prior to harvest, random samples of fruit must be collected from each registered production site under the direction of the NPPO of Chile. These samples must undergo a pest detection and evaluation method as follows: The fruit must be washed using a flushing method, placed in a 200-mesh sieve on top of a 200-mesh sieve, sprinkled with a liquid soap and water solution, washed with water at high pressure, and washed with water at low pressure. The process must then be repeated. The contents of the 200-mesh sieve must then be placed on a petri dish and analyzed for the presence of live Brevipalpus chilensis mites. If a single live B. chilensis mite is found during the inspection process, the certified low-prevalence production site where the fruit was grown will lose its certification.

(c) **Post-harvest processing.** After harvest, all damaged or diseased fruits must be culled at the packinghouse and must be packed into new, clean boxes, crates, or other APHIS-approved packing containers. Each container must have a label identifying the registered production site where the fruit originated and the packing shed where it was packed.

(d) **Phytosanitary inspection.** Fruit must be inspected in Chile at an APHIS-approved inspection site under the direction of APHIS inspectors in coordination with the NPPO of Chile following any post-harvest processing. A biometric sample must be drawn and examined from each consignment. Baby kiwi in any consignment may be shipped to the continental United States under the conditions of this section only if the consignment passes inspection as follows:

(1) Fruit presented for inspection must be identified in the shipping documents accompanying each lot of fruit to specify the production site or sites in which the fruit was produced and the packing shed or sheds in which the fruit was processed. This identification must be maintained until the fruit is released for entry into the United States.

(2) A biometric sample of the boxes, crates, or other APHIS-approved packing containers from each consignment will be selected by the NPPO of Chile, and the fruit from these boxes, crates, or other APHIS-approved packing containers will be visually inspected for quarantine pests. A portion of the fruit must be washed with soapy water and the collected filtrate must be microscopically examined for B. chilensis. If a single live B. chilensis mite is found during the inspection process, the certified low-prevalence production site where the fruit was grown will lose its certification.

(e) **Phytosanitary certificate.** Each consignment of fresh baby kiwi must be accompanied by a phytosanitary certificate issued by the NPPO of Chile that contains an additional declaration stating that the fruit in the consignment was inspected and found free of Brevipalpus chilensis and was grown, packed, and shipped in accordance with the requirements of 7 CFR 319.56–53.

(76 FR 65934, Oct. 25, 2011)
Animal and Plant Health Inspection Service, USDA § 319.59–2

§ 319.59–2 General import prohibitions; exceptions.

(a) Except as provided in paragraph (b) of this section, importation of Triticum spp. plants into the United States from any country except Canada is prohibited. This prohibition does not include seed.

(b) Triticum spp. plants, articles listed in §319.59–3 as prohibited importation pending risk evaluation, and articles regulated for Karnal bunt in §319.59–4(a) may be imported by the U.S. Department of Agriculture for experimental or scientific purposes if:

(1) Imported at the National Plant Germplasm Inspection Station, Building 580, Beltsville Agricultural Center East, Beltsville, MD 20705, or through any USDA plant inspection station listed in §319.37–14 of this part;

(2) Imported pursuant to a departmental permit issued for such article and kept on file at the National Plant Germplasm Inspection Station;
