Proposed Data Collections Submitted for Public Comment and Recommendations

In compliance with the requirement of section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 for opportunity for public comment on proposed data collection projects, the Centers for Disease Control and Prevention (CDC) will publish periodic summaries of proposed projects. To request more information on the proposed projects or to obtain a copy of the data collection plans and instruments, call the CDC Reports Clearance Officer on (404) 498–1210.

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency’s estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology. Send comments to Anne O’Connor, CDC Assistant Reports Clearance Officer, 1600 Clifton Road, MS–D24, Atlanta, GA 30333. Written comments should be received within 60 days of this notice.

Proposed Project: Increasing Cervical Cancer Screening in Never/Rarely Screened, Black Women: Phase I—Now—National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP), Centers for Disease Control and Prevention (CDC).

Black women in the United States have higher incidence of cervical cancer than White women and higher mortality from cervical cancer than White women. Cancer mortality data from 1974–1994 for Black women show stable, geographic patterns of cervical cancer mortality predominantly in the southeastern part of the United States. While screening rates of Black women are shown to be similar to White women, subgroups of Black women may remain unscreened or under-screened (more than three years since last Pap test), specifically those who are medically uninsured or underinsured or live in rural areas of the country. Screening rates are particularly low for women without access to health care.

The purpose of this project is to conduct formative research to better understand why some Black women ages 40 to 64 do not participate in cervical cancer screening. The proposed study will use focus groups and personal interviews to gather information that will be used to guide future intervention strategies to increase cervical cancer screening in never or rarely screened Black women. There will be no cost to respondents.

CDC, in collaboration with the FDA, has been charged with the responsibility of evaluating this nationwide notification process. An interim nationwide survey (0920–0462) of blood collection establishments and transfusion services was conducted in December 1999 to determine the progress that had been made to date and summarize the lookback results. The objective of this study is to resurvey the blood collection establishments and transfusion services to obtain final results and assess the overall effectiveness of the targeted lookback for identifying persons infected with HCV. The evaluation has two specific aims:

1. Determine the effectiveness of targeted lookback for identifying prior transfusion recipients with HCV infection, including the proportion of recipients identified who are still alive, the proportion of those alive who were successfully notified, the proportion of those notified who have already been tested, the proportion of those notified who get tested as a result of the notification, and the proportion of those tested who are HCV positive.

2. Determine the cost-effectiveness of targeted lookback, including resources (person-hours, costs of recipient notification and testing, etc.) utilized by blood collection establishments and transfusion services for implementation of the lookback protocol.

The evaluation will comprise the following components:

1. A nationwide survey of blood collection establishments.
2. A nationwide survey of transfusion services.

The total cost to respondents is their time to complete the survey.

Government-Owned Inventions; Availability for Licensing

AGENCY: National Institutes of Health, Public Health Service, DHHS.

ACTION: Notice.

SUMMARY: The inventions listed below are owned by agencies of the U.S. Government and are available for licensing in the U.S. in accordance with 35 U.S.C. 207 to achieve expeditious commercialization of results of federally-funded research and development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.

ADDRESSES: Licensing information and copies of the U.S. patent applications listed below may be obtained by writing to the indicated licensing contact at the Office of Technology Transfer, National Institutes of Health, 6011 Executive Boulevard, Suite 325, Rockville, Maryland 20852–3804; telephone: 301/496–7057; fax: 301/402–0220. A signed Confidential Disclosure Agreement will be required to receive copies of the patent applications.

Detection of Mutational Frequency in Human Bone Marrow

Neal S. Young et al. (NHLBI)
Licensing Contact: Fatima Sayyid; 301/435–4521; sayyidf@mail.nih.gov

To date there have been no adequate methods to determine the frequency of mutations in humans. This invention discloses a method of measuring the mutational frequency of a mitochondrial DNA sequence by sequencing mitochondrial DNA from clonally expanded single cells such as CD34+ human stem cells. Sequencing for mitochondrial DNA polymorphisms and mutations may also be useful as a general method to detect minimal residual disease in leukemia. The mitochondrial genome is particularly susceptible to mutations and these may be used to measure genomic mutagenesis by virtue of comparison. The application of this invention includes the determination of mutational frequency after chemotherapy, radiation, environmental toxic exposure and genetic disease. The invention also provides a screening for an agent that has a mutagenic effect on a cell.

Donor Test Results Indicating Infection with HCV

Structurally Rigid Dopamine D3 Receptor Selective Ligands as Cocaine and Methamphetamine Abuse Therapeutics

Amy Newman et al. (NIDA)
Licensing Contact: Norbert Pontzer; 301/435–5502; np59n@nih.gov

The dopamine D3 receptor subtype has been implicated in a number of central nervous system (CNS) disorders including but not limited to drug abuse, schizophrenia and Parkinson’s disease. Since D3 receptor ligands show efficacy in animal models of cocaine self-administration and Parkinson’s disease, there has been a significant effort to design and develop novel dopamine D3 ligands. However most currently known compounds are highly lipophilic, leading to poor bioavailability and toxicity, or are not highly D3 selective.

The present invention provides a family of structurally rigid, potent and selective D3 receptor antagonists and partial agonists with lowered lipophilicity. Bioavailable compounds that bind with high affinity and selectivity to D3 receptors can not only provide important tools with which to study the structure and function of this receptor subtype, but may also have therapeutic uses in psychiatric, behavioral and neurologic disorders. More information on these potential therapeutic agents was recently published in Newman et al., Bioorganic
