§ 10.460 Indirect materials.

An indirect material, as defined in §10.402(o), will be considered to be an originating material without regard to where it is produced.

Example. Chilean Producer C produces good C using non-originating material A. Producer C imports non-originating rubber gloves for use by workers in the production of good C. Good C is subject to a tariff shift requirement. As provided in §10.453(b)(1) and General Note 26(n), each of the non-originating materials in good C must undergo the specified change in tariff classification in order for good C to be considered originating. Although non-originating material A must undergo the applicable tariff shift in order for good C to be considered originating, the rubber gloves do not because they are indirect materials and are considered originating without regard to where they are produced.

§ 10.461 Retail packaging materials and containers.

Packaging materials and containers in which a good is packaged for retail sale, if classified with the good for which preferential tariff treatment under the US-CFTA is claimed, will be disregarded in determining whether all non-originating materials used in the production of the good undergo the applicable change in tariff classification set out in General Note 26(n), HTSUS. If the good is subject to a regional value content requirement, the value of such packaging materials and containers will be taken into account as originating or non-originating materials, as the case may be, in calculating the regional value content of the good.

Example 1. Chilean Producer A of good C imports 100 non-originating blister packages to be used as retail packaging for good C. As provided in §10.455(a)(1), the value of the blister packages is $10. Good C has a regional value content requirement. The United States importer of good C decides to use the build-down method, $\text{RVC} = \frac{(\text{AV}-\text{VNM})}{\text{AV}} \times 100$ (see §10.454(a) of this subpart), in determining whether good C satisfies the regional value content requirement. In applying this method, the non-originating blister packages are taken into account as non-originating. As such, their $\$10$ adjusted value is included in the VNM, value of non-originating materials, of good C.

Example 2. Same facts as in Example 1, but the blister packages are originating. In this case, the adjusted value of the originating blister packages would not be included as part of the VNM of good C under the build-down method. However, if the United States importer had used the build-up method, $\text{RVC} = \frac{\text{VOM}}{\text{AV}} \times 100$ (see §10.454(b)), the adjusted value of the blister packaging would be included as part of the VOM, value of originating material.

§ 10.462 Packing materials and containers for shipment.

(a) Packing materials and containers for shipment, as defined in §10.450(m), are to be disregarded in determining whether the non-originating materials used in the production of the good undergo an applicable change in tariff classification set out in General Note 26(n), HTSUS. Accordingly, such materials and containers do not have to undergo the applicable change in tariff classification even if they are non-originating.

(b) Packing materials and containers for shipment, as defined in §10.450(m), are to be disregarded in determining the regional value content of a good imported into the United States. Accordingly, in applying either the build-down or build-up method for determining the regional value content of the good imported into the United States, the value of such packaging materials and containers for shipment (whether originating or non-originating) is disregarded and not included in AV, adjusted value, VNM, value of non-originating materials, or VOM, value of originating materials.

Example. Chilean Producer A produces good C. Producer A ships good C to the United States in a shipping container which it purchased from Company B in Chile. The shipping container is originating. The value of the shipping container determined under section §10.455(a)(2) is $3. Good C is subject to a regional value content requirement. The transaction value of good C is $100, which includes the $3 shipping container. The U.S. importer decides to use the build-up method,
