§ 3.379 Anterior poliomyelitis.

If the first manifestations of acute anterior poliomyelitis present themselves in a veteran within 35 days of termination of active military service, it is probable that the infection occurred during service. If they first appear after this period, it is probable that the infection was incurred after service.

[26 FR 1592, Feb. 24, 1961]

§ 3.380 Diseases of allergic etiology.

Diseases of allergic etiology, including bronchial asthma and urticaria, may not be disposed of routinely for compensation purposes as constitutional or developmental abnormalities. Service connection must be determined on the evidence as to existence prior to enlistment and, if so existent, a comparative study must be made of its severity at enlistment and subsequently. Increase in the degree of disability during service may not be disposed of routinely as natural progress nor as due to the inherent nature of the disease. Seasonal and other acute allergic manifestations subsiding on the absence of or removal of the allergen are generally to be regarded as acute diseases, healing without residuals. The determination as to service incurrence or aggravation must be on the whole evidentiary showing.

[26 FR 1592, Feb. 24, 1961]

§ 3.381 Service connection of dental conditions for treatment purposes.

(a) The Veterans Benefits Administration (VBA) will adjudicate a claim for service connection of a dental condition for treatment purposes after the Veterans Health Administration determines a veteran meets the basic eligibility requirements of §17.161 of this chapter and requests VBA make a determination on questions that include, but are not limited to, any of the following:

(1) Former Prisoner of War status;
(2) Whether the veteran has a compensable or noncompensable service-connected dental condition or disability;
(3) Whether the dental condition or disability is a result of combat wounds;
(4) Whether the dental condition or disability is a result of service trauma; or
(5) Whether the veteran is totally disabled due to a service-connected disability.

(b) Treatable carious teeth, replaceable missing teeth, dental or alveolar abscesses, and periodontal disease are not compensable disabilities, but may nevertheless be service connected solely for the purpose of establishing eligibility for outpatient dental treatment as provided for in §17.161 of this chapter. These conditions and other dental conditions or disabilities that are noncompensably rated under §4.150 of this chapter may be service connected for purposes of Class II or Class II (a) dental treatment under §17.161 of this chapter.

(c) The rating activity will consider each defective or missing tooth and each disease of the teeth and periodontal tissues separately to determine whether the condition was incurred or aggravated in line of duty during active service.

(d) In determining service connection, the condition of teeth and periodontal tissues at the time of entry into active duty will be considered. Treatment during service, including filling or extraction of a tooth, or placement of a prosthesis, will not be considered evidence of aggravation of a condition that was noted at entry, unless additional pathology developed after 180 days or more of active service.

(e) The following principles apply to dental conditions noted at entry and treated during service:

(1) Teeth noted as normal at entry will be service-connected if they were filled or extracted after 180 days or more of active service.
(2) Teeth noted as filled at entry will be service-connected if they were extracted, or if the existing filling was replaced, after 180 days or more of active service.
(3) Teeth noted as carious but restorable at entry will not be service-connected on the basis that they were filled during service. However, new caries that developed 180 days or more after such a tooth was filled will be service-connected.
