current Haemophilus influenzae type b conjugate vaccines have no protective effect against nontypeable strains. The technologies described herein are conjugate vaccines against nontypeable Haemophilus influenzae. The vaccines are comprised of lipooligosaccharides (LOS) from which esterified fatty acids have been removed from lipid A to form detoxified LOS conjugated to an immunogenic carrier such as tetanus toxoid, and an adjuvant such as alum. In vivo data in the Chinchilla animal model are available. The vaccines can be potentially used as a component in a combination vaccine with other pediatric vaccine components.

**Applications:** Vaccines for the prevention of respiratory infections and otitis media caused by nontypeable Haemophilus influenzae.

**Advantages:**
- Novel vaccine candidates.
- Conserved antigen.

**Development Status:** In vitro and in vivo data can be provided upon request. Data is also available from a phase I clinical trial with a representative vaccine showing safety and immunogenicity in adults.

**Market:**
- Pediatric vaccines.
- Preventative vaccines.

**Inventors:** Xin-xing Gu (NIDCD), John Robbins (NICHD), et al.

**Patent Status:**

**Licensing Status:** Available for licensing.
