APHIS, have been taken. The NPPO of Peru must keep records of *S. catenifer* detections for each orchard, update the records each time the orchards are surveyed, and make the records available to APHIS inspectors upon request. The records must be maintained for at least 1 year after the beginning of the harvest.

(e) Harvesting requirements. Harvested avocados must be placed in field cartons or containers that are marked with the official registration number of the place of production. The place of production where the avocados were grown must remain identifiable when the fruit leaves the grove, at the packinghouse, and throughout the export process. The fruit must be moved to a registered packinghouse within 3 hours of harvest or must be protected from fruit fly infestation until moved. The fruit must be safeguarded by an insect-proof screen or plastic tarpaulin while in transit to the packinghouse and while awaiting packing.

(f) Packinghouse requirements. (1) During the time registered packinghouses are in use for packing avocados for export to the United States, the packinghouses may only accept avocados that are from registered places of production and that are produced in accordance with the requirements of this section.

(2) Avocados must be packed within 24 hours of harvest in an insect-exclusionary packinghouse. All openings to the outside of the packinghouse must be covered by screening with openings of not more than 1.6 mm or by some other barrier that prevents pests from entering. The packinghouse must have double doors at the entrance to the facility and at the interior entrance to the area where the avocados are packed.

(3) Before packing, all avocados must be cleaned of all plant debris.

(4) Fruit must be packed in insect-proof packaging, or covered with insect-proof mesh or a plastic tarpaulin, for transport to the United States. These safeguards must remain intact until arrival in the United States.

(5) Shipping documents accompanying consignments of avocados from Peru that are exported to the United States must include the official registration number of the place of production at which the avocados were grown and must identify the packing shed or sheds in which the fruit was processed and packed. This identification must be maintained until the fruit is released for entry into the United States.

(g) NPPO of Peru inspection. Following any post-harvest processing, inspectors from the NPPO of Peru must inspect a biometric sample of fruit from each place of production at a rate to be determined by APHIS. The inspectors must visually inspect for the quarantine pests listed in the introductory text of this section and must cut fruit to inspect for *S. catenifer*. If any quarantine pests are detected in this inspection, the place of production where the infested avocados were grown will immediately be suspended from the export program until an investigation has been conducted by APHIS and the NPPO of Peru and appropriate mitigations have been implemented.

(h) Phytosanitary certificate. Each consignment of Hass avocados imported from Peru into the United States must be accompanied by a phytosanitary certificate issued by the NPPO of Peru with an additional declaration stating that the avocados in the consignment were grown, packed, and inspected and found to be free of pests in accordance with the requirements of 7 CFR 319.56-50.

§ 319.56–51 Shepherd's purse with roots from the Republic of Korea.

Shepherd’s purse (*Capsella bursapastoris* (L.) Medick) with roots from the Republic of Korea may be imported only under the following conditions:

(a) The shepherd’s purse with roots must be grown in a pest-free place of production that is registered with the national plant protection organization (NPPO) of the Republic of Korea. Fields must be certified free of the quarantine nematodes *Hemicycliophora koreana*, *Paratylenchus pandus*, *Rotylenchus orientalis*, and *Rotylenchus*
Animal and Plant Health Inspection Service, USDA § 319.56–52

Tomatoes with stems from the Republic of Korea.

Fresh tomatoes with stems (Solanum lycopersicum L.) (Synonym: Lycopersicon esculentum P. Mill.) may be imported into the United States from the Republic of Korea only under the conditions described in this section. These conditions are designed to prevent the introduction of the following quarantine pests: Bactrocera depressa, Heliothis armigera, Heliothis assulta, Mamestra brassicae, Ostrinia furnacalis, Scirtothrips dorsalis, and Thrips palmi.

(a) Registered pest-exclusionary structures. The tomatoes must be grown in pest-exclusionary structures that are registered with the national plant protection organization (NPPO) of the Republic of Korea and approved by the NPPO of the Republic of Korea and APHIS. The pest-exclusionary structures must be equipped with double self-closing doors. Any vents or openings in the pest-exclusionary structures (other than the double self-closing doors) must be covered with 1.6 mm or smaller screening in order to prevent the entry of pests into the pest-exclusionary structures.

(b) Trapping for Bactrocera depressa. Trapping for B. depressa is required both inside and outside the pest-exclusionary structures. Trapping must begin at least 2 months prior to the start of harvest and continue until the end of harvest.

(1) Inside the pest-exclusionary structures. APHIS-approved traps with an APHIS-approved protein bait must be placed inside the pest-exclusionary structures at a density of at least two traps per pest-exclusionary structure. The traps must be serviced at least once per week. If a single B. depressa is captured in a trap inside a pest-exclusionary structure, the NPPO of the Republic of Korea will immediately prohibit that pest-exclusionary structure from exporting tomatoes to the United States and notify APHIS of the action. The prohibition will remain in effect until the NPPO of the Republic of Korea and APHIS agree that the risk has been mitigated.

(2) Outside the pest-exclusionary structures. APHIS-approved traps with an approved protein bait must be placed in a 500-meter-wide buffer area around the registered pest-exclusionary structure at a density of one trap per 10 hectares. During the months of March through November, at least one trap must be placed in the buffer area near each pest-exclusionary structure. The traps must be serviced at least once per week. If three B. depressa are found inside the buffer zone within 2 kilometers of each other within a 30-day period, the NPPO of the Republic of Korea will immediately prohibit all registered pest-exclusionary structures within 2 kilometers of the finds from exporting tomatoes to the United States and notify APHIS of the action. The prohibition will remain in effect until the NPPO of the Republic of Korea and APHIS agree that the risk has been mitigated.

(3) Records of trap placement, trap servicing, and fruit fly captures for each pest-exclusionary structure must be maintained by the NPPO of the Republic of Korea and must be provided to APHIS on a regular basis.

(4) The growing season (March through November) by the NPPO of the Republic of Korea or its approved designee to ensure that phytosanitary procedures are employed to exclude plant pests and diseases and to verify that the screening is intact.

(5) The sampling and inspection protocol must be preapproved by APHIS.

(b) The shepherd’s purse with roots must be free from soil.

(c) The shepherd’s purse with roots must be imported in commercial shipments only.

(d) Each consignment of shepherd’s purse with roots must be accompanied by a phytosanitary certificate of inspection issued by the NPPO of the Republic of Korea stating that the shipment has been inspected and found free of quarantine pests with an additional declaration stating that the shepherd’s purse with roots has been produced and inspected in accordance with the requirements of 7 CFR 319.56–51.
