**BILLING CODE 4184–01–P**

**DEPARTMENT OF HEALTH AND HUMAN SERVICES**

**National Institutes of Health**

**Government-Owned Inventions; Availability for Licensing**

**AGENCY:** National Institutes of Health, Public Health Service, HHS.

**ACTION:** Notice.

**SUMMARY:** The inventions listed below are owned by an agency of the U.S. Government and are available for licensing in the U.S. in accordance with 35 U.S.C. 207 to achieve expeditious commercialization of results of federally-funded research and development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.

**FOR FURTHER INFORMATION CONTACT:** Licensing information and copies of the U.S. patent applications listed below may be obtained by writing to the indicated licensing contact at the Office of Technology Transfer, National Institutes of Health, 6011 Executive Boulevard, Suite 325, Rockville, Maryland 20852–3804; telephone: 301–496–7057; fax: 301–402–0220. A signed Confidential Disclosure Agreement will be required to receive copies of the patent applications.

**Small-Molecule Modulators of Lipid Storage for Treatment of Obesity, Atherosclerosis, Metabolic Syndrome and Lipid Storage Diseases**

**Description of Technology:** Lipid droplets are key organelles involved in lipid homeostasis. In normal physiology, these droplets are formed in response to elevated fatty acid levels, and are broken down when needed for energy production. Imbalances in lipid homeostasis trigger compensatory alterations in metabolism that can lead to diseases such as obesity, atherosclerosis, and metabolic syndrome. There are also a number of inherited lipid storage diseases that result in harmful buildup of various lipids, such as Gaucher disease, Fabry disease, and others. Reducing the accumulation of lipid droplets is a promising potential strategy for treatment of such disorders.

This technology describes three novel structural classes of small-molecule compounds that significantly reduce the accumulation of lipid droplets. These compounds hold promise for the treatment of diseases associated with aberrant lipid deposition.

**Potential Commercial Applications:**

- Treatment of inherited metabolic diseases such as Gaucher disease, Fabry disease, and Tay Sachs disease.
- Treatment of obesity and metabolic disease.
- Treatment of atherosclerosis.

**Competitive Advantages:** Modulation of lipid droplet accumulation is a novel mechanism for treatment of lipid storage diseases.

**Development Stage:**

- Early-stage
- In vitro data available

**Inventors:** Matthew Boxer et al. (NCATS).

**Licensing Contact:** Tara L. Kirby, Ph.D.; 301–435–4426; tarak@mail.nih.gov.

**A Broadly Neutralizing Human Anti-HIV Monoclonal Antibody (10E8) Capable of Neutralizing Most HIV–1 Strains**

**Description of Technology:** This Human Anti-HIV Monoclonal Antibody (10E8) has great potential to provide passive protection from infection, as a therapeutic vaccine, or as a tool for the development of vaccine immunogens. 10E8 is one of the most potent HIV-neutralizing antibodies isolated thus far and it can potently neutralize up to 98% of genetically diverse HIV–1 strains. 10E8 is specific to the membrane-proximal external region (MPER) of the HIV envelope protein, GP41. It is anticipated that 10E8 could be used in combination with another human anti-HIV–1 monoclonal antibody to provide an antibody response that neutralizes nearly all strains of HIV–1. Additionally, 10E8 is a useful tool for the design of vaccine immunogens that can elicit an adaptive immune response to produce 10E8 like antibodies. This technology also includes monoclonal antibodies from the same germ line as 10E8.

**Potential Commercial Applications:**

- Passive protection to prevent HIV infection
- Passive protection to prevent mother-to-infant HIV transmission
- Topical microbicide to prevent HIV infection
- Gene-based vectors for anti-gp41 antibody expression
- Therapeutic for the elimination of HIV infected cells that are actively producing virus

**Competitive Advantages:**
The 2J family is expressed at high levels actively in the NADPH-dependent many of the P450 enzymes are also included tolbutamide, S-Warfarin, and taxol. An extensive number of drugs which include the CYP2J and CYP2C family of cytochrome P450 metabolizes both arachidonic acid and linoleic acid. The CYP2J and CYP2C subfamily members have a wide tissue distribution and may be useful as model systems for studies of cardiovascular disease, drug metabolism and toxicity. Recombinant proteins of mouse cytochrome P450s CYP2C2 and CYP2J have also been expressed and can be used as controls in immunoblotting, as well as for metabolism studies.

**Potential Commercial Applications:**
- Research tool to elucidate the mechanism of base excision repair
- Research reagents

**Competitive Advantages:** Can be utilized in a variety of applications to study Pol B.

**Development Stage:**
- Early-stage
- In vitro data available

**Inventors:** Samuel Wilson and Rajendra Prasad (NIH).

**Publications:**

**Intellectual Property:**

**Collaborative Research Opportunity:**
- The National Institutes of Health announces polyclonal antibodies against mouse cytochrome P450s CYP2J and CYP2C. Cytochrome P450s catalyze the metabolism of a wide range of exogenous compounds, including drugs, industrial chemicals, environmental pollutants, and carcinogens. The C2 family of cytochrome P450 metabolizes an extensive number of drugs which include tolbutamide, S-Warfarin, mefenytoin, diazepam and taxol. Many of the P450 enzymes are also active in the NADPH-dependent oxidation of arachidonic acid to various eicosanoids found in several species. The 2J family is expressed at high levels in the heart and has been shown to detect Pol B in samples with a variety of techniques including immunoblotting, ELISA, immunoprecipitation, and immunohistochemistry.

**Description of Technology:** Available for licensing are monoclonal antibodies targeting human DNA polymerase beta (Pol B). Pol B is a constitutively expressed “housekeeping” enzyme that plays a role in base excision repair (BER), a cellular defense mechanism that repairs DNA base damage and loss. Aberrant Pol B expression is associated with genomic instability indicating that Pol B is required for DNA maintenance, replication and recombination. These antibodies can be utilized to elucidate BER’s mechanism of action and Pol B’s structure and function. Moreover, the antibodies can be used to commercialize these monoclonal antibodies. Treatment of Acute and Chronic Neurological Disorders Using GLP–1, Exendin-4 and Analogs

Description of Technology: Glucagon-like peptide-1 (GLP–1) and related peptides, including exendin-4 and liraglutide, are incretin mimetics that enhance glucose-dependent insulin secretion following food ingestion as a regulator of glucose homeostasis. Exendin-4 and liraglutide are used clinically in the safe and effective treatment of type 2 diabetes to enhance insulin secretion and maintain a euglycemic state. These actions are primarily mediated at the level of the GLP–1 receptor in the pancreas; however, these compounds are known to enter the brain where the GLP–1 receptor also is expressed.

Researchers at the NIH have discovered the novel use of GLP–1 and exendin-4 analogs in the treatment of acute and chronic neurological disorders and neurodegenerative diseases. Studies conducted in extensive cell culture and in mouse models using these analogs have demonstrated significant neurotrophic and neuroprotective actions in models of several disorders, including Alzheimer’s disease, Parkinson’s disease, Huntington’s disease, ALS, stroke, head trauma and peripheral neuropathy. These studies have now been extensively published and independently validated by other scientific groups. Furthermore, clinical studies are ongoing to evaluate the use of GLP–1 receptor agonists for the treatment of early Alzheimer’s disease, Parkinson’s disease and diabetic neuropathy by several groups within the US and Europe.

Potential Commercial Applications: Therapeutics for:

• Neurodegenerative diseases—Alzheimer’s, Huntington’s, Parkinson’s, ALS
• Stroke
• Head trauma (traumatic brain injury)
• Peripheral neuropathies

Competitive Advantages:

• Compounds reduce neuronal cell death, amyloid deposition and neuroinflammation while promoting neurogenesis.
• Compounds in this class have already been shown to be safe and effective for other indications.
• Extensive in vitro and animal data are available, and clinical studies are ongoing.
• There are extensive publications in the literature, both from the inventors and independent groups.

Development Stage:

• Pre-clinical
• Clinical
• In vitro data available
• In vivo data available (animal)
• In vivo data available (human)

Inventors: Nigel Greig, Harold Halloway, Maire Doyle, Josephine Egan (all of NIA).

Publications:

Listing of additional related publications available upon request.

• U.S. Patent 7,576,050 issued 18 Aug 2009
• Foreign counterparts in Australia, Canada, Europe, India, and Japan

Licensing Contact: Tara L. Kirby, Ph.D.; 301–435–4426; tarak@mail.nih.gov.

Collaborative Research Opportunity: The National Institute on Aging, Drug Design and Development Section, is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate or commercialize this technology. For collaboration opportunities, please contact Vio Conley at conleyv@mail.nih.gov.

Dated: April 18, 2012.

Richard U. Rodriguez,
Director, Division of Technology Development and Transfer, Office of Technology Transfer, National Institutes of Health.

Summary: The inventions listed below are owned by an agency of the U.S. Government and are available for licensing in the U.S. in accordance with 35 U.S.C. 207 to achieve expeditious commercialization of results of federally-funded research and development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.
