Food and Drug Administration, HHS

§ 201.319 Water-soluble gums, hydrophilic gums, and hydrophilic muciloids (including, but not limited to agar, alginic acid, calcium polycarboxylate, carboxymethylcellulose sodium, carrageenan, chondrus, glucuronan (B-1,4 linked) polymannose acetate), guar gum, karaya gum, kelp, methylecullulose, plantago seed (psyllium), polycarboxylate tragacanth, and xanthan gum) as active ingredients; required warnings and directions.

(a) Reports in the medical literature and data accumulated by the Food and Drug Administration indicate that esophageal obstruction and asphyxiation have been associated with the ingestion of water-soluble gums, hydrophilic gums, and hydrophilic muciloids including, but not limited to, agar, alginic acid, calcium polycarboxylate, carboxymethylcellulose sodium, carrageenan, chondrus, glucuronan (B-1,4 linked) polymannose acetate), guar gum, karaya gum, kelp, methylecullulose, plantago seed (psyllium), polycarboxylate tragacanth, and xanthan gum. Esophageal obstruction and asphyxiation due to orally-administered water-soluble gums, hydrophilic gums, and hydrophilic muciloids as active ingredients are significant health risks when these products are taken without adequate fluid or when they are used by individuals with esophageal narrowing or dysfunction, or with difficulty in swallowing. Additional labeling is needed for the safe and effective use of any OTC drug product containing a water-soluble gum, hydrophilic gum, or hydrophilic muciloid as an active ingredient when marketed in a dry or incompletely hydrated form to include, but not limited to, the following dosage forms: Capsules, granules, powders, tablets, and wafers. Granular dosage forms containing psyllium are not generally recognized as safe and effective as OTC laxatives (see §310.545(a)(12)(i)(B) of this chapter) and may not be marketed without an approved new drug application because the warnings and directions in paragraph (b) of this section have been found inadequate for these products.

(b) Drugs for human use with thyroid hormone activity are misbranded within the meaning of section 502 of the Federal Food, Drug, and Cosmetic Act unless their labeling bears the following boxed warning at the beginning of the “Warnings” section:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for their anorectic effects.

(c) This section does not apply to digoxin products for oral use, which shall be labeled according to the requirements of §310.500 of this chapter.
