§ 3.375 Determination of inactivity (complete arrest) in tuberculosis.

(a) Pulmonary tuberculosis. A veteran shown to have had pulmonary tuberculosis will be held to have reached a condition of “complete arrest” when a diagnosis of inactive is made.

(b) Nonpulmonary disease. Determination of complete arrest of nonpulmonary tuberculosis requires absence of evidence of activity for 6 months. If there are two or more foci of such tuberculosis, one of which is active, the condition will not be considered to be inactive until the tuberculous process has reached arrest in its entirety.

(c) Arrest following surgery. Where there has been surgical excision of the lesion or organ, the date of complete arrest will be the date of discharge from the hospital, or 6 months from the date of excision, whichever is later.

§ 3.376–3.377 [Reserved]

§ 3.378 Changes from activity in pulmonary tuberculosis pension cases.

A permanent and total disability rating in effect during hospitalization will not be discontinued before hospital discharge on the basis of a change in classification from active. At hospital discharge, the permanent and total rating will be discontinued unless (a) the medical evidence does not support a finding of complete arrest (§ 3.375), or (b) where complete arrest is shown but the medical authorities recommend that employment not be resumed or be resumed only for short hours (not more than 4 hours a day for a 5-day week). If either of the two aforementioned conditions is met, discontinuance will be deferred pending examination in 6 months. Although complete arrest may be established upon that examination, the permanent and total rating may be extended for a further period of 6 months provided the veteran’s employment is limited to short hours as recommended by the medical authorities (not more than 4 hours a day for a 5-day week). Similar extensions may be granted under the same conditions at the end of 12 and 18 months periods. At the expiration of 24 months after hospitalization, the case will be considered under § 3.321(b) if continued short hours of employment is recommended or if other evidence warrants submission.

§ 3.379 Anterior poliomyelitis.

If the first manifestations of acute anterior poliomyelitis present themselves in a veteran within 35 days of termination of active military service, it is probable that the infection occurred during service. If they first appear after this period, it is probable that the infection was incurred after service.

§ 3.380 Diseases of allergic etiology.

Diseases of allergic etiology, including bronchial asthma and urticaria, may not be disposed of routinely for compensation purposes as constitutional or developmental abnormalities. Service connection must be determined on the evidence as to existence prior to enlistment and, if so existent, a comparative study must be made of its severity at enlistment and subsequently. Increase in the degree of disability during service may not be disposed of routinely as natural progress nor as due to the inherent nature of the disease. Seasonal and other acute allergic manifestations subsiding on the absence of or removal of the allergen are generally to be regarded as acute diseases, healing without residuals. The determination as to service incurrence or aggravation must be on the whole evidentiary showing.

§ 3.381 Service connection of dental conditions for treatment purposes.

(a) Treatable carious teeth, replaceable missing teeth, dental or alveolar abscesses, and periodontal disease will be considered service-connected solely
for the purpose of establishing eligibility for outpatient dental treatment as provided in §17.161 of this chapter.

(b) The rating activity will consider each defective or missing tooth and each disease of the teeth and periodontal tissues separately to determine whether the condition was incurred or aggravated in line of duty during active service. When applicable, the rating activity will determine whether the condition is due to combat or other in-service trauma, or whether the veteran was interned as a prisoner of war.

(c) In determining service connection, the condition of teeth and periodontal tissues at the time of entry into active duty will be considered. Treatment during service, including filling or extraction of a tooth, or placement of a prosthesis, will not be considered evidence of aggravation of a condition that was noted at entry, unless additional pathology developed after 180 days or more of active service.

(d) The following principles apply to dental conditions noted at entry and treated during service:

(1) Teeth noted as normal at entry will be service-connected if they were filled or extracted after 180 days or more of active service.

(2) Teeth noted as filled at entry will be service-connected if they were extracted, or if the existing filling was replaced, after 180 days or more of active service.

(3) Teeth noted as carious but restorable at entry will not be service-connected on the basis that they were filled during service. However, new caries that developed 180 days or more after such a tooth was filled will be service-connected.

(4) Teeth noted as carious but restorable at entry, whether or not filled, will be service-connected if extraction was required after 180 days or more of active service.

(5) Teeth noted at entry as non-restorable will not be service-connected, regardless of treatment during service.

(6) Teeth noted as missing at entry will not be service connected, regardless of treatment during service.

(e) The following will not be considered service-connected for treatment purposes:

(1) Calculus;

(2) Acute periodontal disease;

(3) Third molars, unless disease or pathology of the tooth developed after 180 days or more of active service, or was due to combat or in-service trauma; and

(4) Impacted or malposed teeth, and other developmental defects, unless disease or pathology of these teeth developed after 180 days or more of active service.

(f) Teeth extracted because of chronic periodontal disease will be service-connected only if they were extracted after 180 days or more of active service.

(Authority: 38 U.S.C. 1712)

§ 3.383 Special consideration for paired organs and extremities.

(a) Entitlement criteria. Compensation is payable for the combinations of service-connected and nonservice-connected disabilities specified in paragraphs (a)(1) through (a)(5) of this section as if both disabilities were service-connected, provided the nonservice-connected disability is not the result of the veteran’s own willful misconduct.

(1) Impairment of vision in one eye as a result of service-connected disability and impairment of vision in the other eye as a result of non-service-connected disability and

(ii) The impairment of vision in each eye is rated at a visual acuity of 20/200 or less; or

(ii) The peripheral field of vision for each eye is 20 degrees or less.

(2) Loss or loss of use of one kidney as a result of service-connected disability and involvement of the other kidney as a result of nonservice-connected disability.

(3) Hearing impairment in one ear compensable to a degree of 10 percent or more as a result of service-connected disability and hearing impairment as a result of nonservice-connected disability that meets the provisions of §3.385 in the other ear.

(4) Loss or loss of use of one hand or one foot as a result of service-connected disability and loss or loss of use of the other hand or foot as a result of nonservice-connected disability.
