

97.5 percent confidence level for a one-tailed t-test.

Step 7. Compare the mean of the first sample ($X_{\bar{1}}$) with the lower control limit (LCL₁) to determine one of the following:

(i) If the mean of the first sample is below the lower control limit, then the basic model is in non-compliance and testing is at an end.

(ii) If the mean is equal to or greater than the lower control limit, no final determination of compliance or non-compliance can be made; proceed to Step 8.

Step 8. Determine the recommended sample size ($n$) by using equation 6 as follows:

$$n = \left[ \left( \frac{\text{SSD}(m_1)}{\text{RE}(8-0.08\text{RE})} \right)^2 \right]$$

where $S_1$ and $t$ have the values used in Steps 3 and 6, respectively. The factor

$$108 - 0.08\text{RE}$$

is based on an 8-percent tolerance in the total power loss.

Given the value of $n$, determine one of the following:

(i) If the value of $n$ is less than or equal to $n_1$ and if the mean energy efficiency of the first sample ($X_{\bar{1}}$) is equal to or greater than the lower control limit (LCL₁), the basic model is in compliance and testing is at an end.

(ii) If the value of $n$ is greater than $n_1$, and no additional units are available for testing, testing is at an end and the basic model is in non-compliance. If the value of $n$ is greater than $n_1$, and additional units are available for testing, select a second sample $n_2$. The size of the $n_2$ sample is determined to be the smallest integer equal to or greater than the difference $n-n_1$. If the value of $n_2$ so calculated is greater than $20-n_1$, set $n_2$ equal to $20-n_1$.

Step 9. After testing the $n_2$ sample, compute the combined mean ($X_{\bar{2}}$) of the measured energy performance of the $n_1$ and $n_2$ tests of the combined first and second samples by using equation 7 as follows:

$$X_{\bar{2}} = \frac{1}{n_1 + n_2} \sum_{i=1}^{n_1+n_2} X_i$$

Step 10. Compute the standard error (SE($X_{\bar{2}}$)) of the mean efficiency of the $n_1$ and $n_2$ tests in the combined first and second samples by using equation 8 as follows:

$$\text{SE}(X_{\bar{2}}) = \frac{S_1}{\sqrt{n_1 + n_2}}$$

(Note that $S_1$ is the value obtained above in Step 3)

Step 11. Set the lower control limit (LCL₂) to,

$$LCL₂ = SSD(m_1) - t\text{SE}(X_{\bar{2}})$$

where $t$ has the value obtained in Step 5 and SSD($m_1$) is sample size discount from Step 5.

Compare the combined sample mean ($X_{\bar{2}}$) to the lower control limit (LCL₂) to find one of the following:

(i) If the mean of the combined sample ($X_{\bar{2}}$) is less than the lower control limit (LCL₂), the basic model is in non-compliance and testing is at an end.

(ii) If the mean of the combined sample ($X_{\bar{2}}$) is equal to or greater than the lower control limit (LCL₂), the basic model is in compliance and testing is at an end.

**Manufacturer-Option Testing**

If a determination of non-compliance is made in Steps 6, 7 or 11, above, the manufacturer may request that additional testing be conducted, in accordance with the following procedures.

Step A. The manufacturer requests that an additional number, $n_3$, of units be tested, with $n_3$ chosen such that $n_1+H_n+H_3$ does not exceed 20.

Step B. Compute the mean efficiency, standard error, and lower control limit of the new combined sample in accordance with the procedures prescribed in Steps 8, 9, and 10, above.

Step C. Compare the mean performance of the new combined sample to the lower control limit (LCL₂) to determine one of the following:

(a) If the new combined sample mean is equal to or greater than the lower control limit, the basic model is in compliance and testing is at an end.

(b) If the new combined sample mean is less than the lower control limit and the value of $n_1+H_2+H_3$ is less than 20, the manufacturer may request that additional units be tested. The total of all units tested may not exceed 20. Steps A, B, and C are then repeated.

(c) Otherwise, the basic model is determined to be in non-compliance.

[71 FR 24999, Apr. 27, 2006]

**Subpart L—Illuminated Exit Signs**

**Source**: 70 FR 60417, Oct. 18, 2005, unless otherwise noted.
§ 431.201 Purpose and scope.
This subpart contains energy conservation requirements for illuminated exit signs, pursuant to Part B of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6291-6309.

§ 431.202 Definitions concerning illuminated exit signs.
Basic model means, with respect to illuminated exit signs, all units of a given type of illuminated exit sign (or class thereof) manufactured by one manufacturer and which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing electrical, physical, or functional characteristics that affect energy consumption.

Face means an illuminated side of an illuminated exit sign.

Illuminated exit sign means a sign that—
(1) Is designed to be permanently fixed in place to identify an exit; and
(2) Consists of an electrically powered integral light source that—
(i) Illuminates the legend “EXIT” and any directional indicators; and
(ii) Provides contrast between the legend, any directional indicators, and the background.

Input power demand means the amount of power required to continuously illuminate an exit sign model, measured in watts (W). For exit sign models with rechargeable batteries, input power demand shall be measured with batteries at full charge.

§ 431.203 Materials incorporated by reference.
(a) General. The Department incorporates by reference the following test procedures into subpart L of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless and until DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of reference—(1) Inspection of test procedure. The test procedure incorporated by reference are available for inspection at:
(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.
(ii) U.S. Department of Energy, Forrestal Building, Room 1J–018 (Resource Room of the Building Technologies Program), 1000 Independence Avenue, SW., Washington, DC 20585–0121, (202) 586–9127, between 9 a.m. and 4 p.m., Monday through Friday, except Federal holidays.

(2) Obtaining copies of the standard. Copies of the Environmental Protection Agency “ENERGY STAR Program Requirements for Exit Signs,” Version 2.0, may be obtained from the Environmental Protection Agency, Ariel Rios Building, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, (202) 272–0367 or at http://www.epa.gov.

[71 FR 71373, Dec. 8, 2006]

§ 431.204 Uniform test method for the measurement of energy consumption of illuminated exit signs.
(a) Scope. This section provides the test procedure for measuring, pursuant to EPCA, the input power demand of illuminated exit signs. For purposes of this part 431 and EPCA, the test procedure for measuring the input power demand of illuminated exit signs shall be the test procedure specified in § 431.203(b).

(b) Testing and Calculations. Determine the energy efficiency of each covered product by conducting the test
§ 431.223 Materials incorporated by reference.

(a) General. The Department incorporates by reference the following test procedures into subpart M of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless and until DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of references—(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:
§ 431.224 Uniform test method for the measurement of energy consumption for traffic signal modules and pedestrian modules.

(a) Scope. This section provides the test procedures for measuring, pursuant to EPCA, the maximum wattage and nominal wattage of traffic signal modules and pedestrian modules. For purposes of 10 CFR part 431 and EPCA, the test procedures for measuring the maximum wattage and nominal wattage of traffic signal modules and pedestrian modules shall be the test procedures specified in § 431.223(b).

(b) Testing and Calculations. Determine the nominal wattage and maximum wattage of each covered traffic signal module or pedestrian module by conducting the test procedure set forth in Environmental Protection Agency, "ENERGY STAR Program Requirements for Traffic Signals," Version 1.1, section 1, "Definitions," and section 4, "Test Criteria." (Incorporated by reference, see § 431.223) Use a wattmeter having an accuracy of ±1% to measure the nominal wattage and maximum wattage of a red and green traffic signal module, and a pedestrian module when conducting the photometric and colorimetric tests as specified by the testing procedures in VTCSH 2005.

§ 431.226 Energy conservation standards and their effective dates.

Any traffic signal module or pedestrian module manufactured on or after January 1, 2006, shall meet both of the following requirements:

(a) Have a nominal wattage and maximum wattage no greater than:

<table>
<thead>
<tr>
<th>Traffic Signal Module Type</th>
<th>Maximum wattage (at 74 °C)</th>
<th>Nominal wattage (at 25 °C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>12&quot; Red Ball</td>

(b) Be installed with compatible, electrically connected signal control interface devices and conflict monitoring systems.

§ 431.241 Purpose and scope.

This subpart contains energy conservation requirements for unit heaters, pursuant to Part B of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6291-6309.

Subpart N—Unit Heaters

SOURCE: 70 FR 60418, Oct. 18, 2005, unless otherwise noted.

§ 431.241 Purpose and scope.

This subpart contains energy conservation requirements for unit heaters, pursuant to Part B of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6291-6309.
within the heated space; however, the term does not include a warm air furnace.

Automatic flue damper means a device installed in the flue outlet or in the inlet of or upstream of the draft control device of an individual, automatically operated, fossil fuel-fired appliance that is designed to automatically open the flue outlet during appliance operation and to automatically close the flue outlet when the appliance is in a standby condition.

Automatic vent damper means a device intended for installation in the venting system of an individual, automatically operated, fossil fuel-fired appliance either in the outlet or downstream of the appliance draft control device, which is designed to automatically open the venting system when the appliance is in operation and to automatically close off the venting system when the appliance is in a standby or shutdown condition.

Intermittent ignition device means an ignition device in which the ignition source is automatically shut off when the appliance is in an off or standby condition.

Power venting means a venting system that uses a separate fan, either integral to the appliance or attached to the vent pipe, to convey products of combustion and excess or dilution air through the vent pipe.

Warm air furnace means commercial warm air furnace as defined in § 431.72.

§ 431.263 Materials incorporated by reference.

(a) General. The Department incorporates by reference the following test procedure into subpart O of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the Federal Register.

§ 431.264 Uniform test method for the measurement of flow rate for commercial prerinse spray valves.

(a) Scope. This section provides the test procedure for measuring, pursuant to EPCA, the water consumption flow rate of commercial prerinse spray valves.

(b) Testing and Calculations. The test procedure to determine the water consumption flow rate for prerinse spray valves, expressed in gallons per minute (gpm) or liters per minute (L/min), shall be conducted in accordance with the test requirements specified in sections 4.1 and 4.2 (Summary of Test Method), 5.1 (Significance and Use), 6.1 through 6.9 (Apparatus) except 6.5, 9.1 through 9.5 (Preparation of Apparatus), and 10.1 through 10.2.5 (Procedure), and calculations in accordance with sections 11.1 through 11.3.2 (Calculation and Report) of the ASTM F2324-03, “Standard Test Method for Prerinse Spray Valves.” (Incorporated by reference, see §431.263) Perform only the procedures pertinent to the measurement of flow rate. Record measurements at the resolution of the test instrumentation. Round off calculations to the same number of significant digits as the previous step. Round the final water consumption value to one decimal place as follows:

(1) A fractional number at or above the midpoint between two consecutive decimal places shall be rounded up to the higher of the two decimal places; or

(2) A fractional number below the midpoint between two consecutive decimal places shall be rounded down to the lower of the two decimal places.

[71 FR 71374, Dec. 8, 2006]
such lamps that are clear, phosphor-coated, and self-ballasted.

Mercury vapor lamp ballast means a device that is designed and marketed to start and operate mercury vapor lamps by providing the necessary voltage and current.

TEST PROCEDURES [RESERVED]

ENERGY CONSERVATION STANDARDS

§ 431.286 Energy conservation standards and their effective dates.

Subpart Q—Refrigerated Bottled or Canned Beverage Vending Machines

SOURCE: 71 FR 71375, Dec. 8, 2006, unless otherwise noted.

§ 431.291 Scope.

This subpart specifies test procedures for certain commercial refrigerated bottled or canned beverage vending machines, pursuant to part C of Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6311–6316.

§ 431.292 Definitions concerning refrigerated bottled or canned beverage vending machines.

Basic model means, with respect to refrigerated bottled or canned beverage vending machines, all units of a given type of refrigerated bottled or canned beverage vending machine (or class thereof) manufactured by one manufacturer and which have the same primary energy source, which have electrical characteristics that are essentially identical, and which do not have any differing electrical, physical, or functional characteristics that affect energy consumption.

Refrigerated bottled or canned beverage vending machine means a commercial refrigerator that cools bottled or canned beverages and dispenses the bottled or canned beverages on payment.

TEST PROCEDURES

§ 431.293 Materials incorporated by reference.

(a) General. The Department incorporates by reference the following test procedures into subpart Q of part 431. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE test procedures unless DOE amends its test procedures. The Department incorporates the material as it exists on the date of the approval by the Federal Register and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of references—(1) Inspection of test procedures. The test procedures incorporated by reference are available for inspection at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030, or go to: http://www.archives.gov/federal-register/cfr/ibr-locations.html.

(ii) U.S. Department of Energy, Forrestal Building, Room 1J–018 (Resource Room of the Building Technologies Program), 1000 Independence Avenue, SW., Washington, DC 20585–0121, (202) 586–9127, between 9 a.m. and 4 p.m., Monday through Friday, except Federal holidays.

(2) Obtaining copies of the standard. (i) Anyone can purchase a copy of ANSI/ASHRAE Standard 32.1–2004, “Methods
Uniform test method for the measurement of energy consumption of refrigerated bottled or canned beverage vending machines.

(a) Scope. This section provides test procedures for measuring, pursuant to EPCA, the energy consumption of refrigerated bottled or canned beverage vending machines.

(2) Determine “vendible capacity” of refrigerated bottled or canned beverage vending machines in accordance with the second paragraph of section 5, “Vending Machine Capacity,” of ANSI/ASHRAE Standard 32.1–2004, “Methods of Testing for Rating Vending Machines for Bottled, Canned, and Other Sealed Beverages.” (Incorporated by reference, see §431.293) and measure “refrigerated volume” of refrigerated bottled or canned beverage vending machines in accordance with the methodology specified in section 5.2, “Total Refrigerated Volume,” (excluding subsections 5.2.2.2 through 5.2.2.4) of the ANSI/AHAM HRF–1–2004, “Energy, Performance and Capacity of Household Refrigerators, Refrigerator-Freezers and Freezers.” (Incorporated by reference, see §§431.63 and 431.293).
Department of Energy  § 431.383

this shall not apply to an advertisement of an electric motor in a catalog if distribution of the catalog began before the effective date of the labeling rule applicable to that motor;

(5) Failure of a manufacturer to supply at his expense a reasonable number of units of covered equipment to a test laboratory designated by the Secretary;

(6) Failure of a manufacturer to permit a representative designated by the Secretary to observe any testing required by the Act and this part, and to inspect the results of such testing; and

(7) Distribution in commerce by a manufacturer or private labeler of any new covered equipment which is not in compliance with an applicable energy efficiency standard prescribed under the Act and this part.

(b) In accordance with sections 333 and 345 of the Act, any person who knowingly violates any provision of paragraph (a) of this section may be subject to assessment of a civil penalty of no more than $110 for each violation. Each violation of paragraphs (a)(1), (2), and (7) of this section shall constitute a separate violation with respect to each unit of any covered equipment, and each day of noncompliance with paragraphs (a)(3) through (6) of this section shall constitute a separate violation.

(c) For purposes of this section:

(1) The term “new covered equipment” means covered equipment the title of which has not passed to a purchaser who buys such product for purposes other than:

(i) Reselling it; or

(ii) Leasing it for a period in excess of one year; and

(2) The term “knowingly” means:

(i) Having actual knowledge; or

(ii) Presumed to have knowledge deemed to be possessed by a reasonable person who acts in the circumstances, including knowledge obtainable upon the exercise of due care.

§ 431.383 Enforcement process for electric motors.

(a) Test notice. Upon receiving information in writing, concerning the energy performance of a particular electric motor sold by a particular manufacturer or private labeler, which indicates that the electric motor may not be in compliance with the applicable energy efficiency standard, or upon undertaking to ascertain the accuracy of the efficiency rating on the nameplate or in marketing materials for an electric motor, disclosed pursuant to subpart B of this part, the Secretary may conduct testing of that electric motor under this subpart by means of a test notice addressed to the manufacturer in accordance with the following requirements:

(1) The test notice procedure will only be followed after the Secretary or his/her designated representative has examined the underlying test data (or, where appropriate, data as to use of an alternative efficiency determination method) provided by the manufacturer and after the manufacturer has been offered the opportunity to meet with the Department to verify, as applicable, compliance with the applicable efficiency standard, or the accuracy of labeling information, or both. In addition, where compliance of a basic model was certified based on an AEDM, the Department shall have the discretion to pursue the provisions of §431.17(a)(4)(iii) prior to invoking the test notice procedure. A representative designated by the Secretary shall be permitted to observe any reverification procedures undertaken pursuant to this subpart, and to inspect the results of such reverification.

(2) The test notice will be signed by the Secretary or his/her designee. The test notice will be mailed or delivered by the Department to the plant manager or other responsible official, as designated by the manufacturer.

(3) The test notice will specify the model or basic model to be selected for testing, the method of selecting the test sample, the date and time at which testing shall be initiated, the date by which testing is scheduled to be completed and the facility at which testing will be conducted. The test notice may also provide for situations in which the specified basic model is unavailable for testing, and may include alternative basic models.

(4) The Secretary may require in the test notice that the manufacturer of an electric motor shall ship at his expense a reasonable number of units of a basic
model specified in such test notice to a testing laboratory designated by the Secretary. The number of units of a basic model specified in a test notice shall not exceed 20.

(5) Within five working days of the time the units are selected, the manufacturer shall ship the specified test units of a basic model to the testing laboratory.

(b) Testing laboratory. Whenever the Department conducts enforcement testing at a designated laboratory in accordance with a test notice under this section, the resulting test data shall constitute official test data for that basic model. Such test data will be used by the Department to make a determination of compliance or non-compliance if a sufficient number of tests have been conducted to satisfy the requirements of appendix A of this subpart.

(c) Sampling. The determination that a manufacturer’s basic model complies with its labeled efficiency, or the applicable energy efficiency standard, shall be based on the testing conducted in accordance with the statistical sampling procedures set forth in appendix A of this subpart and the test procedures set forth in appendix B to subpart B of this part.

(d) Test unit selection. A Department inspector shall select a batch, a batch sample, and test units from the batch sample in accordance with the provisions of this paragraph and the conditions specified in the test notice.

(1) The batch may be subdivided by the Department utilizing criteria specified in the test notice.

(2) A batch sample of up to 20 units will then be randomly selected from one or more subdivided groups within the batch. The manufacturer shall keep on hand all units in the batch sample until such time as the basic model is determined to be in compliance or non-compliance.

(3) Individual test units comprising the test sample shall be randomly selected from the batch sample.

(4) All random selection shall be achieved by sequentially numbering all of the units in a batch sample and then using a table of random numbers to select the units to be tested.

(e) Test unit preparation. (1) Prior to and during the testing, a test unit selected in accordance with paragraph (d) of this section shall not be prepared, modified, or adjusted in any manner unless such preparation, modification, or adjustment is allowed by the applicable Department of Energy test procedure. One test shall be conducted for each test unit in accordance with the applicable test procedures prescribed in appendix B to subpart B of this part.

(2) No quality control, testing, or assembly procedures shall be performed on a test unit, or any parts and sub-assemblies thereof, that is not performed during the production and assembly of all other units included in the basic model.

(3) A test unit shall be considered defective if such unit is inoperative or is found to be in noncompliance due to failure of the unit to operate according to the manufacturer’s design and operating instructions. Defective units, including those damaged due to shipping or handling, shall be reported immediately to the Department. The Department shall authorize testing of an additional unit on a case-by-case basis.

(f) Testing at manufacturer’s option. (1) If a manufacturer’s basic model is determined to be in noncompliance with the applicable energy performance standard at the conclusion of Department testing in accordance with the sampling plan specified in appendix A of this subpart, the manufacturer may request that the Department conduct additional testing of the basic model according to procedures set forth in appendix A of this subpart.

(2) All units tested under this paragraph shall be selected and tested in accordance with the provisions given in paragraphs (a) through (e) of this section.

(3) The manufacturer shall bear the cost of all testing conducted under this paragraph.

(4) The manufacturer shall cease distribution of the basic model tested under the provisions of this paragraph from the time the manufacturer elects to exercise the option provided in this paragraph until the basic model is determined to be in compliance. The Department may seek civil penalties for
all units distributed during such period.

(5) If the additional testing results in a determination of compliance, a notice of allowance to resume distribution shall be issued by the Department.

§ 431.384 [Reserved]

§ 431.385 Cessation of distribution of a basic model of an electric motor.

(a) In the event that a model of an electric motor is determined non-compliant by the Department in accordance with §431.192 or if a manufacturer or private labeler determines a model of an electric motor to be in non-compliance, then the manufacturer or private labeler shall:

(1) Immediately cease distribution in commerce of the basic model.

(2) Give immediate written notification of the determination of non-compliance, to all persons to whom the manufacturer has distributed units of the basic model manufactured since the date of the last determination of compliance.

(3) Pursuant to a request made by the Secretary, provide the Department within 30 days of the request, records, reports, and other documentation pertaining to the acquisition, ordering, storage, shipment, or sale of a basic model determined to be in non-compliance.

(4) The manufacturer may modify the non-compliant basic model in such manner as to make it comply with the applicable performance standard. Such modified basic model shall then be treated as a new basic model and must be certified in accordance with the provisions of this subpart; except that in addition to satisfying all requirements of this subpart, the manufacturer shall also maintain records that demonstrate that modifications have been made to all units of the new basic model prior to distribution in commerce.

(b) If the manufacturer, private labeler or any other person as required, fails to stop distribution of the non-compliant basic model, the Secretary may seek to restrain such violation in accordance with sections 334 and 345 of the Act.

(c) The Secretary will determine whether the facts of the case warrant the assessment of civil penalties for knowing violations in accordance with sections 333 and 345 of the Act.

§ 431.386 Remedies.

(a) If the Secretary determines that a basic model of any covered equipment does not comply with an applicable energy conservation standard:

(1) The Secretary will notify the manufacturer, private labeler, or any other person as required, of this finding and of the Secretary's intent to seek a judicial order restraining further distribution in commerce of units of such a basic model unless the manufacturer, private labeler or other person as required, delivers, within 15 calendar days, a satisfactory statement to the Secretary, of the steps the manufacturer, private labeler or other person will take to insure that the noncompliant basic model will no longer be distributed in commerce. The Secretary will monitor the implementation of such statement.

(b) If the manufacturer, private labeler or any other person as required, fails to stop distribution of the non-compliant basic model, the Secretary may seek to restrain such violation in accordance with sections 334 and 345 of the Act.

(c) The Secretary will determine whether the facts of the case warrant the assessment of civil penalties for knowing violations in accordance with sections 333 and 345 of the Act.

§ 431.387 Hearings and appeals.

(a) Under sections 333(d) and 345 of the Act, before issuing an order assessing a civil penalty against any person, the Secretary must provide to such a person a notice of the proposed penalty. Such notice must inform the person that such person can choose (in writing within 30 days after receipt of the notice) to have the procedures of paragraph (c) of this section (in lieu of those in paragraph (b) of this section) apply with respect to such assessment.

(b)(1) Unless a person elects, within 30 calendar days after receipt of a notice under paragraph (a) of this section, to have paragraph (c) of this section apply with respect to the civil penalty under paragraph (a), the Secretary will assess the penalty, by order, after providing an opportunity for an agency hearing under 5 U.S.C. 554, before an administrative law judge appointed.
under 5 U.S.C. 3105, and making a determination of violation on the record. Such assessment order will include the administrative law judge’s findings and the basis for such assessment.

(2) Any person against whom the Secretary assesses a penalty under this paragraph may, within 60 calendar days after the date of the order assessing such penalty, initiate action in the United States Court of Appeals for the appropriate judicial circuit for judicial review of such order in accordance with 5 U.S.C. chapter 7. The court will have jurisdiction to enter a judgment affirming, modifying, or setting aside in whole or in part, the order of the Secretary, or the court may remand the proceeding to the Secretary for such further action as the court may direct.

(c)(1) In the case of any civil penalty with respect to which the procedures of this paragraph have been elected, the Secretary will promptly assess such penalty, by order, after the date of the receipt of the notice under paragraph (a) of this section of the proposed penalty.

(2) If the person has not paid the civil penalty within 60 calendar days after the assessment has been made under paragraph (c)(1) of this section, the Secretary will institute an action in the appropriate District Court of the United States for an order affirming the assessment of the civil penalty. The court will have authority to review de novo the law and the facts involved and jurisdiction to enter a judgment enforcing, modifying, and enforcing as so modified, or setting aside in whole or in part, such assessment.

(3) Any election to have this paragraph apply can only be revoked with the consent of the Secretary.

(d) If any person fails to pay an assessment of a civil penalty after it has become a final and unappealable order under paragraph (b) of this section, or after the appropriate District Court has entered final judgment in favor of the Secretary under paragraph (c) of this section, the Secretary will institute an action to recover the amount of such penalty in any appropriate District Court of the United States. In such action, the validity and appropriateness of such final assessment order or judgment will not be subject to review.

(e)(1) In accordance with the provisions of sections 333(d)(5)(A) and 345 of the Act and notwithstanding the provisions of title 28, United States Code, or Section 502(c) of the Department of Energy Organization Act, the General Counsel of the Department of Energy (or any attorney or attorneys within DOE designated by the Secretary) will represent the Secretary, and will supervise, conduct, and argue any civil litigation to which paragraph (c) of this section applies (including any related collection action under paragraph (d) of this section) in a court of the United States or in any other court, except the Supreme Court of the United States. However, the Secretary or the General Counsel will consult with the Attorney General concerning such litigation and the Attorney General will provide, on request, such assistance in the conduct of such litigation as may be appropriate.

(2) In accordance with the provisions of sections 333(d)(5)(B) and 345 of the Act, and subject to the provisions of Section 502(c) of the Department of Energy Organization Act, the Secretary will be represented by the Attorney General, or the Solicitor General, as appropriate, in actions under this section, except to the extent provided in paragraph (e)(1) of this section.

(3) In accordance with the provisions of Section 333(d)(5)(c) and 345 of the Act, Section 402(d) of the Department of Energy Organization Act will not apply with respect to the function of the Secretary under this section.

APPENDIX A TO SUBPART U OF PART 431—SAMPLING PLAN FOR ENFORCEMENT TESTING OF ELECTRIC MOTORS

Step 1. The first sample size \( n_1 \) must be five or more units.

Step 2. Compute the mean \( \bar{X}_i \) of the measured energy performance of the \( n_1 \) units in the first sample as follows:

\[
\bar{X}_i = \frac{1}{n_1} \sum_{i=1}^{n_1} X_i
\]

(1)

where \( X_i \) is the measured full-load efficiency of unit \( i \).
Step 3. Compute the sample standard deviation \( (S_1) \) of the measured full-load efficiency of the \( n_1 \) units in the first sample as follows:

\[
S_1 = \sqrt{\frac{1}{n_1-1} \sum_{i=1}^{n_1} (x_i - \bar{x})^2}
\]  

(2)

Step 4. Compute the standard error \( (SE(\bar{x}_1)) \) of the mean full-load efficiency of the first sample as follows:

\[
SE(\bar{x}_1) = \frac{S_1}{\sqrt{n_1}}
\]  

(3)

Step 5. Compute the lower control limit \( (LCL_{1}) \) for the mean of the first sample using \( RE \) as the desired mean as follows:

\[
LCL_{1} = RE - tSE(\bar{x}_1)
\]  

(4)

where: \( RE \) is the applicable EPCA nominal full-load efficiency when the test is to determine compliance with the applicable statutory standard, or is the labeled nominal full-load efficiency when the test is to determine compliance with the labeled efficiency value, and \( t \) is the 2.5th percentile of a t-distribution for a sample size of \( n_1 \), which yields a 97.5 percent confidence level for a one-tailed \( t \)-test.

Step 6. Compare the mean of the first sample \( (\bar{x}_1) \) with the lower control limit \( (LCL_{1}) \) to determine one of the following:

(i) If the mean of the first sample is below the lower control limit, then the basic model is in non-compliance and testing is at an end.

(ii) If the mean is equal to or greater than the lower control limit, then the basic model is in compliance and testing is at an end.

Step 7. Determine the recommended sample size \( (n) \) as follows:

\[
n = \left[ \frac{tS_1(120 - 0.2RE)}{RE(20 - 0.2RE)} \right]^2
\]  

where \( S_1, RE \) and \( t \) have the values used in Steps 3 and 5, respectively. The factor \( 120 - 0.2RE \)

\[
\frac{RE(20 - 0.2RE)}{}
\]

is based on a 20 percent tolerance in the total power loss at full-load and fixed output power.

Given the value of \( n \), determine one of the following:

(i) If the value of \( n \) is less than or equal to \( n_1 \), and if the mean energy efficiency of the first sample \( (\bar{x}_1) \) is equal to or greater than the lower control limit \( (LCL_{1}) \), the basic model is in compliance and testing is at an end.

(ii) If the value of \( n \) is greater than \( n_1 \), the basic model is in non-compliance. The size of a second sample \( n_2 \) is determined to be the smallest integer equal to or greater than the difference \( n - n_1 \). If the value of \( n_2 \) so calculated is greater than \( 20 - n_1 \), set \( n_2 \) equal to \( 20 - n_1 \).

Step 8. Compute the combined \( (\bar{x}_2) \) mean of the measured energy performance of the \( n_1 \) and \( n_2 \) units of the combined first and second samples as follows:

\[
\bar{x}_2 = \frac{1}{n_1 + n_2} \sum_{i=1}^{n_1 + n_2} x_i
\]  

(6)

Step 9. Compute the standard error \( (SE(\bar{x}_2)) \) of the mean full-load efficiency of the \( n_1 \) and \( n_2 \) units in the combined first and second samples as follows:

\[
SE(\bar{x}_2) = \frac{S_1}{\sqrt{n_1 + n_2}}
\]  

(7)

(Note that \( S_1 \) is the value obtained above in Step 3.)

Step 10. Set the lower control limit \( (LCL_{2}) \) to

\[
LCL_{2} = RE - tSE(\bar{x}_2)
\]  

(8)

where \( t \) has the value obtained in Step 5, and compare the combined sample mean \( (\bar{x}_2) \) to the lower control limit \( (LCL_{2}) \) to find one of the following:

(i) If the mean of the combined sample \( (\bar{x}_2) \) is less than the lower control limit \( (LCL_{2}) \), the basic model is in non-compliance and testing is at an end.

(ii) If the mean of the combined sample \( (\bar{x}_2) \) is equal to or greater than the lower control limit \( (LCL_{2}) \), the basic model is in compliance and testing is at an end.

**Manufacturer-Option Testing**

If a determination of non-compliance is made in Steps 6, 7 or 10, of this appendix A, the manufacturer may request that additional testing be conducted, in accordance with the following procedures.

Step A. The manufacturer requests that an additional number, \( n_3 \), of units be tested, with \( n_3 \) chosen such that \( n_1 + n_2 + n_3 \) does not exceed 20.

Step B. Compute the mean full-load efficiency, standard error, and lower control limit of the new combined sample in accordance with the procedures prescribed in Steps 8, 9, and 10, of this appendix A.

Step C. Compare the mean performance of the new combined sample to the lower control limit \( (LCL_{2}) \) to determine one of the following:

(a) If the new combined sample mean is equal to or greater than the lower control
(b) If the new combined sample mean is less than the lower control limit and the value of \( n_1 + n_2 + n_3 \) is less than 20, the manufacturer may request that additional units be tested. The total of all units tested may not exceed 20. Steps A, B, and C are then repeated.

(c) Otherwise, the basic model is determined to be in non-compliance.

Subpart V—General Provisions

\section*{§ 431.401 Petitions for waiver, and applications for interim waiver, of test procedure.}

(a) General criteria. (1) Any interested person may submit a petition to waive for a particular basic model any requirements of §§ 431.16, 431.76, 431.86, 431.96, and 431.106 of this part, upon the grounds that either the basic model contains one or more design characteristics which prevent testing of the basic model according to the prescribed test procedures, or the prescribed test procedures may evaluate the basic model in a manner so unrepresentative of its true energy consumption characteristics as to provide materially inaccurate comparative data.

(2) Any person who has submitted a Petition for Waiver as provided in this subpart, may also file an Application for Interim Waiver of the applicable test procedure requirements.

(b) Submission, content, and publication. (1) You must submit your Petition for Waiver in triplicate, to the Assistant Secretary for Energy Efficiency and Renewable Energy, U.S. Department of Energy. Each Petition for Waiver must:

(i) Identify the particular basic model(s) for which a waiver is requested, the design characteristic(s) constituting the grounds for the petition, and the specific requirements sought to be waived, and must discuss in detail the need for the requested waiver;

(ii) Identify manufacturers of all other basic models marketed in the United States and known to the petitioner to incorporate similar design characteristic(s);

(iii) Include any alternate test procedures known to the petitioner to evaluate the characteristics of the basic model in a manner representative of its energy consumption; and

(iv) Be signed by you or by an authorized representative. In accordance with the provisions set forth in 10 CFR 1004.11, any request for confidential treatment of any information contained in a Petition for Waiver or in supporting documentation must be accompanied by a copy of the petition, application or supporting documentation from which the information claimed to be confidential has been deleted. DOE will publish in the \textit{FEDERAL REGISTER} the petition and supporting documents from which confidential information, as determined by DOE, has been deleted in accordance with 10 CFR 1004.11 and will solicit comments, data and information with respect to the determination of the petition.

(2) You must submit any Application for Interim Waiver in triplicate, with the required three copies of the Petition for Waiver, to the Assistant Secretary for Energy Efficiency and Renewable Energy, U.S. Department of Energy. Each Application for Interim Waiver must demonstrate likely success of the Petition for Waiver by identifying the particular basic model(s) for which you seek a waiver and temporary exception. You or an authorized representative must sign the Application for Interim Waiver.

(c) Notification to other manufacturers. (1) After filing a Petition for Waiver with DOE, and after DOE has published the Petition for Waiver in the \textit{FEDERAL REGISTER}, you must, within five working days of such publication, notify all known manufacturers of domestically marketed units of the same product type (as defined in Section 340(1) of the Act) and must include in the notice a statement that DOE has published in the \textit{FEDERAL REGISTER} on a certain date the Petition for Waiver.
and supporting documents from which confidential information, if any, as determined by DOE, has been deleted in accordance with 10 CFR 1004.11. In complying with the requirements of this paragraph, you must file with DOE a statement certifying the names and addresses of each person to whom you have sent a notice of the Petition for Waiver.

(2) If you apply for Interim Waiver, whether filing jointly with or subsequent to your Petition for Waiver with DOE, you must concurrently notify in writing all known manufacturers of domestically marketed units of the same product type (as defined in Section 340(1) of the Act), and must include in the notice a copy of the Petition for Waiver and a copy of the Application for Interim Waiver. In complying with this section, you must in the written notification include a statement that the Assistant Secretary for Energy Efficiency and Renewable Energy will receive and consider timely written comments on the Application for Interim Waiver. Upon filing an Application for Interim Waiver, you must in complying with the requirements of this paragraph certify to DOE that a copy of these documents has been sent to all known manufacturers of domestically marked units of the same product type (as listed in Section 340(1) of the Act). Such certification must include the names and addresses of such persons. You must comply with the provisions of paragraph (c)(1) of this Section with respect to the petition for waiver.

(d) Comments; responses to comments. (1) Any person submitting written comments to DOE with respect to an Application for Interim Waiver must also send a copy of the comments to the applicant.

(2) Any person submitting written comments to DOE with the respect to a Petition for Waiver must also send a copy of such comments to the petitioner. In accordance with paragraph (b)(1) of this section, a petitioner may submit a rebuttal statement to the Assistant Secretary for Energy Efficiency and Renewable Energy.

(e) Provisions specific to interim waivers—(1) Disposition of application. If administratively feasible, DOE will notify the applicant in writing of the disposition of the Application for Interim Waiver within 15 business days of receipt of the application. Notice of DOE's determination on the Application for Interim Waiver will be published in the FEDERAL REGISTER.

(2) Consequences of filing application. The filing of an Application for Interim Waiver will not constitute grounds for noncompliance with any requirements of this subpart, until an Interim Waiver has been granted.

(3) Criteria for granting. The Assistant Secretary for Energy Efficiency and Renewable Energy will grant an Interim Waiver from test procedure requirements if he or she determines that the applicant will experience economic hardship if the Application for Interim Waiver is denied, if it appears likely that the Petition for Waiver will be granted, and/or if the Assistant Secretary determines that it would be desirable for public policy reasons to grant immediate relief pending a determination on the Petition for Waiver.

(4) Duration. An interim waiver will terminate 180 days after issuance or upon the determination on the Petition for Waiver, whichever occurs first. DOE may extend an interim waiver for up to 180 days or modify its terms based on relevant information contained in the record and any comments received subsequent to issuance of the interim waiver. DOE will publish in the FEDERAL REGISTER notice of such extension and/or any modification of the terms or duration of the interim waiver.

(f) Provisions specific to waivers—(1) Rebuttal by petitioner. Following publication of the Petition for Waiver in the FEDERAL REGISTER, a petitioner may, within 10 working days of receipt of a copy of any comments submitted in accordance with paragraph (b)(1) of this section, submit a rebuttal statement to the Assistant Secretary for Energy Efficiency and Renewable Energy. A petitioner may rebut more than one response in a single rebuttal statement.

(2) Disposition of petition. DOE will notify the petitioner in writing as soon as practicable of the disposition of each Petition for Waiver. The Assistant Secretary for Energy Efficiency and Renewable Energy will issue a decision on the petition as soon as is practicable.
§ 431.402 Preemption of State regulations for commercial HVAC & WH products.

Beginning on the effective date of such standard, an energy conservation standard set forth in this Part for a commercial HVAC & WH product supersedes any State or local regulation concerning the energy efficiency or energy use of that product, except as provided for in Section 345(b)(2)(B)-(D) of the Act.

§ 431.403 Maintenance of records.

(a) If you are the manufacturer of any covered equipment, you must establish, maintain and retain records of the following:

1. The test data for all testing conducted pursuant to this part;
2. For electric motors, the development, substantiation, application, and subsequent verification of any AEDM used under this part; and
3. For electric motors, any written certification received from a certification program, including a certificate or conformity, relied on under the provisions of this part.

(b) You must organize such records and index them so that they are readily accessible for review. The records must include the supporting test data associated with tests performed on any test units to satisfy the requirements of this Part (except tests performed by us directly).

(c) For each basic model, you must retain all such records for a period of two years from the date that production of all units of that basic model has ceased. You must retain records in a form allowing ready access to DOE, upon request.

§ 431.404 Imported equipment.

(a) Under sections 331 and 345 of the Act, any person importing any covered equipment into the United States must comply with the provisions of the Act and of this part, and is subject to the remedies of this part.

(b) Any covered equipment offered for importation in violation of the Act and of this part will be refused admission into the customs territory of the United States under rules issued by the Secretary of the Treasury, except that the Secretary of the Treasury may, by such rules, authorize the importation of such covered equipment upon such terms and conditions (including the furnishing of a bond) as may appear to the Secretary of the Treasury appropriate to ensure that such covered equipment...
§ 431.422 Prescriptions of a rule.

(a) Criteria for exemption from preemption. Upon petition by a State which has prescribed an energy conservation standard or other requirement for a type or class of covered equipment for which a Federal energy conservation standard is applicable, the Secretary shall prescribe a rule that such standard not be preempted if he/she determines that the State has established by a preponderance of evidence that such requirement is needed to meet unusual and compelling State or local energy interests. For the purposes of this regulation, the term “unusual and compelling State or local energy interests” means interests which are substantially different in nature or magnitude from those prevailing in the U.S. generally, and are such that when evaluated within the context of the State’s energy plan and forecast, the
costs, benefits, burdens, and reliability of energy savings resulting from the State regulation make such regulation preferable or necessary when measured against the costs, benefits, burdens, and reliability of alternative approaches to energy savings or production, including reliance on reasonably predictable market-induced improvements in efficiency of all equipment subject to the State regulation. The Secretary may not prescribe such a rule if he finds that interested persons have established, by a preponderance of the evidence, that the State’s regulation will significantly burden manufacturing, marketing, distribution, sale or servicing of the covered equipment on a national basis. In determining whether to make such a finding, the Secretary shall evaluate all relevant factors including: The extent to which the State regulation will increase manufacturing or distribution costs of manufacturers, distributors, and others; the extent to which the State regulation will disadvantage smaller manufacturers, distributors, or dealers or lessen competition in the sale of the covered equipment in the State; the extent to which the State regulation would cause a burden to manufacturers to redesign and produce the covered equipment type (or class), taking into consideration the extent to which the regulation would result in a reduction in the current models, or in the projected availability of models, that could be shipped on the effective date of the regulation to the State and within the U.S., or in the current or projected sales volume of the covered equipment type (or class) in the State and the U.S.; and the extent to which the State regulation is likely to contribute significantly to a proliferation of State commercial and industrial equipment efficiency requirements and the cumulative impact such requirements would have. The Secretary may not prescribe such a rule if he finds that such a rule will result in the unavailability in the State of any covered equipment (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the State at the time of the Secretary’s finding.

The failure of some classes (or types) to meet this criterion shall not affect the Secretary’s determination of whether to prescribe a rule for other classes (or types).

1. Requirements of petition for exemption from preemption. A petition from a State for a rule for exemption from preemption shall include the information listed in paragraphs (a)(1)(i) through (a)(1)(vi) of this section. A petition for a rule and correspondence relating to such petition shall be available for public review except for confidential or proprietary information submitted in accordance with the Department of Energy’s Freedom of Information Regulations set forth in 10 CFR Part 1004.

   (i) The name, address, and telephone number of the petitioner;
   (ii) A copy of the State standard for which a rule exempting such standard is sought;
   (iii) A copy of the State’s energy plan and forecast;
   (iv) Specification of each type or class of covered equipment for which a rule exempting a standard is sought;
   (v) Other information, if any, believed to be pertinent by the petitioner; and
   (vi) Such other information as the Secretary may require.

2. Criteria for exemption from preemption when energy emergency conditions exist within State. Upon petition by a State which has prescribed an energy conservation standard or other requirement for a type or class of covered equipment for which a Federal energy conservation standard is applicable, the Secretary may prescribe a rule, effective upon publication in the Federal Register, that such regulation not be preempted if he determines that in addition to meeting the requirements of paragraph (a) of this Section the State has established that: an energy emergency condition exists within the State that imperils the health, safety, and welfare of its residents because of the inability of the State or utilities within the State to provide adequate quantities of gas or electric energy to its residents at less than prohibitive costs; and cannot be substantially alleviated by the importation of energy or the use of interconnection
agreements; and the State regulation is necessary to alleviate substantially such condition.

(1) Requirements of petition for exemption from preemption when energy emergency conditions exist within a State. A petition from a State for a rule for exemption from preemption when energy emergency conditions exist within a State shall include the information listed in paragraphs (a)(1)(i) through (a)(1)(vi) of this section. A petition shall also include the information prescribed in paragraphs (b)(1)(i) through (b)(1)(iv) of this section, and shall be available for public review except for confidential or proprietary information submitted in accordance with the Department of Energy's Freedom of Information Regulations set forth in 10 CFR Part 1004:

(i) A description of the energy emergency condition which exists within the State, including causes and impacts.
(ii) A description of emergency response actions taken by the State and utilities within the State to alleviate the emergency condition;
(iii) An analysis of why the emergency condition cannot be alleviated substantially by importation of energy or the use of interconnection agreements;
(iv) An analysis of how the State standard can alleviate substantially such emergency condition.

(c) Criteria for withdrawal of a rule exempting a State standard. Any person subject to a State standard which, by rule, has been exempted from Federal preemption and which prescribes an energy conservation standard or other requirement for a type or class of covered equipment, when the Federal energy conservation standard for such equipment subsequently is amended, may petition the Secretary requesting that the exemption rule be withdrawn. The Secretary shall consider such petition in accordance with the requirements of paragraph (a) of this section, except that the burden shall be on the petitioner to demonstrate that the exemption rule received by the State should be withdrawn as a result of the amendment to the Federal standard. The Secretary shall withdraw such rule if he determines that the petitioner has shown the rule should be withdrawn.

(1) Requirements of petition to withdraw a rule exempting a State standard. A petition for a rule to withdraw a rule exempting a State standard shall include the information prescribed in paragraphs (c)(1)(i) through (c)(1)(vii) of this section, and shall be available for public review, except for confidential or proprietary information submitted in accordance with the Department of Energy's Freedom of Information Regulations set forth in 10 CFR Part 1004:

(i) The name, address and telephone number of the petitioner;
(ii) A statement of the interest of the petitioner for which a rule withdrawing an exemption is sought;
(iii) A copy of the State standard for which a rule withdrawing an exemption is sought;
(iv) Specification of each type or class of covered equipment for which a rule withdrawing an exemption is sought;
(v) A discussion of the factors contained in paragraph (a) of this section;
(vi) Such other information, if any, believed to be pertinent by the petitioner; and
(vii) Such other information as the Secretary may require.

(2) [Reserved]
act, or transaction has been or presently is being considered or investigated by any State agency, department, or instrumentality.

(d) Computation of time. (1) Computing any period of time prescribed by or allowed under this subpart, the day of the action from which the designated period of time begins to run is not to be included. If the last day of the period is Saturday, or Sunday, or Federal legal holiday, the period runs until the end of the next day that is neither a Saturday, or Sunday or Federal legal holiday.

(2) Saturdays, Sundays, and intervening Federal legal holidays shall be excluded from the computation of time when the period of time allowed or prescribed is 7 days or less.

(3) When a submission is required to be made within a prescribed time, DOE may grant an extension of time upon good cause shown.

(4) Documents received after regular business hours are deemed to have been submitted on the next regular business day. Regular business hours for the DOE’s National Office, Washington, DC, are 8:30 a.m. to 4:30 p.m.

(5) DOE reserves the right to refuse to accept, and not to consider, untimely submissions.

(2) A petition may be submitted on behalf of more than one person. A joint petition shall indicate each person participating in the submission. A joint petition shall provide the information required by §431.212 for each person on whose behalf the petition is submitted.

(3) All petitions shall be signed by the person(s) submitting the petition or by a duly authorized representative. If submitted by a duly authorized representative, the petition shall certify this authorization.

(4) A petition for a rule to withdraw a rule exempting a State regulation, all supporting documents, and all future submissions shall be served on each State agency, department, or instrumentality whose regulation the petitioner seeks to supersede. The petition shall contain a certification of this service which states the name and mailing address of the served parties, and the date of service.

(f) Acceptance for filing. (1) Within 15 days of the receipt of a petition, the Secretary will either accept it for filing or reject it, and the petitioner will be so notified in writing. The Secretary will serve a copy of this notification on each other party served by the petitioner. Only such petitions which conform to the requirements of this subpart and which contain sufficient information for the purposes of a substantive decision will be accepted for filing. Petitions which do not so conform will be rejected and an explanation provided to petitioner in writing.

(2) For purposes of the Act and this subpart, a petition is deemed to be filed on the date it is accepted for filing.

(g) Docket. A petition accepted for filing will be assigned an appropriate docket designation. Petitioner shall use the docket designation in all subsequent submissions.

§ 431.424 Notice of petition.

(a) Promptly after receipt of a petition and its acceptance for filing, notice of such petition shall be published in the FEDERAL REGISTER. The notice shall set forth the availability for public review of all data and information available, and shall solicit comments, data and information with respect to the determination on the petition. Except as may otherwise be specified, the period for public comment shall be 60 days after the notice appears in the FEDERAL REGISTER.

(b) In addition to the material required under paragraph (a) of this section, each notice shall contain a summary of the State regulation at issue and the petitioner’s reasons for the rule sought.

§ 431.425 Consolidation.

DOE may consolidate any or all matters at issue in two or more proceedings docketed where there exist common parties, common questions of
§ 431.426 Hearing.

The Secretary may hold a public hearing, and publish notice in the Federal Register of the date and location of the hearing, when he determines that such a hearing is necessary and likely to result in a timely and effective resolution of the issues. A transcript shall be kept of any such hearing.

§ 431.427 Disposition of petitions.

(a) After the submission of public comments under §431.213(a), the Secretary shall prescribe a final rule or deny the petition within 6 months after the date the petition is filed.

(b) The final rule issued by the Secretary or a determination by the Secretary to deny the petition shall include a written statement setting forth his findings and conclusions, and the reasons and basis therefor. A copy of the Secretary's decision shall be sent to the petitioner and the affected State agency. The Secretary shall publish in the Federal Register a notice of the final rule granting or denying the petition and the reasons and basis therefor.

(c) If the Secretary finds that he cannot issue a final rule within the 6-month period pursuant to paragraph (a) of this section, he shall publish a notice in the Federal Register extending such period to a date certain, but no longer than one year after the date on which the petition was filed. Such notice shall include the reasons for the delay.

§ 431.428 Effective dates of final rules.

(a) A final rule exempting a State standard from Federal preemption will be effective:

(1) Upon publication in the Federal Register if the Secretary determines that such rule is needed to meet an “energy emergency condition” within the State;

(2) Three years after such rule is published in the Federal Register; or

(3) Five years after such rule is published in the Federal Register if the Secretary determines that such additional time is necessary due to the burdens of retooling, redesign or distribution.

(b) A final rule withdrawing a rule exempting a State standard will be effective upon publication in the Federal Register.

§ 431.429 Request for reconsideration.

(a) Any petitioner whose petition for a rule has been denied may request reconsideration within 30 days of denial. The request shall contain a statement of facts and reasons supporting reconsideration and shall be submitted in writing to the Secretary.

(b) The denial of a petition will be reconsidered only where it is alleged and demonstrated that the denial was based on error in law or fact and that evidence of the error is found in the record of the proceedings.

(c) If the Secretary fails to take action on the request for reconsideration within 30 days, the request is deemed denied, and the petitioner may seek such judicial review as may be appropriate and available.

(d) A petitioner has not exhausted other administrative remedies until a request for reconsideration has been filed and acted upon or deemed denied.

§ 431.430 Finality of decision.

(a) A decision to prescribe a rule that a State energy conservation standard or other requirement not be preempted is final on the date the rule is issued, i.e., signed by the Secretary. A decision to prescribe such a rule has no effect on other regulations of covered equipment of any other State.

(b) A decision to prescribe a rule withdrawing a rule exempting a State standard or other requirement is final on the date the rule is issued, i.e., signed by the Secretary. A decision to deny such a petition is final on the day a denial of a request for reconsideration is issued, i.e., signed by the Secretary.
PART 433—ENERGY EFFICIENCY STANDARDS FOR THE DESIGN AND CONSTRUCTION OF NEW FEDERAL COMMERCIAL AND MULTI-FAMILY HIGH-RISE RESIDENTIAL BUILDINGS

§ 433.1 Purpose and scope.
This part establishes an energy efficiency performance standard for the new Federal commercial and multi-family high-rise buildings, for which design for construction began on or after January 3, 2007, as required by section 305(a) of the Energy Conservation and Production Act, as amended (42 U.S.C. 6834(a)).

§ 433.2 Definitions.
For purposes of this part, the following terms, phrases and words are defined as follows:

ANSI means the American National Standards Institute.

ASHRAE means the American Society of Heating, Refrigerating and Air-Conditioning Engineers.

Baseline building means a building that is otherwise identical to the proposed building but is designed to meet but not exceed the energy efficiency specifications of ANSI/ASHRAE/IESNA Standard 90.1-2004, Energy Standard for Buildings Except Low-Rise Residential Buildings, January 2004 (incorporated by reference, see §433.3).

Commercial and multi-family high-rise residential building means all buildings other than low-rise residential buildings.

DOE means the U.S. Department of Energy.

IESNA means Illuminating Engineering Society of North America.

Life-cycle cost means the total cost related to energy conservation measures of owning, operating and maintaining a building over its useful life as determined in accordance with 10 CFR part 436.

Life-cycle cost-effective means that the proposed building has a lower life-cycle cost than the life-cycle costs of the baseline building, as described by 10 CFR 436.19, or has a positive estimated net savings, as described by 10 CFR 436.20; or has a savings-to-investment ratio estimated to be greater than one, as described by 10 CFR 436.21; or has an adjusted internal rate of return, as described by 10 CFR 436.22.

Low-rise residential building means any building three stories or less in height above grade that includes sleeping accommodations where the occupants are primarily permanent in nature (30 days or more).

New Federal building means any building to be constructed by, or for the use of, any Federal agency which is not legally subject to State or local building codes or similar requirements.

Proposed building means the building design of a new Federal commercial and multi-family high-rise building proposed for construction.

§ 433.2 Definitions.

* * * * *

476
Design for construction means the stage when the energy efficiency and sustainability details (such as insulation levels, HVAC systems, water-using systems, etc.) are either explicitly determined or implicitly included in a project cost specification.

New Federal building means any building to be constructed on a site that previously did not have a building or a complete replacement of an existing building from the foundation up, by, or for the use of, any Federal agency which is not legally subject to State or local building codes or similar requirements.

Process load means the load on a building resulting from energy consumed in support of a manufacturing, industrial, or commercial process. Process loads do not include energy consumed maintaining comfort and amenities for the occupants of the building (including space conditioning for human comfort).

Receptacle load means the load on a building resulting from energy consumed by any equipment plugged into electrical outlets.

§ 433.3 Materials incorporated by reference.

(a) General. DOE incorporates by reference the energy performance standard listed in paragraph (b) of this section into 10 CFR part 433. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE building energy performance standard unless and until DOE amends its building energy performance standards. DOE incorporates the material as it exists on the date specified in the approval and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of references. The building energy performance standard incorporated by reference is available for inspection at:

(1) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html

(2) U.S. Department of Energy, Forrestal Building, Room 1M-048 (Resource Room of the Federal Energy Management Program), 1000 Independence Avenue, SW., Washington, DC 20585-0121, (202) 586-9138, between 9 a.m. and 4 p.m., Monday through Friday, except Federal holidays.

§ 433.4 Energy efficiency performance standard.

(a) All Federal agencies shall design new Federal commercial and multi-family high-rise residential buildings, for which design for construction began on or after January 3, 2007, to:

(1) Meet ANSI/ASHRAE/IESNA Standard 90.1-2004, Energy Standard for Buildings Except Low-Rise Residential Buildings, January 2004 (incorporated by reference, see 433.3); and

(2) If life-cycle cost-effective, achieve energy consumption levels, calculated consistent with paragraph (b) of this section, that are at least 30 percent below the levels of the baseline building.

(b) Energy consumption for the purposes of calculating the 30 percent savings shall include space heating, space cooling, ventilation, service water heating, lighting and all other energy consuming systems normally specified as part of the building design except for receptacle and process loads.

(c) If a 30 percent reduction is not life-cycle cost-effective, the design of the proposed building shall be modified so as to achieve an energy consumption...
§ 433.5 Level at the maximum level of energy efficiency that is life-cycle cost-effective, but at a minimum complies with paragraph (a) of this section.

Effective Date Note: At 72 FR 72570, Dec. 21, 2007, §433.4 was amended by revising paragraph (c), effective Jan. 22, 2008. For the convenience of the user, the revised text is set forth as follows:

§ 433.4 Energy efficiency performance standard.

* * * * *

(c) If a 30 percent reduction is not life-cycle cost-effective, the design of the proposed building shall be modified so as to achieve energy consumption level at or better than the maximum level of energy efficiency that is life-cycle cost-effective, but at a minimum complies with paragraph (a) of this section.

§ 433.5 Performance level determination.

(a) Each Federal agency shall determine energy consumption levels for both the baseline building and proposed building by using the Performance Rating Method found in Appendix G of ANSI/ASHRAE/IESNA Standard 90.1-2004, Energy Standard for Buildings Except Low-Rise Residential Buildings; January 2004 (incorporated by reference, see § 433.3), except the formula for calculating the Performance Rating in paragraph G1.2 shall read as follows:

Percentage improvement = 100 x (Baseline building consumption—Proposed building consumption)/(Baseline building consumption—Receptacle and process loads).

(b) Each Federal agency shall consider laboratory fume hoods and kitchen ventilation systems as part of the ASHRAE-covered HVAC loads subject to the 30 percent savings requirements, rather than as process loads.

§ 433.6 Sustainable principles for siting, design and construction. [Reserved]

§ 433.7 Water used to achieve energy efficiency. [Reserved]

§ 433.8 Life-cycle costing.

Each Federal agency shall determine life-cycle cost-effectiveness by using the procedures set out in subpart A of part 436. A Federal agency may choose to use any of four methods, including lower life-cycle costs, positive net savings, savings-to-investment ratio that is estimated to be greater than one, and an adjusted internal rate of return that is estimated to be greater than the discount rate as listed in OMB Circular Number A-94 "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs."

PART 434—ENERGY CODE FOR NEW FEDERAL COMMERCIAL AND MULTI-FAMILY HIGH RISE RESIDENTIAL BUILDINGS

Sec. 434.99 Explanation of numbering system for codes.

Subpart A—Administration and Enforcement—General

434.100 Purpose.
434.101 Scope.
434.102 Compliance.
434.103 Referenced standards (RS).
434.105 Materials and equipment.

Subpart B—Definitions

434.201 Definitions.

Subpart C—Design Conditions

434.301 Design criteria.

Subpart D—Building Design Requirements—Electric Systems and Equipment

434.401 Electrical power and lighting systems.
434.402 Building envelope assemblies and materials.
434.403 Building mechanical systems and equipment.
434.404 Building service systems and equipment.

Subpart E—Building Energy Cost Compliance Alternative

434.501 General.
434.502 Determination of the annual energy cost budget.
434.503 Prototype building procedure.
434.504 Use of the prototype building to determine the energy cost budget.
434.505 Reference building method.
434.506 Use of the reference building to determine the energy cost budget.
434.507 Calculation procedure and simulation tool.
434.508 Determination of the design energy consumption and design energy cost.
434.509 Compliance.
Subpart F—Building Energy Compliance

434.601 General.
434.602 Determination of the annual energy budget.
434.603 Determination of the design energy use.
434.604 Compliance.
434.605 Standard calculation procedure.
434.606 Simulation tool.
434.607 Life cycle cost analysis criteria.

Subpart G—Reference Standards

434.701 General.

Source: 65 FR 60012, Oct. 6, 2000, unless otherwise noted.

§ 434.99 Explanation of numbering system for codes.

(a) For purposes of this part, a derivative of two different numbering systems will be used.

(1) For the purpose of designating a section, the system employed in the Code of Federal Regulations (CFR) will be employed. The number “434” which signifies part 434 in chapter II of Title 10, Code of Federal Regulations, is used as a prefix for all section headings. The suffix is a two or three digit section number. For example the lighting section of the standards is designated § 434.401.

(2) Within each section, a numbering system common to many national voluntary consensus standards is used. A decimal system is used to denote paragraphs and subparagraphs within a section. For example, in § 434.401, “401.2.1” refers to subsection 401, paragraph 2, subparagraph 1.

(b) The hybrid numbering system is used for two purposes:

(1) The use of the Code of Federal Regulations’ numbering system allows the researcher using the CFR easy access to the standards.

(2) The use of the second system allows the builder, designer, architect or engineer easy access because they are familiar to this system numbering. This system was chosen because of its commonality among the building industry.

Subpart A—Administration and Enforcement—General

§ 434.100 Purpose.

The provisions of this part provide minimum standards for energy efficiency for the design of new Federal commercial and multi-family high rise residential buildings, for which design for construction began before January 3, 2007. The performance standards are designed to achieve the maximum practicable improvements in energy efficiency and increases in the use of non-depletable sources of energy. This rule is based upon the ASHRAE/IESNA Standard 90.1–1989 and addenda b, c, d, e, f, g, and i. (This document is available from the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., 1791 Tullie Circle NE, Atlanta, GA.) It is not incorporated by reference in this document, but is mentioned for informational purposes only.

[71 FR 70283, Dec. 4, 2006]

§ 434.101 Scope.

101.1 This part provides design requirements for the building envelope, electrical distribution systems and equipment for electric power, lighting, heating, ventilating, air conditioning, service water heating and energy management. It applies to new Federal multi-family high rise residential buildings and new Federal commercial buildings, for which design for construction began before January 3, 2007.

101.1.1 (a) Except as provided by section 101.2, the provisions of this part apply if an agency is constructing:

(1) A building that has never been in service;

(2) An addition that adds new space with provision for a heating or cooling system, or both, or for a hot water system; or
§ 434.102

(3) A substantial renovation of a building, involving replacement of a heating or cooling system, or both, or hot water system, that is either in service or has been in service.

101.2 The provisions of this part do not apply to:

101.2.1 Buildings, or portions thereof separated from the remainder of the building, that have a peak energy usage for space conditioning, service water heating, and lighting of less than 3.5 Btu/(h•ft²) of gross floor area.

101.2.2 Buildings of less than 100 square feet of gross floor area.

101.2.3 Heating, cooling, ventilating, or service hot water requirements for those spaces where processes occur for purposes other than occupant comfort and sanitation, and which impose thermal loads in excess of 5% of the loads that would otherwise be required for occupant comfort and sanitation without the process.

101.2.4 Envelope requirements for those spaces where heating or cooling requirements are excepted in subsection 101.2.3 of this section.

101.2.5 Lighting for tasks not listed or encompassed by areas or activities listed in Tables 401.3.2b, 401.3.2c and 401.3.2d.

101.2.6 Buildings that are composed entirely of spaces listed in subsections 101.2.4 and 101.2.5.

101.2.7 Individual components of a building under renovation, if the building components are not in the scope of a renovation as defined by the agency.

(65 FR 60002, Oct. 6, 2000, as amended at 71 FR 70283, Dec. 4, 2006)

EFFECTIVE DATE NOTE: At 72 FR 72571, Dec. 21, 2007, § 434.101 was amended by revising in paragraph 101.1.1, paragraphs (a)(2) and (3), effective Jan. 22, 2008. For the convenience of the user, the added and revised text is set forth as follows:

§ 434.101 Scope.

* * * * * * *

101.1.1 (a) * * *

(2) An addition for which design for construction began before January 3, 2007, that adds new space with provision for a heating or cooling system, or both, or for a hot water system; or

(3) A substantial renovation of a building for which design for construction began before January 3, 2007, involving replacement of a heating or cooling system, or both, or hot water system, that is either in service or has been in service.

* * * * * * *

§ 434.102 Compliance.

102.1 A covered building must be designed and constructed consistent with the provisions of subpart D of this part.

102.2 Buildings designed and constructed to meet the alternative requirements of subparts E or F of this part shall be deemed to satisfy the requirements of this part. Such designs shall be certified by a registered architect or engineer stating that the estimated energy cost or energy use for the building as designed is no greater than the energy cost or energy use of a prototype building or reference building as determined pursuant to subparts E or F of this part.

§ 434.103 Referenced standards (RS).

103.1 The standards, technical handbooks, papers and regulations listed in §434.701, shall be considered part of this part to the prescribed extent of such reference. Where differences occur between the provisions of this part and referenced standards, the provisions of this part shall apply. Whenever a reference is made in this part to an RS standard it refers to the standards listed in §434.701.

§ 434.105 Materials and equipment.

105.1 Building materials and equipment shall be identified in designs in a manner that will allow for a determination of their compliance with the applicable provisions of this part.

Subpart B—Definitions

§ 434.201 Definitions.

For the purposes of this part, the following terms, phrases, and words shall be defined as provided:

Accessible (as applied to equipment): admitting close approach; not guarded by locked doors, elevations, or other effective means. (See also “readily accessible”)

10 CFR Ch. II (1–1–08 Edition)
Annual Fuel Utilization Efficiency (AFUE): the ratio of annual output energy to annual input energy that includes any non-heating season pilot input loss.

Area of the space (A): the horizontal lighted area of a given space measured from the inside of the perimeter walls or partitions, at the height of the working surface.

Automatic: self-acting, operating by its own mechanism when actuated by some impersonal influence, such as a change in current strength, pressure, temperature, or mechanical configuration. (See also "manual")

Automatic flue damper device: an electrically operated device, in the flue outlet or in the inlet of or upstream of the draft hood of an individual automatically operated gas-fired appliance, which is designed to automatically open the flue outlet during appliance operation and to automatically close off the flue outlet when the appliance is in a standby condition.

Automatic vent damper device: a device intended for installation in the venting system, in the outlet of or downstream of the appliance draft hood, of an individual automatically operated gas-fired appliance, which is designed to automatically open the venting system when the appliance is in operation and to automatically close off the venting system when the appliance is in a standby or shutdown condition.

(1) Electrically operated: an automatic vent damper device that employs electrical energy to control the device.

(2) Thermally actuated: an automatic vent damper device dependent for operation exclusively upon the direct conversion of the thermal energy of the vent gases into mechanical energy.

Boiler capacity: the rated heat output of the boiler, in Btu/h, at the design inlet and outlet conditions and rated fuel or energy input.

Building: means any structure to be constructed which includes provision for a heating or cooling system, or both, or for a hot water system.

Building code: means a legal instrument which is in effect in a State or unit of general purpose local government, the provisions of which must be adhered to if a building is to be considered to be in conformance with law and suitable for occupancy and use.

Building envelope: the elements of a building that enclose conditioned spaces through which thermal energy may be transferred to or from the exterior or to or from unconditioned spaces.

Check metering: measurement instrumentation for the supplementary monitoring of energy consumption (electric, gas, oil, etc) to isolate the various categories of energy use to permit conservation and control, in addition to the revenue metering furnished by the utility.

Coefficient of performance (COP)—Cooling: the ratio of the rate of heat removal to the rate of energy input, in consistent units, for a complete cooling system or factory assembled equipment, as tested under a nationally recognized standard or designated operating conditions.

Coefficient of performance (COP) heat pump—Heating: the ratio of the rate of heat delivered to the rate of energy input, in consistent units, for a complete heat pump system under designated operating conditions.

Commercial building: a building other than a residential building, including any building developed for industrial or public purposes. Including but not limited to occupancies for assembly, business, education, institutions, food sales and service, merchants, and storage.

Conditioned floor area: the area of the conditioned space measured at floor level from the interior surfaces of the walls.

Conditioned space: a cooled space, heated space, or indirectly conditioned space.

Cooled space: an enclosed space within a building that is cooled by a cooling system whose sensible capacity:

(1) Exceeds 5 Btu/(h·ft²); or

(2) Is capable of maintaining a space dry bulb temperature of 90°F or less at design cooling conditions.

Daylight sensing control (DS): a device that automatically regulates the power input to electric lighting near the fenestration to maintain the desired workplace illumination, thus taking advantage of direct or indirect sunlight.
Daylighted space: the space bounded by vertical planes rising from the boundaries of the daylighted area on the floor to the floor or roof above.

Daylighted zone:
(1) Under skylights: the area under each skylight whose horizontal dimension in each direction is equal to the skylight dimension in that direction plus either the floor-to-ceiling height or the dimension to an opaque partition, or one-half the distance to an adjacent skylight or vertical glazing, whichever is least.

(2) At vertical glazing: the area adjacent to vertical glazing that receives daylighting from the glazing. For purposes of this definition and unless more detailed daylighting analysis is provided, the daylighting zone depth is assumed to extend into the space a distance of 15 ft or to the nearest opaque partition, whichever is less. The daylighting zone width is assumed to be the width of the window plus either 2 ft on each side, the distance to an opaque partition, or one half the distance to an adjacent skylight or vertical glazing, whichever is least.

Dead band (dead zone): the range of values within which an input variable that can be varied without initiating any noticeable change in the output variable.

Degree-day, cooling: a unit, based upon temperature difference and time, used in estimating cooling energy consumption. For any one day, when the mean temperature is more than a reference temperature, typically 65°F, there are as many degree-days as degrees Fahrenheit temperature difference between the mean temperature for the day and the reference temperature. Annual cooling degree-days (CDD) are the sum of the degree-days over a calendar year.

Degree-day, heating: a unit, based upon temperature difference and time, used in estimating heating energy consumption. For any one day, when the mean temperature is less than a reference temperature, typically 65°F, there are as many degree-days as degrees Fahrenheit temperature difference between the mean temperature for the day and the reference temperature. Annual heating degree days (HDD) are the sum of the degree-days over a calendar year.

Dwelling unit: a single housekeeping unit comprised of one or more rooms providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking, and sanitation.

Economizer, air: a ducting arrangement and automatic control system that allows a cooling supply fan system to supply outdoor (outside) air to reduce or eliminate the need for mechanical refrigeration during mild or cold weather.

Economizer, water: a system by which the supply air of a cooling system is cooled directly or indirectly or both by evaporation of water or by other appropriate fluid in order to reduce or eliminate the need for mechanical refrigeration.

Efficiency, HVAC system: the ratio of the useful energy output, at the point of use to the energy input in consistent units, for a designated time period, expressed in percent.

Emergency system (back-up system): a system that exists for the purpose of operating in the event of failure of a primary system.

Emergency use: electrical and lighting systems required to supply power automatically for illumination and equipment in the event of a failure of the normal power supply.

Energy efficiency ratio (EER): the ratio of net equipment cooling capacity in Btu/h to total rate of electric input in watts under designated operating conditions. Whenconsistent units are used, this ratio becomes equal to COP. (See also “coefficient of performance”.)

Fan system energy demand: the sum of the demand of all fans that are required to operate at design conditions to supply air from the heating or cooling source to the conditioned space(s) and return it back to the source or exhaust it to the outdoors.

Federal Building: means any building to be constructed by, or for the use of, any Federal Agency which is not legally subject to State or local building codes or similar requirements.

Fenestration: any light-transmitting section in a building wall or roof. The fenestration includes glazing material (which may be glass or plastic), framing (mullions, muntins, and dividers), external shading devices, internal shading devices, and integral (between glass) shading devices.

Fenestration area: the total area of fenestration measured using the rough opening and including the glass or plastic, sash, and frame. For doors where the glazed vision area is less than 50% of the door area, the fenestration area is glazed vision area. For all other doors, the fenestration area is the door area.

Flue damper: a device, in the flue outlet or in the inlet of or upstream of the draft hood of an individual automatically operated gas-fired appliance, which is designed to automatically open the flue outlet during appliance operation and to automatically close off the flue outlet when the appliance is in a standby condition.

Gross floor area: the sum of the floor areas of the conditioned spaces within the building, including basements, mezzanine and intermediate-floor tiers, and penthouses of headroom height 7.5 ft or greater. It is measured from the exterior faces of exterior walls or from the centerline of walls separating buildings (excluding covered walkways, open roofed-over areas, porches and similar spaces, pipe trenches, exterior terraces or steps, chimneys, roof overhangs, and similar features).

Gross lighted area (GLA): the sum of the total lighted areas of a building measured from the inside of the perimeter walls for each floor of the building.

Heat capacity (HC): the amount of heat necessary to raise the temperature of a given mass 1°F. Numerically, the mass expressed per unit of wall surface multiplied by the specific heat Btu/(ft²·°F).

Heat trap: device or piping arrangement that effectively restricts the natural tendency of hot water to rise in vertical pipes during standby periods.

Examples are the U-shaped arrangement of elbows or a 360-degree loop of tubing.

Heated space: an enclosed space within a building that is heated by a heating system whose output capacity

1. Exceeds 10 Btu/(h·ft²), or
2. Is capable of maintaining a space dry-bulb temperature of 50°F or more at design heating conditions.

Heating seasonal performance factor (HSPF): the total heating output of a heat pump during its normal annual usage period for heating, in Btu, divided by the total electric energy input during the same period, in watt-hours.

High rise residential building: hotels, motels, apartments, condominiums, dormitories, barracks, and other residential-type facilities that provide complete housekeeping or transient living quarters and are over three stories in height above grade.

Humidistat: an automatic control device responsive to changes in humidity.

HVAC system: the equipment, distribution network, and terminals that provide either collectively or individually the processes of heating, ventilating, or air conditioning to a building.

Indirectly conditioned space: an enclosed space within the building that is not a heated or cooled space, whose area-weighted heat transfer coefficient to heated or cooled spaces exceeds that to the outdoors or to unconditioned spaces; or through which air from heated or cooled spaces is transferred at a rate exceeding three air changes per hour. (See also “heated space”, “cooled space”, and “unconditioned space”.)

Infiltration: the uncontrolled inward air leakage through cracks and crevices in any building element and around windows and doors of a building.

Integrated part-load value (IPLV): a single-number figure of merit based on part-load EER or COP expressing part-load efficiency for air-conditioning and heat pump equipment on the basis of weighted operation at various load capacities for the equipment.

Lumen maintenance control: a device that senses the illumination level and causes an increase or decrease of illumination to maintain a preset illumination level.
Manual: action requiring personal intervention for its control. As applied to an electric controller, manual control does not necessarily imply a manual controller but only that personal intervention is necessary. (See automatic.)

Marked rating: the design load operating conditions of a device as shown by the manufacturer on the nameplate or otherwise marked on the device.

Multi-family high rise residential: a residential building containing three or more dwelling units and is designed to be 3 or more stories above grade.

Occupancy sensor: a device that detects the presence or absence of people within an area and causes any combination of lighting, equipment, or appliances to be adjusted accordingly.

Opaque areas: all exposed areas of a building envelope that enclose conditioned space except fenestration areas and building service openings such as vents and grilles.

Orientation: the directional placement of a building on a building site with reference to the building's longest horizontal axis or, if there is no longest horizontal axis, then with reference to the designated main entrance.

Outdoor air: air taken from the exterior of the building that has not been previously circulated through the building. (See “ventilation air”)

Ozone depletion factor: a relative measure of the potency of chemicals in depleting stratospheric ozone. The ozone depletion factor potential depends upon the chlorine and the bromine content and atmospheric lifetime of the chemical. The depletion factor potential is normalized such that the factor for CFC-11 is set equal to unity and the factors for the other chemicals indicate their potential relative to CFC-11.

Packaged terminal air conditioner (PTAC): a factory-selected wall sleeve and separate unencased combination of heating and cooling components, assemblies, or sections (intended for mounting through the wall to serve a single room or zone). It includes heating capability by hot water, steam, or electricity.

Packaged terminal heat pump: a PTAC capable of using the refrigeration system in a reverse cycle or heat pump mode to provide heat.

Plenum: an enclosure that is part of the air-handling system and is distinguished by having a very low air velocity. A plenum often is formed in part or in total by portions of the building.

Private driveways, walkways, and parking lots: exterior transit areas that are associated with a commercial or residential building and intended for use solely by the employees or tenants and not by the general public.

Process energy: energy consumed in support of a manufacturing, industrial, or commercial process other than the maintenance of comfort and amenities for the occupants of a building.

Process load: the calculated or measured time-integrated load on a building resulting from the consumption or release of process energy.

Programmable: capable of being preset to certain conditions and having self-initiation to change to those conditions.

Projection factor: the exterior horizontal shading projection depth divided by the sum of the height of the fenestration and the distance from the top of the fenestration to the bottom of the external shading projection in units consistent with the projection depth.

Prototype building: a generic building design of the same size and occupancy type as the proposed design that complies with the prescriptive requirements of subpart D of this part and has prescribed assumptions used to generate the energy budget concerning shape, orientation, and HVAC and other system designs.

Public driveways, walkways, and parking lots: exterior transit areas that are intended for use by the general public.

Public facility restroom: a restroom used by the transient public.

Readily accessible: capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc. (See also accessible.)

Recooling: lowering the temperature of air that has been previously heated by a heating system.
Reference building: a specific building design that has the same form, orientation, and basic systems as the prospective design that is to be evaluated for compliance and meets all the criteria listed in subsection 501.2 or subsection 601.2.

Reheating: raising the temperature of air that has been previously cooled either by refrigeration or an economizer system.

Reset: adjustment of the controller setpoint to a higher or lower value automatically or manually.

Roof: those portions of the building envelope, including all opaque surfaces, fenestration, doors, and hatches, that are above conditioned space and are horizontal or tilted at less than 60° from horizontal. (See also “walls”)

Room air conditioner: an encased assembly designed as a unit to be mounted in a window or through a wall or as a console. It is designed primarily to provide free delivery of conditioned air to an enclosed space, room, or zone. It includes a prime source of refrigeration for cooling and dehumidification and means for circulating and cleaning air and may also include means for ventilating and heating.

Seasonal energy efficiency ratio (SEER): the total cooling output of an air conditioner during its normal annual usage period for cooling, in Btu, divided by the total electric energy input during the same period, in watt-hours.

Service systems: all energy-using or energy-distributing components in a building that are operated to support the occupant or process functions housed therein (including HVAC, service water heating, illumination, transportation, cooking or food preparation, laundering, or similar functions).

Service water heating: the supply of hot water for purposes other than comfort heating and process requirements.

Shading coefficient (SC): the ratio of solar heat gain through fenestration under a specific set of conditions, with or without integral shading devices, to that occurring through unshaded ⅛-in-thick clear double-strength glass under the same conditions.

Shell Building: a building for which the envelope is designed, constructed, or both prior to knowing the occupancy type. (See also “speculative building”)

Single-Line Diagram: a simplified schematic drawing that shows the connection between two or more items. Common multiple connections are shown as one line.

Skylight: glazing that is horizontal or tilted less than 60° from horizontal.

Solar energy source: natural daylighting or thermal, chemical, or electrical energy derived from direct conversion of incident solar radiation at the building site.

Solar heat gain coefficient (SHGC): the ratio of the solar heat gain entering the space through the fenestration area to the incident solar radiation. Solar heat gain includes directly transmitted solar heat and absorbed solar radiation, which is then reradiated, conducted, or convected into the space. (See fenestration area)

Speculative building: a building for which the envelope is designed, constructed, or both prior to the design of the lighting, HVAC systems, or both. A speculative building differs from a shell building in that the intended occupancy is known for the speculative building. (See also “shell building”)

System: a combination of equipment and/or controls, accessories, interconnecting means, and terminal elements by which energy is transformed so as to perform a specific function, such as HVAC, service water heating, or illumination.

Tandem wiring: pairs of luminaries operating with lamps in each luminaire powered from a single ballast contained in one of the luminaires.

Task lighting: lighting that provides illumination for specific functions and is directed to a specific surface or area.

Task location: an area of the space where significant visual functions are performed and where lighting is required above and beyond that required for general ambient use.

Terminal element: a device by which the transformed energy from a system is finally delivered. Examples include registers, diffusers, lighting fixtures, and faucets.

Thermal conductance (C): the constant time rate of heat flow through the unit.
area of a body induced by a unit temperature difference between the surfaces, expressed in Btu/(h·ft²·°F). It is the reciprocal of thermal resistance. (See "thermal resistance")

Thermal mass: materials with mass heat capacity and surface area capable of affecting building loads by storing and releasing heat as the interior or exterior temperature and radiant conditions fluctuate. (See also “heat capacity” and “wall heat capacity”)

Thermal mass wall insulation position:
(1) Exterior insulation position: a wall having all or nearly all of its mass exposed to the room air with the insulation on the exterior of that mass.
(2) Integral insulation position: a wall having mass exposed to both room and outside (outside) air with substantially equal amounts of mass on the inside and outside of the insulation layer.
(3) Interior insulation position: a wall not meeting either of the above definitions, particularly a wall having most of its mass external to an insulation layer.

Thermal resistance (R): the reciprocal of thermal conductance 1/C, l/H, 1/U; expressed in (h·ft²·°F)/Btu.

Thermal transmittance (U): the overall coefficient of heat transfer from air to air. It is the time rate of heat flow per unit area under steady conditions from the fluid on the warm side of the barrier to the fluid on the cold side, per unit temperature difference between the two fluids, expressed in Btu/(h·ft²·°F).

Thermal transmittance, overall (U₀): the gross overall (area weighted average) coefficient of heat transfer from air to air for a gross area of the building envelope, Btu/(h·ft²·°F). The U₀ value applies to the combined effect of the time rate of heat flows through the various parallel paths, such as windows, doors, and opaque construction areas, composing the gross area of one or more building envelope components, such as walls, floors, and roof or ceiling.

Thermostat: an automatic control device responsive to temperature.

Unconditioned space: space within a building that is not a conditioned space. (See “conditioned space”)

Unitary cooling equipment: one or more factory-made assemblies that normally include an evaporator or cooling coil, a compressor, and a condenser combination (and may also include a heating function).

Unitary heat pump: one or more factory-made assemblies that normally include an indoor conditioning coil, compressor(s), and outdoor coil or refrigerant-to-water heater exchanger, including means to provide both heating and cooling functions.

Variable-air-volume (VAV) HVAC system: HVAC systems that control the dry-bulb temperature within a space by varying the volume of heated or cooled supply air to the space.

Vent damper: a device intended for installation in the venting system, in the outlet of or downstream of the appliance draft hood, of an individual automatically operating gas-fired appliance, which is designed to automatically open the venting system when the appliance is in operation and to automatically close off the venting system when the appliance is in a standby or shutdown condition.

Ventilation: the process of supplying or removing air by natural or mechanical means to or from any space. Such air may or may not have been conditioned.

Ventilation air: that portion of supply air which comes from the outside, plus any recirculated air, to maintain the desired quality of air within a designated space. (See also “outdoor air”)

Visible light transmittance: the fraction of solar radiation in the visible light spectrum that passes through the fenestration (window, clerestory, or skylight).

Walls: those portions of the building envelope enclosing conditioned space, including all opaque surfaces, fenestration, and doors, which are vertical or tilted at an angle of 60° from horizontal or greater. (See also “roof”)

Wall heat capacity: the sum of the products of the mass of each individual material in the wall per unit area of wall surface times its individual specific heat, expressed in Btu/(ft²·°F). (See “thermal mass”)

Window to wall ratio (WWR): the ratio of the wall fenestration area to the gross exterior wall area.
Zone: a space or group of spaces within a building with any combination of heating, cooling, or lighting requirements sufficiently similar so that desired conditions can be maintained throughout by a single controlling device.

Subpart C—Design Conditions
§ 434.301 Design criteria.
301.1 The following design parameters shall be used for calculations required under subpart D of this part.
301.1.1 Exterior Design Conditions. Exterior Design Conditions shall be expressed in accordance with Table 301.1.

<table>
<thead>
<tr>
<th>Winter Design Dry-Bulb (99%)</th>
<th>Degrees F.</th>
</tr>
</thead>

301.2 Indoor Design Conditions. Indoor design temperature and humidity conditions shall be in accordance with the comfort criteria in RS–2 (incorporated by reference, see §434.701), except that humidification and dehumidification are not required.

Subpart D—Building Design Requirements—Electric Systems and Equipment
§ 434.401 Electrical power and lighting systems.
Electrical power and lighting systems, other than those systems or portions thereof required for emergency use only, shall meet these requirements.
401.1 Electrical Distribution Systems.
401.1.1 Check Metering. Single-tenant buildings with a service over 250 kVA and tenant spaces with a connected load over 100 kVA in multiple-tenant buildings shall have provisions for check metering of electrical consumption. The electrical power feeders for which provision for check metering is required shall be subdivided as follows:

401.1.1.1 Lighting and receptacle outlets
401.1.1.2 HVAC systems and equipment
401.1.1.3 Service water heating (SWH), elevators, and special occupant equipment or systems of more than 20 kW.
401.1.1.4 Exception to 401.1.1 through 401.1.3: 10 percent or less of the loads on a feeder may be from another usage or category.
401.1.2 Tenant-shared HVAC and service hot water systems in multiple tenant buildings shall have provision to be separately check metered.
401.1.3 Subdivided feeders shall contain provisions for portable or permanent check metering. The minimum acceptable arrangement for compliance shall provide a safe method for access by qualified persons to the enclosures through which feeder conductors pass and provide sufficient space to attach clamp-on or split core current transformers. These enclosures may be separate compartments or combined spaces with electrical cabinets serving another function. Dedicated enclosures so furnished shall be identified as to measuring function available.
401.1.4 Electrical Schematic. The person responsible for installing the electrical distribution system shall provide
§ 434.401 10 CFR Ch. II (1–1–08 Edition)

the Federal building manager a single-line diagram of the record drawing for the electrical distribution system, which includes the location of check metering access, schematic diagrams of non-HVAC electrical control systems, and electrical equipment manufacturer's operating and maintenance literature.

401.2 Electric Motors. All permanently wired polyphase motors of 1 hp or more shall meet these requirements:

401.2.1 Efficiency. NEMA design A & B squirrel-cage, foot-mounted, T-frame induction motors having synchronous speeds of 3600, 1800, 1200, and 900 rpm, expected to operate more than 1000 hours per year shall have a nominal full-load efficiency no less than that shown in Table 401.2.1 or shall be classified as an “energy efficient motor” in accordance with RS–3 (incorporated by reference, see §434.701). The following are not covered:

(a) Multispeed motors used in systems designed to use more than one speed.

(b) Motors used as a component of the equipment meeting the minimum equipment efficiency requirements of subsection 403, provided that the motor input is included when determining the equipment efficiency.

1 For many applications, efficiencies greater than those listed are likely to be cost-effective. Guidance for evaluating the cost effectiveness of energy efficient motor applications is given in RS–43 and RS–44 (incorporated by reference, see § 434.701).

401.3 Lighting Power Allowance. The lighting system shall meet the provisions of subsections 401.3.1 through 401.3.5.

401.3.1 Building Exteriors. The total connected exterior lighting power for the building, or a facility containing multiple buildings, shall not exceed the total exterior lighting power allowance, which is the sum of the individual allowances determined from Table 401.3.1. The individual allowances are determined by multiplying the specific area or length of each area description times the allowance for that area. Exceptions are as follows: Lighting for outdoor manufacturing or processing facilities, commercial greenhouses, outdoor athletic facilities, public monuments, designated high-risk security areas, signs, retail storefronts, exterior enclosed display windows, and lighting specifically required by local ordinances and regulations.

401.3.1.1 Trade-offs of exterior lighting budgets among exterior areas shall be allowed provided the total connected lighting power of the exterior area does not exceed the exterior lighting power allowance. Trade-offs between interior lighting power allowances and exterior lighting power allowances shall not be allowed.

401.3.2 Building interiors. The total connected interior lighting power for a building, including adjustments in accordance with subsection 401.3.3, shall not exceed the total interior lighting power allowance explained in this paragraph. Using Table 401.3.2a, multiply the interior lighting power allowance value by the gross lighted area of the most appropriate building or space activity. For multi-use buildings, using Table 401.3.2a, select the interior power allowance value for each activity using the column for the gross lighted area of the whole building and multiply it by the associated gross area for that activity. The interior lighting power allowance is the sum of all the wattages for each area/activity. Using Table 401.3.2b, c, or d, multiply the interior lighting power allowance values of each individual area/activity by the area of the space and by the area factor from Figure 401.3.2e, based on the most appropriate area/activity provided. The
interior lighting power allowance is the sum of the wattages for each individual space. When over 20% of the building's tasks or interior areas are undefined, the most appropriate value for that building from Table 401.3.2a shall be used for the undefined spaces. Exceptions are as follows:

(a) Lighting power that is an essential technical element for the function performed in theatrical, stage, broadcasting, and similar uses.
(b) Specialized medical, dental, and research lighting.
(c) Display lighting for exhibits in galleries, museums, and monuments.
(d) Lighting solely for indoor plant growth (between the hours of 10:00 pm and 6:00 am).
(e) Emergency lighting that is automatically off during normal building operation.
(f) High-risk security areas.
(g) Spaces specifically designed for the primary use by the physically impaired or aged.
(h) Lighting in dwelling units.

401.3.2.1 Trade-offs of the interior lighting power budgets among interior spaces shall be allowed provided the total connected lighting power within the building does not exceed the interior lighting power allowance. Trade-offs between interior lighting power allowances and exterior lighting power allowances shall not be allowed.

401.3.2.2 Building Space Activities. Definitions of buildings/space activity as they apply to Table 401.3.2a are as follows. These definitions are necessary to characterize the activities for which lighting is provided. They are applicable only to Table 401.3.2a. They are not intended to be used elsewhere in place of building use group definitions provided in the Building Code. They are not included in §434.201, "Definitions," to avoid confusion with "Occupancy Type Categories."

(a) Food service, fast food, and cafeteria: This group includes cafeterias, hamburger and sandwich stores, bakeries, ice cream parlors, cookie stores, and all other kinds of retail food service establishments in which customers are generally served at a counter and their direct selections are paid for and taken to a table or carried out.

(b) Garages: This category includes all types of parking garages, except for service or repair areas.
(c) Leisure dining and bar: This group includes cafes, diners, bars, lounges, and similar establishments where orders are placed with a wait person.
(d) Mail concourse, multi-store service: This group includes the interior of multifunctional public spaces, such as shopping center malls, airports, resort concourses and malls, entertainment facilities, and related types of buildings or spaces.
(e) Offices: This group includes all kinds of offices, including corporate and professional offices, office/labatories, governmental offices, libraries, and similar facilities, where paperwork occurs.
(f) Retail: A retail store, including departments for the sale of accessories, clothing, dry goods, electronics, and toys, and other types of establishments that display objects for direct selection and purchase by consumers. Direct selection means literally removing an item from display and carrying it to the checkout or pick-up at a customer service facility.
(g) Schools: This category, subdivided by pre-school/elementary, junior high/high school, and technical/vocational, includes public and private educational institutions, for children or adults, and may also include community centers, college and university buildings, and business educational centers.
(h) Service establishment: A retail-like facility, such as watch repair, real estate offices, auto and tire service facilities, parts departments, travel agencies and similar facilities, in which the customer obtains services rather than the direct selection of goods.
(i) Warehouse and storage: This includes all types of support facilities, such as warehouses, barns, storage buildings, shipping/receiving buildings, boiler or mechanical buildings, electric power buildings, and similar buildings where the primary visual task is large items.

Office Category 3:

- Open plan offices 900 ft² or larger w/partitions higher than 3.5 ft below the ceiling.
- Offices less than 900 ft² shall use category 1.

Office Category 3:

- Drafting
- Accounting
- Reading, Typing and Filing

Common Activity Areas

- Conference/Meeting Room
- Computer/Office Equipment
- Filing, Inactive
- Shop (Non-Industrial): Machinery
- Electrical/Electronic
- Painting
- Carpentry
- Welding
- Storage and Warehouse: Inactive Storage
- Active Storage, Bulky
- Active Storage, Fine
- Material Handling

Unlisted Space

- Use a weighted average UPD in rooms with multiple simultaneous activities, weighted in proportion to the area served.
- A 1.5 power adjustment factor is applicable for multi-function spaces when a supplementary system having independent controls is installed that has installed power < 33% of the adjusted lighting power for that space.
- This factor of 1.0 shall be used for these spaces.
- UPD includes lighting power required for clean-up purposes.
- Area factor shall not exceed 1.55.
- Not less than 90 percent of all work stations shall be individually enclosed with partitions of at least the height described.

1. Area factor of 1.0 shall be used for these spaces.
2. Consider as 10 ft. beyond playing boundaries but less than or equal to the total floor area of the sports space minus spectator seating area.

**Figure 401.3.2e—Area Factor Formula**

\[
\text{Area Factor Formula:}
\]

\[
\text{Area Factor (AF) = 0.2 + 0.8(1/0.9)}
\]

Where:
- AF = area factor,
- CH = ceiling height (ft),
- Ar = space area (ft²).

If AF < 1.0 use 1.0; if AF > 1.8 use 1.8

#### 401.3.3 Lighting Power Control Credits.

The interior connected lighting power determined in accordance with §434.401.3.2 can be decreased for luminaries that are automatically controlled for occupancy, daylight, lumen maintenance, or programmable timing. The adjusted interior connected lighting power shall be determined by subtracting the sum of all lighting power control credits from the interior connected lighting power. Using Table 401.3.3, the lighting power control credit equals the power adjustment factor times the connected lighting power of the controlled lighting. The lighting power adjustment shall be applied with the following limitations:

(a) It is limited to the specific area controlled by the automatic control device.
(b) Only one lighting power adjustment may be used for each building space or luminaire, and 50 percent or more of the controlled luminaire shall be within the applicable space.
(c) Controls shall be installed in series with the lights and in series with all manual switching devices.
(d) When sufficient daylight is available, daylight sensing controls shall be capable of reducing electrical power consumption for lighting (continuously or in steps) to 50 percent or less of maximum power consumption.
(e) Daylight sensing controls shall control all luminaires to which the adjustment is applied and that direct a minimum of 50 percent of their light output into the daylight zone.
(f) Programmable timing controls shall be able to program different schedules for occupied and unoccupied days, be readily accessible for temporary override with automatic return to the original schedule, and keep time during power outages for at least four hours.

**TABLE 401.3.3—LIGHTING POWER ADJUSTMENT FACTORS**

<th>PAF</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Daylight Sensing controls (DS), continuous dimming</td>
<td>0.30</td>
</tr>
</tbody>
</table>
401.3.4 Lighting controls.

401.3.4.1 Type of Lighting Controls. All lighting systems shall have controls, with the exception of emergency use or exit lighting.

401.3.4.2 Number of Manual Controls. Spaces enclosed by walls or ceiling-high partitions shall have a minimum of one manual control (on/off switch) for lighting in that space. Additional manual controls shall be provided for each task location or for each group of task locations within an area of 450 ft² or less. For spaces with only one lighting fixture or with a single ballast, one manual control is required. Exceptions are as follows:

401.3.4.2.1 Continuous lighting for security;

401.3.4.2.2 Systems in which occupancy sensors, local programmable timers, or three-level (including OFF) step controls or preset dimming controls are substituted for manual controls at the rate of one for every two required manual controls, providing at least one control is installed for every 1500 watts of power.

401.3.4.2.3 Systems in which four-level (including OFF) step controls or preset dimming controls or automatic or continuous dimming controls are substituted for manual controls at a rate of one for every three required manual controls, providing at least one control is installed for every 1500 watts of power.

401.3.4.2.4 Spaces that must be used as a whole, such as public lobbies, retail stores, warehouses, and storerooms.

401.3.4.3 Multiple Location Controls. Manual controls that operate the same load from multiple locations must be counted as one manual control.

401.3.4.4 Control Accessibility. Lighting controls shall be readily accessible from within the space controlled. Exceptions are as follows: Controls for spaces that are to be used as a whole, automatic controls, programmable controls, controls requiring trained operators, and controls for safety hazards and security.

401.3.4.5 Hotel and Motel Guest Room Control. Hotel and motel guest rooms and suites shall have at least one master switch at the main entry door that controls all permanently wired lighting fixtures and switched receptacles excluding bathrooms. The following exception applies: Where switches are provided at the entry to each room of a multiple-room suite.

401.3.4.6 Switching of Exterior Lighting. Exterior lighting not intended for 24-hour use shall be automatically switched by either timer or photocell or a combination of timer and photocell. When used, timers shall be capable of seven-day and seasonal daylight schedule adjustment and have power backup for at least four hours.

401.3.5 Ballasts.
401.3.5.1 Tandem Wiring. One-lamp or three-lamp fluorescent luminaries that are recess mounted within 10 ft center-to-center of each other, or pendant mounted, or surface mounted within 1 ft of each other, and within the same room, shall be tandem wired, unless three-lamp ballasts are used.

401.3.5.2 Power Factor. All ballasts shall have a power factor of at least 90%, with the exception of dimming ballasts, and ballasts for circline and compact fluorescent lamps and low wattage high intensity discharge (HID) lamps not over 100 W.

§ 434.402 Building envelope assemblies and materials.

The building envelope and its associated assemblies and materials shall meet the provisions of this section.

402.1 Calculations and Supporting Information.

402.1.1 Material Properties. Information on thermal properties, building envelope system performance, and component heat transfer shall be obtained from RS–4. When the information is not available from RS–4, (incorporated by reference, see § 434.701) the data shall be obtained from manufacturer’s information or laboratory or field test measurements using RS–5, RS–6, RS–7, or RS–8 (incorporated by reference, see § 434.701).

402.1.1.1 The shading coefficient (SC) for fenestration shall be obtained from RS–4 (incorporated by reference, see § 434.701) or from manufacturer’s test data. The shading coefficient of the fenestration, including both internal and external shading devices, is SCX and excludes the effect of external shading projections, which are calculated separately. The shading coefficient used for louvered shade screens shall be determined using a profile angle of 30 degrees as found in Table 41, Chapter 27 of RS–4 (incorporated by reference, see § 434.701).

402.1.2 Thermal Performance Calculations. The overall thermal transmittance of the building envelope shall be calculated in accordance with Equation 402.1.2:

\[ U_o = \sum \frac{U_i A_i}{A_o} = \left( \frac{U_1 A_1}{A_o} + \frac{U_2 A_2}{A_o} + \ldots + \frac{U_n A_n}{A_o} \right) A_o \]  

(402.1.2)

Where:

\( U_o \) = the area-weighted average thermal transmittance of the gross area of the building envelope; i.e., the exterior wall assembly including fenestration and doors, the roof and ceiling assembly, and the floor assembly, Btu/(h·ft²·°F)

\( A_o \) = the gross area of the building envelope, ft²

\( U_i \) = the thermal transmittance of each individual path of the building envelope, i.e., the opaque portion or the fenestration, Btu/(h·ft²·°F)

\( A_i \) = the area of each individual element of the building envelope, ft²

The thermal transmittance of opaque elements of assemblies shall be determined using a series path procedure with corrections for the presence of parallel paths within an element of the envelope assembly (such as wall cavities with parallel paths through insulation and studs). The thermal performance of adjacent ground in below-grade applications shall be excluded from all thermal calculations.

402.1.2.1 Envelope Assemblies Containing Metal Framing. The thermal transmittance of the envelope assembly containing metal framing shall be determined from one of three methods:

(a) Laboratory or field test measurements based on RS–5, RS–6, RS–7, or RS–8 (incorporated by reference, see § 434.701).

(b) The zone method described in Chapter 22 of RS–4 (incorporated by reference, see § 434.701) and the formulas on page 22.10.
(c) For metal roof trusses or metal studs covered by Tables 402.1.2.1a and b, the total resistance of the series path shall be calculated in accordance with the following Equations:

\[ U_i = \frac{1}{R_i} \quad \text{Equation 402.1.2.1a} \]

\[ R_i = R_t + R_e \]

Where:
- \( R_t \) = the total resistance of the envelope assembly
- \( R_i \) = the resistance of the series elements (for \( i = 1 \) to \( n \)) excluding the parallel path element(s)
- \( R_e \) = the equivalent resistance of the element containing the parallel path (R-value of insulation \( \times F_c \)). Values for \( F_c \) and equivalent resistances shall be taken from Tables 402.1.2.1a or b.

402.1.2.2 Envelope Assemblies Containing Nonmetal Framing. The thermal transmittance of the envelope assembly shall be determined from laboratory or field test measurements based on RS-5, RS-6, RS-7, or RS-8 (incorporated by reference, see §434.701) or from the series-parallel (isothermal planes) method provided in page 23.2 of Chapter 23 of RS-4 (incorporated by reference, see §434.701).

402.1.2.3 Metal Buildings. For elements with internal metallic structures bonded on one or both sides to a metal skin or covering, the calculation procedure specified in RS-9 (incorporated by reference, see §434.701) shall be used.

402.1.2.4 Fenestration Assemblies. Determine the overall thermal transmittance of fenestration assemblies in accordance with RS-18 and RS-19 (incorporated by reference, see §434.701) or by calculation. Calculation of the overall thermal transmittance of fenestration assemblies shall consider the center-of-glass, edge-of-glass, and frame components.

(a) The following equation 402.1.2.4a shall be used.
§ 434.402  
10 CFR Ch. II (1–1–08 Edition)

\[ U_{ir} = \left[ \sum_{i=1}^{n} \left( U_{g1} A_{g1} + U_{g2} A_{g2} + U_{g3} A_{g3} + U_{f} A_{f} \right) \right] / \left[ \sum A_{g1} A_{g2} A_{g3} A_{f} \right] \]

\[ = \left[ U_{g1} A_{g1} + U_{g2} A_{g2} + U_{g3} A_{g3} + U_{g4} A_{g4} + U_{g5} A_{g5} + U_{g6} A_{g6} + U_{g7} A_{g7} + U_{g8} A_{g8} + U_{g9} A_{g9} + U_{f} A_{f} \right] / \left[ A_{g1} A_{g2} A_{g3} A_{g4} A_{g5} A_{g6} A_{g7} A_{g8} A_{g9} A_{f} \right] \]

Equation 402.1.2.4a

Where:

- \( U_{ir} \) = the overall thermal transmittance of the fenestration assemblies, including the center-of-glass, edge-of-glass, and frame components, Btu/(h·ft²·°F)
- \( i \) = numerical subscript (1, 2, . . .n) refers to each of the various fenestration types present in the wall
- \( n \) = the number of fenestration assemblies in the wall assembly
- \( U_{ir} \) = the thermal transmittance of the center-of-glass area, Btu/(h·ft²·°F)
- \( A_{ir} \) = the center of glass area, that is the overall visible glass area minus the edge-of-glass area, ft²
- \( U_{ir} \) = the thermal transmittance of the edge of the visible glass area including the effects of spacers in multiple glazed units, Btu/(h·ft²·°F)
- \( A_{ir} \) = the edge of the visible glass area, that is the 2.5 in. perimeter band adjacent to the frame, ft²
- \( U_{ir} \) = the thermal transmittance of the frame area, Btu/(h·ft²·°F)
- \( A_{ir} \) = the frame area that is the overall area of the entire glazing product minus the center-of-glass area and minus the edge-of-glass area, ft²

(b) Values of \( U_{ir} \) shall be based on one of the following methods:

1. Results from laboratory test of center-of-glass, edge-of-glass, and frame assemblies tested as a unit at winter conditions. One of the procedures in Section 8.3.2 of RS–1 (incorporated by reference, see §434.701) shall be used.

2. Overall generic product C (commercial) in Table 13, Chapter 27, of the RS–4 (incorporated by reference, see §434.701). The generic product C in Table 13, Chapter 27, is based on a product of 24 ft². Larger units will produce lower \( U \)-values and thus it is recommended to use the calculation procedure detailed in Equation 402.1.2.4a.

3. Calculations based on the actual area for center-of-glass, edge-of-glass, and frame assemblies and on the thermal transmittance of components derived from 402.1.2.4a, 402.1.2.4b or a combination of the two.

402.1.3 Gross Areas of Envelope Components.

402.1.3.1 Roof Assembly. The gross area of a roof assembly shall consist of the total surface of the roof assembly exposed to outside air or unconditioned spaces and is measured from the exterior faces of exterior walls and centerline of walls separating buildings. The roof assembly includes all roof or ceiling components through which heat may flow between indoor and outdoor environments, including skylight surfaces but excluding service openings. For thermal transmittance purposes when return air ceiling plenums are employed, the roof or ceiling assembly shall not include the resistance of the ceiling or the plenum space as part of the total resistance of the assembly.

402.1.3.2 Floor Assembly. The gross area of a floor assembly over outside or unconditioned spaces shall consist of the total surface of the floor assembly exposed to outside air or unconditioned space and is measured from the exterior face of exterior walls and centerline of walls separating buildings. The floor assembly shall include all floor components through which heat may flow between indoor and outdoor or unconditioned space environments.

402.1.3.3 Wall Assembly. The gross area of exterior walls enclosing a heated or cooled space is measured on the exterior and consists of the opaque
402.2 Air Leakage and Moisture Mitigation. The requirements of this section shall apply only to those building components that separate interior building conditioned space from the outdoors or from unconditioned space or crawl spaces. Compliance with the criteria for air leakage through building components shall be determined by tests conducted in accordance with RS-10 (incorporated by reference, see §434.701).

402.2.1 Air Barrier System. A barrier against leakage shall be installed to prevent the leakage of air through the building envelope according to the following requirements:

(a) The air barrier shall be continuous at all plumbing and heating penetrations of the building opaque wall.

(b) The air barrier shall be sealed at all penetrations of the opaque building wall for electrical and telecommunications equipment.

NOTE: [The "Maximum Allowable Infiltration Rates" are from current standards to allow the use of available products.]

* Incorporated by reference, see §434.701.

402.2.2 Building Envelope. The following areas of the building envelope shall be sealed, caulked, gasketed, or weatherstripped to limit air leakage:

(a) Intersections of the fenestration and door frames with the opaque wall sections.
(b) Openings between walls and foundations, between walls and roof and wall panels.
(c) Openings at penetrations of utility service through, roofs, walls, and floors.
(d) Site built fenestration and doors.
(e) All other openings in the building envelope.

Exceptions are as follows: Outside air intakes, exhaust outlets, relief outlets, stair shaft, elevator shaft smoke relief openings, and other similar elements shall comply with subsection 403.

402.2.2.1 Fenestration and Doors Fenestration and doors shall meet the requirements of Table 402.2.1.

402.2.2.2 Building Assemblies Used as Ducts or Plenums. Building assemblies used as ducts or plenums shall be sealed, caulked, and gasketed to limit air leakage.

402.2.2.3 Vestibules. A door that separates conditioned space from the exterior shall be equipped with an enclosed vestibule with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be

499
§ 434.402
10 CFR Ch. II (1–1–08 Edition)

designed so that in passing through the vestibule, it is not necessary for the interior and exterior doors to open at the same time. Exceptions are as follows: Exterior doors need not be protected with a vestibule where:

(a) The door is a revolving door.
(b) The door is used primarily to facilitate vehicular movement or material handling.
(c) The door is not intended to be used as a general entrance door.
(d) The door opens directly from a dwelling unit.
(e) The door opens directly from a retail space less than 2,000 ft² in area, or from a space less than 1,500 ft² for other uses.
(f) In buildings less than three stories in building height in regions that have less than 6,300 heating degree days base 65°F.

402.2.2.4 Compliance Testing. All buildings shall be tested after completion using the methodology in RS–11, (incorporated by reference, see §434.701) or an equivalent approved method to determine the envelope air leakage. A standard blower door test is an acceptable technique to pressurize the building if the building is 5,000 ft² or less in area. The building's air handling system can be used to pressurize the building if the building is larger than 5,000 ft². The following test conditions shall be:

(a) The measured envelope air leakage shall not exceed 1.57 pounds per square foot of wall area at a pressure difference of 0.3 inches water.
(b) At the time of testing, all windows and outside doors shall be installed and closed, all interior doors shall be open, and all air handlers and dampers shall be operable. The building shall be unoccupied.
(c) During the testing period, the average wind speed during the test shall be less than 6.6 feet per second, the average outside temperature greater than 59°F, and the average inside-outside temperature difference is less than 41°F.

402.2.2.5 Moisture Migration. The building envelope shall be designed to limit moisture migration that leads to deterioration in insulation or equipment performance as determined by the following construction practices:

(a) A vapor retarder shall be installed to retard, or slow down the rate of water vapor diffusion through the building envelope. The position of the vapor retarder shall be determined taking into account local climate and indoor humidity levels. The methodologies presented in Chapter 20 of RS–4 (incorporated by reference, see §434.701) shall be used to determine temperature and water vapor profiles through the envelope systems to assess the potential for condensation within the envelope and to determine the position of the vapor retarder within the envelope system.
(b) The vapor retarder shall be installed over the entire building envelope.
(c) The perm rating requirements of the vapor retarder shall be determined using the methodologies contained in Chapter 20 of RS–4, (incorporated by reference, see §434.701) and shall take into account local climate and indoor humidity level. The vapor retarder shall have a performance rating of 1 perm or less.

402.3 Thermal Performance Criteria.
402.3.1 Roofs; Floors and Walls Adjacent to Unconditioned Spaces. The area weighted average thermal transmittance of roofs and also of floors and walls adjacent to unconditioned spaces shall not exceed the criteria in Table 402.3.1a. Exceptions are as follows: Skylights for which daylight credit is taken may be excluded from the calculations of the roof assembly Uₐ if all of the following conditions are met:

(a) The opaque roof thermal transmittance is less than the criteria in Table 402.3.1b.
(b) Skylight areas, including framing, as a percentage of the roof area do not exceed the values specified in Table 402.3.1b. The maximum skylight area from Table 402.3.1b may be increased by 50% if a shading device is used that blocks over 50% of the solar gain during the peak cooling design condition. For shell buildings, the permitted skylight area shall be based on a light level of 30 foot candles and a lighting power density (L.P.D) of less than 1.0 w/ ft². For speculative buildings, the permitted skylight area shall be based on the unit lighting power allowance from Table 402.3.2a and an illuminance level.
as follows: for LPD < 1.0, use 30 foot-candles; for 1.0 < LPD ≤ 2.5, use 50 foot-candles; and for LPD ≥ 2.5, use 70 foot-candles.

(c) All electric lighting fixtures within daylit zones under skylights are controlled by automatic daylighting controls.

(d) The U-value of the skylight assembly including framing does not exceed 0.70 Btu/(h·ft²·°F) for ≤ 8000 HDD65 and 0.45 for >8000 HDD65 or both if the jurisdiction includes cities that are both below and above 8000 HDD65.

(e) Skylight curb U-value does not exceed 0.21 Btu/(h·ft²·°F).

(f) The infiltration coefficient of the skylights does not exceed 0.05 cfm/ft².

402.4.3.2 Blow-Grade Walls and Slabs-on-Grade. The thermal resistance (R-value) of insulation for slabs-on-grade, or the overall thermal resistance of walls in contact with the earth, shall be equal to or greater than the values in Table 402.3.2.

402.4.4 Exterior Walls. Exterior walls shall comply with either 402.4.1 or 402.4.2.

402.4.1 Prescriptive Criteria. (a) The exterior wall shall be designed in accordance with subsections 402.4.1.1 and 402.4.1.2. When the internal load density range is not known, the 0–1.50 W/ft² range shall be used for residential, hotel/motel guest rooms, or warehouse occupancies; the 3.01–3.50 W/ft² range shall be used for retail stores smaller than 2,000 ft² and technical and vocational schools smaller than 10,000 ft²; and the 1.51–3.00 W/ft² range shall be used for all other occupancies and building sizes. When the building envelope is designed or constructed prior to knowing the building occupancy type, an internal load density of 1.5 W/ft² shall be used. [Use 3.0 W/ft² for HDD65 <3000, 2.25 W/ft² for 3000 < HDD65 < 6000, and 1.5 W/ft² for HDD65 > 6000.]

(b) When more than one condition exists, area weighted averages shall be used. This requirement shall apply to all thermal transmittances, shading coefficients, projection factors, and internal load densities rounded to the same number of decimal places as shown in the respective table.

402.4.1.1 Opaque Walls. The weighted average thermal transmittance (U-value) of opaque wall elements shall be less than the values in Table 402.4.1.1. For mass walls (HC ≥ 5), criteria are presented for low and high window/wall ratios and the criteria shall be determined by interpolating between these values for the window/wall ratio of the building.

402.4.1.2 Fenestration. The design of the fenestration shall meet the criteria of Table 402.4.1.2. When the fenestration columns labeled “Perimeter Daylighting” are used, automatic daylighting controls shall be installed in the perimeter daylit zones of the building. These daylighting controls shall be capable of reducing electric lighting power to at least 50% of full power. Only those shading or lighting controls for perimeter daylighting that are shown on the plans shall be considered. The column labeled “VLT > = SC” shall be used only when the shading coefficient of the glass is less than its visible light transmittance.

APPENDIX A
402.4.2 System Performance Criteria. The cumulative annual energy flux attributable to thermal transmittance and solar gains shall be less than the criteria determined using the ENVSTD24 computer program in Standard 90.1–1989, or the equations in RS–1, (incorporated by reference, see §434.701) Attachment 8–B. The cumulative annual energy flux shall be calculated using the ENVSTD24 computer program or the equations in RS–1, (incorporated by reference, see §434.701) Attachment 8–B.
402.4.2.1 Equipment Power Density (EQUIP). The equipment power density used in the ENVSTD24 computer program shall use the actual equipment power density from the building plans and specifications or be taken from Table 402.4.2 using the column titled “Default Adjusted Equipment Power Density” or calculated for the building using the procedures of RS–1 (incorporated by reference, see §434.701). The program limits consideration of the equipment power density to a maximum of 1 W/ft².

402.4.2.2 Lighting Power Density (LIGHTS). The lighting power density used in the ENVSTD24 computer program shall use the actual lighting power density from the building plans and specifications or the appropriate value from Tables 401.3.2a, b, c, or d.

402.4.2.3 Daylighting Control Credit Fraction (DLCF). When the daylighting control credit fraction is other than zero, automatic daylighting controls shall be installed in the appropriate perimeter zones(s) of the building to justify the credit.

§ 434.403 Building mechanical systems and equipment.

Mechanical systems and equipment used to provide heating, ventilating, and air conditioning functions as well as additional functions not related to space conditioning, such as, but not limited to, freeze protection in fire projection systems and water heating, shall meet the requirements of this section.

403.1 Mechanical Equipment Efficiency. When equipment shown in Tables 403.1a through 403.1f is used, it shall have a minimum performance at the specified rating conditions when tested in accordance with the specified reference standard. The reference standards listed in Tables 403.1a through 403.1f are incorporated by reference, see §434.701. Omission of minimum performance requirements for equipment not listed in Tables 403.1a through 403.1f does not preclude use of such equipment.

* Incorporation by reference, see § 434.701.

403.1.1 Where multiple rating conditions and/or performance requirements are provided, the equipment shall satisfy all stated requirements.

403.1.2 Equipment used to provide water heating functions as part of a combination integrated system shall satisfy all stated requirements for the appropriate space heating or cooling category.

403.1.3 The equipment efficiency shall be supported by data furnished by the manufacturer or shall be certified under a nationally recognized certification program or rating procedure.

403.1.4 Where components, such as indoor or outdoor coils, from different manufacturers are used, the system designer shall specify component efficiencies whose combined efficiency meets the standards herein.

403.2 HVAC Systems

403.2.1 Load Calculations. Heating and cooling systems design loads for the purpose of sizing systems and equipment shall be determined in accordance with the procedures described in RS-1 (incorporated by reference, see § 434.701) using the design parameters specified in subpart C of this part.
403.2.2 Equipment and System Sizing. Heating and cooling equipment and systems shall be sized to provide no more than the loads calculated in accordance with subsection 403.2.1. A single piece of equipment providing both heating and cooling must satisfy this provision for one function with the other function sized as small as possible to meet the load, within available equipment options. Exceptions are as follows:

(a) When the equipment selected is the smallest size needed to meet the load within available options of the desired equipment line.

(b) Standby equipment provided with controls and devices that allow such equipment to operate automatically only when the primary equipment is not operating.

(c) Multiple units of the same equipment type with combined capacities exceeding the design load and provided with controls that sequence or otherwise optimally control the operation of each unit based on load.

403.2.3 Separate Air Distribution System. Zones with special process temperature and/or humidity requirements shall be served by air distribution systems separate from those serving zones requiring only comfort conditions or shall include supplementary provisions so that the primary systems may be specifically controlled for comfort purposes only. Exceptions: Zones requiring only comfort heating or comfort cooling that are served by a system primarily used for process temperature and humidity control need not be served by a separate system if the total supply air to these comfort zones is no more than 25% of the total system supply air or the total conditioned floor area of the zones is less than 1000 ft².

403.2.4 Ventilation and Fan System Design. Ventilation systems shall be designed to be capable of reducing the supply of outdoor air to the minimum ventilation rates required by Section 6.1.3 of RS-41 (incorporated by reference, see §434.701) through the use of return ducts, manually or automatically operated control dampers, fan volume controls, or other devices. Exceptions are as follows: Minimum outdoor air rates may be greater if:

(a) Required to make up air exhausted for source control of contaminants such as in a fume hood.

(b) Required by process systems.

(c) Required to maintain a slightly positive building pressure. For this purpose, minimum outside air intake may be increased up to no greater than 0.30 air changes per hour in excess of exhaust quantities.

403.2.4.1 Ventilation controls for variable or high occupancy areas. Systems with design outside air capacities greater than 3,000 cfm serving areas having an average design occupancy density of 100 people per 1,000 ft² shall include means to automatically reduce outside air intake to the minimum values required by RS-41 (incorporated by reference, see §434.701) during unoccupied or low-occupancy periods. Outside air shall not be reduced below 0.14 cfm/ft². Outside air intake shall be controlled by one or more of the following:

(a) A clearly labeled, readily accessible bypass timer that may be used by occupants or operating personnel to temporarily increase minimum outside air flow up to design levels.

(b) A carbon dioxide (CO₂) control system having sensors located in the spaces served, or in the return air from the spaces served, capable of maintaining space CO₂ concentrations below levels recommended by the manufacturer, but no fewer than one sensor per 25,000 ft² of occupied space shall be provided.

(c) An automatic timeclock that can be programmed to maintain minimum outside air intake levels commensurate with scheduled occupancy levels.

(d) Spaces equipped with occupancy sensors.

403.2.4.2 Ventilation Controls for enclosed parking garages. Garage ventilation fan systems with a total design capacity greater than 30,000 cfm shall have automatic controls that stage fans or modulate fan volume as required to maintain carbon monoxide (CO) below levels recommended in RS-41.

403.2.4.3 Ventilation and Fan Power. The fan system energy demand of each HVAC system at design conditions shall not exceed 0.8 W/cfm of supply air for constant air volume systems and 1.25 W/cfm of supply air for variable-
§ 434.403 10 CFR Ch. II (1–1–08 Edition)

air-volume (VAV) systems. Fan system energy demand shall not include the additional power required by air treatment or filtering systems with pressure drops over 1 in. w.c. Individual VAV fans with motors 75 hp and larger shall include controls and devices necessary for the fan motor to demand no more than 30 percent of design wattage at 50 percent of design air volume, based on manufacturer’s test data. Exceptions are as follows:

(a) Systems with total fan system motor horsepower of 10 hp or less.
(b) Unitary equipment for which the energy used by the fan is considered in the efficiency ratings of subsection 403.1.

403.2.5 Pumping System Design. HVAC pumping systems used for comfort heating and/or comfort air conditioning that serve control valves designed to modulate or step open and closed as a function of load shall be designed for variable fluid flow and capable of reducing system flow to 50 percent of design flow or less. Exceptions are as follows:

(a) Systems where a minimum flow greater than 50% of the design flow is required for the proper operation of equipment served by the system, such as chillers.
(b) Systems that serve no more than one control valve.
(c) Systems with a total pump system horse power ≤ 10 hp.
(d) Systems that comply with subsection 403.2.6.8 without exception.

403.2.6 Temperature and Humidity Controls.

403.2.6.1 System Controls. Each heating and cooling system shall include at least one temperature control device.

403.2.6.2 Zone Controls. The supply of heating and cooling energy to each zone shall be controlled by individual thermostatic controls responding to temperature within the zone. For the purposes of this section, a dwelling unit is considered a zone. Exceptions are as follows: Independent perimeter systems that are designed to offset building envelope heat losses or gains or both may serve one or more zones also served by an interior system when the perimeter system includes at least one thermostatic control zone for each building exposure having exterior walls facing only one orientation for at least 50 contiguous ft and the perimeter system heating and cooling supply is controlled by thermostat(s) located within the zone(s) served by the system.

403.2.6.3 Zone Thermostatic Control Capabilities. Where used to control comfort heating, zone thermostatic controls shall be capable of being set locally or remotely by adjustment or selection of sensors down to 55°F or lower. Where used to control comfort cooling, zone thermostatic controls shall be capable of being set locally or remotely by adjustment or selection of sensors up to 85°F or higher. Where used to control both comfort heating and cooling, zone thermostatic controls shall be capable of providing a temperature range or deadband of at least 5°F within which the supply of heating and cooling energy to the zone is shut off or reduced to a minimum. Exceptions are as follows:

(a) Special occupancy or special usage conditions approved by the building official or
(b) Thermostats that require manual changeover between heating and cooling modes.

403.2.6.4 Heat Pump Auxiliary Heat. Heat pumps having supplementary electric resistance heaters shall have controls that prevent heater operation when the heating load can be met by the heat pump. Supplemental heater operation is permitted during outdoor coil defrost cycles not exceeding 15 minutes.

403.2.6.5 Humidistats. Humidistats used for comfort purposes shall be capable of being set to prevent the use of fossil fuel or electricity to reduce relative humidity below 60% or increase relative humidity above 30%.

403.2.6.6 Simultaneous Heating and Cooling. Zone thermostatic and humidistatic controls shall be capable of operating in sequence the supply of heating and cooling energy to the zone. Such controls shall prevent: Reheating; recooling; mixing or simultaneous supply of air that has been previously mechanically heated and air that has been previously cooled, either by mechanical refrigeration or by economizer systems; and other simultaneous operation of heating and cooling systems to
the same zone. Exceptions are as follows:

(a) Variable-air-volume systems that, during periods of occupancy, are designed to reduce the air supply to each zone to a minimum before heating, recooling, or mixing takes place. This minimum volume shall be no greater than the larger of 30% of the peak supply volume, the minimum required to meet minimum ventilation requirements of the Federal agency. (0.4 cfm/ft² of zone conditioned floor area, and 300 cfm).

(b) Zones where special pressurization relationships or cross-contamination requirements are such that variable-air-volume systems are impractical, such as isolation rooms, operating areas of hospitals and clean rooms.

(c) At least 75% of the energy for reheating or for providing warm air in mixing systems is provided from a site-recovered or site-solar energy source.

(d) Zones where specified humidity levels are required to satisfy process needs, such as computer rooms and museums.

(e) Zones with a peak supply air quantity of 300 cfm or less.

403.2.6.7 Temperature Reset for Air Systems. Air systems supplying heated or cooled air to multiple zones shall include controls that automatically reset supply air temperatures by representative building loads or by outside air temperature. Temperature shall be reset by at least 25% of the design supply air to room air temperature difference. Zones that are expected to experience relatively constant loads, such as interior zones, shall be designed for the fully reset supply temperature. Exception are as follows: Systems that comply with subsection 403.2.6.6 without using exceptions (a) or (b).

403.2.6.8 Temperature Reset for Hydronic Systems. Hydronic systems of at least 600,000 Btuhr design capacity supplying heated and/or chilled water to comfort conditioning systems shall include controls that automatically reset supply water temperatures by representative building loads (including return water temperature) or by outside air temperature. Temperature shall be reset by at least 25% of the design supply-to-return water temperature difference. Exceptions are as follows:

(a) Systems that comply with subsection 403.2.5 without exception or

(b) Where the design engineer certifies to the building official that supply temperature reset controls cannot be implemented without causing improper operation of heating, cooling, humidification, or dehumidification systems.

403.2.7 Off Hour Controls.

403.2.7.1 Automatic Setback or Shutdown Controls. HVAC systems shall be equipped with automatic controls capable of accomplishing a reduction of energy use through control setback or equipment shutdown. Exceptions are as follows:

(a) Systems serving areas expected to operate continuously or

(b) Equipment with full load demands not exceeding 2 kW controlled by readily accessible, manual off-hour controls.

403.2.7.2 Shutoff Dampers. Outdoor air supply and exhaust systems shall be provided with motorized or gravity dampers or other means of automatic volume shutoff or reduction. Exceptions are as follows:

(a) Systems serving areas expected to operate continuously.

(b) Individual systems which have a design airflow rate of 3000 cfm or less.

(c) Gravity and other non-electrical ventilation systems controlled by readily accessible, manual damper controls.

(d) Where restricted by health and life safety codes.

403.2.7.3 Zone Isolation systems that serve zones that can be expected to operate nonsimultaneously for more than 750 hours per year shall include isolation devices and controls to shut off or set back the supply of heating and cooling to each zone independently. Isolation is not required for zones expected to operate continuously or expected to be inoperative only when all other zones are inoperative. For buildings where occupancy patterns are not known at the time of system design, such as speculative buildings, the designer may predesignate isolation areas. The grouping of zones on one floor into a single isolation area shall
§ 434.403

10 CFR Ch. II (1–1–08 Edition)

be permitted when the total conditioned floor area does not exceed 25,000 ft² per group.

403.2.8 Economizer Controls.

403.2.8.1 Each fan system shall be designed and capable of being controlled to take advantage of favorable weather conditions to reduce mechanical cooling requirements. The system shall include either: A temperature or enthalpy air economizer system that is capable of automatically modulating outside air and return air dampers to provide up to 85% of the design supply air quantity as outside air, or a water economizer system that is capable of cooling supply air by direct and/or indirect evaporation and is capable of providing 100% of the expected system cooling load at outside air temperatures of 50°F dry-bulb/45°F wet-bulb and below. Exceptions are as follows:

(a) Individual fan-cooling units with a supply capacity of less than 3000 cfm or a total cooling capacity less than 90,000 Btu/h.

(b) Systems with air-cooled or evaporatively cooled condensers that include extensive filtering equipment provided in order to meet the requirements of RS–41 (incorporated by reference, see § 434.701).

(c) Systems with air-cooled or evaporatively cooled condensers where the design engineer certifies to the building official that use of outdoor air cooling affects the operation of other systems, such as humidification, dehumidification, and supermarket refrigeration systems, so as to increase overall energy usage.

(d) Systems that serve envelope-dominated spaces whose sensible cooling load at design conditions, excluding transmission and infiltration loads, is less than or equal to transmission and infiltration losses at an outdoor temperature of 60°F.

(e) Systems serving residential spaces and hotel or motel rooms.

(f) Systems for which at least 75% of the annual energy used for mechanical cooling is provided from a site-recovered or site-solar energy source.

(g) The zone(s) served by the system each have operable openings (windows, doors, etc.) with an openable area greater than 5% of the conditioned floor area. This applies only to spaces open to and within 20 ft of the operable openings. Automatic controls shall be provided that lock out system mechanical cooling to these zones when outdoor air temperatures are less than 60°F.

403.2.8.2 Economizer systems shall be capable of providing partial cooling even when additional mechanical cooling is required to meet the remainder of the cooling load. Exceptions are as follows:

(a) Direct-expansion systems may include controls to reduce the quantity of outdoor air as required to prevent coil frosting at the lowest step of compressor unloading. Individual direct-expansion units that have a cooling capacity of 180,000 Btu/h or less may use economizer controls that preclude economizer operation whenever mechanical cooling is required simultaneously.

(b) Systems in climates with less than 750 average operating hours per year between 8 a.m. and 4 p.m. when the ambient dry-bulb temperatures are between 55°F and 69°F inclusive.

403.2.9 System Design and Economizer Controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

403.2.9 Distribution System Construction and Insulation.

403.2.9.1 Piping Insulation. All HVAC system piping shall be thermally insulated in accordance with Table 403.2.9.1. Exceptions are as follows:

(a) Factory-installed piping within HVAC equipment tested and rated in accordance with subsection 403.1.

(b) Piping that conveys fluids that have a design operating temperature range between 55°F and 105°F.

(c) Piping that conveys fluids that have not been heated or cooled through the use of fossil fuels or electricity.
403.2.9.1 Duct and Plenum Insulation. All supply and return air ducts and plenums installed as part of an HVAC air distribution system shall be thermally insulated in accordance with Table 403.2.9.1. Exceptions are as follows:

(a) Factory-installed plenums, casings, or ductwork furnished as a part of the HVAC equipment tested and rated in accordance with subsection 403.1.

(b) Ducts within the conditioned space that they serve. (incorporated by reference, see §434.701)ca a06oc0.186

403.2.9.3 Duct and Plenum Construction. All air-handling ductwork and plenums shall be constructed and erected in accordance with RS-34, RS-

| Below 40 | 0.22-0.28 | 100 | 0.5 | 0.5 | 0.5 | 0.5 | 0.5 |

Note: For insulation outside the stated conductivity range, the minimum thickness (T) shall be determined as follows: T = r(1 + 1/2 k) - 1.

Where T = minimum insulation thickness (in), t = actual outside radius of pipe (in), t = insulation thickness listed in this table for applicable fluid temperature and pipe size, K = conductivity of alternate material at mean rating temperature indicated for the applicable fluid temperature.

These thicknesses are based on energy efficiency considerations only. Safety issues, such as insulation surface temperatures, have not been considered.

Piping insulation is not required between the control valve and coil on run-outs when the control valve is located within four feet of the coil and the pipe diameter is 1 inch or less.

Note that the required minimum thickness does not take water vapor transmission and possible surface condensation into account.

*Insulation R-values, measured in (h.F²/Btu), are for the insulation as installed and do not include film resistance. The required minimum thickness do not consider water vapor transmission and possible surface condensation. For ducts that are designed to convey both heated and cooled air, duct insulation shall be as required by the most restrictive condition. Where exterior walls are used as plenum walls, wall insulation shall be as required by the most restrictive condition of this section or subsection 402. Insulation resistance measured on a horizontal plane in accordance with RS-6 (incorporated by reference, see §434.701) at a mean temperature of 75 °F. RS-6 is incorporated by reference at §434.701.

*Includes crawl spaces, both ventilated and non-ventilated.

*Includes return air plenums, with and without exposed roofs above.
§ 434.403

35, and RS–36 (incorporated by reference, see § 434.701). Where supply ductwork and plenums designed to operate at static pressures from 0.25 in. wc to 2 in. wc, inclusive, are located outside of the conditioned space or in return plenums, joints shall be sealed in accordance with Seal Class C as defined in RS–34 (incorporated by reference, see § 434.701). Pressure sensitive tape shall not be used as the primary sealant where such ducts are designed to operate at static pressures of 1 in. wc, or greater.

403.2.9.3.1 Ductwork designed to operate at static pressures in excess of 3 in. wc shall be leak-tested in accordance with Section 5 of RS–35, (incorporated by reference, see § 434.701), or equivalent. Test reports shall be provided in accordance with Section 6 of RS–35 (incorporated by reference, see § 434.701) or equivalent. The tested duct leakage class at a test pressure equal to the design duct pressure class rating shall be equal to or less than leakage Class 6 as defined in Section 4.1 of RS–35 (incorporated by reference, see § 434.701). Representative sections totaling at least 25% of the total installed duct area for the designated pressure class shall be tested.

403.2.10 Completion.

403.2.10.1 Manuals. Construction documents shall require an operating and maintenance manual provided to the Federal Agency. The manual shall include, at a minimum, the following:

(a) Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance, including assumptions used in outdoor design calculations.

(b) Operating and maintenance manuals for each piece of equipment requiring maintenance. Required maintenance activity shall be specified.

(c) Names and addresses of at least one qualified service agency to perform the required periodic maintenance shall be provided.

(d) HVAC controls systems maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field determined setpoints shall be permanently recorded on control drawings, at control devices, or, for digital control systems, in programming comments.

(e) A complete narrative, prepared by the designer, of how each system is intended to operate shall be included with the construction documents.

403.2.10.2 Drawings. Construction documents shall require that within 30 days after the date of system acceptance, record drawings of the actual installation be provided to the Federal agency. The drawings shall include details of the air barrier installation in every envelope component, demonstrating continuity of the air barrier at all joints and penetrations.

403.2.10.3 Air System Balancing. Construction documents shall require that all HVAC systems be balanced in accordance with the industry accepted procedures (such as National Environmental Balancing Bureau (NEBB) Procedural Standards, Associated Air Balance Council (AABC) National Standards, or ANSI/ASHRAE Standard 110). Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10% of design rates, except variable flow distribution systems need not be balanced upstream of the controlling device (VAV box or control valve).

403.2.10.3.1 Construction documents shall require a written balance report be provided to the Federal agency for HVAC systems serving zones with a total conditioned area exceeding 5,000 ft².

403.2.10.3.2 Air systems shall be balanced in a manner to first minimize throttling losses, then fan speed shall be adjusted to meet design flow conditions or equivalent procedures. Exceptions are as follows: Damper throttling may be used for air system balancing;

(a) With fan motors of 1 hp (0.746 kW) or less, or

(b) Of throttling results in no greater than ½ hp (0.248 kW) fan horsepower draw above that required if the fan speed were adjusted.

403.2.10.4 Hydronic System Balancing. Hydronic systems shall be balanced in a manner to first minimize throttling losses; then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Exceptions are as follows:

512
§ 434.404 Building service systems and equipment.

404.1 Service Water Heating Equipment Efficiency. Equipment must satisfy the minimum performance efficiency specified in Table 404.1 when tested in accordance with RS–37, RS–38, or RS–39 (incorporated by reference, see §434.701). Omission of equipment from Table 404.1 shall not preclude the use of such equipment. Service water heating equipment used to provide additional function of space heating as part of a combination (integrated) system shall satisfy all stated requirements for the service water heating equipment. All gas-fired storage water heaters that are not equipped with a flue damper and use indoor air for combustion or draft hood dilution and that are installed in a conditioned space, shall be equipped with a vent damper listed in accordance with RS–42 (incorporated by reference, see §434.701). Unless the water heater has an available electrical supply, the installation of such a vent damper shall not require an electrical connection.

</table>

*For detailed references see Subpart E.

* DOE Test Procedures apply to electric and gas storage water heaters with input ratings of 20 gallons and gas instantaneous water heaters with input ratings of 50,000 to 200,000 Btu.

* All except those water heaters covered by NAECA.

* Incorporated by reference, see §434.701.
404.1.1 Testing Electric and Oil Storage Water Heaters for Standby Loss.

(a) When testing an electric storage water heater, the procedures of Z21.10.3–1990 (RS–39, incorporated by reference, see §434.701), Section 2.9, shall be used. The electrical supply voltage shall be maintained with ±1% of the center of the voltage range specified on the water heater nameplate. Also, when needed for calculations, the thermal efficiency (Et) shall be 98%.

(b) When testing an oil-fired water heater, the procedures of Z21.10.3–1990 (RS–39, incorporated by reference, see §434.701), Sections 2.8 and 2.9, shall be used. The following modifications shall be made: A vertical length of flue pipe shall be connected to the flue gas outlet of sufficient height to establish the minimum draft specified in the manufacturer's installation instructions. All measurements of oil consumption shall be taken by instruments with an accuracy of ±1% or better. The burner rate shall be adjusted to achieve an hourly Btu input rate within ±2% of the manufacturer's specified input rate with the CO₂ reading as specified by the manufacturer with smoke no greater than 1 and the fuel pump pressure within ±1% of the manufacturer's specification.

404.1.2 Unfired Storage Tanks. The heat loss of the tank surface area Btu/(h·ft²) shall be based on a 80°F water-air temperature difference.

404.1.3 Storage Volume Symbols in Table 404.1. The symbol “V” is the rated storage volume in gallons as specified by the manufacturer. The symbol “V₁” is the storage volume in gallons as measured during the test to determine the standby loss. V₁ may differ from V, but it is within tolerances allowed by the applicable Z21 and Underwriters Laboratories standards. Accordingly, for the purpose of estimating the standby loss requirement using the rated volume shown on the rating plate, V₁ should be considered as no less than 0.95V for gas and oil water heaters and no less than 0.90V for electric water heaters.

404.1.4 Electric Water Heaters. In applications where water temperatures not greater than 125°F are required, an economic evaluation shall be made on the potential benefit of using an electric heat pump water heater(s) instead of an electric resistance water heater(s). The analysis shall compare the extra installed costs of the heat pump unit with the benefits in reduced energy costs (less increased maintenance costs) over the estimated service life of the heat pump water heater. Exceptions are as follows: Electric water heaters used in conjunction with site-recovered or site-solar energy sources that provide 50% or more of the water heating load or off-peak heating with thermal storage.

404.2 Service Hot Water Piping Insulation. Circulating system piping and noncirculating systems without heat traps, the first eight feet of outlet piping from a constant-temperature noncirculating storage system, and the inlet pipe between the storage tank and a heat trap in a noncirculating storage system shall meet the provisions of subsection 403.2.9.

404.2.1 Vertical risers serving storage water heaters not having an integral heat trap and serving a noncirculating system shall have heat traps on both the inlet and outlet piping as close as practical to the water heater.

404.3 Service Water Heating System Controls. Temperature controls that allow for storage temperature adjustment from 110°F to a temperature compatible with the intended use shall be provided in systems serving residential dwelling units and from 90°F for other systems. When designed to maintain usage temperatures in hot water pipes, such as circulating hot water systems or heat trace, the system shall be equipped with automatic time switches or other controls that can be set to turn off the system.

404.3.1 The outlet temperature of lavatory faucets in public facility restrooms shall be limited to 110°F.

404.4 Water Conservation. Showerheads and lavatory faucets must meet the requirements of 10 CFR 430.32 (o)-(p).

404.4.1 Lavatory faucets in public facility restrooms shall be equipped with a foot switch, occupancy sensor, or similar device or, in other than lavatories for physically handicapped persons, limit water delivery to 0.25 gal/cycle.
§ 434.502 Determination of the annual energy cost budget.

502.1 The annual Energy Cost Budgets shall be determined in accordance with the Prototype Building Procedure in §434.503 and §434.504 or the Reference Building Procedure in §434.506. Both methods calculate an annual Energy Consumption and Design Energy Cost. The Energy Cost Budget shall be determined through the calculation of monthly energy consumption and energy cost of a Prototype or Reference Building design configured to meet the requirements of subsections 401 through 404.

501.3 Designers are encouraged to employ the Building Energy Cost Budget compliance method set forth in this section for evaluating proposed design alternatives to using the elements prescribed in subpart D. The Building Energy Cost Budget establishes the relative effectiveness of each design alternative in energy cost savings, providing an energy cost basis upon which the building owner and designer may select one design over another. This Energy Cost Budget is the highest allowable calculated energy cost for a specific building design. Other alternative designs are likely to have lower annual energy costs and life cycle costs than those used to minimally meet the Energy Cost Budget.

501.4 The Energy Cost Budget is a numerical reference for annual energy cost. Its purpose is to assure neutrality with respect to choices such as HVAC system type, architectural design and fuel choice by providing a fixed, repeatable budget that is independent of any of these choices wherever possible (i.e., for the prototype buildings). The Energy Cost Budget for a given building size and type will vary only with climate, the number of stories, and the choice of simulation tool. The specifications of the prototypes are necessary to assure repeatability, but have no other significance. They are not necessarily recommended energy conserving practice, or even physically reasonable practice for some climates or buildings, but represent a reasonable worst case of energy cost resulting from compliance with the provisions of subsections 401 through 404.
§ 434.503 Prototype building procedure.

503.1 The Prototype Building procedure shall be used for all building types listed below. For mixed-use buildings the Energy Cost Budget is derived by allocating the floor space of each building type within the floor space of the prototype building. For buildings not listed below, the Reference Building procedure of § 434.505 shall be used. Prototype buildings include:

(a) Assembly;
(b) Office (Business);
(c) Retail (Mercantile);
(d) Warehouse (Storage);
(e) School (Educational);
(f) Hotel/Motel;
(g) Restaurant;

(h) Health/Institutional; and
(i) Multi-Family.

§ 434.504 Use of the prototype building to determine the energy cost budget.

504.1 Determine the building type of the Proposed Design using the categories in subsection 503.1. Using the appropriate Prototype Building characteristics from all of the tables contained in Subpart E, the building shall be simulated using the same gross floor area and number of floors for the Prototype Building as in the Proposed Design.

504.2 The form, orientation, occupancy and use profiles for the Prototype Building shall be fixed as described in subsection 511. Envelope, lighting, other internal loads and HVAC systems and equipment shall meet the requirements of subsection 301, 401, 402, 403, and 404 and are standardized inputs.

§ 434.505 Reference building method.

505.1 The Reference Building procedure shall be used only when the Proposed Design cannot be represented by one or a combination of the Prototype Building listed in subsection 503.1 or the assumptions for the Prototype Building in Subsection 510, such as occupancy and use-profiles, do not reasonably represent the Proposed Design.

Cost by summing the 12 monthly Energy Cost Budgets. Each monthly Energy Cost Budget is the product of the monthly Building Energy Consumption of each type of energy used multiplied by the monthly Energy Cost per unit of energy for each type of energy used.  

502.2 The Energy Cost Budget shall be determined in accordance with Equation 502.2.a as follows:

\[ ECB = ECB_{jan} + \ldots + ECB_{m} + \ldots + ECB_{dec} \]  

(Equation 502.2.a)

Based on:

\[ ECB_{m} = BECON_{mi} \times ECOS_{mi} + \ldots + BECON_{mi} \times ECOS_{mi} \]  

(Equation 502.2.b)

Where:

- ECB = The annual Energy Cost Budget
- ECB_{m} = The monthly Energy Cost Budget
- BECON_{mi} = The monthly Budget Energy Consumption of the i\textsuperscript{th} type of energy
- ECOS_{mi} = The monthly Energy Cost, per unit of the i\textsuperscript{th} type of energy
§ 434.506 Use of the reference building to determine the energy cost budget.

Each floor shall be oriented in the same manner for the Reference Building as in the Proposed Design. The form, gross and conditioned floor areas of each floor and the number of floors shall be the same as in the Proposed Design. All other characteristics, such as lighting, envelope and HVAC systems and equipment, shall meet the requirements of subsections 301, 401, 402, 403 and 404.

§ 434.507 Calculation procedure and simulation tool.

The Prototype or Reference Buildings shall be modeled using the criteria of subsections 510 and 521. The modeling shall use a climate data set appropriate for both the site and the complexity of the energy conserving features of the design. ASHRAE Weather Year for Energy Calculations (WYEC) data or bin weather data shall be used in the absence of other appropriate data.

§ 434.508 Determination of the design energy consumption and design energy cost.

The Design Energy Consumption shall be calculated by modeling the Proposed Design using the same methods, assumptions, climate data, and simulation tool as were used to establish the Energy Cost Budget, except as explicitly stated in 509 through 534. The Design Energy Cost shall be calculated per Equation 508.1.

\[
\text{DECOS} = \text{DECOS}_{\text{jan}} + \ldots + \text{DECOS}_{\text{m}} + \ldots + \text{DECOS}_{\text{dec}} \quad \text{Equation 508.1}
\]

Based on:

\[
\text{DECOS}_{\text{m}} = \text{DECON}_{\text{m}} \times \text{ECOS}_{\text{m}} + \ldots + \text{DECON}_{\text{m}} \times \text{ECOS}_{\text{m}} \quad \text{(Equation 508.1.2)}
\]

Where:

- \( \text{DECOS} \) = The annual Design Energy Cost
- \( \text{DECOS}_{\text{m}} \) = The monthly Design Energy Cost
- \( \text{DECON}_{\text{m}} \) = The monthly Design Energy Consumption of the \( i_{\text{th}} \) type of energy
- \( \text{ECOS}_{\text{m}} \) = The monthly Energy Cost per unit of the \( i_{\text{th}} \) type of energy

The \( \text{DECON}_{\text{m}} \) shall be calculated from the first day through the last day of the month, inclusive.

§ 434.509 Compliance.

If the Design Energy Cost is less than or equal to the Energy Cost Budget, and all of the minimum requirements of subsection 501.2 are met, the Proposed Design complies with the standards.

§ 434.510 Standard calculation procedure.

The Standard Calculation Procedure consists of methods and assumptions for calculating the Energy Cost Budget for the Prototype or Reference Building and the Design Energy Consumption and Design Energy Cost of the Proposed Design. In order to maintain consistency between the Energy Cost Budget and the Design Energy Cost, the input assumptions to be used are stated below. These inputs shall be used to determine the Energy Cost Budget and the Design Energy Consumption.

Prescribed assumptions shall be used without variation. Default assumptions shall be used unless the designer can demonstrate that a different assumption better characterizes the building's energy use over its expected life. The default assumptions shall be used in modeling both the Prototype or Reference Building and the Proposed Design, unless the designer demonstrates clear cause to modify these assumptions. Special procedures for speculative buildings are discussed in subsection 503. Shell buildings may not use subpart E.
§ 434.511 Orientation and shape.

511.1 The Prototype Building shall consist of the same number of stories, and gross and conditioned floor area as the Proposed Design, with equal area per story. The building shape shall be rectangular, with a 2.5:1 aspect ratio. The long dimensions of the building shall face East and West. The fenestration shall be uniformly distributed in proportion to exterior wall area. Floor-to-floor height for the Prototype Building shall be 13 ft, except for dwelling units in hotels/motels and multi-family high-rise residential buildings where floor-to-floor height shall be 9.5 ft.

511.2 The Reference Building shall consist of the same number of stories, and gross floor area for each story as the Proposed Design. Each floor shall be oriented in the same manner as the Proposed Design. The geometric form shall be the same as the Proposed Design.

§ 434.512 Internal loads.

512.1 The systems and types of energy specified in this section are provided only for purposes of calculating the Energy Cost Budget. They are not requirements for either systems or the type of energy to be used in the Proposed Design or for calculation of Design Energy Cost.

512.2 Internal loads for multi-family high-rise residential buildings are prescribed in Tables 512.2.a and b, Multi-Family High Rise Residential Building Schedules. Internal loads for other building types shall be modeled as noted in this subsection.

### Note

The table above represents percentage multipliers for different types of buildings, with specific entries for weekdays, Saturdays, and Sundays. The values range from 0 to 80, indicating the percentage of occupancy or activity levels.
§ 434.514 Lighting

514.1 Interior Lighting Power Allowance (ILPA), for calculating the Energy Cost Budget shall be determined from subsection 401.3.2. The lighting power used to calculate the Design Energy Consumption shall be the actual adjusted power for lighting in the Proposed Design. If the lighting controls in the Proposed Design are more effective at saving energy than those required by subsection 401.3.1 and 401.3.2, the actual installed lighting power shall be used along with the schedules reflecting the action of the controls to calculate the Design Energy Consumption.

Table 513.2.b

Note for Table 513.2.b

2. Table 513.2b contains multipliers for computing the nominal values for building occupancy (Table 515.2), acceptable power density (Table 516.2), service hot water (Table 312.1) and lighting energy (§434.513) into time series data for estimating building loads under the Standard Calculation Procedure.

3. For each standard building profile there are three series - one each for weekdays, Saturday and Sunday. Each series includes elements 411 through 413. Each element 411 through 413 includes elements 421 through 424. The estimated load for any hour is simply the multiplier from the appropriate standard profile multiplied by the appropriate value from the tables cited above.

4. The Building HVAC Systems Schedule listed in Table 517.1 lists the periods when the HVAC system shall be considered "on" or "off" in accordance with §434.514.
§ 434.515 Receptacles.

515.1 Receptacle loads and profiles are default assumptions. The same assumptions shall be made in calculating Design Energy Consumption as were used in calculating the Energy Cost Budget.

515.2 Receptacle loads include all general service loads that are typical in a building. These loads exclude any process electrical usage and HVAC primary or auxiliary electrical usage. Table 515.2, Receptacle Power Densities, establishes the density, in W/ft², to be used for each building type. The receptacle energy profiles shall be the same as the lighting energy profiles in Table 513.2b. This profile establishes the percentage of the receptacle load that is switched on by hour of the day and by building type.

</table>

Table 515.2—Receptacle Power Densities

516.1 Insulation and Glazing. The insulation and glazing characteristics of the Prototype and Reference Buildings shall be determined by using the first column under "Base Case", with no assumed overhangs, for the appropriate Alternate Component Tables (ACP) in Table 402.4.12, as defined by climate range. The insulation and glazing characteristics from this ACP are prescribed assumptions for Prototype and Reference Buildings calculating the Energy Cost Budget. In calculating the Design Energy Consumption of the Proposed Design, the envelope characteristics of the Proposed Design shall be used.

516.2 Infiltration. For Prototype and Reference Buildings, the infiltration assumptions in subsection 516.2.1 shall be prescribed assumptions for calculating the Energy Cost Budget and default assumptions for the Design Energy Consumption. Infiltration shall impact perimeter zones only.

516.2.1 When the HVAC system is switched “on,” no infiltration shall be assumed. When the HVAC system is switched “off,” the infiltration rate for buildings with or without operable windows shall be assumed to be 0.038 cfm/ft² of gross exterior wall. Hotels/motels and multi-family high-rise residential buildings shall have infiltration rates of 0.038 cfm/ft² of gross exterior wall area at all times.

516.3 Envelope and Ground Absorptivities. For Prototype and Reference Buildings, absorptivity assumptions shall be prescribed assumptions for computing the Energy Cost Budget and default assumptions for computing the Design Energy Consumption. The solar absorptivity of opaque elements of the building envelope is assumed to be 70%. The solar absorptivity of ground surfaces is assumed to be 80% (20% reflectivity).

516.4 Window Management. For the Prototype and Reference Building, window management drapery assumptions shall be prescribed assumptions for setting the Energy Cost Budget. No draperies shall be the default assumption for computing the Design Energy Consumption. Glazing is assumed to be internally shaded by medium-weight draperies, closed one-half time. The...
draperies shall be modeled by assuming that one-half the area in each zone is draped and one-half is not. If manually-operated draperies, shades, or blinds are to be used in the Proposed Design, the Design Energy Consumption shall be calculated by assuming they are effective over one-half the glazing area in each zone.

§ 434.517 HVAC systems and equipment.

517.1 The specifications and requirements for the HVAC systems of the Prototype and Reference Buildings shall be those in Table 517.1.1, HVAC Systems for Prototype and Reference Buildings. For the calculation of the Design Energy Consumption, the HVAC systems and equipment of the Proposed Design shall be used.

517.2 The systems and types of energy presented in Table 517.1.1 are assumptions for calculating the Energy Cost Budget. They are not requirements for either systems or the type of energy to be used in the Proposed Building or for the calculation of the Design Energy Cost.

</table>

1. Space and Service Water Heating budget calculations shall be made using both electricity and natural gas. The Energy Cost Budget shall be the lower of these two calculations. If natural gas is not available at the rate, electricity and No. 2 fuel oil shall be used for the budget calculations.

2. The system and energy types presented in this Table are not intended as requirements or recommendations for the proposed design. Floor areas below are the total conditioned floor areas for the listed occupancy type. The number of floors indicated below is the total number of occupied floors for the listed occupancy type.

517.3 HVAC Zones. HVAC zones for calculating the Energy Cost Budget of the Prototype or Reference Building shall consist of at least four perimeter and one interior zones per floor. Prototype Buildings shall have one perimeter zone facing each cardinal direction. The perimeter zones of Prototype and Reference Buildings shall be 15 ft in width, or one-third the narrow dimension of the building, when this dimension is between 30 ft and 45 ft inclusive, or one-half the narrow dimension of the building when this dimension is less than 30 ft. Zoning requirements shall be a default assumption for calculating the Energy Cost Budget. For multi-family high-rise residential...
buildings, the prototype building shall have one zone per dwelling unit. The proposed design shall have one zone per unit unless zonal thermostatic controls are provided within units; in this case, two zones per unit shall be modeled. Building types such as assembly or warehouse may be modeled as a single zone if there is only one space.

517.4 For calculating the Design Energy Consumption, no fewer zones shall be used than were in the Prototype and Reference Buildings. The zones in the simulation shall correspond to the zones provided by the controls in the Proposed Design. Thermally similar zones, such as those facing one orientation on different floors, may be grouped together for the purposes of either the Design Energy Consumption or Energy Cost Budget simulation.

8. Prototype energy budget cost calculations shall be made using both electricity and natural gas. If natural gas is not available at the site, electricity and #2 fuel oil shall be used. The Energy Cost Budget shall be the lower of these results. Alternatively, the Energy Cost Budget may be based on the fuel source that minimizes total operating, maintenance, equipment, and installation costs for the prototype over the building lifetime. Equipment and installation cost estimates shall be prepared using professionally recognized cost estimating tools, guides, and techniques. The methods of analysis shall conform to those of Subpart A of 10 CFR part 436. Energy costs shall be based on actual costs to the building as defined in this Section.

9. Design supply air circulation rate shall be based on a supply air to room air temperature differences of 20°F. A higher supply air temperature may be used if required to maintain a minimum circulation rate of 4.5 air changes per hour or 15 cfm per person at design conditions to each zone served by the system. If return fans are specified, they shall be sized from the supply fan capacity less the required minimum ventilation with outside air, or 75% of the supply air capacity, whichever is larger. Except where noted, supply and return fans shall be operated continuously during occupied hours.

10. Fan System Energy when included in the efficiency rating of the unit as defined in §403.2.4.3 need not be modeled explicitly for this system. The fan shall cycle with calls for heating or cooling.

11. Chilled water systems shall be modeled using a reciprocating chiller for systems with total cooling capacities less than 175 tons, and centrifugal chillers for systems...
§ 434.518  Service water heating.

518.1  The service water loads for Prototype and Reference Buildings are defined in terms of Btu/h per person in Table 518.1.1, Service Hot Water Quantities. The service water heating loads from Table 518.1.1 are prescribed assumptions for multi-family high-rise residential buildings and default assumptions for all other buildings. The same service water heating load assumptions shall be made in calculating Design Energy Consumption as were used in calculating the Energy Cost Budget.

![Service Hot Water Quantities](image)

§ 434.519  Controls.

519.1  All occupied conditioned spaces in the Prototype, Reference and
Proposed Design Buildings in all climates shall be simulated as being both heated and cooled. The assumptions in this subsection are prescribed assumptions. If the Proposed Design does not include equipment for cooling or heating, the Design Energy Consumption shall be determined by the specifications for calculating the Energy Cost Budget as described in Table 517.4.1 HVAC System Description for Prototype and Reference Buildings. Exceptions to 519.1 are as follows:

519.1.1 If a building is to be provided with only heating or cooling, both the Prototype or Reference Building and the Proposed Design shall be simulated, using the same assumptions. Such an assumption cannot be made unless the building interior temperature meets the comfort criteria of RS–2 (incorporated by reference, see § 434.701) at least 98% of the occupied hours during the year.

519.1.2 If warehouses are not intended to be mechanically cooled, both the Energy Cost Budget and Design Energy Consumption shall be modeled assuming no mechanical cooling; and

519.1.3 In climates where winter design temperature (97.5% occurrence) is greater than 59°F, space heating need not be modeled.

519.2 Space temperature controls for the Prototype or Reference Building, except multi-family high-rise residential buildings, shall be set at 70°F for space heating and 75°F for space cooling with a deadband per subsection 403.2.6.3. The system shut off during off-hours shall be according to the schedule in Table 515.2, except that the heating system shall cycle on if any space should drop below the night setback setting of 59°F. There shall be no similar setpoint during the cooling season. Lesser deadband ranges may be used in calculating the Design Energy Consumption. Exceptions to 519.2 are as follows:

(a) Setback shall not be modeled in determining either the Energy Cost Budget or Design Energy Cost if setback is not realistic for the Proposed Design, such as 24-hour/day operations. Health facilities need not have night setback during the heating season; and

(b) Hotel/motels and multi-family high-rise residential buildings shall have a night setback temperature of 60 °F from 11:00 p.m. to 6:00 a.m. during the heating season; and

(c) If deadband controls are not to be installed, the Design Energy Cost shall be calculated with both heating and cooling thermostat setpoints set to the same value between 70 °F and 75 °F inclusive, assumed to be constant for the year.

519.2.1 For multi-family buildings, the thermostat schedule for the dwelling units shall be as in Table 519.1.2, Thermostat Settings for Multi-Family High-rise Buildings. The Prototype Building shall use the single zone schedule. The Proposed Design shall use the two-zone schedule only if zonal thermostatic controls are provided.

For Proposed Designs that use heat pumps employing supplementary heat, the controls used to switch on the auxiliary heat source during morning warm-up periods shall be simulated accurately. The thermostat assumptions for multi-family high-rise buildings are prescribed assumptions.

519.3 When providing for outdoor air ventilation in calculating the Energy Cost Budget, controls shall be assumed to close the outside air intake to reduce the flow of outside air to 0 cfm during setback and unoccupied periods. Ventilation using inside air may still be required to maintain scheduled setback temperature. Outside air ventilation, during occupied periods, shall be as required by RS–41, (incorporated by reference, see § 434.701) or the Proposed Design, whichever is greater.

519.4 If humidification is to be used in the Proposed Design, the same level of humidification and system type shall be used in the Prototype or Reference Building. If dehumidification requires subcooling of supply air, then reheat for the Prototype or Reference Building shall be from recovered waste heat such as condenser waste heat.

§ 434.520 Speculative buildings.

520.1 Lighting. The interior lighting power allowance (ILPA) for calculating the Energy Cost Budget shall be determined from Table 401.3.2a. The Design Energy Consumption may be based on an assumed adjusted lighting power for future lighting improvements.

520.2 The assumption about future lighting power used to calculate the Design Energy Consumption must be documented so that the future installed lighting systems may be in compliance with these standards. Documentation must be provided to enable future lighting systems to use either the Prescriptive method or the Systems Performance method of subsection 401.3.

520.3 Documentation for future lighting systems that use subsection 401.3 shall be stated as a maximum adjusted lighting power for the tenant spaces. The adjusted lighting power allowance for tenant spaces shall account for the lighting power provided for the common areas of the building.

520.4 Documentation for future lighting systems that use subsection 401.3 shall be stated as a required lighting adjustment. The required lighting adjustment is the whole building lighting power assumed in order to calculate the Design Energy Consumption minus the ILPA value from Table 401.3.2c that was used to calculate the Energy Cost Budget. When the required lighting adjustment is less than zero, a complete lighting design must be developed for one or more representative tenant spaces, demonstrating acceptable lighting within the limits of the assumed lighting power allowance.

520.5 HVAC Systems and Equipment. If the HVAC system is not completely specified in the plans, the Design Energy Consumption shall be based on reasonable assumptions about the construction of future HVAC systems and equipment. These assumptions shall be documented so that future HVAC systems and equipment may be in compliance with these standards.

§ 434.521 The simulation tool.

521.1 Annual energy consumption shall be simulated with a multi-zone, 8760 hours per year building energy model. The model shall account for:

521.1.1 The dynamic heat transfer of the building envelope such as solar and internal gains;

521.1.2 Equipment efficiencies as a function of load and climate;

521.1.3 Lighting and HVAC system controls and distribution systems by simulating the whole building;

521.1.4 The operating schedule of the building including night setback during various times of the year; and

521.1.5 Energy consumption information at a level necessary to determine the Energy Cost Budget and Design Energy Cost through the appropriate utility rate schedules.

521.1.6 While the simulation tool should simulate an entire year on an hour by hour basis (8760 hours), programs that approximate this dynamic analysis procedure and provide equivalent results are acceptable.

521.1.7 Simulation tools shall be selected for their ability to simulate accurately the relevant features of the building in question, as shown in the tool’s documentation. For example, a single-zone model shall not be used to simulate a large, multi-zone building, and a steady-state model such as the degree-day method shall not be used to simulate buildings when equipment efficiency or performance is significantly.
affected by the dynamic patterns of weather, solar radiation, and occupancy. Relevant energy-related features shall be addressed by a model such as daylighting, atriums or sunspaces, night ventilation or thermal storage, chilled water storage or heat recovery, active or passive solar systems, zoning and controls of heating and cooling systems, and ground-coupled buildings. In addition, models shall be capable of translating the Design Energy Consumption into energy cost using actual utility rate schedules with the coincidental electrical demand of a building. Examples of public domain models capable of handling such complex building systems and energy cost translations available in the United States are DOE—2.1C and BLAST 3.0 and in Canada, Energy Systems Analysis Series.

521.1.8 All simulation tools shall use scientifically justifiable documented techniques and procedures for modeling building loads, systems, and equipment. The algorithms used in the program shall have been verified by comparison with experimental measurements, loads, systems, and equipment.
601.4 Compliance under the Building Energy Use Budget method requires a detailed energy analysis, using a conventional simulation tool, of the Proposed Design. A life cycle cost analysis shall be used to select the fuel source for the HVAC systems, service hot water, and process loads from available alternatives. The Annual Energy Consumption of the Proposed Design with the life cycle cost-effective fuel selection is calculated to determine the modeled energy consumption, called the Design Energy Use.

601.5 The Design Energy Use is defined as the energy that is consumed within the five foot line of a proposed building per ft² over a 24-hour day, 365-
day year period and specified operating hours. The calculated Design Energy Use is then compared to a calculated Energy Use Budget.

601.6 Compliance. The Energy Use Budget is determined by calculating the annual energy usage for a Reference or Prototype Building that is configured to comply with the provisions of Subpart E for such buildings, except that the fuel source(s) of the Prototype or Reference Building shall be the same life cycle cost-effective source(s) selected for the Proposed Design. If the Design Energy Use is less than or equal to the Energy Use Budget then the proposed design complies with these standards.

601.7 This section provides instructions for determining the Design Energy Use and for calculating the Energy Use Budget. The Energy Use Budget is the highest allowable calculated annual energy consumption for a specified building design. Designers are encouraged to design buildings whose Design Energy Use is lower than the Energy Use Budget.

§ 434.602 Determination of the annual energy budget.

602.1 The Energy Use Budget shall be calculated for the appropriate Prototype or Reference Building in accordance with the procedures prescribed in subsection 502 with the following exceptions: The Energy Use Budget shall be stated in units of Btu/ft²/yr and the simulation tool shall segregate the calculated energy consumption by fuel type producing an Energy Use Budget for each fuel (the fuel selections having been made by a life cycle cost analysis in determining the proposed design).

602.2 The Energy Use Budget is calculated similarly for the Reference or Prototype Building using equation 602.2.

\[ EUB = EUB_1 f_1 + EUB_2 f_2 + \ldots + EUB_i f_i \]  

Where \( EUB_1, EUB_2, \ldots, EUB_i \) are the calculated annual energy targets for each fuel used in the Reference or Prototype building and \( f_1, f_2, \ldots, f_i \) are the energy conversion factors given in Table 602.2, Fuel Conversion Factors for Computing Design Annual Energy Uses. In lieu of case by case calculation of the Energy Use Budget, the designer may construct Energy Use Budget tables for the combinations of energy source(s) that may be considered in a set of project designs, such as electric heating, electric service water, and gas cooling or oil heating, gas service water and electric cooling. The values in such optional Energy Use Budget tables shall be equal to or less than the corresponding Energy Use Budgets calculated on a case by case basis according to this section. Energy Use Budget tables shall be constructed to correspond to the climatic regions and building types in accordance with provisions for Prototype or Reference Building models in subpart E of this part.

</tbody>
</table>

**NOTE:** At specific locations where the energy source Btu content varies significantly from the value presented above the local fuel value may be used provided there is supporting documentation from the fuel source supplier stating this actual energy value and verifying that this value will remain consistent for the foreseeable future. The fuel content for fuels not given this table shall be determined from the best available source.
§ 434.603 Determination of the design energy use.

603.1 The Design Energy Use shall be calculated by modeling the Proposed Design using the same methods, assumptions, climate data, and simulation tool as were used to establish the Energy Use Budget, but with the design features that will be used in the final building design. The simulation tool used shall segregate the calculated energy consumption by fuel type giving an annual Design Energy Use for each fuel. The sum of the Design Energy Uses multiplied by the fuel conversion factors in Table 602.2 yields the Design Energy Use for the proposed design:

\[
DEU = \text{DEU}_1 x f_1 + \text{DEU}_2 x f_2 + \ldots + \text{DEU}_i x f_i \quad \text{Equation 603.1}
\]

Where \( f_1, f_2, \ldots, f_i \) are the fuel conversion factors in Table 602.2.

603.2.1 Fuel sources selected for the Proposed Design and Prototype or Reference buildings shall be determined by considering the energy cost and other costs and cost savings that occur during the expected economic life of the alternative.

603.2.2 The designer shall use the procedures set forth in subpart A of 10 CFR part 436 to make this determination. The fuel selection life cycle cost analysis shall include the following steps:

603.2.2.1 Determine the feasible alternatives for energy sources of the Proposed Design's HVAC systems, service hot water, and process loads.

603.2.2.2 Model the Proposed Design including the alternative HVAC and service water systems and conduct an annual energy analysis for each fuel source alternative using the simulation tool specified in this section. The annual energy analysis shall be computed on a monthly basis in conformance with subpart E with the exception that all process loads shall be included in the calculation. Separate the output of the analysis by fuel type.

603.2.2.3 Determine the unit price of each fuel using information from the utility or other reliable local source. During rapid changes in fuel prices it is recommended that an average fuel price for the previous twelve months be used in lieu of the current price. Calculate the annual energy cost of each energy source alternative in accordance with procedures in subpart E for the Design Energy Cost. Estimate the initial cost of the HVAC and service water systems and other initial costs such as energy distribution lines and service connection fees associated with each fuel source alternative. Estimate other costs and benefits for each alternative including, but not necessarily limited to, annual maintenance and repair, periodic and one time major repairs and replacements and salvage of the energy and service water systems. Cost estimates shall be prepared using professionally recognized estimating tools, guides and techniques.

603.2.2.4 Perform a life cycle cost analysis using the procedure specified in subsection 603.2.

603.2.2.5 Compare the total life cycle cost of each energy source alternative. The alternative with the lowest total life cycle cost shall be chosen as the energy source for the proposed design.

§ 434.604 Compliance.

604.1 Compliance with this section is demonstrated if the Design Energy Use is equal to or less than the Energy Use Budget.

\[
\text{DEU} < \text{EUB} \quad \text{Equation 604.1}
\]

604.2 The energy consumption shall be measured at the building five foot line for all fuels. Energy consumed from non-depletable energy sources and heat recovery systems shall not be included in the Design Energy Use calculations. The thermal efficiency of fixtures, equipment, systems or plants in the proposed design shall be simulated by the selected calculation tool.
§ 434.605 Standard Calculation Procedure.
605.1 The Standard Calculation Procedure consists of methods and assumptions for calculating the Energy Use Budgets for Prototype and Reference Buildings and the Energy Use for the Proposed Design. In order to maintain consistency between the Energy Use Budgets and the Design Energy Use, the input assumptions stated in subsection 510.2 are to be used.
605.2 The terms Energy Cost Budget and Design Energy Cost or Design Energy Consumption used in subpart E of this part correlate to Energy Use Budget and Design Energy Use, respectively, in subpart F of this part.

§ 434.606 Simulation tool.
606.1 The criteria established in subsection 521 for the selection of a simulation tool shall be followed when using the compliance path prescribed in subpart F of this part.

§ 434.607 Life cycle cost analysis criteria.
607.1 The following life cycle cost criteria applies to the fuel selection requirements of this subpart and to optional life cycle cost analyses performed to evaluate energy conservation design alternatives. The fuel source(s) selection shall be made in accordance with the requirements of subpart A of 10 CFR part 436. When performing optional life cycle cost analyses of energy conservation opportunities the designer may use the life cycle cost procedures of subpart A of 10 CFR part 436 or OMB Circular 1-94 or an equivalent procedure that meets the assumptions listed below:
607.1.1 The economic life of the Prototype Building and Proposed Design shall be 25 years. Anticipated replacements or renovations of energy related features and systems in the Prototype or Reference Building and Proposed Design during this period shall be included in their respective life cycle cost calculations.
607.1.2 The designer shall follow established professional cost estimating practices when determining the costs and benefits associated with the energy related features of the Prototype or Reference Building and Proposed Design.
607.1.3 All costs shall be expressed in current dollars. General inflation shall be disregarded. Differential escalation of prices (prices estimated to rise faster or slower than general inflation) for energy used in the life cycle cost calculations shall be those in effect at the time of the latest “Annual Energy Outlook” (DOE/EIA–0383) as published by the Department of Energy’s Energy Information Administration.
607.1.4 The economic effects of taxes, depreciation and other factors not consistent with the practices of subpart A of 10 CFR part 436 shall not be included in the life cycle cost calculation.

Subpart G—Reference Standards
§ 434.701 General.
701.1 General. The standards, technical handbooks, papers, regulations, and portions thereof, that are referred to in the sections and subsections in the following list are hereby incorporated by reference into this part 434. The following standards have been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 522(a) and 1 CFR part 51. A notice of any change in these materials will be published in the Federal Register. The standards incorporated by reference are available for inspection at the U.S. Department of Energy, Office of Energy Efficiency, Hearings and Dockets, Forrestal Building, 1000 Independence Avenue SW, Washington, DC 20585, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html. The standards may be purchased at the addresses listed at the end of each standard. The following standards are incorporated by reference in this part:

RS–20 RESERVED.

RS–24 ANSI Z83.8–96, Gas Unit Heater and Gas-Fired Duct Furnaces, American National Standards Institute, 11 West 42nd Street, New York, NY 10036.

PART 435—ENERGY EFFICIENCY STANDARDS FOR NEW FEDERAL LOW-RISE RESIDENTIAL BUILDINGS

§ 435.1 Purpose and scope.
This part establishes energy efficiency performance standard for the construction of new Federal low-rise residential buildings as required by section 305(a) of the Energy Conservation and Production Act, as amended (42 U.S.C. 6834(a)).

§ 435.2 Definitions.
For purposes of this part, the following terms, phrases and words shall be defined as follows:

Baseline building means a new Federal low-rise residential building that is otherwise identical to the proposed building but is designed to meet but not exceed the energy efficiency specifications in the ICC International Energy Conservation Code, 2004 Supplement Edition, January 2005 (incorporated by reference, see § 435.3).

DOE means U.S. Department of Energy.

Life-cycle cost means the total cost related to energy conservation measures of owning, operating and maintaining a building over its useful life as determined in accordance with 10 CFR part 436.

Life-cycle cost-effective means that the proposed building has a lower life-cycle cost than the life-cycle costs of the baseline building, as described by 10 CFR 436.19, or has a positive estimated net savings, as described by 10 CFR 436.20, or has a savings-to-investment ratio estimated to be greater than one, as described by 10 CFR 436.21, or has an adjusted internal rate of return, as described by 10 CFR 436.22, that is estimated to be greater than the discount rate as listed in OMB Circular Number A-94 “Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs.”

Low-rise residential building means any building three stories or less in height above grade that includes sleeping accommodations where the occupants are primarily permanent in nature (30 days or more).

New Federal building means any building to be constructed by, or for the use...
§ 435.2 Definitions.

* * * * *

Design for construction means the stage when the energy efficiency and sustainability details (such as insulation levels, HVAC systems, water-using systems, etc.) are either explicitly determined or implicitly included in a project cost specification.

* * * * *

New Federal building means any building to be constructed by, or for the use of, any Federal agency which is not legally subject to State or local building codes or similar requirements. A new building is a building constructed on a site that previously did not have a building or a complete replacement of an existing building from the foundation up.

* * * * *

§ 435.3 Material incorporated by reference.

(a) General. DOE incorporates by reference the energy performance standard listed in paragraph (b) of this section into 10 CFR Part 435 subpart A. The Director of the Federal Register has approved the material listed in paragraph (b) of this section for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Any subsequent amendment to this material by the standard-setting organization will not affect the DOE building energy performance standard unless and until DOE amends its building energy performance standards. DOE incorporates the material as it exists on the date specified in the approval and a notice of any change in the material will be published in the FEDERAL REGISTER.

(c) Availability of references. The building energy performance standard incorporated by reference is available for inspection at:

(1) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html

(d) Obtaining copies of standards. The building energy performance standard incorporated by reference may be obtained from the following source: the International Code Council, 4051 West Flossmoor Road, Country Club Hills, IL 60478–5795, http://www.iccsafe.org/el/category.html

§ 435.4 Energy efficiency performance standard.

(a) All Federal agencies shall design new Federal low-rise residential buildings, for which design for construction began on or after January 3, 2007, to:

(1) Meet ICC International Energy Conservation Code, 2004 Supplement Edition, January 2005 (incorporated by reference, see § 435.3), and

(2) If life-cycle cost-effective, achieve energy consumption levels, calculated consistent with paragraph (b) of this section, that are at least 30 percent below the levels of the baseline building.

(b) Energy consumption for the purposes of calculating the 30 percent savings shall include space heating, space cooling, and domestic water heating.

(c) If a 30 percent reduction is not life-cycle cost-effective, the design of the proposed building shall be modified so as to achieve an energy consumption level at the maximum level of energy efficiency.
§ 435.5 Efficiency that is life-cycle cost-effective, but at a minimum complies with paragraph (a) of this section.

EFFECTIVE DATE NOTE: At 72 FR 72571, Dec. 21, 2007, §435.4 was amended by revising paragraph (c), effective Jan. 22, 2008. For the convenience of the user, the revised text is set forth as follows:

§ 435.4 Energy efficiency performance standard.

* * * * *

(c) If a 30 percent reduction is not life-cycle cost-effective, the design of the proposed building shall be modified so as to achieve an energy consumption level at or better than the maximum level of energy efficiency that is life-cycle cost-effective, but at a minimum complies with paragraph (a) of this section.

§ 435.5 Performance level determination.

§ 435.6 Sustainable principles for siting, design and construction. [Reserved]

§ 435.7 Water used to achieve energy efficiency. [Reserved]

§ 435.8 Life-cycle costing.

Each Federal agency shall determine life-cycle cost-effectiveness by using the procedures set out in subpart A of 10 CFR part 436. A Federal agency may choose to use any of four methods, including lower life-cycle costs, positive net savings, savings-to-investment ratio that is estimated to be greater than one, and an adjusted internal rate of return that is estimated to be greater than the discount rate as listed in OMB Circular Number A-94 "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs."

Subpart B—Voluntary Performance Standards for New Non-Federal Residential Buildings [Reserved]

Subpart C—Mandatory Energy Efficiency Standards for Federal Residential Buildings

§ 435.300 Purpose.

(a) This subpart establishes voluntary energy conservation performance standards for new residential buildings. The voluntary energy conservation performance standards are designed to achieve the maximum practicable improvements in energy efficiency and increases in the use of non-depletable sources of energy.

(b) Voluntary energy conservation performance standards prescribed under this subpart shall be developed solely as guidelines for the purpose of providing technical assistance for the design of energy conserving buildings, and shall be mandatory only for the Federal buildings for which design for construction began before January 3, 2007.

(c) The energy conservation performance standards will direct Federal policies and practices to ensure that cost-effective energy conservation features will be incorporated into the designs of all new Federal residential buildings for which design for construction began January 3, 2007.

§ 435.301 Scope.

(a) The energy conservation performance standards in this subpart will apply to all Federal residential buildings for which design of construction began before January 3, 2007 except multifamily buildings more than three stories above grade.

(b) The primary types of buildings built by or for the Federal agencies, to which the energy conservation performance standards will apply, are:

(1) Single-story single-family residences;
§ 435.302 Definitions.

(a) ANSI means American National Standards Institute.

(c) ASTM means American Society of Testing and Measurement.

(d) British thermal unit (Btu) means approximately the amount of heat required to raise the temperature of one pound of water from 59°F to 60°F.

(e) Building means any new residential structure:

(1) That includes or will include a heating or cooling system, or both, or a domestic hot water system, and

(2) For which a building design is created after the effective date of this rule.

(f) Building design means the development of plans and specifications for human living space.

(g) Conservation Optimization Standard for Savings in Federal Residences means the computerized calculation procedure that is used to establish an energy consumption goal for the design of Federal residential buildings.

(h) COSTSAFR means the Conservation Optimization Standard for Savings in Federal Residences.

(i) DOE means U.S. Department of Energy.

(j) Domestic hot water (DHW) means the supply of hot water for purposes other than space conditioning.

(k) Energy conservation measure (ECM) means a building material or component whose use will affect the energy consumed for space heating, space cooling, domestic hot water or refrigeration.

(l) Energy performance standard means an energy consumption goal or goals to be met without specification of the method, materials, and processes to be employed in achieving that goal or goals, but including statements of the requirements, criteria evaluation methods to be used, and any necessary commentary.

(m) Federal agency means any department, agency, corporation, or other entity or instrumentality of the executive branch of the Federal Government, including the United States Postal Service, the Federal National Mortgage Association, and the Federal Home Loan Mortgage Corporation.

(n) Federal residential building means any residential building to be constructed by or for the use of any Federal agency in the Continental U.S., Alaska, or Hawaii that is not legally subject to state or local building codes or similar requirements.

(o) Life cycle cost means the minimum life cycle cost calculated by using a methodology specified in subpart A of 10 CFR part 436.

(p) Point system means the tables that display the effect of the set of energy conservation measures on the design energy consumption and energy costs of a residential building for a particular location, building type and fuel type.

(q) Practicable optimum life cycle energy cost means the energy costs of the set of conservation measures that has the minimum life cycle cost to the Federal government incurred during a 25 year period and including the costs of construction, maintenance, operation, and replacement.

(r) Project means the group of one or more Federal residential buildings to be built at a specific geographic location that are included by a Federal agency in specifications issued or used by a Federal agency for design or construction of the buildings.

(s) Prototype means a fundamental house design based on typical construction assumptions. The nine prototypes in COSTSAFR are: single-section manufactured house, double-section manufactured house, ranch-style house, two-
§ 435.303 Requirements for the design of a Federal residential building.

(a) The head of each Federal agency responsible for the construction of Federal residential buildings shall establish an energy consumption goal for each residential building to be designed or constructed by or for the agency, for which design for construction began before January 3, 2007.

(b) The energy consumption goal for a Federal residential building for which design for construction began before January 3, 2007, shall be a total point score derived by using the microcomputer program and user manual entitled “Conservation Optimization Standard for Savings in Federal Residences (COSTSAFR),” unless the head of the Federal agency shall establish more stringent requirements for that agency.

(c) The head of each Federal agency shall adopt such procedures as may be necessary to ensure that the design of a Federal residential building is not less energy conserving than the energy consumption goal established for the building.

§ 435.304 The COSTSAFR Program.

(a) The COSTSAFR Program (Version 3.0) provides a computerized calculation procedure to determine the most effective set of energy conservation measures, selected from among the measures included within the Program that will produce the practicable optimum life cycle cost for a type of residential building in a specific geographic location. The most effective set of energy conservation measures is expressed as a total point score that serves as the energy consumption goal.

(b) The COSTSAFR Program (Version 3.0) also prints out a point system that identifies a wide array of different energy conservation measures indicating how many points various levels of each measure would contribute to reaching the total point score of the energy consumption goal. This enables a Federal agency to use the energy consumption goal and the point system in the design and procurement procedures so that designers and builders can pick and choose among different combinations of energy conservation measures to meet or exceed the total point score required to meet the energy consumption goal.

(c) The COSTSAFR Program (Version 3.0) operates on a micro-computer system that uses the MS DOS operating system and is equipped with an 8087 co-processor.

(d) The COSTSAFR Program (Version 3.0) may be obtained from:
National Technical Information Service; Department of Commerce; Springfield, Virginia 22161; (202) 487-4600

§ 435.305 Alternative compliance procedure.

(a) If a proposed building design includes unusual or innovative energy conservation measures which are not covered by the COSTSAFR program, the Federal agency shall determine whether that design meets or exceeds the applicable energy consumption
Department of Energy § 435.305

goal in compliance with the procedures set forth in this section.

(b) The Federal agency shall determine the estimated discounted energy cost for the COSTSAFR prototype building design, which is the most similar of the COSTSAFR prototypes to the proposed building design, by—

(1) Printing out the COSTSAFR compliance forms for the prototype showing the points attributable to levels of various energy conservation measures; (2) Calculating the estimated unit energy cost on the compliance forms, on the basis of selecting the optimum levels on the compliance forms or otherwise in the User's Manual for each energy conservation measure; and (3) Multiplying the estimated unit energy cost by 100.

(c) The Federal agency shall determine the estimated discounted energy cost for the proposed building design by—

(1) Estimating the heating and cooling total annual coil loads of the proposed building design with the DOE 2.1C computer program on the basis of input assumptions including—

(i) Shading coefficients of 0.6 for summer and 0.8 for winter;

(ii) Thermostat setpoints of 78 degrees Fahrenheit for cooling, 70 degrees Fahrenheit for heating (6 am to 12 midnight), and 60 degrees Fahrenheit for Night Setback (12 midnight to 6 am, except for houses with heat pumps);

(iii) The infiltration rate measured in air changes per hour as calculated using appendix B of the COSTSAFR User's Manual;

(iv) Natural venting with a constant air change rate of 10 air changes per hour—

(A) When the outdoor temperature is lower than the indoor temperature, but not above 78 degrees Fahrenheit; and

(B) When the enthalpy of the outdoor air is lower than the indoor air.

(v) Internal gains in accordance with the following table for a house with 1540 square feet of floor area, adjusted by 0.35 Btu/hr to account for changes in lighting as the floor area varies from 1540 square feet—

APPENDIX C TO PART 436—GENERAL OPERATIONS ENERGY CONSERVATION MEASURES

APPENDIX D TO PART 436—ENERGY PROGRAM CONSERVATION ELEMENTS

Source: 44 FR 60669, Oct. 19, 1979, unless otherwise noted.

§ 436.1 Scope.

This part sets forth the rules for Federal energy management and planning programs to reduce Federal energy consumption and to promote life cycle cost effective investments in building energy systems, building water systems and energy and water conservation measures for Federal buildings.

§ 436.2 General objectives.

The objectives of Federal energy management and planning programs are:

(a) To apply energy conservation measures to, and improve the design for construction of Federal buildings such that the energy consumption per gross square foot of Federal buildings in use during the fiscal year 1995 is at least 10 percent less than the energy consumption per gross square foot in 1985;

(b) To promote the methodology and procedures for conducting life cycle cost analyses of proposed investments in building energy systems, building water systems and energy and water conservation measures;

(c) To promote the use of energy savings performance contracts by Federal agencies for implementation of privately financed investment in building and facility energy conservation measures for existing Federally owned buildings; and

(d) To promote efficient use of energy in all agency operations through general operations plans.

Subpart A—Methodology and Procedures for Life Cycle Cost Analyses

Source: 55 FR 48220, Nov. 20, 1990, unless otherwise noted.

§ 436.10 Purpose.

This subpart establishes a methodology and procedures for estimating and comparing the life cycle costs of Federal buildings, for determining the life cycle cost effectiveness of energy conservation measures and water conservation measures, and for ranking ordering life cycle cost effective measures in order to design a new Federal building or to retrofit an existing Federal building. It also establishes the method by which efficiency shall be considered when entering into or renewing leases of Federal building space.

61 FR 32649, June 25, 1996

§ 436.11 Definitions.

As used in this subpart—

Base Year means the fiscal year in which a life cycle cost analysis is conducted.

Building energy system means an energy conservation measure or any portion of the structure of a building or any mechanical, electrical, or other functional system supporting the building, the nature or selection of which for a new building influences significantly the cost of energy consumed.

Building water system means a water conservation measure or any portion of the structure of a building or any mechanical, electrical, or other functional system supporting the building, the nature or selection of which for a new building influences significantly the cost of water consumed.

Component price means any variable sub-element of the total charge for a
§ 436.12 Life cycle cost methodology.

The life cycle cost methodology for this part is a systematic analysis of relevant costs, excluding sunk costs, over a study period, relating initial costs to future costs by the technique of discounting future costs to present values.

§ 436.13 Presuming cost-effectiveness results.

(a) If the investment and other costs for an energy or water conservation measure considered for retrofit to an existing Federal building or a building energy system or building water system considered for incorporation into a new building design are insignificant, a Federal agency may presume that such recurring costs mean future costs that are incurred uniformly and annually over the study period.

Replacement costs mean future cost to replace a building energy system or building water system, an energy or water conservation measure, or any component thereof.

Retrofit means installation of a building energy system or building water system alternative in an existing Federal building.

Salvage value means the value of any building energy system or building water system removed or replaced during the study period, or recovered through resale or remaining at the end of the study period.

Study period means the time period covered by a life cycle cost analysis.

Sunk costs means costs incurred prior to the time at which the life cycle cost analysis occurs.

Time-of-day rate means the charge for service during periods of the day based on the cost of supplying services during various times of the day.

Water conservation measures mean measures that are applied to an existing Federal building that improve the efficiency of water use, reduce the amount of water for sewage disposal and are life cycle cost effective and that involve water conservation, improvements in operation and maintenance efficiencies, or retrofit activities.

a system is life cycle cost-effective without further analysis.

(b) A Federal agency may presume that an investment in an energy or water conservation measure retrofit to an existing Federal building is not life cycle cost-effective for Federal investment if the Federal building is—

(1) Occupied under a short-term lease with a remaining term of one year or less, and without a renewal option or with a renewal option which is not likely to be exercised;

(2) Occupied under a lease which includes the cost of utilities in the rent and does not provide a pass-through of energy or water savings to the government; or

(3) Scheduled to be demolished or retired from service within one year or less.

§ 436.14 Methodological assumptions.

(a) Each Federal Agency shall discount to present values the future cash flows established in either current or constant dollars consistent with the nominal or real discount rate, and related tables, published in the annual supplement to the Life Cycle Costing Manual for the Federal Energy Management Program (NIST 85-3273) and determined annually by DOE as follows—

(1) The nominal discount rate shall be a 12 month average of the composite yields of all outstanding U.S. Treasury bonds neither due nor callable in less than ten years, as most recently reported by the Federal Reserve Board; and

(2) Subject to a ceiling of 10 percent and a floor of three percent the real discount rate shall be a 12 month average of the composite yields of all outstanding U.S. Treasury bonds neither due nor callable in less than ten years, as most recently reported by the Federal Reserve Board, adjusted to exclude estimated increases in the general level of prices consistent with projections of inflation in the most recent Economic Report of the President’s Council of Economic Advisors.

(b) Each Federal agency shall assume that energy prices will change at rates projected by DOE’s Energy Information Administration and published by NIST annually no later than the beginning of the fiscal year in the Annual Supplement to the Life Cycle Costing Manual for the Federal Energy Management Program, in tables consistent with the discount rate determined by DOE under paragraph (a) of this section, except that—

(1) If the Federal agency is using component prices under §436.14(c), that agency may use corresponding component escalation rates provided by the energy or water supplier.

(2) For Federal buildings in foreign countries, the Federal agency may use a “reasonable” escalation rate.

(c) Each Federal agency shall assume that the price of energy or water in the base year is the actual price charged for energy or water delivered to the Federal building and may use actual component prices as provided by the energy or water supplier.

(d) Each Federal agency shall assume that the appropriate study period is as follows:

(1) For evaluating and ranking alternative retrofits for an existing Federal building, the study period is the expected life of the retrofit, or 25 years from the beginning of beneficial use, whichever is shorter.

(2) For determining the life cycle costs or net savings of mutually exclusive alternatives for a given building energy system or building water system (e.g., alternative designs for a particular system or size of a new or retrofit building energy system or building water system), a uniform study period for all alternatives shall be assumed which is equal to—

(i) The estimated life of the mutually exclusive alternative having the longest life, not to exceed 25 years from the beginning of beneficial use with appropriate replacement and salvage values for each of the other alternatives; or

(ii) The lowest common multiple of the expected lives of the alternative, not to exceed 25 from the beginning of beneficial use with appropriate replacement and salvage values for each alternative.

(3) For evaluating alternative designs for a new Federal building, the study period extends from the base year...
§ 436.15 Formatting cost data.

In establishing cost data under §§ 436.16 and 436.17 and measuring cost effectiveness by the modes of analysis described by § 436.19 through § 436.22, a format for accomplishing the analysis which includes all required input data and assumptions shall be used. Subject to § 436.18(b), Federal agencies are encouraged to use worksheets or computer software referenced in the Life Cycle Cost Manual for the Federal Energy Management Program.

§ 436.16 Establishing non-fuel and non-water cost categories.

(a) The relevant non-fuel cost categories are—

(1) Investment costs;
(2) Non-fuel operation and maintenance cost;
(3) Replacement cost; and
(4) Salvage value.

(b) The relevant non-water cost categories are—

(1) Investment costs;
(2) Non-water operation and maintenance cost;
(3) Replacement cost; and
(4) Salvage value.

(c) The present value of recurring costs is the product of the base year value of recurring costs as multiplied by the appropriate uniform present worth factor under § 436.14, or as calculated by computer software indicated in § 436.18(b) and used with the official discount rate and escalation rate assumptions under § 436.14. When recurring costs begin to accrue at a later time, subtract the present value of recurring costs over the delay, calculated using the appropriate uniform present worth factor for the period of the delay, from the present value of recurring costs over the study period or, if using computer software, indicate a delayed beneficial occupancy date.

(d) The present value of non-recurring cost under § 436.16(a) is the product of the non-recurring costs as multiplied by appropriate single present worth factors under § 436.14 for the respective years in which the costs are expected to be incurred, or as calculated by computer software provided or approved by DOE and used with the official discount rate and escalation rate assumptions under § 436.14.

§ 436.17 Establishing energy or water cost data.

(a) Each Federal agency shall establish energy costs in the base year by multiplying the total units of energy used in the base year by the price per unit of energy in the base year as determined in accordance with § 436.14(c).

(b) When energy costs begin to accrue in the base year, the present value of energy costs over the study period is the product of energy costs in the base year as established under § 436.17(a), multiplied by the appropriate modified uniform present worth factor adjusted through the expected life of the building or 25 years from the beginning of beneficial use, whichever is shorter.

(e) Each Federal agency shall assume that the expected life of any building energy system or building water system is the period of service without major renewal or overhaul, as estimated by a qualified engineer or architect, as appropriate, or any other reliable source except that the period of service of a building energy or water system shall not be deemed to exceed the expected life of the owned building, or the effective remaining term of the leased building (taking into account renewal options likely to be exercised).

(f) Each Federal agency may assume that investment costs are a lump sum occurring at the beginning of the base year, or may discount future investment costs to present value using the appropriate present worth factors under paragraph (a) of this section.

(g) Each Federal agency may assume that energy or water costs and non-fuel or non-water operation and maintenance costs begin to accrue at the beginning of the base year or when actually projected to occur.

(h) Each Federal agency may assume that costs occur in a lump sum at any time within the year in which they are incurred.

(i) This section shall not apply to calculations of estimated simple payback time under § 436.22 of this part.

for energy price escalation for the applicable region, sector, fuel type, and study period consistent with §436.14, or as calculated by computer software provided or approved by DOE and used with the official discount rate and escalation rate assumptions under §436.14. When energy costs begin to accrue at a later time, subtract the present value of energy costs over the delay, calculated using the adjusted, modified uniform present worth factor for the period of delay, from the present value of energy costs over the study period or, if using computer software, indicate a delayed beneficial occupancy date.

(c) Each Federal agency shall establish water costs in the base year by multiplying the total units of water used in the base year by the price per unit of water in the base year as determined in accordance with §436.14(c).

(d) When water costs begin to accrue in the base year, the present value of water costs over the study period is the product of water costs in the base year as established under §436.17(a), or as calculated by computer software provided or approved by DOE and used with the official discount rate and assumptions under §436.14. When water costs begin to accrue at a later time, subtract the present value of water costs over the delay, calculated using the uniform present worth factor for the period of delay, from the present value of water costs over the study period or, if using computer software, indicate a delayed beneficial occupancy date.

§ 436.18 Measuring cost-effectiveness.

(a) In accordance with this section, each Federal agency shall measure cost-effectiveness by combining cost data established under §§436.16 and 436.17 in the appropriate mode of analysis as described in §436.19 through §436.22.

(b) Federal agencies performing LCC analysis on computers shall use either the Federal Buildings Life Cycle Costing (FBLCC) software provided by DOE or software consistent with this subpart.

(c) Replacement of a building energy or water system with an energy or water conservation measure by retrofit to an existing Federal building or by substitution in the design for a new Federal building shall be deemed cost-effective if—

1. Life cycle costs, as described by §436.19, are estimated to be lower; or
2. Net savings, as described by §436.20, are estimated to be positive; or
3. The savings-to-investment ratio, as described by §436.21, is estimated to be greater than one; or
4. The adjusted internal rate of return, as described by §436.22, is estimated to be greater than the discount rate as set by DOE.

(d) As a rough measure, each Federal agency may determine estimated simple payback time under §436.23, which indicates whether a retrofit is likely to be cost effective under one of the four calculation methods referenced in §436.18(c). An energy or water conservation measure alternative is likely to be cost-effective if estimated payback time is significantly less than the useful life of that system, and of the Federal building in which it is to be installed.

(e) Mutually exclusive alternatives for a given building energy or water system, considered in determining such matters as the optimal size of a solar energy system, the optimal thickness of insulation, or the best choice of double-glazing or triple-glazing for windows, shall be compared and evaluated on the basis of life cycle costs or net savings over equivalent study periods. The alternative which is estimated to result in the lowest life cycle costs or the highest net savings shall be deemed the most cost-effective because it tends to minimize the life cycle cost of Federal building.

(f) When available appropriations will not permit all cost-effective energy or water conservation measures to be undertaken, they shall be ranked in descending order of their savings-to-investment ratios, or their adjusted internal rate of return, to establish priority. If available appropriations cannot be fully exhausted for a fiscal year by taking all budgeted energy or water conservation measures according to their rank, the set of energy or water
conservation measures that will maximize net savings for available appropriations should be selected.

(g) Alternative building designs for new Federal buildings shall be evaluated on the basis of life cycle costs. The alternative design which results in the lowest life cycle costs for a given new building shall be deemed the most cost-effective.

§ 436.19 Life cycle costs.
Life cycle costs are the sum of the present values of—
(a) Investment costs, less salvage values at the end of the study period;
(b) Non-fuel operation and maintenance costs:
(c) Replacement costs less salvage costs of replaced building systems; and
(d) Energy and/or water costs.

§ 436.20 Net savings.
For a retrofit project, net savings may be found by subtracting life cycle costs based on the proposed project from life cycle costs based on not having it. For a new building design, net savings is the difference between the life cycle costs of an alternative design and the life cycle costs of the basic design.

§ 436.21 Savings-to-investment ratio.
The savings-to-investment ratio is the ratio of the present value savings to the present value costs of an energy or water conservation measure. The numerator of the ratio is the present value of net savings in energy or water and non-fuel or non-water operation and maintenance costs attributable to the proposed energy or water conservation measure. The denominator of the ratio is the present value of the net increase in investment and replacement costs less salvage value attributable to the proposed energy or water conservation measure.

§ 436.22 Adjusted internal rate of return.
The adjusted internal rate of return is the overall rate of return on an energy or water conservation measure. It is calculated by subtracting 1 from the nth root of the ratio of the terminal value of savings to the present value of costs, where n is the number of years in the study period. The numerator of the ratio is calculated by using the discount rate to compound forward to the end of the study period the yearly net savings in energy or water and non-fuel or non-water operation and maintenance costs attributable to the proposed energy or water conservation measure. The denominator of the ratio is the present value of the net increase in investment and replacement costs less salvage value attributable to the proposed energy or water conservation measure.

§ 436.23 Estimated simple payback time.
The estimated simple payback time is the number of years required for the cumulative value of energy or water cost savings less future non-fuel or non-water costs to equal the investment costs of the building energy or water system, without consideration of discount rates.

§ 436.24 Uncertainty analyses.
If particular items of cost data or timing of cash flows are uncertain and are not fixed under §436.14, Federal agencies may examine the impact of uncertainty on the calculation of life cycle cost effectiveness or the assignment of rank order by conducting additional analyses using any standard engineering economics method such as sensitivity and probabilistic analysis. If additional analysis casts substantial doubt on the life cycle cost analysis results, a Federal agency should consider obtaining more reliable data or eliminating the building energy or water system alternative.
Subpart B—Methods and Procedures for Energy Savings Performance Contracting

§ 436.30 Purpose and scope.

(a) General. This subpart provides procedures and methods which apply to Federal agencies with regard to the award and administration of energy savings performance contracts awarded on or before September 30, 2003. This subpart applies in addition to the Federal Acquisition Regulation at Title 48 of the CFR and related Federal agency regulations. The provisions of this subpart are controlling with regard to energy savings performance contracts notwithstanding any conflicting provisions of the Federal Acquisition Regulation and related Federal agency regulations.

(b) Utility incentive programs. Nothing in this subpart shall preclude a Federal agency from—

(1) Participating in programs to increase energy efficiency, conserve water, or manage electricity demand conducted by gas, water, or electric utilities and generally available to customers of such utilities;

(2) Accepting financial incentives, goods, or services generally available from any such utility to increase energy efficiency or to conserve water or manage electricity demand; or

(3) Entering into negotiations with electric, water, and gas utilities to design cost-effective demand management and conservation incentive programs to address the unique needs of each Federal agency.

(c) Promoting competition. To the extent allowed by law, Federal agencies should encourage utilities to select contractors for the conduct of utility incentive programs in a competitive manner to the maximum extent practicable.

(d) Interpretations. The permissive provisions of this subpart shall be liberally construed to effectuate the objectives of Title VIII of the National Energy Conservation Policy Act, 42 U.S.C. 8287-8287c.

[60 FR 18334, Apr. 10, 1995, as amended at 60 FR 19343, Apr. 18, 1995; 65 FR 39786, June 28, 2000]

§ 436.31 Definitions.

As used in this subpart—

Act means Title VIII of the National Energy Conservation Policy Act.

Annual energy audit means a procedure including, but not limited to, verification of the achievement of energy cost savings and energy unit savings guaranteed resulting from implementation of energy conservation measures and determination of whether an adjustment to the energy baseline is justified by conditions beyond the contractor’s control.

Building means any closed structure primarily intended for human occupancy in which energy is consumed, produced, or distributed.

Detailed energy survey means a procedure which may include, but is not limited to, a detailed analysis of energy cost savings and energy unit savings potential, building conditions, energy consuming equipment, and hours of use or occupancy for the purpose of confirming or revising technical and price proposals based on the preliminary energy survey.

DOE means Department of Energy.

Energy baseline means the amount of energy that would be consumed annually without implementation of energy conservation measures based on historical metered data, engineering calculations, submetering of buildings or energy consuming systems, building load simulation models, statistical regression analysis, or some combination of these methods.

Energy conservation measures means measures that are applied to an existing Federally owned building or facility that improves energy efficiency, are life-cycle cost-effective under subpart A of this part, and involve energy conservation, cogeneration facilities, renewable energy sources, improvements in operation and maintenance efficiencies, or retrofit activities.

Energy cost savings means a reduction in the cost of energy and related operation and maintenance expenses, from

553
§ 436.32 Qualified contractors lists.

(a) DOE shall prepare a list, to be updated annually, or more often as necessary, of firms qualified to provide energy cost savings performance services and grouped by technology. The list shall be prepared from statements of qualifications by or about firms engaged in providing energy savings performance contract services on questionnaires obtained from DOE. Such statements shall, at a minimum, include prior experience and capabilities of firms to perform the proposed energy cost savings services by technology and financial and performance information. DOE shall issue a notice annually, for publication in the Commerce Business Daily, inviting submission of new statements of qualifications and requiring listed firms to update their statements of qualifications for changes in the information previously provided.

(b) On the basis of statements of qualifications received under paragraph (a) of this section and any other relevant information, DOE shall select a firm for inclusion on the qualified list if—

(1) It has provided energy savings performance contract services or services that save energy or reduce utility costs for not less than two clients, and the firm possesses the appropriate project experience to successfully implement the technologies which it proposes to provide;

(2) Previous project clients provide ratings which are “fair” or better;

(3) The firm or any principal of the firm has neither been insolvent nor declared bankruptcy within the last five years;

(4) The firm or any principal of the firm is not on the list of parties excluded from procurement programs under 48 CFR part 9, subpart 9.4; and

(5) There is no other adverse information which warrants the conclusion that the firm is not qualified to perform energy savings performance contracts.

(c) DOE may remove a firm from DOE’s list of qualified contractors after notice and an opportunity for comment if—

(1) There is a failure to update its statement of qualifications;

(2) There is credible information warranting disqualification; or

(3) There is other good cause.
(d) A Federal agency shall use DOE’s list unless it elects to develop its own list of qualified firms consistent with the procedures in paragraphs (a) and (b) of this section.

(e) A firm not designated by DOE or a Federal agency pursuant to the procedures in paragraphs (a) and (b) of this section as qualified to provide energy cost savings performance services shall receive a written decision and may request a debriefing.

(f) Any firm receiving an adverse final decision under this section shall apply to the Board of Contract Appeals of the General Services Administration in order to exhaust administrative remedies.

§ 436.33 Procedures and methods for contractor selection.

(a) Competitive selection. Competitive selections based on solicitation of firms are subject to the following procedures—

(1) With respect to a particular proposed energy cost savings performance project, Federal agencies shall publish a Commerce Business Daily notice which synopsizes the proposed contract action.

(2) Each competitive solicitation—

(i) Shall request technical and price proposals and the text of any third-party financing agreement from interested firms;

(ii) Shall consider DOE model solicitations and should use them to the maximum extent practicable;

(iii) May provide for a two-step selection process which allows Federal agencies to make an initial selection based, in part, on proposals containing estimated energy cost savings and energy unit savings, with contract award conditioned on confirmation through a detailed energy survey that the guaranteed energy cost savings are within a certain percentage (specified in the solicitation) of the estimated energy cost savings in the selectee’s proposal. If the detailed energy survey does not confirm that guaranteed energy savings are within the fixed percentage of estimated savings, the Federal agency may select another firm from those within the competitive range.

(3) After selection under paragraph (a)(3) or (a)(4) of this section, but prior to award, a Federal agency may require the selectee to conduct a detailed energy survey to confirm that guaranteed energy cost savings are within a certain percentage (specified in the solicitation) of the estimated energy cost savings in the selectee’s proposal. If the detailed energy survey does not confirm that guaranteed energy savings are within the fixed percentage of estimated savings, the Federal agency may select another firm from those within the competitive range.

(b) Unsolicited proposals. Federal agencies may—

(1) Consider unsolicited energy savings performance contract proposals from firms on a qualified contractor list under this subpart which include technical and price proposals and the text of any financing agreement (including a lease-acquisition) without regard to the requirements of 48 CFR 15.602 and 15.603–2(a)(1); 48 CFR 15.603; and 48 CFR 15.607(a), (a)(2), (a)(3), (a)(4) and (a)(5).
§ 436.34 Multiyear contracts.

(2) Pursuant to the authority provided under section 304A(b)(1)(B) of the Federal Property and Administrative Services Act of 1949, the heads of procuring activities shall waive the requirement for submission of certified cost or pricing data. However, this does not exempt offerors from submitting information (including pricing information) required by the Federal agency to ensure the impartial and comprehensive evaluation of proposals.

[60 FR 18334, Apr. 10, 1995, as amended at 65 FR 39786, June 28, 2000]

§ 436.35 Standard terms and conditions.

(a) Mandatory requirements. In addition to contractual provisions otherwise required by the Act or this subpart, any energy savings performance contract shall contain clauses—

(1) Authorizing modification, replacement, or changes of equipment, at no cost to the Federal agency, with the prior approval of the contracting officer who shall consider the expected level of performance after such modification, replacement or change; and

(2) Providing for the disposition of title to systems and equipment;

(3) Requiring prior approval by the contracting officer of any financing agreements (including lease-acquisitions) and amendments to such an agreement entered into after contract award for the purpose of financing the
acquisition of energy conservation measures;
(4) Providing for an annual energy audit and identifying who shall conduct such an audit, consistent with §436.37 of this subpart; and
(5) Providing for a guarantee of energy cost savings to the Federal agency, and establishing payment schedules reflecting such guarantee.

(b) Third party financing. If there is third party financing, then an energy savings performance contract may contain a clause:
(1) Permitting the financing source to perfect a security interest in the installed energy conservation measures, subject to and subordinate to the rights of the Federal agency; and
(2) Protecting the interests of a Federal agency and a financing source, by authorizing a contracting officer in appropriate circumstances to require a contractor who defaults on an energy savings performance contract or who does not cure the failure to make timely payments, to assign to the financing source, if willing and able, the contractor’s rights and responsibilities under an energy savings performance contract;

§436.36 Conditions of payment.
(a) Any amount paid by a Federal agency pursuant to any energy savings performance contract entered into under this subpart may be paid only from funds appropriated or otherwise made available to the agency for the payment of energy expenses and related operation and maintenance expenses which would have been incurred without an energy savings performance contract. The amount the agency would have paid is equal to:
(1) The energy baseline under the energy savings performance contract (adjusted if appropriate under §436.37), multiplied by the unit energy cost; and
(2) Any related operations and maintenance cost prior to implementation of energy conservation measures, adjusted for increases in labor and material price indices.

(b) Federal agencies may incur obligations pursuant to energy savings performance contracts to finance energy conservation measures provided guaranteed energy cost savings exceed the contractor’s debt service requirements.

§436.37 Annual energy audits.
(a) After contractor implementation of energy conservation measures and annually thereafter during the contract term, an annual energy audit shall be conducted by the Federal agency or the contractor as determined by the contract. The annual energy audit shall verify the achievement of annual energy cost savings performance guarantees provided by the contractor.

(b) The energy baseline is subject to adjustment due to changes beyond the contractor’s control, such as—
(1) Physical changes to building;
(2) Hours of use or occupancy;
(3) Area of conditioned space;
(4) Addition or removal of energy consuming equipment or systems;
(5) Energy consuming equipment operating conditions;
(6) Weather (i.e., cooling and heating degree days); and
(7) Utility rates.

(c) In the solicitation or in the contract, Federal agencies shall specify requirements for annual energy audits, the energy baseline, and baseline adjustment procedures.

§436.38 Terminating contracts.
(a) Except as otherwise provided by this subpart, termination of energy savings performance contracts shall be subject to the termination procedures of the Federal Acquisition Regulation in 48 CFR part 49.

(b) In the event an energy savings performance contract is terminated for the convenience of a Federal agency, the termination liability of the Federal agency shall not exceed the cancellation ceiling set forth in the contract, for the year in which the contract is terminated.

Subparts C–E [Reserved]

Subpart F—Guidelines for General Operations Plans

§ 436.100  Purpose and scope.

(a) Purpose. The purpose of this subpart is to provide guidelines for use by Federal agencies in their development of overall 10-year energy management plans to establish energy conservation goals, to reduce the rate of energy consumption, to promote the efficient use of energy, to promote switching for petroleum-based fuels and natural gas to coal and other energy sources, to provide a methodology for reporting their progress in meeting the goals of those plans, and to promote emergency energy conservation planning to assuage the impact of a sudden disruption in the supply of oil-based fuels, natural gas or electricity. The plan is intended to provide the cornerstone for a program to conserve energy in the general operations of an agency.

(b) Scope. This subpart applies to all general operations of Federal agencies and is applicable to management of all energy used by Federal agencies that is excluded from coverage pursuant to section 543(a)(2) of part 3 of title V of the National Energy Conservation Policy Act, as amended (42 U.S.C. 8251–8261).

[45 FR 44561, July 1, 1980, as amended at 55 FR 48223, Nov. 20, 1990]

§ 436.101  Definitions.

As used in this subpart—

Automotive gasoline means all grades of gasoline for use in internal combustion engines except aviation gasoline. Does not include diesel fuel.

Aviation gasoline (AVGAS) means all special grades of gasoline for use in aviation reciprocating engines.

Btu means British thermal unit; the quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit.

Cogeneration means the utilization of surplus energy, e.g., steam, heat or hot water produced as a by-product of the manufacture of some other form of energy, such as electricity. Thus, diesel generators are converted to cogeneration sets when they are equipped with boilers that make steam and hot water (usable as energy) from the heat of the exhaust and the water that cools the generator.

Diesel and petroleum distillate fuels means the lighter fuel oils distilled-off during the refining process. Included are heating oils, fuels, and fuel oil. The major uses of distillate fuel oils include heating, fuel for on- and off-highway diesel engines, marine diesel engines and railroad diesel fuel.

DOE means the Department of Energy.

Emergency conservation plan means a set of instructions designed to specify actions to be taken in response to a serious interruption of energy supply.

Energy efficiency goal means the ratio of production achieved to energy used.

Energy use avoidance means the amount of energy resources, e.g., gasoline, not used because of initiatives related to conservation. It is the difference between the baseline without a plan and actual consumption.

Facility means any structure or group of closely located structures, comprising a manufacturing plant, laboratory, office or service center, plus equipment.

Federal agency means any Executive agency under 5 U.S.C. 105 and the United States Postal Service, each entity specified in 5 U.S.C. 5721(1) (B) through (H) and, except that for purposes of this subpart, the Department of Defense shall be separated into four reporting organizations: the Departments of the Army, Navy and Air Force and the collective DOD agencies, with each responsible for complying with the requirements of this subpart.

Fiscal year or FY means, for a given year, October 1 of the prior year through September 30 of the given year.

Fuel types means purchased electricity, fuel oil, natural gas, liquefied petroleum gas, coal, purchased steam, automotive gasoline, diesel and petroleum distillate fuels, aviation gasoline, jet fuel, Navy special, and other identified fuels.

General operations means world-wide Federal agency operations, other than building operations, and includes services; production and industrial activities; operation of aircraft, ships, and
land vehicles; and operation of Government-owned, contractor-operated plants.

General transportation means the use of vehicles for over-the-road driving as opposed to vehicles designed for off-road conditions, and the use of aircraft and vessels. This category does not include special purpose vehicles such as combat aircraft, construction equipment or mail delivery vehicles.

Goal means a specific statement of an intended energy conservation result which will occur within a prescribed time period. The intended result must be time-phased and must reflect expected energy use assuming planned conservation programs are implemented.

Guidelines means a set of instructions designed to prescribe, direct and regulate a course of action.

Industrial or production means the operation of facilities including buildings and plants which normally use large amounts of capital equipment, e.g., GOCO plants, to produce goods (hardware).

Jet fuel means fuels for use, generally in aircraft turbine engines.

Life cycle cost means the total cost of acquiring, operating and maintaining equipment over its economic life, including its fuel costs, determined on the basis of a systematic evaluation and comparison of alternative investments in programs, as defined in subpart A of this part.

Liquefied petroleum gas means propane, propylene-butanes, butylene, propane-butane mixtures, and isobutane that are produced at a refinery, a natural gas processing plant, or a field facility.

Maintenance means activities undertaken to assure that equipment and energy-using systems operate effectively and efficiently.

Measures means actions, procedures, devices or other means for effecting energy efficient changes in general operations which can be applied by Federal agencies.

Measure of performance means a scale against which the fulfillment of a requirement can be measured.

Navy special means a heavy fuel oil that is similar to ASTM grade No. 6 oil or Bunker C oil. It is used to power U.S. Navy ships.

Non-renewable energy source means fuel oil, natural gas, liquefied petroleum gas, synthetic fuels, and purchased steam or electricity, or other such energy sources.

Operational training and readiness means those activities which are necessary to establish or maintain an agency's capability to perform its primary mission. Included are major activities to provide essential personnel strengths, skills, equipment, supply inventory and equipment condition. General administrative and housekeeping activities are not included.

Overall plan means the comprehensive agency plan for conserving fuel and energy in all operations, to include both the Buildings Plan developed pursuant to subpart C of this part and the General Operations Plan.

Plan means those actions which an agency envisions it must undertake to assure attainment of energy consumption and efficiency goals without an unacceptably adverse impact on primary missions.

Program means the organized set of activities and allocation of resources directed toward a common purpose, objective, or goal undertaken or proposed by an agency in order to carry out the responsibilities assigned to it.

Renewable energy sources means sunlight, wind, geothermal, biomass, solid wastes, or other such sources of energy.

Secretary means the Secretary of the Department of Energy.

Services means the provision of administrative assistance or something of benefit to the public.

Specific Functional Category means those Federal agency activities which consume energy, or which are directly linked to energy consuming activities and which fall into one of the following groups: Services, General Transportation, Industrial or Production, Operational Training and Readiness, and Others.

Standard means an energy conservation measure determined by DOE to be applicable to a particular agency or agencies. Once established as a standard, any variance or decision not to adopt the measure requires a waiver.
§ 436.102 General operations plan format and content.

(a) Each Federal agency shall prepare and submit to the Under Secretary, DOE, within six months from the effective date of these guidelines, a general operations 10-year plan which shall consist of two parts, an executive summary and a text. Subsequent agency revisions to plans shall be included in each agency's annual report on progress which shall be forwarded to DOE by July 1 annually.

(b) The following information shall be included in each Federal agency general operations 10-year plan for the period of fiscal years 1980–1990:

(1) An Executive Summary which includes—

(i) A brief description of agency missions, and applicable functional categories pursuant to § 436.106(a)(2);

(ii) A Goals and Objectives Section which summarizes what energy savings or avoidance will be achieved during the plan period, and what actions will be taken to achieve those savings, and the costs and benefits of measures planned for reducing energy consumption, increasing energy efficiencies, and shifting to a more favorable fuel mix. Assumptions of environmental, safety and health effects of the goals should be included;

(iii) A chart depicting the agency organizational structure for energy management, showing energy management program organization for headquarters and for major subordinate elements of the agency;

(iv) A schedule for completion of requirements directed in this subpart, including phase-out of any procedures made obsolete by these guidelines; and

(v) Identification of any significant problem which may impede the agency from meeting its energy management goals.

(2) A Text which includes—

(i) A Goals and Objectives Section developed pursuant to § 436.103 describing agency conservation goals; these goals will be related to primary mission goals;

(ii) An Investment Section describing the agency planned investment program by fiscal year, pursuant to appendix B of this subpart, all measures selected pursuant to § 436.104, and the estimated costs and benefits of the measures planned for reducing energy consumption and increasing energy efficiencies;

(iii) An Organization Section which includes: (A) Designation of the principal energy conservation officer, such as an Assistant Secretary or Assistant Administrator, who is responsible for supervising the preparation, updating and execution of the Plan, for planning and implementation of agency energy conservation programs, and for coordination with DOE with respect to energy matters; (B) designation of a middle-level staff member as a point of contact to interface with the DOE Federal Programs Office at the staff level; and (C) designation of key staff members within the agency who are responsible for technical inputs to the plan or monitoring progress toward meeting the goals of the plan;

(iv) An Issues Section addressing problems, alternative courses of action for resolution, and agency recommendations that justify any decisions not to plan for or implement measures contained in appendix C of this subpart, and identifying any special projects, programs, or administrative procedures which may be beneficial to other Federal agency energy management programs;

(v) An Implementing Instructions Section which includes a summary of implementing instructions issued by
agency headquarters, and attachments of appropriate documents such as:

(A) Specific tasking resulting from development of the Plan;
(B) Guidance for the development of emergency conservation plans;
(C) Task milestones;
(D) Listing of responsible sub-agencies and individuals at both agency headquarters and subordinate units;
(E) Reporting and administrative procedures for headquarters and subordinate organizations;
(F) Report schedules pursuant to §436.106(c);
(G) Schedules for feedback in order to facilitate plan updating, to include reviews of emergency conservation plans developed pursuant to §436.105;
(H) Schedules for preparing and submitting the annual report on energy management pursuant to §436.106(a);
(I) Schedules of plan preparation and publication;
(j) Communication, implementation, and control measures such as inspections, audits, and others; and
(vi) An Emergency Conservation Plan Summary Section pursuant to the requirements of §436.105(d).

(3) Appendices which are needed to discuss and evaluate any innovative energy conserving technologies or methods, not included in this section, which the agency has identified for inclusion in its plan.

(c) Each plan must be approved and signed by the principal energy conservation officer designated pursuant to paragraph (b)(2) of this section.

§ 436.103 Program goal setting.

(a) In developing and revising plans for a projected 10-year plan each agency shall establish and maintain energy conservation goals in accordance with the requirements of this section.

(b) Agencies shall establish three types of conservation goals:

(1) Energy consumption goals, by fuel type by functional category (see appendix B).
(2) Energy efficiency goals by fuel type by functional category (see appendix B).
(3) Fuel switching goals for shifting energy use from oil and natural gas to other fuels in more plentiful supply from domestic sources (see appendix B).

(c) General operations energy conservation goals shall be established by each Federal agency with the broad purpose of achieving reductions in total energy consumption and increased efficiency without serious mission degradation or unmitigated negative environmental impacts. Within the broad framework, each agency should seek first to reduce energy consumption per unit of output in each applicable functional category. In evaluating energy efficiency, each agency should select and use standards of measurement which are consistent throughout the planning period. Particular attention should be given to increased energy use efficiency in non-renewable fuel consumption. The second focus of attention should be on initiatives which shift energy use from oil and natural gas to other fuels in more plentiful supply from domestic sources.

§ 436.104 Energy conservation measures and standards.

(a) Each agency shall consider for inclusion in its plan the measures identified in appendix C of this subpart.

(b) The following questions should be considered in the evaluation of each measure:

(1) Does this measure provide an incentive or disincentive?
(2) What is the estimate of savings by fuel type?
(3) What are the direct and indirect impacts of this measure?
(4) Is this measure to be mandatory throughout the agency?
(5) If not mandatory, under what circumstances will it be implemented, and who will be responsible for determining specific applicability?
(6) Who will be the direct participants in the implementation of this measure?
(7) What incentives (if any) are to be provided for the participants?
(8) When will this measure be implemented?
(9) Will this measure be implemented in a single step or will it be phased in? If it will be phased in, over what period of time?
(10) Will performance of the measure be evaluated and reported?
§ 436.105 Emergency conservation plan.

(a) Each agency shall establish an emergency conservation plan, a summary of which shall be included in the general operations plan, for assuaging the impact of a sudden disruption in the supply of oil-based fuels, natural gas or electricity. Priorities for temporarily reducing missions, production, services, and other programmatic or functional activities shall be developed in accordance with paragraph (b) of this section. Planning for emergencies is to address both buildings and general operations. Provisions shall be made for testing emergency actions to ascertain that they are effective.

(b) Federal agencies shall prepare emergency conservation plans for 10 percent, fifteen percent, and 20 percent reduction compared to the previous fiscal year in gasoline, other oil-based fuels, natural gas, or electricity for periods of up to 12 months. In developing these plans, agencies shall consider the potential for emergency reductions in energy use in buildings and facilities which the agency owns, leases, or has under contract and by employees through increased use of car and van pooling, preferential parking for multi-passenger vehicles, and greater use of mass transit. Agencies may formulate whatever additional scenarios they consider necessary to plan for various energy emergencies.

(c) In general, Federal agencies’ priorities shall go to those activities which directly support the agencies’ primary missions. Secondary mission activities which must be curtailed or deferred will be reported to DOE as mission impacts. The description of mission impacts shall include estimates of the associated resources and time required to mitigate the effects of the reduction in energy. Other factors or assumptions to be used in energy conservation emergency planning are as follows:

(1) Agencies will be given 15–30 days notice to implement any given plan.

(2) Substitution of fuels in plentiful supply for fuels in short supply is authorized, if the substitution can be completed within a 3-month period and the cost is within the approval authority of the executive branch.

(3) All costs and increases in manpower or other resources associated with activities or projects to assure mission impacts will be clearly defined in respective agency plans. One-time costs will be identified separately.

(4) Confronting the emergency situation will be considered a priority effort and all projects and increases in operating budgets within the approval authority of the executive branch will be expeditiously considered and approved if justified.

(d) Summary plans for agency-wide emergency conservation management shall be provided to DOE pursuant to §436.102(b)(2)(vi). Such summaries shall include:

(1) Agency-wide impacts of energy reductions as determined in accordance with paragraph (b) of this section.

(2) Actions to be taken agency-wide to alleviate the energy shortfalls as they occur.

(3) An assessment of agency services or production that may need to be curtailed or limited after corrective actions have been taken.

(4) A summation of control and feedback mechanisms for managing an energy emergency situation.

§ 436.106 Reporting requirements.

(a) By July 1 of each year each Federal agency shall submit an “Annual Report on Energy Management” based on fiscal year data to the Secretary of DOE. The general operations portion of this report will encompass all agency energy use not reported in the buildings portion and shall include:

(1) A summary evaluation of progress toward the achievement of energy consumption, energy efficiency, and fuel switching goals established by the agency in its plans;
(2) Energy consumption reported by functional categories. Reports must include General Transportation and one or more of the following functional categories: industrial or production, services, operational training and readiness, and other. Agencies may report in subcategories of their own choosing. The following information is to be reported for the usage of each fuel type in physical units for each selected functional category:
   (i) Total energy consumption goal;
   (ii) Total energy consumed;
   (iii) Total energy use avoidance;
   (iv) Variance between actual consumption and consumption goal;
   (v) Cost saved;
   (vi) Status of planned investments, and if different from the investment program upon which existing goals are based, the expected impact on meeting goals; and
   (vii) Summary of any other benefits realized.
(3) The energy efficiencies as calculated in accordance with appendix B of this subpart, or by an equivalent method, for the appropriate functional categories identified in paragraph (a)(2) of this section. The following information is to be reported for the energy efficiency for each fuel type by functional category:
   (i) Energy efficiency goal;
   (ii) Efficiency for the reporting period;
   (iii) Summary of any other benefits realized.
(4) A summary of fuel switching progress including:
   (i) Description and cost of investments in fuel switching;
   (ii) Avoidance in use of oil-based fuels and natural gas;
   (iii) Increased use of solar, wood, gasohol and other renewable energy sources;
   (iv) Increased use of coal and coal derivatives, and
   (v) Use of all other alternative fuels.
(b) Each agency's annual report shall be developed in accordance with a format to be provided by DOE and will include agency revisions to 10-year plans.
(c) Agencies whose annual total energy consumption exceeds one hundred billion Btu's, shall, in addition to the annual report required under paragraph (a) of this section, submit quarterly reports of the energy usage information specified in paragraph (a)(2) of this section.
(d) Agencies who consume energy in operations in foreign countries will include data on foreign operations if foreign consumption is greater than 10% of that consumed by the agency in the United States, its territories and possessions. If an agency's estimated foreign consumption is less than 10% of its total domestic energy use, reporting of foreign consumption is optional. Reports should be annotated if foreign consumption is not included.

§ 436.107 Review of plan.
(a) Each plan or revision of a plan shall be submitted to DOE and DOE will evaluate the sufficiency of the plan in accordance with the requirements of this subpart. Written notification of the adequacy of the plan including a critique, will be made by DOE and sent to the agency submitting the plan or revision within 60 days of submission. Agencies shall be afforded an opportunity to modify and return the plan within an appropriate period of time for review by DOE.
(b) A general operations plan under the guidelines will be evaluated with respect to:
   (1) Adequacy of information or plan content required to be included by §436.102;
   (2) Adequacy of goal setting methodology or baseline justification as stated in §436.103;
   (3) Adequacy of a well-justified investment program which considers all measures included in appendix C of this subpart; and
   (4) Other factors as appropriate.
(c) After reviewing agency plans or revisions of plans, the Under Secretary of DOE, may submit to the “656” Committee for its recommendation, major problem areas or common deficiencies.
(d) Status of the plan review, the Under Secretary’s decisions, and “656” Committee recommendations, will be published as appropriate in the DOE annual report to the President, titled “Energy Management in the Federal Government.”
§ 436.108 Waivers.

(a) Any Federal agency may submit a written request to the Under Secretary for a waiver from the procedures and requirements of this subpart. The request for a waiver must identify the specific requirements and procedures of this subpart from which a waiver is sought and provide a detailed explanation, including appropriate information or documentation, as to why a waiver should be granted.

(b) A request for a waiver under this section must be submitted at least 60 days prior to the due date for the required submission.

(c) A written response to a request for a waiver will be issued by the Under Secretary no later than 30 days from receipt of the request. Such a response will either (1) grant the request with any conditions determined to be necessary to further the purposes of this subpart, (2) deny the request based on a determination that the reasons given in the request for a waiver do not establish a need that takes precedence over the furtherance of the purposes of this subpart, or (3) deny the request based on the failure to submit adequate information upon which to grant a waiver.

(d) A requested waiver may be submitted by the Under Secretary to the “656” Committee for its review and recommendation. The agency official that submitted the request may attend any scheduled meeting of the “656” Committee at which the request is planned to be discussed. The determination to approve or disapprove a request for a waiver shall be made by the Under Secretary.

(e) Status of the requests for a waiver, the Under Secretary’s decisions, and “656” Committee recommendations, will be published, as appropriate, in the DOE annual report to the President, entitled “Energy Management in the Federal Government.”

APPENDIX A TO PART 436—E NERGY CONSERVATION STANDARDS FOR GENERAL OPERATIONS [RESERVED]

APPENDIX B TO PART 436—GOAL SETTING METHODOLOGY

In establishing and updating agency goals for energy conservation, the following methodology or an equivalent method should be utilized:

(a) For overall energy consumption—

(1) An analysis shall be made to determine what factors have the most significant impact upon the amount of each fuel type used by the agency in performing functions in support of its overall mission. Consideration is to be given, but not limited to, the following factors: Number of people using energy; number of vehicles using gasoline; amounts of other equipment using energy; tempo of operations (one, two, or three shifts); the type of operations (degree of equipment or labor intensity); equipment fuel limitations; environmental conditions (tropical versus arctic, etc.); budget levels for fuel, operations, maintenance, and equipment acquisition; and phase-out schedule (of older equipment or plants which may be inefficient). After identifying these factors, a further analysis shall be made to identify any projected workload changes in the quality or quantity of these factors on a yearly basis up to 1990.

(2) Based upon the analysis in (a)(1) and an evaluation of available information on past energy usage, a baseline of energy use by fuel type by functional category shall be established beginning with FY 1975. In addition to “General Transportation,” other functional categories should be selected to enhance energy management. Total fuel use for a particular activity may be allocated to the functional category for which the preponderance of fuel is used. Figure B-1 is an example of one such baseline.
This example shows an increase in energy use, for a specific fuel type, during the period 1975–1981, with a further increase from 1981 to 1984 and a leveling off and no growth from 1984–1990. A justification, based on factors as discussed above, shall accompany each baseline.

(3) Thereafter, analyses should be made of the measures available for reducing the energy consumption profiles without adverse impact on mission accomplishment. Finding viable opportunities for reducing energy use, increasing energy efficiency and switching energy sources, will require consultation with specialists in the fields of operations, maintenance, engineering, design, and economics, and consideration of the measures identified in Appendix C. The DOE Federal Energy Management Programs Office can, upon request, provide information on where such resources can be located. Once these measures are identified, they are to be incorporated into a time-phased investment program, (using where appropriate, the life cycle costing factors and methodology in subpart A of this part). If investment and other costs for implementing a measure are insignificant, a Federal agency may presume that a measure is cost-effective without further analysis. An estimate must then be made as to the lead time required to implement the program and realize energy reductions.

Figure B–2 shows a summarized investment program, which should be accompanied by a detailed description of the measures, projects, and programs making up the total planned investments for each year. This summary need not be by function or fuel type.
These analyses should enable the agency to project an energy consumption goal, with the assumption that funds for executing the planned projects will be approved. Figure B-3 shows a new energy use profile, with planned initiatives and related investments taken into consideration, and the resulting goal entitled “Energy Use With A Plan” superimposed on Figure B-1. Included are the anticipated effects on consumption caused by improvements in energy efficiency and fuel switching.

A comparison of these projections will show the energy use avoidance resulting from the investment program as depicted in Figure B-2. Using the prices of fuel contained in Appendix C to Subpart A, the dollars saved can be projected against the dollars invested. Life cycle costing methodology pursuant to subpart A, will be used to determine priorities for submitting individual initiatives into the appropriate budget year.

(b) For energy efficiencies—Energy efficiency baselines and goals for each fuel type shall be calculated using the same consumption factors and similar methodology to that outlined in paragraph (a). Energy consumption by fuel type shall be linked to mission through the functional categories listed in §436.106(a)(2). This will identify a rate which will indicate energy efficiency trends. This linkage may be accomplished through the following algorithm:
Department of Energy

Step 1: Determine functional categories from section 436.106(a)(2) which best describe the Agency overall mission.

Step 2: Determine types of fuels used to support the functions selected in Step 1.

Step 3: Determine quantities of fuel consumed or planned for consumption over a specific period of time.

Step 4: Determine quantity of output of function for same period of time used in Step 3. Quantify output in a standard measure which best describes functional category.

Step 5: Determine the energy efficiency ratio by dividing quantity from Step 4 by quantity from Step 3.

This ratio of fuel consumed to a unit measure of output will be used to develop a projection of a baseline and goals through 1990, and used in reporting variance. Examples of ratios that should be considered are:

- Production or industrial process type operations

Ton of product

Cu. ft. of natural gas

- Services, such as postal delivery

Customers served or pounds delivered

Gallons of automotive gasoline

- General transportation

Passenger miles

Gallons of automotive gasoline

- Training

Persons trained or in training

Gallons of navy special

Agencies shall select one or more of these ratios, which shall be used throughout the planning period, or use more appropriate energy efficiency ratios, to describe their overall functions. Figure B-4 illustrates the planning baseline and goal resulting from this type of analysis.
(c) For fuel switching—Fuel switching goals for gasoline other oil-based fuel and natural gas may be calculated as follows:

Step 1: For each fiscal year, identify investments, where appropriate, in fuel switching...
from gasoline, other oil-based fuel and natural gas to alternate renewable or nonrenewable fuel sources.

Step 2: Project for each fiscal year, the avoidance in the use of gasoline, other oil-based fuel and natural gas resulting from previous fuel switching investments.

Completion of these steps will permit the formulation of charts such as that shown in Figure B-5.

FUEL SWITCHING GOALS

APPENDIX C TO PART 436—GENERAL OPERATIONS ENERGY CONSERVATION MEASURES

(a) The following individual measures or set of measures must be considered for inclusion in each agency 10-year energy management plan:

(1) Federal Employee Ridesharing Programs—Includes the use of vanpooling and carpooling and complies with existing orders and regulations governing parking for vanpools and carpools.

(2) Fleet Profile Change—Includes energy considerations in equipment selection and assignment.

(3) Fleet Mileage Efficiency—Includes agency plans to implement existing orders, goals, and laws related to vehicle fuel economy.

(4) Driver Training—Includes development of appropriate programs for training operators of U.S. Government vehicles in energy conservation.

(5) Maintenance Procedures Improvement—Includes activities to insure proper vehicle maintenance to optimize energy conservation.

(6) Operating Procedures Improvement—Includes use of cooperative passenger shuttle and courier services on an interagency or other basis within each metropolitan area.

(7) Mass Transit—Includes employee use of existing services for business-related activities and commuting.

(8) Public Education to Promote Vanpooling and Carpooling—Includes activities to support the EPCA requirement to establish “responsible public education programs to promote vanpooling and carpooling arrangements” through their employee awareness programs.

(9) Elimination of Free or Subsidized Employee Parking—Includes elimination of free or subsidized employee parking on Federal installations in accordance with OMB Cir. A-118, August 13, 1979.

(10) Two-Wheeled Vehicle Programs—Includes activities to encourage the substitution of bicycles, mopeds, etc. for automobiles for commuting and operational purposes. These may include the establishment of weather-protected secure storage facilities, shower and locker facilities, and restricted routes for these vehicles on Federal property. Cooperative programs with local civil authorities may also be included.
(11) Consolidation of Facilities and Process Activities—Includes such measures as physical consolidation of operations to minimize intra-operational travel and may include facility closure or conversion. Alternative work patterns, availability of transportation, energy source availability, and technical and financial feasibility are among the considerations that should be evaluated.

(12) Agency Procurement Programs—Includes activities to ensure that energy conservation opportunities are fully exploited with respect to the agency’s procurement programs including procurements relating to operations and maintenance activities; e.g., (a) giving preference to fuel-efficient products whenever practicable, and (b) ensuring that agency’s contractors having a preponderance of cost-type contracts pursue a comprehensive energy conservation program.

(13) Energy Conservation Awareness Programs—Includes programs aimed at gaining and perpetuating employee awareness and participation in energy conservation measures on the job and in their personal activities.

(14) Communication—Includes substitution of communications for physical travel.

(15) Dress Code—Includes measures to allow employees greater freedom in their choice of wearing apparel to promote greater participation in conservation.

(16) Land Use—Includes energy considerations to be employed in new site selection, such as colocating.

(17) Automatic Data Processing (ADP)—Includes all energy aspects of ADP operation and equipment selection.

(18) Aircraft Operations—Includes energy-conserving measures developed for both military and Federal administrative and research and development aircraft operations.

(19) GOCO Facilities and Industrial Plants Operated by Federal Employees—Includes development of energy conservation plans at these facilities and plants which contain measures such as energy efficient periodic maintenance.

(20) Energy Conserving Capital Plant and Equipment Modification—Includes development of energy conservation and life cycle cost parameter measures for replacement of capital plant and equipment.

(21) Process Improvements—Includes measures to improve energy conservation in industrial process operations. These may include consideration of equipment replacement or modification, as well as scheduling and other operational changes.

(22) Improved Steam Maintenance and Management—Includes measures to improve energy efficiency of steam systems. These may include improved maintenance, installation of energy-conserving devices, and the operational use of substitutes for live steam where feasible.

(23) Improvements in Waste Heat Recovery—Includes measures utilizing waste heat for other purposes.

(24) Improvement in Boiler Operations—Includes energy-conserving retrofit measures for boiler operations.

(25) Improved Insulation—Includes measures addressing the addition or replacement of insulation on pipes, storage tanks, and in other appropriate areas.

(26) Scheduling by Major Electric Power Users—Includes measures to shift major electrical power demands to non-peak hours, to the maximum extent possible.

(27) Alternative Fuels—Includes measures to alter equipment such as generators to use lower quality fuels and to fill new requirements with those that use alternative fuels. The use of gasohol in stationary gasoline-powered equipment should be considered, in particular.

(28) Cogeneration—Includes measures to make full use of cogeneration in preference to single-power generation.

(29) Mobility Training and Operational Readiness—Includes measures which can reduce energy demands through the use of simulators, communications, computers for planning, etc.

(30) Energy Conservation Inspection or Instruction Teams—Includes measures which formulate and perpetuate the review of energy conservation through inspections to determine where specific improvements can be made and then followed by an instruction and training program.

(31) Intra-agency and Interagency Information Exchange Program—Includes measures providing a free exchange of energy conservation ideas and experiences between elements of an agency and between other agencies in the same geographic area.

(32) Recycled Waste—Includes measures to recycle waste materials such as paper products, glass, aluminum, concrete and brick, garbage, asphalt road materials or any material which requires a petroleum base.

(33) Fuel Conversion—Includes measures to accomplish conversion from petroleum based fuels and natural gas to coal and other alternative fuels for appropriate equipment.

(34) Operational Lighting—Includes measures to reduce energy consumption for lighting in operational areas and GOCO plants by: switching off by means of automatic controls; maximizing the use of daylight by floor planning; keeping window and light fixtures clean and replacing fixtures when they begin to deteriorate, rather than when they fail altogether; providing automatic dimmer controls to reduce lighting when daylight increases; and cleaning the work area during daylight, if possible, rather than at night.

(35) Lighting Fixtures—Includes measures to increase energy efficiency of lighting. The following reveals the relative efficiencies of common lamp types.
for the period 1980–1990 must be developed and formalized which sets forth perform-
ance-oriented conservation goals, including the categorized reduction in rates of energy consumption that the program is expected to realize. The plan will be supplemented by guidelines enumerating specific conservation procedures that will be followed. These procedures and initiatives must be life cycle cost-effective as well as energy efficient.

(4) Goals. Goals must be established in a measurable manner to answer questions of "Where are we?" "Where do we want to go?" "Are we getting there?" and "Are our initiatives for getting there life cycle cost-effective?"

(5) Monitoring. Progress must be reviewed periodically both at the agency headquarters and at local facility levels to identify program weakpoint or additional areas for conservation actions. Progress toward achievement of goals should be assessed, and explanations should be required for non-achievement or unusual variations in energy use. Monitoring should include personal inspections and staff visits, management information reporting and audits.

(6) Using Technical Expertise. Personnel with adequate technical background and knowledge of programmatic objectives should be used to help management set technical goals and parameters for efficient planning and implementation of energy conservation programs. These technicians should work in conjunction with the line managers who are accountable for both mission accomplishment and energy conservation.

(7) Employee Awareness. Employees must gain an awareness of energy conservation through formal training and employee information programs. They should be invited to participate in the process of developing an energy conservation program, and to submit definitive suggestions for conservation of energy.

(8) Energy Emergency Planning. Every energy emergency plan must provide for programs to respond to contingencies that may occur at the local, state or National level. Programs must be developed for potential emergency situations calling for reductions of 10 percent, 15 percent and 20 percent for up to 12 months. Emergency plans must be tested to ascertain their effectiveness.

(9) Budgetary and Fiscal Support. Resources necessary for the energy conservation program must be planned and provided for, and the fiscal systems adjusted to support energy management investments and information reporting.

(10) Environmental Considerations. Each agency shall fulfill its obligations under the National Environmental Policy Act in developing its plan.
§ 440.1 Purpose and scope.

This part implements a weatherization assistance program to increase the energy efficiency of dwellings owned or occupied by low-income persons or to provide such persons renewable energy systems or technologies, reduce their total residential expenditures, and improve their health and safety, especially low-income persons who are particularly vulnerable such as the elderly, persons with disabilities, families with children, high residential energy users, and households with high energy burden.

[65 FR 77217, Dec. 8, 2000, as amended at 71 FR 35778, June 22, 2006]

§ 440.2 Administration of grants.

Grant awards under this part shall comply with applicable law including, without limitation, the requirements of:

(a) Executive Order 12372 entitled “Intergovernmental Review of Federal Programs”, 48 FR 3130, and the DOE Regulation implementing this Executive Order entitled “Intergovernmental Review of Department of Energy Programs and Activities” (10 CFR part 1005);

(b) Office of Management and Budget Circular A–97, entitled “Rules and Regulations Permitting Federal Agencies to Provide Specialized or Technical Services to State and Local Units of Government under Title III of the Inter-Governmental Coordination Act of 1968”;

(c) Unless in conflict with provisions of this part, the DOE Financial Assistance Rule (10 CFR part 600); and

(d) Such other procedures applicable to this part as DOE may from time to time prescribe for the administration of financial assistance.

§ 440.3 Definitions.

As used in this part:

Assistant Secretary means the Assistant Secretary for Conservation and Renewable Energy or official to whom the Assistant Secretary’s functions may be redelegated by the Secretary.

Base Allocation means the fixed amount of funds for each State as set forth in §440.10(b)(1).

Base temperature means the temperature used to compute heating and cooling degree days. The average daily outdoor temperature is subtracted from the base temperature to compute heating degree days, and the base temperature is subtracted from the average daily outdoor temperature to compute cooling degree days.

Biomass means any organic matter that is available on a renewable or recurring basis, including agricultural crops and trees, wood and wood wastes and residues, plants (including aquatic plants), grasses, residues, fibers, and animal wastes, municipal wastes, and other waste materials.

CAA means a Community Action Agency.

Capital-Intensive furnace or cooling efficiency modifications means those major heating and cooling modifications which require a substantial
amount of funds, including replacement and major repairs, but excluding such items as tune-ups, minor repairs, and filters.

Children means dependents not exceeding 19 years or a lesser age set forth in the State plan.

Community Action Agency means a private corporation or public agency established pursuant to the Economic Opportunity Act of 1964, Pub. L. 88–452, which is authorized to administer funds received from Federal, State, local, or private funding entities to assess, design, operate, finance, and oversee antipoverty programs.

Cooling Degree Days means a population-weighted annual average of the climatological cooling degree days for each weather station within a State, as determined by DOE.

Deputy Assistant Secretary means the Deputy Assistant Secretary for Technical and Financial Assistance or any official to whom the Deputy Assistant Secretary’s functions may be redelegated by the Assistant Secretary.

DOE means the Department of Energy.

Dwelling Unit means a house, including a stationary mobile home, an apartment, a group of rooms, or a single room occupied as separate living quarters.

Elderly Person means a person who is 60 years of age or older.

Electric base-load measures means measures which address the energy efficiency and energy usage of lighting and appliances.

Family Unit means all persons living together in a dwelling unit.

Formula Allocation means the amount of funds for each State as calculated based on the formula in §440.10(b)(3).

Formula Share means the percentage of the total formula allocation provided to each State as calculated in §440.10(b)(3).

Governor means the chief executive officer of a State, including the Mayor of the District of Columbia.

Grantee means the State or other entity named in the Notification of Grant Award as the recipient.

Heating Degree Days means a population-weighted seasonal average of the climatological heating degree days for each weather station within a State, as determined by DOE.

High residential energy user means a low-income household whose residential energy expenditures exceed the median level of residential expenditures for all low-income households in the State.

Household with a high energy burden means a low-income household whose residential energy burden (residential expenditures divided by the annual income of that household) exceeds the median level of energy burden for all low-income households in the State.

Incidental Repairs means those repairs necessary for the effective performance or preservation of weatherization materials. Such repairs include, but are not limited to, framing or repairing windows and doors which could not otherwise be caulked or weather-stripped and providing protective materials, such as paint, used to seal materials installed under this program.

Indian Tribe means any tribe, band, nation, or other organized group or community of Native Americans, including any Alaska native village, or regional or village corporation as defined in or established pursuant to the Alaska Native Claims Settlement Act, Pub. L. 92–203, 85 Stat. 688, which (1) is recognized as eligible for the special programs and services provided by the United States to Native Americans because of their status as Native Americans, or (2) is located on, or in proximity to, a Federal or State reservation or rancheria.

Local Applicant means a CAA or other public or non profit entity unit of general purpose local government.

Low income means that income in relation to family size which:

(1) Is at or below 125 percent of the poverty level determined in accordance with criteria established by the Director of the Office of Management and Budget, except that the Secretary may establish a higher level if the Secretary, after consulting with the Secretary of Agriculture and the Secretary of Health and Human Services, determines that such a higher level is necessary to carry out the purposes of this part and is consistent with the eligibility criteria established for the weatherization program under section
§ 440.3

222(a)(12) of the Economic Opportunity Act of 1964;

(2) Is the basis on which cash assistance payments have been paid during the preceding twelve month-period under titles IV and XVI of the Social Security Act or applicable State or local law; or

(3) If a State elects, is the basis for eligibility for assistance under the Low Income Home Energy Assistance Act of 1981, provided that such basis is at least 125 percent of the poverty level determined in accordance with criteria established by the Director of the Office of Management and Budget.

Native American means a person who is a member of an Indian tribe.

Non-Federal leveraged resources means those benefits identified by State or local agencies to supplement the Federal grant activities and that are made available to or used in conjunction with the DOE Weatherization Assistance Program for the purposes of the Act for use in eligible low-income dwelling units.

Persons with Disabilities means any individual (1) who is a handicapped individual as defined in section 7(6) of the Rehabilitation Act of 1973, (2) who is under a disability as defined in section 1614(a)(3)(A) or 223(d)(1) of the Social Security Act or in section 102(7) of the Developmental Disabilities Services and Facilities Construction Act, or (3) who is receiving benefits under chapter 11 or 15 of title 38, U.S.C.

Program Allocation means the base allocation plus formula allocation for each State.

Relevant Reporting Period means the Federal fiscal year beginning on October 1 and running through September 30 of the following calendar year.

Renewable energy system means a system which when installed in connection with a dwelling—

(1) Transmits or uses solar energy, energy derived from geothermal deposits, energy derived from biomass (or any other form of renewable energy which DOE subsequently specifies through an amendment of this part) for the purpose of heating or cooling such dwelling or providing hot water or electricity for use within such dwelling; or wind energy for nonbusiness residential purposes; and

(2) Which meets the performance and quality standards prescribed in §440.21 (c) of this part.

Rental Dwelling Unit means a dwelling unit occupied by a person who pays rent for the use of the dwelling unit.

Residential Energy Expenditures means the average annual cost of purchased residential energy, including the cost of renewable energy resources.

Secretary means the Secretary of the Department of Energy.

Separate Living Quarters means living quarters in which the occupants do not live and eat with any other persons in the structure and which have either direct access from the outside of the building or through a common hall or complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements, and includes shelters for homeless persons.

Shelter means a dwelling unit or units whose principal purpose is to house on a temporary basis individuals who may or may not be related to one another and who are not living in nursing homes, prisons, or similar institutional care facilities.

Single-Family Dwelling Unit means a structure containing no more than one dwelling unit.

Skirting means material used to border the bottom of a dwelling unit to prevent infiltration.

State means each of the States and the District of Columbia.

Subgrantee means an entity managing a weatherization project which receives a grant of funds awarded under this part from a grantee.

Support Office Director means the Director of the DOE Field Support Office with the responsibility for grant administration or any official to whom that function may be redelegated by the Assistant Secretary.

Total Program Allocations means the annual appropriation less funds reserved for training and technical assistance.

Tribal Organization means the recognized governing body of any Indian tribe or any legally established organization of Native Americans which is...
controlled, sanctioned, or chartered by such governing body. Unit of General Purpose Local Government means any city, county, town, parish, village, or other general purpose political subdivision of a State. Vestibule means an enclosure built around a primary entry to a dwelling unit. Weatherization Materials mean:

- (1) Caulking and weatherstripping of doors and windows;
- (2) Furnace efficiency modifications including, but not limited to—
  - (i) Replacement burners, furnaces, or boilers or any combination thereof;
  - (ii) Devices for minimizing energy loss through heating system, chimney, or venting devices; and
  - (iii) Electrical or mechanical furnace ignition systems which replace standing gas pilot lights;
- (3) Cooling efficiency modifications including, but not limited to—
  - (i) Replacement air conditioners;
  - (ii) Ventilation equipment;
  - (iii) Screening and window films; and
  - (iv) Shading devices.
Weatherization Project means a project conducted in a single geographical area which undertakes to weatherize dwelling units that are energy inefficient.

§ 440.10 Allocation of funds.

(a) DOE shall allocate financial assistance for each State from sums appropriated for any fiscal year, upon annual application.

(b) Based on total program allocations at or above the amount of total program allocations under Pub. L. 103-322, DOE shall determine the program allocation for each State from available funds as follows:

1. Allocate to each State a “Base Allocation” as listed in Table 1.

(2) Subtract 171,258,000 from total program allocations.

(3) Calculate each State’s formula share as follows:

(i) Divide the number of “Low Income” households in each State by the number of “Low Income” households in the United States and multiply by 100.

(ii) Divide the number of “Heating Degree Days” for each State by the median “Heating Degree Days” for all States.

(iii) Divide the number of “Cooling Degree Days” for each State by the
§ 440.11 Native Americans.

(a) Notwithstanding any other provision of this part, the Support Office Director may determine, after taking into account the amount of funds made available to a State to carry out the purposes of this part, that:

(1) The low-income members of an Indian tribe are not receiving benefits under this part equivalent to the assistance provided to other low-income persons in the State under this part and

(2) The low-income members of such tribe would be better served by means of a grant made directly to provide such assistance.

(b) In any State for which the Support Office Director shall have made the determination referred to in paragraph (a) of this section, the Support Office Director shall reserve from the sums that would otherwise be allocated to the State under this part not less than:

[60 FR 29480, June 5, 1995]
than 100 percent, or more than 150 percent, of an amount which bears the same ratio to the State's allocation for the fiscal year involved as the population of all low-income Native Americans for whom a determination under paragraph (a) of this section has been made bears to the population of all low-income persons in the State.

(c) The Support Office Director shall make the determination prescribed in paragraph (a) of this section in the event a State:

(1) Does not apply within the sixty-day time period prescribed in §440.12(a);
(2) Recommends that direct grants be made for low-income members of an Indian tribe as provided in §440.12(b)(5);
(3) Files an application which DOE determines, in accordance with the procedures in §440.30, not to make adequate provision for the low-income members of an Indian tribe residing in the State;
(4) Has received grant funds and DOE determines, in accordance with the procedures in §440.30, that the State has failed to implement the procedures required by §440.16(6).

(d) Any sums reserved by the Support Office Director pursuant to paragraph (b) of this section shall be granted to the tribal organization serving the individuals for whom the determination has been made, or where there is no tribal organization, to such other entity as the Support Office Director determines is able to provide adequate weatherization assistance pursuant to this part. Where the Support Office Director intends to make a grant to an organization to perform services benefiting more than one Indian tribe, the approval of each Indian tribe shall be a prerequisite for the issuance of a notice of grant award.

(e) Within 30 days after the Support Office Director has reserved funds pursuant to paragraph (b) of this section, the Support Office Director shall give written notice to the tribal organization or other qualified entity of the amount of funds reserved and its eligibility to apply therefor.

(f) Such tribal organization or other qualified entity shall thereafter be treated as a unit of general purpose local government eligible to apply for funds hereunder, pursuant to the provisions of §440.13.

§440.12 State application.

(a) To be eligible for financial assistance under this part, a State shall submit an application to DOE in conformity with the requirements of this part not later than 60 days after the date of notice to apply is received from the Support Office Director. After receipt of an application for financial assistance or for approval of an amendment to a State plan, the Support Office Director may request the State to submit within a reasonable period of time any revisions necessary to make the application complete or to bring the application into compliance with the requirements of this part. The Support Office Director shall attempt to resolve any dispute over the application informally and to seek voluntary compliance. If a State fails to submit timely appropriate revisions to complete the application, the Support Office Director may reject the application as incomplete in a written decision, including a statement of reasons, which shall be subject to administrative review under §440.30 of this part.

(b) Each application shall include:

(1) The name and address of the State agency or office responsible for administering the program;
(2) A copy of the final State plan prepared after notice and a public hearing in accordance with §440.14(a), except that an application by a local applicant need not include a copy of the final State plan;
(3) The budget for total funds applied for under the Act, which shall include a justification and explanation of any amounts requested for expenditure pursuant to §440.18(d) for State administration;
(4) The total number of dwelling units proposed to be weatherized with grant funds during the budget period for which assistance is to be awarded—
   (i) With financial assistance previously obligated under this part, and
   (ii) With the program allocation to the State;

§440.12 State application.

(a) To be eligible for financial assistance under this part, a State shall submit an application to DOE in conformity with the requirements of this part not later than 60 days after the date of notice to apply is received from the Support Office Director. After receipt of an application for financial assistance or for approval of an amendment to a State plan, the Support Office Director may request the State to submit within a reasonable period of time any revisions necessary to make the application complete or to bring the application into compliance with the requirements of this part. The Support Office Director shall attempt to resolve any dispute over the application informally and to seek voluntary compliance. If a State fails to submit timely appropriate revisions to complete the application, the Support Office Director may reject the application as incomplete in a written decision, including a statement of reasons, which shall be subject to administrative review under §440.30 of this part.

(b) Each application shall include:

(1) The name and address of the State agency or office responsible for administering the program;
(2) A copy of the final State plan prepared after notice and a public hearing in accordance with §440.14(a), except that an application by a local applicant need not include a copy of the final State plan;
(3) The budget for total funds applied for under the Act, which shall include a justification and explanation of any amounts requested for expenditure pursuant to §440.18(d) for State administration;
(4) The total number of dwelling units proposed to be weatherized with grant funds during the budget period for which assistance is to be awarded—
   (i) With financial assistance previously obligated under this part, and
   (ii) With the program allocation to the State;

§440.12 State application.

(a) To be eligible for financial assistance under this part, a State shall submit an application to DOE in conformity with the requirements of this part not later than 60 days after the date of notice to apply is received from the Support Office Director. After receipt of an application for financial assistance or for approval of an amendment to a State plan, the Support Office Director may request the State to submit within a reasonable period of time any revisions necessary to make the application complete or to bring the application into compliance with the requirements of this part. The Support Office Director shall attempt to resolve any dispute over the application informally and to seek voluntary compliance. If a State fails to submit timely appropriate revisions to complete the application, the Support Office Director may reject the application as incomplete in a written decision, including a statement of reasons, which shall be subject to administrative review under §440.30 of this part.

(b) Each application shall include:

(1) The name and address of the State agency or office responsible for administering the program;
(2) A copy of the final State plan prepared after notice and a public hearing in accordance with §440.14(a), except that an application by a local applicant need not include a copy of the final State plan;
(3) The budget for total funds applied for under the Act, which shall include a justification and explanation of any amounts requested for expenditure pursuant to §440.18(d) for State administration;
(4) The total number of dwelling units proposed to be weatherized with grant funds during the budget period for which assistance is to be awarded—
   (i) With financial assistance previously obligated under this part, and
   (ii) With the program allocation to the State;
(5) A recommendation that a tribal organization be treated as a local applicant eligible to submit an application pursuant to §440.13(b), if such a recommendation is to be made;

(6) A monitoring plan which shall indicate the method used by the State to insure the quality of work and adequate financial management control at the subgrantee level;

(7) A training and technical assistance plan which shall indicate how funds for training and technical assistance will be used; and

(8) Any further information which the Secretary finds necessary to determine whether an application meets the requirements of this part.

(c) On or before 60 days from the date that a timely filed application is complete, the Support Office Director shall decide whether DOE shall approve the application. The Support Office Director may—

(1) Approve the application in whole or in part to the extent that the application conforms to the requirements of this part;

(2) Approve the application in whole or in part subject to special conditions designed to ensure compliance with the requirements of this part; or

(3) Disapprove the application if it does not conform to the requirements of this part.

(Approved by the Office of Management and Budget under control number 1904–0047)

§ 440.13 Local applications.

(a) The Support Office Director shall give written notice to all local applicants throughout a State of their eligibility to apply for financial assistance under this part in the event:

(1) A State, within which a local applicant is situated, fails to submit an application within 60 days after notice in accordance with §440.12(a) or

(2) The Support Office Director finally disapproves the application of a State, and, under §440.30, either no appeal is filed or the Support Office Director’s decision is affirmed.

(b) To be eligible for financial assistance, a local applicant shall submit an application pursuant to §440.12(b) to the Support Office Director within 30 days after receiving the notice referred to in paragraph (a) of this section.

(c) In the event one or more local applicants submits an application for financial assistance to carry out projects in the same geographical area, the Support Office Director shall hold a public hearing with the same procedures that apply under section §440.14(a).

(d) Based on the information provided by a local applicant and developed in any hearing held under paragraph (c) of this section, the Support Office Director shall determine in writing whether to award a grant to carry out one or more weatherization projects.

(e) If there is an adverse decision in whole or in part under paragraph (d) of this section, that decision is subject to administrative review under §440.30 of this part.

(f) If, after a State application has been finally disapproved by DOE and the Support Office Director approves local applications under this section, the Support Office Director may reject a new State application in whole or in part as disruptive and untimely without prejudice to submission of an application for the next program year.

(Approved by the Office of Management and Budget under control number 1904–0047)

§ 440.14 State plans.

(a) Before submitting to DOE an application, a State must provide at least 10 days notice of a hearing to inform prospective subgrantees, and must conduct one or more public hearings to receive comments on a proposed State plan. The notice for the hearing must specify that copies of the plan are available and state how the public may obtain them. The State must prepare a transcript of the hearings and accept written submission of views and data for the record.

(b) The proposed State plan must:

(1) Identify and describe proposed weatherization projects, including a statement of proposed subgrantees and the amount of funding each will receive;
§ 440.15 Subgrantees.

(a) The grantee shall ensure that:

(1) Each subgrantee is a CAA or other public or nonprofit entity;

(2) Each subgrantee is selected on the basis of public comment received during a public hearing conducted pursuant to § 440.14(a) and other appropriate findings regarding:

(i) The subgrantee’s experience and performance in weatherization or housing renovation activities;

(ii) The subgrantee’s experience in assisting low-income persons in the area to be served; and

(iii) The subgrantee’s capacity to undertake a timely and effective weatherization program.

(3) In selecting a subgrantee, preference is given to any CAA or other public or nonprofit entity which has, or is currently administering, an effective program under this part or under title II of the Economic Opportunity Act of 1964, with program effectiveness evaluated by consideration of factors including, but not necessarily limited to, the following:

(i) The extent to which the past or current program achieved or is achieving weatherization goals in a timely fashion;

(ii) The quality of work performed by the subgrantee;
§ 440.16 Minimum program requirements.

Prior to the expenditure of any grant funds each grantee shall develop, publish, and implement procedures to ensure that:

(a) No dwelling unit may be weatherized without documentation that the dwelling unit is an eligible dwelling unit as provided in § 440.22;

(b) Priority is given to identifying and providing weatherization assistance to:
(1) Elderly persons;
(2) Persons with disabilities;
(3) Families with children;
(4) High residential energy users; and
(5) Households with a high energy burden.

(c) Financial assistance provided under this part will be used to supplement, and not supplant, State or local funds, and, to the maximum extent practicable as determined by DOE, to increase the amounts of these funds that would be made available in the absence of Federal funds provided under this part;

(d) To the maximum extent practicable, the grantee will secure the services of volunteers when such personnel are generally available, training participants and public service employment workers, other Federal or State training program workers, to work under the supervision of qualified supervisors and foremen;

(e) To the maximum extent practicable, the use of weatherization assistance shall be coordinated with other Federal, State, local, or privately funded programs in order to improve energy efficiency and to conserve energy;

(f) The low-income members of an Indian tribe shall receive benefits equivalent to the assistance provided to other low-income persons within a State unless the grantee has made the recommendation provided in § 440.12(b)(5);

(g) No dwelling unit may be reported to DOE as completed until all weatherization materials have been installed and the subgrantee, or its authorized representative, has performed a final inspection(s) including any mechanical work performed and certified that the work has been completed in a workmanlike manner and in accordance with the priority determined by the audit procedures required by § 440.21; and

(h) Subgrantees limit expenditure of funds under this part for installation of materials (other than weatherization materials) to abate energy-related health and safety hazards, to a list of types of such hazards, permissible abatement materials and their costs which is submitted, and updated as necessary at the same time as an annual application under § 440.12 of this part and which DOE shall approve if—
§ 440.18 Allowable expenditures.

(a) Except as adjusted, the expenditure of financial assistance provided under this part for labor, weatherization materials, and related matters included in paragraphs (c)(1) through (9) of this section shall not exceed an average of $2,500 per dwelling unit weatherized in the State, except as adjusted in paragraph (b) of this section.

(b) The expenditure of financial assistance provided under this part for labor, weatherization materials, and related matters for a renewable energy system, shall not exceed an average of $3,000 per dwelling unit.

(c) The $2,500 average ($3,000 for renewable energy systems) will be adjusted annually by DOE beginning in calendar year 2000 by increasing the limitation by an amount equal to:

(1) The limitation amount for the previous year, multiplied by

(2) The lesser of:

(i) The percentage increase in the Consumer Price Index (all items, United States city average) for the most recent calendar year completed before the beginning of the year for which the determination is being made, or

(ii) Three percent.

(3) For the purposes of determining the average cost per dwelling limitation, costs for the purchase of vehicles or other certain types of equipment as defined in 10 CFR part 600 may be amortized over the useful life of the vehicle or equipment.

(d) Allowable expenditures under this part include only:

(1) The cost of purchase and delivery of weatherization materials;

(2) Labor costs, in accordance with §440.19;

(3) Transportation of weatherization materials, tools, equipment, and work
crews to a storage site and to the site of weatherization work;
(4) Maintenance, operation, and insurance of vehicles used to transport weatherization materials;
(5) Maintenance of tools and equipment;
(6) The cost of purchasing vehicles, except that any purchase of vehicles must be referred to DOE for prior approval in every instance.
(7) Employment of on-site supervisory personnel;
(8) Storage of weatherization materials, tools, and equipment;
(9) The cost of incidental repairs if such repairs are necessary to make the installation of weatherization materials effective;
(10) The cost of liability insurance for weatherization projects for personal injury and for property damage;
(11) The cost of carrying out low-cost/no-cost weatherization activities in accordance with §440.20;
(12) The cost of weatherization program financial audits as required by §440.23(d);
(13) Allowable administrative expenses under paragraph (d) of this section; and
(14) Funds used for leveraging activities in accordance with §440.14(b)(9)(xiv); and
(15) The cost of eliminating health and safety hazards elimination of which is necessary before, or because of, installation of weatherization materials.
(e) Not more than 10 percent of any grant made to a State may be used by the grantee and subgrantees for administrative purposes in carrying out duties under this part, except that not more than 5 percent may be used by the State for such purposes, and not less than 5 percent must be made available to subgrantees by States. A State may provide in its annual plan for recipients of grants of less than $350,000 to use up to an additional 5 percent of such grants for administration if the State has determined that such recipient requires such additional amount to implement effectively the administrative requirements established by DOE pursuant to this part.
(f) No grant funds awarded under this part shall be used for any of the following purposes:
(1) To weatherize a dwelling unit which is designated for acquisition or clearance by a Federal, State, or local program within 12 months from the date weatherization of the dwelling unit would be scheduled to be completed; or
(2) To install or otherwise provide weatherization materials for a dwelling unit weatherized previously with grant funds under this part, except:
(i) As provided under §440.20;
(ii) If such dwelling unit has been damaged by fire, flood, or act of God and repair of the damage to weatherization materials is not paid for by insurance; or
(iii) That dwelling units partially weatherized under this part or under other Federal programs during the period September 30, 1975, through September 30, 1993, may receive further financial assistance for weatherization under this part. While DOE will continue to require these homes to be reported separately, States may count these homes as completions for the purposes of compliance with the per-home expenditure limit in §440.18. Each dwelling unit must receive a new energy audit which takes into account any previous energy conservation improvements to the dwelling.
§ 440.19 Labor.
Payments for labor costs under §440.18(c)(2) must consist of:
(a) Payments permitted by the Department of Labor to supplement wages paid to training participants, public service employment workers, or other Federal or State training programs; and
(b) Payments to employ labor or to engage a contractor (particularly a nonprofit organization or a business owned by disadvantaged individuals which performs weatherization services), provided a grantee has determined an adequate number of volunteers, training participants, public service employment workers, or other Federal or State training programs are
§ 440.20 Low-cost/no-cost weatherization activities.

(a) An eligible dwelling unit may be weatherized without regard to the limitations contained in §440.18 (e)(2) or §440.21(b) from funds designated by the grantee for carrying out low-cost/no-cost weatherization activities provided:

(1) Inexpensive weatherization materials are used, such as water flow controllers, furnace or cooling filters, or items which are primarily directed toward reducing infiltration, including weatherstripping, caulking, glass patching, and insulation for plugging and

(2) No labor paid with funds provided under this part is used to install weatherization materials referred to in paragraph (a)(1) of this section.

(b) A maximum of 10 percent of the amount allocated to a subgrantee, not to exceed $50 in materials costs per dwelling unit, may be expended to carry out low-cost/no-cost weatherization activities, unless the Support Office Director approves a higher expenditure per dwelling unit.

§ 440.21 Weatherization materials standards and energy audit procedures.

(a) Paragraph (b) of this section describes the required standards for weatherization materials. Paragraph (c)(1) of this section describes the performance and quality standards for renewable energy systems. Paragraph (c)(2) of this section specifies the procedures and criteria that are used for considering a petition from a manufacturer requesting the Secretary to certify an item as a renewable energy system.

(b) Only weatherization materials which are listed in appendix A to this part and which meet or exceed standards prescribed in appendix A to this part may be purchased with funds provided under this part. However, DOE may approve an unlisted material upon application from any State.

(c)(1) A system or technology shall not be considered by DOE to be a renewable energy system under this part unless:

(i) It will result in a reduction in oil or natural gas consumption;

(ii) It will not result in an increased use of any item which is known to be, or reasonably expected to be, environmentally hazardous or a threat to public health or safety;

(iii) Available Federal subsidies do not make such a specification unnecessary or inappropriate (in light of the most advantageous allocation of economic resources); and

(iv) If a combustion rated system, it has a thermal efficiency rating of at least 75 percent; or, in the case of a solar system, it has a thermal efficiency rating of at least 15 percent.

(2) Any manufacturer may submit a petition to DOE requesting the Secretary to certify an item as a renewable energy system.

(i) Petitions should be submitted to: Weatherization Assistance Program, Office of Energy Efficiency and Renewable, Mail Stop EE–2K, 1000 Independence Avenue, SW., Washington, DC 20585.

(ii) A petition for certification of an item as a renewable energy system must be accompanied by information demonstrating that the item meets the criteria in paragraph (c)(1) of this section.

(iii) DOE may publish a document in the Federal Register that invites public comment on a petition.
(iv) DOE shall notify the petitioner of the Secretary's action on the request within one year after the filing of a complete petition, and shall publish notice of approvals and denials in the Federal Register.

(d) Except for materials to eliminate health and safety hazards allowable under §440.18(c)(15), each individual weatherization material and package of weatherization materials installed in an eligible dwelling unit must be cost-effective. These materials must result in energy cost savings over the lifetime of the measure(s), discounted to present value, that equal or exceed the cost of materials, installation, and on-site supervisory personnel as defined by the Department. States have the option of requiring additional related costs to be included in the determination of cost-effectiveness. The cost of incidental repairs must be included in the cost of the package of measures installed in a dwelling.

(e) The energy audit procedures must assign priorities among individual weatherization materials in descending order of their cost-effectiveness according to paragraph (d) of this section after:

1. Adjusting for interaction between architectural and mechanical weatherization materials by using generally accepted engineering methods to decrease the estimated fuel cost savings for a lower priority weatherization material in light of fuel cost savings for a related higher priority weatherization material; and

2. Eliminating any weatherization materials that are no longer cost-effective, as adjusted under paragraph (e)(1) of this section.

(f) The energy audit procedures also must—

1. Compute the cost of fuel saved per year by taking into account the climatic data of the area where the dwelling unit is located, where the baseline temperature approximates the number of heating or cooling degree days (if used) reasonably approximates conditions when operation of heating and cooling equipment is required to maintain comfort, and must otherwise use reasonable energy estimating methods and assumptions.

2. Determine existing energy use and energy requirements of the dwelling unit from actual energy bills or by generally accepted engineering calculations.

3. Address significant heating and cooling needs.

4. Make provision for the use of advanced diagnostic and assessment techniques which DOE has determined are consistent with sound engineering practices.

5. Identify health and safety hazards to be abated with DOE funds in compliance with the State's DOE-approved health and safety procedures under §440.16(h).

6. Treat the dwelling unit as a whole by examining its heating and cooling system, its air exchange system, and its occupants' living habits and needs, and making necessary adjustments to the priority of weatherization materials with adequate documentation of the reasons for such an adjustment; and

7. Be specifically approved by DOE for use on each major dwelling type that represents a significant portion of the State's weatherization program in light of the varying energy audit requirements of different dwelling types including single-family dwellings, multi-family buildings, and mobile homes.

(g) For similar dwelling units without unusual energy-consuming characteristics, energy audits may be accomplished by using a priority list developed by conducting, in compliance with paragraphs (b) through (f) of this section, site-specific energy audits of a representative subset of these dwelling units. For DOE approval, States must describe how the priority list was developed, how the subset of similar homes was determined, and circumstances that will require site-specific audits rather than the use of the priority lists. States also must provide the input data and list of weatherization measures recommended by the energy audit software or manual methods for several dwelling units from the subset of similar units.

(h) States may use, as a part of an energy audit, general heat waste reduction weatherization materials that DOE has determined to be generally...
cost-effective. States may request approval to use general heat waste materials not listed in DOE policy guidance by providing documentation of their cost-effectiveness and a description of the circumstances under which such materials will be used.

(i) States must resubmit their energy audit procedures (and priority lists, if applicable, under certain conditions) to DOE for approval every five years. States must also resubmit to DOE, for approval every five years, their list of general heat waste materials in addition to those approved by DOE in policy guidance, if applicable. Policy guidance will describe the information States must submit to DOE and the circumstances that reduce or increase documentation requirements.

§ 440.22 Eligible dwelling units.

(a) A dwelling unit shall be eligible for weatherization assistance under this part if it is occupied by a family unit:

(1) Whose income is at or below 125 percent of the poverty level determined in accordance with criteria established by the Director of the Office of Management and Budget;

(2) Which contains a member who has received cash assistance payments under Title IV or XVI of the Social Security Act or applicable State or local law at any time during the 12-month period preceding the determination of eligibility for weatherization assistance; or

(3) If the State elects, is eligible for assistance under the Low-Income Home Energy Assistance Act of 1981, provided that such basis is at least 125 percent of the poverty level determined in accordance with criteria established by the Director of the Office of Management and Budget.

(b) A subgrantee may weatherize a building containing rental dwelling units using financial assistance for dwelling units eligible for weatherization assistance under paragraph (a) of this section, where:

(1) The subgrantee has obtained the written permission of the owner or his agent;

(2) Not less than 66 percent (50 percent for duplexes and four-unit buildings, and certain eligible types of large multi-family buildings) of the dwelling units in the building:

(i) Are eligible dwelling units, or

(ii) Will become eligible dwelling units within 180 days under a Federal, State, or local government program for rehabilitating the building or making similar improvements to the building; and

(3) The grantee has established procedures for dwellings which consist of a rental unit or rental units to ensure that:

(i) The benefits of weatherization assistance in connection with such rental units, including units where the tenants pay for their energy through their rent, will accrue primarily to the low-income tenants residing in such units;

(ii) For a reasonable period of time after weatherization work has been completed on a dwelling containing a unit occupied by an eligible household, the tenants in that unit (including households paying for their energy through their rent) will not be subjected to rent increases unless those increases are demonstrably related to matters other than the weatherization work performed; and

(iv) No undue or excessive enhancement shall occur to the value of the dwelling units.

(c) In order to secure the Federal investment made under this part and address the issues of eviction from and sale of property receiving weatherization materials under this part, States may seek landlord agreement to placement of a lien or to other contractual restrictions;

(d) As a condition of having assistance provided under this part with respect to multifamily buildings, a State may require financial participation, when feasible, from the owners of such buildings. Such financial participation...
shall not be reported as program income, nor will it be treated as if it were appropriated funds. The funds contributed by the landlord shall be expended in accordance with the agreement between the landlord and the weatherization agency.

(e) In devising procedures under paragraph (b)(3)(iii) of this section, States should consider requiring use of alternative dispute resolution procedures including arbitration.

(f) A State may weatherize shelters. For the purpose of determining how many dwelling units exist in a shelter, a grantee may count each 800 square feet of the shelter as a dwelling unit or it may count each floor of the shelter as a dwelling unit.

§ 440.23 Oversight, training, and technical assistance.

(a) The Secretary and the appropriate Support Office Director, in coordination with the Secretary of Health and Human Services, shall monitor and evaluate the operation of projects carried out by CAA's receiving financial assistance under this part through on-site inspections, or through other means, in order to ensure the effective provision of weatherization assistance for the dwelling units of low-income persons.

(b) DOE shall also carry out periodic evaluations of a program and weatherization projects that are not carried out by a CAA and that are receiving financial assistance under this part.

(c) The Secretary and the appropriate Support Office Director, the Comptroller General of the United States, and for a weatherization project carried out by a CAA, the Secretary of Health and Human Services or any of their duly authorized representatives, shall have access to any books, documents, papers, information, and records of any weatherization project receiving financial assistance under the Act for the purpose of audit and examination.

(d) Each grantee shall ensure that audits by or on behalf of subgrantees are conducted with reasonable frequency, on a continuing basis, or at scheduled intervals, usually annually, but not less frequently than every two years, in accordance with 10 CFR part 600, and OMB Circular 110, Attachment F, as applicable.

(e) The Secretary may reserve from the funds appropriated for any fiscal year an amount not to exceed 10 percent to provide, directly or indirectly, training and technical assistance to any grantee or subgrantee. Such training and technical assistance may include providing information concerning conservation practices to occupants of eligible dwelling units.

§ 440.24 Recordkeeping.

Each grantee or subgrantee receiving Federal financial assistance under this part shall keep such records as DOE shall require, including records which fully disclose the amount and disposition by each grantee and subgrantee of the funds received, the total cost of a weatherization project or the total expenditure to implement the State plan for which assistance was given or used, the source and amount of funds for such project or program not supplied by DOE, the average costs incurred in weatherization of individual dwelling units, the average size of the dwelling being weatherized, the average income of households receiving assistance under this part, and such other records as DOE deems necessary for an effective audit and performance evaluation. Such recordkeeping shall be in accordance with the DOE Financial Assistance Rule, 10 CFR part 600, and any further requirements of this part.

§ 440.25 Reports.

DOE may require any recipient of financial assistance under this part to provide, in such form as may be prescribed, such reports or answers in writing to specific questions, surveys, or questionnaires as DOE determines to be necessary to carry out its responsibilities or the responsibilities of the Secretary of Health and Human Services under this part.

(Approved by the Office of Management and Budget under control number 1901–0127)
§ 440.30 Administrative review.

(a) An applicant shall have 20 days from the date of receipt of a decision under § 440.12 or § 440.13 to file a notice requesting administrative review. If an applicant does not timely file such a notice, the decision under § 440.12 or § 440.13 shall become final for DOE.

(b) A notice requesting administrative review shall be filed with the Support Office Director and shall be accompanied by a written statement containing supporting arguments and requesting, if desired, the opportunity for a public hearing.

(c) A notice or any other document shall be deemed filed under this section upon receipt.

(d) On or before 15 days from receipt of a notice requesting administrative review which is timely filed, the Support Office Director shall forward to the Deputy Assistant Secretary, the notice requesting administrative review, the decision under § 440.12 or § 440.13 as to which administrative review is sought, a draft recommended final decision for the concurrence of the Deputy Assistant Secretary, and any other relevant material.

(e) If the applicant requests a public hearing, the Deputy Assistant Secretary, within 15 days, shall give actual notice to the State and FEDERAL REGISTER notice of the date, place, time, and procedures which shall apply to the public hearing. Any public hearing under this section shall be informal and legislative in nature.

(f) On or before 45 days from receipt of documents under paragraph (d) of this section or the conclusion of the public hearing, whichever is later, the Deputy Assistant Secretary shall concur in, concur in as modified, or issue a substitute for the recommended decision of the Support Office Director.

(g) On or before 15 days from the date of receipt of the determination under paragraph (f) of this section, the Governor may file an application, with a supporting statement of reasons, for discretionary review by the Assistant Secretary. On or before 15 days from filing, the Assistant Secretary shall send a notice to the Governor stating whether the Deputy Assistant Secretary's determination will be reviewed. If the Assistant Secretary grants review, a decision shall be issued no later than 60 days from the date review is granted. The Assistant Secretary may not issue a notice or decision under this paragraph without the concurrence of the DOE Office of General Counsel.

(h) A decision under paragraph (f) of this section shall be final for DOE if there is no review under paragraph (g) of this section. If there is review under paragraph (g) of this section, the decision thereunder shall be final for DOE, and no appeal shall lie elsewhere in DOE.

(i) Prior to the effective date of the termination of eligibility for further participation in the program because of failure to comply substantially with the requirements of the Act or of this part, a grantee shall have the right to written notice of the basis for the enforcement action and the opportunity for a public hearing notwithstanding any provisions to contrary of 10 CFR 600.26, 600.28(b), 600.29, 600.121(c), and 600.443. A notice under this paragraph shall be mailed by the Support Office Director by registered mail, return-receipt requested, to the State, local grantee, and other interested parties.

To obtain a public hearing, the grantee must request an evidentiary hearing, with prior FEDERAL REGISTER notice, in the election letter submitted under Rule 2 of 10 CFR 1024.4 and the request shall be granted notwithstanding any provisions of Rule 2 to the contrary.

APPENDIX A TO PART 440—STANDARDS FOR WEATHERIZATION MATERIALS

The following Government standards are produced by the Consumer Product Safety Commission and are published in title 16, Code of Federal Regulations:

Fire Safety Requirements for Thermal Insulating Materials According to Insulation Use—Attic Floor—insulation materials intended for exposed use in attic floors shall be capable of meeting the same flammability...
requirements given for cellulose insulation in 16 CFR part 1209.

Enclosed spaces—insulation materials intended for use within enclosed stud or joist spaces shall be capable of meeting the smoldering combustion requirements in 16 CFR part 1209.

The following standards which are not otherwise set forth in part 440 are incorporated by reference and made a part of part 440. The following standards have been approved for incorporation by reference by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. These materials are incorporated as they exist on April 5, 1993 and a notice of any change in these materials will be published in the Federal Register. The standards incorporated by reference are available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

The standards incorporated by reference in part 440 can be obtained from the following sources:

Air Conditioning and Refrigeration Institute, 1501 Wilson Blvd., Arlington, VA 22209; (703) 524-8800.

THERMAL INSULATING MATERIALS FOR BUILDING ELEMENTS INCLUDING WALLS, FLOORS, CEILINGS, ATTICS, AND ROofs

[Standards for conformance]

Insulation—mineral fiber:

- Insulation—mineral cellular:
  - Vermiculite loose-fill insulation. ASTM C516–80
  - Perlite loose-fill insulation .... (1986).
- Perlite insulation board ........ ASTM C728–89a.
- Insulation—organic fiber:
  - Cellulosic fiber insulation board. ASTM C208–72
- Insulation-organic cellular:
  - Preformed block-type polyurethane insulation board. ASTM C578–87a.
  - Rigid preformed polyurethane insulation board. ASTM C591–85.
  - Polyurethane or polyisocyanurate insulation board faced with aluminum foil on both sides. FS HH–I–1972/1

(Amendment 1, October 3, 1985.)
**Department of Energy**

§ 451.1 Purpose and scope.

(a) The provisions of this part cover the policies and procedures applicable to the determinations by the Department of Energy (DOE) to make incentive payments, under the authority of 42 U.S.C. 13317, for electric energy generated and sold by a qualified renewable energy facility owned by a State or political subdivision thereof; a nonprofit electric cooperative; a public utility described in section 115 of the Internal Revenue Code of 1986; an Indian tribal government or subdivision thereof; or a Native corporation. (b) Determinations to make incentive payments under this part are not subject to the provisions of 10 CFR part 600 and such payments shall not be construed to be financial assistance.

[58 FR 12529, Mar. 4, 1993, as amended at 69 FR 18903, Apr. 9, 2004]
§ 451.2 Definitions.

As used in this part—

Biomass means biologically generated energy sources such as heat derived from combustion of plant matter, or from combustion of gases or liquids derived from plant matter, animal wastes, or sewage, or from combustion of gases (derived from landfills, or hydrogen derived from these same sources).

Closed-loop biomass means any organic material from a plant which is planted exclusively for purposes of being used as a qualified renewable energy facility to generate electricity.

Date of first use means, at the option of the facility owner, the date of the first kilowatt-hour sale, the date of completion of facility equipment testing, or the date when all approved permits required for facility construction are received.

Deciding Official means the Manager of the Golden Field Office of the Department of Energy (or any DOE official to whom the authority of the Manager of the Golden Field Office may be redelegated by the Secretary of Energy).

DOE means the Department of Energy.

Finance Office means the DOE Office of the Chief Financial Officer (or any office to which that Office's authority may be redelegated by the Secretary of Energy).

Fiscal year means the Federal fiscal year beginning October 1 and ending on September 30 of the following calendar year.

Indian tribal government means the governing body of an Indian tribe as defined in section 4 of the Indian Self-Determination and Education Assistance Act (25 U.S.C. 450b).

Native corporation has the meaning set forth in the Alaska Native Claims Settlement Act (25 U.S.C. 1602).

Net electric energy means the metered kilowatt-hours (kWh) generated and sold, and excludes electric energy used within the renewable energy facility to power equipment such as pumps, motors, controls, lighting, heating, cooling, and other systems needed to operate the facility.

Not-for-profit electrical cooperative means a cooperative association that is legally obligated to operate on a not-for-profit basis and is organized under the laws of any State for the purpose of providing electric service to its members.

Ocean means the waters of the Atlantic Ocean (including the Gulf of Mexico) and the Pacific Ocean within the jurisdiction of the United States from which energy may be derived through application of tides, waves, currents, thermal differences, or other means.

Renewable energy facility means a single module or unit, or an aggregation of such units, that generates electric energy which is independently metered and which results from the utilization of a renewable energy source.

Renewable energy source means solar heat, solar light, wind, ocean, geothermal heat, and biomass, except for—

(1) Heat from the burning of municipal solid waste; or

(2) Heat from a dry steam geothermal reservoir which—

(i) Has no mobile liquid in its natural state;

(ii) Is a fluid composed of at least 95 percent water vapor; and

(iii) Has an enthalpy for the total produced fluid greater than or equal to 2.791 megajoules per kilogram (1200 British thermal units per pound).

State means the District of Columbia, Puerto Rico, and any of the States, Commonwealths, territories, and possessions of the United States.

§ 451.3 Who may apply.

Any owner, or operator with the written consent of the owner, but not both, of a qualified renewable energy facility, may apply for incentive payments for net electric energy generated from a renewable energy source and sold.

§ 451.4 What is a qualified renewable energy facility.

In order to qualify for an incentive payment under this part, a renewable energy facility must meet the following qualifications—

(a) Owner qualifications. The owner must be—
§ 451.6 Duration of incentive payments.

Subject to the availability of appropriated funds, DOE shall make incentive payments under this part with respect to a qualified renewable energy facility for 10 consecutive fiscal years. Such period shall begin with the fiscal year in which application for payment for electricity generated by the facility is first made and the facility is determined by DOE to be eligible for receipt
§ 451.7 Metering requirements.

The net electric energy generated and sold (kilowatt-hours) by the owner or operator of a qualified renewable energy facility must be measured by a standard metering device that—

(a) Meets generally accepted industry standards;

(b) Is maintained in proper working order according to the instructions of its manufacturer; and

(c) Is calibrated according to generally accepted industry standards.

§ 451.8 Application content requirements.

An application for an incentive payment under this part must be signed by an authorized executive official and shall provide the following information—

(a) A statement indicating that the applicant is the owner of the facility or is the operator of the facility and has the written consent of an authorized executive official of the owner to file an application;

(b) The name of the facility or other official designation;

(c) The location and address of the facility and type of renewable energy source;

(d) The name, address, and telephone number of a point of contact to respond to questions or requests for additional information;

(e) A clear statement of how the application satisfies each and every part of the eligibility criteria under § 451.4;

(f) A statement of the annual and monthly metered net electric energy generated and sold during the prior fiscal year by the qualified renewable energy facility, measured in kilowatt-hours, for which an incentive payment is requested;

(g) In the case of a qualified renewable energy facility which generates electric energy using a fossil fuel, nuclear energy, or other non-qualified energy source in addition to using a renewable energy source, a statement of the net electric energy generated, measured in kilowatt-hours, attributable to the renewable energy source, including a calculation showing the total monthly and annual kilowatt-hours generated and sold during the fiscal year multiplied by a fraction consisting of the heat input, as measured in appropriate energy units, received by the working fluid from the renewable energy sources divided by the heat input, as measured in the same energy units, received by the working fluid from all energy sources;

(h) The total amount of electric energy for which payment is requested, including the net electric energy generated in the prior fiscal year, as determined according to paragraph (f) or (g) of this section;

(i) Copies of permit authorizations if the date of first use is based on permit approvals and this is the initial application;

(j) Instructions for payment by electronic funds transfer;

(k) A statement agreeing to retain records for a period of three (3) years which substantiate the annual and monthly metered number of kilowatt-hours generated and sold, and to provide access to, or copies of, such records within 30 days of a written request by DOE; and

(l) A statement signed by an authorized executive official certifying that the information contained in the application is accurate.

(m) If a not-for-profit electric cooperative, a statement certifying that no claim for tax credit has been made for the same electricity for which incentive payments are requested.

§ 451.9 Procedures for processing applications.

(a) Supplemental information. DOE may request supplementary information relating to the application.

(b) Audits. DOE may require the applicant to conduct at its own expense and submit an independent audit, or DOE may conduct an audit, to verify the number of kilowatt-hours claimed to have been generated and sold by the qualified renewable energy facility and for which an incentive payment has been requested or made.
Department of Energy § 451.9

(c) DOE determinations. The Assistant Secretary for Energy Efficiency and Renewable Energy shall determine the extent to which appropriated funds are available to be obligated under this program for each fiscal year. Upon evaluating each application and any other relevant information, DOE shall further determine:

1. Eligibility of the applicant for receipt of an incentive payment, based on the criteria for eligibility specified in this part;
2. The number of kilowatt-hours to be used in calculating a potential incentive payment, based on the net electric energy generated from a qualified renewable energy source at the qualified renewable energy facility and sold during the prior fiscal year;
3. The number of kilowatt-hours to be used in calculating a potential additional incentive payment, based on the total quantity of accrued energy generated during prior fiscal years;
4. The amounts represented by 60 percent of available funds and by 40 percent of available funds; and
5. Whether justification exists for altering the 60:40 payment ratio specified in paragraph (e) of this section. If DOE intends to modify the 60:40 ratio, the Department shall notify Congress, setting forth reasons for such change.

(d) Calculating payments. Subject to the provisions of paragraph (e) of this section, potential incentive payments under this part shall be determined by multiplying the number of kilowatt-hours determined under §451.9(c)(2) by 1.5 cents per kilowatt-hour, and adjusting that product for inflation for each fiscal year beginning after calendar year 1993 in the same manner as provided in section 29(d)(2)(B) of the Internal Revenue Code of 1986, except that in applying such provisions calendar year 1993 shall be substituted for calendar year 1979. Using the same procedure, a potential additional payment shall be determined for the number of kilowatt-hours determined under paragraph (c)(3) of this section. If the sum of these calculated payments does not exceed the funds determined to be available by the Assistant Secretary for Energy Efficiency and Renewable Energy under §451.9(c), DOE shall make payments to all qualified applicants.

(e) Insufficient funds. If funds are not sufficient to make full incentive payments to all qualified applicants, DOE shall—

1. Calculate potential incentive payments, if necessary on a pro rata basis, not to exceed 60 percent of available funds to owners or operators of qualified renewable energy facilities using solar, wind, ocean, geothermal, and closed-loop biomass technologies based on prior year energy generation;
2. Calculate potential incentive payments, if necessary on a pro rata basis, not to exceed 40 percent of available funds to owners or operators of all other qualified renewable energy facilities based on prior year energy generation;
3. If the amounts calculated in paragraph (e)(1) and (2) of this section result in one owner group with insufficient funds and one with excess funds, allocate excess funds to the owner group with insufficient funds and calculate additional incentive payments, on a pro rata basis if necessary, to such owners or operators based on prior year energy generation.
4. If potential payments calculated in paragraphs (e)(1), (2), and (3) of this section do not exceed available funding, allocate 60% of remaining funds to paragraph (e)(1) recipients and 40% to paragraph (e)(2) recipients and calculate additional incentive payments, if necessary on a pro rata basis, to owners or operators based on accrued energy;
5. If the amounts calculated in paragraph (e)(4) of this section result in one owner group with insufficient funds and one with excess funds, allocate excess funds to the owner group with insufficient funds and calculate additional incentive payments, on a pro rata basis if necessary, to such owners or operators based on accrued energy.
6. Notify Congress if potential payments resulting from paragraphs (e)(3) or (5) of this section above will result in alteration of the 60:40 payment ratio;
7. Make incentive payments based on the sum of the amounts determined in paragraphs (e)(1) through (5) of this section for each applicant;
8. Treat the number of kilowatt-hours for which an incentive payment
is not made as a result of insufficient funds as accrued energy for which future incentive payment may be made; and

(9) Maintain a record of each applicant’s accrued energy.

(f) Notice to applicant. After calculating the amount of the incentive payment under paragraphs (e) through (g) of this section, the DOE Deciding Official shall then issue a written notice of the determination to the applicant—

(1) Approving the application as eligible for payment and forwarding a copy to the DOE Finance Office with a request to pay;

(2) Setting forth the calculation of the approved amount of the incentive payment; and

(3) Stating the amount of accrued energy, measured in kilowatt-hours, for each qualified renewable energy facility, if any, and the energy source for same.

(g) Disqualification. If the application does not meet the requirements of this part or some of the kilowatt-hours claimed in the application are disallowed as unqualified, the Deciding Official shall issue a written notice denying the application in whole or in part with an explanation of the basis for denial.

§ 451.10 Administrative appeals.

(a) In order to exhaust administrative remedies, an applicant who receives a notice denying an application in whole or in part shall appeal, on or before 45 days from date of the notice issued by the DOE Deciding Official, to the Office of Hearings and Appeals, 1000 Independence Avenue, S.W., Washington, D.C. 20585, in accordance with the procedures set forth in subpart C of 10 CFR part 1003.

(b) If an applicant does not appeal under paragraph (a) of this section, the determination of the DOE Deciding Official shall become final for DOE and judicially unreviewable.

(c) If an applicant appeals on a timely basis under paragraph (a) of this section, the decision and order of the Office of Hearings and Appeals shall be final for DOE.

(d) If the Office of Hearings and Appeals orders an incentive payment, the DOE Deciding Official shall send a copy of such order to the DOE Finance Office with a request to pay.

PART 455—GRANT PROGRAMS FOR SCHOOLS AND HOSPITALS AND BUILDINGS OWNED BY UNITS OF LOCAL GOVERNMENT AND PUBLIC CARE INSTITUTIONS

Subpart A—General Provisions

Sec.

455.1 Purpose and scope.

455.2 Definitions.

455.3 Administration of grants.

455.4 Recordkeeping.

455.5 Suspension and termination of grants.

Subpart B—State Plan Development and Approval

455.20 Contents of State Plan.

455.21 Submission and approval of State Plans and State Plan amendments.

Subpart C—Allocation of Appropriations Among the States

455.30 Allocation of funds.

455.31 Allocation formulas.

455.32 Reallocation of funds.

Subpart D—Preliminary Energy Audit and Energy Audit Grants [Reserved]

Subpart E—Technical Assistance Programs for Schools, Hospitals, Units of Local Government, and Public Care Institutions

455.60 Purpose.

455.61 Eligibility.

455.62 Contents of a technical assistance program.

455.63 Cost-effectiveness testing.

455.64 Life-cycle cost methodology.

Subpart F—Energy Conservation Measures for Schools and Hospitals

455.70 Purpose.

455.71 Eligibility.

455.72 Scope of the grant.

Subpart G—State Administrative Expenses

455.80 Purpose.

455.81 Eligibility.
§ 455.1 Purpose and scope.

(a) This part establishes programs of financial assistance pursuant to Title III of the Energy Policy and Conservation Act, as amended, 42 U.S.C. 6371 et seq.

(b) This part authorizes grants to States or to public or non-profit schools and hospitals to assist them in conducting preliminary energy audits and energy audits, in identifying and implementing energy conservation maintenance and operating procedures, and in evaluating, acquiring, and installing energy conservation measures, including renewable resource measures, to reduce the energy use and anticipated energy costs of buildings owned by schools and hospitals.

(c) This part also authorizes grants to States or units of local government and public care institutions to assist...
§ 455.2 Definitions.

Assistant Secretary means the Assistant Secretary for Conservation and Renewable Energy or any official to whom the Assistant Secretary’s functions may be redelegated by the Secretary.

Auditor means any person who is qualified in accordance with 10 CFR 450.44 and with State requirements pursuant to §455.20(k), to conduct an energy audit.

Building means any structure, including a group of closely situated structural units that are centrally metered or served by a central utility plant, or an eligible portion thereof, the construction of which was completed on or before May 1, 1989, which includes a heating or cooling system, or both.

Civil rights requirements means civil rights responsibilities of applicants and grantees pursuant to 10 CFR 1040.44 and with State requirements pursuant to §455.20(k), to conduct an energy audit.

Complex means a closely situated group of buildings on a contiguous site such as a school or college campus or multibuilding hospital.

Construction completion means the date of issuance of an occupancy permit for a building or the date the building is ready for occupancy as determined by DOE.

Cooling degree days means the annual sum of the number of Fahrenheit degrees of each day’s mean temperature above 65° for a given locality.

Coordinating agency means a State or any public or nonprofit organization legally constituted within a State which provides either administrative control or services for a group of institutions within a State and which acts on behalf of such institutions with respect to their participation in the program.

Deputy Assistant Secretary means the Deputy Assistant Secretary for Technical and Financial Assistance or any official to whom the Deputy Assistant Secretary’s functions may be redelegated by the Assistant Secretary.

DOE means the Department of Energy.

Energy audit means a determination of the energy consumption characteristics of a building which:

(1) Identifies the type, size, and rate of energy consumption of such building and the major energy-consuming systems of such building;

(2) Determines appropriate energy conservation maintenance and operating procedures;

(3) Indicates the need, if any, for the acquisition and installation of energy conservation measures; and

(4) If paid for with financial assistance under this part, complies with 10 CFR 450.43.

Energy conservation maintenance and operating procedures means modifications in the maintenance and operations of a building and any installation therein which are designed to reduce the energy consumption in such building and which require no significant expenditure of funds, including, but not limited to:

(1) Effective operation and maintenance of ventilation systems and control of infiltration conditions, including:

(i) Repair of caulking or weatherstripping around windows and doors;

(ii) Reduction of outside air intake, shutting down ventilation systems in unoccupied areas, and shutting down ventilation systems when the building is not occupied; and

(iii) Assuring central or unitary ventilation controls, or both, are operating properly;
(2) Changes in the operation and maintenance of heating or cooling systems through:
   (i) Lowering or raising indoor temperatures;
   (ii) Locking thermostats;
   (iii) Adjusting supply or heat transfer medium temperatures; and
   (iv) Reducing or eliminating heating or cooling at night or at times when a building or complex is unoccupied;

(3) Changes in the operation and maintenance of lighting systems through:
   (i) Reducing illumination levels;
   (ii) Maximizing use of daylight;
   (iii) Using higher efficiency lamps; and
   (iv) Reducing or eliminating evening cleaning of buildings;

(4) Changes in the operation and maintenance of water systems through:
   (i) Repairing leaks;
   (ii) Reducing the quantity of water used, e.g., using flow restrictors;
   (iii) Lowering settings for hot water temperatures; and
   (iv) Raising settings for chilled water temperatures;

(5) Changes in the maintenance and operating procedures of the building's mechanical systems through:
   (i) Cleaning equipment;
   (ii) Adjusting air/fuel ratio;
   (iii) Monitoring combustion;
   (iv) Adjusting fan, motor, or belt drive systems;
   (v) Maintaining steam traps; and
   (vi) Repairing distribution pipe insulation; and

(6) Such other actions relating to operations and maintenance procedures as the State may determine useful or necessary. In general, energy conservation maintenance and operating procedures involve cleaning, repairing or adjusting existing equipment rather than acquiring new equipment.

Energy conservation measure means an installation or modification of an installation in a building which is primarily intended to maintain (in the case of load management systems) or reduce energy consumption and reduce energy costs, or allow the use of an alternative energy source, including, but not limited to:

(1) Insulation of the building structure and systems within the building:

(2) Storm windows and doors, multi-glazed windows and doors, heat-absorbing or heat-reflective glazed and coated windows and door systems, additional glazing, reductions in glass area, and other window and door systems modifications;

(3) Automatic energy control systems which would reduce energy consumption;

(4) Load management systems which would shift demand for energy from peak hours to hours of low demand and lower cost;

(5) Equipment required to operate variable steam, hydraulic, and ventilating systems adjusted by automatic energy control systems;

(6) Active or passive solar space heating or cooling systems, solar electric generating systems, or any combination thereof;

(7) Active or passive solar water heating systems;

(8) Furnace or utility plant and distribution system modifications including:
   (i) Replacement burners, furnaces, boilers, or any combination thereof which substantially increase the energy efficiency of the heating system;
   (ii) Devices for modifying flue openings which will increase the energy efficiency of the heating system;
   (iii) Electrical or mechanical furnace ignition systems which replace standing gas pilot lights; and
   (iv) Utility plant system conversion measures including conversion of existing oil- and gas-fired boiler installations to alternative energy sources;

(9) Addition of caulking and weather-stripping;

(10) Replacement or modification of lighting fixtures (including exterior light fixtures which are physically attached to, or connected to, the building) to increase the energy efficiency of the lighting system without increasing the overall illumination of a facility, unless such increase in illumination is necessary to conform to any applicable State or local building code or, if no such code applies, the increase is considered appropriate by DOE;

(11) Energy recovery systems;

(12) Cogeneration systems which produce steam or forms of energy such as heat as well as electricity for use
primarily within a building or a complex of buildings owned by an eligible institution and which meet such fuel efficiency requirements as DOE may by rule prescribe;

(13) Such other measures as DOE identifies by rule for purposes of this part as set forth in subpart D of 10 CFR part 450; and

(14) Such other measures as a grant applicant shows will save a substantial amount of energy and as are identified in an energy audit or energy use evaluation in accordance with §455.20(k) or a technical assistance report in accordance with §455.62.

Energy use evaluation means a determination of:

(1) Whether the building is a school facility, hospital facility, or a building owned and primarily occupied and used throughout the year by a unit of local government or by a public care institution;

(2) The name and address of the owner of record, indicating whether owned by a public institution, private nonprofit institution, or an Indian tribe;

(3) The building's potential suitability for renewable resource applications;

(4) Major changes in functional use or mode of operation planned in the next 15 years, such as demolition, disposal, rehabilitation, or conversion from office to warehouse;

(5) Appropriate energy conservation maintenance and operating procedures which have been implemented for the building;

(6) The need, if any, for the acquisition and installation of energy conservation measures including an assessment of the estimated costs and energy and cost savings likely to result from the purchase and installation of one or more energy conservation measures and an evaluation of the need and potential for retrofit based on consideration of one or more of the following:

(i) An energy use index or indices, for example, Btu's per gross square foot per year;

(ii) An energy cost index or indices, for example, annual energy costs per gross square foot; or

(iii) The physical characteristics of the building envelope and major energy-using systems; and

(7) Such other information as the State has determined useful or necessary, in accordance with §455.20(k).

Fuel means any commercial source of energy used within the building or complex being surveyed such as natural gas, fuel oil, electricity, or coal.

Governor means the chief executive officer of a State including the Mayor of the District of Columbia or a person duly designated in writing by the Governor to act on her or his behalf.

Grant program cycle means the period of time specified by DOE which relates to the fiscal year or years for which monies are appropriated for grants under this part, during which one complete cycle of DOE grant activity occurs including fund allocations to the States; applications receipt, review, approval, or disapproval; and award of grants by DOE but which does not include the grantee's performance period.

Grantee means the entity or organization named in the Notice of Financial Assistance Award as the recipient of the grant.

Gross square feet means the sum of all heated or cooled floor areas enclosed in a building, calculated from the outside dimensions or from the centerline of common walls.

Heating or cooling system means any mechanical system for heating, cooling, or ventilating areas of a building including a system of through-the-wall air conditioning units.

Heating degree days means the annual sum of the number of Fahrenheit degrees for each day's mean temperature below 65°F for a given locality.

Hospital means a public or nonprofit institution which is a general hospital, tuberculosis hospital, or any other type of hospital other than a hospital furnishing primarily domiciliary care and which is duly authorized to provide hospital services under the laws of the State in which it is situated.

Hospital facilities means buildings housing a hospital and related facilities including laboratories, laundries, outpatient departments, nurses' residence and training facilities, and central service facilities operated in connection with a hospital; it also includes

602
buildings containing education or training facilities for health profession personnel operated as an integral part of a hospital.

Indian tribe means any tribe, band, nation, or other organized group or community of Indians including any Alaska native village or regional or tribal corporation, as defined in or established pursuant to, the Alaska Native Claims Settlement Act, Public Law 92–203, 85 Stat. 688, which (a) is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians; or (b) is located on, or in proximity to, a Federal or State reservation or rancheria.

Load management system means a device or devices which are designed to shift energy use to hours of low demand in order to reduce energy costs and which do not cause more energy to be used than was used before their installation.

Local educational agency means a public board of education or other public authority or a nonprofit institution legally constituted within, or otherwise recognized by, a State either for administrative control or direction of, or to perform administrative services for, a group of schools within a State.

Maintenance means activities undertaken in a building to assure that equipment and energy-using systems operate effectively and efficiently.

Marketing means a program or activity managed or performed by the State including but not limited to:

(1) Obtaining non-Federal funds to finance energy conservation measures consistent with this part;
(2) Making site visits to school and hospital officials to review program opportunities;
(3) Giving presentations to groups such as school or hospital officials and personnel; and
(4) Preparing and disseminating articles in publications directed to school and hospital personnel.

Native American means a person who is a member of an Indian tribe.

Non-Federal funds means financing sources obtained or arranged for by a State as a result of the State program(s) pursuant to §455.20(j), to be used to pay for energy conservation measures for institutions eligible under this part, and includes petroleum violation escrow funds except for those funds required to be treated as if they were Federal funds by statute, court order, or settlement agreement.

Operating means the operation of equipment and energy-using systems in a building to achieve or maintain specified levels of environmental conditions of service.

Owned or owns means property interest which is or shall become a fee simple title in a building or complex.

Preliminary energy audit means a determination of the energy consumption characteristics of a building including the size, type, rate of energy consumption, and major energy-using systems of such building which if paid for with financial assistance under this part, complies with 10 CFR 450.42.

Primarily occupied means that in excess of 50 percent of a building's square footage or time of occupancy is occupied by a public care institution or an office or agency of a unit of local government.

Program assistance means a program or activity managed or performed by the State and designed to provide support to eligible institutions to help ensure the effectiveness of energy conservation programs carried out consistent with this part including such relevant activities as:

(1) Evaluating the services and reports of consulting engineers;
(2) Training school or hospital personnel to perform energy accounting and to identify and implement energy conservation maintenance and operating procedures;
(3) Monitoring the implementation and operation of energy conservation measures; and
(4) Aiding in the procurement of energy-efficient equipment.

Public care institution means a public or nonprofit institution which owns:

(1) A facility for long-term care, rehabilitation facility, or public health center, as described in section 1624 of the Public Health Service Act (42 U.S.C. 300s–3; 88 Stat. 2270); or
(2) A residential child care center which is an institution, other than a
foster home, operated by a public or nonprofit institution. It is primarily intended to provide full-time residential care, with an average length of stay of at least 30 days, for at least 10 minor persons who are in the care of such institution as a result of a finding of abandonment or neglect or of being persons in need of treatment or supervision.

Public or nonprofit institution means an institution owned and operated by:

(1) A State, a political subdivision of a State, or an agency or instrumentality of either; or

(2) A school or hospital which is, or would be in the case of such entities situated in American Samoa, Guam, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands, exempt from income tax under section 501(c)(3) of the Internal Revenue Code of 1954; or

(3) A unit of local government or public care institution which is, or would be in the case of such entities situated in American Samoa, Guam, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands, exempt from income tax under section 501(c)(3) or 501(c)(4) of the Internal Revenue Code of 1954.

School means a public or nonprofit institution which:

(1) Provides, and is legally authorized to provide, elementary education or secondary education, or both, on a day or residential basis;

(2) Provides, and is legally authorized to provide, a program of education beyond secondary education, on a day or residential basis and:

(i) Admits as students only persons having a certificate of graduation from a school providing secondary education, or the recognized equivalent of such certificate;

(ii) Is accredited by a nationally recognized accrediting agency or association; and

(iii) Provides an educational program for which it awards a bachelor's degree or higher degree or provides not less than a 2-year program which is acceptable for full credit toward such a degree at any institution which meets the preceding requirements and which provides such a program;

(3) Provides not less than a 1-year program of training to prepare students for gainful employment in a recognized occupation and which meets the provisions cited in paragraph (2), and subparagraphs (2)(i), and (2)(ii) of this definition; or

(4) Is a local educational agency.

School facilities means buildings housing classrooms, laboratories, dormitories, administrative facilities, athletic facilities, or related facilities operated in connection with a school.

Secretary means the Secretary of the Department of Energy or his/her designee.

State means, in addition to the several States of the Union, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands.

State energy agency means the State agency responsible for developing State energy conservation plans pursuant to section 362 of the Energy Policy and Conservation Act (42 U.S.C. 6322) or, if no such agency exists, an agency designated by the Governor of such State to prepare and submit the State Plan required under section 394 of the Energy Policy and Conservation Act.

State hospital facilities agency means an existing agency which is broadly representative of the public hospitals and the nonprofit hospitals or, if no such agency exists, an agency designated by the Governor of such State which conforms to the requirements of this definition.

State school facilities agency means an existing agency which is broadly representative of public institutions of higher education, nonprofit institutions of higher education, public elementary and secondary schools, nonprofit elementary and secondary schools, public vocational education institutions, nonprofit vocational education institutions, and the interests of handicapped persons in a State or, if no
such agency exists, an agency which is designated by the Governor of such State which conforms to the requirements of this definition.

Support office director means the Director of the DOE field support office with the responsibility for grant administration or any official to whom that function may be redelegated.

Technical assistance means: (1) The conduct of specialized studies to identify and specify energy savings or energy cost savings that are likely to be realized as a result of the modification of maintenance and operating procedures in a building, the acquisition and installation of one or more specified energy conservation measures in a building, or both; and

(2) The planning or administration of such specialized studies. For schools and hospitals which are eligible to receive grants to carry out energy conservation measures, the term also means the planning or administration of specific remodeling, renovation, repair, replacement, or insulation projects related to the installation of energy conservation or renewable resource measures in a building.

Technical assistance program update means a brief revision to an existing technical assistance program report designed to provide current information such as that relating to energy use, equipment costs, and other data needed to substantiate an application for an energy conservation measure grant. Such an update shall be limited to the particular measures included in the related grant application together with any relevant data regarding interactions or relationships to previously installed energy conservation measures.

Unit of local government means the government of a county, municipality, parish, borough, or township which is a unit of general purpose government below the State level (such as a community, district, or region) free of charge and which derive at least 40 percent of their operating funds from tax revenues of a taxing authority below the State level.

§ 455.3 Administration of grants.

Grants provided under this part shall comply with applicable law, regulation, or procedure including, without limitation, the requirements of:

(a) The DOE Financial Assistance Rules (10 CFR part 600 as amended) except as otherwise provided in this rule;

(b) Executive Order 12372 entitled “Intergovernmental Review of Federal Programs” (48 FR 3130, January 24, 1983; 3 CFR, 1982 Comp., p. 197) and the DOE regulation implementing this Executive Order entitled “Intergovernmental Review of Department of Energy Programs and Activities” (10 CFR part 1005);

(c) Office of Management and Budget Circular A–97 entitled “Rules and Regulations Permitting Federal Agencies to Provide Specified or Technical Services to State and Local Units of Government under title III of the Intergovernmental Coordination Act of 1968” available from the Office of Management and Budget, Office of Publications Services, 725 17th Street, NW., Washington, DC 20503;

(d) DOE regulation entitled “Non-discrimination in Federally Assisted Programs” (10 CFR part 1040) which implements the following public laws: Title VI of the Civil Rights Act of 1964; section 16 of the Federal Energy Administration Act of 1974; section 401 of the Energy Reorganization Act of 1974; title IX of the Education Amendments of 1972; The Age Discrimination Act of 1975; and section 504 of the Rehabilitation Act of 1973; and

(e) Such other procedures applicable to this part as DOE may from time to time prescribe for the administration of financial assistance.

§ 455.4 Recordkeeping.

Each State or other entity within a State receiving financial assistance under this part shall make and retain records required and specified by the DOE Financial Assistance Rules, 10 CFR part 600, and this part.
§ 455.5 Suspension and termination of grants.

Suspension and termination procedures shall be as set forth in the DOE Financial Assistance Rules, 10 CFR part 600.

Subpart B—State Plan Development and Approval

§ 455.20 Contents of State Plan.

Each State shall develop and submit to DOE a State Plan for technical assistance programs and energy conservation measures, including renewable resource measures and, to the extent appropriate, program assistance, and/or marketing. The State Plan shall include:

(a) A statement setting forth the procedures by which the views of eligible institutions or coordinating agencies representing such institutions, or both, were solicited and considered during development of the State Plan and any amendment to a State Plan;

(b) The procedures the State will follow to notify eligible institutions and coordinating agencies of the content of the approved State Plan or any approved amendment to a State Plan;

(c) The procedures the State will follow to notify eligible institutions and coordinating agencies of the availability (each funding cycle) of funding under this program and related funding available from non-Federal sources to fund technical assistance programs and energy conservation measures consistent with this part;

(d) The procedures for submittal of grant applications to the State;

(e) The procedures to be used by the State for evaluating and ranking technical assistance and energy conservation measure grant applications pursuant to §§ 455.130 and 455.131, including the weights assigned to each criterion set forth in §§ 455.131(c)(1), (c)(2), (c)(3), (c)(4) and (c)(5). In addition, the State shall determine the order of priority given to fuel types that include oil, natural gas, and electricity, under § 455.131(c)(2);

(f) The procedures that the State will follow to insure that funds will be allocated equitably among eligible applicants within the State including procedures to insure that funds will not be allocated on the basis of size or type of institution, but rather on the basis of relative need, taking into account such factors as cost, energy consumption, and energy savings, in accordance with § 455.131;

(g) The procedures that the States will follow for identifying schools and hospitals experiencing severe hardship and for apportioning the funds that are available for schools and hospitals in a case of severe hardship. Such policies and procedures shall be in accordance with § 455.131;

(h) A statement setting forth the extent to which, and by which methods, the State will encourage utilization of solar space heating, cooling and electric systems, and solar water heating systems;

(i) The procedures to assure that all financial assistance under this part will be expended in compliance with the requirements of the State Plan, in compliance with the requirements of this part, and in coordination with other State and Federal energy conservation programs;

(j) If a State is eligible and elects to use up to 100 percent of the funds provided by DOE under this part for any fiscal year for program and technical assistance and/or up to 50 percent of such funds for marketing:

(1) A description of each activity the State proposes, including the procedures for program operation, monitoring, and evaluation;

(2) The level of funding to be used for each program and the source of those funds;

(3) The amount of the State's allocated funds that the State proposes to use for each;

(4) A description of the non-Federal financing mechanisms to be used to fund energy conservation measures in the State during the fiscal year;

(5) A description of the evaluation/selection criteria to be used by the State in determining which institutions receive funding for energy conservation measures;

(6) The procedures for assuring that all segments of the State's eligible institutions, including religiously affiliated institutions receive an equitable share of the assistance provided both
for program and technical assistance, marketing, and energy conservation measures;

(7) A description of how the State will track: the amount of total available funds by source; the amount of funds obligated against those funds; and any limits on types of institutions eligible for particular funding sources; and

(8) The procedures for assisting institutions which initially receive program, technical, or marketing assistance (as part of the State's special program(s)) in later participating in the State's program(s) to provide energy conservation measure funding;

(k) The requirements for an energy audit or an energy use evaluation, and the requirements for qualifications for auditors or persons who will conduct energy use evaluations in the State;

(l) With regard to energy conservation maintenance and operating procedures:

(1) The procedures to insure implementation of energy conservation maintenance and operating procedures in those buildings for which financial assistance is requested under this part;

(2) A provision that all maintenance and operating procedure changes recommended in an energy audit pursuant to §455.20(k), or in a technical assistance report under §455.62, or a combination of these are implemented as provided under this part; or

(3) An assurance that the maintenance and operating procedures will be implemented in the future, or a reasonable justification for not implementing such procedures, as appropriate;

(m) The procedures to assure that financial assistance under this part will be used to supplement, and not to supplant, State, local or other funds, including at least:

(1) The screening of applicants for eligibility for available State funds;

(2) The identification of applicants which are seeking or have obtained private sector funds; and,

(3) Limiting or excluding (at the option of the State) the availability of financial assistance under this part for funding particular measures for which funding is being provided by other sources in the State (such as utility rebates) together with any requirements for potential applicants to first seek other sources of funding and document the results of that attempt before seeking financial assistance under this part and a description of the State's plan to assist potential applicants in identifying and obtaining other sources of funding;

(n) The procedures for determining that technical assistance programs performed without the use of Federal funds and used as the basis for energy conservation measure grant applications have been performed in compliance with the requirements of §455.62, for the purposes of satisfying the eligibility requirements contained in §455.71(a)(3);

(o) The State's policy regarding reasonable selection of energy conservation measures for study in a technical assistance program including any restrictions based on category of building or on groups of structures where measures may, or may not, be appropriate for all the structures and any additional State requirements for the conduct of such a program;

(p) The procedures for State management, monitoring, and evaluation of technical assistance programs and energy conservation measures receiving financial assistance under this part. This includes any State requirements for hospital certifications from a State agency with descriptions of the review procedures and coordination process applicable in such cases. If there is no school facilities agency in the State, or if the existing agency does not certify all types of schools, it also includes any State requirements for an alternative review and certification process for schools;

(q) The circumstances under which the State requires an updated technical assistance program report to accompany an application for an energy conservation measure grant and the scope and contents of such an update;

(r) A description of the State's policies for establishing and insuring compliance with qualifications for technical assistance analysts. Such policies shall require that technical assistance analysts be free from financial interests which may conflict with the proper performance of their duties and have experience in energy conservation and:
§ 455.20  

(1) Be a registered professional engineer licensed under the regulatory authority of the State;  

(2) Be an architect-engineer team, the principal members of which are licensed under the regulatory authority of the State; or  

(3) Be otherwise qualified in accordance with such criteria as the State may prescribe in its State Plan to insure that individuals conducting technical assistance programs possess the appropriate training and experience in building energy systems;  

(s) The circumstances under which the State will or will not consider accepting applications for technical assistance programs or energy conservation measures which were included in earlier approved grant awards but which were not implemented and for which no funds were expended after the original grant award;  

(t) A statement setting forth:  

(1) An estimate of energy savings which may result from the modification of maintenance and operating procedures and installation of energy conservation measures;  

(2) A recommendation as to the types of energy conservation measures considered appropriate within the State; and  

(3) An estimate of the costs of carrying out technical assistance and energy conservation measure programs;  

(u) For purposes of the technical assistance program pursuant to § 455.62:  

(1) A statement setting forth uniform conversion factors to be used by all grant applicants in the technical assistance analysis for conversion of fuels to Btu equivalents. For the conversion of kilowatt hours to Btus, the State may use 3,413, representing consumption at the consumer’s end, or 11,600, representing consumption at the producer’s end, or may assign 3,413 to some types of energy conservation measures and 11,600 to other types of measures in which case the State shall specify the conversion factor to be used for each type of measure, providing a rationale and citing the sources used in making this decision, and the State shall always apply the specified factor consistently to all ECMs of a particular type;  

(2) A statement setting forth the cost-effectiveness testing approach to be used to evaluate energy conservation measures pursuant to § 455.63. States may select either the simple payback approach or the life-cycle costing approach. Only one approach may be used for all technical assistance programs in the State. If the State elects to use the life-cycle costing approach, it must specify, consistent with § 455.64(g), whether it will use DOE-provided or its own energy cost escalation rate or annual discount rate, together with any other procedures required to be used (in addition to those specified in § 455.64); and  

(3) A statement setting forth that 50 percent (or a higher percent) of total cost savings (used in calculating cost effectiveness pursuant to § 455.63(a)(1) for simple payback, or §§ 455.64(c) for life-cycle costing) must be from the cost of the energy to be saved.  

(v) For any coordinating agency, a description of how it will operate including but not limited to:  

(1) Name and address;  

(2) Type of institutions covered;  

(3) Application processing procedures;  

(4) Whether TA applications, ECM applications, or both are covered;  

(5) Intended schedule for soliciting and processing applications;  

(6) Any special provisions for religiously affiliated institutions;  

(7) Nature of subagreement to be used with institutions;  

(8) Whether TA or ECM contractors selected by the coordinating agency will be offered incident to, or as a condition in, subagreements; and  

(9) Other significant policies and procedures;  

(w) If a State elects to allow credit toward the cost share for an energy conservation measure for the costs of technical assistance programs, technical assistance program updates, or energy conservation measures previously incurred and wholly paid for with non-Federal funds, the policies regarding such credit, including any time limits for the age of the earlier-funded work being proposed for credit; and  

(x) The limit to the Federal share to be provided to applicants in the State if a State elects to provide less than a
§ 455.30 Allocation of funds.

(a) DOE will allocate available funds among the States for two purposes: to award grants to schools, hospitals, units of local government, and public care institutions and coordinating agencies representing them to implement technical assistance and energy conservation measures grant programs and to award grants to eligible States for administrative expenses, technical assistance programs, program assistance, and marketing expenses in accordance with this part.

(b) DOE shall notify each Governor of the total amount allocated for grants within the State for any grant program cycle:

1. For schools and hospitals, the allocation amount shall be for technical assistance programs, subject to any limitation placed on technical assistance, and energy conservation measures;

2. For States that are eligible pursuant to § 455.91, up to 100 percent of the funds allocated to the State by DOE may be used for technical assistance programs and/or for program assistance and up to 50 percent of the funds allocated to the State by DOE may be used for marketing as defined in § 455.2;

3. For States eligible under § 455.81, a portion of the allocation may be used for a grant to the State for administrative expenses as described in § 455.120;

4. For unit of local government and public care institutions, the allocation amount shall be solely for technical assistance programs; and

5. For coordinating agencies, the allocation amount shall be for either technical assistance programs subject to any limitation placed on technical assistance, or energy conservation measures, or both depending on how the coordinating agency elects to operate.

(c) DOE shall notify each Governor of the period for which funds allocated for a grant program cycle will be made available for grants within the State.

(d) Each State shall make available up to 10 percent of its allocation for schools and hospitals in each grant program cycle to provide financial assistance, not to exceed a 90 percent Federal share, for technical assistance programs and energy conservation measures for schools and hospitals determined to be in a class of severe hardship. Such determinations shall be made in accordance with § 455.132.
§ 455.31 Allocation formulas.
(a) Financial assistance for conducting technical assistance programs for units of local government and public care institutions shall be allocated among the States by multiplying the sum available by the allocation factor set forth in paragraph (c) of this section.
(b) Financial assistance for conducting technical assistance programs and acquiring and installing energy conservation measures, including renewable resource measures, for schools and hospitals, shall be allocated among the States by multiplying the sum available by the allocation factor set forth in paragraph (c) of this section.
(c) The allocation factor (K) shall be determined by the formula:
\[ K = \frac{0.07}{N} + 0.1 \left( \frac{Sfc}{Nfc} \right) + 0.83 \left( \frac{SP(SC)}{NPC} \right) \]
where, as determined by DOE:
(1) Sfc is the projected average retail cost per million Btu's of energy consumed within the region in which the State is located as contained in current regional energy cost projections obtained from DOE.
(2) Nfc is the summation of the Sfc numerators for all States;
(3) N is the total number of eligible States;
(4) SP is the population of the State;
(5) SC is the sum of the State's heating and cooling degree days; and
(6) NPC is the summation of the (SP)(SC) numerators for all States.
(d) Except for the District of Columbia, Puerto Rico, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands, no allocation available to any State may be less than 0.5 percent of all amounts allocated in any grant program cycle. No State will be allocated more than 10 percent of the funds allocated in any grant program cycle.

§ 455.32 Reallocation of funds.
(a) If a State Plan has not been approved and implemented by a State by the close of the period for which allocated funds are available as set forth in the notice issued by DOE pursuant to §455.30(c), funds allocated to that State for technical assistance and energy conservation measures will be reallocated among all States for the next grant program cycle, if available.
(b) Funds which have been allocated to States in a grant program cycle but which have not been obligated to eligible State, school, or hospital grant applicants by the end of that cycle shall be reallocated by DOE among all States in the next grant program cycle.
(c) Funds which become available due to deobligations resulting from funds returned by grantees due to cost underruns or scope-of-work reductions on completed projects shall be reallocated by DOE among all States in the next grant program cycle.
(d) Funds which become available because of declined grants to schools and hospitals within a State may be reallocated to other eligible applicants in the State until the December 31 following the close of the cycle for which the funds were allocated to the State. Such funds which have not been reallocated by that deadline shall be reallocated by DOE among all States in the next grant program cycle.
(e) Funds which become available because of declined or deobligated financial assistance provided through coordinating agencies to schools and hospitals within a State may be reallocated to other eligible applicants in the State until the December 31 following the close of the cycle for which the funds were allocated to the coordinating agency. Such funds which have not been reallocated by that deadline shall be reallocated by DOE among all States in the next grant program cycle.
(f) Funds granted to States for technical assistance, program assistance, and marketing pursuant to §455.144 are subject to reallocation by DOE among all the States in the next program cycle if such funds are not committed by the State to their intended purposes by means of grants, contracts, or other legally binding obligations, or redirected to schools and hospitals grant applications pursuant to §455.144(d), by the December 31 following the close of
the cycle for which the funds were allocated to the State.

Subpart D—Preliminary Energy Audit and Energy Audit Grants

[Reserved]

Subpart E—Technical Assistance Programs for Schools, Hospitals, Units of Local Government, and Public Care Institutions

§ 455.60 Purpose.
This subpart specifies what constitutes a technical assistance program eligible for financial assistance under this part and sets forth the eligibility criteria for schools, hospitals, units of local government, and public care institutions to receive grants for technical assistance to be performed in buildings owned by such institutions.

§ 455.61 Eligibility.
To be eligible to receive financial assistance for a technical assistance program, an applicant must:

(a) Be a school, hospital, unit of local government, public care institution, or coordinating agency representing them except that financial assistance for units of local government and public care institutions will be provided only for buildings which are owned and primarily occupied by offices or agencies of a unit of local government or public care institution and which are not intended for seasonal use and not utilized primarily as a school or hospital eligible for assistance under this program;

(b) Be located in a State which has an approved State Plan as described in subpart B of this part;

(c) Have conducted an energy audit or an energy use evaluation required pursuant to §455.20(k) and adequate to estimate energy conservation potential for the building for which financial assistance is to be requested, subsequent to the most recent construction, reconfiguration, or utilization change which significantly modified energy use within the building;

(d) If an energy audit has been performed, give assurance that it has implemented all energy conservation maintenance and operating procedures required pursuant to §455.20(k) or provide a written justification for not implementing them pursuant to §455.20(l)(3); and

(e) Submit an application in accordance with the provisions of this part and the approved State Plan.

§ 455.62 Contents of a technical assistance program.

(a) The purpose of a technical assistance program is to provide a report based on an on-site analysis of the building which meets the requirements of this section and the State's procedures for implementing this section.

(b) A technical assistance program shall be designed to identify and document energy conservation maintenance and operating procedure changes and energy conservation measures in sufficient detail to support possible application for an energy conservation measure grant and to provide reviewers and decision makers handling such applications sufficient information upon which to base a judgment as to their reasonableness and a decision whether to pursue any or all of the recommended improvements.

(c) A technical assistance program shall be conducted by a technical assistance analyst who has the qualifications established in the State Plan in accordance with §455.20(r).

(d) At the conclusion of a technical assistance program, the technical assistance analyst shall prepare a report which shall include:

(1) A description of building characteristics and energy data including:

(i) The results of the energy audit or energy use evaluation of the building together with a statement as to the accuracy and completeness of the energy audit or energy use evaluation data and recommendations;

(ii) The operation characteristics of energy-using systems; and

(iii) The estimated remaining useful life of the building;

(2) An analysis of the estimated energy consumption of the building, by fuel type in total Btus and Btu/sq.ft./yr., using conversion factors prescribed by the State in the State Plan, at optimum efficiency (assuming implementation of all energy conservation maintenance and operating procedures);
§ 455.63 Cost-effectiveness testing.

(a) This paragraph applies to calculation of the simple payback period of energy conservation measures.

(1) The simple payback period of each energy conservation measure (except measures to shift demand, or renewable
resource measures) shall be calculated, taking into account the interactions among the various measures, by dividing the estimated total cost of the measure, as determined pursuant to § 455.62(d)(3)(ii), by the estimated annual cost savings accruing from the measure (adjusted for demand charges), as determined pursuant to § 455.62(d)(3)(vi), provided that:

(i) At least 50 percent of the annual cost savings used in this calculation shall be from the cost of the energy to be saved or a higher percent if required by a State in its State Plan pursuant to § 455.20(u)(3); and

(ii) No more than 50 percent of the annual cost savings used in this calculation shall be from other cost savings, such as those resulting from energy conservation maintenance and operating procedures related to particular energy conservation measures, or from changes in type of fuel used, or a lower percent if required by a State in its State Plan pursuant to § 455.20(u)(3).

(2) The simple payback period of each renewable resource energy conservation measure shall be calculated, taking into account the interactions among the various measures, by dividing the estimated total cost of the measure, as determined pursuant to § 455.62(d)(3)(iii), by the estimated annual cost savings accruing from the measure taking into account at least the annual cost of the non-renewable fuels displaced less the annual cost of the renewable fuel, if any, and the annual cost of any backup non-renewable fuel needed to operate the system, adjusted for demand charges, as determined pursuant to § 455.62(d)(3)(vi).

(3) The simple payback period of each energy conservation measure designed to shift demand to a period of lower demand and lower cost shall be calculated, taking into account the interactions among the various measures, by dividing the estimated total cost of the measure, as determined pursuant to § 455.62(d)(3)(iii), by the estimated annual cost savings accruing from the measure taking into account at least the annual cost of the energy used before the measure is installed less the estimated annual cost of the energy to be used after the measure is installed, adjusted for demand charges, as determined pursuant to § 455.62(d)(3)(vi).

(b) This paragraph applies, in addition to paragraph (a) of this section, if the State plan requires the cost effectiveness of an energy conservation measure to be determined by life-cycle cost analysis or if the applicant requests such an analysis.

(1) A life-cycle cost analysis, showing a savings-to-investment ratio greater than or equal to one over the useful life of the energy conservation measure or 15 years, whichever is less, shall be conducted in accordance with the requirements set forth in the State Plan pursuant to §§ 455.20(u)(2), 455.20(u)(3) and § 455.64.

(2) The resulting savings-to-investment ratio shall be used for the purpose of ranking applications.

§ 455.64 Life-cycle cost methodology.

(a) The life-cycle cost methodology under § 455.63(b) of this part is a systematic comparison of the relevant significant cost savings and costs associated with an energy conservation measure over its expected useful life, or other appropriate study period with future cost savings and costs discounted to present value. The format for displaying life-cycle costs shall be a savings-to-investment ratio.

(b) An energy conservation measure must be cost effective, and its savings-to-investment ratio must be greater than or equal to one no earlier than the end of the second year of the study period.

(c) A savings-to-investment ratio is the ratio of the present value of net cost savings attributable to an energy conservation measure to the present value of the net increase in investment, maintenance and operating, and replacement costs less salvage value or disposal cost attributable to that measure over a study period.

(d) Except for energy conservation measures to shift demand or to use renewable energy resources, the numerator of the savings-to-investment ratio shall include net cost savings, appropriately discounted and adjusted for energy cost escalation consistent with paragraph (g) of this section, subject to the limitation that the cost of the energy to be saved shall constitute at
least 50 percent of the net cost savings unless the State specifies a higher percent in its State plan pursuant to §455.20(u)(3).

(e) With respect to energy conservation measures to shift demand or to use renewable energy resources, the numerator of the savings-to-investment ratio shall be net cost savings appropriately discounted and adjusted for energy cost escalation consistent with paragraph (g) of this section.

(f) The study period for a life-cycle cost analysis, which may not exceed 15 years, shall be the useful life of the energy conservation measure or of the energy conservation measure with the longest life (for purposes of ranking buildings with multiple energy conservation measures).

(g) The discount rate must equal or exceed the discount rate annually provided by DOE under 10 CFR part 436. The energy cost escalation rates must not exceed those annually provided by DOE under 10 CFR part 436.

(h) Investment costs may be assumed to be a lump sum occurring at the beginning of the base year, or to the extent that there are future investment costs, discounted to present value.

(i) The cost of energy and maintenance and operating costs may be assumed to begin to accrue at the beginning of the base year or when they are actually projected to occur.

(j) It may be assumed that costs occur in a lump sum at any time within the year in which they are incurred.

Subpart F—Energy Conservation Measures for Schools and Hospitals

§ 455.70 Purpose.

This subpart sets forth the eligibility criteria for schools and hospitals to receive grants for energy conservation measures, including renewable resource measures, and the elements of an energy conservation measure program.

§ 455.71 Eligibility.

(a) To be eligible to receive financial assistance for an energy conservation measure, including renewable resource measures, an applicant must: (1) Be a school, hospital, or coordinating agency representing them as defined in §455.2;

(2) Be located in a State which has an approved State Plan as described in subpart B of this part;

(3) Have completed a technical assistance program consistent with §455.62, as determined by the State in accordance with the State Plan, for the building for which financial assistance is to be requested subsequent to the most recent construction, reconfiguration, or utilization change to the building which significantly modified energy use within the building;

(4) Have completed an updated technical assistance program if required in the State Plan as specified in §455.20(q);

(5) Have implemented all energy conservation maintenance and operating procedures which are identified as the result of a technical assistance program or have provided pursuant to the State plan a satisfactory written justification for not implementing any specific maintenance and operating procedures so identified;

(6) Have met any requirements set forth in the State Plan pursuant to §455.20(m) regarding the avoidance of supplanting other funds in the financing of energy conservation measures under this part;

(7) Have no plan or intention at the time of application to close or otherwise dispose of the building for which financial assistance is to be requested within the simple payback period or useful life (depending on the State's requirement for determining cost effectiveness) of any energy conservation measure recommended for that building; and

(8) Submit an application in accordance with the provisions of this part and the approved State Plan;

(b) To be eligible for financial assistance:

(1) In States where simple payback has been selected as the cost-effectiveness test pursuant to §455.20(u)(2), the simple payback period of each energy conservation measure for which financial assistance is requested shall not be less than 2 years nor greater than 10 years, and the estimated useful life of
the measure shall be greater than its simple payback period; or
(2) In States where life-cycle costing has been selected as the cost-effectiveness test pursuant to §455.20(u)(2), the savings-to-investment ratio of each energy conservation measure must be greater than or equal to one under §455.63(b)(1), over a period for analysis which does not exceed 15 years, and the useful life of the energy conservation measure must be at least 2 years.

(c) Leased equipment is not eligible for financial assistance under this part. Equipment which becomes the property of the grantee at the conclusion of a long-term purchase agreement without any additional payment is eligible.

§ 455.72 Scope of the grant.
Financial assistance awarded under this subpart may be expended for the design (excluding design costs funded under the technical assistance program), acquisition, and installation of energy conservation measures to reduce energy consumption or measures to allow the use of renewable resources in schools and hospitals or to shift energy usage to periods of low demand and cost. Such measures include, but are not necessarily limited to, those included in the definition of "energy conservation measure" in §455.2.

Subpart G—State Administrative Expenses

§ 455.80 Purpose.
This subpart describes what constitutes a State administrative expense that may receive financial assistance under this part and sets forth the eligibility criteria for States to receive grants for administrative expenses.

§ 455.81 Eligibility.
To be eligible to receive financial assistance for administrative expenses, a State must:
(a) Have in place a State Plan approved by DOE pursuant to §455.21 and
(b) Be operating a program to provide technical assistance and energy conservation measure grants, or technical assistance, program assistance, and marketing (where energy conservation measures are funded non-Federally) to eligible institutions pursuant to this part.

§ 455.90 Purpose.
This subpart describes what constitutes a State program for technical assistance, program assistance, and marketing that may receive financial assistance under this part and sets forth the eligibility criteria for States to receive grants for technical assistance, program assistance, and marketing.

§ 455.91 Eligibility.
To be eligible to receive financial assistance for technical assistance, program assistance, and marketing, a State must:
(a) Have in place a State Plan approved by DOE which includes a description of the State's program or programs to provide technical assistance, program assistance, and marketing, pursuant to §455.20(j)(1);
(b) Have established a program consistent with this part to fund, from non-Federal sources, energy conservation measures for eligible institutions; and
§ 455.92 State technical assistance awards.

Technical assistance awards by States under this subpart are subject to all requirements of this part which apply to DOE-awarded technical assistance program grants except that States:

(a) Are not required to award the funds in grant instruments;
(b) May award the funds throughout the fiscal year subject to §455.144(a)(3); and
(c) Are not required to rank applications under §455.131(b) of this part.

Subpart I—Cost Sharing

§ 455.100 Limits to Federal share.

Amounts made available under this part, together with any other amounts made available from other Federal sources, may not be used to pay more than 50 percent of the costs of technical assistance programs and energy conservation measures unless the grantee qualifies for the exceptions specified in §§455.141(a), 455.142(a), and 455.142(b), or for severe hardship assistance specified in §455.142(c). In cases of severe hardship, the Federal share of the cost cannot exceed 50 percent.

§ 455.101 Borrowing the non-Federal share/title to equipment.

The non-Federal share of the costs of acquiring and installing energy conservation measures may be provided by using financing or other forms of borrowed funds, such as those provided by loans and performance contracts, even if such financing does not provide for the grantee to receive clear title to the equipment being financed until after the grant is closed out. However, grantees in such cases must otherwise meet all the requirements of this part, and financing and loan agreements and performance contracts under this section are subject to the requirements of 10 CFR Part 600 and the certification requirements under §455.111(e). Grantees must receive clear title to the equipment when the loan is paid off.

§ 455.102 Energy conservation measure cost-share credit.

To the extent a State provides in its State Plan, DOE may wholly or partially credit the costs of the following, with respect to a building, toward the required cost-share for an energy conservation measure grant in that building:

(a) A non-Federally funded technical assistance program;
(b) A non-Federally funded technical assistance program update to comply with §455.20(q); and
(c) The non-Federally funded implementation of one or more energy conservation measures, which complies with the eligibility criteria set forth in §455.71.

§ 455.103 Requirements for applications for credit.

(a) If a State has provided for credit in its State Plan pursuant to §455.20(w), applications for credit will be considered only when the technical assistance programs or updates and the energy conservation measure projects for which credit is sought meet the applicable program requirements, such as those specified in §455.61, §455.62, §455.71, and the relevant sections of 10 CFR part 600, except that the project need not comply with the Davis-Bacon Act regarding labor standards or wage rates.
(b) Credit for energy conservation measures will be considered only when supported by a technical assistance analysis that meets the requirements of §455.62 and that was performed prior to the installation of the energy conservation measures.

§ 455.104 Rebates from utilities and other entities.

(a) Grantees which receive rebates or other monetary considerations from utilities or other entities for installing the energy conservation measures funded by a grant under this part may use such funds to meet their cost-sharing obligations pursuant to §455.100.
(b) Where the rebate or monetary consideration does not exceed the non-Federal share of the cost of the measures applied for in a grant application, grantees are not required to deduct the
amount of the rebate or monetary consideration from the cost of the measures, and DOE does not consider such rebates or monetary considerations to be program income which would have to be remitted to DOE upon receipt by the grantee.

(c) Where the rebate or monetary consideration does exceed the non-Federal share of the cost of the measures applied for in a grant application, grantees may use the excess to fund additional measures if such measures have been recommended in the technical assistance report. If it is not possible to use the excess funding in this way, the grantee must reduce the cost—and DOE will reduce the Federal share—by the amount of the excess above the non-Federal share.

Subpart J—Applicant Responsibilities—Grants to Institutions and Coordinating Agencies

§ 455.110 Grant application submittals for technical assistance and energy conservation measures.

(a) Each eligible applicant desiring to receive financial assistance (either from DOE directly, through a State serving as a coordinating agency, or through another organization serving as a coordinating agency) shall file an application in accordance with the provisions of this subpart and the approved State Plan of the State in which such building is located. The application, which may be amended in accordance with applicable State procedures at any time prior to the State's final determination thereon, shall be filed with the State energy agency designated in the State Plan. Coordinating agencies shall file a single application with DOE which includes all of the information required below for each building for which assistance has been requested and to which is attached a copy of each application from each building owner.

(b) Applications from schools, hospitals, units of local government, public care institutions, and coordinating agencies for financial assistance for technical assistance programs shall include the certifications contained in § 455.111 and:

(1) The applicant’s name and mailing address;

(2) The energy audit or energy use evaluation required by the State pursuant to § 455.20(k) for each building for which financial assistance is requested;

(3) A project budget, by building, which stipulates the intended use of all Federal and non-Federal funds, including in-kind contributions (valued in accordance with the guidelines in 10 CFR part 600), to be used to meet the cost-sharing requirements described in subpart I of this part;

(4) A brief description, by building, of the proposed technical assistance program, including a schedule, with appropriate milestone dates, for completing the technical assistance program;

(5) Additional information required by the applicable State Plan and any other information which the applicant desires to have considered, such as information to support an application from a school or hospital for financial assistance in excess of the 50 percent Federal share on the basis of severe hardship or an application which proposes the use of Federal funds, paid under and authorized by another Federal agreement to meet cost sharing requirements.

(c) Applications from schools and hospitals and coordinating agencies for financial assistance for energy conservation measures, including renewable resource measures, shall include the certifications contained in § 455.111 and:

(1) The applicant’s name and mailing address;

(2) A description of each building for which financial assistance is requested sufficient to determine the building’s eligibility, ownership, use, and size in gross square feet;

(3) A project budget, by measure or building, as provided in the State Plan which stipulates the intended use of all Federal and non-Federal funds and identifies the sources and amounts of non-Federal funds, including in-kind contributions (valued in accordance with the guidelines in 10 CFR part 600) to be used to meet the cost-sharing requirements described in subpart I of this part;

(4) A schedule, including appropriate milestone dates, for the completion of
§ 455.111 Applicant certifications for technical assistance and energy conservation measure grants to institutions and coordinating agencies.

Applications for financial assistance for technical assistance programs and energy conservation measures, including renewable resource measures, shall include certification that the applicant:

(a) Is eligible under § 455.61 for technical assistance or § 455.71 for energy conservation measures;
(b) Has satisfied the requirements set forth in § 455.110;
(c) For applications for technical assistance, has implemented all energy conservation maintenance and operating procedures recommended in the energy audit pursuant to § 455.20(k), if done, and for applications for energy conservation measures, those recommended in the report obtained under a technical assistance program pursuant to § 455.62. If any such procedure has not been implemented, the application shall contain a satisfactory written justification consistent with the State plan for not implementing that procedure;
(d) Will obtain from the technical assistance analyst, before the analyst performs any work in connection with a technical assistance program or energy conservation measure, a signed statement certifying that the technical assistance analyst has no conflicting financial interest and is otherwise qualified to perform the duties of technical assistance analyst in accordance with the standards and criteria established in the approved State Plan;
(e) When using borrowed funds for the non-Federal share of an energy conservation project where a lien is placed by the lender on equipment funded under the grant, will obtain clauses in the financing contract:
(1) Stating the percent of DOE interest in the equipment (i.e., the percent of the total cost provided by the grant); and
(2) Requiring lender notification, with certified return receipt requested, to the applicable Support Office Director of the filing of a lawsuit seeking a remedy for a default; and
(f) Will comply with all reporting requirements contained in § 455.113.
funded under this part, has a total estimated cost for acquisition and installation of more than $5,000, any construction contract or subcontract in excess of $2,000, using any grant funds awarded under this part must include:

(a) Those contract labor standards provisions set forth in 29 CFR 5.5 and
(b) A provision for payment of laborers and mechanics at the minimum wage rates determined by the Secretary of Labor in accordance with the Davis-Bacon Act (40 U.S.C. 276a) as set forth in 29 CFR part 1.

§ 455.113 Grantee records and reports for technical assistance and energy conservation measure grants to institutions and coordinating agencies.

(a) Each unit of local government or public care institution which receives a grant for a technical assistance program and each school, hospital, and coordinating agency which receives a grant for a technical assistance program or an energy conservation measure, including renewable resource measures, shall keep all the records required by § 455.4 in accordance with this part and the DOE Financial Assistance Rules.

(b) Each grantee shall submit reports as follows:

(1) For technical assistance programs, two copies of a final report of the analysis completed on each building for which financial assistance was provided shall be submitted, either both to the State energy agency, or one to the State energy agency, and one to DOE as agreed upon between the State and the DOE Support Office no later than 90 days following completion of the analysis. These reports shall contain:

(i) The report submitted to the institution by the technical assistance analyst, and

(ii) The institution's plan to implement energy conservation maintenance and operating procedures;

(2) For energy conservation measure projects:

(i) Semi-annual progress reports. Two copies shall be submitted, either both to the State energy agency or one to the State energy agency and one to DOE, as agreed upon between the State and the DOE Support Office, no later than the end of July (for the period January 1 through June 30), and January (for the period July 1 through December 31) and shall detail and discuss milestones accomplished, those not accomplished, status of in-progress activities, and remedial actions if needed to achieve project objectives. Reports of coordinating agency grantees shall include financial assistance which an institution declines or does not use as a result of a change in scope. A final report may be submitted in lieu of the last semi-annual report if it satisfies the semi-annual progress report and final report designated time frames;

(ii) A final report. Two copies shall be submitted, either both to the State energy agency or one to the State energy agency and one to DOE, as agreed upon between the State and the DOE Support Office, within 90 days of the completion of the project and shall list and describe the energy conservation measures acquired and installed, contain a final actual cost and a final estimated simple payback period for each measure and the project as a whole, or a final savings-to-investment ratio for each measure and the project as a whole (depending on the State requirement), and include a statement that the completed energy conservation measures conform to the approved grant application;

(iii) Annual energy use reports from a representative sample to be selected by the State which will reflect the grantee's actual post-retrofit energy use experiences for 3 years after project completion. Two copies of these reports shall be submitted, either both to the State energy agency or one to the State energy agency and one to DOE, as agreed upon between the State and the DOE Support Office within 60 days after the end of each 12-month period covered in the reports and shall identify each building and provide data on energy use for that building for the relevant 12-month period. To the extent feasible, energy consumption data in each annual report should be the monthly usage data by fuel or energy type, and the reports should include brief descriptions of any changes in building usage, equipment, or structure occurring during the reporting period.
§ 455.120 Grant applications for State administrative expenses.

Each State desiring to receive grants to help defray State administrative expenses shall file an application in accordance with the provisions of this section.

(a) Where a State is operating a program solely to provide grants to schools and hospitals, the maximum amount of administrative expenses the State may apply for is $50,000 or 5 percent of the Federal share of its schools and hospitals grant awards, whichever is greater.

(1) At any time after notice by DOE of the amounts allocated to each State for a grant program cycle, each State may apply to DOE for an amount for administrative expenses not exceeding $50,000.

(2) Once the total amount obligated or legally committed to the program in the cycle is known, a State may subsequently apply for a further grant, not exceeding 5 percent of the total amount (less the $50,000 provided for in paragraph (b)(1) of this section if that was previously awarded to the State for administrative expenses in the same fiscal year) obligated or legally committed to eligible recipients in the State during the fiscal year for technical assistance, program assistance, and marketing, and for energy conservation measures which are funded with non-Federal funds but which meet the certification and other requirements of this part for such energy conservation measures.

(b) Where a State is eligible and elects to apply to use its appropriated allocation for grants to technical assistance, program assistance, and/or marketing pursuant to § 455.121, the maximum amount of administrative expenses the State may apply for is $50,000 or 5 percent of the total amount obligated or legally committed to eligible recipients in the State pursuant to the State's program under this part, whichever is greater.

(1) At any time after notice by DOE of amounts allocated to each State for a grant program cycle, each State may apply to DOE for an amount for administrative expenses not exceeding $50,000.

(2) On the total amount obligated or legally committed to the program in the cycle is known, a State may subsequently apply for a further grant, not exceeding 5 percent of the total amount (less the $50,000 provided for in paragraph (b)(1) of this section if that was previously awarded to the State for administrative expenses in the same fiscal year) obligated or legally committed to eligible recipients in the State during the fiscal year for technical assistance, program assistance, and marketing, and for energy conservation measures which are funded with non-Federal funds but which meet the certification and other requirements of this part for such energy conservation measures.

(c) In the event that a State cannot, or decides not to use the amount available to it for an administrative grant under this section for administrative purposes, these funds may, at the discretion of the State, be used for technical assistance and energy conservation measure grants to eligible institutions within that State in accordance with this part.

(d) Applications for financial assistance to defray State administrative expenses shall include:

(1) The name and address of the person designated by the State to be responsible for the State's functions under this part.

(2) An identification of intended use of all Federal and non-Federal funds to be used for the State administrative expenses listed in §455.82.
§ 455.121 Grant applications for State technical assistance, program assistance, and marketing programs.

(a) A State may apply for up to 100 percent of the amount allocated to it for a grant program cycle to fund administrative expenses under §455.120 and technical assistance and program assistance programs, or for up to 50 percent of the amount allocated to it for a grant program cycle to fund marketing programs provided that:

(1) The State has established a program to fund technical assistance, program assistance, or marketing programs, and has described its program or programs in its State Plan, as specified in §455.20(j);

(2) The State has a program or programs established consistent with this part of that fund, from non-Federal sources, energy conservation measures eligible under this part;

(3) Not more than 15 percent of the aggregate amount of Federal and non-Federal funds legally committed or obligated to eligible recipients in the State to provide program assistance, marketing and technical assistance programs, implement energy conservation measures consistent with this part, and otherwise carry out a program pursuant to this part for the fiscal year concerned are expended for program assistance, technical assistance and marketing costs for such program;

(4) The energy conservation measures funded from non-Federal sources under this section would be eligible for funding under §455.71; and

(5) The institutions undertaking the non-Federally funded energy conservation measures do so in accordance with all applicable Federal, State, and local laws and regulations with particular attention paid to applicable Federal and State non-discrimination laws and regulations.

(b) Applications for financial assistance to defray State technical assistance, program assistance, or marketing expenses shall include:

(1) The name and address of the person designated by the State to be responsible for the State's functions under this part;

(2) An identification of intended use of all Federal and non-Federal funds for the State administrative expenses listed in §455.82, or the technical assistance, program assistance, or marketing programs pursuant to this section;

(3) Descriptions of the activities to be implemented together with a description of the State's program to provide non-Federal sources of funding to carry out the State's program(s) for energy conservation measures consistent with this part;

(4) A certification that the 15 percent limit specified in subparagraph (a)(3) of this section will not be exceeded; and

(5) Any other information required by DOE.

§ 455.122 Applicant certifications for State grants for technical assistance, program assistance, and marketing.

Applications from States for financial assistance for technical assistance programs, program assistance, and marketing shall include certifications that the State:

(a) Has established a program or programs to fund, from non-Federal sources, energy conservation measures for eligible buildings consistent with this part;

(b) Will not expend, for technical assistance, program assistance, and marketing, more than 15 percent of the aggregate amount of Federal and non-Federal funds legally obligated or committed to eligible recipients in the State to provide technical assistance, program assistance, marketing programs, implement energy conservation measures consistent with this part, and otherwise carry out a program pursuant to this part for the fiscal year concerned; and

(c) Has provided for regular DOE-funded grants to eligible religiously affiliated institutions if the State has a State constitutional or other legal prohibition on providing State assistance to such institutions and if such institutions would be ineligible to apply for the non-Federally funded energy conservation measures or State-funded technical assistance.
§ 455.123 Grantee records and reports for State grants for administrative expenses, technical assistance, program assistance, and marketing.

(a) Each State which receives a grant for administrative expenses, or a grant for technical assistance programs, program assistance, or marketing shall keep all the records required by § 455.4 in accordance with this part and the DOE Financial Assistance Rules.

(b) Each State shall submit a semi-annual program performance report to DOE by the close of each February and August, including, but not limited to:

(1) A discussion of administrative activities pursuant to § 455.82, if a State has received a grant to fund such activities, and a discussion of milestones accomplished, those not accomplished, status of in-progress activities, problems encountered, and remedial actions, if any, planned pursuant to § 455.135(f);

(2) A discussion of technical assistance, program assistance, and/or marketing programs pursuant to § 455.121, if the State has received grants to fund such activities, including a discussion of the results of the State's program to non-Federally fund energy conservation measures consistent with this part pursuant to § 455.121, with a list of buildings receiving assistance for technical assistance programs and a list of buildings which obtained energy conservation measures using non-Federal funds, including the name and address of each building, the amount and type of funding provided to each, and for energy conservation measures, the types of measures funded in each building together with each measure's total estimated cost and estimated annual cost savings, annual energy savings, and the annual cost of the energy to be saved (determined pursuant to § 455.62(d)) consistent with the data currently provided to DOE on all ICP grants;

(3) A summary of grantee reports received by the State during the report period pursuant to §§ 455.113(b)(1) and (b)(2);

(4) For the report due to be submitted to DOE by the close of each August, an estimate of annual energy use reductions in the State, by energy source, attributable to implementation of energy conservation maintenance and operating procedures and installation of energy conservation measures under this part. Such estimates shall be based upon a sampling of institutions participating in the technical assistance phase of this program and upon the energy use reports submitted to the State pursuant to § 455.113(b)(2)(iii); and

(5) Such other information as DOE may from time to time request.

(c) Each copy of any report covering grants for State administrative, technical assistance, program assistance, or marketing expenses shall be accompanied by a financial status report completed in accordance with the documents listed in § 455.3. In addition, States shall file quarterly financial status reports for the quarters which occur between the semi-annual report periods covered in their program performance reports. These quarterly reports are due within 30 days following the end of the applicable quarters.

Subpart L—State Responsibilities

§ 455.130 State evaluation of grant applications.

(a) If an application received by a State is reviewed and evaluated by that State and determined to be in compliance with subparts E, F, and J of this part, § 455.130(b), any additional requirements of the approved State Plan, State environmental laws, and other applicable laws and regulations, then such application will be eligible for financial assistance.

(b) Concurrent with its evaluation and ranking of grant applications pursuant to § 455.131, the State will forward applications for technical assistance or for energy conservation measures for schools to the State school facilities agency for review and certification that each school application is consistent with related State programs for educational facilities. For hospitals the certification requirement applies only if there is a State requirement for it in which case the procedure should be described in the State Plan.
§ 455.131 State ranking of grant applications.

(a) Except as provided by §455.92 of this part, all eligible applications received by the State will be ranked by the State in accordance with its approved State Plan.

(b) For technical assistance programs, buildings shall be ranked in descending priority based upon the energy conservation potential, on a savings percentage basis, of the building as determined in the energy audit or energy use evaluation pursuant to §455.20(k). Each State shall develop separate rankings for all buildings covered by eligible applications for:

(1) Technical assistance programs for units of local government and public care institutions and

(2) Technical assistance programs for schools and hospitals.

(c) All eligible applications for energy conservation measures received will be ranked by the State on building-by-building or a measure-by-measure basis. If a State ranks on a building-by-building basis, several buildings may be ranked as a single building if the application proposes a single energy conservation measure which is physically connected to all of the buildings. If a State ranks on a measure-by-measure basis, a measure that is physically connected to a number of buildings may be ranked as a single measure. Buildings or measures shall be ranked in accordance with the procedures established by the State Plan on the basis of the information developed during a technical assistance program (or its equivalent) for the building and the criteria for ranking applications. The criterion set forth in paragraph (1) of this subsection shall receive at least 50 percent of the weight given to the criteria used to rank applications. Each State may assign weights to the other criteria as set forth in the State Plan pursuant to §455.20(e). The criteria for ranking applications are:

(1) Simple payback or a life-cycle cost analysis, calculated in accordance with §455.63 and §455.64, as applicable;

(2) The types and quantities of energy to be saved, including oil, natural gas, or electricity, in a priority as established in the approved State Plan;

(3) The types of energy sources to which conversion is proposed, including renewable energy;

(4) The quality of the technical assistance program report; and

(5) Other factors as determined by the State.

(d) A State is exempt from the ranking requirements of this section when:

(1) The total amount requested by all applications for schools and hospitals for technical assistance and energy conservation measures in a given grant program cycle for grants up to 50 percent is less than or equal to the funds available to the State for such grants and the total amount recommended for hardship funding is less than or equal to the amounts available to the State for such grants and

(2) The total amount requested by all applications for buildings owned by units of local government and public care institutions in a given grant program cycle is less than or equal to the total amount allocated to the State for technical assistance program grants in the State;

(e) If a State elects to permit applications for credit pursuant to §455.102, such applications for completed or partially completed energy conservation measures shall reflect both the work done and the work to be done and will be reviewed and ranked on the basis of the cost of all of the measures in the project. The credit shall not exceed the non-Federal share of the proposed additional energy conservation measures (and the Federal share shall not exceed the cost of the work remaining to be done).

(f) Within the rankings of school and hospital buildings for technical assistance and energy conservation measures including renewable resource measures to the extent that approvable applications are submitted, a State shall initially assure that:

(1) Schools receive at least 30 percent of the total funds allocated for schools and hospitals to the State in any grant program cycle and

(2) Hospitals receive at least 30 percent of the total funds allocated for schools and hospitals to the State in any grant program cycle.

(g) If there are insufficient applications from schools or hospitals to cover
§ 455.132 State evaluation of requests for severe hardship assistance.

(a) To the extent provided in § 455.30(d), financial assistance will be initially available for schools and hospitals experiencing severe hardship based upon an applicant’s inability to provide the non-Federal share as specified in the State plan pursuant to § 455.20(g). This financial assistance will be available only to the extent necessary to enable such institutions to participate in the program.

(b) The State shall recommend funds for severe hardship applications wholly or partially from the funds reserved in accordance with § 455.30(d) and as stated in an approved State Plan.

(c) Applications for Federal funding in excess of the non-Federal share in the State plan pursuant to § 455.20(x) based on claims of severe hardship shall be given an additional evaluation by the State to assess on a quantifiable basis the maximum extent practicable the relative need among eligible institutions. The minimum amount of additional Federal funding necessary for the applicant to participate in the program will be determined by the State in accordance with the procedures established in the State Plan. The primary consideration shall be the institution’s inability to provide the non-Federal share of the project cost as specified in the State plan pursuant to § 455.20(x). Secondary criteria such as climate, fuel cost and fuel availability, borrowing capacity, median family income in the area, and other relevant factors as determined by the State may be addressed in the State Plan as specified in § 455.20(g).

(d) A State shall indicate, for those schools and hospitals with the highest rankings, determined pursuant to § 455.131(b) and (c):

(1) The amount of additional hardship funding requested by each eligible applicant for each building determined to be in a class of severe hardship and

(2) The amount of hardship funding recommended by the State based upon relative need, as determined in accordance with the State Plan, to the limit of the hardship funds available. The State must decide on a case-by-case basis whether, and to what extent, it will recommend hardship funding.

(e) If there are insufficient applications from hardship applicants to cover the 10 percent allocation provided for in § 455.30(d), then the State may recommend use of the remaining funds for other qualified applicants. The total amount recommended for hardship grants cannot exceed the 10 percent limit.

§ 455.133 Forwarding of applications from institutions and coordinating agencies for technical assistance and energy conservation measure grants.

(a) Except as provided by § 455.92 of this part, each State shall forward all applications recommended for funding within its allocation to DOE once each program cycle along with a listing of buildings or measures covered by eligible applications for schools, hospitals, units of local government, and public care institutions ranked by the State if necessary pursuant to the provisions of § 455.131. If ranking has been employed, the list shall include the standings of buildings or measures.

(1) Measure-by-measure rankings will be recomputed for the respective buildings with more than one recommended measure and

(2) Buildings will be consolidated under one grantee application.

(b) The State shall indicate the amount of financial assistance requested by the applicant for each eligible building and, for those buildings recommended for funding within the limits of the State's allocation, the amount recommended for funding. If the amount recommended is less than the amount requested by the applicant, the list shall also indicate the reason for that recommendation.

(c) The State shall indicate that it has reviewed and evaluated all of the submitted applications and that those applications meet the relevant requirements of the program, and shall certify that applications submitted are eligible pursuant to § 455.130(a).
§ 455.140 Approval of applications from institutions and coordinating agencies for technical assistance and energy conservation measures.

(a) DOE shall review and approve applications submitted by a State in accordance with § 455.133 if DOE determines that the applications meet the objectives of the Act, and comply with the applicable State Plan and the requirements of this part. DOE may disapprove all or any portion of an application to the extent funds are not available to carry out a program or measure (or portion thereof) contained in the application, or for such other reason as DOE may deem appropriate.

(b) DOE shall notify a State and the applicant of the final approval or disapproval of an application at the earliest practicable date after the DOE receipt of the application, and, in the event of disapproval, shall include a statement of the reasons therefor.

(c) An application which has been disapproved for reasons other than lack of funds may be amended to correct the cause of its disapproval and resubmitted in the same manner as the original application at any time within the same grant program cycle. Such an application will be considered to the extent funds have not already been designated for applicants by the ranking process at the time of resubmittal. However, nothing in this provision shall obligate either the State or DOE to take final action regarding a resubmitted application within the grant program cycle. An application not acted upon may be resubmitted in a subsequent grant program cycle.

(d) DOE shall not provide supplemental funds to cover cost overruns or other additional costs beyond those provided for in the original grant award for technical assistance projects and shall fund only one technical assistance project per building.

(e) DOE shall not provide supplemental funds to cover cost overruns or other additional costs beyond those provided for in the original grant award for energy conservation measures funded under a grant in a given grant program cycle. DOE shall not
provide funds to cover energy conservation measures intended to replace energy conservation measures funded in an earlier grant cycle unless the State has funds remaining after all applications for new energy conservation measures have been evaluated and submitted to DOE for funding.

(f) If provided for in the State Plan, an applicant may reapply for a technical assistance program or an energy conservation measure grant which was included in a prior grant application but which was not implemented and for which no funds were expended.

(g) An applicant may apply for, and DOE may make, grant awards in another grant program cycle for additional energy conservation measures which relate to a building which previously received grants for other energy conservation measures.

(h) Funds which become available to a grantee after the installation of all approved measures, due to cost underruns in the installed measures, may be used by the grantee for additional measures if such measures are approved in writing by the State and DOE.

(i) DOE may fund costs incurred by an applicant for technical assistance and energy conservation measure projects after the date of the grant application, so long as that date is no earlier than the close of the preceding grant program cycle. Such costs may be funded when, in the judgment of DOE, the applicant has complied with program requirements and the costs incurred are allowable under applicable cost principles and the approved project budget. The applicant bears the responsibility for the entire project cost unless the application is approved by DOE in accordance with this part.

(j) In addition to the prior approval requirements for project changes as specified in the DOE Financial Assistance Rules (10 CFR part 600), a grantee shall request prior written approval from DOE before:

1. Transferring DOE or matching amounts between buildings included in an approved application when the State ranks on a building-by-building basis or

2. Transferring DOE or matching funds to cover energy conservation measures included in an approved application when the State ranks on a measure-by-measure basis.

§ 455.141 Grant awards for units of local government, public care institutions, and coordinating agencies.

(a) DOE may make grants to units of local government, public care institutions, and coordinating agencies representing them for up to 50 percent of the costs of performing technical assistance programs for buildings covered by an application approved in accordance with § 455.140 except that in the case of units of local government and public care institutions a majority of whose operating and capital funds are provided by the Government of the U.S. Virgin Islands, Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands, a grant may be made for up to 100 percent of such costs.

(b) Total grant awards within any State to units of local government and public care institutions are limited to funds allocated to each State in accordance with § 455.30.

(c) Units of local government and public care institutions are not eligible for financial assistance for severe hardship.

§ 455.142 Grant awards for schools, hospitals, and coordinating agencies.

(a) DOE may make grants to schools, hospitals, and coordinating agencies for up to 50 percent of the costs of performing technical assistance programs for buildings covered by an application approved in accordance with § 455.140 except that in the case of schools and hospitals a majority of whose operating and capital funds are provided by the Government of the U.S. Virgin Islands, Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands a grant may be made for up to 100 percent of such costs. Grant awards for technical assistance programs in any State within any grant program cycle shall be limited to a portion of the total allocation as specified in § 455.30(b)(1).

(b) DOE may make grants to schools, hospitals and coordinating agencies for
up to 50 percent of the costs of acquir-
ing and installing energy conservation
measures, including renewable re-
source measures, for buildings covered
by an application approved in accord-
ance with §455.140, except that in the
case of schools and hospitals a major-
ity of whose operating and capital
funds are provided by the Government
of the U.S. Virgin Islands, Guam,
American Samoa, or the Common-
wealth of the Northern Mariana Is-
lards, a grant may be made for up to
100 percent of such costs.

(c) DOE may award up to 10 percent
of the total amount allocated to a
State for schools and hospitals in cases
of severe hardship, ascertained by the
State in accordance with the State
Plan, for buildings recommended and
in amounts determined by the State
pursuant to §455.132(d)(2).

§455.143 Grant awards for State ad-
ministrative expenses.

(a) For the purpose of defraying
State expenses in the administration of
technical assistance programs in ac-
cordance with subpart E and energy
conservation measures in accordance
with subpart F or energy conservation
measures non-Federally funded pursu-
ant to §455.121, DOE may make grant
awards to a State:

(1) Immediately following public no-
tice of the amounts allocated to a
State for the grant program cycle, and
upon approval of the application for ad-
ministrative costs, in an amount not
exceeding $50,000;

(2) Concurrent with grant awards for
approved applications for technical as-
sistance or energy conservation meas-
ures for institutions in that State and
upon approval of an application for ad-
ministrative costs, in an amount not
exceeding the difference between the
amount granted pursuant to paragraph
(a)(1) of this section and 5 percent of
the Federal share of the total amount
of grants awarded within the State for
technical assistance programs and en-
ergy conservation measures in the ap-
licable grant program cycle; or

(3) Upon receipt by DOE of docu-
mentation from the State dem-
onstrating that sufficient non-Federal
funding has been obligated or legally
committed to schools and hospitals for
energy conservation measures pursu-
ant to §455.121(a) and §455.123(b)(2), and
upon approval of an application for ad-
ministrative costs, in an amount not
exceeding the difference between the
amount granted pursuant to paragraph
(a)(1) of this section and 5 percent of
the aggregate Federal and non-Federal
funds obligated or legally committed
to eligible recipients in the State to
provide technical assistance, program
assistance, and marketing programs
and implement energy conservation
measures consistent with this part, for
the fiscal year concerned.

(b) Grants for such purposes may be
made for up to 100 percent of the pro-
jected administrative expenses, not to
exceed the State's allocation or the
$50,000 or 5 percent limit, as approved
by DOE.

(c) The total of all grants for State
administrative costs, technical assist-
ance programs, and energy conserva-
tion measures (or for State administra-
tive costs, technical assistance, pro-
gram assistance, and marketing, if the
State elects and is eligible to apply for
such grants) in that State shall not ex-
cede the total amount allocated for
that State for any grant program

d. In the event that a State cannot
or decides not to use the amount avail-
able to it for an administrative grant
under this section for administrative
purposes, these funds may, at the dis-
cretion of the State, be used for tech-
nical assistance and energy conserva-
tion grants to eligible institutions
within that State in accordance with
this part.

§455.144 Grant awards for State pro-
grams to provide technical assist-
ance, program assistance, and mar-
keting.

(a) For the purpose of defraying
State expenses in the administration of
special programs to provide technical
assistance and program assistance pur-
suant to §455.121, DOE may make a
grant award to a State for up to 100
percent of the funds allocated to the
State for the grant program cycle, pro-
vided that the State meets the require-
ments described in §455.121(b). In addi-
tion:
§ 455.150 Right to administrative review.

(a) A State shall have a right to file a notice requesting administrative review of a decision under § 455.143 by a Support Office Director to disapprove an application for a grant award for State administrative expenses subject to special conditions or a decision under § 455.21 of this part by a Support Office Director to disapprove a State Plan or an amendment to a State Plan.

(b) A State shall have a right to file a notice requesting administrative review of a decision under § 455.144 by a Support Office Director to disapprove an application for a grant award for State technical assistance, program assistance, or marketing programs.

(c) A school, hospital, coordinating agency, or State acting as an institution’s duly authorized agent shall have a right to file a notice requesting administrative review of a decision under § 455.140 by a Support Office Director to disapprove an application for a grant award to perform technical assistance programs or to acquire and install an energy conservation measure if the disapproval is based on a determination that:

(1) The applicant is ineligible, under § 455.61 or § 455.71 or for any other reason; or

(2) An energy use evaluation submitted in lieu of an energy audit is unacceptable under the State Plan; or

(3) A technical assistance program equivalent performed without the use of Federal funds does not comply with the requirements of § 455.62 for purposes of satisfying the eligibility requirements of § 455.71(a)(3).

§ 455.151 Notice requesting administrative review.

(a) Any applicant shall have 20 days from the date of receipt of a decision subject to administrative review under § 455.150 to disapprove its application for a grant award to file a notice requesting administrative review. If an applicant does not timely file such a notice, the decision to disapprove shall become final for DOE.

(b) A notice requesting administrative review shall be filed with the Support Office Director and shall be accompanied by a written statement containing supporting arguments.

(c) If the applicant is a State appealing pursuant to paragraph (a) of § 455.150, the State shall have the right
to a public hearing. To exercise that right, the State must request such a hearing in the notice filed under paragraph (b) of this section. A public hearing under this section shall be informal and legislative in nature.

(d) A notice or any other document shall be deemed filed under this subpart upon receipt.

§ 455.152 Transmittal of record on review.

On or before 15 days from receipt of a notice requesting administrative review which is timely filed, the Support Office Director shall forward to the Deputy Assistant Secretary the notice requesting administrative review, the decision to disapprove as to which administrative review is sought, a draft recommended final decision for concurrence, and any other relevant material.

§ 455.153 Review by the Deputy Assistant Secretary.

(a) If a State requests a public hearing pursuant to paragraph (a) of §455.150, the Deputy Assistant Secretary, within 15 days, shall give actual notice to the State and Federal Register notice of the date, place, time, and procedures which shall apply to the public hearing. Any public hearing under this section shall be informal and legislative in nature.

(b) The Deputy Assistant Secretary shall concur in, concur in as modified, or issue a substitute for the recommended decision of the Support Office Director:

(1) With respect to a notice filed pursuant to paragraph (a) of §455.150, on or before 60 days from receipt of documents under §455.152 or the conclusion of a public hearing, whichever is later; or

(2) With respect to a notice filed pursuant to paragraph (b) of §455.150, on or before 30 days from receipt of documents under §455.152.

§ 455.154 Discretionary review by the Assistant Secretary.

On or before 15 days from the date of the determination under §455.153(b), the applicant for a grant award may file an application, with a supporting statement of reasons, for discretionary review by the Assistant Secretary. If administrative review is sought pursuant to paragraph (a) of §455.150, the Assistant Secretary shall send a notice granting or denying discretionary review within 15 days and upon granting such review, shall issue a decision no later that 60 days from the date discretionary review is granted. If administrative review is sought pursuant to paragraph (b) of §455.150, the Assistant Secretary shall send a notice granting or denying discretionary review within 15 days and upon granting such review shall issue a decision no later than 30 days from the date discretionary review is granted. The Assistant Secretary may not issue a notice or decision under this paragraph without the concurrence of the DOE Office of General Counsel.

§ 455.155 Finality of decision.

A decision under §455.153 shall be final for DOE if there is no review sought under §455.154. If there is review under §455.154, the decision thereunder shall be final for DOE, and no appeal shall lie elsewhere in DOE.

EDITORIAL NOTE: The recordkeeping requirements contained in this part have been
§ 470.1 Purpose and scope.

This part contains guidelines for the implementation of the appropriate technology small grants program required to be prescribed by section 112 of the Act.

§ 470.2 Definitions.

As used in this part—

Affiliate means a concern which, either directly or indirectly, controls or has the power to control another concern, is controlled by or is within the power to control of another concern or, together with another concern, is controlled by or is within the power to control of a third party, taking into consideration all appropriate factors, including common ownership, common management and contractual relationships.

Concern means any business entity organized for profit (even if its ownership is in the hands of a nonprofit entity) with its principal place of business located in the United States. “Concern” includes, but is not limited to, an individual, partnership, corporation, joint venture, association or cooperative. For the purpose of making affiliation findings, any business entity, whether organized for profit or not, and any foreign business entity (i.e., any entity located outside the United States), shall be included.

DOE means the Department of Energy.

DOE-AR means the Department of Energy Assistance Regulations (10 CFR part 600).

DOE-PR means the Department of Energy Procurement Regulations (41 CFR part 9).

Indian tribe means any tribe band, nation, or other organized group or community of Indians (including any Alaska native village or regional or village corporation as defined in or established pursuant to the Alaska Native Claims Settlement Act, Pub. L. 92–203, 85 Stat. 688, which (1) is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians; or (2) is located on, or in proximity to, a Federal or State reservation or rancheria, acting through its tribal organization.

Local agency means an agency or instrumentality of a local government.

Local government means a local unit of government including specifically a county, municipality, city, town, township, local public authority, special district, intrastate district, council of governments, sponsor group representative organization, and other regional or intrastate government entity.

Local nonprofit organization or institution means any corporation trust, foundation, trade association, or other institution (1) which is entitled to exemption under section 501(c)(3) of the Internal Revenue Code or (2) which is not organized for profit and no part of the net earnings of which shall inure to the benefit of any private shareholder or individual.

Program means the appropriate technology small grants program.

Small business means a concern, including its affiliates, which is organized for profit, is independently owned and operated, is not dominant in the field of operation in which it is submitting a proposal to DOE, and has 100 employees or less.

State means any of the several States of the United States, the District of Columbia, the Commonwealth of Puerto Rico, and any territory or possession of the United States.

State agency means an agency or instrumentality of a State government.

State government means the government of a State, or an interstate organization.

Support means financial support or award under the program by grants, cooperative agreements or contracts.

Tribal organization means the recognized governing body of an Indian tribe, or any legally established organization of Native Americans which is controlled, sanctioned, or chartered by such governing body.
§ 470.10 Establishment of program.

There is established, under direction of the Assistant Secretary for Conservation and Solar Energy of DOE, an appropriate technology small grants program for the purpose of encouraging development and demonstration of, and the dissemination of information with respect to, energy-related systems and supporting technologies appropriate to—

(a) The needs of local communities and the enhancement of community self-reliance through the use of available resources;
(b) The use of renewable resources and the conservation of non-renewable resources;
(c) The use of existing technologies applied to novel situations and uses;
(d) Applications which are energy conserving, environmentally sound, small scale and low cost and
(e) Applications which demonstrate simplicity of installation, operation and maintenance.

§ 470.11 Eligibility requirements.

(a) Support under this part may be made to individuals, local non-profit organizations and institutions. State and local agencies, Indian tribes and small businesses.
(b) The aggregate amount of support made available to any participant in the program, including affiliates, shall not exceed $50,000 during any 2-year period. This limitation applies only to support for projects and not to funds received by participants from DOE for other purposes, such as performance of services.
(c) Projects which shall be considered for support are those which carry out the purposes of the program as expressed in §470.10 and which are within the following categories—

(1) Idea development, i.e., the development of an idea or concept or an investigative finding in areas ranging from development of new concepts of energy resources to the utilization of old procedures or systems for a new application;
(2) Device development, i.e., the systematic use and practical application of investigative findings and theories of a scientific or technical nature toward the production of, or improve-
ments in, useful products to meet specific performance requirements but exclusive of manufacturing and production engineering. The dominant characteristic is that the effort be pointed toward specific energy problem areas to develop and evaluate the feasibility and practicability of proposed solutions and determine their parameters. Device development includes studies, investigations, initial hardware development and ultimately development of hardware, systems, or other means for experimental or operational test; or
(3) Demonstration, i.e., the testing of a system or technique under operation conditions to show that commercial application is technically, economically and environmentally feasible.
(d) Support for each category in paragraph (c) of this section shall not, for a single participant in the program, including affiliates, exceed the following limits for any project—

(1) For idea development, $10,000;
(2) For device development, $50,000; and
(3) For demonstration, $50,000.
(4) A participant may receive under a subsequent program solicitation—

(i) Additional support for a funded project or;
(ii) Initial support for a new project, subject to the support limits set forth in paragraphs (b) and (d) of this section.

§ 470.12 Management.

(a) The program shall be managed by a National Program Director within the Office of the Assistant Secretary for Conservation and Solar Energy of DOE.
(b) The program shall be implemented regionally, based on the 10 standard Federal regions or combinations thereof, to insure substantial consideration of the needs, resources, and special circumstances of local communities. Regions may be combined provided the requirements of Office of Management and Budget Circular A–106 entitled “Standard Federal Regulations” are met. Regional Program Managers shall design and manage the regional programs as directed by the National Program Director and shall consult, as appropriate, with State and
§ 470.13 Program solicitation.

(a) The Regional Program Managers shall be responsible for the preparation of program solicitations which solicit proposals for support under the program pursuant to simplified application procedures. Projects may be supported under the program only if they have successfully completed under a program solicitation.

(b) Each program solicitation shall include—

1. A description of the program;
2. The eligibility requirements;
3. A time schedule for submission of, and action on, proposals;
4. A simple application form for submitting a proposal for support under the program, together with instructions for completing the application form;
5. Evaluation criteria, along with a narrative description of their relative importance;
6. An explanation of the evaluation and selection procedures, including a notice to proposers that if the proposer expressly indicates that only Government evaluation is authorized, DOE may be unable to give full consideration to the proposal;
7. Other applicable information, terms and conditions, including the desired budget format;
8. Place for, and manner of, submission;
9. A unique number for identification purposes;
10. A statement notifying potential proposers that an announcement does not commit DOE to pay any proposal preparation costs and that DOE reserves the right to select for support any, all, or none of the proposals received in response to a solicitation;
11. A late proposal provision;
12. A statement notifying proposers how to identify information in the proposal which the proposer does not want disclosed for purposes other than the evaluation of the proposal;
13. A statement notifying proposers that all information contained in the proposal will be handled in accordance with the policies and procedures set forth in DOE-AR and DOE-PR, as applicable, and disclosed, if appropriate, in accordance with 10 CFR part 1004 entitled “Freedom of Information.”

14. A statement notifying proposers of their right to request a debriefing pursuant to the procedures set forth in § 470.18 and

15. A statement notifying proposers of their right to request a waiver of DOE’s title to inventions made under the program.

(c) Each program solicitation shall be synopsized in the Commerce Business Daily prior to or concurrent with release. The program solicitation also shall be announced to appropriate newspapers, trade and technical publications, and State and local governments, and shall be circulated directly to interested individuals, entities, and associations thereof, to the maximum extent feasible.

§ 470.14 Evaluation and selection.

(a) Prior to making a comprehensive evaluation of a proposal, the receiving office shall determine that it contains sufficient technical, cost, and other information to enable comprehensive evaluation and that it has been properly signed. If the proposal does not meet these requirements, a prompt reply shall be sent to the proposer, indicating the reason(s) for the proposal not being selected for support under the program solicitation. A proposer may correct any minor informality or irregularity or apparent clerical mistake prior to the entering into of grants, contracts, or cooperative agreements. A minor informality or irregularity is one which is merely a matter of form and not of substance or pertains to some immaterial or inconsequential defect or variation from the exact requirements of the program announcement.

(b) The Regional Program Manager shall select a number of technical evaluation reviewers representing several disciplines to ensure adequate technical review of proposals.

1. After receiving nominations from each State or combinations of States within the Region, the Program Manager shall select a number of State reviewers for each State or combinations
of States, respectively. The nominations and selections of State reviewers shall take into consideration representation by persons from a variety of backgrounds, in order that the reviewers are able to evaluate proposals of potential merit in various fields and from various types of proposers.

(3) The Regional Program Manager or designee shall provide proposals to the technical evaluation and State reviewers and shall provide their findings and comments to the selection panel established pursuant to paragraph (3) of this section.

(4) In carrying out the responsibilities set forth in paragraphs (b) (1), (2) and (3) of this section, the Regional Program Manager (i) shall determine the number of technical evaluation and State reviewers who shall review each proposal; (ii) shall determine the sequence of the technical and State review; (iii) may designate a person to serve as both a technical and State reviewer, if appropriate to the needs of the program in the Region. A description of the Program Manager's determinations under this paragraph shall be included in the Program Solicitation pursuant to §470.13(b)(6).

(c) Each technical evaluation reviewer shall evaluate those proposals which he or she receives from the Regional Program Manager or designee and shall provide his or her findings to the Regional Program Manager or designee. In addition to the general criteria underlying establishment of the program as set forth in §470.10, the criteria to be considered by each technical evaluation reviewer shall include—

(1) Whether the proposal is technically feasible, including a determination as to whether the proposed energy savings or energy production can be technically achieved;
(2) Whether the results being proposed are capable of being measured;
(3) Whether the proposal has any potential environmental, health and safety impacts; and
(4) From a technical standpoint, whether the proposal can be carried out within the funds being requested.

(d) Each State reviewer shall evaluate those proposals which he or she receives from the Program Manager or designee and shall provide his or her findings and comments to the Program Manager or designee. In addition to the general criteria underlying establishment of the program as set forth in §470.10, the criteria to be considered by each State reviewer shall include—

(1) The potential impact of the proposal on the energy needs and requirements of the community or region;
(2) The energy resource involved and its importance or availability to the community or region;
(3) The expected energy savings or production that will result from the proposal and the significance of those savings or production to the energy requirements of the community or region;
(4) The institutional barriers that may substantially affect the proposal and the potential of the proposal to deal with those barriers;
(5) The likelihood of commercialization or utilization of the technology, process, or items within the proposal and extent of such commercialization/utilization;
(6) The innovative nature of the proposal;
(7) Any potential environmental, health and safety impacts of the proposal upon the community or region;
(8) The extent to which work beyond the funded project period might be required;
(9) The extent to which local resources, material, and manpower will be utilized; and
(10) The adequacy of the business aspects of the proposal, including the reasonableness of the proposer's budget for carrying out the proposal.

(e) A selection panel composed of DOE personnel appointed by the Regional Program Manager shall, taking into account the findings and comments of the technical evaluation and State reviewers, evaluate and rank the proposals in accordance with the criteria stated in the program solicitation.

(f) For each Region, a DOE selection official shall select proposals for support from the ranking established by the selection panel, taking into account the following program policy factors in order to determine the mix
of proposed projects which will best further specific program goals—
(1) Regional distribution, including geography, population, and climate;
(2) Project type distribution, including a diversity of methods, approaches, and technologies;
(3) Diversity of participants; and
(4) The best overall use of the funds available.

§ 470.15 Allocation of funds.
(a) DOE shall annually allocate fiscal year funds available for support among the 10 standard Federal Regions, according to the following formula;
(1) Two-thirds to be allocated according to population; and
(2) One-third to be allocated according to the number of proposals received, per hundred thousand of population of the Region, which meet the requirements set forth in § 470.14(a).
(b) The minimum annual level of support for projects for each State within a Region shall be 10 percent of the fiscal year funds allocated to the Region, divided by the number of States in the Region.

§ 470.16 Cost sharing and funds from other sources.
Proposers are encouraged to offer to share in the costs of their proposed projects or to arrange that other entities provide cost sharing on their behalf. Regional Program Managers, with the consent of the proposer, may work with States, local governments or other entities to obtain supplemental funding.

§ 470.17 General requirements.
(a) Except where this part provides otherwise, the submission, evaluation and selection for support of proposals under the program and the entering into and administration of grants, cooperative agreements, and contracts under the program, shall be governed by the provisions of DOE-AR and DOE-PR. are applicable, such other procedures applicable to grants, cooperative agreements, and contracts under the program as DOE may from time to time prescribe, and any Federal requirements applicable to grants, cooperative agreements, and contracts under the program.

§ 470.18 Debriefing.
Upon written request, unsuccessful proposers will be accorded debriefings. Such debriefings must be requested within 30 working days of notification of elimination from consideration. Debriefings will be provided at the earliest feasible time as determined by the Regional Program Manager.

§ 470.20 Dissemination of information.
DOE shall disseminate to the public, in an appropriate manner, information of the nature, usage and availability of the energy-related systems and supporting technologies developed or demonstrated under the program. In addition, DOE shall maintain and make available to recipients of support under the program current information on public and private sources of possible assistance for the further development and commercialization of their projects.
PART 473—AUTOMOTIVE PROPULSION RESEARCH AND DEVELOPMENT

REVIEW AND CERTIFICATION OF GRANTS, COOPERATIVE AGREEMENTS, CONTRACTS, AND PROJECTS

Sec. 473.1 Purpose and scope.
473.2 Definitions.

SOURCE: 43 FR 55230, Nov. 24, 1978, unless otherwise noted.

REVIEW AND CERTIFICATION OF GRANTS, COOPERATIVE AGREEMENTS, CONTRACTS, AND PROJECTS

§ 473.1 Purpose and scope.

These regulations implement section 304(f) of the Federal Energy Administration Act of 1978—Civilian Applications, and apply to each new contract, grant, cooperative agreement, Department of Energy project, or other agency project funded or to be funded under the authority of that Act. 15 U.S.C. 2703(f) (1970). These regulations do not apply to subcontractors, or to contracts, grants, cooperative agreements, Department of Energy projects, or other agency projects entered into, made, or formally approved and initiated prior to February 25, 1978, or with respect to any renewal or extension thereof. Insofar as grants, cooperative agreements, and contracts are concerned, these regulations provide procedures and requirements that are in addition to those generally applicable under the assistance and procurement regulations of the Federal agency funding research and development under the Act.

§ 473.2 Definitions.

For purpose of these regulations—

Advanced automobile propulsion system means an energy conversion system, including engine and drivetrain, which utilizes advanced technology and is suitable for use in an advanced automobile.

Agency project means research and development under the Act by employees of a Federal agency furnishing assistance at the request of the DOE.

Annual funding period means the Federal fiscal year during which a grant, cooperative agreement, or contract is funded by an appropriation under the Act.

Applicant means any private laboratory, university, nonprofit organization, industrial organization, private agency, institution, organization, corporation, partnership, individual, or public agency other than a Federal agency.

DOE project means research and development under the Act by employees of the DOE.

Manager means the Federal program official who requests grant agreements, cooperative agreements, or contracts to be negotiated or who authorizes a DOE or agency project to begin.

Notice of availability means a notice published in the Commerce Business Daily advertising the availability of a formal solicitation document to be issued for the purpose of inviting and setting guidelines for submission of proposals for research and development grants, cooperative agreements, or contracts.

Research and development means activities constituting a project to create an advanced automobile propulsion system and does not mean activities involving technology transfer to mass production, evaluative testing, preliminary planning for a DOE or an agency project, or program administration and management.

Solicitation means a formal, written request for proposals to perform research and development under a grant, cooperative agreement, or contract,
§ 473.10 Required information from applicant.

In accordance with applicable procedures of §473.11 any applicant for a grant, cooperative agreement, or contract under the Act to support research and development activities of an advanced automobile propulsion system shall—

(a) State whether the activities will initiate or continue research and development of an advanced automobile propulsion system;

(b) State, insofar as the applicant has information, whether and to what extent the activities to be supported are technically the same as activities conducted previously or to be conducted during the annual funding period by any person for research and development of a substantially similar advanced automobile propulsion system;

(c) Justify research and development activities on an advanced automobile propulsion system abandoned by any person because of a lack of mass production potential by presenting information showing a significant intervening technological advance, promising conceptual innovation, or other special consideration;

(d) Provide—

(1) An assurance that the amount of funds to be expended for research and development of advanced automobile propulsion systems during the initial annual funding period will exceed the amount of funds expended, if any, during the previous year for the same purpose by at least the amount of the grant, cooperative agreement, or contract being sought; and

(2) The estimated delay, if any, which is likely to occur if the application for a grant, cooperative agreement, or contract is denied.

§ 473.11 Submission of applicant’s information.

(a) An applicant submitting an unsolicited proposal to conduct research and development to be funded by a grant, cooperative agreement, or contract under the Act shall include the information required under §473.10 in the unsolicited proposal document filed under the assistance or procurement regulations of the DOE or other Federal agency which funds the proposed research and development under the Act.

(b) In responding to a solicitation for a proposal to conduct research and development funded by a grant, cooperative agreement, or contract under the Act, the applicant shall include the information required under §473.10 in the proposal.

(c) Information submitted under §473.10 of these regulations shall be certified in writing as complete and accurate by the applicant, and if the applicant is not an individual, the chief executive officer of the applicant or his authorized designee shall sign the certification.

§ 473.20 Public notice and opportunity to object.

(a) In compliance with paragraph (b) of this section and unless provisions of paragraph (c) of this section apply, the manager shall cause to be published in the Commerce Business Daily a statement describing the unsolicited proposal, solicitation, DOE project, or agency project, as appropriate, inviting any interested person to submit a written objection, with supporting information at an appropriate address on or before 30 days from the date of publication, if the person believes that the research and development to be performed does not comply with standards and criteria of §473.30.

(b) Except as paragraph (c) of this section applies, the manager shall comply with the requirements of paragraph (a) of this section—

(1) Upon receipt of an unsolicited proposal from an applicant;
(2) In any notice of availability of a solicitation;

(3) Prior to beginning a DOE project; or

(4) Prior to beginning an agency project.

(c) Without publishing a notice under paragraph (a) of this section, the manager may reject an unsolicited proposal that does not comply with these regulations or any other generally applicable requirements.

§ 473.21 Supplemental information and rebuttal.

The manager may request additional information from an applicant or any interested person who files an objection under §473.20.

§ 473.22 Initial review by manager.

(a) Upon expiration of the time for filing information under these regulations, the manager shall—

(1) Review the proposed research and development to be performed under grant, under cooperative agreement, under contract, as a DOE project, or as an agency project and any other pertinent information received under these regulations or otherwise available; and

(2) Initially determine whether the research and development reviewed under paragraph (a)(1) of this section complies with the standards and criteria of §473.30.

(b) A manager who makes a negative determination under paragraph (a)(2) of this section shall inform the applicant and any interested person who objected of the decision in writing with a brief statement of supporting reasons.

(c) A manager who initially determines that research and development reviewed under this section complies with the standards and criteria of §473.30 shall cause an interagency review panel to be convened under §473.23.

§ 473.23 Interagency review panel.

(a) The interagency review panel shall consist of—

(1) A head designated by the Federal agency that employs the manager;

(2) A representative of the DOE if the manager is not an employee of the DOE; and

(3) A representative of any other Federal agency deemed appropriate by the Federal agency that employs the manager.

(b) The interagency review panel shall—

(1) Review the research and development to be performed and consider the information presented by the applicant, in the case of a grant, cooperative agreement, or contract, and by any interested person who filed a statement of objection;

(2) Make a recommendation with a supporting statement of findings to the manager as to whether the research and development to be performed complies with the standards and criteria of §473.30; and

(3) Operate by majority vote with the head of the panel casting the decisive vote in the event of a tie.

§ 473.24 Final action and certification by manager.

(a) Upon consideration of the recommendation of the interagency review panel and other pertinent information, the manager—

(1) Shall determine whether the research and development to be performed complies with the standards and criteria of §473.30.

(2) Shall obtain the concurrence of the DOE if the manager is not an employee of the DOE;

(3) Shall, in the event of a negative determination under this section, advise the applicant, in the case of a grant, cooperative agreement, or contract, and any interested person who filed a statement of objection; and

(4) Shall, in the event of an affirmative determination under this section, prepare a certification—

(i) Explaining the determination;

(ii) Discussing any allegedly related or comparable industrial research and development considered and deemed to be an inadequate basis for not certifying the grant or contract;

(iii) Discussing issues regarding cost sharing and patent rights related to the standards and criteria of §473.30 of these regulations; and

(iv) Discussing any other relevant issue.

(b) After complying with paragraph (a) of this section, the manager shall
§ 473.25 Reviewability of certification.

Any certification issued under these rules is—
(a) Subject to disclosure under 5 U.S.C. 552 (1970) and section 17 of the Federal Nonnuclear Energy Research and Development Act of 1974, as amended, 42 U.S.C. 5918 (1970);
(b) Subject neither to judicial review nor to the provisions of 5 U.S.C. 551–559 (1970), except as provided under paragraph (a) of this section; and
(c) Available to the Committee on Science and Technology of the House of Representatives and the Committee on Energy and Natural Resources of the Senate.

§ 473.30 Standards and criteria.

Research and development to be performed under a grant, under a cooperative agreement, under a contract, as a DOE project, or as an agency project under the Act may be certified under these regulations only if the research and development to be conducted—
(a) Supplements the automotive propulsion system research and development efforts of industry or any other private researcher;
(b) Is not duplicative of efforts previously abandoned by private researchers unless there has been an intervening technological advance, promising conceptual innovation, or justified by other special consideration;
(c) Would not be performed during the annual funding period but for the availability of the Federal funding being sought;
(d) Is likely to produce an advanced automobile propulsion system suitable for steps toward technology transfer to mass production in a shorter time period than would otherwise occur;
(e) Is not technologically the same as efforts by any person conducted previously or to be conducted during the annual funding period regarding a substantially similar advanced automobile propulsion system; and
(f) Is not likely to result in a decrease in the level of private resources expended on advanced automotive research and development by substituting Federal funds without justification.

PART 474—ELECTRIC AND HYBRID VEHICLE RESEARCH, DEVELOPMENT, AND DEMONSTRATION PROGRAM; PETROLEUM-EQUIVALENT FUEL ECONOMY CALCULATION

§ 474.1 Purpose and scope.

This part contains procedures for calculating a value for the petroleum-equivalent fuel economy of electric vehicles, as required by 49 U.S.C. 32904(a)(2). The petroleum-equivalent fuel economy value is intended to be used by the Environmental Protection Agency in calculating corporate average fuel economy values pursuant to regulations at 40 CFR Part 600—Fuel Economy of Motor Vehicles.

§ 474.2 Definitions.

For the purposes of this part, the term:
Combined energy consumption value means the weighted average of the Urban Dynamometer Driving Schedule and the Highway Fuel Economy Driving Schedule energy consumption values (weighted 55/45 percent, respectively), as determined by the Environmental Protection Agency in accordance with 40 CFR parts 86 and 600.

Electric vehicle means a vehicle that is powered by an electric motor drawing current from rechargeable storage
batteries or other portable electrical energy storage devices, provided that:

(1) Recharge energy must be drawn from a source off the vehicle, such as residential electric service; and

(2) The vehicle must comply with all provisions of the Zero Emission Vehicle definition found in 40 CFR 88.104-94(g).

Highway Fuel Economy Driving Schedule energy consumption value means the average number of watt-hours of electrical energy required for an electric vehicle to travel one mile of the Highway Fuel Economy Driving Schedule, as determined by the Environmental Protection Agency.

Petroleum equivalency factor means the value specified in §474.3(b) of this part, which incorporates the parameters listed in 49 U.S.C. 32904(a)(2)(B) and is used to calculate petroleum-equivalent fuel economy.

Petroleum-equivalent fuel economy means the value, expressed in miles per gallon, that is calculated for an electric vehicle in accordance with §474.3(a) of this part, and reported to the Administrator of the Environmental Protection Agency for use in determining the vehicle manufacturer's corporate average fuel economy.

Petroleum-powered accessory means a vehicle accessory (e.g., a cabin heater, defroster, and/or air conditioner) that:

(1) Uses gasoline or diesel fuel as its primary energy source; and

(2) Meets the requirements for fuel, operation, and emissions in 40 CFR part 88.104-94(g).

Urban Dynamometer Driving Schedule energy consumption value means the average number of Watt-hours of electrical energy required for an electric vehicle to travel one mile of the Urban Dynamometer Driving Schedule, as determined by the Environmental Protection Agency.

§ 474.3 Petroleum-equivalent fuel economy calculation.

(a) The petroleum-equivalent fuel economy for an electric vehicle is calculated as follows:

1. Determine the electric vehicle’s Urban Dynamometer Driving Schedule energy consumption value and the Highway Fuel Economy Driving Schedule energy consumption value in units of Watt-hours per mile;

2. Determine the combined energy consumption value by averaging the Urban Dynamometer Driving Schedule energy consumption value and the Highway Fuel Economy Driving Schedule energy consumption value using a weighting of 55 percent urban/45 percent highway; and

3. Calculate the petroleum-equivalent fuel economy by dividing the appropriate petroleum-equivalency factor (depending on whether any petroleum-powered accessories are installed; see paragraph (b) of this section) by the combined energy consumption value, and round to the nearest 0.01 miles per gallon.

(b) The petroleum-equivalency factors for electric vehicles are as follows:

1. If the electric vehicle does not have any petroleum-powered accessories installed, the value of the petroleum-equivalency factor is 82,049 Watt-hours per gallon.

2. If the electric vehicle has any petroleum-powered accessories installed, the value of the petroleum-equivalency factor is 73,844 Watt-hours per gallon.

§ 474.4 Test procedures.

(a) The electric vehicle energy consumption values used in the calculation of petroleum-equivalent fuel economy under §474.3 of this part will be determined by the Environmental Protection Agency using the Highway Fuel Economy Driving Schedule and Urban Dynamometer Driving Schedule test cycles at 40 CFR parts 86 and 600.

(b) The “Special Test Procedures” provisions of 40 CFR 86.090-27 may be used to accommodate any special test procedures required for testing the energy consumption of electric vehicles.

§ 474.5 Review and Update

The Department will review Part 474 five years after the date of publication as a final rule to determine whether any updates and/or revisions are necessary. DOE will publish a notice in the Federal Register soliciting stakeholder input in this review. The Department will publish the findings of the review and any resulting adjustments to Part 474 in the Federal Register.
APPENDIX TO PART 474—SAMPLE PETROLEUM-EQUIVALENT FUEL ECONOMY CALCULATIONS

Example 1: An electric vehicle is tested in accordance with Environmental Protection Agency procedures and is found to have an Urban Dynamometer Driving Schedule energy consumption value of 265 Watt-hours per mile and a Highway Fuel Economy Driving Schedule energy consumption value of 220 Watt-hours per mile. The vehicle is not equipped with any petroleum-powered accessories. The combined electrical energy consumption value is determined by averaging the Urban Dynamometer Driving Schedule energy consumption value and the Highway Fuel Economy Driving Schedule energy consumption value using weighting factors of 55 percent urban, and 45 percent highway:

\[
\text{combined electrical energy consumption value} = (0.55 \times \text{urban}) + (0.45 \times \text{highway}) = (0.55 \times 265) + (0.45 \times 220) = 244.75 \text{ Wh/mile}
\]

Since the vehicle does not have any petroleum-powered accessories installed, the value of the petroleum equivalency factor is 82,049 Watt-hours per gallon, and the petroleum-equivalent fuel economy is:

\[
(82,049 \text{ Wh/gal}) (244.75 \text{ Wh/mile}) = 335.24 \text{ mpg}
\]

Example 2: The vehicle from Example 1 is equipped with an optional diesel-fired cabin heater/defroster. For the purposes of this example, it is assumed that the electrical efficiency of the vehicle is unaffected. Since the vehicle has a petroleum-powered accessory installed, the value of the petroleum equivalency factor is 73,844 Watt-hours per gallon, and the petroleum-equivalent fuel economy is:

\[
(73,844 \text{ Wh/gal}) (244.75 \text{ Wh/mile}) = 301.71 \text{ mpg}
\]

PART 490—ALTERNATIVE FUEL TRANSPORTATION PROGRAM

Subpart A—General Provisions

Sec.
490.1 Purpose and scope.
490.2 Definitions.
490.3 Excluded vehicles.
490.4 General information inquiries.
490.5 Requests for an interpretive ruling.
490.6 Petitions for generally applicable rulemaking.
490.7 Relationship to other law.
490.8 Replacement fuel production goal.

APPENDIX TO SUBPART A OF PART 490—METROPOLITAN STATISTICAL AREAS/CONsolidated METROPOLITAN STATISTICAL AREAS WITH 1980 POPULATIONS OF 250,000 OR MORE

Subpart B [Reserved]
§ 490.2 Definitions.

The following definitions apply to this part—

Acquire means to take into possession or control.

After-Market Converted Vehicle means an Original Equipment Manufacturer vehicle that is reconfigured by a conversion company, which is not under contract to the Original Equipment Manufacturer, to operate on an alternative fuel and whose conversion kit components are under warranty of the conversion company.

Alternative Fueled Vehicle means a dedicated vehicle or a dual fueled vehicle (including a flexible fuel vehicle as defined by this section).

Assistant Secretary means the Assistant Secretary for Energy Efficiency and Renewable Energy or any other DOE official to whom the Assistant Secretary’s duties under this part may be redelegated by the Secretary.

Automobile means a 4-wheeled vehicle propelled by conventional fuel, or by alternative fuel, manufactured primarily for use on public streets, roads, and highways (except a vehicle operated only on a rail line), and rated at

(1) Not more than 6,000 pounds gross vehicle weight; or

(2) More than 6,000, but less than 10,000 pounds gross vehicle weight, if the Secretary of Transportation has decided, by rule, that the vehicle meets the criteria in section 501(1) of the Motor Vehicle Information and Cost Savings Act, as amended, 49 U.S.C. 32901(a)(3).

Capable of Being Centrally Fueled means a vehicle can be refueled at least 75 percent of its time at the location that is owned, operated, or controlled by the fleet or covered person, or is under contract with the fleet or covered person for refueling purposes.
§ 490.2 10 CFR Ch. II (1–1–08 Edition)

Centrally Fueled means that a vehicle is fueled at least 75 percent of the time at a location that is owned, operated, or controlled by the fleet or covered person, or is under contract with the fleet or covered person for refueling purposes.

Control—
(1) When it is used to determine whether one person controls another or whether two persons are under common control, means any one or a combination of the following:
(i) A third person or firm has equity ownership of 51 percent or more in each of two firms; or
(ii) Two or more firms have common corporate officers, in whole or in substantial part, who are responsible for the day-to-day operation of the companies; or
(iii) One person or firm leases, operates, or supervises 51 percent or more of the equipment and/or facilities of another person or firm; owns 51 percent or more of the equipment and/or facilities of another person or firm; or has equity ownership of 51 percent or more of another person or firm.

(2) When it is used to refer to the management of vehicles, means a person has the authority to decide who can operate a particular vehicle, and the purposes for which the vehicle can be operated.

Covered Person means a person that owns, operates, leases, or otherwise controls—
(1) A fleet, as defined by this section, that contains at least 20 light duty motor vehicles that are centrally fueled or capable of being centrally fueled, and are used primarily in a metropolitan statistical area or a consolidated metropolitan statistical area, as established by the Bureau of the Census, with a 1980 population of 250,000 or more (as set forth in Appendix A to this subpart) or in a Federal Register notice; and

(2) At least 50 light duty motor vehicles within the United States.

Dealer Demonstration Vehicle means any vehicle that is operated by a motor vehicle dealer solely for the purpose of promoting motor vehicle sales, either on the sales lot or through other marketing or sales promotions, or for permitting potential purchasers to drive the vehicle for pre-purchase or pre-lease evaluation.

Dedicated Vehicle means—
(1) An automobile that operates solely on alternative fuel; or
(2) A motor vehicle, other than an automobile, that operates solely on alternative fuel.

DOE means the Department of Energy.

Dual Fueled Vehicle means—
(1) An automobile that meets the criteria for a dual fueled automobile as that term is defined in section 513(h)(1)(C) of the Motor Vehicle Information and Cost Savings Act, 49 U.S.C. 32001(a)(8); or
(2) A motor vehicle, other than an automobile, that is capable of operating on alternative fuel and on gasoline or diesel fuel; or

(3) A flexible fuel vehicle.

Electric-hybrid Vehicle means a vehicle primarily powered by an electric motor that draws current from rechargeable storage batteries, fuel cells or other sources of electric current and also relies on a non-electric source of power.

Electric Motor Vehicle means a motor vehicle primarily powered by an electric motor that draws current from rechargeable storage batteries, fuel cells, photovoltaic arrays, or other sources of electric current and may include an electric-hybrid vehicle.

Emergency Motor Vehicle means any vehicle that is legally authorized by a government authority to exceed the speed limit to transport people and equipment to and from situations in which speed is required to save lives or property, such as a rescue vehicle, fire truck or ambulance.

Fleet means a group of 20 or more light duty motor vehicles, excluding certain categories of vehicles as provided by section 490.3, used primarily in a metropolitan statistical area or consolidated metropolitan statistical area, as established by the Bureau of the Census as of December 31, 1992, with a 1980 Census population of more than 250,000 (listed in Appendix A to this Subpart), that are centrally fueled or capable of being centrally fueled, and are owned, operated, leased, or otherwise controlled—
(1) By a person who owns, operates, leases, or otherwise controls 50 or more light duty motor vehicles within the United States and its possessions and territories;

(2) By any person who controls such person;

(3) By any person controlled by such person; and

(4) By any person under common control with such person.

Flexible Fuel Vehicle means any motor vehicle engineered and designed to be operated on any mixture of two or more different fuels.

Law Enforcement Motor Vehicle means any vehicle which is primarily operated by a civilian or military police officer or sheriff, or by personnel of the Federal Bureau of Investigation, the Drug Enforcement Administration, or other enforcement agencies of the Federal government, or by State highway patrols, municipal law enforcement, or other similar enforcement agencies, and which is used for the purpose of law enforcement activities including, but not limited to, chase, apprehension, and surveillance of people engaged in or potentially engaged in unlawful activities.

Lease means the use and control of a motor vehicle for transportation purposes pursuant to a rental contract or similar arrangement with a term of 120 days or more.

Light Duty Motor Vehicle means a light duty truck or light duty vehicle, as such terms are defined under section 216(7) of the Clean Air Act (42 U.S.C. § 7550(7)), having a gross vehicle weight rating of 8,500 pounds or less, before any after-market conversion to alternative fuel operation.

Model Year means the period from September 1 of the previous calendar year through August 31.

Motor Vehicle means a self-propelled vehicle, other than a non-road vehicle, designed for transporting persons or property on a street or highway.

Non-road Vehicle means a vehicle not licensed for on-road use, including such vehicles used principally for industrial, farming or commercial use, for rail transportation, at an airport, or for marine purposes.

Original Equipment Manufacturer means a manufacturer that provides the original design and materials for assembly and manufacture of its product.

Original Equipment Manufacturer Vehicle means a vehicle engineered, designed, produced and warranted by an Original Equipment Manufacturer.

Person means any individual, partnership, corporation, voluntary association, joint stock company, business trust, Governmental entity, or other legal entity in the United States except United States Government entities.

State means any of the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, and any other territory or possession of the United States.

Used Primarily, as utilized in the definition of “fleet,” means that a majority of a vehicle’s total annual miles are accumulated within a covered metropolitan or consolidated metropolitan statistical area.

[61 FR 10653, Mar. 14, 1996, as amended at 64 FR 26829, May 17, 1999]

§ 490.3 Excluded vehicles.

When counting light duty motor vehicles to determine under this part whether a person has a fleet or to calculate alternative fueled vehicle acquisition requirements, the following vehicles are excluded—

(a) Motor vehicles held for lease or rental to the general public, including vehicles that are owned or controlled primarily for the purpose of short-term rental or extended-term leasing, without a driver, pursuant to a contract;

(b) Motor vehicles held for sale by motor vehicle dealers, including demonstration motor vehicles;

(c) Motor vehicles used for motor vehicle manufacturer product evaluations or tests, including but not limited to, light duty motor vehicles owned or held by a university research department, independent testing laboratory, or other such evaluation facility, solely for the purpose of evaluating the performance of such vehicle for engineering, research and development or quality control reasons;

(d) Law enforcement vehicles;

(e) Emergency motor vehicles;
(f) Motor vehicles acquired and used for purposes that the Secretary of Defense has certified to DOE must be exempt for national security reasons;
(g) Nonroad vehicles; and
(h) Motor vehicles which, when not in use, are normally parked at the personal residences of the individuals that usually operate them, rather than at a central refueling, maintenance, or business location.

§ 490.4 General information inquiries.

DOE responses to inquiries with regard to the provisions of this part that are not filed in compliance with §§ 490.5 or 490.6 of this part constitute general information and the responses provided shall not be binding on DOE.

§ 490.5 Requests for an interpretive ruling.

(a) Right to file. Any person who is or may be subject to this part shall have the right to file a request for an interpretive ruling on a question with regard to how the regulations apply to particular facts and circumstances.

(b) How to file. A request for an interpretive ruling shall be filed—

1. With the Assistant Secretary;
2. In an envelope labeled “Request for Interpretive Ruling Under 10 CFR Part 490;” and
3. By messenger or mail at the Office of Energy Efficiency and Renewable Energy, EE–33, U.S. Department of Energy, 1000 Independence Avenue, S.W., Washington, D.C. 20585 or at such other address as DOE may provide by notice in the Federal Register.

(c) Content of request for interpretive ruling. At a minimum, a request under this section shall—

1. Be in writing;
2. Be labeled “Request for Interpretive Ruling Under 10 CFR Part 490;”
3. Identify the name, address, telephone number, and any designated representative of the person requesting the interpretive ruling;
4. State the facts and circumstances relevant to the request;
5. Be accompanied by copies of relevant supporting documents, if any;
6. Specifically identify the pertinent regulations and the related question on which an interpretive ruling is sought with regard to the relevant facts and circumstances; and
7. Contain any arguments in support of the terms of an interpretation the requester is seeking.

(d) Public comment. DOE may give public notice of any request for an interpretive ruling and invite public comment.

(e) Opportunity to respond to public comment. DOE may provide an opportunity for any person who requested an interpretive ruling to respond to public comments.

(f) Other sources of information. DOE may—

1. Conduct an investigation of any statement in a request;
2. Consider any other source of information in evaluating a request for an interpretive ruling; and
3. Rely on previously issued interpretive rulings dealing with the same or a related issue.

(g) Informal conference. DOE, on its own initiative, may convene an informal conference with the person requesting an interpretive ruling.

(h) Effect of an interpretive ruling. The authority of an interpretive ruling shall be limited to the person requesting such ruling and shall depend on the accuracy and completeness of the facts and circumstances on which the interpretive ruling is based. An interpretive ruling by the Assistant Secretary shall be final for DOE.

(i) Reliance on an interpretive ruling. No person who obtains an interpretive ruling under this section shall be subject to an enforcement action for civil penalties or criminal fines for actions reasonably taken in reliance thereon, but a person may not act in reliance on an interpretive ruling that is administratively rescinded or modified, judicially invalidated, or its prospective effect is overruled by statute or regulation.

(j) Denials of requests for an interpretive ruling. DOE shall deny a request for an interpretive ruling if DOE determines that—

1. There is insufficient information upon which to base an interpretive ruling;
2. The questions posed should be treated in a general notice of proposed
Department of Energy

(3) There is an adequate procedure elsewhere in this part for addressing the question posed such as a petition for exemption; or
(4) For other good cause.

(k) Public file. DOE may file a copy of an interpretive ruling in a public file labeled “Interpretive Rulings Under 10 CFR Part 490” which shall be available during normal business hours for public inspection at the DOE Freedom of Information Reading Room at 1000 Independence Avenue, SW, Washington, DC 20585, or at such other addresses as DOE may announce in a Federal Register notice

§ 490.6 Petitions for generally applicable rulemaking.

(a) Right to file. Pursuant to 42 U.S.C. 7191 and 5 U.S.C. 553(e), any person may file a petition for generally applicable rulemaking under titles III, IV, and V of the Act with the DOE General Counsel.

(b) How to file. A petition for generally applicable rulemaking under this section shall be filed by mail or messenger in an envelope addressed to the Office of General Counsel, GC–1, U.S. Department of Energy, 1000 Independence Avenue, SW., Washington, DC 20585.

(c) Content of rulemaking petitions. A petition under this section must—
(1) Be labeled “Petition for Rulemaking Under 10 CFR Part 490”;
(2) Describe with particularity the terms of the rule being sought;
(3) Identify the provisions of law that direct, authorize, or affect the issuance of the rules being sought; and
(4) Explain why DOE should not choose to make policy by precedent through interpretive rulings, petitions for exemption, or other adjudications.

(d) Determination upon rulemaking petitions. After considering the petition and other information deemed to be appropriate, DOE may grant the petition and issue an appropriate rulemaking notice, or deny the petition because the rule being sought—
(1) Would be inconsistent with statutory law;
(2) Would establish a generally applicable policy in an area that should be left to case-by-case determinations;
(3) Would establish a policy inconsistent with the underlying statutory purposes; or
(4) For other good cause.

§ 490.7 Relationship to other law.

(a) Nothing in this part shall be construed to require or authorize sale of, or conversion to, light duty alternative fueled motor vehicles in violation of applicable regulations of any Federal, State or local government agency.

(b) Nothing in this part shall be construed to require or authorize the use of a motor fuel in violation of applicable regulations of any Federal, State, or local government agency.

§ 490.8 Replacement fuel production goal.

The goal of the replacement fuel supply and demand program established by section 502(b)(2) of the Act (42 U.S.C. 13252(b)(2)) and revised by DOE pursuant to section 504(b) of the Act (42 U.S.C. 13254(b)) is to achieve a production capacity of replacement fuels sufficient to replace, on an energy equivalent basis, at least 30 percent of motor fuel consumption in the United States by the year 2030.

APPENDIX A TO SUBPART A OF PART 490—METROPOLITAN STATISTICAL AREAS/CONSOLIDATED METROPOLITAN STATISTICAL AREAS WITH 1980 POPULATIONS OF 250,000 OR MORE
§ 490.200 Purpose and scope.

This subpart sets forth rules implementing the provisions of Section 507(o) of the Act which requires, subject to some exemptions, that certain percentages of new light duty motor vehicles acquired for State fleets be alternative fueled vehicles.

§ 490.201 Alternative fueled vehicle acquisition mandate schedule.

(a) Except as otherwise provided in this part, of the new light duty motor...
vehicles acquired annually for State government fleets, including agencies thereof but excluding municipal fleets, the following percentages shall be alternative fueled vehicles for the following model years:

(1) 10 percent for model year 1997;
(2) 15 percent for model year 1998;
(3) 25 percent for model year 1999;
(4) 50 percent for model year 2000; and
(5) 75 percent for model year 2001 and thereafter.

(b) Each State shall calculate its alternative fueled vehicle acquisition requirements for the State government fleets, including agencies thereof, by applying the alternative fueled vehicle acquisition percentages for each model year to the total number of new light duty motor vehicles to be acquired during that model year for those fleets.

(c) If the calculation performed under paragraph (b) of this section produces a number that requires the acquisition of a partial vehicle, an adjustment to the acquisition number will be made by rounding the number of vehicles down the next whole number if the fraction is less than one half and by rounding the number of vehicles up to the next whole number if the fraction is equal to or greater than one half.

(d) A State fleet that first becomes subject to this part after model year 1997 shall acquire alternative fueled vehicles in the next model year at the percentage applicable to that model year according to the schedule in paragraph (a) of this section, unless the State is granted an exemption or reduction of the acquisition percentage pursuant to the procedures and criteria in section 490.204.

§ 490.202 Acquisitions satisfying the mandate.

The following actions within a model year qualify as acquisitions for the purpose of compliance with the requirements of section 490.201 of this part:

(a) The purchase or lease of an Original Equipment Manufacturer light duty vehicle (regardless of the model year of manufacture), capable of operating on alternative fuels that was not previously under control of the State or State agency;

(b) The purchase or lease of an aftermarket converted light duty vehicle (regardless of model year of manufacture), that was not previously under control of the State or State agency;

(c) The conversion of a newly purchased or leased light duty vehicle to operate on alternative fuels within four months after the vehicle is acquired for a State fleet; and

(d) The application of alternative fueled vehicle credits allocated under subpart F of this part.

(a) General Provisions. (1) In lieu of meeting its requirements under section 490.201 exclusively with acquisitions for State fleets, a State may follow a Light Duty Alternative Fueled Vehicle Plan that has been approved by DOE under this section.

(2) Any Light Duty Alternative Fueled Vehicle Plan must provide for voluntary acquisitions or conversions, or combinations thereof, by State, local, and private fleets that equal or exceed the State’s alternative fuel vehicle acquisition requirement under section 490.201.

(3) Any acquisitions of light duty alternative fueled vehicles by participants in the State plan may be included for purposes of compliance, irrespective of whether the vehicles are in excluded categories set forth in section 490.3 of this part.

(4) Except as provided in paragraph (h) of this section or except for a fleet exempt under section 490.204, a State that does not have an approved plan in effect under this section is subject to the State fleet acquisition percentage requirements of section 490.201.

(5) If a significant commitment under an approved plan is not met by a participant of a plan, the State shall meet its percentage requirements under section 490.201 or submit to DOE an amendment to the plan for DOE approval.

(b) Required elements of a plan. Each plan must include the following elements:

(1) Certification by the Governor, or the Governor’s designee, that the plan meets the requirements of this subpart;
§ 490.204 Process for granting exemptions.

(a) To obtain an exemption, in whole or in part, from the vehicle acquisition mandate in section 490.201 of this part, a State shall submit to DOE a written request for exemption, along with supporting documentation which must demonstrate that—

(1) Alternative fuels that meet the normal requirements and practices of the principal business of the State fleet are not available from fueling sites that would permit central fueling of fleet vehicles in the area in which the vehicles are to be operated; or

(2) Alternative fueled vehicles that meet the normal requirements and practices of the principal business of the State fleet are not available for purchase or lease commercially on reasonable terms and conditions in the State; or

(3) The application of such requirements would pose an unreasonable financial hardship.

(b) Requests for exemption may be submitted at any time and must be accompanied with supporting documentation.

(c) Exemptions are granted for one model year only, and they may be renewed annually, if supporting documentation is provided.

(d) Exemptions may be granted in whole or in part. When granting an exemption in part, DOE may, depending
upon the circumstances, completely relieve a State from complying with a portion of the vehicle acquisition requirements for a model year, or it may require a State to acquire all or some of the exempted vehicles in future model years.

(e) If a State is seeking an exemption under—

(1) Paragraph (a)(1) of this section, the types of documentation that are to accompany the request must include, but are not limited to, maps of vehicle operation zones and maps of locations providing alternative fuel; or

(2) Paragraph (a)(2) of this section, the types of documentation that are to accompany the request must include, but are not limited to, alternative fueled vehicle purchase or lease requests, a listing of vehicles that meet the normal practices and requirements of the State fleet, and any other documentation that exhibits good faith efforts to acquire alternative fueled vehicles; or

(3) Paragraph (a)(3) of this section, it must submit a statement identifying what portion of the alternative fueled vehicle acquisition requirement should be subject to the exemption and describing the specific nature of the financial hardship that precludes compliance.

(f) Requests for exemption shall be addressed to the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, EE-33, 1000 Independence Ave., SW., Washington, DC 20585, or to such other address as DOE may announce in a Federal Register notice.

(g) The Assistant Secretary shall provide to the State, within 45 days of receipt of a request that complies with this section, a written determination as to whether the State’s request has been granted or denied.

(h) If the Assistant Secretary denies an exemption, in whole or in part, and the State wishes to exhaust administrative remedies, the State must appeal within 30 days of the date of the determination, pursuant to 10 CFR part 1003, subpart C, to the Office of Hearings and Appeals, U.S. Department of Energy, 1000 Independence Ave., SW., Washington, DC 20585. The Assistant Secretary’s determination shall be stayed during the pendency of an appeal under this paragraph.

§ 490.205 Reporting requirements.

(a) Any State subject to the requirements of this subpart must file an annual report for each State fleet on or before the December 31 after the close of the model year, beginning with model year 1997. The State annual report may consist of a single State report or separately prepared State agency reports.

(b) The report shall include the following information:

(1) Number of new light duty motor vehicles acquired for the fleet by a State during the model year;

(2) Number of new light duty alternative fueled vehicles that are required to be acquired during the model year;

(3) Number of new light duty alternative fueled vehicle acquisitions by the State during the model year;

(4) Number of alternative fueled vehicle credits applied against acquisition requirements;

(5) For each new light duty alternative fueled vehicle acquisition—

(i) Vehicle make and model;

(ii) Model year;

(iii) Vehicle identification number;

(iv) Dedicated or dual-fueled (including flexible fuel); and

(v) Type of alternative fuel the vehicle is capable of operating on;

(6) Number of light duty alternative fueled vehicles acquired by municipal and private fleets during the model year under an approved Light Duty Alternative Fueled Vehicle Plan (if applicable).

(c) If credits are applied against vehicle acquisition requirements, then a credit activity report, as described in subpart F of this part, must be submitted with the report under this section to DOE.

(d) Records shall be maintained and retained for a period of three years.

(e) All reports, marked “Annual Report,” shall be sent to the Office of Energy Efficiency and Renewable Energy, U.S. Department of Energy, EE-33, 1000 Independence Ave., SW., Washington, DC 20585, or such other address as DOE may provide by notice in the Federal Register.
§ 490.206 Violations.
Violations of this subpart are subject to investigation and enforcement under subpart G of this part.

Subpart D—Alternative Fuel Provider Vehicle Acquisition Mandate

§ 490.300 Purpose and Scope.
This subpart implements section 501 of the Act, which requires, subject to some exemptions, that certain annual percentages of new light duty motor vehicles acquired by alternative fuel providers must be alternative fueled vehicles.

§ 490.301 Definitions.
In addition to the definitions found in section 490.2, the following definitions apply to this subpart—
Affiliate means a person that, directly or indirectly, controls, is controlled by, or is under common ownership or control of a person subject to vehicle acquisition requirements in this part.
Alternative Fuels Business means activities undertaken to derive revenue from—
(1) Producing, storing, refining, processing, transporting, distributing, importing, or selling at wholesale or retail any alternative fuel other than electricity; or
(2) Generating, transmitting, importing, or selling at wholesale or retail electricity.
Business Unit means a semi-autonomous major grouping of activities for administrative purposes and organizational structure within a business entity and that is controlled by or under control of a person subject to vehicle acquisition requirements in this part.
Division means a major administrative unit of an enterprise comprising at least several enterprise units or constituting a complete integrated unit for a specific purpose and that is controlled by or under control of a person subject to vehicle acquisition requirements in this part.
Normal Requirements and Practices means the operating business practices and required conditions under which the principal business of a person subject to vehicle acquisition requirements in this part operates.
Principal Business means the sales-related activity that produces the greatest gross revenue.
Substantial Portion means that at least 30 percent of the annual gross revenue of a covered person is derived from the sale of alternative fuels.
Substantially Engaged means that a covered person, or affiliate, division, or other business unit thereof, regularly derives more than a negligible amount of sales-related gross revenue from an alternative fuels business.

§ 490.302 Vehicle acquisition mandate schedule.
(a) Except as provided in section 490.304 of this part, of the light duty motor vehicles newly acquired by a covered person described in section 490.303 of this part, the following percentages shall be alternative fueled vehicles for the following model years:
(1) 30 percent for model year 1997.
(2) 50 percent for model year 1998.
(3) 70 percent for model year 1999.
(4) 90 percent for model year 2000 and thereafter.
(b) Except as provided in section 490.304 of this part, this acquisition schedule applies to all light duty motor vehicles that a covered person newly acquires for use within the United States.
(c) If, when the mandated acquisition percentage of alternative fuel vehicles is applied to the number of new light duty motor vehicles to be acquired by a covered person subject to this subpart, a number results that requires the acquisition of a partial vehicle, an adjustment will be made to the required acquisition number by rounding down to the next whole number if the fraction is less than one half and by rounding up the number of vehicles to the next whole number if the fraction is equal to or greater than one half.
(d) Only acquisitions satisfying the mandate, as defined by section 490.305, count toward compliance with the acquisition schedule in paragraph (a) of this section.
(e) A covered person that is first subject to the acquisition requirements of this part after model year 1997 shall acquire alternative fueled vehicles in the...
next model year at the percentage applicable to that model year, according to the schedule in paragraph (a) of this section, unless the covered person is granted an exemption or reduction of the acquisition percentage pursuant to the procedures and criteria in section 490.308.

§ 490.303 Who must comply.

(a) Except as provided by paragraph (b) of this section, a covered person must comply with the requirements of this subpart if that person is—

(1) A covered person whose principal business is producing, storing, refining, processing, transporting, distributing, importing or selling at wholesale or retail any alternative fuel other than electricity; or

(2) A covered person whose principal business is generating, transmitting, importing, or selling, at wholesale or retail, electricity; or

(3) A covered person—

(i) Who produces, imports, or produces and imports in combination, an average of 50,000 barrels per day or more of petroleum; and

(ii) A substantial portion of whose business is producing alternative fuels.

(b) This subpart does not apply to a covered person or affiliate, division, or other business unit of such person whose principal business is—

(1) transforming alternative fuels into a product that is not an alternative fuel; or

(2) consuming alternative fuels as a feedstock or fuel in the manufacture of a product that is not an alternative fuel.

§ 490.304 Which new light duty motor vehicles are covered.

(a) General rule. Except as provided in paragraph (b) of this section, the vehicle acquisition mandate schedule in section 490.302 of this part applies to all light duty motor vehicles newly acquired for use within the United States by a covered person described in section 490.303 of this part.

(b) Exception. If a covered person has more than one affiliate, division, or other business unit, then section 490.302 of this part only applies to light duty motor vehicles newly acquired by an affiliate, division, or other such business unit which is substantially engaged in the alternative fuels business.

§ 490.305 Acquisitions satisfying the mandate.

The following actions within the model year qualify as acquisitions for the purpose of compliance with the requirements of section 490.302 of this part—

(a) The purchase or lease of an Original Equipment Manufacturer light duty vehicle (regardless of the model year of manufacture), capable of operating on alternative fuels that was not previously under the control of the covered person;

(b) The purchase or lease of an aftermarket converted light duty vehicle (regardless of the model year of manufacture), that was not previously under the control of the covered person; and

(c) The conversion of a newly purchased or leased light duty vehicle to operate on alternative fuels within four months after the vehicle is acquired by a covered person; and

(d) The application of alternative fueled vehicle credits allocated under subpart F of this part.

§ 490.306 Vehicle operation requirements.

The alternative fueled vehicles acquired pursuant to section 490.302 of this part shall be operated solely on alternative fuels, except when these vehicles are operating in an area where the appropriate alternative fuel is unavailable.

§ 490.307 Option for Electric Utilities.

(a) A covered person or its affiliate, division, or business unit, whose principal business is generating, transmitting, importing, or selling, at wholesale or retail, electricity has the option of delaying the vehicle acquisition mandate schedule in section 490.302 until January 1, 1998, if the covered person intends to comply with this regulation by acquiring electric motor vehicles.

(b) If a covered person or its affiliate, division, or business unit, whose principal business is generating, transmitting, importing, or selling at wholesale or retail electricity has notified the Department as required by the Act, of
its intent to acquire electric motor vehicles, the following percentages of new light duty motor vehicles acquired shall be alternative fueled vehicles for the following time periods:

(1) 30 percent from January 1, 1998 to August 31, 1998.
(2) 50 percent for model year 1999.
(3) 70 percent for model year 2000.
(4) 90 percent for model year 2001 and thereafter.

(c) Any covered person or its affiliate, division, or business unit, that chooses the option provided by this section may apply for an exemption from the vehicle acquisition mandate in accordance with section 490.308 of this regulation.

(d) Any covered person or its affiliate, division, or business unit, that chooses to rescind its election of the option provided in this section shall be required, unless otherwise exempt, to acquire alternative fueled vehicles in accordance with the vehicle acquisition schedule in section 490.302.

§ 490.308 Process for granting exemptions.

(a) To obtain an exemption from the vehicle acquisition mandate in this subpart, a covered person, or its affiliate, division, or business unit which is subject to section 490.302 of this part, shall submit a written request for exemption to the Office of Energy Efficiency and Renewable Energy, U.S. Department of Energy, EE-33, 1000 Independence Ave., SW., Washington, DC 20585, or such other address as DOE may publish in the Federal Register, along with the supporting documentation required by this section.

(b) A covered person requesting an exemption must demonstrate that—

(1) Alternative fuels that meet the normal requirements and practices of the principal business of the covered person are not available from fueling sites that would permit central fueling of that person's vehicles in the area in which the vehicles are to be operated; or

(2) Alternative fueled vehicles that meet the normal requirements and practices of the principal business of the covered person are not available for purchase or lease commercially on reasonable terms and conditions in any State included in a MSA/CMSA that the vehicles are operated in.

(c) Documentation. (1) Except as provided in paragraph (c) (2) of this section, if a covered person is seeking an exemption under paragraph (b)(1) of this section, the types of documentation that are to accompany the request include, but are not limited to, maps of vehicle operation zones and maps of locations providing alternative fuel.

(2) If a covered person seeking an exemption under paragraph (b)(1) of this section operates light duty vehicles outside of the areas listed in Appendix A of subpart A, and central fueling of those vehicles does not meet the normal requirements and practices of that person's business, then that covered person shall only be required to justify in a written request why central fueling is incompatible with its business.

(3) If a covered person is seeking an exemption under paragraph (b)(2) of this section, the types of documentation that are to accompany the request include, but are not limited to, documentation that exhibits good faith efforts to acquire alternative fueled vehicles.

(d) Exemptions are granted for one model year only and may be renewed annually, if supporting documentation is provided.

(e) Exemptions may be granted in whole or in part. When granting an exemption in part, DOE may, depending upon the circumstances, completely relieve a covered person from complying with a portion of the vehicle acquisition requirements for a model year, or it may require a covered person to acquire all or some of the exempted vehicles in future model years.

(f) The Assistant Secretary shall provide to the covered person within 45 days after receipt of a request that complies with this section, a written determination as to whether the State's request has been granted or denied.

(g) If a covered person is denied an exemption, that covered person may file an appeal within 30 days of the date of determination, pursuant to 10 CFR
part 1003, subpart C, with the Office of Hearings and Appeals, U.S. Department of Energy, 1000 Independence Ave, SW, Washington, DC 20585. The Assistant Secretary's determination shall be stayed during the pendency of an appeal under this paragraph.

§ 490.309 Annual reporting requirements.

(a) If a person is required to comply with the vehicle acquisition schedule in section 490.302 or section 490.307, that person shall file an annual report under this section, on a form obtainable from DOE, with the Office of Energy Efficiency and Renewable Energy, U.S. Department of Energy, EE-33, 1000 Independence Ave., SW., Washington, DC 20585, or such other address as DOE may publish in the FEDERAL REGISTER, on or before the December 31 after the close of the applicable model year.

(b) This report shall include the following information—

(1) Number of new light duty motor vehicles acquired by the covered person in the United States during the model year;
(2) Number of new light duty alternative fueled vehicles that are required to be acquired during the model year;
(3) Number of new light duty alternative fueled vehicle acquisitions in the United States during the model year;
(4) Number of alternative fueled vehicle credits applied against acquisition requirements;
(5) For each new light duty alternative fueled vehicle acquisition—
   (i) Vehicle make and model;
   (ii) Model year;
   (iii) Vehicle Identification Number;
   (iv) Dedicated or dual-fueled (including flexible fuel); and
   (v) Type of alternative fuel the vehicle is capable of operating on.
(c) If credits are applied against alternative fueled vehicle acquisition requirements, then a credit activity report, as described in subpart F, must be submitted with the report under this section to DOE.
(d) Records shall be maintained and retained for a period of three years.

§ 490.310 Violations.

Violations of this subpart are subject to investigation and enforcement under subpart G of this part.

Subpart E [Reserved]

Subpart F—Alternative Fueled Vehicle Credit Program

§ 490.500 Purpose and Scope.

This subpart implements the statutory requirements of section 508 of the Act, which provides for the allocation of credits to fleets or covered persons who acquire alternative fueled vehicles in excess of the number they are required or obtain alternative fueled vehicles before the model year when they are first required to do so under this part.

§ 490.501 Applicability.

This subpart applies to all fleets and covered persons who are required to acquire alternative fueled vehicles by this part.

§ 490.502 Creditable actions.

A fleet or covered person becomes entitled to alternative fueled vehicle credits by—

(a) Acquiring alternative fueled vehicles, including those in excluded categories under section 490.3 of this part and those exceeding 8,500 gross vehicle weight rating, in excess of the number of alternative fueled vehicles that fleet or covered person is required to acquire in a model year when acquisition requirements apply; or
(b) Acquiring alternative fueled vehicles, including those in excluded categories under section 490.3 of this part and those exceeding 8,500 gross vehicle weight rating, in model years before the model year when that fleet or covered person is first required to acquire alternative fueled vehicles.
(c) For purposes of this subpart, a fleet or covered person that acquired a motor vehicle on or after October 24, 1992, and converted it to an alternative fueled vehicle before April 15, 1996, shall be entitled to a credit for that vehicle notwithstanding the time limit on conversions established by sections
§ 490.503 Credit allocation.

(a) Based on annual credit activity report information, as described in section 490.507 of this part, DOE shall allocate one credit for each alternative fueled vehicle a fleet or covered person acquires that exceeds the number of alternative fueled vehicles that fleet or person is required to acquire in a model year when acquisition requirements apply.

(b) If an alternative fueled vehicle is acquired by a fleet or covered person in a model year before the first model year that fleet or person is required to acquire alternative fueled vehicles by this part, as reported in the annual credit activity report, DOE shall allocate one credit per alternative fueled vehicle for each year the alternative fueled vehicle is acquired before the model year when acquisition requirements apply.

(c) DOE shall allocate credits to fleets and covered persons under paragraph (b) of this section only for alternative fueled vehicles acquired on or after October 24, 1992.

§ 490.504 Use of alternative fueled vehicle credits.

At the request of a fleet or covered person in an annual report under this part, DOE shall treat each credit as the acquisition of an alternative fueled vehicle that the fleet or covered person is required to acquire under this part. Each credit shall count as the acquisition of one alternative fueled vehicle in the model year for which the fleet or covered person requests the credit to be applied.

§ 490.505 Credit accounts.

(a) DOE shall establish a credit account for each fleet or covered person who obtains an alternative fueled vehicle credit.

(b) DOE shall send to each fleet and covered person an annual credit account balance statement after the receipt of its credit activity report under section 490.507.

§ 490.506 Alternative fueled vehicle credit transfers.

(a) Any fleet or covered person that is required to acquire alternative fueled vehicles may transfer an alternative fueled vehicle credit to—

(1) A fleet that is required to acquire alternative fueled vehicles; or

(2) A covered person subject to the requirements of this part, if the transferor provides certification to the covered person that the credit represents a vehicle that operates solely on alternative fuel.

(b) Proof of credit transfer may be on a form provided by DOE, or otherwise in writing, and must include dated signatures of the transferor and transferee. The proof should be received by DOE within 30 days of the transfer date to the Office of Energy Efficiency and Renewable Energy, U.S. Department of Energy, EE-33, 1000 Independence Ave., SW., Washington, DC 20585 or such other address as DOE publishes in the Federal Register.

§ 490.507 Credit activity reporting requirements.

(a) A covered person or fleet applying for allocation of alternative fueled vehicle credits must submit a credit activity report by the December 31 after the close of a model year to the Office of Energy Efficiency and Renewable Energy, U.S. Department of Energy, EE-33, 1000 Independence Ave, SW., Washington, DC 20585 or other such address as DOE may publish in the Federal Register.

(b) This report must include the following information:

(1) Number of alternative fueled vehicle credits requested for:

(i) alternative fueled vehicles acquired in excess of required acquisition number; and

(ii) alternative fueled vehicles acquired in model years before the first model year the fleet or covered person is required to acquire vehicles by this part.

(2) Purchase of alternative fueled vehicle credits:

(i) Credit source; and

(ii) Date of purchase;

(3) Sale of alternative fueled vehicle credits:

(i) Credit purchaser; and
(ii) Date of sale.

Subpart G—Investigations and Enforcement

§ 490.600 Purpose and scope.

This subpart sets forth the rules applicable to investigations under titles III, IV, V, and VI of the Act and to enforcement of sections 501, 503(b), 507, 508, or 514 of the Act, or any regulation issued under such sections.

[72 FR 12964, Mar. 20, 2007]

§ 490.601 Powers of the Secretary.

For the purpose of carrying out titles III, IV, V, and VI of the Act, DOE may hold such hearings, take such testimony, sit and act at such times and places, administer such oaths, and require by subpoena the attendance and testimony of such witnesses and the production of such books, papers, correspondence, memoranda, contracts, agreements, or other records as the Secretary of Transportation is authorized to do under section 505(b)(1) of the Motor Vehicle Information and Cost Savings Act (15 U.S.C. 2005(b)(1)).

§ 490.602 Special orders.

(a) DOE may require by general or special orders that any person—

(1) File, in such form as DOE may prescribe, reports or answers in writing to specific questions relating to any function of DOE under this part; and

(2) Provide DOE access to (and for the purpose of examination, the right to copy) any documentary evidence of such person which is relevant to any function of DOE under this part.

(b) File under oath any reports and answers provided under this section or as otherwise prescribed by DOE, and file such reports and answers with DOE within such reasonable time and at such place as DOE may prescribe.

§ 490.603 Prohibited acts.

It is unlawful for any person to violate any provision of sections 501, 503(b), 507, 514 of the Act, or any regulations issued under such sections.

[72 FR 12964, Mar. 20, 2007]

§ 490.604 Penalties and Fines.

(a) Civil Penalties. Whoever violates § 490.603 of this part shall be subject to a civil penalty of not more than $5,500 for each violation.

(b) Willful violations. Whoever willfully violates section 490.603 of this part shall pay a criminal fine of not more than $10,000 for each violation.

(c) Repeated violations. Any person who knowingly and willfully violates section 490.603 of this part, after having been subjected to a civil penalty for a prior violation of section 490.603 shall pay a criminal fine of not more than $50,000 for each violation.

§ 490.605 Statement of enforcement policy.

DOE may agree not to commence an enforcement proceeding, or may agree to settle an enforcement proceeding, if the person agrees to come into compliance in a manner satisfactory to DOE. DOE normally will not commence an enforcement action against a person subject to the acquisition requirements of this part without giving that person notice of its intent to enforce 90 days before the beginning of an enforcement proceeding.

§ 490.606 Proposed assessments and orders.

DOE may issue a proposed assessment of, and order to pay, a civil penalty in a written statement setting forth supporting findings of violation of the Act or a relevant regulation of this part. The proposed assessment and order shall be served on the person named therein by certified mail, return-receipt requested, and shall become final for DOE if not timely appealed pursuant to section 490.607 of this part.

§ 490.607 Appeals.

(a) In order to exhaust administrative remedies, on or before 30 days from the date of issuance of a proposed assessment and order to pay, a person must appeal a proposed assessment and order to the Office of Hearings and Appeals, U.S. Department of Energy, 1000
Independence Avenue, SW., Washington, DC 20585.

(b) Proceedings in the Office of Hearings and Appeals shall be subject to subpart F of 10 CFR part 1003 except that—

(1) Appellant shall have the ultimate burden of persuasion;

(2) Appellant shall have right to a trial-type hearing on contested issues of fact only if the hearing officer concludes that cross-examination will materially assist in determining facts in addition to evidence available in documentary form; and

(3) The Office of Hearings and Appeals may issue such orders as it may deem appropriate on all other procedural matters.

(c) The determination of the Office of Hearings and Appeals shall be final for DOE.

Subpart H—Biodiesel Fuel Use Credit

SOURCE: 64 FR 27174, May 19, 1999, unless otherwise noted.

§ 490.701 Purpose and scope.

(a) This subpart implements provisions of the Energy Conservation Reauthorization Act of 1998 (Pub. L. 105–388) that require, subject to some limitations, the allocation of credit to a fleet or covered person under Titles III and V of the Energy Policy Act of 1992 for the purchase of a qualifying volume of the biodiesel component of a fuel containing at least 20 percent biodiesel by volume.

(b) Fleets and covered persons may use these credits to meet, in part, their mandated alternative fueled vehicle acquisition requirements.

§ 490.702 Definitions.

In addition to the definitions found in § 490.2, the following definitions apply to this subpart—

Biodiesel means a diesel fuel substitute produced from nonpetroleum renewable resources that meets the registration requirements for fuels and fuel additives established by the Environmental Protection Agency under section 211 of the Clean Air Act; and

Qualifying volume means—

(1) 450 gallons; or

(2) If DOE determines by rule that the average annual alternative fuel use in light duty vehicles by fleets and covered persons exceeds 450 gallons or gallon equivalents, the amount of such average annual alternative fuel use.

§ 490.703 Biodiesel fuel use credit allocation.

(a) DOE shall allocate to a fleet or covered person one credit for each qualifying volume of the biodiesel component of a fuel that contains at least 20 percent biodiesel by volume if:

(1) Each qualifying volume of the biodiesel component of a fuel was purchased after November 13, 1998;

(2) The biodiesel component of fuel is used in vehicles owned or operated by the fleet or covered person; and

(3) The biodiesel component of the fuel is used in vehicles weighing more than 8,500 pounds gross vehicle weight rating.

(b) No credit shall be allocated under this subpart for a purchase of the biodiesel component of a fuel if the fuel is:

(1) For use in alternative fueled vehicles which have been used to satisfy the alternative fueled vehicle acquisition requirements under Titles III and V of the Energy Policy Act of 1992; or

(2) Required by Federal or State law.

[64 FR 27174, May 19, 1999, as amended at 66 FR 2210, Jan. 11, 2001]

§ 490.704 Procedures and documentation.

(a) To receive a credit under this subpart, the fleet or covered person shall submit its request, on a form obtained from DOE, to the Office of Energy Efficiency and Renewable Energy, U. S. Department of Energy, EE–34, 1000 Independence Ave. SW., Washington, DC 20585, or such other address as DOE may publish in the Federal Register, along with the documentation required by paragraph (b) of this section.

(b) Each request for a credit under this subpart must be submitted on or before the December 31 after the close of the applicable model year and must include written documentation stating the quantity of biodiesel purchased, for the given model year, for use in vehicles weighing in excess of 8,500 lbs. gross vehicle weight;
§ 490.807 Use of credits.

(a) At the request of a fleet or covered person allocated a credit under this subpart, DOE shall, for the model year in which the purchase of a qualifying volume is made, treat that purchase as the acquisition of one alternative fueled vehicle the fleet or covered person is required to acquire under titles III and V of the Energy Policy Act of 1992.

(b) Except as provided in paragraph (c) of this section, credits allocated under this subpart may not be used to satisfy more than 50 percent of the alternative fueled vehicle requirements of a fleet or covered person under titles III and V of the Energy Policy Act of 1992.

(c) A fleet or covered person that is a biodiesel alternative fuel provider described in section 490.303 of this part may use its credits allocated under this subpart to satisfy all of its alternative fueled vehicle requirements under section 490.302.

(d) A fleet or covered person may not trade or bank biodiesel fuel credits.

§ 490.808 Procedure for modifying the biodiesel component percentage.

(a) DOE may, by rule, lower the 20 percent biodiesel volume requirement of this subpart for reasons related to cold start, safety, or vehicle function considerations.

(b) Any person may use the procedures in section 490.6 of this part to petition DOE for a rulemaking to lower the biodiesel volume percentage. A petitioner should include any data or information that it wants DOE to consider in deciding whether or not to begin a rulemaking.

§ 490.809 Increasing the qualifying volume of the biodiesel component.

DOE may increase the qualifying volume of the biodiesel component of fuel for purposes of allocation of credits under this subpart only after it:

(a) Collects data establishing that the average annual alternative fuel use in light duty vehicles by fleets and covered persons exceeds 450 gallons or gallon equivalents; and

(b) Conducts a rulemaking to amend the provisions of this subpart to change the qualifying volume to the average annual alternative fuel use.

§ 490.808 Violations.

Violations of this subpart are subject to investigation and enforcement under subpart G of this part.

Subpart I—Alternative Compliance

SOURCE: 72 FR 12964, Mar. 20, 2007, unless otherwise noted.

§ 490.801 Purpose and scope.

This subpart implements section 514 of the Act (42 U.S.C. 13263a) which permits States and alternative fuel providers to petition for alternative compliance waivers from the alternative fueled vehicle acquisition requirements in subparts C and D of this part, respectively.

§ 490.802 Eligibility for alternative compliance waiver.

Any State subject to subpart C of this part and any covered person subject to subpart D of this part may apply to DOE for a waiver from the applicable alternative fueled vehicle acquisition requirements.

§ 490.803 Waiver requirements.

DOE grants a State or covered person a waiver:

(a) If DOE determines that the State or covered person will achieve a reduction in petroleum consumption, through eligible reductions as specified in § 490.804 of this subpart, equal to the amount of alternative fuel used if the following vehicles were operated 100 percent of the time on alternative fuel
§ 490.804 Eligible reductions in petroleum consumption.

(a) Motor vehicles. Demonstrated reductions in petroleum consumption during the model year for which a waiver is requested that are attributable to motor vehicles owned, operated, leased or otherwise under the control of a State or covered person acquired during waiver years are applicable towards the petroleum fuel reduction required in § 490.803(a) of this subpart.

(b) Qualified nonroad vehicles. Demonstrated reductions in petroleum consumption during the model year for which a waiver is requested that are attributable to nonroad vehicles owned, operated, leased or otherwise under the control of a State or covered person acquired during waiver years are applicable towards the petroleum fuel reduction required in § 490.803(a) of this subpart.

(c) Rollover of excess petroleum reductions. Petroleum reductions achieved by a fleet in excess of the amount required for alternative compliance in a previous model year are applicable towards the petroleum fuel reduction requirements for that fleet under § 490.803(a) of this subpart upon approval by DOE.

(d) Ineligible reductions. The petroleum reduction plan required by paragraph (c)(4) of this section must not include reductions in petroleum attributable to incentives for third parties to reduce their petroleum use, petroleum reductions that are not transportation-related, or petroleum reductions attributable to non-qualified nonroad vehicles.

§ 490.805 Application for waiver.

(a) A State or covered person must apply for a waiver applicable to an entire fleet for a full model year in accordance with the deadlines specified in paragraph (b) of this section. DOE will not grant a waiver for less than an entire fleet or less than a full model year.

(b)(1) A State or covered person must register a preliminary intent to apply for a waiver by March 31 prior to the model year for which a waiver is sought.

(2) If a complete waiver application is dependent on information regarding the availability of motor vehicle models to be released by motor vehicle manufacturers, the waiver application must be received by DOE no later than
§ 490.806 Action on an application for waiver.

(a) DOE grants or denies a complete waiver application within 45 business days after receipt of a complete application.

(b) If DOE determines that an application is not complete in that sufficient information is not provided for DOE to make a determination, DOE notifies the State or covered person of the information that must be submitted to complete the application.

July 31 prior to the model year for which a waiver is sought.

(3) If a complete waiver application is not dependent on information regarding the availability of motor vehicle models to be released by motor vehicle manufacturers, the waiver application must be received by DOE no later than June 30 prior to the model year for which a waiver is sought.

(c) A waiver application must include verifiable data that is sufficient to enable DOE to determine whether the State or covered person is likely to achieve the amount of petroleum reduction required for alternative compliance and whether the fleet is in compliance with Clean Air Act vehicle emission standards. At a minimum, the State entity or covered person must provide DOE with the following information:

(1) The model year for which the waiver is requested;

(2) The total number of required alternative fueled vehicle acquisitions in the fleet including:

(i) The number of alternative fueled vehicle acquisitions that the State or covered person would, without a waiver, be required to acquire during the model year for which the waiver is requested;

(ii) The number of alternative fueled vehicle acquisitions that the State or covered person would, without a waiver, have been required to acquire during the model years for which waivers were previously granted;

(iii) The number of required alternative fueled vehicles existing in the fleet that were acquired during years in which no waiver was in force; and excluding

(iv) Any required alternative fuel vehicles acquired during a waiver or non-waiver year or light-duty vehicles acquired in lieu of alternative fuels vehicles during a waiver year that are to be retired before the beginning of the waiver year;

(3) The anticipated amount of gasoline and diesel and alternative fuel (calculated in gasoline gallon equivalents (gge)) to be used by the covered light-duty vehicles in the fleet for the waiver year including an estimate of per vehicle average fuel use in these vehicles;

(4) A petroleum reduction plan as described in paragraph (d) of this section; and

(5) Documents, or a certification by a responsible official of the State or covered person, demonstrating that the fleet is in compliance with all applicable vehicle emission standards established by the Administrator of the Environmental Protection Agency under the Clean Air Act.

(d) The petroleum reduction plan required by paragraph (c)(4) of this section must contain a documented explanation as to how the State or covered person will meet the reduction in petroleum consumption required by § 490.803(a) of this subpart.

(1) The planned actions must:

(i) Be verifiable;

(ii) Demonstrate a reduction in petroleum use by motor vehicles or qualified nonroad vehicles owned, operated, leased or otherwise controlled by the State or covered person;

(iii) Provide for a net reduction in petroleum consumption as specified in § 490.803(a) of this subpart.

(2) The documentation for the plan may include, but is not limited to, published data on fuel efficiency, Government data, letters from manufacturers, and data on actual usage.

(e) A State or covered person must send its report, and two copies, to DOE on official company or agency letterhead, and the report must be signed by a responsible company or agency official. Send to: Regulatory Manager, Alternative Fuel Transportation Program, FreedomCAR and Vehicle Technologies Program, EE-2G/Forrestal Building, U.S. Department of Energy, 1000 Independence Avenue, SW., Washington, DC 20585.
(c) If DOE denies a waiver, and the State or covered person wishes to exhaust administrative remedies, the State or covered person must appeal within 30 days of the date of the determination, pursuant to 10 CFR part 1003, subpart C, to the Office of Hearings and Appeals, U.S. Department of Energy, 1000 Independence Ave., SW., Washington, DC 20585. DOE’s determination shall be stayed during the pendency of an appeal under this paragraph.

§ 490.807 Reporting requirement.

(a) By December 31 following a model year for which an alternative compliance waiver is granted, a State or covered person must submit a report to DOE that includes:

(1) A statement certifying:

(i) The total number of petroleum gallons and/or alternative fuel gge used by the fleet during the waiver year in its covered light-duty vehicles; and

(ii) The amount of petroleum motor fuel reduced by the fleet in the waiver year through alternative compliance.

(b) A State or covered person must send its report to DOE on official company or agency letterhead, and the report must be signed by a responsible company or agency official. Send to: Regulatory Manager, Alternative Fuel Transportation Program, FreedomCAR and Vehicle Technologies Program, EE–2G/Forrestal Building, U.S. Department of Energy, 1000 Independence Avenue, SW., Washington, DC 20585.

§ 490.808 Use of credits to offset petroleum reduction shortfall.

(a) If a State or covered person granted a waiver under this subpart wants to use alternative fueled vehicle credits purchased or earned pursuant to subpart F of this part to offset any shortfall in meeting the petroleum reduction required under §490.803(a) of this subpart, it must make a written request to DOE.

(1) The State or covered person must provide details about the particular circumstances that led to the shortfall and provide documentation that shows a good faith effort to meet the requirements.

(2) DOE may request that a State or covered person supply additional information about the fleet and its operations if DOE deems such information necessary for a decision on the request.

(b) If DOE grants the request, it notifies the State or covered person of the credit amount required to offset the shortfall. DOE derives the credit amount using the fleet’s fuel use per vehicle data.

(c) DOE gives the State entity or covered person until March 31 following the model year for which the waiver is granted, to acquire the number of credits required for compliance with this subpart.

§ 490.809 Violations.

If a State or covered person that receives a waiver under this subpart fails to comply with the petroleum motor fuel reduction or reporting requirements of this subpart, DOE will revoke the waiver. DOE may impose on the State or covered person a penalty under subpart G of this part.

§ 490.810 Record retention.

A State or covered person that receives a waiver under this subpart must retain documentation pertaining to its waiver application and alternative compliance, including petroleum fuel reduction by its fleet, for a period of three years following the model year for which the waiver is granted.

PARTS 491–499 [RESERVED]
