Environmental Protection Agency

§ 161.170

(d) Section 161.162(b)(6), pertaining to the conditions of the process.
(e) Section 161.162(b)(8), pertaining to quality control measures.

§ 161.167 Discussion of formation of impurities.

The applicant must provide a discussion of the impurities that may be present in the product, and why they may be present. The discussion should be based on established chemical theory and on what the applicant knows about the starting materials, technical grade of active ingredient, inert ingredients, and production or formulation process. If the applicant has reason to believe that an impurity that EPA would consider toxicologically significant may be present, the discussion must include an expanded discussion of the possible formation of the impurity and the amounts at which it might be present. The impurities which must be discussed are the following, as applicable:

(a) Technical grade active ingredients and products produced by an integrated system. (1) Each impurity associated with the active ingredient which was found to be present in any analysis of the product conducted by or for the applicant.
(2) Each other impurity which the applicant has reason to believe may be present in his product at any time before use at a level equal to or greater than 0.1 percent (1000 ppm) by weight of the technical grade of the active ingredient, based on what he knows about the following:
(i) The composition (or composition range) of each starting material used to produce his product.
(ii) The impurities which he knows are present (or believes are likely to be present) in the starting materials, and the known or presumed level (or range of levels) of those impurities.
(iii) The intended reactions and side reactions which may occur in the production of the product, and the relative amounts of byproduct impurities produced by such reactions.
(iv) The possible degradation of the ingredients in the product after its production but prior to its use.
(v) Post-production reactions between the ingredients in the product.
(vi) The possible migration of components of packaging materials into the pesticide.
(vii) The possible carryover of contaminants from use of production equipment previously used to produce other products or substances.
(viii) The process control, purification and quality control measures used to produce the product.

(b) Products not produced by an integrated system. Each impurity associated with the active ingredient which the applicant has reason to believe may be present in the product at any time before use at a level equal to or greater than 0.1 percent (1000 ppm) by weight of the product based on what he knows about the following:
(1) The possible carryover of impurities present in any registered product which serves as the source of any of the product’s active ingredients. The identity and level of impurities in the registered source need not be discussed or quantified unless known to the formulator.
(2) The possible carryover of impurities present in the inert ingredients in the product.
(3) Possible reactions occurring during the formulation of the product between any of its active ingredients, between the active ingredients and inert ingredients, or between the active ingredients and the production equipment.
(4) Post-production reactions between any of the product’s active ingredients and any other component of the product or its packaging.
(5) Possible migration of packaging materials into the product.
(6) Possible contaminants resulting from earlier use of equipment to produce other products.

(c) Expanded discussion. On a case-by-case basis, the Agency may require an expanded discussion of information of impurities:
(1) From other possible chemical reactions;
(2) Involving other ingredients; or
(3) At additional points in the production or formulation process.

§ 161.170 Preliminary analysis.

(a) If the product is produced by an integrated system, the applicant must
provide a preliminary analysis of each technical grade of active ingredient contained in the product to identify all impurities present at 0.1 percent or greater of the TGAI. The preliminary analysis should be conducted at the point in the production process after which no further chemical reactions designed to produce or purify the substance are intended.

(b) Based on the preliminary analysis, a statement of the composition of the technical grade of active ingredient must be provided. If the technical grade of active ingredient cannot be isolated, a statement of the composition of the practical equivalent of the technical grade of active ingredient must be submitted.

§ 161.175 Certified limits.

The applicant must propose certified limits for the ingredients in the product. Certified limits become legally binding limits upon approval of the application. Certified limits will apply to the product from the date of production to date of use, unless the product label bears a statement prohibiting use after a certain date, in which case the certified limits will apply only until that date.

(a) \textit{Ingredients for which certified limits are required}. Certified limits are required on the following ingredients of a pesticide product:

\begin{enumerate}
\item An upper and lower limit for each active ingredient.
\item An upper and lower limit for each inert ingredient.
\item If the product is a technical grade of active ingredient or is produced by an integrated system, an upper limit for each impurity of toxicological significance associated with the active ingredient and found to be present in any sample of the product.
\item On a case-by-case basis, certified limits for other ingredients or impurities as specified by EPA.
\end{enumerate}

(b) \textit{EPA determination of certified limits for active and inert ingredients}. (1) Unless the applicant proposes different limits as provided in paragraph (c) of this section, the upper and lower certified limits for active and inert ingredients will be determined by EPA. EPA will calculate the certified limits on the basis of the nominal concentration of the ingredient in the product, according to the table in paragraph (b)(2) of this section.

(2) Table of standard certified limits.

<table>
<thead>
<tr>
<th>Upper limit</th>
<th>Lower limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>N + 10%N</td>
<td>N - 10%N</td>
</tr>
<tr>
<td>N + 5%N</td>
<td>N - 5%N</td>
</tr>
<tr>
<td>N + 3%N</td>
<td>N - 3%N</td>
</tr>
</tbody>
</table>

(c) \textit{Applicant proposed limits}. (1) The applicant may propose a certified limit for an active or inert ingredient that differs from the standard certified limit calculated according to paragraph (b)(2) of this section.

(2) If certified limits are required for impurities, the applicant must propose a certified limit. The standard certified limits may not be used for such substances.

(3) Certified limits should:

\begin{enumerate}
\item Be based on a consideration of the variability of the concentration of the ingredient in the product when good manufacturing practices and normal quality control procedures are used.
\item Allow for all sources of variability likely to be encountered in the production process.
\item Take into account the stability of the ingredient in the product and the possible formation of impurities between production and sale of distribution.
\end{enumerate}

(4) The applicant may include an explanation of the basis of his proposed certified limits, including how the certified limits were arrived at (e.g., sample analysis, quantitative estimate based on production process), and its accuracy and precision. This will be particularly useful if the range of the certified limit for an active or inert ingredient is greater than the standard certified limits.

(d) \textit{Special cases}. If the Agency finds unacceptable any certified limit (either standard or applicant-proposed), the Agency will inform the applicant of its determination and will provide supporting reasons. EPA may also recommend alternative limits to the applicant. The Agency may require, on a case-by-case basis, any or all of the following:

\begin{enumerate}
\item More precise limits.
