§ 610.42 Fuel economy measurement.

(a) Fuel consumption will be measured by:
   (1) The carbon balance method, or
   (2) Gravimetric or volumetric methods. In the gravimetric and volumetric methods, fuel consumption is determined by weighing the fuel source before and after a test, or by measuring the volume of fuel consumed during a test. Since the distance traveled during the tests is known, the fuel economy, in miles per gallon, can be calculated. Gravimetric and volumetric methods require the use of special test equipment in addition to the emissions measuring equipment.

(b) The carbon balance procedure for measuring fuel consumption relates the carbon products in the exhaust to the amount of fuel burned during the test. This method will be the one used to measure fuel economy unless track or road tests are employed.

(c) Three values of fuel economy will be reported: for city driving ('75 FTP), for highway driving (HFET), and the combined city/highway value calculated according to this equation:

\[
\text{MPG}_{\text{combined}} = 1 / \left( \frac{0.55}{\text{MPG}_{\text{city}}} + \frac{0.45}{\text{MPG}_{\text{hwy}}} \right)
\]

§ 610.43 Chassis dynamometer procedures.

(a)(1) 1975 Federal Test Procedure. Vehicle exhaust emissions and fuel economy under urban driving conditions will be measured according to the Federal emission test procedure described in 40 CFR part 86, subpart B, which is known as the 1975 Federal Test Procedure ('75 FTP). However, the following modifications will be employed:
   (i) No evaporative emission loss, as specified by 40 CFR part 86 need be measured (with the exception of devices modifying or disconnecting existing evaporative control devices in such a manner as would be expected to adversely affect their evaporative emission control performance).

(ii) Vehicle preconditioning shall consist of operation of the vehicle through one (i) EPA Urban Dynamometer Driving Schedule. This preconditioning must be done at least 12 hours, but no earlier than 36 hours before the emission test.

(iii) While the test fuel must meet the specifications outlined in 40 CFR part 86, fuel conditioning as specified for evaporative emission test procedures is not required.

(b) Highway Fuel Economy Test. The test vehicle is fully warmed up at the start of the highway Fuel Economy Test which is ordinarily run immediately following the Federal Emission Test Procedure. The test procedure to be followed for generation of highway fuel economy data is that specified in §600.111.

(c) Steady state tests. Constant speed, road load tests may be conducted to help give insight into operational differences and exhaust emission and fuel economy changes due to a retrofit device. Speeds between 0 (engine idling) and 60 mpg will be investigated, with a time period at each speed long enough to ensure that engine operation has stabilized.

Subpart E—Durability Test Procedures

§ 610.50 Test configurations.

(a) In addition to the tuneup to manufacturer’s specifications per §610.41, all vehicles in the durability fleet will have installed the following new parts: Air, oil, and fuel filters, spark plugs, points, condenser, rotor, distributor cap, PCV valve, and emission control devices such as vacuum control valves and EGR valves.

(b) Vehicles included in the durability fleet will be subjected at zero device-miles to the same test sequence for fuel economy and exhaust emissions as specified in subpart D. Subsequently, they will be tested at 3,000 device-mile intervals, up to and including the final mileage point of 15,000 device-miles. Testing at these mileage points will be performed with the vehicle equipped with the full retrofit system.

(c) After the 15,000-mile test the vehicle will be tuned as necessary and the device adjusted to the manufacturer’s
specifications as required. The fully restored retrofitted configuration will then be tested. The device will then be removed from the vehicle and the vehicle set to vehicle manufacturer’s specifications. A tuned baseline test will then be conducted.

§ 610.51 Mileage accumulation procedure.
(a) Except as otherwise provided in this part, the mileage accumulation procedure will be that provided in 40 CFR part 86. This mileage accumulation schedule, or a suitable alternate procedure approved by the Administrator, will be used.
(b) Fuel used in the accumulation of mileage will be commercial fuel available in the retail market and shall conform to the requirements of 40 CFR part 86 for mileage accumulation fuel.
(1) The requirements of this paragraph may be modified by the Administrator when it is a fuel or fuel additive that is being tested.

§ 610.52 Maintenance.
(a) Maintenance during the durability evaluation can best be considered in three separate categories:
(1) Normal scheduled vehicle maintenance,
(2) Unscheduled vehicle maintenance, and
(3) Retrofit maintenance.
(b) Normal scheduled vehicle maintenance is the periodic service specified in the original owner’s manual supplied to the owner at the time of new vehicle purchase.
(1) Normal periodic engine oil changes, vehicle lubrication, and oil filter changes, as specified in the original owner’s manual, will be performed during durability mileage accumulation.
(2) For purposes of this part, the following items of normally scheduled vehicle maintenance will not be performed during the durability mileage accumulation:
(i) Normal tune-up items:
(A) Spark plugs.
(B) Condenser.
(C) Rotor.
(D) Distributor cap.
(ii) Air Cleaner element.
(iii) PCV Inspection.
(iv) Dwell and timing check.
(v) Charging circuit check.
(3) Periodic maintenance items specified in the original owner’s manual, other than those listed above, may be performed if found to be necessary by the Administrator.
(c) Unscheduled maintenance. Because the vehicles used for durability evaluation in this program will probably have considerable mileage accumulation and unknown maintenance prior to inclusion in the program, it can be anticipated that certain vehicle and engine failures may occur, which may be unrelated to the retrofit device. Unscheduled maintenance will be performed only in those cases where a significant and obvious driveability problem has been reported by the driver of the vehicle.
(1) Correction of the following problems will be made as soon as the problems occur:
(i) Tire replacement (same size and type).
(ii) Vehicle body repairs (remote from engine and retrofit).
(iii) Windshield wipers.
(iv) Fluid levels unrelated to retrofit.
(v) Brakes.
(vi) Hoses unrelated to retrofit.
(vii) Belts unrelated to retrofit.
(viii) Suspension failures.
(ix) Wheel alignment.
(x) Steering.
(xi) Wheel bearings.
(xii) Non-engine electrical system.
(xiii) Drivetrain components (U-joints, axles, transmission adjustments, etc.)
(2) Other unscheduled maintenance of the engine or drivetrain may be made as directed by the Administrator. Upon notification of a need for unscheduled maintenance, the Administrator may decide that before and after maintenance fuel economy tests are required.
(d) Retrofit maintenance. Maintenance of the retrofit device will normally not be performed during the accumulation of durability mileage of 15,000 miles. However, certain retrofit devices may require periodic maintenance that is directly related to device function. An example is the periodic addition of fluid to the reservoir of a vapor injector. The Administrator will determine whether periodic maintenance will be
