(Standard Federal Rate) × (DRG Weight) × (Geographic Adjustment Factor (GAF)) × (COLA for hospitals located in Alaska and Hawaii) × (1 + Capital DSH Adjustment Factor + Capital IME Adjustment Factor, if applicable).

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at § 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under §§ 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, as noted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725 and 51804), FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of $5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, § 412.300(b) of the regulations defines a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS a new hospital is paid 85 percent of its Medicare allowable capital-related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Hospitals Located in Puerto Rico

Section 412.374 of the regulations provides for the use of a blended payment amount for prospective payments for capital-related costs to hospitals located in Puerto Rico. Accordingly, under the capital IPPS, we compute a separate payment rate specific to Puerto Rico hospitals using the same methodology used to compute the national Federal rate for capital-related costs. In general, hospitals located in Puerto Rico are paid a blend of the applicable capital IPPS Puerto Rico rate and the applicable capital IPPS Federal rate. Capital IPPS payments to hospitals located in Puerto Rico are computed based on a blend of 25 percent of the capital IPPS Puerto Rico rate and 75 percent of the capital IPPS Federal rate. For additional details on capital IPPS payments to hospitals located in Puerto Rico, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

C. Prospective Adjustment for the FY 2010 Documentation and Coding Effect

1. Background

In the FY 2008 IPPS final rule with comment period (72 FR 47175 through 47186), we established adjustments to both the national operating standardized amount and the national capital Federal rate to eliminate the estimated effect of changes in documentation and coding resulting from the adoption of the MS–DRGs that do not reflect real changes in case-mix. Specifically, we established prospective documentation and coding adjustments of −1.2 percent for FY 2008, −1.8 percent for FY 2009, and −1.8 percent for FY 2010. However, to comply with section 7(a) of Public Law 110–90, enacted on September 29, 2007, in a final rule published in the **Federal Register** on November 27, 2007 (72 FR 66886 through 66888), we modified the documentation and coding adjustment for FY 2008 to −0.6 percent, and consequently revised the FY 2008 IPPS operating and capital payment rates, factors, and thresholds accordingly, with these revisions effective October 1, 2007.

For FY 2009, section 7(a) of Public Law 110–90 required a documentation and coding adjustment of −0.9 percent instead of the −1.8 percent adjustment established in the FY 2008 IPPS final rule with comment period. As discussed in the FY 2009 IPPS final rule with comment period (73 FR 48447 and 48733 through 48774), we applied an additional documentation and coding adjustment of −0.9 percent to the FY 2009 IPPS national standardized amounts and the national capital Federal rate. The documentation and coding adjustments established in the FY 2009 IPPS final rule, as amended by Public Law 110–90, are cumulative. As a result, the −0.9 percent documentation and coding adjustment in FY 2009 was in addition to the −0.6 percent adjustment in FY 2008, yielding a combined effect of −1.5 percent. (For additional details on the development and implementation of the documentation and coding adjustments for FY 2008 and FY 2009, we refer readers to section II.D. of this preamble and the following rules published in the **Federal Register**: August 22, 2007 (72 FR 47175 through 47186 and 47431 through 47432); November 27, 2007 (72 FR 66886 through 66888); and August 19, 2008 (73 FR 48447 through 48450 and 48773 through 48775).)

For the FY 2011 IPPS/LTCH PPS proposed and final rules, we performed a retrospective evaluation of the FY 2009 claims data updated through December 2009 using the same analysis methodology as we did for FY 2008 claims in the FY 2010 IPPS/RY 2010 LTCH PPS proposed and final rules. Based on this evaluation, our actuaries determined that the implementation of the MS–DRG system resulted in a 5.4 percent change in case-mix due to documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2009. In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50355), we implemented an additional adjustment to the FY 2011 national capital Federal rate of −2.9 percent to account for part of the effect of the estimated changes in documentation and coding under the MS–DRG system that occurred in FYs 2008 and 2009 that did not reflect real changes in case-mix. Consistent with past practice, this −2.9 percent adjustment was applied in a cumulative manner, which yielded a combined effect of −4.4 percent. (For additional information on our estimate of the 5.4 percent cumulative documentation effect under the MS–DRG system for FYs 2008 and 2009 and the additional −2.9 percent documentation and coding adjustment applied to the national capital Federal rate in FY 2011, we refer readers to the FY 2011 IPPS/LTCH PPS proposed rule (75 FR 24014) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50355).)

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51727), we made an additional −1.0 percent adjustment to the national capital Federal rate to account for the remainder of the 5.4 percent estimate of the cumulative effect of documentation and coding changes under the MS–DRG system that occurred during FYs 2008 and 2009. Consistent with past practice, this −1.0 percent adjustment was applied in a cumulative manner, which yielded a combined effect of −5.4 percent.

2. Prospective Adjustment for the Effect of Documentation and Coding in FY 2010

We continue to believe that it is appropriate to make adjustments to the capital IPPS rates to eliminate the effect of any documentation and coding changes as a result of the implementation of the MS–DRGs. These adjustments are intended to ensure that future annual aggregate IPPS payments are the same as payments that otherwise would have been made in those years absent the change to the MS–DRGs. Under section 1886(g) of the Act, the Secretary has broad authority in establishing and implementing the IPPS for acute-care hospital inpatient capital-related costs (that is, the capital IPPS). We have consistently stated since the initial implementation of the MS–DRG system that we do not believe it is appropriate for Medicare expenditures under the capital IPPS to increase due to MS–DRG related changes in documentation and coding. Accordingly, we believe that it is appropriate under the Secretary's broad authority under section 1886(g) of the Act, in conjunction with section 1886(d)(3)(A)(vi) of the Act and section 7(b) of Public Law 110–90, to make adjustments to the national capital Federal rate to eliminate the full effect of the documentation and coding changes resulting from the adoption of the MS–DRGs. We believe that this is appropriate because, in absence of such adjustments, the effect of the documentation and coding changes resulting from the adoption of the MS–DRGs results in inappropriately high capital IPPS payments because that portion of the increase in aggregate payments is not due to an increase in patient severity of illness (and costs).

As discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27997), we analyzed claims data from FY 2010 to determine whether any additional adjustment would be required to ensure that the adoption of MS–DRGs was implemented in a budget neutral manner. Specifically, we analyzed FY 2010 data on claims paid through December 2011 using our existing methodology as described in section II.D.4. of this preamble. Based on this analysis, our actuaries determined that implementation of the MS–DRG system resulted in a 6.2 percent change in case-mix due to documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2010. This is an estimated additional 0.8 percentage point increase over the 5.4 percent reduction currently applied to the national capital Federal rate.

Consistent with our proposal for the operating IPPS standardized amounts, we proposed, under the Secretary's broad authority under section 1886(g) of the Act, in conjunction with section 1886(d)(3)(A)(vi) of the Act, to reduce the national capital Federal rate in FY 2013 by an additional 0.8 percent to account for the remainder of the cumulative effect of the estimated changes in documentation and coding under the MS–DRG system that did not reflect an increase in case-mix severity in FY 2010. Under that proposal, we would leave the −0.8 percent adjustment in place for FY 2013 and subsequent fiscal years to account for the effect in those years.

In section II.D.10. of the preamble of this final rule, we discuss the public comments we received on our proposal to make a -0.8 percent adjustment to the operating IPPS standardized amounts and hospital-specific rates and the national capital Federal rate to account for the remainder of the cumulative effect of the estimated changes in documentation and coding under the MS–DRG system that did not reflect an increase in case-mix severity in FY 2010. In summary, numerous commenters objected to this proposal, and many commenters pointed to MedPAC's analysis, discussed in its comment letter on the FY 2011 IPPS/LTCH PPS proposed rule, that suggested that ''negative documentation and coding'' may have occurred under the CMS–DRGs, creating an overestimation of documentation and coding due to the introduction of MS–DRGs.

As discussed in greater detail in section II.D.10. of the preamble of this final rule, at this time, we believe that, while MedPAC's analysis suggested that a potential overestimate could have, in theory, occurred in our methodology, the estimates are theoretical maximums. It is not clear at this time that, based on the information submitted, to what extent the examples provided by the commenters substantiate these theoretical maximums or any change in adjustments. Nonetheless, we recognize that the methodological issues that surround this question are complex, and may merit further consideration. Therefore, consistent with the policy we are adopting for the operating IPPS standardized amounts and hospital-specific rates for FY 2013, we are not finalizing our proposal to apply a -0.8 percent adjustment to the national capital Federal rate at this time until more analysis can be completed.

3. Documentation and Coding Adjustment to the Puerto Rico-Specific Capital Rate

Under § 412.74, Puerto Rico hospitals are currently paid based on 75 percent of the national capital Federal rate and 25 percent of the Puerto Rico-specific capital rate. In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50358 through 50359), we discussed the retrospective evaluation of the FY 2009 claims data from the March 2010 update of the MedPAR file of hospitals located in Puerto Rico using the same methodology used to estimate documentation and coding changes under IPPS for non-Puerto Rico hospitals. This analysis shows that the change in case-mix due to

documentation and coding that did not reflect real changes in case-mix for discharges occurring during FYs 2008 and 2009 from hospitals located in Puerto Rico was approximately 2.6 percent. We also explained that we continue to believe that an adjustment for such increases is appropriate because all hospitals have the same financial incentives for documentation and coding improvements, and the same ability to benefit from the resulting increase in aggregate payments that do not reflect real changes in case-mix.

Given this case-mix increase due to changes in documentation and coding under the MS–DRGs, under the Secretary's broad authority under section 1886(g) of the Act, we established an adjustment to the Puerto Rico-specific capital rate of –2.6 percent in FY 2011 for the cumulative increase in case-mix due to changes in documentation and coding under the MS–DRGs for FYs 2008 and 2009. In addition, consistent with our implementation of other prospective MS–DRG documentation and coding adjustments to the capital Federal rate and operating IPPS standardized amounts, we established that the -2.6 percent adjustment will remain in place for subsequent fiscal years in order to ensure that changes in documentation and coding resulting from the adoption of the MS–DRGs do not lead to an increase in aggregate payments not reflective of an increase in real case-mix in subsequent years. Therefore, the -2.6 percent adjustment to the capital Puerto Rico-specific rate made in FY 2011 reflects the entire amount of our estimate at that time of the effects of documentation and coding that did not reflect real changes in case-mix for discharges occurring during FYs 2008 and 2009 from hospitals located in Puerto Rico.

As discussed above, for the proposed rule and this final rule, we analyzed FY 2010 data on claims paid through December 2011 using our existing methodology to determine if any additional adjustment for the effects of documentation and coding that did not reflect real changes in case-mix is warranted. Based on this analysis (which is described in greater detail in section II.D.10. of this preamble), we found no significant additional effect of documentation and coding that would warrant any additional adjustment. Therefore, we did not propose to make any additional adjustment to the capital Puerto Rico-specific rate for FY 2013 for the effect of documentation and coding that did not reflect real changes in case-mix.

D. Changes for Annual Update for FY 2013

The annual update to the capital PPS Federal and Puerto Rico-specific rates, as provided for at § 412.308(c), for FY 2013 is discussed in section III. of the Addendum to this final rule.

VI. Changes for Hospitals Excluded From the IPPS

A. Excluded Hospitals

Historically, hospitals and hospital units excluded from the prospective payment system received payment for inpatient hospital services they furnished on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount as defined in § 413.40(a)) was set for each hospital or hospital unit based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. The updated target amount was multiplied by total Medicare discharges during that period and applied as an aggregate upper limit (the ceiling as defined in § 413.40(a)) on total inpatient operating costs for a hospital's cost reporting period. Prior to October 1, 1997, these payment provisions applied consistently to all categories of excluded providers, which included rehabilitation hospitals and units (now referred to as IRFs), psychiatric hospitals and units (now referred to as IPFs), LTCHs, children's hospitals, and IPPS-excluded cancer hospitals.

Payment to children's hospitals and cancer hospitals that are excluded from the IPPS continues to be subject to the rate-of-increase ceiling based on the hospital's own historical cost experience. (We note that, in accordance with § 403.752(a) of the regulations, RNHCIs are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27998), we proposed that the FY 2013 rate-of-increase percentage to be applied to the target amount for cancer and children's hospitals and RNHCIs would be the FY 2013 percentage increase in the IPPS operating market basket. At the time of issuance of the proposed rule, the FY 2013 percentage increase in the IPPS operating market basket was estimated to be 3.0 percent. Beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's and cancer hospitals. As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), with IRFs, IPFs, and LTCHs being paid under their own PPS, the remaining number of providers being paid based on reasonable cost subject to a ceiling (that is, children's hospitals, 11 cancer hospitals, and RNHCIs) is too small and the cost report data are too limited to be able to create a market basket solely for these hospitals. For FY 2013, we proposed to continue to use the IPPS operating market basket to update the target amounts for children's and cancer hospitals and RNHCIs for the reasons discussed in the FY 2006 IPPS final rule.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27998), we proposed to use the FY 2006-based IPPS operating market basket to update the target amounts for children's and cancer hospitals and RNHCIs for FY 2013. Therefore, based on IHS Global Insight, Inc.'s 2012 first quarter forecast, with historical data through the 2011 fourth quarter, we estimated that the IPPS operating market basket update for FY 2013 would be 3.0 percent (that is, the estimate of the market basket rate-of-increase). We proposed that if more recent data become available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2013. Therefore, based on IHS Global Insight, Inc.'s 2012 second quarter forecast, with historical data through the 2012 first quarter, we use the FY 2013 estimate of the IPPS operating market basket rate-of-increase of 2.6 percent. Moreover, consistent with our proposal that the percentage increase in the rate-of-increase limits for cancer and children's hospitals and RNHCIs would be the percentage increase in the FY 2013 IPPS operating market basket, the FY 2013 rate-of-increase percentage that is applied to the FY 2012 target amounts in order to calculate the final FY 2013 target amounts for cancer and children's hospitals and RNHCIs is 2.6 percent, in accordance with the applicable regulations at 42 CFR 413.40.

We note that IRFs, IPFs, and LTCHs, which were paid previously under the reasonable cost methodology, now receive payment under their own prospective payment systems, in accordance with changes made to the statute. In general, the prospective payment systems for IRFs, IPFs, and LTCHs provided transition periods of varying lengths during which time a portion of the prospective payment was based on cost-based reimbursement rules under Part 413. (However, certain providers do not receive a transition period or may elect to bypass the transition period as applicable under 42 CFR Part 412, Subparts N, O, and P.) We note that the various transition periods

provided for under the IRF PPS, the IPF PPS, and the LTCH PPS have ended.

The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section IV. of the Addendum to this final rule for the specific final update changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2013. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

We did not receive any public comments on this section in the proposed rule.

B. Report on Adjustment (Exceptions) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, adjusting, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded hospital must file its cost report for a fiscal year in accordance with § 413.24(f)(2). The fiscal intermediary or MAC reviews the cost report and issues a notice of provider reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the fiscal intermediary or MAC receives the hospital's request in accordance with applicable regulations, the fiscal intermediary or MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are times when the applications are incomplete and additional information must be requested in order to have a completed application. However, in an attempt to provide interested parties with data on the most recent adjustments for which we do have data, we are publishing data on adjustment payments that were processed by the fiscal intermediary or MAC or CMS during FY 2011.

The table below includes the most recent data available from the fiscal intermediaries or MACs and CMS on adjustment payments that were adjudicated during FY 2011. As indicated above, the adjustments made during FY 2011 only pertain to cost reporting periods ending in years prior to FY 2010. Total adjustment payments given to excluded hospitals during FY 2011 are $3,118,588. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of hospital	Number	Excess cost over ceiling	Adjustment payments
Children's	2	$1,362,705	$1,303,381
Cancer	1	$7,805,148	$1,743,053
Religious Nonmedical Health Care Institution (RNHCI)	1	$72,154	$72,154
TOTAL			$3,118,588

VII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2013

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106–113) as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554) provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act defines a LTCH as ''a hospital which has an average inpatient length of stay (as determined by the Secretary) of greater than 25 days.'' Section 1886(d)(1)(B)(iv)(II) of the Act also provides an alternative definition of LTCHs: Specifically, a hospital that first received payment under section 1886(d) of the Act in 1986 and has an average inpatient length of stay (LOS) (as determined by the Secretary of Health and Human Services (the Secretary)) of greater than 20 days and has 80 percent or more of its annual Medicare inpatient discharges with a principal diagnosis that reflects a finding of neoplastic disease in the 12-month cost reporting period ending in FY 1997.

Section 123 of the BBRA requires the PPS for LTCHs to be a ''per discharge'' system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resources and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002 **Federal Register**, we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA (67 FR 55954). For the initial implementation of the LTCH PPS (FYs 2003 through FY 2007), the system used information from LTCH patient records to classify patients into distinct long-term care diagnosis-related groups (LTC–DRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS–LTC–DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97–248) for payments for inpatient services provided by a LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable cost-based payment provisions are located at 42 CFR Part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of

1983 (Pub. L. 98–21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and were paid their reasonable costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital-specific ceiling on payments was determined by multiplying the hospital's updated target amount by the number of total current year Medicare discharges. (Generally, in section VII. of this preamble, when we refer to discharges, the intent is to describe Medicare discharges.) The August 30, 2002 final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002 final rule, we provided for a 5-year transition period from payments under the TEFRA System to payments under the LTCH PPS. During this 5-year transition period, a LTCH's total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless a LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs' cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002 final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR Part 412, Subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002 final rule for a comprehensive discussion of the research and data that supported the establishment of the LTCH PPS (67 FR 55954).

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51733 through 51743) for a chronological summary of the main legislative and regulatory developments affecting the LTCH PPS through the annual update cycles prior to this FY 2013 rulemaking cycle.

2. Criteria for Classification as a LTCH

a. Classification as a LTCH

Under the existing regulations at §§ 412.23(e)(1) and (e)(2)(i), which implement section 1886(d)(1)(B)(iv)(I) of the Act, to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare and must have an average Medicare inpatient LOS of greater than 25 days. Alternatively, § 412.23(e)(2)(ii) states that, for cost reporting periods beginning on or after August 5, 1997, a hospital that was first excluded from the PPS in 1986 and can demonstrate that at least 80 percent of its annual Medicare inpatient discharges in the 12-month cost reporting period ending in FY 1997 have a principal diagnosis that reflects a finding of neoplastic disease must have an average inpatient length of stay for all patients, including both Medicare and non-Medicare inpatients, of greater than 20 days.

b. Hospitals Excluded From the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c), and therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR Part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the Social Security Amendments of 1967 (Pub. L. 90–248) (42 U.S.C. 1395b–1) or section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92–603) (42 U.S.C. 1395b–1 (note)) (Statewide all-payer systems, subject to the rate-of-increase test at section 1814(b) of the Act).
- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002 final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). In the RY 2005 LTCH PPS final rule (69 FR 25676), we clarified that the discussion of beneficiary liability in the August 30, 2002 final rule was not meant to establish rates or payments for, or define Medicare-eligible expenses. Under § 412.507, if the Medicare payment to the LTCH is the full LTC–DRG payment amount, as consistent with other established hospital prospective payment systems, a LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87 and for items and services as specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. Therefore, if the Medicare payment was for a SSO case (§ 412.529) that was less than the full LTC–DRG payment amount because the beneficiary had insufficient remaining Medicare days, the LTCH could also charge the beneficiary for services delivered on those uncovered days (§ 412.507).

4. Administrative Simplification Compliance Act (ASCA) and Health Insurance Portability and Accountability Act (HIPAA) Compliance

Claims submitted to Medicare must comply with both the Administrative Simplification Compliance Act (ASCA) (Pub. L. 107–105), and the Health Insurance Portability and Accountability Act of 1996 (HIPAA) (Pub. L. 104–191). Section 3 of the ASCA requires that the Medicare Program deny payment under Part A or Part B for any expenses incurred for items or services ''for which a claim is submitted other than in an electronic form specified by the Secretary.'' Section 1862(h) of the Act (as added by section 3(a) of the ASCA) provides that the Secretary shall waive such denial in two specific types of cases and may also waive such denial ''in such unusual cases as the Secretary finds appropriate'' (68 FR 48805). Section 3 of the ASCA operates in the context of the HIPAA regulations, which include, among other provisions, the transactions and code sets standards requirements codified as 45 CFR Parts 160 and 162, Subparts A and I through R (generally known as the Transactions Rule). The Transactions Rule requires covered entities, including covered health care providers, to conduct certain electronic health care transactions according to the applicable transactions and code sets standards.

B. Medicare Severity Long-Term Care Diagnosis-Related Group (MS–LTC–DRG) Classifications and Relative Weights for FY 2013

1. Background

Section 123 of the BBRA requires that the Secretary implement a PPS for LTCHs (that is, a per discharge system with a diagnosis-related group (DRG)-based patient classification system reflecting the differences in patient resources and costs). Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring

that the Secretary examine ''the feasibility and the impact of basing payment under such a system [the long-term care hospital (LTCH) PPS] on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients, as well as the use of the most recently available hospital discharge data.''

When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system (that is, the CMS DRGs) that was utilized at that time under the IPPS. As a component of the LTCH PPS, we refer to this patient classification system as the ''long-term care diagnosis-related groups (LTC–DRGs).'' Although the patient classification system used under both the LTCH PPS and the IPPS are the same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect ''the differences in patient resource use * * *'' of LTCH patients (section 123(a)(1) of the BBRA (Pub. L. 106–113)).

As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), the MS–DRGs and the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) were adopted under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development and implementation and rationale for the use of the MS–DRGs and MS–LTC–DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR Part 412, Subpart O applicable to LTCHs for policy descriptions and payment calculations, all references to LTC–DRGs would be considered a reference to MS–LTC–DRGs. For the remainder of this section, we present the discussion in terms of the current MS–LTC–DRG patient classification system unless specifically referring to the previous LTC–DRG patient classification system that was in effect before October 1, 2007.)

The MS–DRGs adopted in FY 2008 represent an increase in the number of DRGs by 207 (that is, from 538 to 745) (72 FR 47171). The MS–DRG classifications are updated annually. As described in section II.G. of this preamble, for FY 2013, as we proposed, we are not creating or deleting any MS–DRGs, and as such we continue to have a total of 751 MS–DRG groupings for FY 2013. Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we use information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS–LTC–DRGs based on clinical characteristics and estimated resource needs. We then assign an appropriate weight to the MS–LTC–DRGs to account for the difference in resource use by patients exhibiting the case complexity and multiple medical problems characteristic of LTCHs. Below we provide a general summary of our existing methodology for determining the MS–LTC–DRG relative weights.

In a departure from the IPPS, and as discussed in greater detail below in section VII.B.3.f. of this preamble, we use low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs with less than 25 LTCH cases) in determining the MS–LTC–DRG relative weights because LTCHs do not typically treat the full range of diagnoses as do acute care hospitals. For purposes of determining the relative weights for the large number of low-volume MS–LTC–DRGs, we group all of the low-volume MS–LTC–DRGs into five quintiles based on average charge per discharge. (A detailed discussion of the initial development and application of the quintile methodology appears in the August 30, 2002 LTCH PPS final rule (67 FR 55978).) Under our existing methodology and as proposed, we account for adjustments to payments for SSO cases (that is, cases where the covered length of stay at the LTCH is less than or equal to five-sixths of the geometric average length of stay for the MS–LTC–DRG). Furthermore, as proposed, we make adjustments to account for nonmonotonically increasing weights, when necessary. That is, theoretically, cases under the MS–LTC–DRG system that are more severe require greater expenditure of medical care resources and will result in higher average charges such that, in the severity levels within a base MS–LTC–DRG, the weights should increase monotonically with severity from the lowest to highest severity level. (We discuss nonmonotonicity in greater detail and our methodology to adjust the MS–LTC–DRG relative weights to account for nonmonotonically increasing relative weights in section VII.B.3.g. (Step 6) of this preamble.)

2. Patient Classifications Into MS–LTC–DRGs

a. Background

The MS–DRGs (used under the IPPS) and the MS–LTC–DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted above in this section, we refer to the DRGs under the LTCH PPS as MS–LTC–DRGs although they are structurally identical to the MS–DRGs used under the IPPS.

The MS–DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems (such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The GROUPER software program does not recognize all ICD–9–CM procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKG), or minor surgical procedures (for example, biopsy of skin and subcutaneous tissue (procedure code 86.11)) do not affect the MS–LTC–DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge and that payment varies by the MS–LTC–DRG to which a beneficiary's stay is assigned. Cases are classified into MS–LTC–DRGs for payment based on the following six data elements:

- Principal diagnosis;
- Additional or secondary diagnoses;
- Surgical procedures;
- Age;
- Sex; and
- Discharge status of the patient.

Through FY 2010, the number of secondary or additional diagnoses and the number of procedure codes considered for MS–DRG assignment was limited to nine and six, respectively. However, for claims submitted on the 5010 format beginning January 1, 2011, we increased the capacity to process diagnosis and procedure codes up to 25 diagnoses and 25 procedures. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. We refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule for a complete discussion of this change (75 FR 50127).

Upon the discharge of the patient, the LTCH must assign appropriate diagnosis and procedure codes from the most

current version of the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD–9–CM). HIPAA Transactions and Code Sets Standards regulations at 45 CFR Parts 160 and 162 require that no later than October 16, 2003, all covered entities must comply with the applicable requirements of Subparts A and I through R of Part 162. Among other requirements, those provisions direct covered entities to use the ASC X12N 837 Health Care Claim: Institutional, Volumes 1 and 2, Version 4010, and the applicable standard medical data code sets for the institutional health care claim or equivalent encounter information transaction (45 CFR 162.1002 and 45 CFR 162.1102). For additional information on the ICD–9–CM Coding System, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47241 through 47243 and 47277 through 47281). We also refer readers to the detailed discussion on correct coding practices in the August 30, 2002 LTCH PPS final rule (67 FR 55981 through 55983). Additional coding instructions and examples are published in the *Coding Clinic for ICD–9–CM,* a product of the American Hospital Association. (We refer readers to section II.G.9. of this preamble for additional information on the annual revisions to the ICD–9–CM codes.)

With respect to the ICD–9–CM coding system, we have been discussing the conversion to the ICD–10–CM and the ICD–10–PCS coding systems for many years. In prior rules published in the **Federal Register** (for example, section II.G.11. of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50122 through 50128)), we discussed the implementation date for the conversion to the ICD–10–CM and ICD–10–PCS coding systems. We refer readers to section II.G.9. of this preamble for additional information on the adoption of the ICD–10–CM and ICD–10–PCS systems.

To create the MS–DRGs (and by extension, the MS–LTC–DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS–DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers to section II.D. of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS–DRGs based on severity of illness levels (72 FR 47141 through 47175).

Medicare contractors (that is, fiscal intermediaries and MACs) enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS–LTC–DRG can be made. During this process, certain cases are selected for further development (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS–LTC–DRG by the Medicare LTCH GROUPER software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The GROUPER software used under the LTCH PPS is the same GROUPER software program used under the IPPS. Following the MS–LTC–DRG assignment, the Medicare contractor determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS–LTC–DRG assignments made by the Medicare contractor and to submit additional information within a specified timeframe as provided in § 412.513(c).

The GROUPER software is used both to classify past cases to measure relative hospital resource consumption to establish the MS–LTC–DRG weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS–DRG and MS–LTC–DRG classification changes and to recalibrate the MS–DRG and MS–LTC–DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS–LTC–DRGs for FY 2013

As specified by our regulations at § 412.517(a), which requires that the MS–LTC–DRG classifications and relative weights be updated annually and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the IPPS, as we proposed, we are updating the MS–LTC–DRG classifications effective October 1, 2012, through September 30, 2013 (FY 2013) consistent with the changes to specific MS–DRG classifications presented in section II.G. of this preamble (that is, GROUPER Version 30.0). Therefore, the MS–LTC–DRGs for FY 2013 presented in this final rule are the same as the MS–DRGs that are being used under the IPPS for FY 2013. In addition, because the MS–LTC–DRGs for FY 2013 are the same as the MS–DRGs for FY 2013, the other changes that affect MS–DRG (and by extension MS–LTC–DRG) assignments under Version 30.0 of the GROUPER discussed in section II.G. of the preamble of this final rule, including the changes to the MCE software and the ICD–9–CM coding system, are also applicable under the LTCH PPS for FY 2013. We note that, we did not receive any public comments regarding the proposals presented under this section. The comments we received on the proposed changes to the MS–DRG classifications for FY 2013 (GROUPER Version 30.0) are discussed in section II.G. of the preamble of this final rule.

3. Development of the FY 2013 MS–LTC–DRG Relative Weights

a. General Overview of the Development of the MS–LTC–DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix in order to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is more costly (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment system rate by the applicable relative weight in determining payment to LTCHs for each case.

Although the adoption of the MS–LTC–DRGs resulted in some modifications of our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity, as proposed, the basic methodology used to develop the MS–LTC–DRG relative weights continues to be consistent with the general methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). (For additional details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550).) Under the LTCH PPS, relative weights for each MS–LTC–DRG are a

primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS–LTC–DRG have access to an appropriate level of services and to encourage efficiency, we calculated a relative weight for each MS–LTC–DRG that represents the resources needed by an average inpatient LTCH case in that MS–LTC–DRG. For example, cases in a MS–LTC–DRG with a relative weight of 2 will, on average, cost twice as much to treat as cases in a MS–LTC–DRG with a relative weight of 1.

b. Development of the MS–LTC–DRG Relative Weights for FY 2013

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28000 through 28007), we presented our proposals for the development of the MS–LTC–DRG relative weights for FY 2013, The basic methodology we proposed to use to develop the FY 2013 MS–LTC–DRG relative weights is the same as the methodology we used to develop the FY 2012 MS–LTC–DRG relative weights in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51738 through 51743) and is consistent with the general methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). Our proposed development of the FY 2013 MS–LTC–DRG relative weights included proposals related to the data, the hospital-specific relative value (HSRV) methodology, the treatment of severity levels in the MS–LTC–DRGs, low-volume and no-volume MS–LTC–DRGs, adjustment for nonmonotonicity, and the steps for calculating the MS–LTC–DRG relative weights with a budget neutrality factor. We did not receive any public comments on our proposals regarding the development of the MS–LTC–DRG relative weights for FY 2013, and are adopting the proposals as final without modification in this final rule. (We refer readers to the FY 2013 IPPS/LTCH PPS proposed rule for additional details on our proposals for the development of the FY 2103 MS–LTC–DRG relative weights (77 FR 28000 through 28007).) Below we present the finalized methodology that we used to determine the MS–LTC–DRG relative weights for FY 2013, which is consistent with the methodology presented in the proposed rule.

Beginning with the FY 2008 update, we established a budget neutrality requirement for the annual update to the MS–LTC–DRG classifications and relative weights at § 412.517(b) (in conjunction with § 412.503), such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the classification and relative weight changes (72 FR 26882 through 26884). Consistent with § 412.517(b) and as proposed, we continue to apply our established two-step budget neutrality methodology, which is based on the current year MS–LTC–DRG classifications and relative weights. We did not receive any public comments regarding this proposal. Thus, for this final rule, we continue to apply our established two-step budget neutrality methodology such that the annual update to the MS–LTC–DRG classifications and relative weights for FY 2013 are based on the FY 2012 MS–LTC–DRG classifications and relative weights established in Table 11 listed in section VI. of the Addendum to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51813). (For additional information on the established two-step budget neutrality methodology, we refer readers to the FY 2008 IPPS final rule (72 FR 47295 through 47296).)

c. Data

For the proposed rule, to calculate the MS–LTC–DRG relative weights for FY 2013, we obtained total charges from FY 2011 Medicare LTCH bill data from the December 2011 update of the FY 2011 MedPAR file, which were the best available data at that time, and used the proposed Version 30.0 of the GROUPER to classify LTCH cases. Consistent with our existing methodology, we also proposed that if more recent data became available, we would use those data and the finalized Version 30.0 of the GROUPER in establishing the FY 2013 MS–LTC–DRG relative weights in the final rule. Consistent with our proposal, to calculate the MS–LTC–DRG relative weights for FY 2013 for this final rule, we obtained total charges from FY 2011 Medicare LTCH bill data from the March 2012 update of the FY 2011 MedPAR file, which are the best available data, and used Version 30.0 of the GROUPER to classify LTCH cases.

As proposed and consistent with our historical methodology, we excluded the data from LTCHs that are all-inclusive rate providers and LTCHs that are reimbursed in accordance with demonstration projects authorized under section 402(a) of Public Law 90–248 or section 222(a) of Public Law 92–603. Furthermore, consistent with our historical practice, we excluded Medicare Advantage (Part C) claims, which are now included in the MedPAR files, in the calculations for the relative weights under the LTCH PPS that are used to determine payments for Medicare fee-for-service claims. Specifically, we did not use any claims from the MedPAR files that have a GHO Paid indicator value of ''1,'' which effectively removes Medicare Advantage claims from the relative weight calculations (73 FR 48532). Accordingly, in the development of the FY 2013 MS–LTC–DRG relative weights in this final rule, we excluded the data of 14 all-inclusive rate providers and the 2 LTCHs that are paid in accordance with demonstration projects that had claims in the March 2012 update of the FY 2011 MedPAR file, as well as any Medicare Advantage claims.

d. Hospital-Specific Relative Value (HSRV) Methodology

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients and treatment of infections and wound care. Some case types (DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS–LTC–DRGs has the potential to inappropriately distort the measure of average charges. As proposed, to account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we have used since the implementation of the LTCH PPS, we continue to use a hospital-specific relative value (HSRV) methodology to calculate the MS–LTC–DRG relative weights for FY 2013. We believe this method removes this hospital-specific source of bias in measuring LTCH average charges (67 FR 55985). Specifically, under this methodology, we reduce the impact of the variation in charges across providers on any particular MS–LTC–DRG relative weight by converting each LTCH's charge for a case to a relative value based on that LTCH's average charge.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each case to hospital-specific relative charge values and then adjust those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for a LTCH is its case-mix, so it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the cases it treats relative to the

complexity of the cases treated by all other LTCHs (the average case-mix of all LTCHs).

We did not receive any public comments regarding this proposal. Thus, in accordance with our established methodology and as proposed, we continue to standardize charges for each case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in section VII.B.3.g. (Step 3) of this preamble) by the average adjusted charge for all cases at the LTCH in which the case was treated. SSO cases are cases with a length of stay that is less than or equal to five-sixths the average length of stay of the MS–LTC–DRG (§ 412.529 and § 412.503). The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The resulting ratio is multiplied by that LTCH's case-mix index to determine the standardized charge for the case (67 FR 55989).

Multiplying the resulting ratio by the LTCH's case-mix index accounts for the fact that the same relative charges are given greater weight at a LTCH with higher average costs than they would at a LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. Because we standardize charges in this manner, we count charges for a Medicare patient at a LTCH with high average charges as less resource intensive than they would be at a LTCH with low average charges. For example, a $10,000 charge for a case at a LTCH with an average adjusted charge of $17,500 reflects a higher level of relative resource use than a $10,000 charge for a case at a LTCH with the same case-mix, but an average adjusted charge of $35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

e. Treatment of Severity Levels in Developing the MS–LTC–DRG Relative Weights

For purposes of determining the MS–LTC–DRG relative weights, under our historical methodology, there are three different categories of DRGs based on volume of cases within specific MS–LTC–DRGs. MS–LTC–DRGs with at least 25 cases are each assigned a unique relative weight; low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs that contain between 1 and 24 cases based on a given year's claims data) are grouped into quintiles (as described below) and assigned the relative weight of the quintile. No-volume MS–LTC–DRGs (that is, no cases in the given year's claims data are assigned to those MS–LTC–DRGs) are cross-walked to other MS–LTC–DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS–LTC–DRG (as described in greater detail below). As proposed, we continue to utilize these same three categories of MS–LTC–DRGs for purposes of the treatment of severity levels in determining the MS–LTC–DRG relative weights for FY 2013. (We provide in-depth discussions of our policy regarding weight-setting for low-volume MS–LTC–DRGs in section VII.B.3.f. of the preamble of this final rule and for no-volume MS–LTC–DRGs, under Step 5 in section VII.B.3.g. of this preamble.)

As also noted above, while the LTCH PPS and the IPPS use the same patient classification system, the methodology that is used to set the DRG relative weights for use in each payment system differs because the overall volume of cases in the LTCH PPS is much less than in the IPPS. In general, as proposed and consistent with our existing methodology we used the following steps to determine the FY 2013 MS–LTC–DRG relative weights: (1) If an MS–LTC–DRG has at least 25 cases, it is assigned its own relative weight; (2) if an MS–LTC–DRG has between 1 and 24 cases, it is assigned to a quintile for which we compute a relative weight for all of the MS–LTC–DRGs assigned to that quintile; and (3) if an MS–LTC–DRG has no cases, it is cross-walked to another MS–LTC–DRG based upon clinical similarities to assign an appropriate relative weight (as described below in detail in Step 5 of section VII.B.3.g. of this preamble). Furthermore, in determining the FY 2013 MS–LTC–DRG relative weights, when necessary, we make adjustments to account for nonmonotonicity, as discussed in greater detail below in Step 6 of section VII.B.3.g. of this preamble. We refer readers to the discussion in the FY 2010 IPPS/RY LTCH PPS final rule for our rationale for including an adjustment for nonmonotonicity (74 FR 43953 through 43954).

f. Low-Volume MS–LTC–DRGs

In order to account for MS–LTC–DRGs with low volume (that is, with fewer than 25 LTCH cases), as proposed and consistent with our existing methodology, for purposes of determining the FY 2013 MS–LTC–DRG relative weights, we continue to employ the quintile methodology for low-volume MS–LTC–DRGs, such that we group the ''low-volume MS–LTC–DRGs'' (that is, MS–LTC–DRGs that contained between 1 and 24 cases annually) into one of five categories (quintiles) based on average charges (67 FR 55984 through 55995 and 72 FR 47283 through 47288). In determining the FY 2013 MS–LTC–DRG relative weights in this final rule, in cases where the initial assignment of a low-volume MS–LTC–DRG to quintiles resulted in nonmonotonicity within a base-DRG, in order to ensure appropriate Medicare payments, consistent with our historical methodology, we made adjustments to the treatment of low-volume MS–LTC–DRGs to preserve monotonicity, as discussed in detail below in section VII.B.3.g. (Step 6) in this preamble.

In this final rule, using LTCH cases from the March 2012 update of the FY 2011 MedPAR file (which is currently the best available data), we identified 304 MS–LTC–DRGs that contained between 1 and 24 cases. This list of MS–LTC–DRGs was then divided into one of the 5 low-volume quintiles, each containing a minimum of 61 MS–LTC–DRGs (304/5 = 64 with 4 MS–LTC–DRGs as the remainder). We assigned a low-volume MS–LTC–DRG to a specific low-volume quintile by sorting the low-volume MS–LTC–DRGs in ascending order by average charge in accordance with our established methodology. Furthermore, because the number of MS–LTC–DRGs with less than 25 cases was not evenly divisible by 5, the average charge of the low-volume quintile was used to determine which of the low-volume quintiles contain the 4 additional low-volume MS–LTC–DRGs. Specifically, after organizing the MS–LTC–DRGs by ascending order by average charge, we assigned the first fifth (1st through 60th) of low-volume MS–LTC–DRGs (with the lowest average charge) into Quintile 1. The MS–LTC–DRGs with the highest average charge cases were assigned into Quintile 5. Because the average charge of the 61st low-volume MS–LTC–DRG in the sorted list was closer to the average charge of the 60th low-volume MS–LTC–DRG (assigned to Quintile 1) than to the average charge of the 62nd low-volume MS–LTC–DRG (assigned to Quintile 3), we assigned it to Quintile 1 (such that Quintile 1 contains 61 low-volume MS–LTC–DRGs before any adjustments for nonmonotonicity, as discussed below). This process was repeated through the remaining low-volume MS–LTC–DRGs so that 4 of the 5 low-volume quintiles contain 61 MS–LTC–DRGs (Quintiles 1, 2, 3 and 4) and the other low-volume quintile contains 60 MS–LTC–DRGs

(Quintiles 5). Table 13A, which is listed in section VI. of the Addendum to this final rule and is available via the Internet, lists the composition of the low-volume quintiles for MS–LTC–DRGs for FY 2013.

Accordingly, in order to determine the FY 2013 relative weights for the MS–LTC–DRGs with low volume, we used the 5 low-volume quintiles described above. The composition of each of the 5 low-volume quintiles shown in Table 13A (listed in section VI. of the Addendum to this final rule and available via the Internet) was used in determining the FY 2013 MS–LTC–DRG relative weights (as shown in Table 11 listed in section VI. of the Addendum to this final rule and available via the Internet). We determined a relative weight and (geometric) average length of stay for each of the 5 low-volume quintiles using the methodology that we applied to the MS–LTC–DRGs (25 or more cases), as described below in section VII.B.3.g. of this preamble. We assigned the same relative weight and average length of stay to each of the low-volume MS–LTC–DRGs that made up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS–LTC–DRGs with a low volume of LTCH cases will vary in the future.

We note that we will continue to monitor the volume (that is, the number of LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS–LTC–DRG relative weights result in appropriate payment for such cases and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

g. Steps for Determining the FY 2013 MS–LTC–DRG Relative Weights

For this final rule, as we proposed, we determined the FY 2013 MS–LTC–DRG relative weights based on our existing methodology. (For additional information on the original development of this methodology, and modifications to it since the adoption of the MS–LTC–DRGs, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55995) and the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43951 through 43966).) In summary, to determine the FY 2013 MS–LTC–DRG relative weights, we grouped LTCH cases to the appropriate MS–LTC–DRG, while taking into account the low-volume quintile (as described above). After grouping the cases to the appropriate MS–LTC–DRG (or low-volume quintile), we calculated the FY 2013 relative weights by first removing statistical outliers and cases with a length of stay of 7 days or less (Steps 1 and 2 below). Next, we adjusted the number of cases in each MS–LTC–DRG (or low-volume quintile) for the effect of SSO cases (Step 3 below). After removing statistical outliers (Step 1 below) and cases with a length of stay of 7 days or less (Step 2 below), the SSO adjusted discharges and corresponding charges were then used to calculate ''relative adjusted weights'' for each MS–LTC–DRG (or low-volume quintile) using the HSRV method.

Below we discuss in detail the steps for calculating the FY 2013 MS–LTC–DRG relative weights. We note that, as we discussed in section VII.B.3.c. of this preamble, we excluded the data of all-inclusive rate LTCHs, LTCHs that are paid in accordance with demonstration projects, and any Medicare Advantage claims in the March 2012 update of the FY 2011 MedPAR file.

Step 1—Remove statistical outliers.

The first step in the calculation of the FY 2013 MS–LTC–DRG relative weights is to remove statistical outlier cases. Consistent with our historical relative weight methodology, we continue to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS–LTC–DRG. These statistical outliers are removed prior to calculating the relative weights because we believe that they may represent aberrations in the data that distort the measure of average resource use. Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among the MS–LTC–DRGs. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 2—Remove cases with a length of stay of 7 days or less.

The MS–LTC–DRG relative weights reflect the average of resources used on representative cases of a specific type. Generally, cases with a length of stay of 7 days or less do not belong in a LTCH because these stays do not fully receive or benefit from treatment that is typical in a LTCH stay, and full resources are often not used in the earlier stages of admission to a LTCH. If we were to include stays of 7 days or less in the computation of the FY 2013 MS–LTC–DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at a LTCH by including data from these very short stays. Therefore, consistent with our historical relative weight methodology, in determining the FY 2013 MS–LTC–DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 3—Adjust charges for the effects of SSOs.

After removing cases with a length of stay of 7 days or less, we are left with cases that have a length of stay of greater than or equal to 8 days. As the next step in the calculation of the FY 2013 MS–LTC–DRG relative weights, consistent with our historical relative weight methodology, we adjusted each LTCH's charges per discharge for those remaining cases for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503).

We made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay for the MS–LTC–DRG for non-SSO cases. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS–LTC–DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient's length of stay been equal to the average length of stay of the MS–LTC–DRG.

Counting SSO cases as full discharges with no adjustment in determining the FY 2013 MS–LTC–DRG relative weights would lower the FY 2013 MS–LTC–DRG relative weight for affected MS–LTC–DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within an MS–LTC–DRG. This would result in an ''underpayment'' for non-SSO cases and an ''overpayment'' for SSO cases. Therefore, we adjusted for SSO cases under § 412.529 in this manner because it results in more appropriate payments for all LTCH cases. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 4—Calculate the FY 2013 MS–LTC–DRG relative weights on an iterative basis.

Consistent with our historical relative weight methodology, we calculated the FY 2013 MS–LTC–DRG relative weights

using the HSRV methodology, which is an iterative process. First, for each LTCH case, we calculated a hospital-specific relative charge value by dividing the SSO adjusted charge per discharge (see Step 3) of the LTCH case (after removing the statistical outliers (see Step 1) and LTCH cases with a length of stay of 7 days or less (see Step 2)) by the average charge per discharge for the LTCH in which the case occurred. The resulting ratio was then multiplied by the LTCH's case-mix index to produce an adjusted hospital-specific relative charge value for the case. An initial case-mix index value of 1.0 is used for each LTCH.

For each MS–LTC–DRG, we calculated the FY 2013 relative weight by dividing the average of the adjusted hospital-specific relative charge values (from above) for the MS–LTC–DRG by the overall average hospital-specific relative charge value across all cases for all LTCHs. Using these recalculated MS–LTC–DRG relative weights, each LTCH's average relative weight for all of its cases (that is, its case-mix) was calculated by dividing the sum of all the LTCH's MS–LTC–DRG relative weights by its total number of cases. The LTCHs' hospital-specific relative charge values (from above) were then multiplied by the hospital-specific case-mix indexes. The hospital-specific case-mix adjusted relative charge values were then used to calculate a new set of MS–LTC–DRG relative weights across all LTCHs. This iterative process was continued until there was convergence between the weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 5—Determine a FY 2013 relative weight for MS–LTC–DRGs with no LTCH cases.

As we stated above, we determined the FY 2013 relative weight for each MS–LTC–DRG using total Medicare allowable total charges reported in the best available LTCH claims data (that is, the March 2012 update of the FY 2011 MedPAR file for this final rule). Using these data, we identified the MS–LTC–DRGs for which there are no LTCH cases in the database, such that no patients who would have been classified to those MS–LTC–DRGs were treated in LTCHs during FY 2011 and, therefore, no charge data are available for these MS–LTC–DRGs. Thus, in the process of determining the MS–LTC–DRG relative weights, we were unable to calculate relative weights for the MS–LTC–DRGs with no LTCH cases using the methodology described in Steps 1 through 4 above. However, because patients with a number of the diagnoses under these MS–LTC–DRGs may be treated at LTCHs, consistent with our historical methodology, we assigned a relative weight to each of the no-volume MS–LTC–DRGs based on clinical similarity and relative costliness (with the exception of ''transplant'' MS–LTC–DRGs and ''error'' MS–LTC–DRGs, as discussed below). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

In general, we determined FY 2013 relative weights for the MS–LTC–DRGs with no LTCH cases in the March 2012 update of the FY 2011 MedPAR file used in this final rule (that is, ''no-volume'' MS–LTC–DRGs) by cross-walking each no-volume MS–LTC–DRG to another MS–LTC–DRG with a calculated relative weight (determined in accordance with the methodology described above). Then, the ''no-volume'' MS–LTC–DRG was assigned the same relative weight (and average length of stay) of the MS–LTC–DRG to which it was cross-walked (as described in greater detail below).

Of the 751 MS–LTC–DRGs for FY 2013, we identified 212 MS–LTC–DRGs for which there are no LTCH cases in the database (including the 8 ''transplant'' MS–LTC–DRGs and 2 ''error'' MS–LTC–DRGs). As stated above, we assigned relative weights for each of the 212 no-volume MS–LTC–DRGs (with the exception of the 8 ''transplant'' MS–LTC–DRGs and the 2 ''error'' MS–LTC–DRGs, which are discussed below) based on clinical similarity and relative costliness to one of the remaining 539 (751 − 212 = 539) MS–LTC–DRGs for which we were able to determine relative weights based on FY 2011 LTCH claims data using the steps described above. (For the remainder of this discussion, we refer to the ''cross-walked'' MS–LTC–DRGs as the MS–LTC–DRGs to which we cross-walk one of the 213 ''no volume'' MS–LTC–DRGs for purposes of determining a relative weight.) Then, we assigned the no-volume MS–LTC–DRG the relative weight of the cross-walked MS–LTC–DRG. (As explained below in Step 6, when necessary, we made adjustments to account for nonmonotonicity.)

For this final rule, we cross-walked the no-volume MS–LTC–DRG to an MS–LTC–DRG for which there are LTCH cases in the March 2012 update of the FY 2011 MedPAR file, and to which it is similar clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. We evaluated the relative costliness in determining the applicable MS–LTC–DRG to which a no-volume MS–LTC–DRG is cross-walked in order to assign an appropriate relative weight for the no-volume MS–LTC–DRGs in FY 2013. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS–LTC–DRGs in FY 2013, the relative weights assigned based on the cross-walked MS–LTC–DRGs will result in an appropriate LTCH PPS payment because the crosswalks, which are based on similar clinical similarity and relative costliness, generally require equivalent relative resource use.

We then assigned the relative weight of the cross-walked MS–LTC–DRG as the relative weight for the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2013. We note that if the cross-walked MS–LTC–DRG had 25 cases or more, its relative weight, which was calculated using the methodology described in Steps 1 through 4 above, was assigned to the no-volume MS–LTC–DRG as well. Similarly, if the MS–LTC–DRG to which the no-volume MS–LTC–DRG was cross-walked had 24 or less cases and, therefore, was designated to one of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume quintile to the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2013. (As we noted above, in the infrequent case where nonmonotonicity involving a no-volume MS–LTC–DRG resulted, additional adjustments as described in Step 6 were required in order to maintain monotonically increasing relative weights.)

For this final rule, a list of the no-volume MS–LTC–DRGs and the MS–LTC–DRG to which it is cross-walked (that is, the cross-walked MS–LTC–DRG) for FY 2013 is shown in Table 13B, which is listed in section VI. of the Addendum to this final rule and is available via the Internet.

To illustrate this methodology for determining the relative weights for the FY 2013 MS–LTC–DRGs with no LTCH cases, we are providing the following example, which refers to the no-volume

MS–LTC–DRGs crosswalk information for FY 2013 provided in Table 13B.

Example: There are no cases in the FY 2011 MedPAR file used for this final rule for MS–LTC–DRG 61 (Acute Ischemic Stroke with Use of Thrombolytic Agent with MCC). We determined that MS–LTC–DRG 70 (Nonspecific Cerebrovascular Disorders with MCC) is similar clinically and based on resource use to MS–LTC–DRG 61. Therefore, we assigned the same relative weight of MS–LTC–DRG 70 of 0.8209 for FY 2013 to MS–LTC–DRG 61 (obtained from Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet).

Again, we note that, as this system is dynamic, it is entirely possible that the number of MS–LTC–DRGs with no volume of LTCH cases based on the system will vary in the future. We used the most recent available claims data in the MedPAR file to identify no-volume MS–LTC–DRGs and to determine the relative weights in this final rule.

Furthermore, for FY 2013, consistent with our historical relative weight methodology, we established MS–LTC–DRG relative weights of 0.0000 for the following transplant MS–LTC–DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS–LTC–DRG 1); Heart Transplant or Implant of Heart Assist System without MCC (MS–LTC–DRG 2); Liver Transplant with MCC or Intestinal Transplant (MS–LTC–DRG 5); Liver Transplant without MCC (MS–LTC–DRG 6); Lung Transplant (MS–LTC–DRG 7); Simultaneous Pancreas/Kidney Transplant (MS–LTC–DRG 8); Pancreas Transplant (MS–LTC–DRG 10); and Kidney Transplant (MS–LTC–DRG 652). This is because Medicare will only cover these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these eight transplant MS–LTC–DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS–LTC–DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS–LTC–DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).)

Step 6—Adjust the FY 2013 MS–LTC–DRG relative weights to account for nonmonotonically increasing relative weights.

As discussed earlier in this section, the MS–DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as ''without CC/MCC.'' When data do not support the creation of three severity levels, the base MS–DRG is subdivided into either two levels or the base MS–DRG is not subdivided. The two-level subdivisions could consist of the MS–DRG with CC/MCC and the MS–DRG without CC/MCC. Alternatively, the other type of two-level subdivision may consist of the MS–DRG with MCC and the MS–DRG without MCC.

In those base MS–LTC–DRGs that are split into either two or three severity levels, cases classified into the ''without CC/MCC'' MS–LTC–DRG are expected to have a lower resource use (and lower costs) than the ''with CC/MCC'' MS–LTC–DRG (in the case of a two-level split) or both the ''with CC'' and the ''with MCC'' MS–LTC–DRGs (in the case of a three-level split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and will result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS–LTC–DRG, an MS–LTC–DRG with CC has a higher relative weight than one with MCC, or the MS–LTC–DRG ''without CC/MCC'' has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS–LTC–DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS–LTC–DRG (which are generally expected to have lower resource use and costs). Consequently, in determining the FY 2013 MS–LTC–DRG relative weights in this final rule, consistent with our historical methodology, we combined MS–LTC–DRG severity levels within a base MS–LTC–DRG for the purpose of computing a relative weight when necessary to ensure that monotonicity is maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2013 MS–LTC–DRG relative weights in this final rule by applying this methodology are denoted in Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet.

Step 7—Calculate the FY 2013 budget neutrality factor.

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS–LTC–DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS–LTC–DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS–LTC–DRG classifications and relative weights, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26881 and 26882).)

The MS–LTC–DRG classifications and relative weights are updated annually based on the most recent available LTCH claims data to reflect changes in relative LTCH resource use (§ 412.517(a) in conjunction with § 412.503). Under the budget neutrality requirement at § 412.517(b), for each annual update, the MS–LTC–DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is, decreased or increased). Consistent with that provision, we updated the MS–LTC–DRG classifications and relative weights for FY 2013 based on the most recent available LTCH data, and applied a budget neutrality adjustment in determining the FY 2013 MS–LTC–DRG relative weights.

To ensure budget neutrality in the update to the MS–LTC–DRG classifications and relative weights under § 412.517(b), we continued to use our established two-step budget neutrality methodology. In this final rule, in the first step of our MS–LTC–DRG budget neutrality methodology, for FY 2013, we calculated and applied a normalization factor to the recalibrated relative weights (the result of Steps 1 through 6 above) to ensure that estimated payments are not influenced by changes in the composition of case types or the changes to the classification system. That is, the normalization adjustment is intended to ensure that the recalibration of the MS–LTC–DRG relative weights (that is, the process

itself) neither increases nor decreases the average CMI.

To calculate the normalization factor for FY 2013 (the first step of our budget neutrality methodology), we used the following three steps: (1.a.) we used the most recent available LTCH claims data (FY 2011) and grouped them using the FY 2013 GROUPER (Version 30.0) and the recalibrated FY 2013 MS–LTC–DRG relative weights (determined in steps 1 through 6 of the Steps for Determining the FY 2013 MS–LTC–DRG Relative Weights above) to calculate the average CMI; (1.b.) we grouped the same LTCH claims data (FY 2011) using the FY 2012 GROUPER (Version 29.0) and FY 2012 MS–LTC–DRG relative weights and calculated the average CMI; and (1.c.) we computed the ratio of these average CMIs by dividing the average CMI for FY 2012 (determined in Step 1.b.) by the average CMI for FY 2013 (determined in Step 1.a.). In determining the MS–LTC–DRG relative weights for FY 2013, each recalibrated MS–LTC–DRG relative weight was multiplied by 1.12412 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produced ''normalized relative weights.''

In the second step of our MS–LTC–DRG budget neutrality methodology, we determined a budget neutrality factor to ensure that estimated aggregate LTCH PPS payments (based on the most recent available LTCH claims data) after reclassification and recalibration (that is, the FY 2013 MS–LTC–DRG classifications and relative weights) are equal to estimated aggregate LTCH PPS payments before reclassification and recalibration (that is, the FY 2012 MS–LTC–DRG classifications and relative weights). Accordingly, consistent with our existing methodology, we used FY 2011 discharge data to simulate payments and compare estimated aggregate LTCH PPS payments using the FY 2012 MS–LTC–DRGs and relative weights to estimate aggregate LTCH PPS payments using the FY 2013 MS–LTC–DRGs and relative weights.

For this final rule, we determined the FY 2013 budget neutrality adjustment factor using the following three steps: (2.a.) we simulated estimated total LTCH PPS payments using the normalized relative weights for FY 2013 and GROUPER Version 30.0 (as described above); (2.b.) we simulated estimated total LTCH PPS payments using the FY 2012 GROUPER (Version 29.0) and the FY 2012 MS–LTC–DRG relative weights in Table 11 of the Addendum to the FY 2012 IPPS/LTCH PPS final rule available on the Internet (76 FR 51813); and (2.c.) we calculated the ratio of these estimated total LTCH PPS payments by dividing the estimated total LTCH PPS payments using the FY 2012 GROUPER (Version 29.0) and the FY 2012 MS–LTC–DRG relative weights (determined in Step 2.b.) by the estimated total LTCH PPS payments using the FY 2013 GROUPER (Version 30.0) and the normalized MS–LTC–DRG relative weights for FY 2013 (determined in Step 2.a.). In determining the FY 2013 MS–LTC–DRG relative weights, each normalized relative weight was multiplied by a budget neutrality factor of 0.9880413 (determined in Step 2.c.) in the second step of the budget neutrality methodology to determine the budget neutral FY 2013 relative weight for each MS–LTC–DRG.

Accordingly, in determining the FY 2013 MS–LTC–DRG relative weights in this final rule, consistent with our existing methodology, we applied a normalization factor of 1.12412 and a budget neutrality factor of 0.9880413 (computed as described above). Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet, lists the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)), and the ''IPPS Comparable Thresholds'' (used in determining SSO payments under § 412.529(c)(3)), for FY 2013. The FY 2013 MS–LTC–DRG relative weights in Table 11, which is listed in section VI. of the Addendum to this final rule and available via the Internet, reflect both the normalization factor of 1.12412 and the budget neutrality factor of 0.9880413.

C. Use of a LTCH-Specific Market Basket under the LTCH PPS

1. Background

The input price index (that is, the market basket) that was used to develop the LTCH PPS for FY 2003 was the ''excluded hospital with capital'' market basket. That market basket was based on 1997 Medicare cost report data and included data for Medicare-participating IRFs, IPFs, LTCHs, cancer hospitals, and children's hospitals. Although the term ''market basket'' technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that market basket. Accordingly, the term ''market basket,'' as used in this section, refers to an input price index.

Beginning with RY 2007, LTCH PPS payments were updated using a FY 2002-based market basket reflecting the operating and capital cost structures for IRFs, IPFs, and LTCHs (hereafter referred to as the rehabilitation, psychiatric, and long-term care (RPL) market basket). We excluded cancer and children's hospitals from the RPL market basket because their payments are based entirely on reasonable costs subject to rate-of-increase limits established under the authority of section 1886(b) of the Act, which are implemented in regulations at § 413.40. Those types of hospitals are not paid under a PPS. Also, the FY 2002 cost structures for cancer and children's hospitals are noticeably different from the cost structures for freestanding IRFs, freestanding IPFs, and LTCHs. A complete discussion of the FY 2002-based RPL market basket appears in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817).

In the FY 2010 IPPS/RY 2010 LTCH PPS proposed rule (74 FR 21062), we expressed our interest in exploring the possibility of creating a stand-alone LTCH market basket that only reflects the cost structures for LTCHs. However, as we discussed in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43967 through 43968), we were in the process of conducting further research to assist us in understanding the underlying reasons for the variations in costs and cost structures between freestanding IRFs and hospital-based IRFs, as well as between freestanding IPFs and hospital-based IPFs. At this time, we remain unable to sufficiently explain the observed differences in costs and cost structures between hospital-based IRFs and freestanding IRFs and between hospital-based IPFs and freestanding IPFs.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51756), we finalized the rebasing and revising of the FY 2002-based RPL market basket by creating and implementing an FY 2008-based RPL market basket. We also discussed that we were exploring the viability of creating two separate market baskets from the current RPL market basket: One market basket would include freestanding IRFs and freestanding IPFs and could be used to update payments under both the IPF and IRF payment systems. We continue our research in this area. The other market basket would be a stand-alone LTCH market basket. We stated that, depending on the outcome of our research, we may propose a stand-alone LTCH market basket in the next LTCH PPS update cycle. We received several public comments in response to the FY 2012

proposed rule, all of which supported deriving a stand-alone LTCH market basket (76 FR 51756 through 51757).

As we routinely do, we have revisited the issue of the market basket used in the LTCH PPS. We previously did not estimate stand-alone market baskets for IRFs, IPFs, and LTCHs because of small sample sizes for freestanding facilities and the data concerns associated with the hospital-based facilities. Although we continue to do research in this area, at this time, we believe it is appropriate to move forward with a proposal to create a LTCH-specific market basket. This is because we believe we have sufficiently robust data to create such a market basket, and no longer need to rely on the cost report data from IPPS hospitals or from IRFs, IPFs, and LTCHs combined. Specifically, over the last several years, the number of LTCH facilities submitting a Medicare cost report has increased, helping to address concerns regarding the size of the available pool of facilities. The completeness and quality of the Medicare cost reports that we have been evaluating over the last several years have improved as well. Therefore, consistent with our intention to use the latest available and complete cost report data, we believe that it would be appropriate to create a market basket that would specifically reflect the cost structures of LTCHs based on Medicare cost report data for FY 2009, which are for cost reporting periods beginning on and after October 1, 2008, and before October 1, 2009.

Therefore, under the LTCH PPS for FY 2013, as we proposed, in this final rule, we are creating a FY 2009-based LTCH-specific market basket as described below. As we proposed, for this final rule, we are using data from cost reports beginning in FY 2009 because these data are the latest available complete data and, therefore, we believe it will enable us to accurately calculate cost weights that specifically reflect the cost structures of LTCHs. In this FY 2013 final rule, we are finalizing our proposal to create a LTCH-specific market basket based solely on Medicare cost report data from LTCHs of which the majority of the reports are settled. In the following discussion, we provide an overview of the market basket and describe the methodologies we used for determining the operating and capital portions of the FY 2009-based LTCH-specific market basket.

2. Overview of the FY 2009-Based LTCH-Specific Market Basket

As we proposed and are adopting in this final rule, the FY 2009-based LTCH-specific market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix (that is, intensity) of goods and services purchased over time are not measured.

As we proposed and are adopting in this final rule, the index itself is constructed in the following three steps. First, a base period is selected (as proposed, in this final rule, we used FY 2009 as the base period) and total base period expenditures are estimated for a set of mutually exclusive and exhaustive spending categories, with the proportion of total costs that each category represents being calculated. These proportions are called ''cost weights'' or ''expenditure weights.'' Second, each expenditure category is matched to an appropriate price or wage variable, referred to as a ''price proxy.'' In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the expenditure weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the expenditure weights multiplied by their price levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe.

As noted above, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to furnish hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital, but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care between base periods.

3. Development of a LTCH-Specific Market Basket

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28009), we invited public comments on our proposed methodology for deriving a LTCH-specific market basket. A summary of the public comments we received on the methodology for creating a LTCH-specific market basket are included in section VII.C.3.d. of the preamble of this final rule. Below we describe the methodology and data used to derive the cost categories, cost weights, and price proxies for the LTCH-specific market basket that we proposed and are adopting in this final rule.

a. Development of Cost Categories

(1) Medicare Cost Reports

As we proposed and are adopting in this final rule, the FY 2009-based LTCH-specific market basket consists of several major cost categories derived from the FY 2009 LTCH Medicare cost reports as described previously, including wages and salaries, employee benefits, contract labor, pharmaceuticals, professional liability insurance, capital, and a residual. These FY 2009 Medicare cost reports are for cost reporting periods beginning on and after October 1, 2008, and before October 1, 2009. As we proposed and are adopting in this final rule, we are using FY 2009 as the base year because we believe that the FY 2009 Medicare cost reports represent the most recent, complete set of Medicare cost report data available for LTCHs.

Medicare cost report data include costs for all patients, including Medicare, Medicaid, and private payer. As we proposed and are adopting in this final rule, because our goal is to measure cost shares for facilities that serve Medicare beneficiaries, and are reflective of case-mix and practice patterns associated with providing services to Medicare beneficiaries in LTCHs, we limit our selection of Medicare cost reports to those from LTCHs that have a Medicare average length of stay that is within a comparable range of their total facility average length of stay. We believe this provides a more accurate reflection of the structure of costs for Medicare covered days. As we proposed and are adopting in this final rule, similar to our methodology for the FY 2008-based RPL market basket, we use the cost reports submitted by LTCHs with Medicare average lengths of stay within 15 percent (that is, 15 percent higher or

lower) of the total facility average length of stay for the hospital. This is the same edit we applied to derive the FY 2008-based RPL market basket and generally includes those LTCHs with Medicare average length of stay within approximately 5 days of the facility average length of stay of the hospital.

Using this set of Medicare cost reports, as we proposed and are adopting in this final rule, we then calculate cost weights for six cost categories, and a residual category as represented by all other costs, directly from the FY 2009 Medicare cost reports submitted by LTCHs (found in Table VII.C–1 below). As we proposed and are adopting in this final rule, these Medicare cost report cost weights are then supplemented with information obtained from other data sources (explained in more detail below) to derive the FY 2009-based LTCH-specific market basket cost weights.

The proposed and final methodology used to develop the FY 2009-based LTCH-specific market basket cost weights is generally the same methodology used to develop the FY 2008-based RPL market basket cost weights, with the exception of the employee benefits and contract labor cost weights. For the FY 2008-based RPL market basket, there was an issue with obtaining data specifically for employee benefits and contract labor from the set of FY 2008 Medicare cost reports, as IRFs, IPFs, and LTCHs were not required to complete the Medicare cost report worksheet from which these data were collected (Form CMS–2552–96, Worksheet S3, Parts II and III). As a result, only a proportion of the total number of IRFs, IPFs, and LTCHs reported data for employee benefits and contract labor; therefore, we developed these cost weights for the FY 2008-based RPL market basket using data obtained from IPPS Medicare cost reports. However, when we reviewed LTCH Medicare cost reports for FY 2009, we found that a greater proportion of LTCHs submitted data for employee benefits and contract labor (approximately 40 percent of LTCHs, whose total costs account for approximately 50 percent of total costs for all LTCHs, submitted a cost report) compared to the proportion of IRFs and IPFs that submitted these data. We believe that it is better to use the LTCH-specific cost report data whenever possible to further our goal to create a market basket that represents the cost structures of LTCHs serving Medicare beneficiaries. Therefore, as we proposed and are adopting in this final rule, we use the LTCH-specific cost reports to derive the employee benefits and contract labor cost weights for the FY 2009-based LTCH-specific market basket, as opposed to using the IPPS Medicare cost reports as a proxy, as was done for the FY 2008-based RPL market basket.

TABLE VII.C–1—MAJOR COST CATEGORIES AND THEIR RESPECTIVE COST WEIGHTS AS CALCULATED DIRECTLY FROM FY 2009 MEDICARE COST REPORTS

Major cost categories	FY 2009-based LTCH-specific market basket cost weights obtained from Medicare cost reports (percent)
Wages and Salaries	40.407
Employee Benefits	6.984
Contract Labor	6.947
Professional Liability Insurance (Malpractice)	0.830
Pharmaceuticals	8.877
Capital	9.829
All Other (Residual)	26.126

(2) Other Data Sources

In addition to the data from Medicare cost reports submitted by LTCHs, as we proposed and are adopting in this final rule, the other data source we use to develop the FY 2009-based LTCH-specific market basket cost weights is the 2002 Benchmark Input-Output (I–O) Tables created by the Bureau of Economic Analysis (BEA), U.S. Department of Commerce. We use the 2002 BEA Benchmark I–O data to disaggregate the ''All Other (Residual)'' cost category (26.126 percent) into more detailed hospital expenditure category shares. We note that we use these data to derive most of the CMS market baskets, including the FY 2008-based RPL and FY 2006-based IPPS market baskets. The BEA Benchmark I–O accounts provide the most detailed information on the goods and services purchased by an industry, which allows for a more detailed disaggregation of expenses in the market basket for which we can then proxy the appropriate price inflation.

The BEA Benchmark I–O data are generally scheduled for publication every 5 years. The most recent data available are for 2002. BEA also produces Annual I–O estimates; however, the 2002 Benchmark I–O data represent a much more comprehensive and detailed set of data that are derived from the 2002 Economic Census. We used the 2002 BEA Benchmark I–O data for the FY 2008-based RPL market basket. Because BEA has not released new Benchmark I–O data, and we believe the data to be comprehensive and complete as indicated above, we use the 2002 Benchmark I–O data in the FY 2009-based LTCH-specific market basket.

Instead of using the less detailed Annual I–O data, as we proposed and are adopting in this final rule, we age the 2002 Benchmark I–O data forward to 2009. As we proposed, the methodology we are using in this final rule to age the data forward involves applying the annual price changes from the respective price proxies to the appropriate cost categories. We repeat this practice for each year.

The ''All Other'' cost category expenditure shares are determined as being equal to each category's proportion to total ''All Other'' expenditures based on the aged 2002 Benchmark I–O data. For instance, if the cost for telephone services represented 10 percent of the sum of the ''All Other'' Benchmark I–O hospital expenditures, telephone services would represent 10 percent of the ''All Other'' cost category of the LTCH-specific market basket.

b. Cost Category Computation

As we proposed and are adopting in this final rule, for the FY 2009-based LTCH-specific market basket, we use data from the Medicare cost reports submitted by LTCHs to derive six major cost categories. The six major categories are: Wages and Salaries, Employee

Benefits, Contract Labor, Professional Liability Insurance, Pharmaceuticals, and Capital, as shown above in Table VII.C–1. These represent the most detailed cost categories available from the Medicare cost reports. As stated above, as we proposed and are adopting in this final rule, we then utilize the Benchmark I–O data in order to further disaggregate expenses. This is the same methodology used to derive most of the CMS market baskets, including the FY 2008-based RPL and FY 2006-based IPPS market baskets. We obtained the same major cost categories from the Medicare cost report for the FY 2009-based LTCH market basket as were obtained for the FY 2008-based RPL market basket (76 FR 51758), and two additional categories, Employee Benefits and Contract Labor.

c. Selection of Price Proxies

After computing the FY 2009 cost weights for the LTCH-specific market basket, it was necessary to select appropriate wage and price proxies to reflect the rate of price change for each expenditure category. With the exception of the proxy for Professional Liability Insurance, all of the proxies that we proposed and are adopting in this final rule for the operating portion of the FY 2009-based LTCH-specific market basket are based on Bureau of Labor Statistics (BLS) data and are grouped into one of the following BLS categories:

Producer Price Indexes—Producer Price Indexes (PPIs) measure price changes for goods sold in markets other than the retail market. PPIs are preferable price proxies for goods and services that hospitals purchase as inputs because PPIs better reflect the actual price changes encountered by hospitals. For example, we use a PPI for prescription drugs, rather than the Consumer Price Index (CPI) for prescription drugs, because hospitals generally purchase drugs directly from a wholesaler. As we proposed and are adopting in this final rule, the PPIs that we are using measure price changes at the final stage of production.

Consumer Price Indexes—Consumer Price Indexes (CPIs) measure change in the prices of final goods and services bought by the typical consumer. As we proposed and are adopting in this final rule, because they may not represent the price encountered by a producer, we use CPIs only if an appropriate PPI is not available, or if the expenditures are more like those faced by retail consumers in general rather than by purchasers of goods at the wholesale level. For example, the CPI for food purchased away from home is used as a proxy for contracted food services.

Employment Cost Indexes—Employment Cost Indexes (ECIs) measure the rate of change in employee wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. Appropriately, they are not affected by shifts in employment mix.

As we proposed and are adopting in this final rule, we evaluated the price proxies using the criteria of reliability, timeliness, availability, and relevance. Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Timeliness implies that the proxy is published regularly, preferably at least once a quarter. Availability means that the proxy is publicly available. Finally, relevance means that the proxy is applicable and representative of the cost category weight to which it is applied. We believe the PPIs, CPIs, and ECIs selected in this final rule meet these criteria.

Table VII.C–2 below sets forth the FY 2009-based LTCH-specific market basket, including the cost categories and their respective weights and price proxies that we proposed and are adopting for this final rule. For comparison purposes, the corresponding FY 2008-based RPL market basket cost weights also are listed. For example, ''Wages and Salaries'' are 46.330 percent of total costs under the FY 2009-based LTCH-specific market basket compared to 49.447 percent under the FY 2008-based RPL market basket. ''Employee Benefits'' are 8.008 percent under the FY 2009-based LTCH-specific market basket compared to 12.831 percent under the FY 2008-based RPL market basket. As a result, compensation costs (wages and salaries plus employee benefits) under the FY 2009-based LTCH-specific market basket are 54.338 percent of total costs compared to 62.278 percent under the FY 2008-based RPL market basket. We note that the ''Wages and Salaries'' cost weight contained in Table VII.C–2 (46.330 percent) differs from that contained in Table VII.C–1 (40.407 percent). We attribute this difference to our allocation of the ''Contract Labor'' cost weight obtained from the Medicare cost reports (6.947 percent) proportionately across the ''Wages and Salaries'' and ''Employee Benefits'' cost weights obtained from the Medicare cost reports.

Following Table VII.C–2 is a summary of the proxies for the operating portion of the FY 2009-based LTCH-specific market basket that we proposed and are adopting for this final rule. We note that the proxies for the operating portion of the FY 2009-based LTCH-specific market basket are the same as those used under the FY 2008-based RPL market basket. Because these proxies meet our criteria of reliability, timeliness, availability, and relevance, we believe they are the best measures of price changes for the cost categories. For further discussion on the FY 2008-based RPL market basket, we refer readers to the discussion in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51759). For the capital-related portion of the FY 2009-based LTCH-specific market basket, the price proxies that we proposed and are adopting for this final rule are the same as those used under the FY 2008-based RPL market basket (prior to any vintage weighting), as described in the FY 2012 IPPS/LTCH PPS final rule (75 FR 51765), and as described in more detail in the capital methodology discussion under section VII.C.3.d. of the preamble of this final rule.

TABLE VII.C–2—FY 2009-BASED LTCH–SPECIFIC MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO FY 2008-BASED RPL MARKET BASKET COST WEIGHTS

Cost categories	FY 2009-based LTCH–specific market basket cost weights	FY 2008-based RPL market basket cost weights	FY 2009–based LTCH market basket price proxies
1. Compensation	54.338	62.278	
A. Wages and Salaries [1]	46.330	49.447	ECI for Wages and Salaries, Civilian Hospital Workers.
B. Employee Benefits [1]	8.008	12.831	ECI for Benefits, Civilian Hospital Workers.

TABLE VII.C–2—FY 2009-BASED LTCH–SPECIFIC MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO FY 2008-BASED RPL MARKET BASKET COST WEIGHTS—Continued

Cost categories	FY 2009-based LTCH–specific market basket cost weights	FY 2008-based RPL market basket cost weights	FY 2009–based LTCH market basket price proxies
2. Utilities	1.751	1.578	
A. Electricity	1.367	1.125	PPI for Commercial Electric Power.
B. Fuel, Oil, and Gasoline	0.281	0.371	PPI for Petroleum Refineries.
C. Water and Sewage	0.103	0.082	CPI–U for Water and Sewerage Maintenance.
3. Professional Liability Insurance	0.830	0.764	CMS Hospital Professional Liability Insurance Premium Index.
4. All Other Products and Services	33.252	26.988	
A. All Other Products	19.531	15.574	
(1.) Pharmaceuticals	8.877	6.514	PPI for Pharmaceutical Preparations for Human Use (Prescriptions).
(2.) Food: Direct Purchases	3.409	2.959	PPI for Processed Foods and Feeds.
(3.) Food: Contract Services	0.478	0.392	CPI–U for Food Away From Home.
(4.) Chemicals[2]	1.275	1.100	Blend of Chemical PPIs.
(5.) Medical Instruments	2.141	1.795	PPI for Medical, Surgical, and Personal Aid Devices.
(6.) Rubber and Plastics	1.329	1.131	PPI for Rubber and Plastic Products.
(7.) Paper and Printing Products	1.226	1.021	PPI for Converted Paper and Paperboard Products.
(8.) Apparel	0.250	0.210	PPI for Apparel.
(9.) Machinery and Equipment	0.127	0.106	PPI for Machinery and Equipment.
(10.) Miscellaneous Products	0.419	0.346	PPI for Finished Goods less Food and Energy.
B. All Other Services	13.721	11.414	
(1.) Labor-Related Services	5.349	4.681	
(a.) Professional Fees: Labor-Related	2.256	2.114	ECI for Compensation for Professional and Related Occupations.
(b.) Administrative and Business Support Services	0.508	0.422	ECI for Compensation for Office and Administrative Services.
(c.) All Other: Labor-Related Services	2.585	2.145	ECI for Compensation for Private Service Occupations.
(2.) Nonlabor-Related Services	8.372	6.733	
(a.) Professional Fees: Nonlabor-Related	5.332	4.211	ECI for Compensation for Professional and Related Occupations.
(b.) Financial Services	1.013	0.853	ECI for Compensation for Financial Activities.
(c.) Telephone Services	0.501	0.416	CPI–U for Telephone Services.
(d.) Postage	0.779	0.630	CPI–U for Postage.
(e.) All Other: Nonlabor-Related Services	0.747	0.623	CPI–U for All Items less Food and Energy.
5. Capital-Related Costs	9.829	8.392	
A. Depreciation	5.707	5.519	
(1.) Building and Fixed Equipment	3.838	3.286	BEA chained price index for Nonresidential Construction for Hospitals and Special Care Facilities—vintage weighted (20 years).
(2.) Movable Equipment	1.869	2.233	PPI for Machinery and Equipment—vintage weighted (8 years).
B. Interest Costs	2.434	1.954	
(1.) Government/Nonprofit	0.702	0.653	Average yield on Domestic Municipal Bonds (Bond Buyer 20 bonds)—vintage-weighted (20 years).
(2.) For Profit	1.732	1.301	Average yield on Moody's Aaa Bonds—vintage-weighted (20 years).
C. Other Capital-Related Costs	1.688	0.919	CPI–U for Residential Rent.
Total	100.000	100.000	

Note: Detail may not add to total due to rounding.

[1] Contract Labor is distributed to Wages and Salaries and Employee Benefits based on the share of total compensation that each category represents.

[2] To proxy the Chemicals cost category, we use a blended PPI composed of the PPI for Industrial Gas Manufacturing, the PPI for Other Basic Inorganic Chemical Manufacturing, the PPI for Other Basic Organic Chemical Manufacturing, and the PPI for Soap and Cleaning Compound Manufacturing. For more detail about this proxy, we refer readers to the FY 2012 IPPS/LTCH final rule (76 FR 51761).

(1) Wages and Salaries

As we proposed and are adopting in this final rule, we use the ECI for Wages and Salaries for Hospital Workers (All Civilian) (BLS series code CIU1026220000000I) to measure the price growth of this cost category.

(2) Employee Benefits

As we proposed and are adopting in this final rule, we use the ECI for Employee Benefits for Hospital Workers (All Civilian) to measure the price growth of this cost category.

(3) Electricity

As we proposed and are adopting in this final rule, we use the PPI for Commercial Electric Power (BLS series code WPU0542) to measure the price growth of this cost category.

(4) Fuel, Oil, and Gasoline

As we proposed and are adopting in this final rule, we use the PPI for Petroleum Refineries (BLS series code PCU324110324110) to measure the price growth of this cost category. We believe that it is appropriate to use this proxy for the same reasons set forth in the FY 2012 IPPS/LTCH final rule when this proxy was adopted for use under the FY 2008-based RPL market basket (76 FR 51761).

(5) Water and Sewage

As we proposed and are adopting in this final rule, we use the CPI for Water and Sewerage Maintenance (All Urban Consumers) (BLS series code CUUR0000SEHG01) to measure the price growth of this cost category.

(6) Professional Liability Insurance

As we proposed and are adopting in this final rule, we determine price changes in hospital professional liability insurance premiums (PLI) using percentage changes as estimated by the CMS Hospital Professional Liability Index. To generate these estimates, we collect commercial insurance premiums for a fixed level of coverage while holding nonprice factors constant (such as a change in the level of coverage). This method is also used to proxy PLI price changes in the Medicare Economic Index (75 FR 73268).

(7) Pharmaceuticals

As we proposed and are adopting in this final rule, we use the PPI for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to measure the price growth of this cost category.

(8) Food: Direct Purchases

As we proposed and are adopting in this final rule, we use the PPI for Processed Foods and Feeds (BLS series code WPU02) to measure the price growth of this cost category.

(9) Food: Contract Services

As we proposed and are adopting in this final rule, we use the CPI for Food Away From Home (All Urban Consumers) (BLS series code CUUR0000SEFV) to measure the price growth of this cost category.

(10) Chemicals

As we proposed and are adopting in this final rule, we use a blended PPI composed of the PPI for Industrial Gas Manufacturing (NAICS 325120) (BLS series code PCU325120325120P), the PPI for Other Basic Inorganic Chemical Manufacturing (NAICS 325180) (BLS series code PCU32518–32518–), the PPI for Other Basic Organic Chemical Manufacturing (NAICS 325190) (BLS series code PCU32519–32519), and the PPI for Soap and Cleaning Compound Manufacturing (NAICS 325610) (BLS series code PCU32561–32561). We believe that it is appropriate to use this blended index for the reasons set forth in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51761) when this proxy was adopted for use under the FY 2008-based RPL market basket.

(11) Medical Instruments

As we proposed and are adopting in this final rule, we use the PPI for Medical, Surgical, and Personal Aid Devices (BLS series code WPU156) to measure the price growth of this cost category. We believe that it is appropriate to use this index for the reasons set forth in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51761 through 51762) when this proxy was adopted for use under the FY 2008-based RPL market basket.

(12) Rubber and Plastics

As we proposed and are adopting in this final rule, we use the PPI for Rubber and Plastic Products (BLS series code WPU07) to measure the price growth of this cost category.

(13) Paper and Printing Products

As we proposed and are adopting in this final rule, we use the PPI for Converted Paper and Paperboard Products (BLS series code WPU0915) to measure the price growth of this cost category.

(14) Apparel

As we proposed and are adopting in this final rule, we use the PPI for Apparel (BLS series code WPU0381) to measure the price growth of this cost category.

(15) Machinery and Equipment

As we proposed and are adopting in this final rule, we use the PPI for Machinery and Equipment (BLS series code WPU11) to measure the price growth of this cost category.

(16) Miscellaneous Products

As we proposed and are adopting in this final rule, we use the PPI for Finished Goods Less Food and Energy (BLS series code WPUSOP3500) to measure the price growth of this cost category.

(17) Professional Fees: Labor-Related

As we proposed and are adopting in this final rule, we use the ECI for Compensation for Professional and Related Occupations (Private Industry) (BLS series code CIS2020000120000I) to measure the price growth of this category. It includes occupations such as legal, accounting, and engineering services.

(18) Administrative and Business Support Services

As we proposed and are adopting in this final rule, we use the ECI for Compensation for Office and Administrative Support Services (Private Industry) (BLS series code CIU2010000220000I) to measure the price growth of this category. We believe this compensation index appropriately reflects the changing price of labor associated with the provision of Administrative and Business Support Services.

(19) All Other: Labor-Related Services

As we proposed and are adopting in this final rule, we use the ECI for Compensation for Service Occupations (Private Industry) (BLS series code CIU2010000300000I) to measure the price growth of this cost category.

(20) Professional Fees: Nonlabor-Related

As we proposed and are adopting in this final rule, we use the ECI for Compensation for Professional and Related Occupations (Private Industry) (BLS series code CIS2020000120000I) to measure the price growth of this category. This is the same price proxy that we used for the Professional Fees: Labor-related cost category.

(21) Financial Services

As we proposed and are adopting in this final rule, we use the ECI for Compensation for Financial Activities (Private Industry) (BLS series code CIU201520A000000I) to measure the price growth of this cost category. We believe that this compensation index appropriately reflects the changing price of labor associated with the provision of Financial Services.

(22) Telephone Services

As we proposed and are adopting in this final rule, we use the CPI for Telephone Services (BLS series code CUUR0000SEED) to measure the price growth of this cost category.

(23) Postage

As we proposed and are adopting in this final rule, we use the CPI for Postage (BLS series code CUUR0000SEEC01) to measure the price growth of this cost category.

(24) All Other: Nonlabor-Related Services

As we proposed and are adopting in this final rule, we use the CPI for ''All

Items Less Food and Energy'' (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. We believe that using the CPI for ''All Items Less Food and Energy'' avoids double counting of changes in food and energy prices as they are already captured elsewhere in the market basket.

d. Methodology for the Capital Portion of the FY 2009-Based LTCH-Specific Market Basket

In order to ensure consistency in the FY 2009-based LTCH-specific market basket, as we proposed and are adopting in this final rule, we calculated the capital-related cost weights using the same set of FY 2009 Medicare cost reports used to develop the operating cost weights with the same length-of-stay edit as applied when calculating the operating cost weights as described in section VII.C.3.a. of this preamble. The resulting capital-related cost weight for the FY 2009 base year is 9.829 percent. Using the methodology that we proposed and are adopting in this final rule, we then separated the total capital-related cost weight into more detailed cost categories.

As we proposed and are adopting in this final rule, we derived cost weights for depreciation, interest, lease, and other capital-related expenses from the Medicare cost reports. Lease expenses are unique in that they are not broken out as a separate cost category in the LTCH-specific market basket, but rather are proportionally distributed among the cost categories of Depreciation, Interest, and Other Capital-Related, reflecting the assumption that the underlying cost structure of leases is similar to that of capital-related costs in general. As was done under the FY 2008-based RPL market basket, and as we proposed and are adopting in this final rule, we assume 10 percent of lease expenses represents overhead and assign those costs to the Other Capital-Related Costs category accordingly. As we proposed and are adopting in this final rule, the remaining lease expenses are distributed across the three cost categories based on the respective weights of depreciation, interest, and other capital-related, not including lease expenses. This is the same method that was applied under the FY 2008-based RPL market basket.

As we proposed and are adopting in this final rule, the ''Depreciation'' cost category contains two subcategories: (1) Building and Fixed Equipment (or Fixed Assets); and (2) Movable Equipment. Under the FY 2008-based RPL market basket, we disaggregated total depreciation expenses into Building and Fixed Equipment and Movable Equipment, using depreciation data from the FY 2008 Medicare cost reports for freestanding IRFs, freestanding IPFs, and LTCHs. Based on FY 2009 LTCH Medicare cost report data, we have determined that depreciation costs for building and fixed equipment account for 42 percent of total depreciation costs, while depreciation costs for movable equipment account for 58 percent of total depreciation costs. As mentioned above, we proposed and are adopting in this final rule to allocate lease expenses among the ''Depreciation,'' ''Interest,'' and ''Other Capital'' cost categories. We determined that leasing building and fixed equipment expenses account for 80 percent of total leasing expenses, while leasing movable equipment expenses account for 20 percent of total leasing expenses. As we proposed and are adopting in this final rule, we sum the depreciation and leasing expenses for building and fixed equipment together, as well as sum the depreciation and leasing expenses for movable equipment. This results in the final building and fixed equipment depreciation cost weight (after leasing costs are included) being 67 percent of total depreciation costs and the movable equipment depreciation cost weight (after leasing costs are included) being 33 percent of total depreciation costs. We note that total leasing costs account for approximately one-half of total capital-related expenses.

As we proposed and are adopting in this final rule, the total ''Interest'' cost category is split between government/nonprofit interest and for-profit interest. The FY 2008-based RPL market basket allocated 33 percent of the total ''Interest'' cost weight to government/nonprofit interest and proxied that category by the average yield on domestic municipal bonds. The remaining 67 percent of the ''Interest'' cost weight was allocated to for-profit interest and was proxied by the average yield on Moody's Aaa bonds (76 FR 51760). This was based on the FY 2008 Medicare cost report data on interest expenses for government/nonprofit and for-profit freestanding IRFs, freestanding IPFs, and LTCHs. Under the FY 2009-based LTCH-specific market basket, as we proposed and are adopting in this final rule, we use the FY 2009 Medicare cost report data on interest expenses for government/nonprofit and for-profit LTCHs. Based on these data, we calculated a 29/71 split between government/nonprofit and for-profit interest. We believe it is important that this split reflects the latest relative cost structure of interest expenses for LTCHs.

Because capital is acquired and paid for over time, capital-related expenses in any given year are determined by both past and present purchases of physical and financial capital. As we proposed and are adopting in this final rule, the vintage-weighted capital-related portion of the FY 2009-based LTCH-specific market basket is intended to capture the long-term consumption of capital, using vintage weights for depreciation (physical capital) and interest (financial capital). These vintage weights reflect the proportion of capital-related purchases attributable to each year of the expected life of building and fixed equipment, movable equipment, and interest. As we proposed and are adopting in this final rule, we use vintage weights to compute vintage-weighted price changes associated with depreciation and interest expenses.

Vintage weights are an integral part of the FY 2009-based LTCH-specific market basket. Capital-related costs are inherently complicated and are determined by complex capital-related purchasing decisions, over time, based on such factors as interest rates and debt financing. In addition, capital is depreciated over time instead of being consumed in the same period it is purchased. By accounting for the vintage nature of capital, we are able to provide an accurate and stable annual measure of price changes. Annual nonvintage price changes for capital are unstable due to the volatility of interest rate changes and, therefore, do not reflect the actual annual price changes for Medicare capital-related costs. As we proposed and are adopting in this final rule, the capital-related component of the FY 2009-based LTCH-specific market basket reflects the underlying stability of the capital-related acquisition process.

To calculate the vintage weights for depreciation and interest expenses, we needed a time series of capital-related purchases for building and fixed equipment and movable equipment. We found no single source that provides an appropriate time series of capital-related purchases by hospitals for all of the above components of capital purchases. The early Medicare cost reports did not have sufficient capital-related data to meet this need. Data we obtained from the American Hospital Association (AHA) do not include annual capital-related purchases. However, the AHA does provide a consistent database of total expenses back to 1963. Consequently, as we proposed and are adopting in this final rule, we used data

from the AHA Panel Survey and the AHA Annual Survey to obtain a time series of total expenses for hospitals. We then used data from the AHA Panel Survey supplemented with the ratio of depreciation to total hospital expenses obtained from the Medicare cost reports to derive a trend of annual depreciation expenses for 1963 through 2009.

In order to estimate capital-related purchases using data on depreciation expenses, the expected life for each cost category (Building and Fixed Equipment, Movable Equipment, and Interest) is needed to calculate vintage weights. Under the FY 2008-based RPL market basket, we used FY 2008 Medicare cost reports for IPPS hospitals to determine the expected life of building and fixed equipment and movable equipment (76 FR 51763). The FY 2008-based RPL market basket was based on an expected average life of building and fixed equipment of 26 years and an expected average life of movable equipment of 11 years, which were both calculated using data for IPPS hospitals. We believed that this data source reflected the latest relative cost structure of depreciation expenses for hospitals at the time and was analogous to freestanding IRFs, freestanding IPFs, and LTCHs.

The expected life of any asset can be determined by dividing the value of the asset (excluding fully depreciated assets) by its current year depreciation amount. This calculation yields the estimated useful life of an asset if the rates of depreciation were to continue at current year levels, assuming straight-line depreciation. As we proposed and are adopting for this final rule, following a similar method to what was applied under the FY 2008-based RPL market basket, we determined the average expected life of building and fixed equipment to be equal to 20 years, and the average expected life of movable equipment to be equal to 8 years. These expected lives are calculated using a 3-year average of data from Medicare cost reports for LTCHs for FY 2007 through FY 2009. We believe that using LTCH-specific data to calculate the expected lives of assets best reflects the cost structures of LTCH facilities.

As we proposed and are adopting in this final rule, we also used the ''Building and Fixed Equipment'' and ''Movable Equipment'' cost weights derived from FY 2009 Medicare cost reports for LTCHs to separate the depreciation expenses into annual amounts of building and fixed equipment depreciation and movable equipment depreciation. As we proposed and are adopting in the final rule, year-end asset costs for building and fixed equipment and movable equipment were determined by multiplying the annual depreciation amounts by the expected life calculations. We then calculated a time series, back to 1963, of annual capital purchases by subtracting the previous year's asset costs from the current year's asset costs. As we proposed, for this final rule, from this capital-related purchase time series, we calculated the vintage weights for building and fixed equipment and for movable equipment. Each of these sets of vintage weights is explained in more detail below.

As we proposed and are adopting in this final rule, for the building and fixed equipment vintage weights, we use the real annual capital-related purchase amounts for building and fixed equipment to capture the actual amount of the physical acquisition, net of the effect of price inflation. This real annual capital-related purchase amount for building and fixed equipment is produced by deflating the nominal annual purchase amount by the building and fixed equipment price proxy, BEA's Chained Price Index for Nonresidential Construction for Hospitals and Special Care Facilities. This is the same proxy used under the FY 2008-based RPL market basket. Because building and fixed equipment have an expected average life of 20 years, the vintage weights for building and fixed equipment are deemed to represent the average purchase pattern of building and fixed equipment over 20-year periods. As we proposed and are adopting in this final rule, with real building and fixed equipment purchase estimates available from 2009 back to 1963, we averaged twenty-seven 20-year periods to determine the average vintage weights for building and fixed equipment that are representative of average building and fixed equipment purchase patterns over time. As proposed, for this final rule, vintage weights for each 20-year period are calculated by dividing the real building and fixed capital-related purchase amount in any given year by the total amount of purchases in the 20-year period. As proposed, for this final rule, this calculation is done for each year in the 20-year period, and for each of the twenty-seven 20-year periods. As proposed, for this final rule, we use the average of each year across the twenty-seven 20-year periods to determine the average building and fixed equipment vintage weights for the FY 2009-based LTCH-specific market basket.

As we proposed and are adopting for this final rule, for the movable equipment vintage weights, the real annual capital-related purchase amounts for movable equipment are used to capture the actual amount of the physical acquisition, net of price inflation. As proposed, for this final rule, this real annual capital-related purchase amount for movable equipment is calculated by deflating the nominal annual purchase amounts by the movable equipment price proxy, the PPI for Machinery and Equipment. This is the same proxy used for the FY 2008-based RPL market basket. Based on our determination that movable equipment has an expected average life of 8 years, the vintage weights for movable equipment represent the average expenditure for movable equipment over an 8-year period. As proposed, for this final rule, with real movable equipment purchase estimates available from 2009 back to 1963, we averaged thirty-nine 8-year periods to determine the average vintage weights for movable equipment that are representative of average movable equipment purchase patterns over time. As proposed, for this final rule, vintage weights for each 8-year period are calculated by dividing the real movable capital-related purchase amount for any given year by the total amount of purchases in the 8-year period. As proposed, for this final rule, this calculation is done for each year in the 8-year period and for each of the thirty-nine 8-year periods. As we proposed and are adopting for this final rule, we use the average of each year across the thirty-nine 8-year periods to determine the average movable equipment vintage weights for the FY 2009-based LTCH-specific market basket.

As proposed, for this final rule, for the interest vintage weights, the nominal annual capital-related purchase amounts for total equipment (building and fixed, and movable) are used to capture the value of the debt instrument (including, but not limited to, mortgages and bonds). The vintage weights for interest should represent the average purchase pattern of total equipment over 20-year periods, which is the average useful life of building and fixed equipment as calculated using the LTCH Medicare cost report data. We believe vintage weights for interest should represent the average useful life of buildings and fixed equipment because, based on previous research described in the FY 1997 IPPS final rule (61 FR 46198), the expected life of hospital debt instruments and the expected life of buildings and fixed equipment are similar. As proposed, for this final rule, with nominal total equipment purchase estimates available from 2009 back to 1963, we averaged twenty-seven 20-year

periods to determine the average vintage weights for interest that are representative of average capital purchase patterns over time. As proposed, with this final rule, vintage weights for each 20-year period are calculated by dividing the nominal total capital purchase amount for any given year by the total amount of purchases in the 20-year period. As proposed, for this final rule, this calculation is done for each year in the 20-year period and for each of the twenty-seven 20-year periods. As proposed, for this final rule, we use the average of each year across the twenty-seven 20-year periods to determine the average interest vintage weights for the FY 2009-based LTCH-specific market basket. As we proposed and are adopting in this final rule, the vintage weights for the capital-related portion of the FY 2008-based RPL market basket and the FY 2009-based LTCH-specific market basket are presented in Table VII.C–4 below.

TABLE VII.C–4—FY 2008 RPL AND FY 2009 LTCH VINTAGE WEIGHTS FOR CAPITAL-RELATED PRICE PROXIES

Year	Building and fixed equipment		Movable equipment		Interest	
	FY 2008 26 years	FY 2009 20 years	FY 2008 11 years	FY 2009 8 years	FY 2008 26 years	FY 2009 20 years
1	0.021	0.034	0.071	0.102	0.010	0.021

Total	1.000	1.000	1.000	1.000	1.000	1.000

Note: Numbers may not add to total due to rounding.

As proposed, for this final rule, after the capital-related cost category weights are computed, it is necessary to select appropriate price proxies to reflect the rate-of-increase for each expenditure category. As we proposed and are adopting in this final rule, we use the same price proxies (prior to any vintage weighting) for the capital-related portion of the FY 2009-based LTCH-specific market basket that were used under the FY 2008-based RPL market. We believe these are the most appropriate proxies for hospital capital-related costs that meet our selection criteria of relevance, timeliness, availability, and reliability.

The price proxies (prior to any vintage weighting) for each of the capital-related cost categories, as shown in Table VII.C–2 above, are the same as those used under the FY 2008-based RPL market basket, as described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51765), as well as the FY 2006-based Capital Input Price Index (CIPI) as described in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43857). The process of creating vintage-weighted price proxies requires applying the vintage weights to the price proxy index where the last applied vintage weight in Table VII.C–4 is applied to the most recent data point. We have provided on the CMS Web site an example of how the vintage weighting price proxies are calculated, using example vintage weights and example price indices. The example can be found at the following link: *http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/MarketBasketResearch.html* in the zip file titled ''Weight Calculations as described in the IPPS FY 2010 Proposed Rule''.

Below is a summary of the public comments we received on the methodology we proposed to derive the LTCH-specific market basket and our responses.

Comment: One commenter stated that CMS should now be able to identify the cost differences between hospitals-within-hospitals (HwHs) and freestanding LTCHs. The commenter asked whether CMS could further detail the cost categories by differentiating the major costs incurred by HwHs from the major costs incurred by freestanding LTCHs, as there is still a fundamental cost difference between these types of providers.

Response: For the methodology to derive the LTCH-specific market basket that we proposed and are adopting in this final rule without modification, we began with the universe of cost reports for LTCHs (both HwHs and freestanding facilities). After analyzing the major cost

category weights obtained from the Medicare cost reports, we found that the weights obtained for HwHs and freestanding LTCHs were similar. Therefore, given that the market basket is intended to reflect the national average distribution of the costs of goods and services that hospitals purchase to furnish inpatient care, and that the weights are similar, we believe it is appropriate to derive the LTCH-specific market basket by using Medicare cost reports from both of these types of facilities. We do not believe that it is appropriate to further subdivide the cost categories of the LTCH-specific market basket on the basis of whether a LTCH is a HwH or a freestanding facility.

Comment: One commenter asked whether there are any provider-type or provider-dominant issues that need to be factored into the calculation of the LTCH-specific market basket because the LTCH industry is dominated by two large chains.

Response: As stated above, the market basket cost weights are intended to capture the national average cost distribution of LTCHs. For each individual cost weight, we reviewed the Medicare cost report data and analyzed the univariate distributions. We then trimmed the Medicare cost report data prior to calculating the final cost weight to attempt to remove any outliers. As a result, we believe the cost weights for the LTCH-specific market basket are representative of a typical cost structure for providers in the LTCH industry. Therefore, we do not believe any provider-type or provider-dominant issues should be factored into the calculation of the LTCH-specific market basket. The purpose of the market basket update (as measured by the percent increase) is to update the base payment to reflect price inflation in the inputs required to provide medical care across all LTCH providers.

e. FY 2013 Market Basket Update for LTCHs

For FY 2013 (that is, October 1, 2012, through September 30, 2013), we proposed to use an estimate of the proposed FY 2009-based LTCH-specific market basket to update payments to LTCHs based on the best available data. Consistent with our historical practice of using the most recent data available, we estimated the proposed LTCH-specific market basket update for the LTCH PPS based on IHS Global Insight, Inc.'s (IGI's) most recent forecast. IGI is a nationally recognized economic and financial forecasting firm that contracts with CMS to forecast the components of the market baskets.

Based on IGI's first quarter 2012 forecast with history through the fourth quarter of 2011, the projected market basket update for FY 2013 was 3.0 percent. Therefore, consistent with our historical practice of estimating market basket increases based on the best available data, we proposed a market basket update of 3.0 percent for FY 2013. Furthermore, because the proposed FY 2013 annual update was based on the most recent market basket estimate for the 12-month period, we also proposed that if more recent data are subsequently available (for example, a more recent estimate of the market basket), we would use such data, if appropriate, to determine the FY 2013 annual update in the final rule.

For this final rule, consistent with our proposal to use updated data, if appropriate, to determine the FY 2013 annual update, we are incorporating a more recent estimate of the market basket update. Based on IGI's second quarter 2012 forecast with history through the first quarter of 2012, the projected market basket update (as measured by the percentage increase) for FY 2013 is 2.6 percent. Therefore, consistent with our historical practice of estimating market basket increases based on the best available data, we are establishing a market basket update of 2.6 percent for FY 2013. We note that the final market basket update for FY 2013 (2.6 percent) is lower than the proposed market basket update (3.0 percent) due to a lower inflationary outlook on wage and energy prices. The wage price revision mostly reflects an expectation of a slower labor market recovery compared to the previous forecast. (As discussed in greater detail in section V.A.2. of the Addendum to this final rule, we are establishing an annual update of 1.8 percent to the LTCH PPS standard Federal rate for FY 2013 under § 412.523(c)(3)(viii) of the regulations.)

Using the current FY 2008-based RPL market basket and IGI's second quarter 2012 forecast for the market basket components, the FY 2013 market basket update (as measured by the percentage increase) would be 2.7 percent (before taking into account any statutory adjustments). Table VII.C–5 below compares the FY 2008-based RPL market basket and the FY 2009-based LTCH-specific market basket percent changes based on IGI's second quarter 2012 forecast. For a comparison of the FY 2008-based RPL market basket and the FY 2009-based LTCH-specific market basket percent changes based on IGI's first quarter 2012 forecast, we refer readers to Table VII.C–5 of the FY 2013 IPPS/LTCH proposed rule (77 FR 28016).

TABLE VII.C–5—FY 2008-BASED RPL MARKET BASKET AND FY 2009-BASED LTCH MARKET BASKET PERCENT CHANGES; FY 2008 THROUGH FY 2015

Fiscal year (FY)	FY 2008-based RPL market basket index percent change	FY 2009-based LTCH-specific market basket index percent change
Historical data:		
FY 2008	3.7	3.9
FY 2009	2.7	2.8
FY 2010	2.2	2.2
FY 2011	2.5	2.6
Average 2008–2011	2.8	2.9
Forecast:		
FY 2012	2.2	2.4
FY 2013	2.7	2.6
FY 2014	2.8	2.7
FY 2015	3.1	3.0
Average 2012–2015	2.7	2.7

Note that these market basket percent changes do not include any further adjustments as may be statutorily required.
Source: IHS Global Insight, Inc. second quarter 2012 forecast.

For FY 2013, the FY 2009-based LTCH-specific market basket update (2.6 percent, as measured by the percentage increase) is forecasted to be slightly lower than the market basket update based on the FY 2008-based RPL market basket at 2.7 percent. The lower total compensation weight in the FY 2009-based LTCH-specific market basket (54.338 percent) relative to the FY 2008-based RPL market basket (62.278 percent), absent other factors, would have resulted in a slightly lower market basket update for FY 2013 using the FY 2009-based LTCH-specific market basket. However, this impact is partially offset by the impact of the larger cost weights associated with the Pharmaceuticals and All Other Services cost categories. The net effect of these offsetting factors is that the market basket update for the FY 2009-based LTCH-specific market basket is forecasted to be slightly lower for FY 2013 than the market basket update based on the current FY 2008-based RPL market basket.

Comment: Several commenters supported the use of a LTCH-specific market basket. One commenter stated that this market basket more accurately reflects costs of those services for LTCHs. A few commenters stated that the new market basket will more closely align market-basket updates under the LTCH PPS with actual LTCH cost structures, which will produce greater accuracy in aggregate Medicare payments to LTCHs. One commenter supported the proposal to identify a 3.0 percent market basket update for FY 2013.

Response: We agree with the commenters that the use of a LTCH-specific market basket is an improvement for the reasons set forth in section VII.C.1 of the preamble of this final rule. We do note that, based on more recent data, the final market basket update is 2.6 percent (and not 3.0 percent, as supported by one commenter). We are adopting the use of a LTCH-specific market basket in this final rule, as proposed.

f. FY 2013 Labor-Related Share

As discussed in section V.B. of the Addendum to this final rule, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS payments to account for differences in LTCH area wage levels (§ 412.525(c)). The labor-related portion of the LTCH PPS standard Federal rate, hereafter referred to as the labor-related share, is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index.

As proposed, for this final rule, the labor-related share is determined by identifying the national average proportion of total costs that are related to, influenced by, or vary with the local labor market. As proposed in the FY 2013 IPPS/LTCH proposed rule (77 FR 28016), and are adopting in this final rule, and similar to the FY 2008-based RPL market basket and FY 2006 IPPS market basket (74 FR 43850), we are classifying a cost category as labor-related and including it in the labor-related share if the cost category is defined as being labor-intensive and its cost varies with the local labor market. Given this, based on our definition of the labor-related share, we proposed and are adopting in this final rule to include in the labor-related share the sum of the relative importance of Wages and Salaries, Employee Benefits, Professional Fees: Labor-related, Administrative and Business Support Services, All Other: Labor-related Services, and a portion of the Capital-Related cost weight. These are the same cost categories that were proposed and adopted in the FY 2012 labor-related share using the FY 2008-based RPL market basket, as we continue to believe these categories meet our criteria of being labor-intensive and whose costs vary with the local labor market. For a more detailed discussion of the selection of cost categories for inclusion in the FY 2012 labor-related share, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766). As proposed, for this final rule, we note that the wages and salaries and benefit cost weights reflect allocated contract labor costs, similar to the FY 2008-based RPL market basket and as described above.

For the FY 2008-based RPL market basket rebasing, in an effort to more accurately determine the share of professional fees for services such as accounting and auditing services, engineering services, legal services, and management and consulting services that should be included in the labor-related share, we obtained data from a survey of IPPS hospitals regarding the proportion of those fees that go to companies that are located beyond their own local labor market. The results from this survey were then used to separate a portion of the Professional Fees cost category into labor-related and nonlabor-related costs. These results and our allocation methodology are discussed in more detail in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766).

As we proposed and are adopting in this final rule, for the FY 2009-based LTCH-specific market basket, we will apply these results from the survey of IPPS hospitals using this same methodology to separate the Professional Fees category into Professional Fees: Labor-related and Professional Fees: Nonlabor-related cost categories. We believe using the survey results serves as an appropriate proxy for the purchasing patterns of professional services for LTCHs as they also are providers of institutional care.

In addition to the professional services listed above, we also proposed and are adopting for this final rule to classify expenses under NAICS 55, Management of Companies and Enterprises, into the Professional Fees: Labor-related and Professional Fees: Nonlabor-related cost categories, as was done for the FY 2008-based RPL market basket. The NAICS 55 industry is mostly comprised of corporate, subsidiary, and regional managing offices (otherwise referred to as home offices). As stated above, we classify a cost category as labor-related and include it in the labor-related share if the cost category is labor-intensive and if its costs vary with the local labor market. We believe many of the costs associated with NAICS 55 are labor-intensive and vary with the local labor market. However, data indicate that not all LTCHs with home offices have home offices located in their local labor market. Therefore, as we proposed and are adopting in this final rule, we will include in the labor-related share only a proportion of the NAICS 55 expenses based on the methodology described below.

For the FY 2008-based RPL market basket, we used data primarily from the Medicare cost reports and a CMS database of Home Office Medicare Records (HOMER) (a database that provides city and state information (addresses) for home offices) and determined that 19 percent of the total number of freestanding IRFs, freestanding IPFs, and LTCHs that had home offices had those home offices located in their respective local labor markets—defined as being in the same Metropolitan Statistical Area (MSA). For a detailed discussion of this analysis, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766 through 51767).

As we proposed and are adopting in this final rule, for the FY 2009-based LTCH-specific market basket, we conducted a similar analysis of home office data. However, instead of using data on freestanding IRF, freestanding IPF, and LTCHs, we began with the initial set of LTCH Medicare cost reports

that were used to derive the cost weights for the proposed FY 2009-based LTCH-specific market basket. As we proposed, for this final rule, for consistency, we believe it is important for our analysis on home office data to be conducted on the same LTCHs used to derive the FY 2009 LTCH-specific market basket cost weights.

The Medicare cost report requires a hospital to report information regarding their home office provider. Approximately 82 percent of LTCHs reported some type of home office information on their Medicare cost report for FY 2009 (for example, home office number, city, state, zip code, or name). For the majority of these providers, we were able to identify in which MSA the LTCH's home office was located using the HOMER database and the Medicare cost reports. We then compared the home office MSA with the MSA in which the LTCH was located.

We found that 13 percent of the LTCHs with home offices had those home offices located in the same MSA as their facilities. We then concluded that these providers were located in the same local labor market as their home office. As a result, we proposed and are adopting for this final rule to apportion the NAICS 55 expense data by this percentage. Thus, we proposed and are adopting for this final rule to classify 13 percent of these costs into the ''Professional Fees: Labor-related Services'' cost category and the remaining 87 percent into the ''Professional Fees: Nonlabor-related Services'' cost category.

Using the methodology described above and IGI's first quarter 2012 forecast of the proposed FY 2009-based LTCH-specific market basket, the proposed LTCH labor-related share for FY 2013 was the sum of the FY 2013 relative importance of each labor-related cost category. Consistent with our proposal to update the labor-related share with the most recent available data, the labor-related share for this final rule reflects IGI's second quarter 2012 forecast of the FY 2009-based LTCH-specific market basket. Table VII.C–6 below shows the FY 2013 labor-related share relative importance using IGI's second quarter 2012 forecast of the FY 2009-based LTCH-specific market basket and the FY 2012 labor-related share relative importance using the FY 2008-based RPL market basket. For a comparison of the FY 2012 labor-related share and the FY 2013 proposed labor-related share based on IGI's first quarter 2012 forecast that was provided in the FY 2013 IPPS/LTCH proposed rule, we refer readers to Table VII.C–6 of the proposed rule (77 FR 28017).

TABLE VII.C–6—COMPARISON OF THE FY 2012 LABOR-RELATED SHARE RELATIVE IMPORTANCE BASED ON THE FY 2008-BASED RPL MARKET BASKET AND THE FY 2013 LABOR-RELATED SHARE RELATIVE IMPORTANCE BASED ON THE FY 2009-BASED LTCH-SPECIFIC MARKET BASKET

	FY 2012 Labor-related share relative importance [1]	FY 2013 Labor-related share relative importance [2]
Wages and Salaries	48.984	45.470
Employee Benefits	12.998	8.146
Professional Fees: Labor-Related	2.072	2.217
Administrative and Business Support Services	0.416	0.503
All Other: Labor-Related Services	2.094	2.507
Subtotal	66.564	58.843
Labor-Related Portion of Capital Costs (46%)	3.635	4.253
Total Labor-Related Share	70.199	63.096

[1] Published in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51767) and based on the second quarter 2011 IGI forecast.
[2] Based on the second quarter 2012 IGI forecast.

As we proposed and are adopting in this final rule, the labor-related share for FY 2013 is the sum of the FY 2013 relative importance of each labor-related cost category, and reflects the different rates of price change for these cost categories between the base year (FY 2009) and FY 2013. For this final rule, the sum of the relative importance for FY 2013 for operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-related, Administrative and Business Support Services, and All Other: Labor-related Services) is 58.843 percent, as shown in Table VII.C–6 above. As we proposed and are adopting in this final rule, the portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent, which is the same percentage applied under the FY 2008-based RPL market basket. For this final rule, because the most recent forecast of the relative importance for capital-related costs is 9.246 percent of the FY 2009-based LTCH-specific market basket in FY 2013, we took 46 percent of 9.246 percent to determine the labor-related share of capital-related costs for FY 2013 (.46 * 9.246). The result is 4.253 percent, which we are adding to 58.843 percent for the operating cost amount to determine the total labor-related share for FY 2013 in this final rule. Thus, the labor-related share that we are establishing under the LTCH PPS for FY 2013 is 63.096 percent. This labor-related share was determined using the same methodology as employed in calculating all previous LTCH labor-related shares.

Comment: One commenter requested that CMS reconsider its proposal to decrease the labor-related share from 70.199 percent for FY 2012 to 63.217 percent for FY 2013, stating that this decrease would unfairly penalize LTCHs in urban areas and reward LTCHs in rural areas.

Response: We believe that the revision to the labor-related share using data exclusively from LTCHs, which we proposed and are finalizing, is an improvement over the current labor-related share based on the RPL market basket. We believe a labor-related share for LTCHs that is based on Medicare cost report data obtained exclusively from the universe of LTCH providers appropriately reflects the national average cost structures of LTCHs. While we recognize that this downward revision to the labor-related share will have an effect on the distribution of payments, the decision to revise the labor-related share was based on what

was most appropriate for LTCHs given the sufficiently robust data available and that the completeness and the quality of the Medicare cost reports we have been evaluating over the last several years have improved. For the reasons stated above, we believe a labor-related share based on the FY 2009-based LTCH-specific market basket (reflecting LTCH-specific Medicare cost report data) is an improvement. Thus, we are adopting our proposal to revise the labor-related share as described in the proposed rule.

Comment: A few commenters were concerned about the significant reduction in the labor-related share from FY 2012 to FY 2013 and its impact on providers, particularly those in high wage index areas. One commenter requested that CMS communicate the driving factors that contribute to such a significant decrease, and evaluate the appropriateness of those contributing factors. One commenter questioned the significant difference between the compensation weights for the FY 2009-based market basket (54.338 percent) and the FY 2008-based RPL market basket (62.278 percent) after there was already a significant decrease in the labor-related share from FY 2011 to FY 2012. One commenter expressed support for phasing-in the reduction in the labor-related share over 3 years to help minimize that impact. Another commenter requested that CMS spread the impact of this change over a longer period of time instead of having it apply all at once.

Response: The principal factors contributing to the difference in the labor-related shares between the proposed and final FY 2009-based LTCH-specific market basket and the FY 2008-based RPL market basket are the base year cost weight differences found in two categories; Wages and Salaries, and Benefits. These weights (as proposed and adopted in this final rule) are shown above in Table VII. C–2. The lower share of costs attributable to wages, salaries, and benefits found in the proposed and final FY 2009-based LTCH-specific market basket is a direct result of incorporating cost data exclusively from LTCHs, as opposed to incorporating cost report data from freestanding IRFs, freestanding IPFs, and LTCHs combined (as is the case in the RPL market basket). For the reasons provided previously, we believe using data solely from LTCHs is appropriate and results in a market basket that better reflects the cost structure of the LTCH industry.

The labor-related share is determined by identifying the national average proportion of total costs that are related to, influenced by, or vary with the local labor market. We generally do not phase-in changes to the labor-related share. As explained above, the labor-related share is determined from the relative importance of each labor-related cost category under the FY 2009-based LTCH-specific market basket, which is developed exclusively from cost data from LTCHs. Because the labor-related share will now be based on data obtained exclusively from the universe of LTCH providers (reflecting the national average cost structures of only LTCHs as compared to the cost structures of freestanding IRFs, freestanding IPFs, and LTCHs combined as is the case in the current LTCH PPS market basket), we believe it appropriately identifies the labor-related portion of the LTCHs' costs that are influenced by the local labor market and, therefore, will result in the most accurate payments to LTCHs in FY 2013 (when making the area wage level adjustment provided for under § 412.525(c). Therefore, we continue to believe that adopting a labor-related share based on the FY 2009-based LTCH-specific market basket will result in the most appropriate LTCH PPS payments. In addition, we do not believe that a phase-in of the change in the LTCH PPS labor-related share is necessary because the majority of LTCHs (approximately 80 percent) are located in areas where the FY 2013 wage index value is less than 1.0 and, therefore, are estimated to experience an increase in LTCH PPS payments as a result of the change to the labor-related share from FY 2012 to FY 2013. Of the approximately 20 percent of LTCHs that are estimated to experience a decrease in LTCH PPS payments as a result of the change to the labor-related share in FY 2013, we estimate that those LTCHs, on average, will experience a 0.5 percent decrease in LTCH PPS payments as a result of the change to the labor-related share under the FY 2009-based LTCH-specific market basket, which is similar in magnitude (and fiscal impact) to changes to aggregate LTCH PPS payments in the past due to annual updates to the adjustment for area wage levels (for which we have not provided a phase-in).

Comment: One commenter stated that the downward revision to the labor-related share creates ongoing future challenges to urban providers and urged CMS to continue to assess if more recent data is available before the FY 2013 annual update is established.

Response: We proposed to use data from cost reports beginning in FY 2009 because these data are the latest available complete data and, therefore, we continue to believe that it will enable us to accurately calculate cost weights that specifically reflect the cost structures of LTCHs. We are finalizing our proposed use of these data for the reasons set forth above. We will continue to monitor the cost weights of the LTCH-specific market basket over time. We note that using the most recent data available at the time of the FY 2013 IPPS/LTCH PPS proposed rule, we proposed a FY 2013 market basket update (as measured by the percentage increase) for LTCHs of 3.0 percent. We also proposed to use more recent data for the final rule, if available and appropriate. As proposed, we have incorporated a more recent forecast from IGI for this final rule, which results in a FY 2013 market basket update of 2.6 percent.

D. Changes to the LTCH Payment Rates for FY 2013 and Other Changes to the LTCH PPS for FY 2013

1. Overview of Development of the LTCH Payment Rates

The basic methodology for determining LTCH PPS Federal prospective payment rates is set forth at § 412.515 through § 412.536. In this section, we discuss the factors that we used to update the LTCH PPS standard Federal rate for FY 2013, that is, effective for LTCH discharges occurring on or after October 1, 2012 through September 30, 2013.

For further details on the development of the FY 2003 standard Federal rate when the LTCH PPS was initially implemented, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the LTCH PPS Federal rate, we refer readers to the following final rules: RY 2004 LTCH PPS final rule (68 FR 34134 through 34140); RY 2005 LTCH PPS final rule (68 FR 25682 through 25684); RY 2006 LTCH PPS final rule (70 FR 24179 through 24180); RY 2007 LTCH PPS final rule (71 FR 27819 through 27827); RY 2008 LTCH PPS final rule (72 FR 26870 through 27029); RY 2009 LTCH PPS final rule (73 FR 26800 through 26804); RY 2010 LTCH PPS final rule (74 FR 44021 through 44030); FY 2011 IPPS/LTCH PPS final rule (75 FR 50443 through 50444); and FY 2012 IPPS/LTCH PPS final rule (76 FR 51769 through 51773).

The update to the LTCH PPS standard Federal rate for FY 2013 is presented in section V.A. of the Addendum to this final rule. The components of the annual market basket update to the LTCH PPS standard Federal rate for FY 2013 are discussed below. Furthermore,

as discussed in section VII.E.4. of this preamble, for FY 2013, in addition to the update factor, we made a one-time prospective adjustment to the standard Federal rate for FY 2013 so that the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years under existing § 412.523(d)(3) (this adjustment will not apply to payments made for discharges occurring on or before December 28, 2012, consistent with the statute). Furthermore, as discussed in section V.A. of the Addendum of this final rule, we made an adjustment to the standard Federal rate to account for the estimated effect of the changes to the area wage level adjustment for FY 2013 on estimated aggregate LTCH PPS payments, in accordance with § 412.523(d)(4).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28018 through 28019), we presented our proposals for the development of the annual update to the LTCH PPS standard Federal rate for FY 2013, including proposals related to the annual market basket update, the revision of certain market basket updates required by the statute, and the methodology for calculating and applying the MFP adjustment. We did not receive any public comments on our proposals regarding the development of the annual update to the LTCH PPS standard Federal rate for FY 2013, and are adopting the proposals as final without modification in this final rule. (We refer readers to the FY 2013 IPPS/LTCH PPS proposed rule for additional details on our proposals for the development of the annual update to the LTCH PPS standard Federal rate for FY 2013 (77 FR 28018 through 28019), The other adjustments we proposed to apply in determining the FY 2013 LTCH PPS standard Federal rate (in addition to the annual update), such as the one-time prospective adjustment discussed in section VII.E.4. of this preamble and the budget neutrality adjustment for changes in the area wage levels discussed in section V.A. of the Addendum of this final rule, are discussed in those respective sections of this final rule.) Below we present the finalized methodology that we used to develop the annual update to the LTCH PPS standard Federal rate for FY 2013, which is consistent with the methodology presented in the proposed rule.

2. FY 2013 LTCH PPS Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital-related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. As discussed in section VII.C. of this preamble, as proposed, we are adopting the newly created FY 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013. For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to section VII.C.1. of this preamble.

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the standard Federal rate and refers to the timeframes associated with such adjustments as a ''rate year.'' (The adjustments are discussed in more detail in section VII.D.2.b. of this preamble.) We note that because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through 50397). Although the language of sections 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as ''rate year,'' consistent with our change in the terminology used under the LTCH PPS from ''rate year'' to ''fiscal year,'' for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we employ ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.

b. Revision of Certain Market Basket Updates as Required by the Affordable Care Act

Section 1886(m)(3)(A) of the Act, as added by section 3401(c) of the Affordable Care Act, specifies that, for rate year 2010 and each subsequent rate year through 2019, any annual update to the standard Federal rate shall be reduced:

- For rate year 2010 through 2019, by the ''other adjustment'' specified in sections 1886(m)(3)(A)(ii) and (m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment (which we refer to as ''the multifactor productivity (MFP) adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year.

Section 1886(b)(3)(B)(xi)(II) of the Act defines the MFP adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business multifactor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other annual period). Under our methodology, the end of the 10-year moving average of changes in the MFP coincides with the end of the appropriate FY update period. In addition, the MFP adjustment that is applied in determining any annual update to the LTCH PPS standard Federal rate is the same adjustment that is required to be applied in determining the applicable percentage increase under the IPPS under section 1886(b)(3)(B)(i) of the Act as they are both based on a fiscal year. The MFP adjustment is derived using a projection of MFP that is currently produced by IHS Global Insight, Inc. (For additional details on the development of the MFP adjustment and its application under the LTCH PPS, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51691 through 51692 and 51770 through 51771).)

We did not receive any public comments and for FY 2013, we continue to use our methodology for calculating and applying the MFP adjustment to determine the annual update to the LTCH PPS standard Federal rate for FY 2013. (For details on the development of the MFP, including our finalized methodology for calculating and applying the MFP adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692).)

c. Market Basket Under the LTCH PPS for FY 2013

For FY 2013, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we are adopting a newly created FY 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013 because we believe it more appropriately reflects the cost structure

of LTCHs. The FY 2009-based LTCH-specific market basket is based solely on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of only LTCHs. For additional details on the development of the FY 2009-based LTCH-specific market basket, we refer readers to section VII.C. of this preamble.

d. Annual Market Basket Update for LTCHs for FY 2013

Consistent with our historical practice, we estimate the market basket update and the MFP adjustment based on IGI's forecast using the most recent available data. Based on IGI's second quarter 2012 forecast, the FY 2013 full market basket estimate for the LTCH PPS using the FY 2009-based LTCH-specific market basket is 2.6 percent (for additional details, we refer readers to section VII.C.3.e. of this preamble). Using our established methodology for determining the MFP adjustment, the current estimate of the MFP adjustment for FY 2013 based on IGI's second quarter 2012 forecast is 0.7 percent (for additional details, we refer readers to section VII.D.2.b. of this preamble).

For FY 2013, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the standard Federal rate be reduced by the productivity adjustment (''the MFP adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act. Consistent with the statute, as proposed, in this final rule we reduced the full FY 2013 market basket update by the FY 2013 MFP adjustment. As proposed, in this final rule, to determine the market basket update for LTCHs for FY 2013, as reduced by the MFP adjustment, consistent with our established methodology, we subtracted the FY 2013 MFP adjustment from the FY 2013 market basket update. Furthermore, sections 1886(m)(3)(A)(ii) and 1886(m)(4)(C) of the Act requires that any annual update to the standard Federal rate for FY 2013 be reduced by the ''other adjustment'' described in paragraph (4), which is 0.1 percentage point for FY 2013. Therefore, as proposed, for this final rule, following application of the productivity adjustment, we reduced the adjusted market basket update (that is, the full market basket increase less the MFP adjustment) by the ''other adjustment'' specified by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act. (For additional details on our established methodology for adjusting the market basket increase by the MFP and the ''other adjustment'' required by the statute, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771).)

In this final rule, in accordance with the statute and as proposed, we reduced the FY 2013 full market basket estimate of 2.6 percent (based on the second quarter 2012 forecast of the FY 2009-based LTCH-specific market basket) by the FY 2013 MFP adjustment (that is, the 10-year moving average of MFP for the period ending FY 2013, as described in section VII.D.2.b. of the preamble of this final rule) of 0.7 percentage point (based on IGI's second quarter 2012 forecast). Following application of the productivity adjustment, the adjusted market basket update of 1.9 percent (2.6 percent minus 0.7 percentage point) was then reduced by 0.1 percentage point, as required by sections 1886(m)(3)(A)(ii) and 1886(m)(4)(C) of the Act. Therefore, in this final rule, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we are establishing an annual market basket update under the LTCH PPS for FY 2013 of 1.8 percent (that is, the most recent estimate of the LTCH PPS market basket update at this time of 2.6 percent less the MFP adjustment of 0.7 percentage point less the 0.1 percentage point required under section 1886(m)(4)(C) of the Act). Accordingly, we are revising § 412.523(c)(3) by adding a new paragraph (ix), which specifies that the standard Federal rate for FY 2013 is the standard Federal rate for the previous LTCH PPS year updated by 1.8 percent, and as further adjusted, as appropriate, as described in § 412.523(d). In addition, consistent with the policy we are establishing under section VII.E.4. of this preamble to adjust the FY 2013 standard Federal rate by a one-time prospective adjustment, we are revising the regulations to specify under § 412.523(c)(3)(ix)(B) that with respect to discharges occurring on or after October 1, 2012, and before December 29, 2012, payments are based on the standard Federal rate in § 412.523(c)(3)(ix)(A) without regard to the one-time prospective adjustment provided for under § 412.523(d)(3)(iii). (We note that we also adjusted the FY 2013 standard Federal rate by an area wage level budget neutrality factor in accordance with § 412.523(d)(4) (as discussed in section V.B.5. of the Addendum of this final rule).)

3. LTCH PPS Cost-of-Living Adjustment (COLA) for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), we established a cost-of-living adjustment (COLA) for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States (67 FR 56022). Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels.

Historically, we have used the most recent updated COLA factors obtained from the U.S. Office of Personnel Management (OPM) Web site at *http://www.opm.gov/oca/cola/rates.asp* to adjust the payments for LTCHs in Alaska and Hawaii. Sections 1911 through 1919 of the Nonforeign Area Retirement Equity Assurance Act, as contained in subtitle B of title XIX of the National Defense Authorization Act (NDAA) for Fiscal Year 2010 (Pub. L. 111–84, October 28, 2009) transitions the Alaska and Hawaii COLAs to locality pay. Under section 1914 of Public Law 111–84, locality pay is being phased in over a 3-year period beginning in January 2010, with COLA rates frozen as of the date of enactment, October 28, 2009, and then proportionately reduced to reflect the phase-in of locality pay. As we discussed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51809), we did not believe it was appropriate to use either the 2010 or 2011 reduced factors to adjust the nonlabor-related portion of the standard Federal rate for LTCHs in Alaska and Hawaii for Medicare payment purposes. Therefore, for FY 2012, we continued to use the same COLA factors (published by OPM) that we used to adjust payments in FY 2011 (which were based on OPM's 2009 COLA factors) to adjust the nonlabor-related portion of the standard Federal rate for LTCHs located in Alaska and Hawaii.

As we discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28019 through 28090), we continue to believe it is appropriate to use ''frozen'' COLA factors to adjust payments in FY 2012 while we explored alternatives for updating the COLA in the future because we believe those COLA factors appropriately adjusted the nonlabor-related portion of the standard Federal rate for LTCHs located in Alaska and Hawaii, consistent with § 412.523(b) (76 FR 51809). In that same proposed rule, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we proposed to continue to use the same ''frozen'' COLA factors used in FY 2012 for FY 2013 and to update the COLA factors for Alaska and Hawaii, beginning in FY 2014, based on a comparison of the growth in the consumer price indices (CPIs) for

Anchorage, Alaska and Honolulu, Hawaii relative to the growth in the CPI for the average U.S. city as published by the BLS. This proposal was consistent with the proposals made for the COLA factors used under the IPPS discussed in section II.B.2. of the Addendum to this final rule.

We did not receive any public comments on these proposals for the COLA factors (that is, our proposal for FY 2013 to continue to use the same COLA factors used in FY 2012, and our proposal for FY 2014 to begin updating the COLA factors for Alaska and Hawaii based on a comparison of the growth in the CPIs for Anchorage, Alaska and Honolulu, Hawaii relative to the growth in the CPI for the average U.S. city. In this final rule, we are adopting these proposals as final without modification because we believe these COLA factors will appropriately adjust the nonlabor-related portion of the standard Federal rate in for LTCHs located in Alaska and Hawaii, consistent with § 412.523(b) (as we discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28019 through 28020). Both our finalized policy for FY 2013 and our finalized policy for FY 2014 and subsequent years are described in detail below.

In this final rule, for FY 2013, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we will use the same ''frozen'' COLA factors used in FY 2012 (which are based on OPM's 2009 COLA factors) for FY 2013 to adjust the nonlabor-related portion of the standard Federal rate for LTCHs located in Alaska and Hawaii. Therefore, for FY 2013, a COLA will be applied to the standard Federal rate for LTCHs located in Alaska and Hawaii, consistent with § 412.525(b), by multiplying the nonlabor-related portion of the standard Federal rate by the factors listed in the chart shown in section V.C. of the Addendum to this final rule.

In addition, in this final rule, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we are establishing that, beginning in FY 2014, we will update the COLA factors published by OPM that we used to adjust payments in FY 2011 (which are based on OPM's 2009 COLA factors) as these are the last COLA factors OPM published prior to transitioning from COLAs to locality pay. Under this updated methodology, we use a comparison of the relative growth in the overall CPI for Anchorage, Alaska and Honolulu, Hawaii to update the COLA factors for all areas in Alaska and Hawaii, respectively, because the BLS publishes CPI data only for the cities of Anchorage and Honolulu. We believe that the relative price differences between these cities and the United States are appropriate and necessary proxies for the relative price differences of the ''other areas'' of Alaska and Hawaii.

Although the BLS publishes the CPI for ''All Items'' for Anchorage, Honolulu, and for the average U.S. city, under this methodology, we will create reweighted CPIs for each of the respective areas to reflect the underlying composition of the IPPS market basket nonlabor-related share. The current composition of the CPI for ''All Items'' for all the respective areas is approximately 40 percent commodities and 60 percent services. However, the IPPS nonlabor-related share is comprised of approximately 60 percent commodities and 40 percent services. Therefore, we will create reweighted indexes for Anchorage, Honolulu, and the average U.S. city using the respective CPI commodities index and CPI services index to comprise the approximate 60/40 share obtained from the IPPS market basket. As we explained in the proposed rule, we believe that using the underlying composition of the IPPS market basket nonlabor-related share to reweight CPIs for each of the respective areas is an appropriate proxy for determining the COLAs for LTCHs because both LTCHs and IPPS hospitals are required to meet the same certification criteria set forth in section 1861(e) of the Act to participate as a hospital in the Medicare program and generally experience similar nonlabor-related costs for providing inpatient hospital services. We also note that the composition of the nonlabor-related share of the LTCH-specific market basket is not significantly different from the approximate 60/40 share obtained from the IPPS market basket.

As we explained in the proposed rule, we believe this methodology is appropriate because we will be able to continue updating COLA factors for hospitals located in Alaska and Hawaii using the relative price differences as a proxy for relative cost differences. We believe this is an appropriate alternative methodology given the discontinuation of COLA factors being published by OPM. We note that OPM's COLA factors were calculated with a statutorily mandated cap of 25 percent, and since the inception of the LTCH PPS, we have exercised our discretionary authority to adjust payments to LTCHs located in Alaska and Hawaii by incorporating this cap. Consistent with our existing policy, our approach for FY 2014 will continue to use such a cap, as our policy is based on OPM's COLA factors (updated by the methodology described above). We note that this policy is consistent with the policy we are adopting for IPPS hospitals discussed in section II.B.2. of the Addendum to this final rule.

Lastly, under this policy and as finalized, we will update the COLA factors using the methodology described above every 4 years (beginning in FY 2014), consistent with the policy we are establishing for updating the COLA factors under the IPPS discussed in section II.B.2. of the Addendum to this final rule. Under the IPPS, we also are adopting a policy to update the COLA factors used to adjust the nonlabor-related portion of the standard Federal rate for Alaska and Hawaii every 4 years (beginning in FY 2014) concurrently with the update to the labor-related share under the IPPS market basket. The labor-related share of the IPPS market basket currently is not scheduled to be updated until FY 2014. At the time of development of the FY 2014 proposed rule, we expect to have CPI data available through 2012. Therefore, under this methodology as updated, we expect the proposed FY 2014 COLA factors for Alaska and Hawaii to be based on the 2009 OPM COLA factors updated through 2012 by the comparison of the growth in the CPIs for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city.

E. Expiration of Certain Payment Rules for LTCH Services and the Moratorium on the Establishment of Certain Hospitals and Facilities and the Increase in Number of Beds in LTCHs and LTCH Satellite Facilities

1. Background

Moratoria on the implementation of certain LTCH payment policies and on the development of new LTCHs and LTCH satellite facilities and on bed increases in existing LTCHs and LTCH satellite facilities established under sections 114(c) and (d) of the MMSEA (Pub. L. 110–173), as amended by section 4302 of the ARRA (Pub. L. 111–5) and further amended by sections 3106 and 10312 of the Affordable Care Act, are set to expire during CY 2012, under current law.

The moratoria established by these provisions delayed the full implementation of the following policies for 5 years beginning at various times in CY 2007:

- The full application of the ''25-percent payment adjustment threshold'' to certain LTCHs, including hospitals-within-hospitals (HwHs) and LTCH satellite facilities for cost reporting periods beginning on or after July 1,

2007, and before July 1, 2012, or cost reporting periods beginning on or after October 1, 2007, and before October 1, 2012, as applicable under the regulations at §§ 412.534 and 412.536.

- The inclusion of an ''IPPS comparable'' option for payment determinations under the short-stay outlier (SSO) adjustment under § 412.529 of the regulations for LTCH discharges occurring on or after December 29, 2007, but prior to December 29, 2012.
- The application of any one-time prospective adjustment to the LTCH PPS standard Federal rate provided for in § 412.523(d)(3) of the regulations from December 29, 2007, until December 29, 2012.
- In general, the development of new LTCHs and LTCH satellite facilities, or increases in the number of beds in existing LTCHs and LTCH satellite facilities from December 29, 2007, and ending December 28, 2012, unless one of the specified exceptions to the particular moratorium was met. (We refer readers to the May 22, 2008 interim final rule with comment period for the MMSEA (73 FR 29699, 29704 through 29707, and 29709), the interim final rule for the ARRA (74 FR 43990 through 43992 and 43997), and the finalizing of the Affordable Care Act changes in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50399 through 50400, and 50416) for a complete description of this moratorium.)

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28021 and 28022), we proposed a 1-year continuation of the existing delay of the full implementation of the 25-percent payment adjustment threshold; that is, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013, as applicable. We also proposed to make a one-time prospective adjustment to the standard Federal rate under § 412.523(d)(3) of the regulations. We proposed to phase in this one-time prospective adjustment to the standard Federal rate over a 3-year period, beginning in FY 2013; however, consistent with the statute, this adjustment would not apply to payments made for discharges occurring on or before December 28, 2012. We did not propose to make any changes to the SSO policy as it currently exists in the regulations at § 412.529. Accordingly, consistent with the existing regulations at § 412.529(c)(3), for SSO discharges occurring on or after December 29, 2012, the ''IPPS comparable'' option at § 412.529(c)(3)(i)(D) would apply to payment determinations as appropriate for certain short-stay cases. The moratoria on the development of new LTCHs or LTCH satellite facilities and on an increase in the number of beds in existing LTCHs or LTCH satellite facilities mandated by section 114(d) of the MMSEA, as amended by section 4302(b) of the ARRA and further amended by section 3106 and 10312 of the Affordable Care Act, are set to expire on December 29, 2012, under current law.

2. The 25-Percent Payment Adjustment Threshold

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28021 and 28022), we proposed to provide a 1-year extension (that is, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013) on the moratorium on the application of the 25-percent payment adjustment threshold policy as provided by section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(c) and 10312(a) of the Affordable Care Act. We proposed to revise §§ 412.534 and 412.536 of the regulations to reflect this extension. Specifically, we proposed to change ''2012'' to ''2013'' in the heading of paragraph § 412.534(c)(1); in paragraph (c)(1)(i) and in paragraph (c)(1)(ii); in the heading of paragraphs (c)(2) and (d)(1); in paragraph (d)(1)(i) and in the headings of paragraphs (d)(2), and (e)(1); in paragraph (e)(1)(i); and in the heading of paragraph (e)(2) to incorporate this change. In addition, we proposed to revise the headings at §§ 412.534(c)(3), (d)(3), and (e)(3), and make conforming changes to (h)(4) and (5) and § 412.536(a)(2) to reflect this extension. This extension would continue the existing statutory exemption of grandfathered HwHs and freestanding LTCHs from the 25-percent payment adjustment threshold and the continued statutory increase in the percentage threshold to 50 or 75 percent, as applicable, for those LTCHs and LTCH satellite facilities presently so affected. For a detailed description of the moratorium on the 25-percent payment adjustment threshold policy, we refer readers to the May 22, 2008 interim final rule with comment period (73 FR 29699 through 29704) and the interim final rule with comment period for the ARRA (74 FR 43990 through 43992).

Although we proposed to extend the moratorium relating to the application of the 25-percent payment adjustment threshold policy effective for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013, we noted that the existing moratorium will expire for certain LTCHs prior to the effective date of the extension. Specifically, under existing regulations, the moratoria for an LTCH described in § 412.23(e)(2)(i) that meets the criteria in § 412.22(f) and a satellite facility of a LTCH described under § 412.22(h)(3)(i) (that is, a grandfathered HwH and a grandfathered LTCH satellite facility, respectively), and the moratoria for a ''freestanding'' LTCH as described in § 412.23(e)(5), will expire effective for cost reporting periods beginning on or after July 1, 2012. In addition, under existing regulations, the moratorium on the 25-percent payment adjustment threshold policies for a LTCH or a LTCH satellite facility that, as of December 29, 2007, was co-located with an entity that is a provider-based, off-campus location of a subsection (d) hospital which did not provide services payable under section 1886(d) of the Act at the off-campus location also expires beginning with discharges occurring in cost reporting periods beginning on or after July 1, 2012. Therefore, under our proposed policy, there would be a period during which some of the above-described LTCHs and LTCH satellite facilities must comply with §§ 412.534 and 412.536 before becoming subject to the moratoria again. Specifically, the above-described LTCHs and LTCH satellite facilities with a cost reporting period beginning on or after July 1, 2012, and before October 1, 2012, would be required to comply with the applicable 25-percent payment adjustment threshold policy under §§ 412.534 and 412.536 for discharges occurring in the LTCH's or LTCH satellite facility's first cost reporting period beginning from July 1, 2012, through September 30, 2012. Then, those same LTCHs and LTCH satellite facilities would be subject to the regulatory moratorium effective for discharges occurring in their first cost reporting period beginning on or after July 1, 2013, and before October 1, 2013.

Comment: Commenters supported the proposed 1-year delay in the full application of the 25-percent payment adjustment threshold policy. Some of the commenters requested that CMS consider extending this delay for 2 years rather than the proposed 1-year extension.

Response: We appreciate the commenters' support of our proposed policy. While we understand the commenters' desire to extend this policy beyond the hospital's first cost reporting period beginning on or after October 1, 2012, and before October 1, 2013, we believe that it is appropriate to only consider extending a moratorium on the 25-percent payment adjustment threshold policy through FY 2013. Accordingly, in this final rule, we are finalizing our proposed 1-year extension

of the existing moratorium for applicable LTCHs for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013. However, as discussed below, in this final rule, we are also revising our regulations to address the situation of those LTCHs that have cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012.

Comment: Many commenters expressed concern about the impact of the proposed effective date of the regulatory moratorium on the 25-percent payment adjustment threshold policy (that is, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013) in light of the July 1, 2012 expiration of the statutory moratorium on certain LTCH providers with cost reporting periods beginning from July 1, 2012, and before October 1, 2012. They pointed out that this group of LTCHs would be required to comply with the fully-implemented 25-percent payment adjustment threshold policy for their first cost reporting period beginning on or after July 1, 2012, and before October 1, 2012. Those hospitals would not benefit from the extension of the moratorium on the 25-percent payment adjustment threshold policy until their first cost reporting period beginning on or after October 1, 2012, and before October 1, 2013, which for these providers would start between July 1, 2013 and September 30, 2013. Requiring them to comply with the fully reinstated policy in the interim, several commenters noted, would contradict CMS' assertion in the proposed rule, where CMS indicated that ''* * * we could be in a position within the near future to propose revisions to our payment policies that could render the 25-percent payment adjustment threshold policy unnecessary.'' Further, ''[i]n light of this potential result, we believe it is prudent to avoid requiring LTCHs (or CMS payment processing systems) to retool in order to implement the full reinstatement of the policy for what could be a relatively short period of time.'' The commenters asserted that this statement further argued for the development of a solution to avoid ''subjecting'' approximately 130 LTCHs to the ''substantial logistic, administrative, and financial burden'' of compliance with the fully implemented policy for a single cost reporting period. Several commenters also noted that the particular group of LTCHs and LTCH satellite facilities that would be effected by the ''gap'' between the July 1, 2012 expiration of the statute and the October 1, 2012 implementation of our proposed policy are those freestanding and grandfathered HwHs that have never actually been subject to the policy and, therefore, would find compliance for one cost reporting period even more burdensome.

In urging consistent treatment for this group of providers and requesting that CMS not delay relief to them under the proposed extension of the moratorium, a number of commenters submitted suggestions regarding how to avoid the ''gap'' period for this group of LTCHs. Suggestions made by commenters can be grouped into two categories: those that focused on how CMS could revise the mechanics of execution of the payment adjustment in order to immediately cover those affected LTCHs and LTCH satellite facilities in the proposed extension of the moratorium or at least limit the impact of the ''gap'' between statutory and regulatory protection for such entities; and those focusing on the Secretary's authority to implement the extension of the moratorium effective for cost reporting periods beginning on July 1, 2012, notwithstanding the rulemaking schedule under the LTCH PPS which establishes an October 1, 2012 implementation date for policies promulgated in the FY 2013 IPPS/LTCH PPS final rule.

Several commenters suggested that CMS issue an interim final rule with comment period as soon as possible that would provide immediate relief for those LTCHs that would be affected by the ''gap'' referenced previously, by accelerating the implementation date of the proposed extension of the moratorium. Other commenters recommended that CMS ''refrain from enforcing the policy.'' A number of commenters suggested that affected LTCHs be allowed to elect to have the 12-month period beginning on October 1, 2012, for the purposes of calculating its compliance with the 25-percent payment adjustment threshold policy. One commenter offered a specific remedy for those LTCHs that would be subject to the ''gap'': That the moratoria on full implementation of the 25-percent payment adjustment threshold policy could be applied to Medicare patient *discharges* occurring on and after October 1, 2012. Therefore, this commenter suggested that the 25-percent payment adjustment threshold policy would only apply to those ''gap'' LTCHs for 1 to 3 months of their cost reporting periods, that is, the months from the beginning of their cost reporting period (from July 1, 2012 through September 30, 2012) until October 1, 2012, when the proposed regulatory moratorium would go into effect.

Several commenters suggested that for CMS to choose July 1, 2012 as the proposed effective date of the extension of the existing statutory moratorium on the full implementation of the 25-percent payment adjustment threshold policy was not actually ''retroactive rulemaking'' because the actual payment adjustment would be applied in the future, upon cost report reconciliation. These and other commenters also argued in the alternative that even if such action constituted retroactive rulemaking, generally the courts disallow it only if it results in ''harm,'' is ''a substantive change from an agency's prior regulatory practice,'' and would ''impair any right, or create any new obligation, duty or disability.'' Furthermore, the commenters argued that the Secretary has the authority to engage in retroactive rulemaking if the public interest is served. A number of commenters urged CMS to eliminate the 25-percent payment adjustment threshold policy entirely for cost reporting periods beginning on or after October 1, 2012, and rather focus on developing and using patient and facility-level criteria to determine which patients are appropriate for LTCH treatment.

Response: We appreciate the suggestions made by the commenters detailed above regarding possible resolutions of the situation faced by those LTCHs subject to the July 1, 2012 expiration of the statutory moratorium, but we believe that the suggestion to apply the extension of the moratorium effective for discharges occurring on or after October 1, 2012, instead of cost reporting periods beginning on or after October 1, 2012 for those LTCHs that would be effected by the ''gap,'' addresses most, if not all, of the concerns raised by the commenters, including that these facilities were being subject—for even a short time—to a policy that we may be reevaluating. We understand the commenters' concerns that gap entities, including freestanding and grandfathered HwHs that have never been subjected to the policy, will have to comply with the full application of the policy for a period of time; that is from 1 to 3 months. Nonetheless, we do not believe that being subjected to the policy for this short period of time will require these entities to have to ''retool'' nor do we think it will impose a ''substantial logistic, administrative, and financial burden'' upon LTCHs that are admitting appropriate patients, that is, extremely sick patients who continue to require hospital-level care at an LTCH

following a course of treatment at a referring hospital. We also believe that, as discussed below, in applying the supplemental moratorium to the gap entities prior to their first cost reporting period for which they would be subjected to our regulatory moratorium, as suggested by a commenter, we are for the most part, bridging the gap for these LTCHs. As we note below, we believe that it is highly unlikely that any of the gap entities will exceed the 25-percent threshold during the time prior to the October 1, 2012 effective date of the supplemental moratorium.

Accordingly, while we are not adopting any of the other suggestions detailed in the comment above, we believe that the suggested discharge-based supplemental moratorium for this specific group of effected LTCHs provides a narrow and ''targeted'' remedy for those particular LTCHs subject to the ''gap'' between the expiration of the statutory moratorium, that is, cost reporting periods beginning on or after July 1, 2012, and the effective date of the regulatory moratorium, that is, for cost reporting periods beginning on or after October 1, 2012, which we believe is superior to other solutions recommended by the commenters.

Accordingly, as revised in this final rule, the statutory moratorium and the regulatory moratorium will be implemented as follows: For those LTCHs for which the statutory moratorium will expire effective with the hospitals' cost reporting periods beginning on or after October 1, 2012, the regulatory moratorium will seamlessly provide for an additional moratorium for the hospitals' first cost reporting period beginning on or after October 1, 2012. For LTCHs and LTCH satellite facilities for which the statutory moratorium expires effective with the hospital's cost reporting periods beginning on or after July 1, 2012, we will apply a regulatory moratorium as follows: For hospitals with cost reporting periods beginning on or after October 1, 2012, the proposed moratorium will be finalized effective for the hospital's first cost reporting period beginning on or after October 1, 2012. In addition, for hospitals with cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012, we are finalizing a regulatory moratorium effective with discharges occurring beginning October 1, 2012, through the end of the hospital cost reporting period (that is, the end of the cost reporting period that began on or after July 1, 2012, and before October 1, 2012).

We provide the following as an example of how this policy will be applied. Assume that LTCH A is a freestanding LTCH that has a cost reporting period beginning August 1, 2012. The statutory moratorium will expire for this LTCH on July 31, 2012. For its FY 2013 cost reporting period, it discharges 200 patients. Because the statutory moratorium expired for LTCH A on July 31, 2012 (which was the completion of its cost reporting period that ended on or after July 1, 2012), the hospital is allowed to admit up to 50 patients from any one referring hospital under the 25-percent payment adjustment threshold policy before the LTCH PPS adjusted payment would be applied for additional patients. Therefore, if LTCH A discharges 35 patients admitted from IPPS Hospital B during August and September, no payment adjustment would be applied. If LTCH A discharges an additional 25 patients after October 1, 2012, no adjustment would be applied to any of the discharges that had been admitted from IPPS Hospital A, effective with discharges occurring on or after October 1, when the regulatory moratorium goes into effect and LTCH B would be permitted to exceed the 50 patient limit under revised § 412.536(a)(3)(1). This LTCH would not be subject to the 25-percent payment adjustment threshold policy until its cost reporting period beginning on or after August 1, 2014 as described in revised § 412.536(a)(2).

Therefore, we will finalize the proposed regulatory moratorium on the full application of the 25-percent payment adjustment threshold policy for LTCHs with reporting periods beginning on or after October 1, 2012, and we will also establish a discharge-based moratorium on the application of the 25-percent payment adjustment threshold policy solely for those LTCHs that would have been effected by the ''gap'' for discharges occurring on or after October 1, 2012, and through the end of their first cost reporting period beginning on or after July 1, 2012, and before October 1, 2012.

We do not agree with the commenters who suggested that we eliminate the 25-percent payment adjustment threshold policy at this time even as we are evaluating revisions to the LTCH PPS that may more accurately target the types of patients who we believe are appropriate for treatment in an LTCH. We adopted the 25-percent payment adjustment threshold policy to limit the percentage of patients an LTCH may admit from another hospital, in order to address our concerns that LTCHs were functioning as step-down units of referring IPPS hospitals and that Medicare was, therefore, paying twice (first to the IPPS hospital and then to the LTCH) for what was essentially one episode of patient care. We believe that the original objectives of the 25-percent payment adjustment threshold policy continue to be valid even though we are presently temporarily extending the moratorium on the policy's full implementation.

Comment: A number of commenters requested that CMS provide more information about the two projects that appear to be moving toward addressing the concerns and perhaps realizing the goals of establishing LTCH facility and patient-level criteria that MedPAC articulated in its 2004 recommendations and that could ''render the 25-percent payment adjustment threshold policy unnecessary.''

Response: We continue to share MedPAC's concerns regarding the treatment of medically appropriate patients in LTCHs. In its March 2012 Report to Congress, MedPAC noted, ''* * * if medically complex cases in LTCHs are, in essence, indistinguishable from medically complex cases in acute care hospitals, then Medicare must ensure that its payments for the same set of services are equitable, regardless of where the services are provided. * * * policymakers must consider whether certain models of care will best serve the needs of medically complex patients. These steps will help ensure that Medicare beneficiaries receive appropriate, high quality care in the least costly setting consistent with their clinical conditions.'' (p. 273). CMS agrees with MedPAC and has been undertaking research to determine whether there are patient level criteria that can be used to determine patients that are appropriately treated in an LTCH or in an IPPS hospital at a higher than the traditional IPPS payment consistent with their higher costs. Generally, preliminary research by our contractor seems to indicate that focusing on a subset of patients who are ''chronically critically ill,'' that is, who have been in intensive or coronary care units for a significant period of time at IPPS hospitals immediately preceding the admission to the LTCH, may prove to be an important step at this point. We are also researching whether under the IPPS it is appropriate to carve out these patients as a separate category within the MS–DRGs, calculating separate relative weights for these patients. As we have in the past, when this research reaches the appropriate stage, we intend to reach out to hospital industry stakeholders for reactions and feedback.

In this final rule, our regulations are revised under §§ 412.534 and 412.536 to reflect our finalized policies. We note that, in each regulatory provision, we

specify that the determination as to whether a payment adjustment is applicable for discharges occurring during the months that an LTCH or LTCH satellite facility will be subject to the gap, that were admitted from a particular referring hospital (that have not achieved high-cost outlier status at the referring hospital), will be based upon whether or not those discharges exceed 25 percent (or 50 percent, as applicable) of total discharges during that cost reporting period.

Although those with cost reporting periods beginning on or after July 1 and before October 1 will be ''technically'' subject to the payment adjustment until October 1, 2012, we believe that very few, if any, LTCHs will actually be disadvantaged because these LTCHs would rarely, if ever admit more than 25 percent of their discharges from any one referring hospital during the limited period of 1 to 3 months (depending on the hospital's cost reporting beginning date) that the 25-percent payment adjustment threshold policy would technically be in effect. For discharges occurring on or after October 1, 2012, they would be protected by our new regulation and would not have to wait until the start of their next cost reporting period for relief. In addition, we would note that because we believe that the application of the 25-percent payment adjustment threshold policy would virtually have no impact on those hospitals for the period of July 1, 2012, through September 30, 2012, we do not intend to expend limited audit dollars to pursue this issue for discharges occurring during that period.

We are revising the regulations at §§ 412.534 and 412.536 to reflect these finalized policies.

3. The ''IPPS Comparable Per Diem Amount'' Payment Option for Very Short Stays Under the Short-Stay Outlier (SSO) Policy

Prior to the enactment of section 114(c)(3) of the MMSEA, for LTCH short stay outlier (SSO) cases with a covered length of stay that was equal to or less than one standard deviation from the geometric average length of stay for the same MS–DRG under the IPPS (that is, the ''IPPS comparable threshold''), the SSO payment adjustment determination included an additional option, the ''IPPS comparable amount per diem amount'' (72 FR 26906). This policy was implemented in our regulations at § 412.529(c)(3)(i) in the RY 2008 LTCH PPS final rule (72 FR 26904 through 26908).

Section 114(c)(3) of the MMSEA, as amended by section 3106(a) of the Affordable Care Act, provided a 5-year moratorium from the application of the ''IPPS comparable amount'' option under the SSO payment adjustment, which is scheduled to expire for discharges beginning on or after December 29, 2012 (75 FR 50399 through 50400). With the expiration of the moratorium, payment for an SSO discharge occurring on or after December 29, 2012, the Medicare payment will be based on the least of the following:

- 100 percent of the estimated cost of the case.
- 120 percent of the MS–LTC–DRG specific per diem amount multiplied by the covered length of stay of the particular case.
- The full MS–LTC–DRG per diem amount.
- Comparing the covered length of stay for as an SSO case and the ''IPPS comparable threshold,'' one of the following:

(a) The blend of the 120 percent of the MS–LTC–DRG specific per diem amount (specified in § 412.529(d)(1)) and an amount comparable to the IPPS per diem amount (specified in § 412.529(d)(4)), for cases where the covered length of stay for an SSO case is greater than the ''IPPS comparable threshold'' (as specified under § 412.529(c)(3)(ii)).

(b) An amount comparable to the IPPS comparable per diem amount (specified in § 412.529(d)(4)), if the covered length of stay for an SSO case is equal to or less than one standard deviation from the geometric average length of stay for the same MS–DRG under the IPPS (the ''IPPS comparable threshold''), as specified under § 412.529(d)(4).

For a comprehensive discussion of the SSO policy, including the payment for very short stays under the SSO policy, we refer readers to the May 6, 2008 interim final rule with comment period (73 FR 24874 through 24881).

The FY 2013 ''IPPS comparable threshold'' (that is, one standard deviation from the geometric average length of stay for the same MS–DRG under the IPPS) used in determining SSO payments for discharges occurring on or after December 29, 2012, under § 412.529(c)(3) of the regulations are provided in Table 11, which is listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site.

Comment: A large number of commenters expressed concern about our application of the ''IPPS comparable amount'' option under the SSO payment adjustment policy in light of the expiration of the 5-year statutory moratorium.

Response: In the proposed rule, we did not propose to make any changes in our policy under § 412.529(c)(3) for LTCH discharges occurring on or after December 29, 2012, that related to these public comments. Therefore, we will not address the commenters' concerns regarding this policy at this time but we will take them into consideration should we contemplate changes to the SSO policy in the future.

Technical change. With the expiration of the moratorium on the application of the ''IPPS comparable per diem amount'' option at § 412.529(c)(3)(i)(D) on the determination of the payment adjustment under the SSO policy, described above, we proposed a technical change to the regulation text at § 412.529(d)(i)(C) in order to clarify the application of our policy. Specifically, at § 412.529(d)(4)(i)(C), we proposed to remove the following introductory phrase that appears at the beginning of the paragraph: ''For purposes of the blend amount described in paragraph (c)(2)(iv) of this section,'' so that the provision of the paragraph is not limited only to the ''blend amount'' option under the SSO policy at § 412.529(c)(2)(iv), but is also applicable to the ''IPPS comparable per diem amount'' option at § 412.529(c)(3)(i)(D).

In the proposed rule, we proposed to clarify this policy by revising the language of paragraph (d)(4)(i)(C) of § 412.529 to read as follows:

''(C) The payment amount specified under paragraph (d)(4)(i)(B) of this section may not exceed the full amount comparable to what would otherwise be paid under the hospital inpatient prospective payment system determined under paragraph (d)(4)(i)(A) of this section.''

We proposed this technical correction in order to clarify that, payment for a case based solely on the ''IPPS comparable per diem amount'' described at § 412.529(d)(4) is calculated in the same way that it is calculated when payment for a case will be based on the ''blend amount'' (under § 412.529(c)(2)(iv)) of the ''IPPS comparable per diem amount'' and the ''120 percent of the LTC–DRG specific per diem payment amount.'' When we finalized the ''IPPS comparable per diem amount'' option to the SSO payment adjustment in the RY 2008 LTCH PPS final rule (72 FR 26907), we stated in the preamble that ''the IPPS comparable per diem amount [was] capped at the full IPPS comparable amount that is used under the blend option of the current SSO policy * * *.'' However, we neglected, at that time, to revise the regulation text. Therefore, we proposed to clarify our

regulations at § 412.529(d)(4)(i)(C) to reflect existing policy that the ''IPPS comparable per diem amount'' is calculated as a per diem that is capped at an amount comparable to what would have been a full payment under the inpatient prospective payment system, such that an SSO payment made under the ''IPPS comparable per diem amount'' option may also not exceed the full amount comparable to what would otherwise be paid under the inpatient prospective payment system.

We did not receive any public comments on this technical change and are finalizing the proposed technical change to § 412.529(d)(4)(i)(C) as described above.

4. One-Time Prospective Adjustment to the Standard Federal Rate Under § 412.523(d)(3)

a. Overview

In the August 30, 2002 LTCH PPS final rule (67 FR 55954), we set forth regulations implementing the LTCH PPS, based upon the broad authority granted to the Secretary, under section 123 of the BBRA (as amended by section 307(b) of the BIPA). Section 123(a)(1) of the BBRA required that the system ''maintain budget neutrality.'' The statute requires the LTCH PPS to be budget neutral in FY 2003, so that estimated aggregate payments under the LTCH PPS for FY 2003 would be equal to the estimated aggregate payments that would have been made if the LTCH PPS were not implemented for FY 2003. The methodology for determining the LTCH PPS standard Federal rate for FY 2003 that would ''maintain budget neutrality'' is described in considerable detail in the August 30, 2002 final rule (67 FR 56027 through 56037). Our methodology for estimating payments for the purposes of budget neutrality calculations used the best available data, and necessarily reflected several assumptions (for example, costs, inflation factors and intensity of services provided) in estimating aggregate payments that would be made if the LTCH PPS was not implemented. In performing our budget neutrality calculations, we took into account the statute's requirement that certain statutory provisions that affect the level of payments to LTCHs in years prior to the implementation of the LTCH PPS shall not be taken into account in the development and implementation of the LTCH PPS. Specifically, section 307(a)(2) of the BIPA requires that the increases to the target amounts and the increases to the cap on the target amounts for LTCHs provided for by section 307(a)(1) of the BIPA (as set forth in section 1886(b)(3)(J) of the Act) and the enhanced continuous improvement bonus (CIB) payments for LTCHs provided for by section 122 of the BBRA (as set forth in section 1886(b)(2)(E) of the Act) are not to be taken into account in the development and implementation of the LTCH PPS.

In the August 30, 2002 final rule, we also stated our intentions to monitor LTCH PPS payment data to evaluate whether later data varied significantly from the data available at the time of the original budget neutrality calculations (for example, data related to inflation factors, intensity of services provided, or behavioral response to the implementation of the LTCH PPS). To the extent the later data significantly differ from the data employed in the original calculations, the aggregate amount of payments during FY 2003 based on later data may be higher or lower than the estimates upon which the budget neutrality calculations were based. Therefore, in that same final rule, under the broad authority conferred upon the Secretary in developing the LTCH PPS, including the authority for establishing appropriate adjustments, provided by section 123(a)(1) of the BBRA, as amended by section 307(b) of BIPA, we provided in § 412.523(d)(3) of the regulations for the possibility of making a one-time prospective adjustment to the LTCH PPS rates by a deadline of October 1, 2006, so that the effect of any significant difference between actual payments and estimated payments for the first year of the LTCH PPS would not be perpetuated in the LTCH PPS rates for future years. This deadline was revised to July 1, 2008, in the RY 2007 LTCH PPS final rule because sufficient time had not elapsed since the start of the LTCH PPS for new data to be generated that would have enabled us to conduct a comprehensive reevaluation of our budget neutrality calculations (71 FR 27842 through 27844). Therefore, we did not implement the one-time prospective adjustment provided under § 412.523(d)(3) at that time. However, we stated that we would continue to collect and interpret new data as they became available in order to determine whether we should propose such an adjustment in the future. Furthermore, we revised § 412.523(d)(3) by changing the original October 1, 2006 deadline to July 1, 2008, to postpone the prospective one-time adjustment due to the time lag in the availability of Medicare data upon which a proposed adjustment would be based, noting that there is a lag time between the submission of claims data and cost report data, and the availability of that data in the MedPAR files and HCRIS, respectively. We also explained that we believed that postponing the deadline of the one-time prospective adjustment to the LTCH PPS rates provided for in § 412.523(d)(3) to July 1, 2008, would allow our decisions regarding a possible adjustment to be based on more complete and up-to-date data (71 FR 27842 through 27845).

Section 114(c)(4) of the Medicare, Medicaid, and SCHIP Extension Act of 2007 (Pub. L. 110–173) (MMSEA) provides that the ''Secretary shall not, for the 3-year period beginning on the date of the enactment of this Act, make the one-time prospective adjustment to long-term care hospital prospective payment rates provided for in section 412.523(d)(3) of title 42, Code of Federal Regulations, or any similar provision.'' That provision delayed the effective date of any one-time prospective adjustment until no earlier than December 29, 2010. Accordingly, we revised § 412.523(d)(3) of the regulations to conform with this requirement (73 FR 26801 through 26804 and 26839). Then, section 3106 of the Affordable Care Act amended section 114(c) of the MMSEA by specifying an additional 2-year delay in the one-time prospective adjustment to the standard Federal rate at § 412.523(d)(3). Thus, under current law, the Secretary is precluded from making the one-time adjustment to the standard Federal rate until December 29, 2012. Therefore, we revised § 412.523(d)(3) to conform with this requirement (75 FR 50399 and 50416).

Prior to the statutory delay in the application of any one-time prospective adjustment required when the MMSEA was enacted on December 29, 2007, we had developed a methodology for evaluating whether to propose a one-time prospective adjustment under § 412.523(d)(3) of the regulations. In order to inform the public of our thinking, and to stimulate comments for our consideration during the statutory delay in implementing any one-time prospective adjustment, we discussed our analysis and its results in the RY 2009 LTCH PPS proposed rule and final rule (73 FR 5353 through 5360 and 26800 through 26804, respectively).

Evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) requires a thorough review of the relevant LTCH data (as described below). As we discussed in the RY 2009 LTCH PPS proposed and final rules, we conducted a thorough review of the relevant data, that is, cost data from FY 2002, representing the final year LTCHs were paid under the TEFRA payment

system. The cost report data for FY 2002 is comprised of a high proportion of settled and audited cost reports submitted by LTCHs. We also have payment data on the first year of the LTCH PPS (that is, FY 2003). On the basis of our review of these data sources, we discussed a potential methodology for determining whether the one-time prospective adjustment provided for under § 412.523(d)(3) of the regulations should be proposed and the computation of such adjustment, if appropriate, based on that potential methodology. We also discussed that, under that potential methodology, our analysis indicated that a permanent adjustment factor of 0.9625 to the LTCH PPS standard Federal rate could be warranted. Consistent with the requirements of section 114(c)(4) of the MMSEA, which delayed the implementation of such an adjustment, we did not propose any one-time prospective adjustment to the standard Federal rate. However, we presented our analysis and welcomed public comment to inform the public of our analysis if and when we decide to propose (and ultimately finalize) such an adjustment under § 412.523(d)(3).

As we discussed in the RY 2009 LTCH PPS final rule (73 FR 26803), our policy objective in providing for this one-time prospective adjustment has always been to ensure that computations based on the earlier, necessarily limited (but at that time best available) data available at the inception of the LTCH PPS would not be built permanently into the rates if data available at a later date could provide more accurate results. When we established the FY 2003 standard Federal rate in a budget neutral manner, we used the most recent LTCH cost data available at that time (that is, FY 1999 data), and trended that data forward to estimate what Medicare would have paid to LTCHs in FY 2003 under the TEFRA payment system if the PPS were not implemented for FY 2003. As we discussed in the RY 2009 LTCH PPS final rule (73 FR 26803), after a thorough evaluation of the currently available data in light of this stated policy objective, we believe that the most appropriate methodology for evaluating an adjustment to the original budget neutrality adjustment would be to compare estimated payments in the first year under the LTCH PPS to what estimated payments would have been under the prior TEFRA payment system for that year based on the best available data. Accordingly, in that same final rule, we revised § 412.523(d)(3) to provide for the possibility of making a one-time prospective adjustment to LTCH PPS rates so that ''the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years.'' As noted above, the statutory moratoria that delayed the implementation of the application of any one-time prospective adjustment to the LTCH PPS standard Federal rate provided for in § 412.523(d)(3) of the regulations for 5 years (from December 29, 2007, until December 29, 2012) is set to expire during FY 2013.

In order to determine whether a one-time prospective adjustment under § 412.523(d)(3) would be warranted, we evaluated several issues regarding the data to use for this purpose. These issues, our proposals related to these issues (as presented in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025 through 28032)), and a summary of the public comments and our responses related to these issues are presented below. As indicated in the proposed rule, we previously discussed these issues in the RY 2009 LTCH PPS proposed and final rules.

b. Data Used To Estimate Aggregate FY 2003 TEFRA Payments

As we discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025 through 28032), as we considered the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations, it is necessary to estimate both aggregate payments under the LTCH PPS for FY 2003 and the estimated aggregate payments that would have been made if the LTCH PPS were not implemented in FY 2003 (that is, estimated FY 2003 TEFRA payments). While it is possible to determine actual TEFRA payments to LTCHs for FY 2002, the last year of payment under that methodology, it is necessary to estimate what TEFRA payments would have been in FY 2003 if the new LTCH PPS had not been implemented. In developing our proposed methodology for evaluating a one-time prospective adjustment, we considered whether we should use actual FY 2003 costs to calculate estimated TEFRA payments for FY 2003 or use costs for FY 2002 trended forward to FY 2003 as the basis for the calculation. As we discussed in that same proposed rule (77 FR 28025), basing the estimate on actual FY 2003 costs would have the considerable advantage of avoiding the need to inflate FY 2002 costs to FY 2003 costs. However, there is also a potentially serious disadvantage to using actual FY 2003 costs. Because FY 2003 was the first year of payment under the LTCH PPS, the cost experience of LTCHs in that year would reflect their response to the incentives provided by the new payment system, instead of reflecting behavior under the reasonable cost payment system. Indeed, implementation of an LTCH PPS should directly affect the behavior of LTCHs, and, therefore, the level of costs in LTCHs. One of the incentives of a PPS is to improve efficiency in the delivery of care, which generally results in decreased cost per discharge. For this reason, using FY 2003 costs directly could be a poor basis for estimating payments that ''would have been made if the LTCH PPS were not implemented.'' On balance, however, we believe that trending the costs incurred under the last year of the TEFRA payment system forward for 1 year poses a smaller prospect for distortion than using costs incurred during the subsequent year, when the incentives faced by LTCHs to reduce costs could have had a significant effect. We also noted that some LTCH stakeholders have expressed concern that using FY 2003 costs directly would provide a poor basis upon which to estimate payments that ''would have been made if the LTCH PPS were not implemented'' for precisely the reasons discussed above. We believe that basing the estimate of FY 2003 TEFRA payments on FY 2002 costs trended forward should satisfy these concerns. For the reasons discussed above, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025 through 28026), in evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations, we proposed to base our calculation of the estimated aggregate payments that would have been made if the LTCH PPS were not implemented (that is, estimated FY 2003 TEFRA payments) on FY 2002 costs trended forward.

We did not receive any public comments on our proposal to base our calculation of the estimated aggregate payments that would have been made if the LTCH PPS were not implemented (that is, estimated FY 2003 TEFRA payments) on FY 2002 costs trended forward for purposes of evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3). We are adopting this policy as final, without modification, for the reasons discussed above. (We discuss the specific methodology we are adopting in this final rule to trend

forward FY 2002 costs to estimated FY 2003 TEFRA payments, which is the same as the methodology we proposed below in this section.)

In this final rule, under the broad authority conferred upon the Secretary by section 123 of the BBRA as amended by section 307(b) of BIPA, in evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations, we based our calculation of the estimated aggregate payments that would have been made if the LTCH PPS were not implemented (that is, estimated FY 2003 TEFRA payments) on FY 2002 costs trended forward for the reasons discussed above. Specifically, as we proposed, under the methodology we are adopting in this final rule, we trended forward the most recent available LTCH FY 2002 costs to FY 2003 using the excluded hospital market basket, because we believe these data best reflect the price changes in hospital inpatient costs realized by LTCHs from FY 2002 to FY 2003. We believe that using the excluded hospital market basket to update FY 2002 reasonable cost-based (TEFRA) payments in order to estimate FY 2003 TEFRA payments is appropriate because the TEFRA payment system under which LTCHs were paid prior to the implementation of the LTCH PPS utilized the excluded hospital market basket to update the hospital-specific limits on payment for operating costs of LTCHs. In addition, we used the excluded hospital market basket to update the inpatient hospital operating and capital costs of LTCHs when we developed the initial LTCH PPS standard Federal rate for FY 2003 (67 FR 56029 through 56031). As we asserted in the proposed rule, we believe that the LTCH cost report data for FY 2002 currently available are appropriate to use for this purpose because, as noted above, they are comprised of settled and audited cost reports submitted by LTCHs. (We noted that this is the same methodology for evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) that we presented in the RY 2009 LTCH PPS proposed rule and final rule (73 FR 5356 and 26802, respectively).)

c. Data Used To Estimate Aggregate FY 2003 LTCH PPS Payments

As discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025) and as discussed above, to determine whether a one-time prospective adjustment under § 412.523(d)(3) was warranted, we believe that an estimate of the payments that would have been made in FY 2003 under the TEFRA payment system methodology should be compared to estimated payments under the new LTCH PPS in FY 2003. Specifically, we explained that the most direct way to determine payments under the new LTCH PPS is simply to aggregate the actual payments calculated under the LTCH PPS methodology for the discharges that occurred during the first year of the LTCH PPS (FY 2003). However, that approach raises an issue of consistency because the discharges for which Medicare payments were made under the LTCH PPS during FY 2003 are not the same as the discharges for which costs were incurred during the last year of payment under the TEFRA methodology, FY 2002. For these reasons discussed above, we believe that the best way to estimate the TEFRA payments that would have been made to LTCHs during FY 2003 is to use inflated FY 2002 costs as a proxy for FY 2003 costs. Comparing actual FY 2003 LTCH PPS payments to FY 2003 TEFRA payments estimated on the basis of FY 2002 discharges would amount to a comparison between payments related to two different sets of discharges, potentially skewing the results. Therefore, for the purpose of consistency, rather than comparing TEFRA payments based on FY 2002 costs updated to FY 2003, to aggregate LTCH PPS payments for discharges that actually occurred in FY 2003, we believe it is preferable to compare estimated TEFRA payments based on updated FY 2002 costs to the estimated payments that would have been made under LTCH PPS methodology in FY 2003 for those same FY 2002 discharges. For these reasons, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025), we proposed to base our estimate FY 2003 LTCH PPS payments on the same set of discharges (from FY 2002) which are the basis for the estimate of what would have been paid in FY 2003 under the reasonable cost-based (TEFRA) payment system.

We did not receive any public comments on our proposal to base the estimate of FY 2003 LTCH PPS payments on the same set of discharges (from FY 2002) for purposes of evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3). We are adopting this policy as final, without modification for the reasons discussed above. (We discuss the methodology we are adopting in this final rule to estimate FY 2003 LTCH PPS payments using those FY 2002 discharges, which is the same as the methodology we proposed below in this section.)

In this final rule, under the broad authority conferred upon the Secretary by section 123 of the BBRA as amended by section 307(b) of BIPA, as we proposed, in evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations, we are using the same set of discharges (from FY 2002) to base our estimate of FY 2003 LTCH PPS payments and our estimate of what would have been paid in FY 2003 under the reasonable cost-based (TEFRA) payment system for purposes of evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3).

d. Methodology To Evaluate Whether a One-Time Prospective Adjustment Under § 412.523(d)(3) Is Warranted

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR), to evaluate the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations, we proposed to compare estimated aggregate FY 2003 TEFRA payments (calculated on the basis of FY 2002 costs, updated to FY 2003) to estimated aggregate payments that would have been made in FY 2003 under the LTCH PPS methodology (by applying the FY 2003 LTCH payment rules to the discharges that occurred in FY 2002). As we asserted in the proposed rule, we believe that this approach would ensure that we are comparing the estimated FY 2003 TEFRA payments, which are based on updated costs incurred for FY 2002 discharges, to the estimated PPS payments that would have been made for those same FY 2002 discharges under the new LTCH PPS payment methodology. (We note that this is the same methodology for evaluating the appropriateness of the possible one-time prospective adjustment under § 412.523(d)(3) of the regulations that we presented in the RY 2009 LTCH PPS proposed rule and final rule (73 FR 5356 and 73 FR 26802, respectively).) We discuss the public comments and our responses to these proposals below in this section.

To evaluate whether a one-time prospective adjustment under § 412.523(d)(3) was warranted, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28024 through 28025), we proposed to consider as ''significant'' any difference greater than or equal to a 0.25 percentage point difference between the original budget neutrality calculations and budget neutrality calculations based on the more recent data now available. As we discussed in that same proposed rule, the regulations at § 412.523(d)(3)

provide that the Secretary may make a one-time prospective adjustment to the LTCH PPS rates in order to ensure that any ''significant'' difference is not perpetuated in the LTCH PPS rates for future years. The regulation does not specifically define what constitutes a significant difference for this purpose.

We did not receive any public comments on our proposal to establish that any difference greater than or equal to 0.25 percentage points is ''significant'' for purposes of determining whether the one-time prospective adjustment provided under § 412.523(d)(3) is warranted. Therefore, we are adopting this policy as final without modification.

In this final rule, as we proposed, in evaluating whether a one-time prospective adjustment under § 412.523(d)(3) was warranted, we will consider as ''significant'' any difference greater than or equal to a 0.25 percentage point difference between the original budget neutrality calculations for FY 2003 and budget neutrality calculations for FY 2003 based on the more recent data now available. As we discussed in the proposed rule (77 FR 28024 through 28025), we believe this threshold will avoid making an adjustment to account for very minor deviations between earlier and later estimates of budget neutrality. It is also consistent with thresholds that we employ for similar purposes in other prospective payment systems. For example, under the capital IPPS, we make a forecast error correction in the framework used to update the capital Federal rate if a previous forecast of input prices varies by at least a 0.25 percentage point from actual input price changes (72 FR 47425). We do not believe that we should treat differences greater than or equal to 0.25 percent as not ''significant,'' because the effect of any difference would be magnified as the rates are updated each year.

e. Methodology To Estimate FY 2003 LTCH Payments Under the TEFRA Payment System

To estimate FY 2003 LTCH payments under the TEFRA payment system, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28026), we proposed to use a methodology that is similar in concept to the methodology we used to estimate FY 2003 LTCH total payments under the TEFRA payment system when we determined the initial standard Federal rate in the August 30, 2002 final rule (67 FR 56030 through 56033). Specifically, we proposed to estimate total LTCH payments under the TEFRA payment system in FY 2003 using the following steps:

- Estimate each LTCH's payment per discharge for inpatient operating costs under the TEFRA payment system for FY 2003, including continuous bonus improvement payments;
- Estimate each LTCH's payment per discharge for capital-related costs for FY 2003; and
- Sum each LTCH's estimated operating and capital payment per case to determine its estimated total FY 2003 TEFRA payment system payments per discharge.

We did not receive any public comments on our proposed methodology for estimating aggregate FY 2003 LTCH TEFRA payments for purposes of evaluating the one-time prospective adjustment at § 412.523(d)(3). We are adopting this methodology as final, without modification, for the reasons discussed in the proposed rule and reiterated below. (We discuss the specific steps of the methodology we are adopting in this final rule to estimate total FY 2003 TEFRA payment system payments per discharge, which is the same as the methodology we proposed below under ''Step 1''.)

f. Methodology to Estimate FY 2003 LTCH PPS Payments

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28030), we proposed to estimate FY 2003 LTCH PPS payments using the same general methodology that we used to estimate FY 2003 payments under the LTCH PPS (without a one-time prospective adjustment) when we determined the initial standard Federal rate in the August 30, 2002 final rule (67 FR 56032). We proposed to estimate FY 2003 LTCH PPS payments for each LTCH by simulating payments on a case-by-case basis by applying the final FY 2003 payment policies established in the August 30, 2002 final rule that implemented the LTCH PPS (67 FR 55954), which generally include the established FY 2003 LTC–DRGs and relative weights (Version 22.0), adjustments for differences in area wage levels, adjustments for SSO cases, additional payments for HCO cases that were applied in determining LTCH PPS payments to discharges occurring in FY 2003. We also proposed to use LTCH case-specific discharge information from the FY 2002 MedPAR files, and we proposed to use LTCH provider-specific data from the FY 2003 Provider-Specific File (PSF), as these were the data used by fiscal intermediaries to make LTCH payments during the first year of the LTCH PPS (FY 2003). To determine total estimated PPS payments for all LTCHs, we summed the individual estimated LTCH PPS payments for each LTCH. (We note that this is the same methodology we used to estimate FY 2003 payments under the LTCH PPS for purposes of evaluating the one-time prospective adjustment at § 412.523(d)(3) that we presented in the RY 2009 LTCH PPS proposed rule (73 FR 5359 through 5360).)

We did not receive any public comments on our proposed methodology for estimating aggregate FY 2003 LTCH PPS payments for purposes of evaluating the one-time prospective adjustment at § 412.523(d)(3). We are adopting this methodology as final, without modification. (We note that we did receive public comments that suggested that we take into account other policy considerations in determining the necessity and magnitude of the one-time prospective adjustment. A summary of these comments and our responses can be found below.)

g. Methodology for Calculating the One-Time Prospective Adjustment Under § 412.523(d)(3)

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28023 through 28032), we described in detail the methodology and the data that we proposed to use to calculate a one-time budget neutrality adjustment factor. In general, under our proposed methodology for evaluating a possible one-time prospective adjustment under § 412.523(d)(3), we proposed to determine a case-weighted average estimated TEFRA payment, consistent with the methodology used when we determined the initial standard Federal rate in the FY 2003 LTCH PPS final rule (68 FR 56032). Then we proposed that each LTCH's estimated total FY 2003 TEFRA payment per discharge would be determined by summing its estimated FY 2003 operating and capital payments under the TEFRA payment system based on FY 2002 cost report data, and dividing that amount by the number of discharges from the FY 2002 cost report data. Next, we proposed to determine each LTCH's average estimated TEFRA payment weighted for its number of discharges in the FY 2002 MedPAR file (for the purpose of estimating FY 2003 LTCH PPS payments) by multiplying its average estimated total TEFRA payment per discharge by its number of discharges in the FY 2002 MedPAR file. We then proposed to estimate total case-weighted TEFRA payments by summing each LTCH's (MedPAR) case-weighted estimated FY 2003 TEFRA payments. Under our proposed methodology, we compared these estimated FY 2003 total TEFRA payments to estimated FY 2003

total LTCH PPS payments in order to determine whether a one-time prospective adjustment would be appropriate. (We also noted that this is the same methodology we used to compare estimated FY 2003 total TEFRA payments to estimated FY 2003 total LTCH PPS payments for purposes of evaluating the one-time prospective adjustment at § 412.523(d)(3) that we presented in the RY 2009 LTCH PPS proposed rule (73 FR 5360).) For additional details on our proposed methodology and the data proposed to use to calculate a one-time budget neutrality adjustment factor, we refer readers to the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28025 through 28031). (As we noted above, we did receive public comments that suggested that we take into account other policy considerations in determining the necessity and magnitude of the one-time prospective adjustment. A summary of these comments and our responses can be found below.)

Based on approximately 91,300 LTCH discharges for 250 LTCHs, under the proposed methodology and data present in the proposed rule, we calculated that estimated FY 2003 LTCH PPS payments are approximately 2.5 percent higher than estimated payments to the same LTCHs in FY 2003 if the LTCH PPS had not been implemented (that is, estimated total FY 2003 TEFRA payment system payments) (77 FR 28031). This 2.5 percent difference exceeded our proposed 0.25 percentage points threshold of what we would consider to be a ''significant difference'' for purposes of determining whether the one-time prospective adjustment provided under § 412.523(d)(3) would be warranted. Although we projected that estimated FY 2003 LTCH PPS payments are approximately 2.5 percent higher than estimated FY 2003 TEFRA payments, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28031), we explained that proposing to reduce the standard Federal rate by 2.5 percent would not ''maintain budget neutrality'' for FY 2003 (that is, estimated FY 2003 LTCH PPS payments would not be equal to estimated FY 2003 TEFRA payments) because a considerable number of LTCH discharges are projected to have received a LTCH PPS payment in FY 2003 based on the estimated cost of the case (rather than a payment based on the standard Federal rate) under the payment adjustment for SSO cases at § 412.529. Specifically, under our proposed methodology, our payment analysis indicates that nearly 20 percent of estimated FY 2003 LTCH PPS payments are SSO payments that were paid based on estimated cost and not based on the LTCH PPS standard Federal rate. These SSO cases that receive a payment based on the estimated cost of the case are generally unaffected by any changes to the standard Federal rate because the estimated cost of the case is determined by multiplying the Medicare allowable charges by the LTCH's CCR (§ 412.529(d)(2)). In other words, if we had proposed to reduce the standard Federal rate by 2.5 percent, estimated total FY 2003 LTCH PPS payments would still be greater than estimated total FY 2003 TEFRA payments (that is, would not be budget neutral), and this difference would be perpetuated in the LTCH PPS payment rates for future years. This is because the estimated LTCH PPS payments for those SSO cases that in FY 2003 were estimated to have been paid 120 percent of the estimated cost of the case generally are not affected (that is, in this case, not lowered) by any one-time prospective adjustment budget neutrality factor that would be applied to the standard Federal rate because those payments are not derived from the standard Federal rate (as explained above). Therefore, it was necessary to propose to offset the standard Federal rate by a factor that is larger than 2.5 percent in order to ensure that estimated total FY 2003 LTCH PPS payments would be equal to estimated total FY 2003 TEFRA payments in order to ''maintain budget neutrality.'' To determine the necessary adjustment factor that would need to be applied to the standard Federal rate in order to ''maintain budget neutrality,'' under the proposed methodology we presented in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28030), we simulated FY 2003 LTCH PPS payments using the same general methodology that we used to estimate FY 2003 LTCH PPS payments when we determined the initial standard Federal rate by simulating payments on a case-by-case basis using the final FY 2003 LTCH PPS payment rates and policies as established when we implemented the LTCH PPS in the August 30, 2002 final rule (67 FR 56032). Using iterative payment simulations using the data from the 250 LTCHs in our database, we determined that we would need to apply a factor of 0.9625 (that is, a reduction of approximately 3.75 percent rather than 2.5 percent) to the standard Federal rate in order to make estimated total FY 2003 LTCH PPS payments equal to estimated total FY 2003 TEFRA payments consistent with our stated policy goal of the one-time prospective adjustment at § 412.523(d)(3) (that is, to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years). (We also noted that the proposed adjustment of approximately −3.75 percent is the same result of the evaluation of the one-time prospective adjustment at § 412.523(d)(3) that we presented in the RY 2009 LTCH PPS proposed rule and final rule (73 FR 5360 and 26804, respectively).) In that same proposed rule (77 FR 258031), we stated (as we did in the RY 2009 LTCH PPS proposed and final rules), that in the years following the initial implementation of the LTCH PPS, we have adopted some revised policies and adjustments to LTCH PPS payment levels. However, none of these revised policies and payment adjustments have addressed the intended purpose of the one-time prospective adjustment allowed under § 412.523(d)(3) of the regulations, to ensure that any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 are not perpetuated in the LTCH PPS rates for future years. For example, the adjustments that we have made to account for coding changes in excess of real severity increases in RYs 2007 through 2010 were made to account for changes in coding behavior in the years following the implementation of the LTCH PPS, and not to address any issue regarding the budget neutrality calculations that were used to establish the base rate for the LTCH PPS. (As we noted above, we received public comments that suggested that we take into account other policy considerations in determining the necessity and magnitude of the one-time prospective adjustment. A summary of these comments and our responses can be found below.)

Based on the general methodology described above, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28031 through 28032), under the broad authority granted to the Secretary under section 123 of the BBRA, as amended by section 307(b) of the BIPA, we proposed to make a one-time prospective adjustment of 0.9625, which would permanently reduce the standard Federal rate by approximately 3.75 percent so to reflect the estimated difference between projected aggregate LTCH PPS payments in FY 2003 and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the

LTCH PPS had not been implemented. Consistent with current law, we also proposed that this adjustment would not apply to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012. Furthermore, given the magnitude of this adjustment and in acknowledgement of hopeful research outcomes (discussed in section VII.E.2. of the preamble of that proposed rule), we proposed to phase-in this approximate 3.75 percent reduction to the standard Federal rate over a 3-year period. Furthermore, we proposed to revise the regulations under § 412.523(d)(3) to specify that the standard Federal rate would be permanently reduced by 3.75 percent (that is, an adjustment of 0.9625) to reflect the estimated difference between projected aggregate LTCH PPS payments in FY 2003 and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented, and this adjustment would be phased-in over 3 years.

We also explained that although the adjustment to the standard Federal rate provided for at § 412.523(d)(3) is called a ''one-time'' prospective adjustment, as stated above, this adjustment would be permanently applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years. Under this proposal, we proposed that we would make a one-time prospective adjustment by applying a factor of 0.98734 to the standard Federal rate in FY 2013 (which would not be applicable to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, consistent with current law), FY 2014, and FY 2015 to completely account for our estimate (determined using the methodology described above) that a factor of 0.9625 (that is $0.98734 \times 0.98734 \times 0.98734 = 0.9625$) needs to be applied to the standard Federal rate in order to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years, consistent with our stated policy goal of the one-time prospective adjustment at § 412.523(d)(3).

The public comments we received on our proposal to make a one-time prospective adjustment of 0.9625, which would permanently reduce the standard Federal rate by approximately 3.75 percent, including our proposed 3-year phase-in of this adjustment, and our responses are presented below.

h. Public Comments and CMS' Responses

Comment: Many commenters objected to the proposed one-time prospective adjustment. Some commenters expressed concern about the financial impact of the proposed reduction to the standard Federal rate with the application of the proposed one-time prospective adjustment in light of LTCH margins for certain providers as cited in MedPAC's March 2012 Report to Congress. Other commenters asserted that, in keeping with CMS' policy goal that any difference between LTCH PPS aggregate payments and estimated TEFRA aggregate payments in the first year of LTCH PPS is not perpetuated in future years, the policy objective behind the one-time prospective adjustment has already been accomplished as a result of other adjustments and payment policy changes under the LTCH PPS since its initial implementation in FY 2003. Some commenters pointed to various payment adjustments made since the inception of the LTCH PPS, including the recalibration of DRG weights, adjustments made to account for changes in documentation and coding that did not reflect actual changes in case mix, elimination of the annual payment updates in interim years, or payment updates that are less than the market basket increase. A number of commenters pointed to the changes made to the SSO policy made in RY 2007 which changed the SSO cost payment option from 120 percent of cost to 100 percent of cost as an adjustment that would preclude CMS from the need to apply the one-time prospective adjustment. Based on an analysis provided by some commenters, they believed that if CMS had paid 100 percent of cost for SSO cases at the time of the LTCH PPS implementation in FY 2003, there would not have been a 2.5 percent difference between aggregate payments made under LTCH PPS and TEFRA payments. These commenters also stated that the SSO policy change in RY 2007 resulted in a reduction in total LTCH payments by 3.6 percent, and argued, therefore, that the SSO policy change essentially accomplishes the intended goal of the one-time prospective adjustment by bringing LTCH spending to at least (or below) the budget neutrality baseline (that is, what current aggregate LTCH PPS payments would be had estimated total FY 2003 LTCH PPS payments been 2.5 percent lower).

In addition, these commenters urged CMS to review and adjust the proposed methodology for calculating the one-time prospective adjustment in a manner that incorporates the SSO policy changes made since the implementation of the LTCH PPS in assessing whether the one-time prospective adjustment is warranted, and believed that doing so would yield a reduced one-time prospective adjustment or eliminate the need for one altogether. These same commenters asserted that CMS must also consider the changes in the SSO policy when calculating the one-time prospective adjustment factor because the SSO policy changes and the one-time prospective adjustment are policies that are aligned because they both were derived from the same broad authority under the statute to make ''appropriate adjustments'' to LTCH PPS. Some commenters also pointed out that, in the past, CMS had indicated that certain payment adjustments, for example the zero percent update to the standard Federal rate for RY 2007, may make the one-time prospective adjustment to the standard Federal rate ''unnecessary. '' These commenters also stated that CMS only cited the adjustments made for documentation and coding to account for the effects of changes in coding that did not reflect actual increase in patient severity in RYs 2007 through 2010 as adjustments that do not address any issue regarding the budget neutrality calculations that were used to establish the base rate for the LTCH PPS. Therefore, these commenters believed that the payment impact of policy changes and adjustment that have been made since the implementation of the LTCH PPS should be taken into consideration when evaluating whether a one-time prospective adjustment is necessary.

Response: We understand the commenters' concern regarding the impact of a reduction to the standard Federal rate due to the application of the proposed one-time prospective adjustment. However, as we discuss below, we believe that a one-time prospective adjustment to the standard Federal rate of approximately 3.75 percent is necessary to ensure that any difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the LTCH PPS rates for future years, and will, therefore, result in appropriate LTCH PPS payments. In light of the magnitude of the proposed one-time prospective adjustment, we proposed to phase-in the

adjustment over a 3-year period, which should mitigate the impact of this reduction to the standard Federal rate. In response to the comment regarding the financial impact on LTCH margins for certain providers, as cited in MedPAC's March 2012 Report to Congress in its rationale for its recommendation to eliminate the update to the LTCH PPS payment rate for FY 2013 in that same report MedPAC noted that LTCH ''margins for 2010 were positive, and [* * *] expect they will remain so. These trends suggest that LTCHs are able to operate within current payment rates.'' (p. 272). We note that, under the proposed phase-in of the proposed one-time prospective adjustment, in conjunction with the proposed market basket update and the subsequent final market basket update (adjusted as required by statute), the proposed update to the LTCH PPS standard Federal rate would result in a slight increase to the LTCH PPS payment rate for FY 2013. Therefore, we believe that the positive update to the standard Federal rate coupled with overall positive LTCH margins (as reported by MedPAC) and the proposed phase-in of the one-time prospective adjustment will act to mitigate the financial impact of the one-time prospective adjustment.

We disagree with commenters that payment policy changes and adjustments made since the implementation of the LTCH PPS have already served as a substitute for the one-time prospective adjustment, and we continue to believe that a one-time prospective adjustment is necessary to ensure that any significant difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates (that is, the standard Federal rate) in future years. The various payment policy changes and adjustments established since the inception of the LTCH PPS were never made to address any budget neutrality requirement related to the initial implementation of the LTCH PPS, nor were they ever presented as such. Our regulations at § 412.523(d)(3) clearly state that the Secretary ''may make a one-time prospective adjustment to the long-term care hospital prospective payment system *rates* * * * so that the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment system *rates* for future years.'' (emphasis added). Our policy has always been that the one-time prospective adjustment be applied to the standard Federal rate. As we discussed in the RY 2009 LTCH PPS final rule (73 FR 26803), our policy objective in providing for this one-time prospective adjustment has always been to ensure that computations based on the earlier, necessarily limited (but at the time best available) data available at the inception of the LTCH PPS would not be built permanently into the rates if data available at a later date could provide more accurate results. The intended goal of the one-time prospective adjustment is to establish the LTCH PPS standard Federal rate in a manner that results in bringing current estimated aggregate LTCH PPS payments to the level they would have been had the estimated total FY 2003 LTCH PPS payments been 2.5 percent lower. The policy changes and adjustments that have been made to the LTCH PPS since its inception are part and parcel of fine-tuning a new prospective payment system, and were made to address explicitly stated policy goals, none of which were duplicative of the stated purpose and end-result of the one-time prospective adjustment, which ensures that any significant difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates (that is, the standard Federal rate) in future years.

In the RY 2007 LTCH PPS final rule, we modified the SSO policy, changing the SSO cost payment option from 120 percent of cost to 100 percent of cost, effective beginning July 1, 2006 (RY 2007). We clearly stated that we believed that by providing a reduced payment for SSO cases, we would discourage hospitals from admitting patients for whom they would not provide complete treatment to maximize Medicare payments. We believed that the previous SSO policy may have unintentionally provided a financial incentive for LTCHs to admit patients more appropriately treated in other settings (71 FR 27845). This policy change was not intended to address the one-time prospective adjustment in any way (nor does it duplicate the stated purpose or effect of the one-time prospective adjustment), but was intended to prevent inappropriate patient movement to LTCHs. The commenters are correct in that both the change to the SSO policy and the one-time prospective adjustment are authorized by the same broad statutory authority to make appropriate adjustments. However, each of these adjustments is proper in its own context, serves different purposes, and reflects different policy concerns. Consequently, we disagree with the commenters that we must consider the changes in the SSO policy when calculating the one-time prospective adjustment factor because the SSO policy changes and the one-time prospective adjustment are policies that were both derived from the same broad authority under the statute to make ''appropriate adjustments'' under the LTCH PPS for the reasons discussed above.

We acknowledge that we have stated in the past (such as in the RY 2007 final rule when we established a 0.0 percent update to the standard Federal rate for RY 2007) that we may consider other payment adjustments when deciding whether or not to implement the one-time prospective adjustment. However, such statements were made prior to the first comprehensive discussion of the stated purpose of the one-time prospective adjustment or the development of a methodology under which to determine whether such an adjustment is warranted (first presented in the RY 2009 proposed and final rules). In the RY 2009 proposed and final rules (73 FR 5354 and 26801), we did, in fact, state that none of revised policies and payment adjustments that were made in the years following the initial implementation of the LTCH PPS addressed the intended purpose of the one-time prospective adjustment allowed under § 412.523(d)(3) of the regulations, to ensure that any significant difference between the original estimates and calculations based on more recent data are not perpetuated in the LTCH PPS rates for future years. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28031), we referenced the documentation and coding adjustment which was made to account for the effects of changes in coding that did not reflect actual increase in patient severity in RYs 2007 through 2010. These adjustments were noted merely as examples of payment adjustments made in the years following the implementation of the LTCH PPS that did not address any issue regarding the budget neutrality calculations that were used to establish the base rate for the LTCH PPS, and were not presented as an exhaustive list of policy changes and payment adjustments that had been implemented since FY 2003.

We continue to believe that the one-time prospective adjustment is based on the difference in payment between what would have otherwise been paid under the TEFRA payment system and

payments made under the LTCH PPS as it was implemented in FY 2003, only, as is consistent with our policy goal of the one-time prospective adjustment. Therefore, we disagree with commenters' assertions that the payment impact of policy changes and adjustment that have been made since the implementation of the LTCH PPS should be taken into consideration when evaluating whether a one-time prospective adjustment is necessary. In the RY 2007 LTCH PPS final rule (71 FR 27864), we stated that it has been our consistent interpretation that the statutory requirement for budget neutrality applies exclusively to FY 2003 when the LTCH PPS was implemented. Accordingly, we are finalizing our methodology for calculating for the one-time prospective adjustment, as proposed, without accounting for any revised policies and payment adjustments that have been made in the years following the initial implementation of the LTCH PPS, including the SSO policy changes.

Comment: Some commenters stated that CMS correctly identified that SSO cases have an impact on the calculation of the one-time perspective adjustment (that is, the proposed adjustment to reduce the standard Federal rate by approximately 3.75 percent was higher than the estimated 2.5 percent difference between LTCH PPS payments and TEFRA payments in FY 2003 in order to account for SSO cases that are not paid based on the standard Federal rate). However, these commenters believed that CMS specifically needs to consider the percentage of LTCH PPS payments that are paid as SSOs and how that percentage has changed over time, highlighting the fact that in 2012 only 30 percent of cases were SSO cases versus 48 percent in 2003. These commenters believed that the proposed 3.75 percent one-time perspective adjustment is overstated because CMS' proposed methodology does not account for the fact that there are currently fewer SSO cases than there were in FY 2003, and specifically requested that CMS recalculate the one-time prospective adjustment to include an adjustment to reflect the current level of SSO case. By accounting for current levels of SSO cases (30 percent versus 48 percent) in CMS' proposed methodology, the commenters calculated a one-time perspective adjustment of 2.75 percent (instead of 3.75 percent).

Response: As mentioned above, although we agree that the levels of SSO cases have changed since the inception of the LTCH PPS, the policy objective behind the one-time prospective adjustment has always been to ensure that any significant difference between the data used in the original computation of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 are not perpetuated in the LTCH PPS rates for future years. Consistent with this policy objective, our proposed methodology for determining a one-time prospective adjustment compares estimated payments that would have been made in FY 2003 under the TEFRA payment system to estimated payments under the LTCH PPS in FY 2003. Thus, the data and methodology that we have employed for this purpose is limited to the types of Medicare cases projected to have been treated in LTCHs in 2003, and the 2012 levels of SSO cases are not germane to the computations of budget neutrality for FY 2003 under the one-time prospective adjustment under § 412.523(d)(3). As discussed above, we continue to believe that the one-time prospective adjustment should be based on any difference in payment between what would have otherwise been paid under the TEFRA payment system and payments made under the LTCH PPS as it was implemented in FY 2003, only. The current level of SSO cases has no relationship to estimated FY 2003 LTCH PPS payments, which were used to evaluate and calculate the proposed one-time prospective adjustment under § 412.523(d)(3). For these reasons, we disagree with the commenters' assertions that the proposed 3.75 percent one-time prospective adjustment is overstated, and are not adopting the commenters' suggestion to make an adjustment to our methodology for calculating the one-time prospective adjustment to account for the current level of SSO cases. Therefore, as stated above, we are finalizing our methodology for calculating for the one-time prospective adjustment, as proposed, without modification.

Comment: One commenter believed that CMS is inconsistent in its treatment of ''the one-time adjustment'' across various PPSs, specifically citing that a Inpatient Rehabilitation Facility (IRF) policy that reduced the standard Federal rate to account for changes in coding that did not reflect changes in case-mix index. The commenter stated that such adjustments to account for changes in coding that did not reflect changes in case-mix index have been adopted under both the IRF PPS and the LTCH PPS. However in the case of the IRF PPS, CMS considered that adjustment to have satisfied ''its responsibility to perform a one-time adjustment'' under the IRF PPS while a similar adjustment to account for changes in coding that did not reflect changes in case-mix index made under the LTCH PPS did not negate CMS' need to impose a one-time prospective adjustment under § 412.523(d)(3). They requested a full explanation on why LTCHs are being treated differently than IRFs and suggested that this inconsistency is inequitable.

Response: We believe that the commenter has mistakenly assumed that the adjustment to account for coding or classification changes that did not reflect real changes in case-mix under the IRF PPS is the same as the one-time prospective adjustment under § 412.523(d)(3). Under the IRF PPS, we established a reduction to the standard payment amount of 1.9 percent to account for coding changes consistent with the requirement set forth in section 1886(j)(2)(C)(ii) of the Act that directs the Secretary to adjust the per payment unit payment rate for IRF services to eliminate the effect of coding or classification changes that do not reflect real changes in case-mix if the Secretary determines that changes in coding or classification of patients' severity of illnesses have resulted or will result in changes in aggregate payments under the classification system (70 FR 47904 through 47908). In the discussion of the development of the IRF standard payment conversion factor for FY 2006 in that same final rule (70 FR 47937, 47939, and 47950), we referred to that ''adjustment'' as ''a *one-time* reduction to the standard payment amount of 1.9 percent to adjust for coding changes that increased payments to IRFs'' (emphasis added). We believe that because the term ''one-time'' was used in conjunction with the 1.9 percent reduction that was applied in determining the IRF standard payment conversion factor for FY 2006, that the commenter mistakenly believed that adjustment serves the same purpose as the one-time prospective adjustment under § 412.523(d)(3).

As discussed in the FY 2006 IRF PPS final rule (70 FR 47904 through 47908), the ''one-time'' reduction to the standard payment amount of 1.9 percent was based on an analysis that showed that there was an increase in FY 2003 IRF PPS payments due to documentation and coding changes that did not reflect real changes in case-mix, and we believed that changes in payment amounts should accurately reflect changes in IRFs' patient case-mix (that is, the true cost of treating patients), and should not be influenced by changes in coding practices. As the commenter pointed out, the purpose of the ''one-time'' 1.9 percent reduction made to the FY 2006 IRF standard

payment amount is similar in purpose to the documentation and coding adjustments that have been made under the LTCH PPS. However, the purpose of those documentation and coding adjustments made under the LTCH PPS (that is, to account for increases in LTCH PPS payments that were due to documentation and coding changes that do not reflect real changes in case-mix) is separate and distinct from that of the stated purpose of the LTCH PPS one-time prospective adjustment under § 412.523(d)(3) (that is, to ensure that any significant difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years). Therefore, we disagree with the commenter that we have been inconsistent or inequitable in our treatment in applying adjustments, including the one-time prospective adjustment provided for at § 412.523(d)(3), across various PPSs. We also note that we responded to a similar comment on our proposal to extend the regulatory timeframe for making the possible one-time prospective adjustment under § 412.523(d)(3) in the RY 2007 LTCH PPS final rule (27842 through 27843), where we believe that the commenter mistakenly assumed that the adjustment to account for changes in documentation and coding practices that did not reflect real changes in case-mix is the same as the one-time prospective adjustment under § 412.523(d)(3). In response, we explained that because the intended purposes of those adjustments are different, we do not believe that we acted in an inconsistent manner by making two separate adjustments under the LTCH PPS that have separate and distinct purposes. Similarly, we disagree with the commenter that CMS is inconsistent in its treatment of ''the one-time adjustment'' across various PPSs since the purposes of those adjustments are separate and distinct (as explained above).

Comment: One commenter objected to the one-time prospective adjustment because a budget neutrality factor is already being applied during the MS-LTC-DRG recalibration process. The commenter believed that applying the one-time prospective adjustment would place providers in double jeopardy because if they are coding accurately, they will get penalized on an annual basis from the MS-LTC-DRG recalibration budget neutrality factors and the one-time prospective adjustment ''budget neutrality factor.''

Response: CMS' regulations under § 412.517(b) require that, ''the annual changes to the LTC–DRG classifications and recalibration of the weighting factors * * * are made in a budget neutral manner such that estimated aggregate LTCH PPS payments are not affected.'' We established this requirement in order to mitigate fluctuations in aggregate LTCH PPS payments resulting from the annual update to the MS–LTC–DRG classifications and relative weights that reflect changes in relative resource use based on the latest available data (72 FR 26880 through 26882). The purpose of the annual MS–LTC–DRG recalibration budget neutrality factor is separate and distinct from that of the one-time prospective adjustment, and is not germane to ensuring that any significant difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years. Therefore, we disagree with the commenter that applying both the one-time prospective adjustment and the annual MS–LTC–DRG recalibration budget neutrality factor would result in a double adjustment to LTCHs for accurate coding.

Comment: Many commenters commended our proposal to phase-in the one-time prospective adjustment over 3 years. Some commenters requested that CMS phase-in the adjustment over 4 years. One commenter requested a 5-year phase-in. One commenter, who supported the 3-year phase-in, requested that the one-time prospective adjustment that would be applied to the standard Federal rate for each year for FYs 2013 through 2015 be removed before establishing the initial base rates each year for FYs 2014 and 2015 so as not to create a compounding effect of the reduction in those years.

Response: We appreciate the commenters' support to phase-in the one-time prospective adjustment. In recognition of the magnitude of this adjustment, we proposed to phase-in the adjustment over a 3 year period, which should mitigate the impact of this reduction to the standard Federal rate, and we continue to believe that 3 years is a sufficient amount of time for providers to adjust to the effect on their LTCH PPS payments resulting from this adjustment.

As we explained in the proposed rule (77 FR 28031), the proposed one-time prospective adjustment of 0.9625 would be *permanently* applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years. To achieve a permanent adjustment of 0.9625, we proposed to apply a factor of 0.98734 to the standard Federal rate in each year of the 3-year phase-in, that is, in FY 2013 (which would not be applicable to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, consistent with current law), FY 2014, and FY 2015. By applying a permanent factor of 0.98734 to the standard Federal rate in each year for FYs 2013, 2014, and 2015, we will completely account for the entire 3.75 percent adjustment by having applied a cumulative factor of 0.9625 (calculated as $0.98734 \times 0.98734 \times 0.98734 = 0.9625$). Consequently, applying a factor of 0.98734 in each of FYs 2013 through 2015 would create a compounding effect of the reduction and it is not appropriate to remove the prior year's factor before establishing the standard federal rate for FYs 2014 and 2015. As discussed above, a factor of 0.9625 (or approximately a 3.75 percent reduction) to the standard Federal rate is necessary to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years consistent with our stated policy goal of the one-time prospective adjustment at § 412.523(d)(3). As discussed below in this section, we are revising our proposed revision to § 412.523(d)(3) to clarify the standard Federal rate will be permanently adjusted by to account for the estimated difference between projected aggregate FY 2003 LTCH PPS payments and the projected aggregate FY 2003 TEFRA payments.

i. Final Policy Regarding the One-Time Prospective Adjustment Under § 412.523(d)(3)

After consideration of the public comments we received, we are finalizing our proposal to make a one-time prospective adjustment to the standard Federal rate so that it will be permanently reduced by approximately 3.75 percent to account for the estimated difference between projected aggregate FY 2003 LTCH PPS payments and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented. Based on approximately 91,300 LTCH discharges for 250 LTCHs, under the methodology and data presented above, we calculated that estimated FY 2003 LTCH PPS payments are approximately

2.5 percent higher than estimated payments to the same LTCHs in FY 2003 if the LTCH PPS had not been implemented (that is, estimated total FY 2003 TEFRA payment system payments). This 2.5 percent difference exceeds the 0.25 percentage points threshold of what we consider to be a ''significant difference'' for purposes of determining whether the one-time prospective adjustment provided under § 412.523(d)(3) is warranted, as discussed above in this final rule. As also discussed in greater detail above, because of the estimated LTCH PPS payments for certain SSO cases are generally not affected by any one-time prospective adjustment factor that is applied to the standard Federal rate, it is necessary to offset the standard Federal rate by a factor that is larger than 2.5 percent in order to ensure that estimated total FY 2003 LTCH PPS payments would be equal to estimated total FY 2003 TEFRA payments in order to ''maintain budget neutrality'', thereby ensuring that the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the LTCH prospective payment rates for future years.

To determine the necessary adjustment factor to apply to the standard Federal rate to make the one-time prospective adjustment under § 412.523(d)(3), using the methodology we are adopting in this final rule (as described in this section), we simulated FY 2003 LTCH PPS payments by simulating payments on a case-by-case basis using the final FY 2003 LTCH PPS payment rates and policies as established when we implemented the LTCH PPS in the August 30, 2002 final rule (67 FR 56032). Using iterative payment simulations using the data from the 250 LTCHs in our database, we determined that we need to apply a factor of 0.9625 (that is, a reduction of approximately 3.75 percent rather than 2.5 percent) to the standard Federal rate in order to make estimated total FY 2003 LTCH PPS payments equal to estimated total FY 2003 TEFRA payments consistent with our stated policy goal of the one-time prospective adjustment under § 412.523(d)(3) (that is, to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years).

Furthermore, given the magnitude of this adjustment and in acknowledgement of hopeful research outcomes, we are finalizing our proposal to phase-in this approximate 3.75 percent reduction to the standard Federal rate over a 3-year period. Although the adjustment to the standard Federal rate provided for at § 412.523(d)(3) is called a ''one-time'' prospective adjustment, as stated above, this adjustment will be permanently applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years. During this 3-year period, we intend to further explore potential revisions to certain LTCH PPS payment policies as discussed above in section VII.E.2. of this preamble. Below, we describe the methodology that we are establishing in this final rule to determine the one-time prospective adjustment under § 412.523(d)(3) of the regulations. (We note that, as discussed above, this is the same methodology we proposed in the FY 2013 IPPS/LTCH PPS proposed rule.)

In this final rule, to evaluate a one-time prospective adjustment under § 412.523(d)(3) of the regulations, we based our estimate of FY 2003 LTCH PPS payments on the same set of discharges (from FY 2002) which are the basis for the estimate of what would have been paid in FY 2003 under the reasonable cost-based (TEFRA) payment system. Specifically, we compared—

- Estimated aggregate FY 2003 TEFRA payments calculated on the basis of FY 2002 costs, updated to FY 2003, to
- Estimated aggregate payments that would have been made in FY 2003 under the LTCH PPS methodology, by applying the FY 2003 LTCH payment rules to the discharges that occurred in FY 2002.

As discussed above, we believe that this approach will ensure that we are comparing the estimated FY 2003 TEFRA payments, which are based on updated costs incurred for FY 2002 discharges, to the estimated PPS payments that would have been made for those same FY 2002 discharges under the new LTCH PPS payment methodology.

Under the policy we are adopting in this final rule to use FY 2002 LTCH costs as a basis for estimating FY 2003 LTCH TEFRA payments in evaluating whether to establish a one-time prospective adjustment under § 412.523(d)(3), as we proposed, we are updating LTCHs' FY 2002 costs for inflation to FY 2003 by our Office of the Actuary's current estimate of the actual increase in the excluded hospital market basket from FY 2002 to FY 2003 of 4.2 percent. This updated amount serves as the proxy for actual FY 2003 costs under the TEFRA payment system in the budget neutrality computation for purposes of the one-time prospective adjustment at § 412.523(d)(3). We note that, as we proposed, under our methodology to estimate reasonable cost-based payments under the TEFRA payment system, we updated LTCHs' TEFRA target amounts from FY 2002 to FY 2003 using the forecasted market basket percentage increase of 3.5 percent, as discussed in greater detail below. This approach maintains consistency with the approach taken in the FY 2003 IPPS final rule in which we established an applicable rate-of-increase percentage to update TEFRA target amounts from FY 2002 to FY 2003 of 3.5 percent (67 FR 50289). This increase was based on our Office of the Actuary's forecasted increase in the excluded hospital market basket for FY 2003, using the best available data at that time. Based on more recent data, our Office of the Actuary now estimates the actual increase in the excluded hospital market based from FY 2002 to FY 2003 is 4.2 percent (as stated above). We believe it is appropriate to use the current estimate of the actual increase in the excluded hospital market basket based from FY 2002 to FY 2003 (4.2 percent) to update LTCHs' FY 2002 costs for inflation to FY 2003 because this reflects the most recent estimate of increases in the prices of goods and services realized by LTCHs when providing inpatient hospital services.

The methodology we are adopting in this final rule to estimate FY 2003 LTCH payments under the TEFRA payment system (which is presented below) is similar in concept to the methodology we used to estimate FY 2003 LTCH total payments under the TEFRA payment system when we determined the initial standard Federal rate in the August 30, 2002 final rule (67 FR 56030 through 56033). We note that our methodology for estimating FY 2003 LTCH total payments under the TEFRA payment system using FY 2002 cost data for the purposes of the one-time prospective adjustment at § 412.523(d)(3), includes modifications to the methodology we used to estimate FY 2003 LTCH total payments under the TEFRA system when we implemented the LTCH PPS because we used data from a later period (FY 2002 as compared to FYs 1998 and 1999), as discussed in greater detail below. As we proposed, in general, we estimated total LTCH

payments under the TEFRA payment system in FY 2003 using the following steps:

- Estimate each LTCH's payment per discharge for inpatient operating costs under the TEFRA payment system for FY 2003, including continuous bonus improvement payments (Step 1);
- Estimate each LTCH's payment per discharge for capital-related costs for FY 2003 (Step 2); and
- Sum each LTCH's estimated operating and capital payment per case to determine its estimated total FY 2003 TEFRA payment system payment per discharge (Step 3).

We discuss each of these steps in greater detail below.

Step 1.—Estimate each LTCH's payment per discharge for inpatient operating costs under the TEFRA payment system for FY 2003.

Under our methodology, the first step in the process of estimating total FY 2003 payments under the TEFRA payment system is to estimate each LTCH's payment per discharge for inpatient operating costs under the TEFRA payment system. Until FY 1998, the payment methodology for inpatient operating costs under the TEFRA payment system was a relatively straightforward process. First, we calculated a target amount by dividing the Medicare total allowable inpatient operating costs in a base year by the number of Medicare discharges. The provider's target amount under the TEFRA payment system (referred to as the TEFRA target amount) was then updated by a rate-of-increase percentage (§ 413.40(c)(3) of the regulations to determine the TEFRA target amount for the subsequent cost reporting period (§ 413.40(c)(4)(i) and (ii)). Generally, for any particular cost reporting period, the Medicare payment for inpatient operating costs would be the lesser of the hospital's allowable net inpatient operating costs, or the updated TEFRA target amount multiplied by the number of Medicare discharges during the cost reporting period, that is, the TEFRA ceiling (§ 413.40(a)(3)).

The TEFRA payment system methodology described above, broadly speaking, is the general approach that we used to arrive at an estimate of what Medicare payments for hospital inpatient operating costs would have been in FY 2003 under the TEFRA payment system. That is, under our methodology, each LTCH's FY 2003 TEFRA target amount was calculated by updating its estimated FY 2002 target amount per discharge by the full market basket percentage increase. The sum of all LTCH payments for operating costs (TEFRA target amount multiplied by Medicare discharges), bonus or relief payments, continuous improvement bonus payments, and payments for capital-related costs yields, in general, the estimate of what total Medicare payments to LTCHs would have been in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented.

However, because sections 4413 through 4419 of the BBA of 1997, section 122 of the BBRA of 1999, and section 307(a)(1) of the BIPA made numerous changes to the TEFRA payment system, our methodology reflects variations in the method described above to arrive at the estimate of FY 2003 payments for the inpatient operating costs of each LTCH under the TEFRA payment system, depending on the participation date of the hospital. Specifically, we made the requisite computations differently for two classes of hospitals, ''existing'' hospitals and ''new'' hospitals. (A detailed explanation of the provisions affecting LTCHs, established by each of the amendments, is found in the August 30, 2002 final rule that implemented the LTCH PPS (67 FR 55959).) We discuss below these specific BBA, BBRA, and BIPA changes, and their impact on the calculations of estimated FY 2003 TEFRA payments for ''existing'' and ''new'' hospitals under our methodology for estimating total LTCH payments under the TEFRA payment system in FY 2003 for purposes of the one-time prospective adjustment under § 412.523(d)(3). As discussed in greater detail below, we employed two approaches to estimate Medicare payments under the TEFRA payment system to LTCHs in FY 2003, depending on how these changes in calculating TEFRA payments, as established by the amendments, applied to each LTCH. (We note, the discussion below of the specific BBA, BBRA, and BIPA changes and their impact on the calculations of estimated FY 2003 TEFRA payments for ''existing'' and ''new'' hospitals under our methodology for estimating total LTCH payments under the TEFRA payment system in FY 2003 for purposes of the one-time prospective adjustment under § 412.523(d)(3) is the same as the discussion presented in the RY 2009 LTCH PPS proposed rule (73 FR 5356 through 5359).)

The first set of changes that we took into account was included in the BBA. The BBA made significant changes to the TEFRA payment methodology starting with cost reporting periods beginning on or after October 1, 1997. While the changes were applicable to three types of PPS-excluded providers (rehabilitation hospitals and units, psychiatric hospitals and units, and LTCHs), the following discussion will address the provisions of the amendments as they relate to LTCHs.

The first change to consider under the BBA is section 4414 that established caps on the TEFRA target amounts for cost reporting periods beginning on or after October 1, 1997, for LTCHs that were paid as IPPS-excluded providers prior to that date. The cap was determined by taking the 75th percentile of target amounts for cost reporting periods ending in FY 1996 for each class of provider (rehabilitation hospitals and units, psychiatric hospitals and units, and LTCHs), updating that amount by the market basket percentage increases to FY 1998, and applying it to the cost reporting period beginning on or after October 1, 1997 (62 FR 46018). The cap calculated for FY 1998 was updated by the applicable market basket percentages for cost reporting periods beginning during FY 1999 through 2002. Providers subject to the 75th percentile cap were paid the lesser of their inpatient operating costs or the TEFRA target amount, which was limited by the 75th percentile cap amount (67 FR 55959). In addition, section 4411 of the BBA established a formula for calculating the update factor for FY 1999 through FY 2002 that was dependent on the relationship of a provider's inpatient operating costs to its ceiling amount based on data from the most recently available cost report. Section 121 of the BBRA provided that the 75th percentile cap amount should be wage adjusted, starting with cost reporting periods beginning on or after October 1, 1999, and before October 1, 2002.

The second change that we took into account was section 4415 of the BBA. This provision revised the percentage factors used to determine the amount of bonus and relief payments for LTCHs meeting specific criteria. If a provider's net inpatient operating costs did not exceed the hospital's ceiling, a bonus payment was made to the LTCH (§ 413.40(d)(2) of the regulations). The bonus payment was the lower of 15 percent of the difference between the hospital's inpatient operating costs and the ceiling, or 2 percent of the ceiling. In addition, relief payments were made to providers whose net inpatient operating costs were greater than 110 percent of the ceiling (or adjusted ceiling, if applicable). These relief payments were the lower of 50 percent of the allowable inpatient operating costs in excess of 110 percent of the ceiling (or the adjusted ceiling, if applicable) or 10 percent of the ceiling

(or adjusted ceiling, if applicable) (§ 413.40(d)(3)(ii) of the regulations).

The third change that was considered was the additional incentive established by section 4415 of the BBA, the CIB payment for providers meeting certain conditions and that kept their costs below the target amount. Eligibility for the CIB payment required that a provider had three full cost reporting periods as an IPPS-excluded provider prior to the applicable fiscal year (62 FR 46019). To qualify for a CIB payment, a provider's operating costs per discharge in the current cost reporting period had to be lower than the least of any of the following: its target amount; its expected costs, that is, the lower of its target amount or allowable inpatient operating costs per discharge from the previous cost reporting period, updated by the market basket percent increase for the fiscal year; or, its trended costs, that is, the inpatient operating costs per discharge from its third full cost reporting period, updated by the market basket percentage increase to the applicable fiscal year (62 FR 46019; § 413.40(d)(5)(ii)(B) of the regulations). For providers with their third or subsequent full cost reporting period ending in FY 1996, trended costs are the lower of their allowable inpatient operating costs per discharge or target amount updated forward to the current year (§ 413.40(d)(5)(ii)(A) of the regulations). The CIB payment equals the lesser of 50 percent of the amount by which the operating costs were less than expected costs, or 1 percent of the ceiling (§ 413.40(d)(4) of the regulations). Section 122 of the BBRA increased this percentage for LTCHs for FY 2001 to 1.5 percent of the ceiling, and beginning in FY 2002, to 2 percent of the ceiling (§ 413.40(d)(4)(ii) and (iii) of the regulations). The increase in the CIB payment percentage is not to be accounted for in the development and implementation of the LTCH PPS in accordance with section 307(a)(2) of BIPA.

The fourth change that we took into account was section 4416 of the BBA, which significantly revised the payment methodology for ''new'' IPPS-excluded providers. This provision applies to three classes of providers—psychiatric hospitals and units, rehabilitation hospitals and units, and LTCHs—that were not paid as excluded hospitals prior to October 1, 1997. The payment amount for a new provider for the first 12-month cost reporting period is the lower of its Medicare inpatient operating cost per discharge or a limit based on 110 percent of the national median of target amounts for the same class of hospital for cost reporting periods ending in FY 1996, updated by the market basket percentage increases to the applicable period, and wage-adjusted. The payment limit in the second 12-month cost reporting period is the same 110 percent limit as for the first year (§ 413.40(f)(2)(ii)). A new provider's target amount would be established in its third cost reporting period by updating the amount paid in its second cost reporting period by the market basket percentage increase for hospitals and hospital units excluded from the IPPS, applicable to the specific year, as published annually in the **Federal Register**, which then becomes the target amount for its third cost reporting period. The target amount for the fourth and subsequent cost reporting periods is determined by updating the target amount from the previous cost reporting period by the applicable market basket percentage increase.

Finally, two provisions under BIPA specifically related to LTCHs. Section 307(a) of BIPA provided a 2 percent increase to the wage-adjusted 75th percentile cap for existing LTCHs for cost reporting periods beginning in FY 2001, and a 25 percent increase to the target amount for LTCHs, subject to the increased 75th percentile cap. However, it is important to note that in accordance with section 307(a)(2) of BIPA, the 2 percent increase to the 75th percentile cap and the 25 percent increase to the target amount were not to be taken into account in the development and implementation of the LTCH PPS.

In this final rule, under our methodology, in order to determine what a LTCH's estimated payments would be under the TEFRA payment system in FY 2003, we used cost report data for LTCHs from the Hospital Cost Reporting Information System (HCRIS) for FYs 1999 through 2002. In addition, to determine whether a LTCH is ''new,'' the certification date for each LTCH was obtained from the On-line Survey & Certification Automated Reporting (OSCAR) file. Based on the certification date, a LTCH would either be a ''new'' LTCH, meaning a LTCH that was not paid as an excluded hospital prior to October 1, 1997, or an ''existing'' LTCH, meaning a LTCH that was paid as an excluded hospital prior to October 1, 1997. This could include a LTCH that was certified as an LTCH on or after October 1, 1997, but was previously paid as another type of IPPS-excluded provider prior to October 1, 1997. Our approach to estimating Medicare payments in FY 2003 under the TEFRA payment system varies somewhat, depending on whether an LTCH was either ''existing'' or ''new'' is discussed in greater detail below. Below we discuss our methodology for estimating FY 2003 inpatient operating payments under the TEFRA payment system for ''existing'' hospitals (Step 1.a.) and ''new'' hospitals (Step 1.b.), and our methodology for estimating CIB payments under the TEFRA payment system in FY 2003 (under Step 1.c.).

Step 1.a.—Estimate FY 2003 inpatient operating payments under the TEFRA payment system for ''existing'' LTCHs.

Based on the applicable statutory changes mentioned above, under our methodology, the first step was to estimate FY 2003 inpatient operating payments under the TEFRA payment system for ''existing'' LTCHs. ''Existing'' LTCHs are those receiving payment as IPPS-excluded providers in cost reporting periods prior to FY 1998. These LTCHs were subject to the 75th percentile cap on their hospital-specific target amounts. While section 307(a)(1) of BIPA provided for a 2-percent increase to the 75th percentile cap amount for LTCHs for cost reporting periods beginning in FY 2001 and a 25-percent increase to the target amount for cost reporting periods beginning in FY 2001 (subject to the limiting or cap amount determined under section 1886(b)(3)(H) of the Act), section 307(a)(2) of BIPA precluded accounting for these increases in developing the LTCH PPS. In addition, section 122 of the BBRA increased the CIB payment percentage to 1.5 percent for FY 2001 and 2.0 percent for FY 2002 (§ 413.40(d)(4)(ii) and (iii)). But these increases, also, are not to be accounted for the development and implementation of the LTCH PPS in accordance with section 307(a)(2) of BIPA. Therefore, to ensure that these increases would be excluded from the computations, as required by the statute, we estimated an existing LTCH's FY 2003 target amount by starting with the hospital's target amount from the FY 2000 cost report, the year prior to when these increases were effective. Target amounts and payments for FY 2003 were simulated using the FY 2000 target amount in the hospital's cost report and updating the target amount for each subsequent cost reporting period by the applicable rate-of-increase percentage as described in § 413.40(c)(3)(vii) through FY 2002. The target amount from FY 2002 was updated by the forecasted market basket percentage increase of 3.5 percent to arrive at the FY 2003 target amount (§ 413.40(c)(3)(viii)). (We note that the forecasted increase in the excluded hospital market basket for FY 2003 of 3.5 percent was used to establish the applicable rate-of-increase percentage used to update TEFRA target

amounts in accordance with § 413.40(c)(3)(viii) in the FY 2003 IPPS final rule (67 FR 50289)). Based on more recent data, our Office of the Actuary currently estimates an increase of 4.2 percent in the excluded hospital market basket for FY 2003, which we used to update LTCHs' FY 2002 costs to FY 2003, as described below.) In a small number of cases where FY 2002 operating cost data were not available, we used operating cost data from the most recent year available and trended it forward to FY 2003. In addition, we estimated FY 2003 bonus or relief payments without the inclusion of the 2-percent and 25-percent increases to the cap amount and target amount, respectively, and without the 1.5 percent and 2.0 percent increases to the CIB payments, consistent with section 307(a)(2) of BIPA as discussed above.

In addition, because comparisons were made between the target amount and Medicare inpatient operating costs to determine bonus or relief payments, under our methodology, we estimated FY 2003 operating costs for each LTCH by updating its FY 2002 operating costs by the actual percentage increase in operating costs for PPS-excluded hospitals from FY 2002 to FY 2003 (4.2 percent, as determined by our Office of the Actuary) because this is currently our best estimate of actual cost increase from FY 2002 to FY 2003 realized by excluded hospitals, including LTCHs. As discussed earlier, we estimated the FY 2003 operating costs using FY 2002 costs rather than using the costs reported on the FY 2003 cost report.

The 75th percentile cap for LTCHs for FY 2002, without the 2-percent and 25-percent increases to the cap and target amount, respectively, was $30,783 for the wage-index adjusted labor-related share, and $12,238 for the nonlabor-related share. If a LTCH's costs and hospital-specific target amount were above the 75th percentile cap, Medicare's payment under the TEFRA system would be the wage-index adjusted cap amount. If under our payment model a LTCH's estimated FY 2002 TEFRA payment would have been limited by the wage-adjusted 75th percentile cap in FY 2002, that amount would be updated by the forecasted market basket percentage increase (of 3.5 percent) to FY 2003 to determine the LTCH's FY 2003 target amount that was used to estimate its TEFRA payment system amount for FY 2003 under our methodology.

Step 1.b.—Estimate FY 2003 inpatient operating payments under the TEFRA payment system for ''new'' LTCHs.

Next, under our methodology, we estimated FY 2003 hospital operating payments under the TEFRA payment system for ''new'' LTCHs based on the applicable statutory changes discussed above. A ''new'' LTCH is one that was first paid as an IPPS-excluded hospital on or after October 1, 1997. For a ''new'' LTCH, payment in the hospital's first 12-month cost reporting period is the lower of its Medicare net inpatient operating costs per discharge or the wage-adjusted 110 percent median amount determined for that particular year (§ 413.40(f)(2)(ii) of the regulations). For the hospital's second 12-month cost reporting period, payment is the lower of their costs, or the same 110 percent median amount that was used in the first cost reporting period, that is, it is not updated. The hospital's ''target amount'' is established in the third cost reporting period by updating the per discharge amount that was paid in the prior cost reporting period by the estimated market basket percentage increase for hospitals and hospital units excluded from the IPPS, applicable to the specific year, as published annually in the **Federal Register**. Therefore, if the LTCH was paid its costs in the previous cost reporting period because costs were lower than the 110 percent median amount, the hospital's cost per discharge for the second cost reporting period is updated and becomes the target amount for the hospital's third cost reporting period. Target amounts for subsequent cost reporting periods are determined by updating the previous year's target amount by the applicable market basket percentage increase.

New LTCHs with their first 12-month cost reporting period beginning in FY 1998 would have had a target amount calculated under section 1886(b)(7)(A)(ii) of the Act in FY 2000. Therefore, consistent with our finalized policies concerning ''existing'' LTCH's (described in Step 1.a. above), in estimating the FY 2003 target amount for ''new'' LTCHs we used the target amount from the FY 2000 cost report and updated that target amount by the applicable estimated market basket percentage increases as published annually in the **Federal Register** for the IPPS final rule, without the 25-percent increase, to FY 2003. That is, we used 3.4 percent to update from FY 2000 to FY 2001, 3.3 percent to update from FY 2001 to FY 2002, and 3.5 percent to update from FY 2002 to FY 2003. For LTCHs with their first 12-month cost reporting period beginning in FY 1999, we used the lower of their costs or target amount from their FY 2000 cost report, and updated that amount by the applicable estimated market basket percentage increase to establish the target amount in FY 2001, without the 25-percent increase. Next, we continued to update that target amount by the estimated market basket percentage increases to FY 2003. We believe that it is necessary to compute an estimated target amount for LTCHs that are ''new'' in FY 1999 under our methodology in order to eliminate the potential inclusion of the increase to the target amounts provided for by section 307(a)(1) of BIPA (consistent with the statute).

The 25-percent increase (under section 307(a) of the BIPA) to the target amount would not be an issue for LTCH's with their first 12-month cost reporting period beginning in FYs 2000, 2001, and 2002 because they would not have a ''target amount'' based on sections 1886(b)(7)(A)(ii) of the Act, in FY 2001. Rather, for these LTCHs, under our methodology we determined the estimated payment amount for their first 12-month cost reporting period by looking at their certification date from the OSCAR file, the applicable 110 percent median amount (adjusted by their wage-index) and their costs from the applicable cost report, and then proceeded in accordance with the policy in § 413.40(f)(2)(ii) of the regulations, to arrive at estimated FY 2003 TEFRA payments.

Step 1c.—Estimate CIB payments that would have been made in FY 2003 under the TEFRA payment system (for both ''existing'' and ''new'' LTCHs).

In addition to the TEFRA system payments for operating costs, and any bonus or relief payments made, we also added an amount to account for the estimate of the CIB payments that would have been made in FY 2003 under the TEFRA payment system under § 413.40(d)(4). We estimated what CIB payments would have been in FY 2003 by using actual CIB payments from the cost reports for FYs 1999 and 2000, as they would not include the statutory increases to the target amount discussed above, and recalculated CIB payments for FYs 2001 and 2002 based on cost report data. Based on these historical CIB payments, we estimated that CIB payments in FY 2003 would have been approximately $10 million. Just as the TEFRA payments and bonus and relief payments had to be recalculated in particular years to eliminate percentage increases that were not to be included in our budget neutrality calculations (as required by the statute), we believe that it is necessary to recalculate the CIB payments in FYs 2001 and 2002 to eliminate the percentage increases to these payments as provided for under

section 122 of BBRA, such that they would not be accounted for in the development of the LTCH in accordance with section 307(a)(2) of BIPA. Therefore, under our methodology, we added $10 million as an estimate of the CIB payments that would have been made in FY 2003 under the TEFRA payment system to our estimated FY 2003 TEFRA system payments for operating costs, including any bonus or relief payments.

Step 2.—Estimate each LTCH's payment per discharge for inpatient capital costs under the TEFRA payment system for FY 2003.

As we discussed above, under our methodology, the second step in estimating total payments under the TEFRA payment system was to estimate each LTCH's payment per discharge for capital-related costs for FY 2003. Under the TEFRA payment system, in accordance with the regulations at 42 CFR Part 413, Medicare allowable capital costs are paid on a reasonable cost basis. Therefore, we updated each LTCH's payment for capital-related costs directly from the FY 2002 cost report for inflation using the FY 2003 capital excluded hospital market basket estimate of 0.7 percent, consistent with the methodology used to establish the initial standard Federal rate (67 FR 56031). Thus, we determined capital-related costs per case using capital cost data from Worksheets D, Parts I and II, and total Medicare discharges for the cost reporting period from Worksheet S–3. (We note that because payments for capital-related costs are on a reasonable-cost basis, capital payments were the same for ''existing'' and ''new'' LTCHs.)

Step 3.—Sum each LTCH's estimated operating and capital payment per case to determine its estimated total FY 2003 TEFRA payment system payment per discharge.

Under our methodology for estimating FY 2003 LTCH total payments under the TEFRA payment system using FY 2002 cost data for the purposes of the one-time prospective adjustment at § 412.523(d)(3), after estimating payments for inpatient operating costs under the TEFRA payment system for FY 2003 and payments for capital-related costs under the TEFRA payment system for FY 2003, we summed each LTCH's estimated operating and capital payment per case to determine its estimated total FY 2003 TEFRA payment system payment per discharge. Therefore, we added the estimate of each LTCH's payment per discharge for inpatient operating costs under the TEFRA payment system for FY 2003, including continuous improvement bonus payments (determined under Steps 1.a. through 1.c. above) and the estimate of each LTCH's payment per discharge for capital-related costs for FY 2003 (determined under Step 2 above).

Once we estimated total TEFRA payments as the sum of each LTCH's estimated operating and capital payment per case, under our methodology for evaluating the one-time prospective adjustment at § 412.523(d)(3), the next step was to estimate FY 2003 payments under the LTCH PPS. As we discussed above, we believe that the best approach was to use FY 2002 LTCH claims data as a proxy for estimating FY 2003 LTCH PPS payments in evaluating the one-time prospective adjustment at § 412.523(d)(3). We note that we used the same FY 2002 LTCH MedPAR data that was used to develop the FY 2004 LTC–DRG relative weights in the FY 2004 IPPS final rule (68 FR 45376), as explained below. As we discussed in that final rule, there is a data problem with the FY 2002 claims data for LTCHs where multiple bills for the stay were submitted. Specifically, given the long stays at LTCHs, some providers had submitted multiple bills for payment under the reasonable cost-based reimbursement system for the same stay. In certain LTCHs, hospital personnel apparently reported a different principal diagnosis on each bill because, under the reasonable cost-based (TEFRA) reimbursement system, payment was not dependent upon principal diagnosis, as it is under a DRG-based PPS system. As a result of this billing practice, we discovered that only data from the final bills were being extracted for the MedPAR file. Therefore, it was possible that the original MedPAR file was not receiving the correct principal diagnosis. In that same IPPS final rule, we discussed how we addressed this problem in the LTCH FY 2002 MedPAR data when we used that data to determine the FY 2004 LTC–DRG relative weights. Therefore, for the evaluation of the one-time prospective adjustment at § 412.523(d)(3) we used the same ''corrected'' FY 2002 LTCH MedPAR data that was used to develop the FY 2004 LTC–DRG relative weights. For the reader's benefit, we are providing a summary of how we addressed the multiple bill problem in the FY 2002 LTCH MedPAR data below. As we explained in the FY 2004 IPPS final rule (68 FR 45376), we addressed this problem by identifying all LTCH cases in the FY 2002 MedPAR file for which multiple bills were submitted. For each of these cases, beginning with the first bill and moving forward consecutively through subsequent bills for that stay, we recorded the first unique diagnosis codes up to 10 and the first unique procedure codes up to 10. We then used these codes to appropriately group each LTCH case to a LTC–DRG for FY 2004.

For this final rule, as we proposed, we estimated FY 2003 LTCH PPS payments using the same general methodology that we used to estimate FY 2003 payments under the LTCH PPS (without a budget neutrality adjustment) when we determined the initial standard Federal rate in the August 30, 2002 final rule (67 FR 56032). Specifically, we estimated FY 2003 LTCH PPS payments for each LTCH by simulating payments on a case-by-case basis by applying the final FY 2003 payment policies established in the August 30, 2002 final rule that implemented the LTCH PPS (67 FR 55954) based on the LTCH case-specific discharge information from the FY 2002 MedPAR files (as explained above), and we also used LTCH provider-specific data from the FY 2003 Provider-Specific File (PSF), as these were the data used by fiscal intermediaries to make LTCH payments during the first year of the LTCH PPS (FY 2003). Under our methodology, we used the FY 2003 LTC–DRG Grouper (Version 22.0), relative weights, and average length of stay (67 FR 55979 through 55995); we made adjustments for differences in area wage levels established for FY 2003 as set forth at § 412.525(c) using the appropriate phase-in wage index values for FY 2003 (67 FR 56015 through 56020); we made a cost-of-living adjustment for LTCHs located in Alaska and Hawaii as set forth at § 412.525(b) (67 FR 56022); we made adjustments for SSO cases based on the method for determining payment applicable for discharges occurring during FY 2003 in accordance with § 412.529(c)(1) (67 FR 55975 and 55995 through 56002); and we included additional payments for HCO cases in accordance with former § 412.525(a) for determining payments for discharges occurring in FY 2003 and the FY 2003 fixed-loss amount of $24,450 (67 FR 56023). (We note that correctly billed interrupted stay cases under § 412.531 are single LTCH cases in the MedPAR files; therefore, we estimated a single LTCH PPS payment for those cases.) Under this methodology, for purposes of this calculation we simulated case-by-case payments for each LTCH as if it were paid based on 100 percent of the standard Federal rate in FY 2003 rather than the transition blend methodology set forth at § 412.533. To determine total estimated PPS payments for all LTCHs, we summed the individual estimated

LTCH PPS payments for each LTCH. (We note that this is the same methodology we used to estimate FY 2003 payments under the LTCH PPS for purposes of evaluating the one-time prospective adjustment at § 412.523(d)(3) that we presented in the RY 2009 LTCH PPS proposed rule (73 FR 5359 through 5360).)

In order to determine if there is any difference between estimated total TEFRA payments and estimated LTCH PPS payments in FY 2003 under our methodology for evaluating a possible one-time prospective adjustment under § 412.523(d)(3), we determined a case-weighted average estimated TEFRA payment, consistent with the methodology used when we determined the initial standard Federal rate in the FY 2003 LTCH PPS final rule (68 FR 56032). Under this methodology, each LTCH's estimated total FY 2003 TEFRA payment per discharge was determined by summing its estimated FY 2003 operating and capital payments under the TEFRA payment system based on FY 2002 cost report data (as described in Step 3 above), and dividing that amount by the number of discharges from the FY 2002 cost report data. Next, we determined each LTCH's average estimated TEFRA payment weighted for its number of discharges in the FY 2002 MedPAR file (for the purpose of estimating FY 2003 LTCH PPS payments, as discussed above) by multiplying its average estimated total TEFRA payment per discharge by its number of discharges in the FY 2002 MedPAR file. We then estimated total case-weighted TEFRA payments by summing each LTCH's (MedPAR) case-weighted estimated FY 2003 TEFRA payments. Under our methodology, we compared these estimated FY 2003 total TEFRA payments to estimated FY 2003 total LTCH PPS payments in order to determine whether a one-time prospective adjustment would be appropriate. (As discussed in greater detail above, we determined both estimated total FY 2003 TEFRA payments and estimated total FY 2003 LTCH PPS payments based on FY 2002 cost report and claims data, respectively.) Our policy to adjust our estimate of FY 2003 TEFRA payments for the number of discharges that we used to estimate FY 2003 LTCH PPS payments will ensure that the comparison of estimated aggregate FY 2003 TEFRA payments to estimated aggregate FY 2003 LTCH PPS payments is based on the same number of LTCH discharges.

Using the methodology and data described above, we calculated that estimated FY 2003 LTCH PPS payments are approximately 2.5 percent higher than estimated payments to the same LTCHs in FY 2003 if the LTCH PPS had not been implemented (that is, estimated total FY 2003 TEFRA payment system payments). Although we project that estimated FY 2003 LTCH PPS payments are approximately 2.5 percent higher than estimated FY 2003 TEFRA payments, as we explained in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28031), reducing the standard Federal rate by 2.5 percent would not ''maintain budget neutrality'' for FY 2003 (that is, estimated FY 2003 LTCH PPS payments would not be equal to estimated FY 2003 TEFRA payments) because a considerable number of LTCH discharges are projected to have received a LTCH PPS payment in FY 2003 based on the estimated cost of the case (rather than a payment based on the standard Federal rate) under the payment adjustment for SSO cases at § 412.529. (As discussed previously, our payment analysis indicates that nearly 20 percent of estimated FY 2003 LTCH PPS payments are SSO payments that were paid based on estimated cost and not based on the LTCH PPS standard Federal rate. These SSO cases that receive a payment based on the estimated cost of the case are generally unaffected by any changes to the standard Federal rate. If we were to reduce the standard Federal rate by 2.5 percent, estimated total FY 2003 LTCH PPS payments would still be greater than estimated total FY 2003 TEFRA payments (that is, would not be budget neutral), and that difference would be perpetuated in the LTCH PPS payment rates for future years.) Therefore, it is necessary to offset the standard Federal rate by a factor that is larger than 2.5 percent in order to ensure that estimated total FY 2003 LTCH PPS payments would be equal to estimated total FY 2003 TEFRA payments in order to ''maintain budget neutrality.'' To determine the necessary adjustment factor that would need to be applied to the standard Federal rate in order to ''maintain budget neutrality,'' we simulated FY 2003 LTCH PPS payments using the same payment simulation model discussed above (that we used to estimate FY 2003 LTCH PPS payments without a budget neutrality factor). Using iterative payment simulations using the data from the 250 LTCHs in our database, we determined that we would need to apply a factor of 0.9625 (that is, a reduction of approximately 3.75 percent rather than 2.5 percent) to the standard Federal rate in order to make estimated total FY 2003 LTCH PPS payments equal to estimated total FY 2003 TEFRA payments, consistent with our stated policy goal of the one-time prospective adjustment at § 412.523(d)(3) (that is, to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28031), based on the methodology described above, we proposed to revise § 412.523(d)(3) to specify that the standard Federal rate would be permanently reduced by 3.75 percent so that the estimated difference between projected aggregate LTCH PPS payments in FY 2003 and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented. Consistent with current law, we also proposed that this adjustment would not apply to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012. We also proposed to phase-in the 3.75 percent reduction to the standard Federal rate over a 3-year period. We also explained that although the adjustment to the standard Federal rate provided for under § 412.523(d)(3) is called a ''one-time'' prospective adjustment, this adjustment will be permanently applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the LTCH prospective payment rates for future years.

Although we did not receive any specific public comments on our proposed revision to § 412.523(d)(3), as we discussed in the comments and responses presented above in this section, in response to the commenter who expressed concern about a potential compounding effect under our proposal to phase-in the one-time prospective adjustment over a 3-year period, we are taking the opportunity in this final rule to clarify in the revisions we are making to § 412.523(d)(3) that the one-time prospective adjustment of 0.9625 will be *permanently* applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the LTCH prospective payment rates for future years.

Therefore, in this final rule, based on the methodology described above, under the broad authority granted to the Secretary under section 123 of the BBRA, as amended by section 307(b) of the BIPA, we are revising § 412.523(d)(3) to specify that the standard Federal rate is permanently adjusted by 3.75 percent (that is, a factor of 0.9625) to reflect the estimated difference between projected aggregate LTCH PPS payments in FY 2003 and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented. Consistent with current law, this adjustment will not apply to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012. And as we discussed above in this section in our response to public comments, given the magnitude of this adjustment and in acknowledgement of hopeful research outcomes, we are finalizing our proposal to phase-in the one-time prospective adjustment of 3.75 percent (or a factor of 0.9625) to the standard Federal rate over a 3-year period. As noted above, although the adjustment to the standard Federal rate provided for under § 412.523(d)(3) is called a ''one-time'' prospective adjustment, this adjustment (that is, a factor of 0.9625) will be permanently applied to the standard Federal rate so that the effect of the estimated difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years. During this 3-year period, we intend to further explore potential revisions to certain LTCH PPS payment policies as discussed above in section VII.E.2. of this preamble.

Under the policy we are establishing in this final rule, consistent with the one-time prospective adjustment authorized under § 412.523(d)(3), we are applying a permanent factor of 0.98734 to the standard Federal rate in FY 2013 (which will not apply to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, consistent with current law), FY 2014, and FY 2015 to completely account for our estimate (determined using the methodology described above) that the standard Federal rate must be adjusted 3.75 percent (or a factor of 0.9625) to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years, consistent with our stated policy goal of the one-time prospective adjustment at § 412.523(d)(3). To achieve a permanent adjustment of 0.9625, under the phase-in of this adjustment that we are establishing in this final rule, we will apply a factor of 0.98734 to the standard Federal rate in each year of the 3-year phase-in, that is, in FY 2013 (which will not be applicable to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, consistent with current law), FY 2014, and FY 2015. By applying a permanent factor of 0.98734 to the standard Federal rate in each year for FYs 2013, 2014, and 2015, we will completely account for the entire adjustment by having applied a cumulative factor of 0.9625 (calculated as $0.98734 \times 0.98734 \times 0.98734 = 0.9625$) to the standard Federal rate.

5. Other Comments Received on the Proposed Rule

We note that we received some public comments on the LTCH PPS that were outside of the scope of the FY 2013 IPPS/LTCH PPS proposed rule. These out-of-scope public comments are not addressed with policy responses in this final rule. However, we appreciate these comments and we may consider these public comments in the development of future rulemaking.

VIII. Quality Data Reporting Requirements for Specific Providers and Suppliers

CMS is seeking to promote higher quality and more efficient health care for Medicare beneficiaries. This effort is supported by the adoption of an increasing number of widely agreed-upon quality measures. CMS has worked with relevant stakeholders to define measures of quality for most settings and to measure various aspects of care for most Medicare beneficiaries. These measures assess structural aspects of care, clinical processes, patient experiences with care, and, increasingly, outcomes.

CMS has implemented quality measure reporting programs for multiple settings of care. To measure the quality of hospital inpatient services, CMS implemented the Hospital Inpatient Quality Reporting (IQR) Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program). In addition, CMS has implemented quality reporting programs for hospital outpatient services, the Hospital Outpatient Quality Reporting (OQR) Program (formerly referred to as the Hospital Outpatient Quality Data Reporting Program (HOP QDRP)), and for physicians and other eligible professionals, the Physician Quality Reporting System (formerly referred to as the Physician Quality Reporting Program Initiative (PQRI)). CMS has also implemented quality reporting programs for inpatient rehabilitation hospitals, hospices, and ambulatory surgical centers, and an end-stage renal disease quality improvement program (76 FR 628 through 646) that links payment to performance.

In implementing the Hospital IQR Program and other quality reporting programs, we have focused on measures that have high impact and support CMS and HHS priorities for improved quality and efficiency of care for Medicare beneficiaries. Our goal for the future is to align the clinical quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act so that the burden for reporting will be reduced. As appropriate, we will consider the adoption of measures with electronic specifications, so that the electronic collection of performance information is part of care delivery. Establishing such a system will require interoperability between EHRs and CMS data collection systems, additional infrastructural development on the part of hospitals and CMS, and the adoption of standards for capturing, formatting, and transmitting the data elements that make up the measures. However, once these activities are accomplished, the adoption of many measures that rely on data obtained directly from EHRs will enable us to expand the Hospital IQR Program measure set with less cost and burden to hospitals. We believe that automatic collection and reporting of data elements for many measures through EHRs will greatly simplify and streamline reporting for various CMS quality reporting programs and that at a future date, such as FY 2015, hospitals will be able to switch primarily to EHR-based reporting of data for many measures that are currently manually chart-abstracted and submitted to CMS for the Hospital IQR Program.

We have also implemented a Hospital Value-Based Purchasing (VBP) Program under section 1886(o) of the Act. In 2011, we issued the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547). We adopted additional policies for the Hospital VBP Program in section IV.B. of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51653 through 51660) and in section XVI. of the CY 2012 OPPS/ASC final rule with

comment period (76 FR 74527 through 74547). Under the Hospital VBP Program, hospitals will receive value-based incentive payments if they meet performance standards with respect to measures for a performance period for the fiscal year involved. The measures under the Hospital VBP Program must be selected from the measures (other than readmission measures) specified under the Hospital IQR Program as required by section 1886(o)(2)(A) of the Act.

In selecting measures for the Hospital IQR Program, we are mindful of the conceptual framework of the Hospital VBP Program. Section 1886(o)(2)(B)(i)(I) of the Act states that for FY 2013, the selected measures for the Hospital VBP Program must cover at least the following five specified conditions or procedures: Acute myocardial infarction (AMI), Heart failure (HF), Pneumonia (PN), surgical care, as measured by the Surgical Care Improvement Project (SCIP), and Healthcare-Associated Infections (HAIs), as measured by the prevention metrics and targets established in the HHS Action Plan to Prevent HAIs (or any successor HHS plan). Section 1886(o)(2)(B)(i)(II) of the Act provides that, for FY 2013, measures selected for the Hospital VBP Program must also be related to the Hospital Consumer Assessment of Healthcare Providers and Systems survey (HCAHPS).

The Hospital IQR Program is linked with the Hospital VBP Program because the measures and reporting infrastructure for both programs overlap. We view the Hospital VBP Program as the next step in promoting higher quality care for Medicare beneficiaries by transforming Medicare into an active purchaser of quality healthcare for its beneficiaries. Value-based purchasing is an important step to revamping how care and services are paid for, moving increasingly toward rewarding better value, outcomes, and innovations instead of merely volume. As we stated in the Hospital Inpatient VBP Program proposed rule (76 FR 2455), we applied the following principles for the development and use of measures and scoring methodologies:

- Public reporting and value-based payment systems should rely on a mix of standards, process, outcomes, and patient experience of care measures, including measures of care transitions and changes in patient functional status. Across all programs, we seek to move as quickly as possible to the use of primarily outcome and patient experience measures. To the extent practicable and appropriate, outcome and patient experience measures should be adjusted for risk or other appropriate patient population or provider characteristics.
- To the extent possible and recognizing differences in payment system maturity and statutory authorities, measures should be aligned across public reporting and payment systems under Medicare and Medicaid. The measure sets should evolve so that they include a focused core set of measures appropriate to the specific provider category that reflects the level of care and the most important areas of service and measures for that provider.
- The collection of information should minimize the burden on providers to the extent possible. As part of this effort, we will continuously seek to align our measures with the adoption of e-specified measures, so the electronic collection of performance information is part of care delivery.
- To the extent practicable, measures used by CMS should be nationally endorsed by a multi-stakeholder organization. Measures should be aligned with best practices among other payers and the needs of the end users of the measures.

We also view the Hospital-Acquired Condition (HAC) payment adjustment program authorized by section 3008 of the Affordable Care Act and the Hospital VBP Program as being related but separate efforts to reduce HACs. The Hospital VBP Program is an incentive program that awards payments to hospitals based on quality performance on a wide variety of measures, while the program established by section 3008 of the Affordable Care Act creates a payment adjustment resulting in payment reductions for the lowest performing hospitals based on their rates of HACs.

Although we intend to monitor the various interactions of programs authorized by the Affordable Care Act and their overall impact on providers and suppliers, we also view programs that could potentially affect a hospital's Medicaid payment as separate from programs that could potentially affect a hospital's Medicare payment.

In this section VIII. of this preamble, we are adopting changes to, or implementing, the following Medicare quality reporting systems:

- In section VIII.A., the Hospital IQR Program.
- In section VIII.B., the Hospital VBP Program.
- In section VIII.C., the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program.
- In section VIII.D., the Long-Term Care Hospital Quality Reporting (LTCHQR) Program.
- In section VIII.E., the Ambulatory Surgical Center Quality Reporting (ASCQR) Program.
- In section VIII.F., the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program.

A. Hospital Inpatient Quality Reporting (IQR) Program

1. Background

a. History of Measures Adopted for the Hospital IQR Program

We refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43860 through 43861) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181) for detailed discussions of the history of the Hospital IQR Program, including the statutory history, and to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51636 through 51637) for the measures we have adopted for the Hospital IQR measure set through FY 2015.

b. Maintenance of Technical Specifications for Quality Measures

The technical specifications for the Hospital IQR Program measures, or links to Web sites hosting technical specifications, are contained in the CMS/The Joint Commission (TJC) Specifications Manual for National Hospital Quality Measures (Specifications Manual). This Specifications Manual is posted on the CMS QualityNet Web site at *https://www.QualityNet.org*. We generally update the Specifications Manual on a semiannual basis and include in the updates detailed instructions and calculation algorithms for hospitals to use when collecting and submitting data on required measures. These semiannual updates are accompanied by notifications to users, providing sufficient time between the change and the effective date in order to allow users to incorporate changes and updates to the specifications into data collection systems.

The technical specifications for the HCAHPS patient experience of care survey are contained in the current HCAHPS *Quality Assurance Guidelines* manual, which is available at the HCAHPS On-Line Web site, *http://www.hcahpsonline.org*. We maintain the HCAHPS technical specifications by updating the HCAHPS *Quality Assurance Guidelines* manual annually, and include detailed instructions on survey implementation, data collection, data submission and other relevant topics. As necessary, HCAHPS Bulletins are issued to provide notice of changes and updates to technical specifications in HCAHPS data collection systems.

Many of the quality measures used in different Medicare and Medicaid reporting programs are endorsed by the National Quality Forum (NQF). The NQF is a voluntary consensus standard-setting organization with a diverse representation of consumer, purchaser, provider, academic, clinical, and other healthcare stakeholder organizations. The NQF was established to standardize healthcare quality measurement and reporting through its consensus development process. As part of its regular maintenance process for endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes to NQF on an annual basis. NQF solicits information from measure stewards for annual reviews and in order to review measures for continued endorsement in a specific 3-year cycle.

Through NQF's measure maintenance process, NQF-endorsed measures are sometimes updated to incorporate changes that we believe do not substantially change the nature of the measure. Examples of such changes could be updated diagnosis or procedure codes, changes to exclusions to the patient population, definitions, or extension of the measure endorsement to apply to other settings. We believe these types of maintenance changes are distinct from more substantive changes to measures that result in what are considered new or different measures, and that they do not trigger the same agency obligations under the Administrative Procedure Act.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28033), we proposed that if the NQF updates an endorsed measure that we have adopted for the Hospital IQR Program in a manner that we consider to not substantially change the nature of the measure, we would use a subregulatory process to incorporate those updates to the measure specifications that apply to the program. Specifically, we would revise the Specifications Manual so that it clearly identifies the updates and provide links to where additional information on the updates can be found. We would also post the updates on the QualityNet Web site at *https://www.QualityNet.org.* We would provide sufficient lead time for hospitals to implement the changes where changes to the data collection systems would be necessary.

We would continue to use the rulemaking process to adopt changes to a measure that we consider to substantially change the nature of the measure. We believe that this proposal adequately balances our need to incorporate NQF updates to NQF–endorsed Hospital IQR Program measures in the most expeditious manner possible, while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We invited public comment on this proposal.

Comment: Many commenters supported the proposed subregulatory process to update the measure specifications of adopted NQF-endorsed measures in the Specifications Manual for non-substantive changes that arise from the NQF maintenance review, as well as the continuation of the rulemaking process for substantive changes that arise from NQF review. Several commenters objected to these proposals, and expressed concern that there is no clear definition of non-substantive updates. These commenters felt that changes such as conversion of measures to ICD–10 codes and eMeasures format, and exclusions to the patient population should be considered substantive changes that would warrant rulemaking. Some commenters stated that all changes to measures that are not NQF-endorsed measures should be subject to the rulemaking process.

Response: We thank those commenters that supported our proposal to update NQF-endorsed measures using a subregulatory process. The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF making updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate non-substantive updates made by the NQF into the measure specifications we have adopted for the Hospital IQR Program so that these measures remain up-to-date. We also recognize that some changes the NQF might make to its endorsed measures are substantive in nature and might not be appropriate for adoption using a subregulatory process. Therefore, we are finalizing a policy under which we will use a subregulatory process to make non-substantive updates to NQF-endorsed measures used for the Hospital IQR program. With respect to what constitutes substantive versus non-substantive changes, we expect to make this determination on a case-by-case basis. Examples of non-substantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures). We believe that non-substantive changes may include updates to NQF-endorsed measures based upon changes to guidelines upon which the measures are based.

We will continue to use rulemaking to adopt substantive updates made by the NQF to the endorsed measures we have adopted for the Hospital IQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent (for example: changes in acceptable timing of medication, procedure/process, or test administration). Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to hospice. These policies regarding what is considered substantive versus non-substantive would apply to all measures in the Hospital IQR Program. We also note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process.

Comment: A few commenters supported the semiannual updates of the Specifications Manual to provide guidance to hospitals on data collection and submission of the required measures. Commenters urged CMS to provide at least 12 to 18 months' notice before nonsubstantive changes are implemented by vendors and providers.

Response: We thank the commenter for the support for this process, which is consistent across all quality reporting programs. Per our existing policy for specification updates, we will provide at least 6 months lead time for hospitals to implement updates to measures that would require changes to abstraction or data collection systems. This would include non-substantive changes.

Comment: A commenter suggested that CMS must be more transparent about the NQF maintenance review and update process in the Hospital IQR Program proposed rules. Specifically, the commenter urged CMS to describe the NQF status, including the status of maintenance review, of every proposed and previously finalized measure in

proposed rules. The commenter believed that the lack of information regarding a measure's NQF status may disadvantage the public in commenting on Hospital IQR Program measures.

Response: We appreciate the suggestion and recognize the commenter's desire to have more information about the measures in the program. This information is currently available and updated frequently on the measures list available on the NQF Web site: *http://www.qualityforum.org/Measures_List.aspx*. We will strive to provide additional NQF-related information about the Hospital IQR Program measures in the future.

After consideration of the public comments we received, we are finalizing a policy under which we will use a subregulatory process to make non-substantive updates to measures in the Hospital IQR Program. We will continue to use the rulemaking process to adopt changes to measures that we consider to be substantive.

c. Public Display of Quality Measures

Section 1886(b)(3)(B)(viii)(VII) of the Act, as amended by section 3001(a)(2) of the Affordable Care Act, requires that the Secretary establish procedures for making information regarding measures submitted available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. We will continue our current practice of reporting data from the Hospital IQR Program as soon as it is feasible on CMS Web sites such as the *Hospital Compare* Web site, *http://www.hospitalcompare.hhs.gov*, after a 30-day preview period.

The *Hospital Compare* Web site is an interactive Web tool that assists beneficiaries by providing information on hospital quality of care to those who need to select a hospital. It further serves to encourage beneficiaries to work with their doctors and hospitals to discuss the quality of care hospitals provide to patients, thereby providing an additional incentive to hospitals to improve the quality of care that they furnish. The Hospital IQR Program currently includes process of care measures, risk-adjusted outcome measures, the HCAHPS patient experience-of-care survey, structural measures, Emergency Department Throughput timing measures, hospital acquired condition measures, immunization measures, and hospital acquired infection measures, all of which are featured on the *Hospital Compare* Web site.

However, information that may not be relevant to or easily understood by beneficiaries and information for which there are unresolved display issues or design considerations for inclusion on *Hospital Compare* may be made available on other CMS Web sites that are not intended to be used as an interactive Web tool, such as *http://www.cms.hhs.gov/HospitalQualityInits/*. Publicly reporting the information in this manner, although not on the *Hospital Compare* Web site, allows CMS to meet the requirement under section 1886(b)(3)(B)(viii)(VII) of the Act for establishing procedures to make information regarding measures submitted under the Hospital IQR Program available to the public following a preview period. In such circumstances, affected parties are notified via CMS listservs, CMS email blasts and memorandums, Hospital Open Door Forums, national provider calls, and QualityNet announcements regarding the release of preview reports followed by the posting of data on a Web site other than *Hospital Compare.*

Comment: A commenter recommended that CMS collect and present data on *Hospital Compare* in a stratified manner in terms of race, language, and gender as the commenter believed all of the above are crucial data to address and reduce health disparities.

Response: We are unable to collect data that is unrelated to quality measures, and therefore, it is not possible for us to stratify measures using demographic data as this commenter suggests.

Comment: A commenter supported display of the Standardized Infection Ratio (SIR) for both CLABSI and CAUTI on *Hospital Compare.*

Response: We thank the commenter for their support.

Comment: A commenter believed that the public reporting of hospital-specific readmission rates on *Hospital Compare* needs significant improvement by providing more specific data on actual readmission rates. The commenter pointed out that the current display of readmissions as either ''same as the national average,'' ''worse than the national average,'' or ''better than the national average'' indicate little variation among hospitals and does not offer to consumers and purchasers meaningful information about how well specific hospitals are performing.

Response: The purpose of the initial display of the readmission measures as ''same as the national average,'' ''worse than the national average,'' or ''better than the national average'' is to address consumer preferences for the display of information that incorporates confidence intervals or interval estimates for outcome measures such as hospital readmission rates. However, alternative displays that we provide, which can also be accessed through links on the main display at the *Hospital Compare* Web site, contain both graphical and table displays and provide more information, including the risk-adjusted readmission rates. Additional information is also available in the downloadable file at: *http://www.medicare.gov/download/downloaddb.asp* that accompanies each *Hospital Compare* release in order to facilitate customized comparative analyses.

Comment: A commenter requested that CMS notify hospitals of changes to QualityNet Web site reports in a timely manner.

Response: We send out memos in a timely manner to notify hospitals of changes to reports when there is a system release or production fix.

2. Removal and Suspension of Hospital IQR Program Measures

a. Considerations in Removing Quality Measures From the Hospital IQR Program

We generally retain measures from the previous year's Hospital IQR Program measure set for subsequent years' measure sets except when they are removed or replaced as indicated. In previous rulemakings, we have referred to the removal of measures from the Hospital IQR Program as ''retirement.'' We have used this term to indicate that Hospital IQR Program measures are no longer included in the Hospital IQR Program measure set for one or more indicated reasons. However, we note that this term may imply that other payers/purchasers/programs should cease using these measures that are no longer required for the Hospital IQR Program. In order to clarify that this is not our intent, beginning with this rulemaking cycle, we will use the term ''remove'' rather than ''retire'' to refer to the action of no longer including a measure in the Hospital IQR Program.

As we stated in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50185), the criteria that we consider when determining whether to remove Hospital IQR Program measures are the following: (1) Measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (''topped out'' measures); (2) availability of alternative measures with a stronger relationship to patient outcomes; (3) a measure does not align with current clinical guidelines or practice; (4) the availability of a more broadly applicable (across settings, populations, or

conditions) measure for the topic; (5) the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic; (6) the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic; and (7) collection or public reporting of a measure leads to negative unintended consequences other than patient harm. These criteria were suggested by commenters during rulemaking, and we agreed that these criteria should be among those considered in evaluating Hospital IQR Program quality measures for removal.

In addition, we take into account the views of the Measure Application Partnership (MAP). The MAP is a public-private partnership convened by the NQF for the primary purpose of providing input to HHS on selecting performance measures for quality reporting programs and pay for reporting programs. The MAP views patient safety as a high priority area and it strongly supports the use of NQF-endorsed safety measures. Furthermore, for efficiency and streamlining purposes, we strive to eliminate redundancy of similar measures.

Comment: Several commenters supported the proposals regarding measure removal criteria and the use of ''removal'' terminology. Some commenters also recommended that CMS provide a list of potential measures for removal from the Hospital IQR Program for MAP review and recommendations.

Response: We thank the commenters for the support of our measure removal criteria and the use of the term ''removal.'' We will consider the recommendation to provide a list of potential measures for removal from the Hospital IQR Program to MAP for its input.

b. Hospital IQR Program Measures Removed in Previous Rulemakings

In previous rulemakings, we have removed several Hospital IQR Program quality measures, including:

- PN–1: Oxygenation Assessment for Pneumonia, a ''topped out'' measure, because measures with very high performance among hospitals present little opportunity for improvement and do not provide meaningful distinctions in performance for consumers (73 FR 48604).
- AMI–6: Beta Blocker at Arrival measure from the Hospital IQR Program because it no longer ''represent[ed] the best clinical practice,'' as required under section 1886(b)(3)(B)(viii)(VI) of the Act. We stated that when there is reason to believe that the continued collection of a measure as it is currently specified raises potential patient safety concerns, it is appropriate for CMS to take immediate action to remove a measure from the Hospital IQR Program and not wait for the annual rulemaking cycle. Therefore, we adopted the policy (74 FR 43864 and 43865) that we would promptly remove such a measure, confirm the removal in the next IPPS rulemaking cycle, and notify hospitals and the public of the decision to promptly remove measures through the usual hospital and QIO communication channels used for the Hospital IQR Program. These channels include memos, email notification, and QualityNet Web site postings. To this end, we confirmed the removal of the AMI–6 measure in the FY 2010 IPPS/LTCH PPS rulemaking cycle after immediate suspension because the measure posed patient safety risks.
- Mortality for Selected Procedures Composite measure because the measure is not considered suitable for purposes of comparative reporting by the measure developer (75 FR 50186).
- Three adult smoking cessation measures: AMI–4: Adult Smoking Cessation Advice/Counselling; HF–4: Adult Smoking Cessation Advice/Counselling; and PN–4: Adult Smoking Cessation Advice/Counselling, because these measures are ''topped-out'' and no longer NQF-endorsed (76 FR 51611).
- PN–5c: Timing of Receipt of Initial Antibiotic Following Hospital Arrival measure out of concerns that the continued collection of this measure might lead to the unintended consequence of antibiotic overuse (76 FR 51611).

c. Removal of Hospital IQR Program Measures for FY 2015 Payment Determination and Subsequent Years

To accommodate the expansion of the measure set, we have considered the removal of additional Hospital IQR Program measures using our stated measure removal criteria. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), based on some of these criteria, we proposed to remove 17 measures from the Hospital IQR Program. One of these 17 measures is chart-abstracted, and the other 16 are claims-based.

(1) Removal of One Chart-Abstracted Measure

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), we proposed to remove the SCIP–Venous Thromboembolism (VTE) measure: ''SCIP–VTE–1: Surgery patients with recommended VTE prophylaxis ordered'' measure because we believe that the ''SCIP–VTE–2: Surgery patients who received appropriate VTE prophylaxis within 24 hours of pre/post surgery'' measure currently used in the Hospital IQR Program assesses practices that are more proximal in time to better surgical outcomes resulting from the use of VTE prophylaxis. We also note that during a recent NQF maintenance review of SCIP–VTE–1, the measure was not recommended for continued endorsement.

Comment: Many commenters strongly agreed with CMS' rationale for proposing the removal of the SCIP–VTE–1 measure and urged its immediate removal from the Hospital IQR Program. One commenter was disappointed that the measure was removed shortly after it was adopted. Commenters requested that CMS clarify whether the end date for data submission of the proposed chart-abstracted measure is effective immediately, or on the effective date of this final rule.

Response: We thank the commenters for the support of the removal of this measure. The removal of this measure is consistent with one of our measure removal criteria of removing a measure when an alternative measure(s) that is either more proximal to or that has a stronger relationship with patient outcomes is available. We are finalizing the removal of this measure from the Hospital IQR Program measure set. The data collection for this chart-abstracted measure will end with December 31, 2012 discharges.

(2) Removal of 16 Claims-Based Measures

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), we proposed to remove eight HAC measures, three AHRQ Inpatient Quality Indicator (IQI) measures, and five AHRQ Patient Safety Indicator (PSI) measures from the Hospital IQR Program measure set.

(A) Removal of Eight Hospital-Acquired Condition (HAC) Measures

In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50194 through 50196), for the FY 2012 payment determination, we adopted 8 claims-based HAC measures based on 8 of the 10 conditions applicable under the HAC payment provisions specified in section 1886(d)(4)(D) of the Act. These eight HAC measures are: Air Embolism; Blood Incompatibility; Catheter-Associated Urinary Tract Infection (UTI); Falls and Trauma: (Includes Fracture Dislocation, Intracranial Injury, Crushing Injury, Burn, Electric Shock); Foreign Object Retained After Surgery; Manifestations of Poor Glycemic Control; Pressure

Ulcer Stages III or IV; and Vascular Catheter Associated Infections. Six of these HACS were identified by NQF as serious reportable events.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), we proposed to remove these eight HAC measures based on several considerations. First, the MAP recommended that we replace the HAC measures in the Hospital IQR Program with NQF-endorsed measures. Second, we seek to reduce redundancy among the measures in the program. Two of the eight HAC measures address HAIs which are addressed by other measures currently in the Hospital IQR Program. These two HAI measures are the NQF-endorsed CAUTI and CLABSI measures collected via the CDC's NHSN system. An additional three of the eight HAC measures address similar topics (pressure ulcers, air embolism, and manifestations of poor glycemic control) to patient safety indicators that are included in the NQF-endorsed AHRQ PSI composite that is also included in the Hospital IQR Program. Accordingly, because more broadly applicable NQF-endorsed measures are available that address some of the same HAIs and HACs, we believe it is appropriate to remove these measures from the program. We note that section 3008 of the Affordable Care Act will require public reporting of HACs, including those conditions adopted under section 1886(d)(4)(D) of the Act. HACs remain an important aspect of our commitment to patient safety, and the measurement and reduction of patient harm. ''Safer care'' is one of the six priorities identified to address the three aims established under the National Quality Strategy. We stated our intention to pursue development of an all-cause harm composite measure for potential use in our quality reporting programs.

Comment: The majority of the commenters who commented on the proposed removal of the eight HAC measures supported the MAP recommendation as well as our proposal to remove the eight HAC measures from the Hospital IQR Program. Commenters requested their immediate removal from the Hospital IQR Program as they believed their removal will minimize the potential for hospitals to be penalized twice for these conditions due to the measures' inclusion in the Hospital IQR Program and the HAC payment provisions under section 1886(d)(4)(D) of the Act.

Response: We thank the commenters for their support for the removal of these measures. We are finalizing this proposal, and we do not intend to provide or publicly report new calculations of these individual HACs as part of the Hospital IQR Program after 2012.

Comment: Two commenters supported the removal of the Catheter-Associated Urinary Tract Infection (UTI) and the Vascular Catheter Associated Infections HACs but recommended the retention of rest of the HACs (Air Embolism; Blood Incompatibility; Falls and Trauma: (Includes Fracture Dislocation, Intracranial Injury, Crushing Injury, Burn, Electric Shock); Foreign Object Retained After Surgery; Manifestations of Poor Glycemic Control; and Pressure Ulcer Stages III), and urged us to work with stakeholders to address any coding irregularities that may affect the accuracy of the data used to calculate these six measures. These commenters also suggested continued reporting of these measures on *Hospital Compare.*

Response: We appreciate the commenters' support of the removal of the Catheter-Associated Urinary Tract Infection (UTI) and the Vascular Catheter Associated Infections HACs. We are not considering the retention of any of the other six non-infection related HACs for the Hospital IQR Program at this time due to the MAP recommendations and our intent to pursue development of an all-cause harm composite measure for potential use in our quality reporting programs.

Comment: One commenter opposed CMS' intention to develop an all-cause harm composite measure, noting that there are too many variables to account for in measuring all-cause harm.

Response: We wish to clarify that our goal of developing an all-cause harm composite measure is to inform the healthcare community and the general public of hospital performance in terms of managing patient safety efficiently and economically. While we agree that HACs often result from multiple factors, some of these conditions are ''never events;'' they could cause serious injuries or even death, and should not happen under any circumstances. These never events are foreign objects retained after surgery, air embolism, and blood incompatibility. We are examining risk factors for other HACs. In pursuing this goal, we intend to work with clinical experts in injuries, complications, and infections, and with measure experts with knowledge in composite measures and risk adjustment to develop an all-cause harm measure that can inform clinicians of gaps in their patient safety performance.

(B) Removal of Three AHRQ IQI Measures

In the FY 2009 IPPS final rule (73 FR 48607), we adopted three claims-based AHRQ IQI outcome measures for the FY 2010 payment determination: (1) IQI–11: Abdominal aortic aneurysm (AAA) repair mortality rate (with or without volume); (2) IQI–19: Hip fracture mortality rate; and (3) IQI–91: Mortality for selected medical conditions (composite).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), we proposed to remove these three AHRQ IQI measures from the Hospital IQR Program. In removing measures from the Hospital IQR Program, we seek to eliminate measures that would not be used under the Hospital VBP Program, and to reduce redundancy among the measures in the Hospital IQR Program. Three of the six conditions in the IQI composite measure overlap with 30-day mortality measures that we have in the Hospital IQR Program, and which were recommended by the MAP for use in the Hospital VBP Program. The proposed removal of these AHRQ IQI measures would eliminate unnecessary redundancy in the Hospital IQR Program measure set. We also believe that inclusion of a large number of in-hospital mortality measures, the performance on which is highly dependent upon hospital discharge patterns, may lead to unintended consequences of patients being discharged sooner than advisable. We invited public comment on this proposal.

Comment: All the commenters who commented on the proposed removal of the AHRQ IQI measures strongly supported and requested the removal of the three proposed AHRQ IQI measures from the Hospital IQR Program.

Response: We thank the commenters for their support.

Based on these comments, we are finalizing the removal of IQI–11, IQI–19, and the IQI–90 composite measures. These measures' calculations will not be refreshed on *Hospital Compare* after 2012.

(C) Removal of Five AHRQ PSI Measures

In the FY 2009 IPPS final rule (73 FR 48607), we adopted three claims-based PSI outcome measures for the FY 2010 payment determination: (1) PSI–06: Iatrogenic pneumothorax; (2) PSI–14: Postoperative wound dehiscence; and (3) PSI–15: Accidental puncture or laceration. In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50194), we adopted two more claims-based PSI

outcome measures for the FY 2012 payment determination: PSI–11: Post Operative Respiratory Failure; and PSI 12: Post Operative PE or DVT.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28035), we proposed to remove these five AHRQ PSI measures from the Hospital IQR Program because four of these five individual measures (all but PSI–11) are included in the NQF-endorsed AHRQ PSI Composite measure that is already included in the Hospital IQR Program. Also, the post-operative ventilator associated events assessed in PSI–11 could be captured more robustly using non-administrative data collected via the NHSN in the near future. Therefore, we proposed to remove these five individual PSIs from the Hospital IQR Program measure set in order to eliminate unnecessary redundancy. We invited public comment on this proposal.

Comment: Almost all of the commenters who commented on the proposed removal of the AHRQ PSI measures supported their removal from the Hospital IQR Program. Commenters stated that these measures, which are based on administrative data, are less sensitive than those measures that utilize chart-abstracted data, and lack the specificity required for use in comparative public reporting programs. One commenter was concerned that the removal of the measures would deprive stakeholders of the opportunity to drill down and access more granular information on the individual measures. The commenter requested assurance that the transparency of information on these safety events is not compromised by the removal of these measures.

Response: We appreciate the supportive comments received for this proposal. Four of the five measures to be removed are part of the PSI Composite that is being retained for the Hospital IQR Program, and we will be able to continue providing this information in ''drill down'' displays of the PSI Composite because the individual measure information can be made available through links or pop-up windows from the main display of the composite score. We are finalizing the removal of these five PSI measures from the Hospital IQR Program.

Comment: Many commenters strongly supported the proposal to remove the 16 claims-based measures and one chart-abstracted measure as one way to streamline measures in the Hospital IQR Program and make the numbers of Hospital IQR Program measures more manageable. Commenters urged CMS to expedite the proposed removal of the 17 measures sooner than 2015 as proposed and to remove the 17 measures from the *Hospital Compare* Web site immediately. The commenters recommended that we use the CY 2013 OPPS/ASC proposed rule as a vehicle to propose the removal of these measures from the FY 2013 and 2014 Hospital IQR Program measure set.

Response: We are sensitive to the comments on streamlining measures in the Hospital IQR Program. We thank the commenters for the support. Although we proposed the removal of these measures for the FY 2015 payment determination, the impact from the removal of these measures begins in 2012. In particular, the data collection for the chart-abstracted measure, SCIP–VTE–1: Surgery patients with recommended VTE prophylaxis ordered, will end with December 31, 2012 discharges. New calculations of the 16 individual claims-based measures on the *Hospital Compare* Web site will not be displayed as distinct measures after July 2012 for purposes of the Hospital IQR Program. However, because the PSI Composite Measure is comprised of individual PSI measures, information on the specific measures that are part of the AHRQ PSI Composite can be provided on *Hospital Compare* in ''drill down'' displays from the main composite. Also, some or all of the HAC measures may be reported on *Hospital Compare* in some manner in the future under the public reporting authority under section 3008 of the Affordable Care Act.

Comment: Two commenters assumed that because CMS proposed the removal of several individual AHRQ PSI measures from the Hospital IQR Program, that we would also remove these indicators from the calculation of the AHRQ PSI–90 composite measure for both Hospital IQR and the Hospital VBP Programs. Furthermore, these commenters believed that the statutory display requirement for the AHRQ PSI–90 composite measure has not been met because CMS did not display data for all eight of the individual AHRQ indicators that are used in the composite.

Response: We wish to clarify that our removal of several individual AHRQ indicators from the Hospital IQR Program does not in any way change the composition of the AHRQ PSI–90 composite measure for either the Hospital IQR or Hospital VBP Programs. No changes have been proposed for the AHRQ PSI–90 composite for the Hospital IQR or Hospital VBP Programs. We adopted and displayed the NQF-endorsed AHRQ PSI–90 composite measure for the Hospital IQR Program (NQF#531) which is comprised of the following individual indicators: PSI–03, PSI–06, PSI–07, PSI–08, PSI–12, PSI–13, PSI–14, and PSI–15. We will continue to use/display this NQF-endorsed version of the PSI composite for the program. Regarding the 1 year display requirement for the PSI-composite for the Hospital VBP Program, we have proposed to use the AHRQ PSI–90 composite calculation in its totality for Hospital VBP Program scoring. We displayed this composite score in its totality on *Hospital Compare* beginning in October 2011. Therefore, the PSI–90 composite meets the display requirement for use in the Hospital VBP Program regardless of how many individual AHRQ indicators were displayed.

Some commenters also provided suggestions for removal of other measures in the Hospital IQR Program.

Comment: A commenter recommended the removal of the HF–1 (Discharge Instructions) measure because the measure did not receive continued NQF-endorsement and was perceived as a ''check-the-box'' measure that does not convey meaningful or actionable information about the quality of the discharge process. Another commenter believed that HF–1 should be replaced with a Post-Discharge Appointment for Heart Failure Patients measure.

One commenter proposed the removal of the SCIP Infection-2 (Prophylactic Antibiotic Selection for Surgical Patients) measure because the commenter believed implementation of the Surgical Site Infection measures targeted for FY 2014 will provide more meaningful outcome information than this process measure.

One commenter recommended the removal of all non-NQF-endorsed measures except those measures that are part of TJC's accountability measure set.

One commenter requested the removal of SCIP–INF–10 (Surgery Patients with Perioperative Temperature Management), which the commenter contended is topped out and which is not required for the Hospital VBP Program. One commenter indicated that PN–3b (Blood Culture Performed in the Emergency Department prior to First Antibiotic Received in Hospital) should be removed from the Hospital IQR Program because of the pending removal of its NQF-endorsement status, the consensus among stakeholders, the evidence citing the ineffective and inefficient implementation, and the unintended consequences associated with the measure.

Response: We appreciate the commenters' input on the removal of the measures and we will take this into consideration when we select measures

for removal in the future. In our view, currently, these recommended measures for removal still yield valuable information in the improvement of healthcare and we have no plans to remove them unless evidence indicates otherwise. As for the suggested removal of non-NQF-endorsed measures, while we seek to use NQF-endorsed measures where possible, we note that measures that we believe to be important in assessing the quality of hospital care can be adopted for the Hospital IQR Program through our exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act. This section provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a), the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

After consideration of the public comments we received on measure removal, we are finalizing our proposal to remove 1 chart-abstracted measure and 16 claims-based measures as set forth in the table below:

Topic	17 Measures removed from Hospital IQR Program measure set for FY 2015 and subsequent payment determinations
Surgical Care Improvement Project (SCIP) Measure.	• SCIP INF–VTE-1: Surgery patients with recommended Venous Thromboembolism (VTE) prophylaxis ordered.
AHRQ Patient Safety Indicators (PSIs), Inpatient Quality Indicators (IQIs) and Composite Measures.	• PSI 06: Iatrogenic pneumothorax, adult. • PSI 11: Post Operative Respiratory Failure. • PSI 12: Post Operative PE or DVT. • PSI 14: Postoperative wound dehiscence. • PSI 15: Accidental puncture or laceration. • IQI 11: Abdominal aortic aneurysm (AAA) mortality rate (with or without volume). • IQI 19: Hip fracture mortality rate. • IQI 91: Mortality for selected medical conditions (composite).
Hospital Acquired Condition Measures.	• Foreign Object Retained After Surgery. • Air Embolism. • Blood Incompatibility. • Pressure Ulcer Stages III & IV. • Falls and Trauma: (Includes: Fracture Dislocation Intracranial Injury Crushing Injury Burn Electric Shock). • Vascular Catheter-Associated Infection. • Catheter-Associated Urinary Tract Infection (UTI). • Manifestations of Poor Glycemic Control.

d. Suspension of Data Collection for the FY 2014 Payment Determination and Subsequent Years

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51611), we suspended data collection for four measures beginning with January 1, 2012 discharges, affecting the FY 2014 payment determination and subsequent years.

Topic	Hospital IQR Program measures suspended for FY 2015 payment determination and subsequent years
Acute Myocardial Infarction (AMI)	• AMI–1 Aspirin at arrival. • AMI–3 ACEI/ARB for left ventricular systolic dysfunction. • AMI–5 Beta-blocker prescribed at discharge.
Surgical Care Improvement Project (SCIP).	• SCIP INF–6 Appropriate Hair Removal.

We suspended, rather than removed, these measures because although our analysis indicated that these measures are topped-out measures (that is, their performance is uniformly high nationwide, with little variability among hospitals), we recognized some commenters' belief that the processes assessed by the measures were tied to better patient outcomes, and that removal of the measures from the program may result in declines in performance and hence, worse outcomes.

The suspension of data collection for these four measures will be continued unless we have evidence that performance on the measures is in danger of declining. Should we determine that hospital adherence to these practices has unacceptably declined, we would resume data collection using the same form and manner and on the same quarterly schedule that we finalize for these and other chart abstracted measures, providing at least 3 months of notice prior to resuming data collection. Hospitals would be notified of this via CMS listservs, CMS email blasts, national provider calls, and QualityNet announcements. In addition, we would comply with any requirements imposed by the Paperwork Reduction Act before resuming data collection of these four measures.

Comment: Many commenters supported CMS' measure suspension policy, which provides a balance between maintaining quality and avoiding unnecessary administrative burden. Several commenters indicated that instead of suspension, these four previously suspended measures should be removed from the Hospital IQR Program permanently.

Response: We thank the commenters for their support of our measure suspension policy. Before we can remove the suspended measures we will need to determine whether the important practices addressed by these suspended measures continue to be routinely practiced.

Comment: A few commenters requested that CMS clarify: (1) The methodology used to determine if the measures are declining in performance; and (2) requirements to resume collection of a suspended measure. The commenters stated that if CMS decides to resume collection of a measure, it should integrate the timeline with the current process for implementation of technical specifications. Commenters offered to collaborate with CMS to identify measures warranting suspension.

Response: We will continue to monitor the measures for evidence of performance slippage by reviewing published literature and examining national performance trends on these measures from data collected by other parties. In the event that data collection on a suspended measure must be resumed, we intend to align with Specifications Manual release and collection cycle timelines in order to provide sufficient notice to hospitals.

3. Measures for the FY 2015 and FY 2016 Hospital IQR Program Payment Determinations

a. Additional Considerations in Expanding and Updating Quality Measures Under the Hospital IQR Program

In general, we seek to adopt measures for the Hospital IQR Program that would promote better, safer, more efficient care. We believe it is important to expand the pool of measures to include measures that aim to improve patient safety. This goal is supported by many reports documenting that tens of thousands of patients do not receive safe care in the nation's hospitals.[53,54]

In addition to our goals to align measures and support the Hospital VBP Program, we also take into account other considerations in implementing and expanding the Hospital IQR Program:

- Our overarching purpose is to support the National Quality Strategy's (NQS') three-part aim of better health care for individuals, better health for populations, and lower costs for health care. The Hospital IQR Program will help achieve the three-part aim by creating transparency around the quality of care at inpatient hospitals to support patient decision-making and quality improvement. Given the availability of well-validated measures and the need to balance breadth with minimizing burden, measures should take into account and address, as fully as possible, the six domains of measurement that arise from the six NQS priorities: Clinical care; Person- and caregiver-centered experience and outcomes; Safety; Efficiency and cost reduction; Care coordination; and Community/population health. More information regarding the National Quality Strategy can be found at: *http://www.hhs.gov/secretary/about/priorities/priorities.html* and *http://www.ahrq.gov/workingforquality/.* HHS engaged a wide range of stakeholders to develop the National Quality Strategy, as required by the Affordable Care Act.
- We seek to collect data in a manner that balances the need for information related to the full spectrum of quality performance and the need to minimize the burden of data collection and reporting. Within the framework of our statutory authority and taking into account programmatic considerations, measures used in the Hospital IQR Program should be harmonized with other Medicare/Medicaid quality reporting programs and incentive programs to promote coordinated efforts to improve quality.
- As part of our burden reduction efforts, we will continuously weigh the relevance and utility of the measures compared to the burden on hospitals in submitting data under the Hospital IQR Program. We seek to use measures based on alternative sources of data that do not require chart abstraction or that utilize data already being reported by many hospitals, such as data that hospitals report to clinical data registries, or all-payer claims databases. In recent years we have adopted measures that do not require chart abstraction, including structural measures and claims-based measures that we can calculate using other data sources.
- To the extent practicable, measures we use should be nationally endorsed by a multi-stakeholder organization. Section 3001(a)(2) of the Affordable Care Act added new sections 1886(b)(3)(B)(viii)(IX)(aa) and (bb) of the Act. These sections state that ''* * * effective for payments beginning with fiscal year 2013, each measure specified by the Secretary under this clause shall be endorsed by the entity with a contract under section 1890(a) [of the Act],'' and ''[i]n the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) [of the Act], the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.'' Accordingly, we attempt to utilize endorsed measures whenever possible.
- Measures should be developed with the input of providers, purchasers/payers, and other stakeholders. Measures should be aligned with best practices among other payers and the needs of the end users of the measures. We take into account widely accepted criteria established in medical literature.
- Section 1890A(a)(4) of the Act, as added by section 3014(b) of the Affordable Care Act, requires the Secretary to take into consideration input from multi-stakeholder groups in selecting quality and efficiency measures that have been endorsed by the entity with a contract under section 1890 of the Act, currently NQF, and measures that have not been endorsed. The MAP is a partnership comprised of multi-stakeholder groups that was convened by NQF to provide input on measures. Accordingly, we consider the MAP's recommendations in selecting quality and efficiency measures (*http://www.qualityforum.org/map/*).
- HHS Strategic Plan and Initiatives. HHS is the U.S. government's principal agency for protecting the health of all Americans. HHS accomplishes its mission through programs and initiatives. Every 4 years HHS updates its Strategic Plan and measures its progress in addressing specific national problems, needs, or mission-related challenges. The goals of the HHS Strategic Plan for Fiscal Years 2010 through 2015 are: Strengthen Health Care; Advance Scientific Knowledge and Innovation; Advance the Health, Safety, and Well-Being of the American People; Increase Efficiency, Transparency, and Accountability of HHS Programs; and Strengthen the Nation's Health and Human Services Infrastructure and Workforce (*http://www.hhs.gov/about/FY2012budget/strategicplandetail.pdf*). HHS prioritizes policy and program interventions to address the leading causes of death and disability in the United States, including heart disease, cancer, stroke, chronic lower respiratory diseases, unintentional injuries, and preventable behaviors. Initiatives such as the HHS Action Plan to Reduce HAIs in clinical settings and the Partnership for Patients exemplify these programs.
- CMS Strategic Plan. We strive to ensure that measures for different Medicare and Medicaid programs are aligned with priority quality goals, that measure specifications are aligned

[53] OEI–06–09–00090, ''Adverse Events in Hospitals: National Incidence Among Medicare Beneficiaries.'' Department of Health and Human Services, Office of Inspector General, November 2010.

[54] 2009 National Healthcare Quality Report, pp. 107–122. ''Patient Safety,'' Agency for Healthcare Research and Quality.

across settings, that outcome measures are used whenever possible, and that quality measures are collected from EHRs as appropriate.

- We give priority to measures that assess performance on: (a) Conditions that result in the greatest mortality and morbidity in the Medicare population; (b) conditions that are high volume and high cost for the Medicare program; and (c) conditions for which wide cost and treatment variations in the Medicare population have been reported, despite established clinical guidelines, across populations or geographic areas.
- We will focus on selecting measures that we believe will also meet the Hospital VBP Program measure inclusion criteria and advance the goals of the Hospital VBP Program by targeting hospitals' ability to improve patient care and patient outcomes.

In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50191 through 502192), we finalized our proposal to adopt measures for the Hospital IQR Program for three consecutive payment determinations. The intent of this policy was to provide greater certainty for hospitals to plan to meet future reporting requirements and implement related quality improvement efforts. In addition to giving hospitals more advance notice in planning quality reporting, this multiyear approach also provides more time for us to prepare, organize, and implement the infrastructure needed to collect data on the measures and make payment determinations. However, we indicated that these finalized measure sets for multiple years could still be updated through the rulemaking process should we need to respond to agency and/or legislative changes.

Finally, in section IV.A.5.a.(2) of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50219 through 50220), we adopted a proposal to make Hospital IQR Program payment determinations beginning with FY 2013 using one calendar year of data for chart-abstracted measures. We began using this approach, which synchronizes the quarters for which data on these measures must be submitted during each year with the quarters used to make payment determinations with respect to a fiscal year, beginning with January 1, 2011 discharges. However, it will not affect our payment determinations until FY 2013.

Comment: Some commenters complimented CMS for successfully identifying measures that fall into the six NQS domains which can be used to identify measure gaps in domain areas for future measure development. The commenters strongly believed this approach will signal to the private sectors that the public and private sectors are progressing toward a common path to improve health care quality. However, one commenter noted that it may be premature to utilize the NQS domains for the purposes of payment determination at this time.

Response: We thank the commenters for recognizing our intent for using the NQS as the framework to attain a cohesive public and private national quality strategy to achieve the overarching goal of improving patient care quality across the full healthcare spectrum. We point out that the NQS is intended to be used to identify gap areas in the program, but that individual measures considered for the Hospital IQR Program will continue to be evaluated against the more specific criteria articulated for the Hospital IQR Program.

Comment: Many commenters highly commended CMS for moving the Hospital IQR Program in the right direction by essentially transforming a set of discrete process measures aimed at internal quality improvement to a comprehensive quality reporting program that addresses the needs of consumers and purchasers by including meaningful measures of outcomes, patient experience, and patient safety. The commenters commended CMS' efforts to foster transparency in healthcare quality and believed this approach incentivizes quality improvement and promotes better care, better value, and lower cost. One commenter praised our previous efforts to adopt measures for three consecutive payment determinations.

Response: We are encouraged by the public support of our efforts to promote high-quality care, improve patient outcomes, and make quality data publicly available for consumers. We will continue to strive to improve the Hospital IQR Program.

Comment: For program alignment, one commenter suggested CMS should deem a hospital as a meaningful user as required under the HITECH EHR Incentive Program if it participates in the Hospital IQR Program.

Response: It would not be possible to deem Hospital IQR Program participating hospitals as meaningful users under the EHR Incentive Program. We note that aside from quality measure reporting, meaningful users under the HITECH EHR Incentive Program also have other program requirements with which to comply.

Comment: For burden reduction purposes, several commenters recommended that CMS limit data collection for clinical process of care measures to aggregate performance levels only and, in addition, closely monitor the association of process with outcomes, such as mortality and readmission rates.

Response: We thank the commenters for these suggestions. We have found that to fully address the relationship between clinical processes of care and patient outcomes, the analysis of patient level data on processes of care with individual patient level outcomes is necessary. We intend to continue monitoring this association using these data.

Comment: A commenter praised CMS for driving the portfolio of programs administered via the IPPS to be more aligned with what private sector purchasers and payers are doing to improve care and reduce costs. The commenter recommended CMS develop a parsimonious list of high-impact measures suitable for both private purchasers/payers and public purchasers/payers through collaboration with private and state purchasers during pre-rulemaking, using the MAP process. Many commenters applauded CMS' recognition of recommendations from the MAP in this proposed rule. The commenters noted that the MAP recommends a unified data strategy for public and private sectors, a standardized data platform, approaches to performance-based payment, and use of NQF-endorsed measures.

Response: We thank the commenters for the commendations. We value the recommendations of the MAP and considered these recommendations carefully in determining the measure proposals to include in this year's rulemaking. In adopting many of the MAP's recommendations while giving priority to measures that have high impact in terms of mortality, morbidity, volume, and cost, that could be applicable to both the private and public sectors, we feel that we have developed a portfolio of high impact measures that are suitable for use by both private and public purchasers, even though some of the measures in the Hospital IQR Program are not NQF-endorsed. We have adhered to the pre-rulemaking process as required under section 1890A(a) of the Act in the selection of quality and efficiency measures. As part of this process, we made available to the public a list of the measures described in section 1890(b)(7)(B) of the Act that the Secretary was considering under Title XVIII of the Act.

Comment: For the future growth of the Hospital IQR Program and burden reduction purposes, some commenters recommended that all new measures

proposed for the Hospital IQR Program should: (1) Align with objectives of the National Priorities Partnership, HHS Strategic Plan, and the NQS; (2) align with criteria for meaningful use of EHRs; (3) avoid duplicative reporting via both chart-abstraction and e-reporting; and (4) avoid measures of broad or global facility populations.

Response: We thank the commenters for their valuable suggestions and we will take them into consideration in our future measure proposals.

b. Hospital IQR Program Measures for the FY 2015 Payment Determination and Subsequent Years

(1) Process for Retention of Hospital IQR Program Measures Adopted in Previous Payment Determinations

We previously finalized 76 measures for the FY 2015 Hospital IQR Program measure set (76 FR 51636 through 51637). We note that this number includes the four measures for which we have suspended data collection.

In past rulemakings, we have proposed to retain previously adopted measures for each payment determination on a year-by-year basis and invited public comment on the proposal to retain such measures for all future payment determinations unless otherwise specified. Specifically, for the purpose of streamlining the rulemaking process, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28038), we proposed that when we adopt measures for the Hospital IQR Program beginning with a payment determination and subsequent years, these measures are automatically adopted for all subsequent payment determinations unless we propose to remove, suspend, or replace the measures. We invited public comment on this approach.

Comment: Some commenters supported CMS' proposed policy to automatically retain all previously adopted measures for all subsequent payment determinations unless we propose to remove, suspend, or replace the measures. Some commenters opposed the automatic retention of measures because they were concerned that the public may miss an opportunity to comment on the measures and potential changes to them. These commenters recommended that CMS propose to retain previously adopted measures through rulemaking on a year by year basis.

Response: We thank the commenters for their support of the proposed retention of quality measures from previous payment determinations. Regarding the opportunity for the public to comment on the measures and potential changes to them, automatic retention of measures in the program does not preclude the public from submitting comments on measures in the program, and we post the specifications for the measures used in the program publicly on the QualityNet Web site with updates issued at regular 6-month intervals. Whether NQF-endorsed or not, we consistently maintain the measures used in the program. Should there be changes in scientific evidence or health care delivery models, or if patient safety concerns arise, we will evaluate the adopted measures accordingly. NQF-endorsed measures also undergo a full maintenance review with public comment every three years. The purpose of retaining measures automatically is to streamline the regulation process and make it more efficient.

Comment: A commenter reported significant improvement in the appropriate interventions provided for AMI, HF, PN, and surgical care-hospitalized patients since the initial implementation of the 10 starter measures in 2003 and urged CMS to continue to retain these inpatient measures.

Response: We note that some of the measures in the 10 starter measures were removed for different reasons in previous rulemakings. We thank the commenter for their support and will consider the suggestion regarding retaining the remaining measures in the 10 starter measures in making future proposals.

Comment: A commenter was concerned about the increasing number of chart-abstracted and structural measures in the Hospital IQR Program. The commenter recommended that CMS exclude the four structural measures as well as the chart-abstracted Stroke and VTE measure sets from the Hospital IQR Program.

Response: We will consider these suggestions for future removal of measures from the program. Our understanding is that, although required collection of the previously adopted Stroke and VTE measures for the Hospital IQR Program will begin with January 1, 2013 discharges, many hospitals already have experience collecting and reporting one or both of these measure sets either to TJC, or to a registry. The structural measures impose minimal burden to hospitals.

We also received some comments on some of the measures that we have previously adopted and proposed to retain.

Comment: A commenter was concerned that in some cases, the ED–1: Median time from emergency department arrival to time of departure from the emergency room for patients admitted to the hospital from the emergency department (ED) measure that was finalized for the FY 2014 payment determination in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50210 through 50211) may be inflated to span days in some cases. The commenter gave an example that a patient may go to the ED, be sent home, return to the ED, and be admitted to the hospital, all over the course of 2 days. The commenter noted that the Medicare billing structure rolls up these 2 ED visits into one single episode of care and thus the median time from ED to time of departure from the ED would appear to span days.

Response: The commenter is correct that in some instances, the timeframe for ED visits may span 2 calendar days reflecting Medicare billing processes and structures. We are aware of this issue and are working to address these concerns and will review the impact of this situation during upcoming technical expert panel meetings. We are also tracking the frequency in which scenarios like the one described occur in order to determine the impact of this billing process.

Comment: A commenter requested that the ED–1 and ED–2 measures not apply to patients who suffer sexual assault and domestic violence because forensic evidence must be collected from these patients and application of the measures may compromise the time needed to stabilize and treat these patients.

Response: We thank the commenter for the suggestion. However, we believe that all patients, no matter what their situation, should be seen and treated in the ED in a timely manner. The measure does not place time constraints on any type of treatment provided during an ED visit or indicate how much time provision of care in the ED should take. Therefore, we do not agree that patients who are being treated in the ED because they are victims of domestic violence or sexual assault should be excluded from the measure population.

Comment: A commenter recommended the exclusions of various patients from the Influenza Immunization and Pneumococcal Immunization measures that were finalized for the FY 2014 payment determination in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50210 through 50211) as follows: left against medical advice, transferred to another hospital, discharged to hospice, documentation of comfort measures only.

Response: We agree with the commenter and accordingly, beginning with January 1, 2013 discharges, the Specifications Manual includes exclusions for patients transferring to another acute care facility and patients who leave against medical advice. The manual informing January 1, 2013 discharges was published in July 2012, and includes these changes. Patients who leave against medical advice cannot realistically be given vaccinations if they have already left the facility. Patients transferred to another facility for completion of medical care, vaccinations would be completed by the accepting facility. With these exclusions, the likelihood for double counting a patient is removed, and attribution is correctly achieved for this metric. We do not believe that patients discharged to hospice or those with orders for comfort measures only, should be excluded from the denominator because a secondary infection, potentially resulting from withholding of a vaccination, in this vulnerable population could reduce quality of life.

Comment: A commenter suggested that the measure specification of the SCIP INF–4 (Cardiac surgery patients with controlled 6AM postoperative serum glucose) should be updated to reflect the recent NQF maintenance review updates. The updates would mean changing the 6AM time frame to the currently endorsed time frame of 18 to 24 hours post operative. The commenter also stated that the Specifications Manual should clearly indicate post-operative states.

Response: We thank the commenter for the suggestion. We will evaluate the nature of this change, as well as the optimal timing for instituting system changes, and downstream impacts for other programs before determining whether an update can be made to the Specifications Manual.

Comment: One commenter recommended moving the implementation date of the Healthcare Personnel Influenza Vaccination measure from the FY 2015 payment determination to the FY 2014 payment determination. Another commenter recommended delaying the reporting of the measure on *Hospital Compare* because CDC/NHSN has significantly revised the measure with new data collection protocols, forms, and reports. The commenter noted that hospitals need to gain experience with the data collection process prior to public reporting of the information.

Response: We will continue to require reporting of this measure for the Hospital IQR Program for patients discharged on or after January 1, 2013. In response to the comment regarding the need for experience with the revised CDC/NHSN data collection process prior to public reporting, we will allow the first submission of cases spanning October 1, 2012 to December 31, 2012 to be on a voluntary basis, and we will not publicly report the first submission on *Hospital Compare.* We will plan to begin public reporting with the second submission of the Healthcare Personnel Influenza Vaccination measure, which would span the complete flu season from October 1, 2013 through March 30, 2014, in December of 2014.

Comment: Two commenters strongly supported the retention of the Stroke measure set even though they may be burdensome because commenters believed these are important for measurement of stroke care.

Response: We thank the commenters for the support of the Stroke measure set. We note that the e-specifications for these 2 measure sets have been completed. We anticipate that once hospitals have acquired the capability to submit data on measures electronically at a future date, such as 2015, the burden will be reduced significantly.

Comment: One commenter noted that the names of the measures in the VTE measure set should be updated to align with TJC's measure names.

Response: We thank the commenter for the input. To maintain alignment between CMS and TJC, we have updated the inpatient Specifications Manual to reflect TJC VTE measure set names.

Comment: One commenter requested delaying the implementation of the MRSA Bacteremia and the C. *difficile* measures by one year to allow CMS and CDC to collaborate in developing and maintaining a set of technical specifications for the detection and reporting of LabID events from laboratory information systems.

Response: We note that CDC has developed specifications for detecting and reporting LabID events and is prepared to provide the specifications and assistance to implementers. The technical specifications are simply instructions for how to collect and submit the measure using healthcare data that are available in electronic form. However, these detection specifications do not change the measure. Therefore, we believe that there is no need to delay the implementation of these two measures.

After consideration of the public comments we received, we are finalizing the measure retention policy as proposed.

(2) Additional Hospital IQR Program Measures for the FY 2015 Payment Determination and Subsequent Years

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51636 through 51637), we finalized 17 new measures for the Hospital IQR Program measure set for FY 2015 payment determination: 3 HAI measures collected through the NHSN, (MRSA Bacteremia, C. *difficile* SIR, and the Healthcare Personnel Influenza Vaccination), the Stroke measure set (8 measures) and the VTE measure set (6 measures).

(A) New Survey-Based Measure Items for Inclusion in the HCAHPS Survey Measure for the FY 2015 Payment Determination and Subsequent Years

For the FY 2015 payment determination and subsequent years, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28038), we proposed to add the NQF-endorsed 3-Item Care Transition Measure (CTM–3) (NQF #0228) to the existing HCAHPS survey. This measure is NQF-endorsed; therefore, the measure meets the selection criteria under section 1886(b)(3)(B)(viii)(IX)(aa) of the Act. The CTM–3 was developed by the University of Colorado Health Sciences Center for the NQF Endorsement Project entitled ''National Voluntary Consensus Standards for Quality of Cancer Care.'' The MAP supports the immediate inclusion of the CTM–3 within the Hospital IQR Program. The three care transitions items that comprise the CTM–3, which we proposed to add to the HCAHPS survey beginning with January 2013 discharges, are listed below. Detailed information on scoring methodology can be found on the Care Transition Measure Web site: *http://www.caretransitions.org/documents/CTM3Specs0807.pdf.*

The HCAHPS Survey was designed to accommodate the addition of supplemental items, provided such items adhere to the relevant HCAHPS survey protocols, see HCAHPS Quality Assurance Guidelines V7.0, p. 72: *http://www.hcahpsonline.org/files/HCAHPS%20Quality%20Assurance%20Guidelines%20V7.0%20March%202012.pdf.* The survey items that comprise the CTM–3 that we propose to add to HCAHPS meet these protocols. The addition of select items to HCAHPS is consistent with the survey's original design, development and NQF endorsement. Further, the CTM–3 was designed by its developers to be consistent and compatible with extant HCAHPS items and HCAHPS sampling and survey administration protocols. The original, NQF-endorsed

CTM–3 items and response options are as follows:

• The hospital staff took my preferences and those of my family or caregiver into account in deciding what my health care needs would be when I left the hospital.

☐ Strongly Disagree
☐ Disagree
☐ Agree
☐ Strongly Agree
☐ Don't Know/Don't Remember/Not Applicable

• When I left the hospital, I had a good understanding of the things I was responsible for in managing my health.

☐ Strongly Disagree
☐ Disagree
☐ Agree
☐ Strongly Agree
☐ Don't Know/Don't Remember/Not Applicable

• When I left the hospital, I clearly understood the purpose for taking each of my medications.

☐ Strongly Disagree
☐ Disagree
☐ Agree
☐ Strongly Agree
☐ Don't Know/Don't Remember/Not Applicable

In order to make the CTM–3 items more fully consistent and compatible with the original HCAHPS Survey items, we have made a few small modifications. Specifically, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28038), we proposed: (1) To slightly reword the first care transition item by adding the phrase, ''During this hospital stay;'' (2) to delete the ''Don't Know/Don't Remember/Not Applicable'' response option from each item; and (3) to add a new response option, ''I was not given any medication when I left the hospital,'' to the third care transition item. These small modifications preserve the integrity and utility of the HCAHPS Survey as it is expanded to encompass a new dimension of patients' experience of hospital care. The developer of the CTM–3 has agreed to these modifications, which we believe are consistent with the NQF endorsement of the original 27-item HCAHPS Survey and the CTM–3.

After incorporating these modifications, the CTM–3 items that we proposed to add to the HCAHPS Survey are as follows:

• During this hospital stay, staff took my preferences and those of my family or caregiver into account in deciding what my health care needs would be when I left.

☐ Strongly disagree
☐ Disagree
☐ Agree
☐ Strongly agree

• When I left the hospital, I had a good understanding of the things I was responsible for in managing my health.

☐ Strongly disagree
☐ Disagree
☐ Agree
☐ Strongly agree

• When I left the hospital, I clearly understood the purpose for taking each of my medications.

☐ Strongly disagree
☐ Disagree
☐ Agree
☐ Strongly agree
☐ I was not given any medication when I left the hospital

We also proposed to add two items to the ''About You'' section of the HCAHPS survey beginning with January 2013 discharges. These two items would not be included in public reporting of the HCAHPS survey but may be employed in the patient-mix adjustment of survey responses.

The two proposed ''About You'' items are as follows:

• During this hospital stay, were you admitted to this hospital through the Emergency Room?

☐ Yes
☐ No

• In general, how would you rate your overall mental or emotional health?

☐ Excellent
☐ Very good
☐ Good
☐ Fair
☐ Poor

The two new ''About You'' items were developed and tested in the Three-State Pilot Study of HCAHPS in 2003. Neither item was adopted in the national implementation of HCAHPS in 2006; however, current circumstances, as explained below, warrant the addition of these items to the HCAHPS survey at this time.

We invited public comment on the three proposed CTM–3 items.

Comment: Commenters expressed support for the CTM–3 items.

Response: We thank the commenters for their support for the CTM–3 items. Inclusion of these tested and well-accepted questions will enable HCAHPS to report on transition of care measures as part of its overall public reporting program.

Comment: One commenter stated that the response options for the CTM–3 items are different from those of existing HCAHPS questions and that this may confuse respondents as well as pose a challenge for hospital public reporting.

Response: The current HCAHPS questionnaire includes a variety of response sets, depending upon the questions being asked. It is standard practice within survey research to use different response sets for different questions within a single questionnaire. Asking respondents to agree or disagree with statements is a common response set option. We have no evidence that a variety of response sets confuses respondents or poses a significant challenge for hospital public reporting.

Comment: Some commenters stated that some of the CTM–3 items appear to be redundant with items already on the HCAHPS survey and are not distinct enough to warrant inclusion.

Response: Similar items do exist in the current survey, but they are asked in contexts other than care transitions. For example, current HCAHPS questions about medications are asked in the context of the hospital environment, rather than care transitions. Accordingly, we believe the CTM–3 is appropriate for inclusion in the HCAHPS survey.

Comment: One commenter believed that the CTM–3 item on medications will not be answered accurately or will confuse patients and should be limited to new medications.

Response: Testing has not revealed any issues with this item. In addition, the wording of the item reflects a wide variety of scenarios, including situations in which patients were handed prescriptions, or actual medications, when they left the hospital. The item is intended to measure the degree to which patients feel they understand the purpose for all of their medications as they transition to another care location. It is not intended to focus solely on new medications that may have been prescribed at the hospital.

Comment: Commenters expressed their belief that the CTM–3 item regarding ''care needs'' is really about patient preferences, not care transitions.

Response: The CTM–3 item regarding ''care needs'' asks patients about an issue that patients have identified in qualitative studies as critically important to care coordination when leaving the hospital.

Comment: Comments suggested that the CTM–3 items be reworded for clarity, to make them easier to read, to avoid questions that ask patients about both their own preferences and those of the patient's family or caregiver, and to make the response items more similar to other response items already included in the HCAHPS survey.

Response: We carefully reviewed the CTM–3 items for both content and style before proposing their inclusion in the HCAHPS Survey and found no reason to make substantial changes. In terms of content, the CTM–3 was developed to be compatible with HCAHPS Survey.

While the style of the CTM–3 items differs slightly from existing HCAHPS Survey items, our testing indicates this not a problem for patients. In addition, hospitals that currently use the CTM–3 have not reported problems with item wording or confusion with questions that ask patients about their preferences and those of their family or caregiver (which are considered a unit). Finally, the CTM–3 items have been tested by their developer and are NQF-endorsed. While we made some minor modifications to the CTM–3 items and their response options to make them more compatible with other items on the HCAHPS Survey, we are not free to substantially alter either the wording of NQF-endorsed items or to change their response sets without re-submitting them for endorsement.

Until 2010, ''emergency room admission'' as a point of origin for hospital patients was an administrative code provided by hospitals and was used as a patient-mix adjustment for HCAHPS scores. However, since July 2010, the ''Point of Origin for Admission or Visit'' code for Emergency Room has been discontinued for use by Medicare payment systems and, thus became unavailable for HCAHPS patient-mix adjustment. In the original HCAHPS mode experiment, we determined empirically that emergency room admission status both vary across hospitals and have an important bearing on patient experience of care: *http://www.hcahpsonline.org/files/Final%20Draft%20Description%20of%20HCAHPS%20Mode%20and%20PMA%20with%20bottom%20box%20modedoc%20April%2030,%202008.pdf.* The inclusion of a new patient-reported survey item will allow us to again use emergency room admission as a patient-mix adjustment variable.

We have received numerous inquiries and requests from hospitals and researchers to add a survey item concerning the patient's overall mental health. The survey item we proposed to add, which is very similar in structure to the existing ''overall health'' item, will allow us to introduce a patient-mix adjustment for this characteristic in the future. Although we chose not to add a survey item about patient's overall mental health status in the national implementation of HCAHPS in 2006, we continue to receive inquiries and requests from hospitals and researchers on this topic. Some researchers claim that mental health status is an important factor in how patients respond to HCAHPS survey items. The continuing interest in this topic, coupled with the direct impact of HCAHPS performance on hospital payments beginning in October 2012, led to the decision to add an overall mental health item to the HCAHPS survey. The overall mental health survey item we have chosen very closely resembles the Overall General Health item in the HCAHPS Survey, has been extensively tested, and is currently included in several other CAHPS surveys.

We proposed to add these two ''About You'' items to the existing HCAHPS survey, with required collection beginning January 1, 2013. More detail regarding HCAHPS requirements is included in the Form, Manner and Timing section of this preamble for this program. We invited public comment on the proposed addition of these items for the FY 2015 payment determination.

Comment: Commenters on the mental/emotional health status rating question believed that the item is too sensitive and that it constitutes a self-diagnosis of psychiatric conditions. Commenters also asked whether the item has been tested and how it will be used in case-mix adjustment and expressed concern that responses to this question might put the hospital in the position of having information that might or might not be in the medical record.

Response: Cognitive testing across a variety of populations, including commercial, Medicare and Medicaid populations, has revealed no respondent hesitancy to answer this question. This item does not request self-diagnoses, but merely a rating of perceived mental or emotional health status. There is a body of literature to indicate that single-item health perception measures (overall ratings) are substantially correlated with long-form (multi-item) measures of physical and emotional health. This is a well-established approach to capturing general health perceptions. The mental/emotional health item is one of the oldest and best-validated items in patient surveys; it has been successfully fielded on Medicare CAHPS surveys since 2002. The HCAHPS project team has received many requests to adjust HCAHPS scores for perceived mental/emotional health status. We will be looking at the feasibility of making patient mix adjustments using this item. Asking patients for a self-assessment of their mental and/or physical health is a well-established survey item that has been successfully used in many contexts, including other CAHPS surveys. Patient responses to this and other HCAHPS items are collected after discharge, and thus, are not in hospitals' possession during the hospitalization or part of the patient medical record. Finally, responses to this item do not constitute a clinical assessment of the patient's mental or emotional health, nor do they constitute a self-diagnosis. They relate to the patient's *perception* of his or her mental or emotional health.

Comment: Commenters on the question about being admitted through the hospital ED believed that patients may not be able to accurately report whether they were admitted through the ED and that administrative data are preferable to self-reports as a source of this information. One commenter said the item has the potential to decrease the confidence of their patients because the patients may perceive that the hospital should already know this information. A commenter asked whether the validity of the item had been tested.

Response: The ''Point of Origin for Admission or Visit'' code for Emergency Room was discontinued for use by Medicare payment systems in July 2010 and became unavailable for HCAHPS patient-mix adjustment. The inclusion of a new patient-reported survey item will allow us to again use emergency room admission as a patient mix adjustment variable if it is shown to influence response tendencies. The emergency room admission self-report question was included in the original HCAHPS three-State pilot study in 2003. In that study we were able to compare patient self-reports with administrative data and found that the patient self-report is a valid indicator of whether the patient had been admitted through the ED. Prior testing did not reveal a pattern of decreased patient confidence resulting from this item. Patients who are unsure about their admission origin may leave this question unanswered.

Comment: Commenters suggested that the addition of the CTM–3 and two About You items will increase the survey's length, resulting in a reduced response rate, more administrative difficulties, and higher costs for hospitals. Commenters suggested that we develop a core set of items, plus a rotating set of items in order to keep the survey short, but allow for the inclusion of new topics.

Response: We have not found issues with survey administration of instruments that are more than twice as long as Hospital CAHPS. Many vendors currently add questions to the HCAHPS questionnaire. As many as 25 additional items are now being successfully fielded as part of the HCAHPS survey. We believe that adding five items is unlikely to substantially impact either the cost or the difficulty of administering the survey. We are, however, concerned that using a set of rotating questions would unnecessarily

increase the complexity, cost, and difficulty of survey administration for both hospitals and vendors.

After consideration of the public comments we received, we are adopting the proposed changes as final.

(B) New Claims-Based Measures for the FY 2015 Payment Determination and Subsequent Years

(i) Hip/Knee Complication: Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) (NQF #1550)

The THA and TKA are commonly performed procedures for the Medicare population to improve quality of life. In 2003, there were 202,500 THAs and 402,100 TKAs performed,[55] and the number of procedures performed annually has increased steadily over the past decades. Annual hospital charges are projected to increase by 340 percent to $17.4 billion for THA and by 450 percent to $40.8 billion for TKA by 2015.[56] The post-operation complications of these procedures are high considering these are selective procedures and usually the complications are devastating to patients. For example, rates for periprosthetic joint infection, a rare but devastating complication, have been reported at 2.3 percent for THA/TKA patients with rheumatoid arthritis,[57] and 1.6 percent in primary elective TKA patients after 1 and 2 years of follow up, respectively.[58] Two studies reported 90-day death rates following THA at 0.7 percent[59] and 2.7 percent.[60] Reported rates for pulmonary embolism following TKA range from 0.5 percent to 0.9 percent.[61,62,63,64] Reported rates for septicemia range from 0.1 percent, during the index admission[65] to 0.3 percent, 90 days following discharge for primary TKA.[66] Rates for bleeding and hematoma following TKA have been reported at 0.94 percent[67] to 1.7 percent.[68] In 2005, annual hospital charges totaled $3.95 billion and $7.42 billion for primary THA and TKA, respectively.[69] Combined, THA and TKA procedures account for the largest payments for procedures under Medicare.[70]

Both hip and knee arthroplasty procedures improve the function and quality of life of patients with disabling arthritis, and the volume and cost associated with these procedures are very high. We believe it is important to assess the quality of care provided to Medicare beneficiaries who undergo one or both of these procedures.

The Hip/Knee Complication: Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) measure (NQF # 1550) is an outcome measure. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28039), we proposed this measure for the Hospital IQR Program because outcome measures are priority areas for the Hospital IQR Program. We believe it is important to assess the quality of care provided to Medicare beneficiaries who undergo one or both of these procedures and publicly report the hospital rates for consumer choice of care.

The proposed measure assesses complications occurring after THA and TKA surgery from the date of the index admission to 90 days post date of the index admission. The outcome is one or more of the following complications: Acute myocardial infarction, pneumonia, or sepsis/septicemia within 7 days of admission; surgical site bleeding, pulmonary embolism or death within 30 days of admission; or mechanical complications, periprosthetic joint infection or wound infection within 90 days of admission. The data indicated that the median hospital-level risk-standardized complication rate for 2008 was 4.2 percent, with a range from 2.2 percent to 8.9 percent in hospitals. The variation in complication rates suggest that there are important differences in the quality of care delivered across hospitals, and that there is room for quality improvement.

In 2010, we developed a hospital-level risk-standardized complication rate (RSCR) following elective primary THA and TKA surgery. NQF endorsed this THA and TKA complication measure in February 2012 (NQF #1550). In its Pre-Rulemaking Report for 2012, the MAP also recommended the inclusion of this measure in the Hospital IQR Program. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28040), we proposed to adopt the Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) measure for the Hospital IQR Program for the FY 2015 payment determination and subsequent years. This measure is NQF-endorsed (NQF #1550); therefore, the measure meets the selection criteria under section 1886(b)(3)(B)(viii)(IX)(aa) of the Act. The measure specifications can be found at: *http://www.qualityforum.org/Projects/Surgery_Maintenance.aspx#t=2&s=&p=.*

The proposed measure uses the same hierarchical logistic modeling (HLM) methodology that is specified for other NQF-endorsed CMS inpatient outcome measures previously adopted for this program, including AMI, HF, and PN readmission and mortality measures because this modeling has already been subjected to NQF review, and has been determined to appropriately account for the types of patients a hospital treats, the number of patients it treats, and the quality of care it provides. The HLM model estimates risk-standardized complications rates. Medicare Part A

and Part B (FFS) claims are the data source we used to develop the measure and that we proposed to use to calculate the measure if finalized. Index admission diagnoses and in-hospital comorbidities would be assessed using Medicare Part A claims. Additional comorbidities prior to the index admission would be assessed using Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to index (initial) admission. Enrollment and post-discharge mortality status would be obtained from Medicare's enrollment database which contains beneficiary demographic, benefit/coverage, and vital status information.

The proposed Total Hip and Total Knee Arthroplasty Complication measure includes Medicare FFS beneficiaries, aged 65 years or older, admitted to non-Federal acute care hospitals for THA or TKA. The measure methodology identifies eligible index admissions, using the following ICD–9–CM procedure codes: 81.51 Total Hip Arthroplasty; and 81.54 Total Knee Arthroplasty in Medicare Part A inpatient claims data. The measure specifications will be updated yearly and will be specified using ICD–10.

In addition, the proposed measure includes patients who have had continuous enrollment in Medicare FFS for one year prior to the date of index admission to ensure full data availability for risk adjustment. We restrict the sample to admissions of patients enrolled in Medicare FFS coverage in the 12 months prior to and including the time of their index admission to a non-Federal acute care hospital because of the availability of complete administrative data for most Medicare FFS patients.

The proposed measure does not include beneficiaries enrolled in Medicare Managed Care (''Medicare Advantage'') plans because only partial administrative data are reported to CMS. We would not have complete data on these Medicare Advantage enrollees. Patients under age 65 (the qualifying age for Medicare coverage for those not considered disabled or with end-stage renal disease) or for whom we otherwise have incomplete information—for example, those enrolled in a Medicare Advantage plan during any part of the relevant time period—will also be excluded to ensure data comparability. These restrictions on the data also allow for an appropriately comprehensive risk-adjustment for patient case-mix and comorbidity that would not be possible without access to data available to this population.

The proposed measure excludes patients with hip fractures (patients with hip fractures have higher mortality, complication rates and the procedure (THA) is not elective); patients undergoing revision procedures (may be performed at a disproportionately small number of hospitals and are associated with higher mortality, complication and readmission rates); patients undergoing partial hip arthroplasty (primarily done for hip fractures and are typically performed on patients who are older, more frail, and with more comorbid conditions); patients undergoing resurfacing procedures (different type of procedure which is typically performed on younger, healthier patients); patients who are transferred to the index hospital (it is likely that the procedure is not elective); patients who leave the hospital against medical advice (it is likely that the procedure is not elective); patients with more than two THA/TKA procedure codes during the index hospitalization (unlikely that patients would receive more than two THA/TKA procedures in one hospitalization, and this pattern may reflect coding errors); and patients with multiple admissions for THA/TKA in the 12 months studies.

Consistent with the requirements in section 1886(b)(3)(B)(viii)(VIII) of the Act, the proposed measure is risk-adjusted. It takes into account the patient case-mix to assess hospital performance. The patient risk factors are defined using the Hierarchical Condition Categories (CC), which are clinically relevant diagnostic groups of ICD–9–CM codes.[71] The CCs used in the risk adjustment model for this measure, are provided at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1182785083979*. The proposed measure meets the statutory requirement because it adjusted for hospital patient mix including age and comorbidities to ensure that hospitals that care for a less healthy patient population are not penalized unfairly. The measure methodology defines ''complications'' as Acute myocardial infarction; Pneumonia; Sepsis/septicemia; Pulmonary embolism; Surgical site bleeding; Death; Wound infection; Periprosthetic joint infection; and Mechanical complication within 30 to 90 days post the index date of admission, depending on the complication. The decision on the appropriate follow-up period was based on our analysis of 90-day trends in complication rates using the 2008 Medicare FFS Part A Inpatient Data. We found that rates for mechanical complications are elevated until 90 days post the date of index admission. We found that the rates for four other complications—death, surgical site bleeding, wound infection, and pulmonary embolism—are elevated for 30 days, and that AMI, pneumonia, and sepsis/septicemia level off 7 days post date of index admission. The following table presents the follow-up period for each complication.

COMPLICATION FOLLOW-UP PERIODS

Complication	Follow-up period (days)
Death	30
Mechanical complications	90
Periprosthetic joint infection (PJI)	90
Surgical site bleeding	30
Wound infection	30
Pulmonary embolism	30
AMI	7
Pneumonia	7
Sepsis/septicemia	7

We proposed to calculate the hospital risk-standardized complication rate by producing a ratio of the number of ''predicted'' complications (that is, the adjusted number of complications at a specific hospital based on its patient population) to the number of ''expected'' complications (that is, the number of complications if an average quality hospital treated the same patients) for each hospital and then multiplying the ratio by the national raw complication rate.

We invited public comment on the proposed inclusion of the Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty measure in the Hospital IQR Program for the FY 2015 payment determination and future years.

Comment: Many commenters strongly supported this NQF-endorsed and MAP-recommended hip/knee complication measure, stated that the measure will provide valuable data for improvement and enhance patient care, and commended CMS for considering the measure for patients undergoing inpatient joint procedures. Commenters stated that this measure is important in capturing patient outcomes during the post-discharge period, and provides hospitals access to data to which they may not have access otherwise, including a limited set of complications that occur after the patient has left the hospital. A commenter stated that hip

[71] Pope G, Ellis R, Ash A, *et al.,* Principal Inpatient Diagnostic Cost Group Models for Medicare Risk Adjustment. Health Care Financing Review. 2000;21(3):26.

and knee replacements are often non-emergent procedures, therefore information on outcomes will give consumers an opportunity to research the quality of care provided in their local hospitals.

Several commenters also supported our exclusion criteria for the hip/knee complication measure, the hierarchical logistic modeling for risk-adjustment, and the inclusion of major bleeds in the list of complications.

Response: We thank the commenters for the support and recognizing the significance of this measure.

Comment: Several commenters did not support this claims-based measure and asserted that the infection data obtained from claims significantly differs from post-operative infection data recorded in medical records and reported to NHSN, which is a better indicator of surgical site infections.

Response: The claims-based hip/knee complications measure underwent a medical record validation process. We found a high level of consistency between the complications found in claims with those found in the medical records. Using the current specifications, 99 percent of patients were found to have a complication in the claims as well as in the medical records.

Comment: A few commenters noted this measure does not have adequate adjustment for socioeconomic status (SES) and psycho-social support, and recommended such adjustments be made prior to implementation.

Response: The measure does not adjust for SES or other patient factors such as psycho-social support because we do not want to hold hospitals to different standards of patient care simply because they treat a large number of low SES patients. Moreover, we do not want to mask potential disparities in care or minimize incentives to improve the outcomes of care for disadvantaged populations. This is also consistent with the NQF's position regarding risk adjustment, which is that risk-adjusted measures should not include variables such as SES and race that would adjust away disparities in care.

During development and review of the hip/knee measures some stakeholders and experts expressed concerns regarding the influence of patient SES on hip/knee readmission and complication rates. We conducted preliminary analyses to explore disparities by SES (*http://www.nysna.org/images/pdfs/practice/nqf_ana_outcomes_draft10.pdf*) focusing on the readmission measure where concerns were greatest. We used Medicaid eligibility status identified in the Medicare claims enrollment database (EDB) as a proxy for SES. Patients were categorized into two groups, based on their eligibility status for Medicaid (yes/no). The Medicaid eligible population represents lower SES status. We then estimated the odds ratio for this SES variable by adding it to the hip/knee risk-adjustment model. The results showed that although SES was an independent predictor of readmission risk (odds ratio of 1.2), adding the variable to the model did not improve the model's overall ability to predict patient readmission risk. When the SES variable was added, the strength of clinical variables in the model was attenuated and the model c-statistic was essentially unchanged. This analysis suggested that the clinical variables in the model are adequately accounting for differences in patients' risk of readmission. The results were presented to the national Technical Expert Panel for the hip/knee measures. Based on these analyses, we did not include SES as a risk-adjuster in either of the hip/knee measures.

However, we are committed to tracking this issue and will continue to evaluate disparities in care and the impact of the hospital risk- standardized complication rates on providers of vulnerable populations.

Comment: One commenter was concerned about the unintended consequence of the Hip/Knee Complications measure for rheumatoid arthritis patients who are at high risk for infection. In particular, the commenter was concerned that this measure could cause hospitals to hesitate to perform the total hip/knee arthroplasty procedure on patients with rheumatoid arthritis.

Response: The hip/knee measures include risk-adjustment in order to level the playing field and account for differences in the risk between the case-mix at different hospitals. Rheumatoid arthritis is one of the risk-adjustment variables, so any increased risk associated with patients that have rheumatoid arthritis will be accounted for by the measure.

Comment: A few commenters requested clarifications regarding several aspects of the proposed measure: Complications attributable to the process of care, unrelated complications, POA complications, and the measurement period. Another commenter was concerned that data analysis of this measure is challenging and difficult for consumers to interpret. The commenter inquired about the level of data that will be made available to providers and suggested that providing detailed information regarding the count by complication and cohort would help quality improvement efforts.

Response: The commenter appears to be asking for clarification about why complications attributable to the processes of care and unrelated complications are included. The hip/knee complications measure is designed to capture complications related to both the surgical and medical care provided for elective hip/knee procedures. The outcome, therefore, includes both medical and surgical complications. The timeframe for each was chosen based on the typical window in which each of these complications occurs. Specifically, the measure counts in the outcome: AMI, pneumonia, or sepsis/septicemia during the admission or within 7 days of the admission date; surgical site bleeding, pulmonary embolism or death during the admission or within 30 days of admission; or mechanical complications or PJI or wound infection during the admission or within 90 days of admission. We included these outcomes because they are clinically related to care provided as documented in the literature and informed by extensive expert input. The measure is structured so that it does not count complications that are present on admission. For example, patients with mechanical complications on admission are excluded from the measure. To help hospitals with their quality improvement effort, we will provide hospitals with their hospital-specific report with detailed information about the patients included in the measure. We will share with hospitals this report prior to posting of the measures on the *Hospital Compare* Web site during the 30-day preview period for the Hospital IQR Program. We welcome specific suggestions on additional data that would be helpful for hospital quality improvement.

Comment: A commenter requested the publication of the ICD–10–CM/PCS versions of the measure specifications in the final rule.

Response: We are working on specifying the measures using the ICD–10–CM/PCS and will make the specifications available to the public as soon as possible.

After consideration of the public comments we received, we are finalizing the proposed Hip/Knee Complication: Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) measure for the FY 2015 payment determination and subsequent years as proposed.

(ii) Hip/Knee Readmission: Hospital-Level 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Elective Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) (NQF #1551)

As previously stated, outcome measures such as complications and readmissions are the priority areas for the Hospital IQR Program. The THA and TKA are commonly performed procedures that improve quality of life. The complications are usually devastating to the patient and costly to the Medicare program. Furthermore, we believe that there is an opportunity for quality improvement by hospitals to improve quality of life for the patient. The 2008 Medicare FFS claims data indicate that 30-day hospital-level risk-standardized readmission rates ranged from 3.06 percent to 50.94 percent among hospitals with a median rate of 6.06 percent. The mean risk-standardized readmission rate was 6.3 percent. This variation suggests there are important differences in the quality of care received across hospitals, and that there is room for improvement. Given the high volume and high cost associated with these hip and knee procedures (relative to other elective procedures performed in the Medicare population), we believe that it is imperative to assess the quality of care provided to Medicare beneficiaries who undergo one or both of these procedures. A measure that addresses readmission rates following THA and TKA provides an opportunity to provide targets for efforts to improve the quality of care and reduce costs for patients undergoing these elective procedures. The measure also increases transparency for consumers and provides patients with information that could guide their choices. Finally, it has the potential to lower health care costs associated with readmissions. The development of risk-adjusted measures of patient readmission outcomes can provide a critical perspective on the provision of care, and support improvements in care for the Medicare patient population following THA/TKA hospitalization.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28041), we proposed to adopt the Hip/Knee Readmission: Hospital 30-Day All-Cause Readmission Following Elective Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) measure for the Hospital IQR Program for the FY 2015 payment determination and subsequent years. This measure is NQF-endorsed; therefore, the measure meets the selection criteria under section 1886(b)(3)(B)(viii)(IX)(aa) of the Act. The measure specification for this measure can be found on the Web site at: *http://www.qualityforum.org/Projects/Surgery_Maintenance.aspx#t=2&s=&p=*. In its Pre-Rulemaking Report, the MAP recommended the inclusion of this measure in the Hospital IQR Program. The objective of this proposed measure is to assess readmission from any cause within 30 days of the initial total hip arthroplasty and total knee arthroplasty admissions for patients discharged from the hospital following elective primary THA and TKA.

The proposed measure uses the same HLM methodology that is specified for the NQF-endorsed AMI, HF, and PN 30-day risk-adjusted all-cause readmission measures in the Hospital IQR Program because it has already been subjected to NQF review and has been determined to appropriately account for the types of patients the hospital treats, the number of patients it treats, and the quality of care it provides. The HLM model estimates risk-standardized readmission rates. The data source we used to develop the measure and that we would use to calculate the measure if finalized is Medicare Part A (FFS) claims. Index admission diagnoses and in-hospital comorbidity data would be assessed using Medicare Part A claims. Additional comorbidities prior to the index admission would be assessed using Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to index (initial) admission. Enrollment status would be obtained from Medicare's enrollment database which contains beneficiary demographic, benefit/coverage, and vital status information.

The proposed measure includes admissions for patients who were Medicare FFS beneficiaries, aged 65 years or older, admitted to non-Federal acute care hospitals with an ICD–9–CM code for THA or TKA. Eligible index admissions would be identified using the following ICD–9–CM procedure codes: 81.51 (Total hip arthroplasty); and 81.54 (Total knee arthroplasty) in Medicare Part A inpatient claims data.

In addition, patients must have had continuous enrollment in Medicare FFS for one year prior to the date of index admission to ensure full data availability for risk adjustment. We restrict the included cases to admissions of patients enrolled in Medicare FFS coverage in the 12 months prior to and including the time of their index admission to a non-Federal acute care hospital because of the availability of complete administrative data for most Medicare FFS patients.

We proposed not to include beneficiaries enrolled in Medicare Managed Care (''Medicare Advantage'') plans because only partial administrative data are reported to CMS. We would not have complete data on these Medicare Advantage enrollees. Patients under age 65 (the qualifying age for Medicare coverage for those not considered disabled or with end-stage renal disease) or for whom we otherwise have incomplete information—for example, those enrolled in a Medicare Managed Care plan during any part of the relevant time period— will also be excluded to ensure data comparability.

We proposed to exclude patients with hip fractures (patients with hip fractures have higher mortality, complication and readmission rates and the procedure (THA) is generally not elective) patients undergoing revision procedures (may be performed at a disproportionately small number of hospitals and are associated with higher readmission rates); patients undergoing partial hip arthroplasty (partial arthroplasties are primarily done for hip fractures and are typically performed on patients who are older, more frail, and with more comorbid conditions); patients undergoing resurfacing procedures (resurfacing procedures are a different type of procedure which are typically performed on younger, healthier patients); patients who are transferred into the index hospital (it is likely that the procedure is not elective); patients who are admitted for the index procedure and subsequently transferred to another acute care facility (attribution of readmission to the index hospital would not be possible in these cases); patients who leave the hospital against medical advice (providers do not have the opportunity to provide the highest quality care for these patients); patients with more than two THA/TKA procedure codes during the index hospitalization (unlikely that patients would receive more than two THA/TKA procedures in one hospitalization and this may reflect a coding error); patients without at least 30-days post-discharge enrollment in Medicare FFS (the 30-day readmission outcome cannot be assessed for the standardized time period); and patients who die during the index admission (patients who die during the initial hospitalization are not eligible for readmission).

The proposed measure methodology does not count readmissions that are associated with a subsequent ''planned'' THA/TKA procedure within 30 days of discharge from index hospitalization. Some patients may elect to stage their orthopedic replacement procedures across hospitalizations (for example, a

patient may have the left and right knees replaced within one or two weeks of each other, potentially across multiple hospitalizations). The planned readmissions are defined as a second admission with a procedure code for THA or TKA AND a primary discharge diagnosis of osteoarthritis, rheumatoid arthritis, osteonecrosis, or arthropathy (excluding septic arthropathy).

Consistent with the requirements in section 1886(b)(3)(B)(viii)(VIII) of the Act, the proposed measure is risk-adjusted. It takes into account patient age and comorbidities to allow a fair assessment of hospital performance. The measure defines the patient risk factors for readmission using diagnosis codes collected from all patient claims one year prior to patient index hospitalization for THA and TKA. The patient diagnosis codes are grouped using Hierarchical Condition Categories (CCs), which are clinically relevant diagnostic groups of ICD–9–CM codes.[72]

The CCs used in the risk adjustment model for this measure are provided at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1219069856694*. Patient risk factors are used to determine how sick the patients are on admission (that is, patient comorbidities). The hospital measure rates are calculated taking into account how sick their patients are. In summary, age and comorbidities present at the time of admission would be adjusted for differences in hospital case mix (patient risk factors).

The proposed measure uses the HLM methodology for risk adjustment. As we do for all the other 30-day readmission measures adopted for the Hospital IQR Program, we would calculate (using the HLM) the hospital risk-standardized readmission rate by producing a ratio of the number of ''predicted'' readmissions (that is, the adjusted number of readmissions at a specific hospital) to the number of ''expected'' readmissions (that is, the number of readmissions if an average quality hospital treated the same patients) for each hospital and then multiplying the ratio by the national raw readmission rate.

While the hip and knee complications measure will inform quality improvement efforts targeted toward minimizing medical and surgical complications during surgery and in the recovery phase, the hip and knee readmission measure portrays a broader range of medical and surgical outcomes affected by in-hospital care and the transition to post-acute care. This measure was endorsed by the NQF (#1551) and recommended by the MAP for the Hospital IQR Program in its Pre-Rulemaking report for 2012.

We proposed to include the Hospital-Level 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Elective Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) measure in the Hospital IQR Program for the FY 2015 payment determination and future years. We invited public comment on this proposal.

Comment: Many commenters supported this measure because elective total hip and knee procedures are on the rise on Medicare beneficiaries; also, the measure is NQF-endorsed and is recommended by the MAP. The commenters believed that hip and knee arthroplasty readmissions are an important measure of patient outcomes and that the measure would positively reduce patient readmissions overall. Another commenter stated that hip and knee replacements are often non-emergent procedures, therefore information on outcomes will give consumers an opportunity to research the quality of care provided in their local hospitals to select where to have these procedures performed.

Response: We thank the commenters for the support and sharing our goal to focus on improving patient outcomes in hip/knee surgical procedures.

Comment: A few commenters supported our exclusion criteria for the hip/knee complication measure and the hierarchical logistic modeling for risk-adjustment. Nonetheless, several commenters argued that there are flaws in its methodology because it does not: differentiate between planned and unplanned readmissions or between related and unrelated readmissions; exclude extreme circumstances (transplant, ESRD, burn, trauma, psychosis, and substance abuse); or adjust for patient characteristics (dual eligible status, race/ethnicity, and SES). Commenters noted that this measure would require extensive measure specification revisions should CMS adopt it for the Hospital Readmissions Reduction Program.

Response: We thank the commenters that supported the risk-adjustment model and the exclusion criteria of this measure. We disagree with commenters that the measure does not differentiate between planned and unplanned readmissions. The measure does identify and not count certain planned readmissions. For example, some patients are admitted within 30 days of the index hospitalization to undergo another elective primary THA/TKA procedure. If a patient undergoes a second elective primary THA/TKA within 30 days of the discharge date for the index admission, and the admission is associated with a primary discharge diagnosis of osteoarthritis, rheumatoid arthritis, osteonecrosis, or arthropathy (excluding septic arthropathy), the readmission is considered ''planned'' and is not counted as a readmission in the measure.

We used all-cause readmission, rather than narrowly related readmission, to assess performance for several reasons. First, from the patient perspective, readmission for any reason is likely to be an undesirable outcome of care after an acute hospitalization. Second, readmissions not directly related to hip/knee replacement may still be a result of the care received during hospitalization for the procedure. For example, a patient hospitalized for a hip/knee replacement who developed renal failure may ultimately be readmitted for care. It would be inappropriate to treat this readmission as unrelated to the care the patient received during the index hospitalization. Furthermore, the range of potentially avoidable readmissions also includes those not directly related to the initial hospitalization, such as those resulting from poor communication at discharge or inadequate follow-up. In addition, readmissions for rare reasons completely unrelated to hospital care, such as car accidents involving the patient as a passenger, are likely to be distributed randomly across hospitals and are not expected to introduce any bias into the measure results. We appreciate the concern expressed by the commenters that patients of these ''extreme circumstances'' clinically could be sicker and likely to be readmitted. The measures address clinical differences in hospitals' case-mix through risk adjustment rather than through excluding patients from the measure as suggested by the commenter. The goal in developing outcomes measures is to create a clinically cohesive cohort that includes as many patients as possible admitted with the given condition. Greatly expanding our list of exclusions would result in a measure that was less useful and meaningful because it would reflect the care of fewer patients. In addition, we believe that by excluding patients with significant comorbidities, the measure would not assess the quality of care for those patients. To fairly profile hospitals' performance, it is critical to

[72] Pope G, Ellis R, Ash A, *et al.,* Principal Inpatient Diagnostic Cost Group Models for Medicare Risk Adjustment. Health Care Financing Review. 2000;21(3):26.

place hospitals on a level playing field and account for their differences in the patients that present for care. This is accomplished through adequate risk-adjustment for patients' clinical presentation rather than exclusion of patients.

Consistent with NQF guidelines, this measure does not risk-adjust for SES factors, such as race or dual eligibility, because we do not want to hold hospitals to different standards for the outcomes of their low SES patients. We do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations by adjusting for these factors. The findings from our analyses of disparities by SES in the past (discussed in our responses to comments on the Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) (NQF #1550)) indicated that although SES is a significant predictor of readmission at the patient level, it does not affect overall hospital performance in the risk-adjusted readmission model. We are committed to tracking SES issues and will continue to evaluate disparities in care and the impact of the hospital risk standardized readmission rates on providers of vulnerable populations.

With respect the commenters' concern that this measure would require extensive measure specification revisions should we adopt it for the Hospital Readmissions Reduction Program, in the FY 2013 IPPS/LTCH PPS proposed rule, we proposed use of the measure only for the Hospital IQR Program and not for Hospital Readmissions Reduction Program. We will propose additional readmission measures for Hospital Readmissions Reduction Program through future rulemaking.

Comment: A commenter requested the post-discharge time period be shortened to 7 days.

Response: The measure uses 30 day time frame versus 7 days as suggested by the commenter because it is a clinically meaningful and sufficient time period for hospitals to show the result of their efforts to reduce readmissions. These efforts include ensuring that patients are clinically ready at discharge, reducing risk of infection, reconciling medications, improving communication with community providers participating in transitions of care, educating patients adequately upon discharge, and assuring patients understand follow-up care upon discharge. Furthermore, our analyses show that risk of readmission is highest within the first two weeks post discharge of the index admission. The rate plateaus between 30 and 45 days post discharge, suggesting that a 30-day window would capture the period of highest risk of readmission. In addition, the 30-day timeframe is consistent with the other CMS readmissions measures that are NQF-endorsed and publicly reported by CMS.

Comment: A commenter was uncertain of the impact of the 3-day waiver policy on readmission rates, and cautioned there may be potential negative implications of the waiver policy on this measure. The commenter encouraged CMS to adopt a time period that will ensure sufficient data and rates that are statistically significant and also requested clarification regarding the measurement period for this measure.

Response: We appreciate the commenter's concern and suggestions. It appears that the issue that the commenter is concerned about is whether implementation of the measure would have an impact on use of outpatient services, such as use of ED or observation services 3 days prior to hospitalization. It is our intent to track use of these services as unintended consequences. We plan to use 3 years of data to calculate the hospital rates. We believe this time period would ensure sufficient data for meaningful statistical analysis.

Comment: A commenter requested that CMS clarify whether a single year of data or three years of data will be used for display on *Hospital Compare* in the future. The commenter believed that three years of data yields more robust and reliable results.

Response: We agree with the commenter that 3 years of data will yield more robust and reliable results. We plan to use 3 years of data to calculate the measure for display on *Hospital Compare*.

Comment: A few commenters requested the publication of the ICD–10–CM/PCS versions of the measure specifications in the final rule.

Response: We are working on specifying the measures using the ICD–10–CM/PCS and will make the specifications available to the public as soon as possible.

Comment: A commenter opposed the proposed adoption of this measure as the commenter believed readmission rates are more closely related to patient expectations, community standards, health literacy, and other unknown factors during hospitalization, which are not accounted for in the risk models articulated in the rule. The commenter suggested that there is little correlation between quality of care provided and overall readmission rates.

Response: We believe that readmissions are related to quality of care provided by hospitals during hospitalization as well as transition from inpatient to outpatient settings. We chose to measure readmission within 30 days of discharge because during this period, readmission can be strongly influenced by hospital care and the early transition to the outpatient setting. The timeframe of 30 days is a clinically meaningful period for hospitals to collaborate with their communities in an effort to reduce readmissions. Such efforts may include ensuring patients are clinically ready at discharge, reducing risk of infection, reconciling medications, improving communication with community providers participating in transitions of care, educating patients adequately upon discharge, and assuring patients understand follow-up care upon discharge. The commenter suggested that patient factors such as patient expectations and health literacy are closely related to readmissions. The CMS measure takes into account patient health/clinical factors at the time of admission but not patients' SES factors. One reason is that we want to encourage hospitals to work with their communities to help patients with low SES (for example, low health literacy) transition to post-acute care. The other reason is that risk adjusting for patient SES, we would adjust away potential disparities of care by hospitals.

After consideration of the public comments we received, we are finalizing the proposed Hip/Knee Readmission: Hospital-Level 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Elective Total Hip Arthroplasty (THA) and Total Knee Arthroplasty measure for the FY 2015 payment determination and subsequent years as proposed.

(iii) Hospital-Wide Readmission (Tentative NQF #1789)

During 2003 and 2004, over 2.3 million Medicare patients (almost one fifth of all Medicare beneficiaries) were rehospitalized within 30 days of discharge from an acute care hospital, and it was estimated that readmissions within 30 days of discharge cost Medicare more than $17 billion annually.[73] In its 2007 Report to the Congress, MedPAC estimated that in 2005, 17.6 percent of hospital patients were readmitted within 30 days of

[73] Jencks SF, Williams MV, Coleman EA. Rehospitalizations among patients in the Medicare fee-for-service program. N Engl J Med. Apr 2 2009; 360(14):1418–1428.

discharge.[74] MedPAC estimated that the average payment for a ''potentially preventable'' readmission was approximately $7,200. A 2006 Commonwealth Fund Report estimated that if national readmission rates were lowered to the levels achieved by the top performing regions, Medicare would save $1.9 billion annually.[75] We believe that reducing preventable readmissions will bring down healthcare costs.

Since 2009, we have publicly reported risk-standardized readmission rates (RSRRs) for three conditions: heart failure (HF), pneumonia (PN) and acute myocardial infarction (AMI) on *Hospital Compare* (*http://www.hospitalcompare.hhs.gov/*), as part of the efforts to improve quality of care and lower health care costs. However, these three conditions account for only a relatively small proportion of total hospital readmissions. High RSRRs and substantial variations in hospital RSRRs were found. The median 30-day RSRRs across hospitals is 19.9 percent for AMI (range from 15.3 percent to 26.8 percent); 24.8 percent for HF (range from 17.0 percent to 33.0 percent); and 18.4 percent for PN (range from 13.8 percent to 26.4 percent).[76]

A hospital's readmission rate is affected by complex and critical aspects of care such as communication between providers or between providers and patients; prevention of, and response to, complications; patient safety; and coordinated transitions to the outpatient environment. While disease-specific measures of readmission are useful in identifying deficiencies in care for specific groups of patients, they account for only a small minority of total readmissions.[77] By contrast, a hospital-wide, all-condition readmission measure could portray a broader sense of the quality of care in hospitals. Consequently, hospital-wide, all-condition readmission measures can promote hospital quality improvement and better inform consumers about care quality.

Studies have estimated the rate of preventable readmissions to be as low as 12 percent and as high as 76 percent.[78,79] Some readmissions are unavoidable, for example, those that result from inevitable progression of disease or worsening of chronic conditions. However, readmissions may also result from poor quality of care or inadequate transitional care. Randomized controlled trials have shown that improvement in the following areas can directly reduce hospital readmission rates: quality of care during the initial admission; improvement in communication with patients, their caregivers and their clinicians; patient education; pre-discharge assessment; and coordination of care after discharge. Successful randomized trials have reduced 30-day readmission rates by 20–40 percent.[80,81,82,83,84,85,86] Evidence that hospitals have been able to reduce readmission rates through these quality-of-care initiatives illustrates the degree to which hospital best practices can affect readmission rates.

Our Quality Improvement Organizations (QIOs) began projects to improve care transitions during the 9th Statement of Work in 14 communities by applying successful interventions learned from clinical trials, such as medication reconciliation, increased patient education, follow up after discharge, and post-discharge instructions for patients.[87] Important interventions to integrate care for populations and communities now continue among all 53 QIOs on a national scale in the QIO 10th Statement of Work which began August 2011.

Because many studies have shown readmissions to be related to quality of care, and that interventions have been able to reduce 30-day readmission rates, we believe that it is appropriate to include an all-condition readmission rate as a quality measure in the Hospital IQR Program. Promoting quality improvements leading to successful transition of care for patients from acute care to outpatient setting, and reducing short term, preventable hospital-wide readmission rates are CMS' priority objectives.

To provide a broader assessment of the quality of care at hospitals, especially for hospitals with too few AMI/HF/PN readmissions to count separately, we have developed a Hospital-Wide Readmission (HWR) measure using 2008 Medicare FFS data. Detailed information and specifications for this measure can be found on the NQF Web site at: *http://www.qualityforum.org/Projects/Readmissions_Endorsement_Maintenance.aspx#t=2&s=&p=7%7C6%7C5%7C4%7C*. The objective of the proposed HWR measure is to assess the hospital-level, risk-standardized rate of unplanned, all-cause readmissions after admissions for any eligible condition within 30 days of hospital discharge. The proposed measure comprises a single summary score, derived from the results of five different models, one for each of the following specialty cohorts (groups of discharge condition categories or procedure categories): medicine, surgery/gynecology; cardiorespiratory; cardiovascular; and neurology.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28043), we proposed to use one year of data to calculate the measure rate for the HWR measure, which we believe is sufficient to calculate this measure in a statistically reliable manner. This is because the reliability of a hospital's measure rate is related to its sample size. For its rate to be calculated reliably statistically, a hospital needs to have a

sufficient number of patient cases to which the measure applies. Because the proposed HWR measure addresses over 90 percent of Medicare FFS hospitalizations for patients aged 65 and older (a much larger number of patients than the condition-specific measures for AMI, Heart Failure, Pneumonia, and Total Hip/Knee procedures), we believe one year of data would yield a sufficient number of cases to assess hospital performance in a statistically reliable manner. In contrast, for the condition-specific readmission measures for AMI, Heart Failure and Pneumonia, each of which address a smaller proportion of Medicare FFS Hospitalizations than the HWR measure, we must use three years of data to have enough patient cases to calculate the rates for these measures. We also believe that use of one year of data for the HWR measure is appropriate because it allows us to calculate up-to-date hospital performance for the most recent year, rather than calculating hospital performance over the course of three years, as we must do for the AMI, HF, and PN readmission measures. The proposed measure methodology is described in greater detail below.

The proposed measure uses 30 days following the index admission as the timeframe for assessing hospital performance because within this timeframe, readmissions are more likely attributable to care received during the index hospitalization and during the transition to the outpatient setting. For example, hospitals, in collaboration with their medical communities take actions to reduce readmission, such as ensuring patients are clinically ready at discharge, reducing risk of infection, reconciling medications, improving communications among providers involved in management principles, and educating patients about symptoms to monitor, whom to contact with questions, and where and when to seek follow-up care. Furthermore our ''time-to-event curve'' analyses showed a readmission curve with rapid early accrual of readmissions with a stable and consistent readmission rate thereafter; the curve typically stabilized within 30 days of discharge. Finally, the proposed 30-day timeframe is consistent with the other publicly reported CMS readmission measures endorsed by the NQF.

The proposed HWR measure defines the outcome as ''all-cause'' unplanned readmissions. Unplanned readmissions are acute clinical events experienced by a patient that require urgent hospital admission. Higher than expected unplanned readmission rates suggest lower quality of care and are the focus of quality measurement as part of quality improvement efforts. Because planned readmissions are not a signal of quality of care, we chose to exclude planned readmissions from being considered as an outcome for this measure. The proposed measure includes hospitalizations of patients who were age 65 or older (at the time of admission) who were in Medicare Fee-for-Service (FFS) for 12 months prior to the index admission, and who remained in Medicare FFS for at least 30 days post-discharge. The measure excludes patients who died during the index admission; patients who were transferred to another acute care hospital; patients who were discharged against medical advice; and patients who died within the 30-day post-discharge period. The measure also excludes admissions for medical treatment of cancer; for primary psychiatric disease (patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals); or for physical rehabilitation and prosthetic services.

The proposed measure excludes patients undergoing medical treatment for their cancer as their primary procedure because we concluded that readmission may not be a good quality indicator for this cohort of patients compared to other cohorts. For example, the cancer cohort had more than twice the post-discharge mortality of any other cohort. It also has a planned readmission rate six times that of any other cohort—41 percent of readmissions in this cohort were considered planned. This indicates that readmission in this population is a different phenomenon than for other cohorts. Most importantly, this cohort's risk standardized readmission ratio (SRR) was poorly correlated with the composite hospital-wide SRR of all other cohorts. Statistically this implies that readmission for the cancer cohort is likely measuring an aspect of quality very different from that for other cohorts. Consequently, we elected to exclude this subset of cancer patients from the measure.

For this measure, a patient is considered to have been readmitted if they experience one or more inpatient admissions within the 30 days after being discharged from an initial inpatient admission, whether the patient was readmitted to the same hospital or another. The proposed measure identifies ''planned readmissions'' in claims data that will not count as readmissions in the measure using an algorithm that identifies readmissions that are likely to be planned as opposed to readmissions due to probable complications. The algorithm was based on two main principles:

- The ''planned'' readmissions are those in which one of a pre-specified list of procedures took place (we refer readers to the measure methodology documentation on the NQF Web site at: *http://www.qualityforum.org/Projects/Readmissions_Endorsement_Maintenance.aspx#t=2&p=2/3/&s* for the list), or those for maintenance chemotherapy or rehabilitation. Maintenance chemotherapy and rehabilitation are common planned readmissions that are reliably distinguishable in the data even though they are not accompanied by procedures.
- Admissions for acute illness or for complications of care are likely not ''planned.'' Clinically, any procedure completed during an admission for an acute illness is not likely to have been planned, even if that procedure is usually planned in other non-acute cases.

Therefore, the proposed measure uses procedure codes and discharge diagnosis categories for each readmission to identify planned readmissions. Readmissions that occur for planned procedures (we refer readers to the measure methodology report on the NQF Web site at: *http://www.qualityforum.org/Projects/Readmissions_Endorsement_Maintenance.aspx#t=2&p=2/3/&s* for the list) and which are not for acute diagnoses or complications of care (listed below) are identified as planned.

For example, some patients have their gallbladders removed after having been identified as having symptomatic gallstones. Usually this is a surgery that is planned in advance and scheduled. However, occasionally a patient becomes acutely ill or has sudden inflammation or infection that requires a gallbladder surgery that was not planned in advance. The measure uses the patients' principal discharge diagnosis to differentiate between patients coming in for gallbladder removal with chronic gallstones (biliary disease) and patients acutely ill with inflamed gallbladders (cholecystitis) who are having an unplanned gallbladder removal.

Therefore, the proposed HWR measure defines planned readmissions which are excluded from the measure as any readmission:

- In which any of these procedures set out in the table below are performed if the discharge condition category is

not acute or a complication of care, as discussed below; or

- For maintenance chemotherapy.

All other readmissions are considered unplanned and are counted as readmissions in the measure.

The following is the list of planned procedures based on the full AHRQ Clinical Classification Software (CCS) procedure category list.

PROCEDURE CATEGORIES CONSIDERED PLANNED DEPENDING ON THE DISCHARGE CONDITION

	Description
45	Percutaneous transluminal coronary angioplasty (PTCA).
	Rehabilitation (condition CCS 254).
84	Cholecystectomy and common duct exploration.
157	Amputation of lower extremity.
44	Coronary artery bypass graft (CABG).
78	Colorectal resection.
51	Endarterectomy; vessel of head and neck.
113	Transurethral resection of prostate (TURP).
99	Other OR gastrointestinal therapeutic procedures.
48	Insertion; revision; replacement; removal of cardiac pacemaker or cardioverter/defibrillator.
	Maintenance Chemotherapy (condition CCS 45).
211	Therapeutic radiology for cancer treatment.
3	Laminectomy; excision intervertebral disc.
43	Heart valve procedures.
152	Arthroplasty knee.
158	Spinal fusion.
55	Peripheral vascular bypass.
52	Aortic resection; replacement or anastomosis.
36	Lobectomy or pneumonectomy.
153	Hip replacement; total and partial.
60	Embolectomy and endarterectomy of lower limbs.
85	Inguinal and femoral hernia repair.
104	Nephrectomy; partial or complete.
1	Incision and excision of CNS.
124	Hysterectomy; abdominal and vaginal.
167	Mastectomy.
10	Thyroidectomy; partial or complete.
114	Open prostatectomy.
74	Gastrectomy; partial and total.
119	Oophorectomy; unilateral and bilateral.
154	Arthroplasty other than hip or knee.
	Radical laryngectomy, revision of tracheostomy, scarification of pleura (ICD–9 codes 30.4, 31.74, 34.6).
166	Lumpectomy; quadrantectomy of breast.
64	Bone marrow transplant.
105	Kidney transplant.
176	Other organ transplantation.
	Electroshock therapy (ICD–9 codes 94.26, 94.27).

The algorithm is designed to identify admissions for acute illness or complication of care as ''unplanned'' readmissions. The acute and complication discharge condition categories for unplanned readmissions are listed below.

DISCHARGE CONDITION CATEGORIES CONSIDERED ACUTE OR COMPLICATIONS OF CARE

AHRQ CCS	Description
237	Complication of device; implant or graft.
106	Cardiac dysrhythmias.
	Fracture (condition CCS 207, 225, 226, 227, 229, 230, 231, 232).
100	Acute myocardial infarction.
238	Complications of surgical procedures or medical care.
108	Congestive heart failure; nonhypertensive.
2	Septicemia (except in labor).
146	Diverticulosis and diverticulitis.
105	Conduction disorders.
109	Acute cerebrovascular disease.
145	Intestinal obstruction without hernia.
233	Intracranial injury.
116	Aortic and peripheral arterial embolism or thrombosis.
122	Pneumonia (except that caused by TB or sexually transmitted disease).
131	Respiratory failure; insufficiency; arrest (adult).
157	Acute and unspecified renal failure.
201	Infective arthritis and osteomyelitis (except that caused by TB or sexually transmitted disease).
153	Gastrointestinal hemorrhage.

DISCHARGE CONDITION CATEGORIES CONSIDERED ACUTE OR COMPLICATIONS OF CARE—Continued

AHRQ CCS	Description
130	Pleurisy; pneumothorax; pulmonary collapse.
97	Peri-; endo-; and myocarditis; cardiomyopathy.
127	Chronic obstructive pulmonary disease and bronchiectasis.
55	Fluid and electrolyte disorders.
159	Urinary tract infections.
245	Syncope.
139	Gastroduodenal ulcer (except hemorrhage).
160	Calculus of urinary tract.
112	Transient cerebral ischemia.
	All condition categories.

To compare readmission performance across hospitals, the proposed measure accounts for differences in patient characteristics (patient case mix) as well as differences in mixes of services and procedures offered by hospitals (hospital service-mix). The proposed measure includes 93.4 percent of Medicare FFS hospitalizations occurring in 2008, and includes 92.1 percent of readmissions following those hospitalizations.

The proposed measure uses the conditions and procedures defined by the AHRQ CCS, which is a widely used and accepted method of grouping patients into diagnostic categories. The AHRQ CCS collapsed the more than 17,000 different ICD–9–CM diagnosis and procedure codes into 285 clinically-coherent, mutually-exclusive condition categories and 231 mutually-exclusive procedure categories. We created five major specialty cohorts based on organization of care (medical, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology), and assigned each condition category to a cohort. Admissions that included major surgical procedures (regardless of condition category) were assigned to the surgery/gynecology cohort. We estimated separate adjustment coefficients for each cohort using a single set of risk factors. We used hierarchical logistic regression to adjust for differences in hospital case mix and to account for the clustering of patients within a hospital. We adjusted for case mix differences among hospitals by risk-adjusting for patients' comorbid conditions identified in inpatient episodes of care for the 12 months prior to the index admission as well as those present at admission. We did not risk adjust for diagnoses that may have been a complication of care during the index admission. We used CMS Condition Category groups (CMS–CCs) to define the comorbid risk adjusters and used a fixed set of comorbid risk variables across models. We risk adjusted for service mix differences among hospitals within each major cohort by including indicator variables for discharge condition categories (as defined by AHRQ CCS) in each model.

Finally, we used each of the five cohort models to calculate predicted and expected numbers of readmissions for each hospital in each cohort. We then derived a single summary score from the results of the five models by calculating the volume-weighted log average of the predicted over expected ratios from each model and multiplying the resulting ratio by the average national readmission rate. This approach allowed us to take into account the variation in hospital specialty cohort mix.

The proposed HWR measure was recommended to the NQF board of directors for endorsement in March 2012 by the NQF Consensus Standards Approval Committee (CSAC). The MAP supported selection of the HWR measure for the Hospital IQR Program contingent on NQF endorsement. This measure is in the final stages of the NQF measure endorsement process, and we expect its endorsement to be finalized in the coming months.

We proposed to adopt this measure in the Hospital IQR Program for the FY 2015 payment determination and subsequent years under the exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act. This section provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a), the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed the NQF-endorsed measures, and we were unable to identify any other NQF-endorsed measures that assess hospital-wide readmissions. We also are not aware of any other hospital-wide readmission measures that have been endorsed or adopted by a consensus organization other than NQF. The one other hospital-wide readmissions measure of which we are aware is the Risk-Adjusted 30-Day All-Cause Readmission Rate measure (formerly NQF #0329). This measure was endorsed by NQF, but NQF removed the measure's endorsement during a recent consensus development project that recommended endorsement of the HWR measure. Accordingly, we proposed to adopt the HWR measure under the Secretary's authority set forth at section 1886(b)(3)(B)(IX)(bb) of the Act. We invited public comment on this proposal.

Comment: Two commenters supported the proposed measure and added that avoidable readmission can result from poor quality of care or inadequate transitional care. The commenters anticipate that the HWR measure will be a robust measure to identify deficiencies in communication and gaps in care as it would enable hospitals to examine all facets of their hospital operations.

Response: We thank the commenters for their support.

Comment: Many commenters appreciated CMS' newly added exclusion criteria (such as medical treatment of cancer, transplants and primary psychiatric diagnoses) for certain planned readmissions for this measure and recommended that for harmonization efforts, CMS should harmonize measure exclusions for the condition-specific readmission measures in the Hospital IQR Program and the Hospital Readmissions Reduction Program.

Response: We are currently updating the planned readmissions for other CMS condition-specific readmission measures using the newly added criteria in the HWR measure and will submit the updated measures to the NQF for re-endorsement.

Comment: Many commenters did not support the inclusion of this measure in

the Hospital IQR Program because it was not targeted to a specific condition. Commenters attributed success from the implementation of the AMI, HF and PN readmission measures to the condition-specific nature of these measures which allow hospitals to target their intervention efforts on specific causes of readmissions for each condition. The commenters stated that, in contrast, the proposed hospital-wide, all-cause, all-condition readmission measure does not highlight any specific condition and, therefore, it will only serve to detract away from successful condition-specific strategies.

Response: We agree that it is helpful to assess readmission rates and hence target quality improvement for specific groups for patients with specific conditions, as indicated by the commenters. However, we are mindful that these conditions account for only a small proportion of total hospital readmissions. That is the reason for our proposal of the hospital-wide readmission measure, which would provide a broader assessment of the quality of care provided to hospital patients who have medical conditions other than AMI, HF, and PN. The hospital-wide measure will allow for a more comprehensive evaluation of a hospital's quality. The hospital-wide measure is designed with five distinct cohorts, which allow for quality improvement efforts within particular service lines. Overall the hospital-wide measure and condition-specific measures should be complementary in allowing both for profiling overall hospital quality and promoting quality improvement.

Comment: Some commenters specifically opposed our proposal to account for the variations in hospital specialty cohort mix with a single summary score obtained from calculating the volume-weighted log average of the predicted over expected ratios from each of the five models and multiplying the resulting ratio by the average national readmission rate.

Response: The commenters opposed, but did not provide the rationale for opposing, using a single summary score obtained from 5 models for the measure. We explain our rationale for using it here. The measure approach allows us to take into account the variation in hospital specialty cohort mix. In particular, we wanted to be careful to fully account for the differences in readmission risk between surgical and non-surgical patients. Our analyses found that even within the same discharge condition, patient risk for readmission was strongly affected by whether a surgical procedure was performed during hospitalization. Patients undergoing surgical procedures typically had better outcomes than patients who did not undergo a procedure but were admitted with the same discharge condition. In short, using five models rather than a single model improves model performance and patient-level discrimination, and will significantly improve the usability of the measure.

Comment: Some commenters were concerned that hospitals might have difficulties in using the measure which is based on the AHRQ Clinical Classification Software (CCS) for acute and complication discharge condition categories for unplanned readmissions, whereas hospitals use the ICD–9 DRGs for claims purposes. The CCS codes do not match the Medicare Severity Diagnosis related groups-driven claim data that the hospitals are using. Therefore, the commenters recommended organizing readmissions in a manner consistent with current hospital claim data such as specific ICD–9 codes and future ICD–10 codes.

Response: Although hospitals are paid by DRG, the claims that hospitals submitted to CMS contain diagnoses (the primary and secondary diagnoses) in the ICD–9 format. The AHRQ software groups patients into CCS using the ICD–9 codes. Hospitals should have no problems crosswalk between the AHRQ CCS (maintained for both ICD–9 and ICD–10 codes) and the diagnosis on hospital claims.

Comment: Many commenters did not support this measure and perceived the measure as lacking in: (1) Differentiation between related and unrelated readmissions; and identification of all planned readmissions; (2) sufficient risk-adjustments for patient characteristics (dual eligible status, race/ethnicity, and SES factors); and (3) exclusions for extreme circumstances (transplant, end-stage renal disease burn, trauma, psychosis, and substance abuse). Commenters were particularly concerned that the lack of adjustments for SES factors will have unintended consequences of unfairly penalizing hospitals treating disadvantaged patients as well as impairing patients, access to hospitals.

Response: The measure does not differentiate between related and unrelated readmission for a number of reasons. First, from the patient perspective, readmission for any reason is likely to be an undesirable outcome of care after an acute hospitalization. Second, readmissions not directly related to the index hospitalization may still be a result of the care received during hospitalization. For example, a patient hospitalized COPD who develops a hospital-acquired infection may ultimately be readmitted for sepsis. It would be inappropriate to treat this readmission as unrelated to the care the patient received during the index hospitalization. Furthermore, the range of potentially avoidable readmissions also includes those not directly related to the initial hospitalization, such as those resulting from poor communication at discharge or inadequate follow-up. In addition, readmissions for rare reasons completely unrelated to hospital care, such as car accidents involving the patient as a passenger, are likely to be distributed randomly across hospitals and are not expected to introduce any bias into the measure results. Thus, the goal of this measure is not to reduce readmissions to zero, but to instead assess hospital performance relative to what is expected given the performance of other hospitals with similar case mixes.

We appreciate the concern expressed by the commenters that patients of these ''extreme circumstances'' clinically could be sicker and likely to be readmitted. The measure addresses clinical differences in hospitals' case-mix through risk adjustment rather than through excluding patients from the measure as suggested by the commenter. The goal in developing outcomes measures is to create a clinically cohesive cohort that includes as many patients as possible admitted with the given condition. Greatly expanding our list of exclusions would result in a measure that was less useful and meaningful, because it would reflect the care of fewer patients. In addition, we believe that by excluding patients with significant comorbidities, the measure would not assess of the quality of care for those patients. To fairly profile hospitals' performance, it is critical to place hospitals on a level playing field and account for their differences in the patients that present for care. This is accomplished through adequate risk-adjustment for patients' clinical presentation rather than exclusion of patients.

Comment: A few commenters opposed the proposed adoption of this measure as the commenters believed readmission rates are more closely related to patient expectations, community standards, health literacy, and other unknown factors during hospitalization which are not accounted for in the risk models articulated in the rule. The commenters suggested that there is little correlation between quality of care provided and overall readmission rates.

Response: Risk-standardized readmission rates provide an important quality signal. Readmission of patients who were recently discharged after hospitalization with AMI, HF, or pneumonia represents an important, expensive, and often modifiable adverse outcome. The risk of readmission can be modified by the quality and type of care provided to these patients. There is ample evidence that hospitals can reduce their readmission rates through such efforts as: ensuring patients are clinically ready at discharge, reducing risk of infection, reconciling medications, improving communication with community providers participating in transitions of care, educating patients adequately upon discharge, and assuring patients understand follow-up care upon discharge.

Comment: A commenter raised some methodological questions on the HWR measure. First, the commenter noted that the HWR model was originally estimated using 2008 data and the commenter asked for the anticipated lag between finalization and when the measure is implemented for FY 2015 payment determination. Second, the commenter asked whether it was methodologically appropriate to view statistical power as additive between the five individual models for the five specialty cohorts identified by the model developers. Finally, the commenter asked for the sample size of the five cohort models in the 2008 data.

Response: For 2013 public reporting, we plan to use one year of data to calculate the measure. We note that all of the patients in the five models contribute to the statistical power of the measure. The measure is divided into five specialty cohorts in order to enable hospitals to focus improvement efforts within clinically coherent specialties. CMS evaluated the appropriateness of combining the 5 specialty cohort scores into a single score by looking at the correlation among the specialty cohort scores and calculating Cronbach's alpha, a statistic that measures the internal consistency of a composite. The correlations among the coefficients ranged from 0.35 to 0.65, and the Cronbach alpha result was 0.83, indicating good internal consistency. Both of these analyses confirmed the appropriateness of combining the 5 scores into a composite score. These findings were included in the technical report submitted to the National Quality Forum. Finally, the sample size of the five cohort models in the 2008 data for the Medicine group is 3,086,792, Surgery/gynecology 2,163,279, Cardiorespiratory 1,405,267, Cardiovascular 843,373, and Neurology 7,957,901.

Comment: A commenter asked if the new proposed readmission exclusion criteria would be applied to the existing condition-specific measures before the October implementation of the Hospital Readmissions Reduction Program.

Response: In the FY 2013 IPPS/LTCH PPS proposed rule, we proposed to use the current NQF-endorsed AMI, HF, and pneumonia condition-specific measure specifications for the Hospital Readmissions Reduction Program. However, in response to stakeholder input, we will update the condition-specific measures to include more planned readmissions which would not be counted as readmissions. The updated measures will be submitted to NQF for approval. Should NQF approve these changes to the measures, because we have already adopted these NQF endorsed measures in the IQR and Hospital Readmission Reduction, we would adopt these updates to the measures for future use in these programs through the subregulatory process we are finalizing in this rule.

Comment: Many commenters believed it is premature to include the 30-day all-cause hospital-wide readmission measure at this time. The commenters indicated several reasons for not supporting this measure. The commenters stated that the measure is still under appellate review by the NQF and endorsement is still pending. The commenters believed that CMS is risking the disengagement of the provider community by proposing a non-NQF-endorsed measure.

Some commenters were concerned over the suitability of this measure for public reporting and future ties to payment policy because the claims data used is between 18 to 30 months old. The commenters contended that older data does not afford hospitals the opportunity for meaningful feedback needed for immediate improvement opportunities. Commenters inquired if hospitals will have the opportunity to verify and/or appeal their HWR discrepancies. The commenters recommended that CMS provide calculated actionable data results on a quarterly basis, rather than the annual posting currently used for the conditions-specific measures.

Finally, the commenters believed the measure creates potential for significant and harmful unintended consequences by resulting in more ED visits or more repeated observation stays during the 30-day period. The commenters also cautioned that publicly reporting readmission rates without monitoring potentially adverse unintended consequences as stated in the comment could undermine patient-centered care.

Response: We note that NQF endorsed the Hospital-Wide Readmission (tentative NQF #1789) measure in the summer of 2012. Therefore the measure we proposed is an NQF-endorsed measure. For public reporting of this measure, we intend to use one year of data. This would allow the measures to be calculated using the most recent data. There will be one year lag when the data are finally posted on *Hospital Compare.* It is because we need to build in sufficient time for data production and data display and for hospitals to preview their data before they are posted on *Hospital Compare.* We appreciate the commenters' request for timely, quarterly data and we are considering options for providing hospitals with unadjusted all-hospital readmission data on a more frequent basis to assist hospitals in their quality improvement efforts.

We want to assure the commenters that we have a solid review, correction and payment process in place that would appropriately link submitted data to payment. The hospital-wide readmission measures are calculated based on the claims that hospitals submitted to and were paid by CMS. We will share with hospitals their measure data using the same ''preview'' process that we have been implementing for the Hospital IQR Program. We will transmit to hospitals through QualityNet their hospital-specific reports containing their individual patient data and their measure rates 30 days prior to posting their measures on *Hospital Compare* Web site. Hospitals are encouraged to verify their data during this 30-day preview period. If hospitals find errors in the claims they submitted to CMS for calculating the measure, they can submit the corrections in accordance with the normal claims adjustment and timely filing rules specified in the Medicare Claims Processing Manual Pub. 100–04, Chapter 1. During the preview period, hospitals' hospital-specific reports we will include data to track where their patients were readmitted in their hospital-specific report, which should help hospitals with their quality improvement efforts. Regarding the concern whether we are applying the exclusion criteria of the measure methodology correctly, the preview process can be helpful. Hospitals will have the opportunity to verify and monitor the cases being included in the measures.

We appreciate the commenter's suggestion to monitor for unintended consequences such as more ED visits and observations services and CMS

plans to conduct analyses to monitor these consequences.

Comment: A few commenters recommended that with the implementation of the 30-day all-cause hospital-wide readmission, the 30-day risk-standardized readmission measures for AMI, HF, and PN should be removed from the Hospital IQR Program measure set so that these three conditions would not be counted twice.

Response: We appreciate the comment, however, we see value in reporting both the condition-specific measures and the hospital-wide measure. The condition-specific measures give hospitals detailed information and results on well-defined clinical groups of patients that account for a disproportionate number of hospital readmissions, and we expect that these results can provide important benchmarks for hospitals and inform quality improvement. In contrast, the hospital-wide measure will provide hospitals with information on how it compares to other hospitals with similar patients hospital-wide and inform strategies for lowering readmission risk across the board for all patients. CMS intends to publicly report both the hospital-wide and condition-specific readmission measures as we believe both measures help present a more comprehensive picture of the quality of care in hospitals.

Comment: A commenter encouraged CMS to recognize a patient's responsibility regarding hospital readmissions as hospitals should not be held accountable for patient behavior.

Response: We recognize the role of patient compliance and the role of primary care and post acute care providers in preventing readmissions. However, currently approximately one out of five admissions resulted in readmission. We believe that this rate is too high. We recognize that reducing readmission is a multi-facet effort that requires collaboration among different stakeholders in the communities. However there is ample evidence that hospitals can reduce their readmission rates through such efforts as: Ensuring patients are clinically ready at discharge, reducing risk of infection; reconciling medications; improving communication with community providers participating in transitions of care; educating patients adequately upon discharge; and assuring patients understand follow-up care upon discharge. The measure encourages hospitals to improve patient care transitions and collaborate with the providers and other resources in their communities to reduce readmissions.

After consideration of the public comments we received, we are finalizing the HWR measure for the FY 2015 payment determination and subsequent years as proposed.

(C) New Chart-Abstracted Measure: Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation (NQF #0469)

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28046), we proposed for the FY 2015 payment determination and subsequent years to add a chart-abstracted measure, Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation. In launching the Strong Start Initiative (*http://www.innovation.cms.gov/initiatives/strong-start/*) to help reduce preterm births, the HHS Secretary indicated in a press release that more than half a million infants are born prematurely in America each year, and that this trend has increased 36 percent over the last 20 years. Preterm births may require additional medical attention and early intervention services. Some recent research indicates that elective deliveries before 39 weeks increase the risk of significant complications for mother and baby, as well as long-term health problems.[88,89,90,91] Preterm births are a growing public health problem that has significant consequences for families well into a child's life.

As a public campaign to reduce preterm births, the Strong Start Initiative's objective is to test ways to reverse this trend by helping provide expectant mothers with the care they need for a healthy delivery and a healthy baby, and by focusing on reducing early elective deliveries, which can lead to a variety of health problems for mothers and infants.

The Strong Start Initiative cuts across many agencies within HHS and involves external organizations including the March of Dimes, and the American College of Obstetricians and Gynecologists (ACOG). We believe that a reduction in the number of nonmedically indicated elective deliveries at ≥37 to <39 weeks gestation will result in a substantial decrease in neonatal morbidity and mortality, as well as a significant savings in healthcare costs. In addition, the rate of cesarean sections should decrease with fewer elective inductions resulting in decreased length of stay and healthcare costs. The proposed measure would assist hospitals in tracking nonmedically indicated early term elective deliveries and reduce the occurrence of such deliveries. This measure would assess patients with elective vaginal deliveries or elective cesarean sections at ≥37 and <39 weeks of gestation completed. The numerator for this measure is the number of patients with elective deliveries with principal or other procedure codes for one or more of the following: Medical induction of labor, and Cesarean section while not in active labor or experiencing spontaneous rupture of membranes. Exclusions are: Less than 8 years of age; Greater than or equal to 65 years of age; Length of Stay >120 days; and enrolled in clinical trials.

We proposed to adopt this measure for the Hospital IQR Program because we believe this measure furthers the National Quality Strategy's three-part aim of better health care for individuals, better health for populations, and low costs for health care. In addition, we have determined that the measure is relevant to the nearly 2 million Medicare beneficiaries who are aged 44 and under, most of whom are dual eligible beneficiaries, who have the potential to be impacted by pre-term births. This is evidenced by the fact that, in 2011, Medicare paid for roughly 14,000 births. The measure is NQF-endorsed; therefore, the measure meets the selection criteria under section 1886(b)(3)(B)(viii)(IX)(aa) of the Act. The measure is currently under NQF maintenance review. In its Pre-Rulemaking report for 2012, the MAP also recommended the inclusion of this measure in the Hospital IQR Program. TJC is the measure steward of this measure and the detailed measure specification can be found on the TJC Web site at: *http://manual.jointcommission.org/releases/TJC2012A/MIF0166.html*.

We proposed to add this measure to the Hospital IQR Program for the FY 2015 payment determination, with collection beginning with January 1, 2013 discharges. Although this measure is chart-abstracted, we proposed that

[88] Glantz, J. (Apr. 2005). Elective induction vs. spontaneous labor associations and outcomes. *J Reprod Med*. 50(4):235–40.

[89] Vardo, J., Thornburg, L., Glantz J., (2011). Maternal and neonatal morbidity among nulliparous women undergoing elective induction of labor. J. report med. 56(1–2): 25–30.

[90] Tita, A., Landon, M., Spong, C., Lai, Y., Leveno, K., Varner, M., *et al.* (2009). Timing of elective repeat cesarean delivery at term and neonatal outcomes. [Electronic Version]. *NEJM.* 360:2, 111–120.

[91] Clark, S., Miller, D., Belfort, M., Dildy, G., Frye, D., & Meyers, J. (2009). Neonatal and maternal outcomes associated with elective delivery. [Electronic Version]. *Am J Obstet Gynecol.* 200:156.e1–156.e4.

this measure would be collected in aggregated numerator, denominator, and exclusion counts per hospital via a Web-based tool (as opposed to collecting patient-level data from hospitals). Specific details regarding this proposed approach to data collection are included in section VIII.A.5. of this preamble on the form, manner, and timing of quality data submission for the Hospital IQR Program. We anticipate that the e-specifications of this measure will be completed in the summer of 2012. We intend to move to EHR-based collection of this and other measures once the necessary infrastructure to do so is in place. We invited public comment on our proposal to adopt this measure.

Comment: A commenter suggested that preterm delivery is better defined as delivery ''prior to 37 completed weeks of gestation'' rather than ''prior to 39 completed weeks of gestation'' as indicated in the proposed measure.

Response: After reviewing the comment, we recognize that in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28046), we incorrectly used the term ''pre-term births'' to describe the measure, which refers to early elective deliveries occurring ≥37 weeks and <39 weeks. The commenter is correct that preterm delivery is better defined as delivery prior to 37 weeks of gestation. However, for this measure, we clarify that we are not referring to deliveries prior to 37 weeks gestation.

Comment: Many commenters supported this proposed measure for inclusion in the Hospital IQR Program, but did not believe it is appropriate for the Hospital VBP Program in future years. Instead, the commenters suggested that a measure focusing on obstetrical delivery of babies would be more appropriate for potential inclusion in a Medicaid VBP Program or for use by other purchasers for whom this constitutes a substantial proportion of hospitalized patients.

Four commenters supported this proposed NQF-endorsed and MAP-recommended measure for inclusion in the Hospital IQR Program, and they believed the measure will encourage providers to reduce the number of non-medically indicated elective deliveries, which could result in a substantial decrease in neonatal morbidity and mortality. Two commenters stated that the measure sends a clear signal that CMS recognizes the importance of using measures that go beyond the Medicare population and reflects the quality concerns of the private purchasers as well as states that are facing extreme financial challenges related to Medicaid. One commenter noted that this measure will be enormously meaningful to women, a large and important group of health care consumers, who can then make informed decisions about non-medically indicated elective delivery.

Response: We thank the commenters for their support and note that regardless of the source of health benefits for women of childbearing age, the ACOG and AAP standard of requiring 39 weeks gestation prior to elective delivery should be adhered to. Therefore, we believe that whether a woman of childbearing age is provided healthcare benefits under Medicare, Medicaid or both should not determine which CMS program this measure is implemented in. We have not yet evaluated this measure in terms of its suitability for the Hospital VBP Program, but we believe that patient safety in general is a topic that should be addressed in the Hospital VBP Program.

Comment: A few commenters noted that Medicare paid for only about 14,000 deliveries in 2011 out of approximately 4 million babies born in the U.S. each year. The commenters asked for clarification on whether a hospital is expected to report the early-term elective delivery rate for all obstetric patients or only for the tiny fraction of Medicare patients with elective deliveries. Commenters assumed that CMS proposed this measure for all patients given that individual hospitals would likely lack enough data for Medicare-only deliveries to produce meaningful rates of early-term elective deliveries. One commenter stated that the inclusion of such a measure that only applies to a small number of hospitals is not appropriate to expand the Hospital IQR Program. A commenter requested clarification whether the measure applies to all patients or just Medicare patients.

Response: We appreciate the opportunity to clarify the population in which the measure will be used. We intend to apply the measure to all births, not just births to Medicare patients in order to identify the percentage that is occurring ≥37 weeks and <39 weeks. The applicable patients are all patients that are >8 years of age. We are not restricting the population to Medicare patients for this or any other chart abstracted measures used in the Hospital IQR Program.

Comment: Two commenters suggested induction should be defined as when cervical drugs are administered, outpatient cervical ripening occurs, or cervical ripening occurs in non-delivery admissions when patients are sent home and admitted later for delivery. The commenters also suggested that gestational age should be defined as cervical ripening, AROM, or oxytocin started. One commenter believed the current definition of gestational age used by CMS is inadequate, and recommends that CMS amend the acceptable sources for determination of gestational age.

Commenters recommended risk-adjustment as well as the inclusion of membrane stripping and cervical ripening agents in this measure as an induction. Commenters preferred data collection from registries rather than a Web-based tool. For the future, one commenter recommended including patients within a medical necessity category that may benefit from a gestation period greater than 39 weeks.

Response: Regarding the definition of induction and gestational age, data collection for measure calculation from registry data and refining the measure inclusion criteria, we will take these recommendations into consideration and collaborate with the steward of the measure to address these concerns. We note that the measure is endorsed with the current methodology. Should the measure steward change the current measure methodology by the addition of risk adjustment and/or make changes to induction definitions or inclusion criteria, the measure could change substantially and place the measure at risk for losing its endorsement status. We will take these definitions and recommendations into consideration prior to the next measure maintenance review.

Comment: One commenter requested clarification regarding the definition of elective and recommends CMS exclude cases of prior cesarean or myomectomy.

Response: In the context of this measure and as defined by the measure steward, elective deliveries are those that occur without medical indication. In the context of this measure and as defined by the measure steward, elective deliveries are those that occur without medical indication. For those situations in which a history of prior myomectomy or cesarean section are clear medical indications for delivery prior to 39 weeks, the measure allows for the abstractors to indicate that delivery was medically indicated. We will also convey the recommended exclusions of cases with a history of medical indication of prior cesarean or myomectomy to the measure steward for consideration.

Comment: A commenter pointed out that this measure is part of the required clinical quality measures proposed for Stage 2 meaningful use of certified EHR technology. The commenter recommended that CMS defer the

implementation of this measure until the measure can be reported as an eMeasure.

Response: Because we believe that the data reporting based on the current measure specification is not burdensome, we do not see a need to delay the implementation of this measure in the Hospital IQR Program. Once e-specification of the measure is completed, we will consider the option of e-reporting.

Comment: A few commenters supported the proposed aggregate data reporting but were unclear how would this data collection method would alleviate burden on hospitals.

One commenter requested that CMS clarify the frequency of data reporting as well as how the data would be displayed accurately without validation. The commenter was encouraged that TJC is working on the e-specification of this measure and the commenter requested CMS to consult with TJC for any recent changes in the measure.

Response: We appreciate the importance of having adequate resources when performing quality health assessments. We believe that methods of collecting data for this measure should minimize additional hospital burden because the measure data are submitted for the hospital's aggregate numerator, denominator and exclusions through a Web-based entry tool rather than submitting data on each of the hospital's individual patient cases. Display of measure results on *Hospital Compare* is required as part of the Hospital IQR Program, and we note that not all measure results on *Hospital Compare* are validated, but that hospitals are responsible for ensuring completeness and accuracy of the data regardless of whether CMS independently validates that data. We will work closely with TJC to implement the measure. The frequency of reporting this measure is addressed in the Form, Manner and Timing section of this program.

Comment: A commenter urged CMS to allow hospitals to authorize an ORYX vendor to submit the same data that the vendor is submitting to TJC.

Response: We will consider this suggestion for future implementation.

Based on the public comments we received, we are finalizing the Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation measure for FY 2015 payment determination and subsequent years as proposed. The data collection requirements for this measure are detailed in the ''Form, Manner, and Timing of Quality Data Submission'' section of this preamble.

In summary, we are adopting all the Hospital IQR Program measures adopted in previous payment determinations, with the exception of the 17 measures (1 chart-abstracted measure and 16 claims-based measures) that we are removing. We are finalizing new survey-based measure items for inclusion in the HCAHPS survey measure, 3 claims-based measures, and 1 chart-abstracted measure, for a total of 59 measures for the FY 2015 payment determination and subsequent years. These 59 measures are listed below.

Topic	Hospital IQR program measures for FY 2015 payment determination and subsequent years
Acute Myocardial Infarction (AMI) Measures.	• AMI–2 Aspirin prescribed at discharge. • AMI–7a Fibrinolytic (thrombolytic) agent received within 30 minutes of hospital arrival. • AMI–8a Timing of Receipt of Primary Percutaneous Coronary Intervention (PCI). • AMI–10 Statin Prescribed at Discharge.
Heart Failure (HF) Measures	• HF–1 Discharge instructions. • HF–2 Evaluation of left ventricular systolic function. • HF–3 Angiotensin Converting Enzyme Inhibitor (ACE–I) or Angiotensin II Receptor Blocker (ARB) for left ventricular systolic dysfunction.
Stroke (STK) Measure Set	• STK–1 VTE prophylaxis. • STK–2 Antithrombotic therapy for ischemic stroke. • STK–3 Anticoagulation therapy for Afib/flutter. • STK–4 Thrombolytic therapy for acute ischemic stroke. • STK–5 Antithrombotic therapy by the end of hospital day 2. • STK–6 Discharged on Statin. • STK–8 Stroke education. • STK–10 Assessed for rehab.
VTE Measure Set	• VTE–1 VTE prophylaxis. • VTE–2 ICU VTE prophylaxis. • VTE–3 VTE patients with anticoagulation overlap therapy. • VTE–4 Patients receiving un-fractionated Heparin with doses/labs monitored by protocol. • VTE–5 VTE discharge instructions. • VTE–6 Incidence of potentially preventable VTE.
Pneumonia (PN) Measures	• PN–3b Blood culture performed in the emergency department prior to first antibiotic received in hospital. • PN–6 Appropriate initial antibiotic selection.
Surgical Care Improvement Project (SCIP) Measures.	• SCIP INF–1 Prophylactic antibiotic received within 1 hour prior to surgical incision. • SCIP INF–2: Prophylactic antibiotic selection for surgical patients. • SCIP INF–3 Prophylactic antibiotics discontinued within 24 hours after surgery end time (48 hours for cardiac surgery). • SCIP INF–4: Cardiac surgery patients with controlled 6AM postoperative serum glucose. • SCIP INF–9: Postoperative urinary catheter removal on post operative day 1 or 2 with day of surgery being day zero. • SCIP INF–10: Surgery patients with perioperative temperature management. • SCIP Cardiovascular-2: Surgery Patients on a Beta Blocker prior to arrival who received a Beta Blocker during the perioperative period. • SCIP–VTE–2: Surgery patients who received appropriate VTE prophylaxis within 24 hours pre/post surgery.
Mortality Measures (Medicare Patients).	• Acute Myocardial Infarction (AMI) 30-day mortality rate. • Heart Failure (HF) 30-day mortality rate. • Pneumonia (PN) 30-day mortality rate.
Patients' Experience of Care Measures.	• HCAHPS survey (expanded to include one 3-item care transition set and two new ''About You'' items).

Topic	Hospital IQR program measures for FY 2015 payment determination and subsequent years
Readmission Measures (Medicare Patients).	• Acute Myocardial Infarction 30-day Risk Standardized Readmission Measure. • Heart Failure 30-day Risk Standardized Readmission Measure. • Pneumonia 30-day Risk Standardized Readmission Measure. • 30-day Risk Standardized Readmission following Total Hip/Total Knee Arthroplasty.* • Hospital-Wide All-Cause Unplanned Readmission (HWR).*
AHRQ Patient Safety Indicators (PSIs) Composite Measures.	• Complication/patient safety for selected indicators (composite).
AHRQ PSI and Nursing Sensitive Care.	• PSI–4 Death among surgical inpatients with serious treatable complications.
Structural Measures	• Participation in a Systematic Database for Cardiac Surgery. • Participation in a Systematic Clinical Database Registry for Stroke Care. • Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care. • Participation in a Systematic Clinical Database Registry for General Surgery.
Healthcare-Associated Infections Measures.	• Central Line Associated Bloodstream Infection. • Surgical Site Infection. • Catheter-Associated Urinary Tract Infection. • MRSA Bacteremia. • Clostridium Difficile (C.Diff). • Healthcare Personnel Influenza Vaccination.
Surgical Complications	• Hip/Knee Complication: Hospital-level Risk-Standardized Complication Rate (RSCR) following Elective Primary Total Hip Arthroplasty.*
Emergency Department (ED) Throughput Measures.	• ED–1 Median time from emergency department arrival to time of departure from the emergency room for patients admitted to the hospital. • ED–2 Median time from admit decision to time of departure from the emergency department for emergency department patients admitted to the inpatient status.
Prevention: Global Immunization (IMM) Measures.	• Immunization for Influenza. • Immunization for Pneumonia.
Cost Efficiency	• Medicare Spending per Beneficiary.
Perinatal Care	• Elective delivery prior to 39 completed weeks of gestation.*

* New measures/items for the FY 2015 payment determination and subsequent years.

(D) Clarifications Regarding Existing Hospital IQR Program Measures That Have Undergone Changes During NQF Measure Maintenance Processes

As discussed previously, once adopted, we retain measures in the Hospital IQR Program unless specifically stated otherwise. Recently the CLABSI and CAUTI measures were expanded to pertain to non-ICU locations in hospitals and to other types of care settings as part of NQF maintenance review. These measures retained their original NQF numbers as these changes were not considered substantive by NQF. However, we will continue to require hospitals to submit data for these two measures on ICU locations only for the Hospital IQR Program. We sought comment from hospitals on the feasibility and timing of expanding collection of these measures to include non-ICU locations in hospitals. We address these comments below in the VIII.A.4., Possible New Quality Measures and Measure Topics for Future Years section.

NQF, in addition to expanding the care settings to which the CLABSI and CAUTI measures could apply, also changed how these measures are calculated. The original endorsed versions of the measures calculated an infection rate per 1,000 central line days for CLABSI and for 1,000 urinary catheter days for CAUTI. In the course of its maintenance review, NQF changed the way the measures are calculated from an infection rate per 1,000 days to a standardized infection ratio (''SIR''), which is comprised of the actual rate of infection over the expected rate of infection. We note that although the previously endorsed versions of the CAUTI and CLABSI measures did not include the SIR calculation, we have reported the CDC-calculated SIR for both measures on the *Hospital Compare* Web site. While use of this calculation is different from the original NQF-endorsed measure output, we believe the SIR is a more accurate way to calculate the CLABSI and CAUTI measures for comparative purposes rather than the rate per 1,000 infection days because it takes into account hospitals' case mix. We will continue to report SIRs for both measures because this calculation is now consistent with NQF's endorsement of the measures. We also note that use of the SIR calculation does not change the type of data that hospitals submit on the CLABSI and CAUTI measures.

c. Hospital IQR Program Quality Measures for the FY 2016 Payment Determination and Subsequent Years

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74466), we adopted the Safe Surgery Checklist Use measure for the Hospital OQR Program for the CY 2014 payment determination. In the same rule, we adopted this measure for the ASCQR Program for the CY 2015 payment determination (76 FR 74507). This structural measure assesses whether a hospital outpatient department utilizes a Safe Surgery checklist that assesses whether effective communication and safe practices are performed during three distinct perioperative periods: (1) The period prior to the administration of anesthesia; (2) the period prior to skin incision; and (3) the period of closure of incision and prior to the patient leaving the operating room. The use of such checklists has been credited with dramatic decreases in preventable harm, complications and post-surgical mortality.[92] Like hospital outpatient settings and ambulatory surgical centers, acute care hospitals also perform many surgical procedures. Therefore, we believe this measure is also applicable for hospital inpatient settings in strengthening patient safety precautions in hospitals and in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28048), we proposed to adopt this measure for the Hospital IQR Program for FY 2016 payment determination and subsequent years.

For this proposed structural measure, a hospital inpatient department would

[92] Haynes, A.B.; Weiser, T.G.; Berry, W.G. *et al.* (2009). ''A Surgical Safety Checklist to Reduce Morbidity and Mortality in a Global Population.'' New England Journal of Medicine. 360: 491–499.

indicate whether or not it uses a safe surgery checklist for its surgical procedures that includes safe surgery practices during each of the three critical perioperative periods discussed above. The measure would not require a hospital to report whether it uses a checklist in connection with each individual inpatient procedure. We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74505 through 74506) for a detailed discussion of the Safe Surgery Checklist Use measure.

We proposed to adopt this Safe Surgery Checklist structural measure, which is not NQF-endorsed, under the exception authority provided in section 1886(b)(3)(B)(IX)(bb) of the Act. This section provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed the NQF-endorsed measures, and we were unable to identify any NQF-endorsed measures that assess use of safe surgery checklists. We also are not aware of any other safe surgery checklist use measures that have been endorsed or adopted by a consensus organization other than NQF. Accordingly, we propose to adopt the Safe Surgery Checklist measure under the Secretary's authority set forth at section 1886(b)(3)(B)(IX)(bb) of the Act.

This measure was included on the pre-rulemaking list for consideration by the MAP, and this multi-stakeholder organization comprised of affected parties supported the direction of this measure pending availability of specifications. These specifications will be made available in an upcoming manual release for the ASCQR Program which will be available on Quality Net Web site at *http://www.qualitynet.gov*. The proposed safe surgery checklist measure assesses the adoption of a best practice for surgical care that is broadly accepted and in widespread use among affected parties. In addition to being adopted by The World Federation of Societies of Anesthesiologists, the use of a safe surgery checklist is one of the safe surgery principles endorsed by the Council on Surgical and Perioperative Safety, which is comprised of the American Association of Nurse Anesthetists, the American College of Surgeons, the American Association of Surgical Physician Assistants, the American Society of Anesthesiologists, the American Society of PeriAnesthesia Nurses, the AORN, and the Association of Surgical Technologists. Two State agencies (Oregon and South Carolina), the Veterans Health Administration,[93] numerous hospital systems, State hospital associations (such as California and South Carolina), national accrediting organizations, and large private insurers have endorsed the use of a safe surgery checklist as a best practice for reducing morbidity, mortality, and medical errors.[94,95] Although there is not currently an NQF endorsed measure for safe surgery checklist use, because the use of a safe surgery checklist is a widely accepted best practice for surgical care, we believe that the proposed structural measure of Safe Surgery Checklist use reflects consensus among affected parties. We also note that TJC included safe surgery checklist practices among those to be used to achieve National Patient Safety Goals (NPSGs) adopted for 2011 for surgeries performed in ambulatory settings and hospitals.

Given that this measure is pivotal in preventing human errors in surgical operations which are commonly performed by acute care hospitals, we proposed to adopt this measure for the Hospital IQR Program for the FY 2016 payment determination and subsequent years. This proposal would achieve our goal to align measures across settings.

Comment: Many commenters supported the proposed measure if a specific checklist is not mandated.

Response: We appreciate the support for the measure, which was designed to assess the adoption of a best practice for surgical care to reduce preventable medical errors and mortality while giving hospitals the flexibility to develop their own checklist that meets their needs. We chose not to finalize any specific checklist but will consider providing links to specific examples of Surgical Safety Checklists as an Appendix in the Specification Manual.

Comment: Many commenters did not support the Safe Surgery Checklist measure, and believed that the proposed measure is merely a concept and not a fully developed measure. Some commenters noted that CMS should first seek NQF endorsement for the measure. Commenters also stated that the MAP only supports the general concept and direction of the measure but did not recommend the measure for inclusion in the Hospital IQR Program.

A commenter stated that managing the processes involved in surgical care is what improves quality of care, not the mere use of a checklist.

Response: We agree that good management of processes around surgical care is critical to high quality surgical care, however, we also believe that the use of a surgical checklist facilitates management and communication of these processes. In addition, the MAP 2012 Pre-Rulemaking Report indicated that the MAP supported the direction of this measure pending further specification. We have since specified this measure for implementation in the Hospital OQR Program and the ASCQR Program, and specifications are available on the QualityNet Web site in the Specifications Manuals for these two programs at: *https://www.qualitynet.org/* . We also note that non-endorsed measures that we believe to be important in assessing the quality of hospital care can be adopted for the Hospital IQR Program through our exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act. This section provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a), the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We believe the Safe Surgery Checklist complements the management of surgical care processes and ultimately contributes to better patient outcomes by increasing safe surgery practices, reducing preventable human error, and minimizing complications and post-surgical mortality. To that end, we believe it warrants inclusion in the Hospital IQR Program.

Comment: A commenter provided examples of other safeguards that are already in place to address safe surgeries. The commenter also noted that the introduction of this measure would create an undue burden on hospitals because the Medicare National Coverage Determinations already specify no Medicare reimbursement for any adverse event from any aspects of a surgery. The commenter presumed that this is a strong incentive for hospitals to take steps to ensure safe

[93] Neily, J; Mills, PD, Young-Xu, Y. (2010). ''Association between implementation of a Medical Team Training Program and Surgical Mortality.'' JAMA. 304 (15): 1693–1700.

[95] Birkmeyer, JD (2010) ''Strategies for Improving Surgical Quality—Checklists and Beyond.'' NEJM. 363: 1963–1965.

surgeries. Furthermore, the commenter noted that TJC surveys all accredited institutions for surgery checklists as part of its patient safety requirements. Therefore, the commenter concluded that there is already adequate use of the safe surgery checklist among hospitals performing surgeries.

Response: In our view, the widespread use of safe surgery checklists affirms our view regarding the significance of this structural measure. We believe that reporting information about the implementation of these safeguards to consumers is important for transparency and awareness. This is why this measure has been adopted for the Hospital OQR and ASCQR Programs as well. Public reporting of this measure is not occurring; therefore, we believe that including this measure in the Hospital IQR Program and publicly reporting the measure data is not redundant. This measure imposes a minimal reporting burden on hospitals.

Comment: One commenter requested that CMS provide sources of surgical safety checklists, which include safe surgery practices during each of the three critical perioperative periods. A few commenters stated that the WHO Safe Surgery Checklist Implementation Manual described one time pause, and not three as stated in the proposed rule. Commenters agreed that the pauses are important but a series of three time outs are disruptive and impracticable. Commenters recommended CMS clarifies and ensures that surgeons can implement and modified CMS' sample Safe surgery Checklist and are not mandated to incorporate the three ''pauses.''

Response: We did not propose to require the use of any particular checklist for this measure. In the discussion of the Safe Surgery Checklist Use measure in the proposed rule we referred readers to the discussion of this measure in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74464 through 74466). In that final rule with comment period, we presented examples of typical safe surgery practices corresponding to three critical preoperative periods. Although the discussion in the CY 2012 OPPS/ASC final rule with comment period noted that the WHO Surgical Safety Checklist ''lists safe surgery practices during each of these three perioperative periods,'' we agree with the commenters that the WHO Safe Surgery Checklist Implementation Manual only specifies a single pause. However, we did not propose to adopt the WHO checklist and, under our proposal, hospitals have the flexibility to determine the use of a safe surgery checklist with the number of pauses they feel are necessary to elicit the safest surgical practices. The measure does not assess the process or content of their safe surgery checklists, nor does the Safe Surgery Checklist Use measure finalized for the Hospital OQR Program or ASCQR Program. The measure does not prescribe for facilities the processes for completion of (for example, number of pauses) or content of a safe surgery checklist (for example, which items to check on). Instead, the measure just requires hospitals to report whether or not they use a safe surgery checklist.

Comment: A commenter recommended that after implementation, CMS should evaluate the appropriate implementation and utilization of the use of the safe surgery checklist by providers as indicated in this measure. Commenters were concerned that the use of a surgical checklist may result in a ''check the box'' process which does not result in the improved delivery of care for which the checklist is intended. A commenter suggested focusing on specifying standardized criteria to be followed in using the safe surgery checklist instead of whether the checklist is in place.

Response: We agree with the commenters that the use of a safe surgery checklist as indicated in this measure should be implemented appropriately to achieve improved delivery rather than just creating an additional documentation requirement. The use of a checklist is intended to help prevent serious medical errors involving surgical care such as anesthesia dosing errors and allergic reactions, wrong site surgery, wrong procedure or wrong patient surgery, and the retention of foreign objects in the body. During our measure maintenance process, we will review the improvement potential for this measure, like all the measures we adopted for the Hospital IQR Program, for indication of best practices, among other review criteria.

Comment: A commenter was skeptical that the proposed Safe Surgery Checklist attestation could be validated by CMS and therefore, does not warrant consideration as a structural measure.

Response: At this time we have not proposed to validate this measure or other structural measures previously adopted in the Hospital IQR Program.

After consideration of public comments we received, we are finalizing the Safe Surgery Checklist use measure as proposed for a total of 60 measures for the FY 2016 payment determination and subsequent years. The data collection requirements for this measure are detailed in the ''Form, Manner, and Timing of Quality Data Submission'' section of this preamble. The 60 measures for the FY 2016 payment determination and subsequent years are listed below.

Topic	Hospital IQR program measures for FY 2016 payment determination and subsequent years
Acute Myocardial Infarction (AMI) Measures.	• AMI–2 Aspirin prescribed at discharge. • AMI–7a Fibrinolytic (thrombolytic) agent received within 30 minutes of hospital arrival. • AMI–8a Timing of Receipt of Primary Percutaneous Coronary Intervention (PCI). • AMI–10 Statin Prescribed at Discharge.
Heart Failure (HF) Measures	• HF–1 Discharge instructions. • HF–2 Evaluation of left ventricular systolic function. • HF–3 Angiotensin Converting Enzyme Inhibitor (ACE–I) or Angiotensin II Receptor Blocker (ARB) for left ventricular systolic dysfunction.
Stroke Measure (STK) Set	• STK–1 VTE prophylaxis. • STK–2 Antithrombotic therapy for ischemic stroke. • STK–3 Anticoagulation therapy for Afib/flutter • STK–4 Thrombolytic therapy for acute ischemic stroke. • STK–5 Antithrombotic therapy by the end of hospital day 2. • STK–6 Discharged on Statin. • STK–8 Stroke education. • STK–10 Assessed for rehab.
VTE Measure Set	• VTE–1 VTE prophylaxis. • VTE–2 ICU VTE prophylaxis. • VTE–3 VTE patients with anticoagulation overlap therapy.

Topic	Hospital IQR program measures for FY 2016 payment determination and subsequent years
	• VTE–4 Patients receiving un-fractionated Heparin with doses/labs monitored by protocol.
	• VTE–5 VTE discharge instructions.
	• VTE–6 Incidence of potentially preventable VTE.
Pneumonia (PN) Measures	• PN–3b Blood culture performed in the emergency department prior to first antibiotic received in hospital.
	• PN–6 Appropriate initial antibiotic selection.
Surgical Care Improvement Project (SCIP) Measures.	• SCIP INF–1 Prophylactic antibiotic received within 1 hour prior to surgical incision.
	• SCIP INF–2 Prophylactic antibiotic selection for surgical patients.
	• SCIP INF–3 Prophylactic antibiotics discontinued within 24 hours after surgery end time (48 hours for cardiac surgery).
	• SCIP INF–4 Cardiac surgery patients with controlled 6AM postoperative serum glucose.
	• SCIP INF–9 Postoperative urinary catheter removal on post operative day 1 or 2 with day of surgery being day zero.
	• SCIP INF–10 Surgery patients with perioperative temperature management.
	• SCIP Cardiovascular-2 Surgery Patients on a Beta Blocker prior to arrival who received a Beta Blocker during the perioperative period.
	• SCIP VTE–2 Surgery patients who received appropriate VTE prophylaxis within 24 hours pre/post surgery.
Mortality Measures (Medicare Patients).	• Acute Myocardial Infarction (AMI) 30-day mortality rate.
	• Heart Failure (HF) 30-day mortality rate.
	• Pneumonia (PN) 30-day mortality rate.
Patients' Experience of Care Measures.	• HCAHPS survey (expanded to include one 3-item care transition set* and two new ''About You'' items).
Readmission Measures (Medicare Patients).	• Acute Myocardial Infarction 30-day Risk Standardized Readmission Measure.
	• Heart Failure 30-day Risk Standardized Readmission Measure.
	• Pneumonia 30-day Risk Standardized Readmission Measure.
	• 30-day Risk Standardized Readmission following Total Hip/Total Knee Arthroplasty.*
	• Hospital-Wide All-Cause Unplanned Readmission (HWR).*
AHRQ Patient Safety Indicators (PSIs) Composite Measures.	• Complication/patient safety for selected indicators (composite).
AHRQ PSI and Nursing Sensitive Care.	• PSI–4 Death among surgical inpatients with serious treatable complications.
Structural Measures	• Participation in a Systematic Database for Cardiac Surgery.
	• Participation in a Systematic Clinical Database Registry for Stroke Care.
	• Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care.
	• Participation in a Systematic Clinical Database Registry for General Surgery.
	• Safe Surgery Checklist Use.**
Healthcare-Associated Infections Measures.	• Central Line Associated Bloodstream Infection.
	• Surgical Site Infection.
	• Catheter-Associated Urinary Tract Infection.
	• MRSA Bacteremia.
	• Clostridium Difficile (C.Diff).
	• Healthcare Personnel Influenza Vaccination.
Surgical Complications	• Hip/Knee Complication: Hospital-level Risk-Standardized Complication Rate (RSCR) following Elective Primary Total Hip Arthroplasty.*
Emergency Department (ED) Throughput Measures.	• ED–1 Median time from emergency department arrival to time of departure from the emergency room for patients admitted to the hospital.
	• ED–2 Median time from admit decision to time of departure from the emergency department for emergency department patients admitted to the inpatient status.
Prevention: Global Immunization (IMM) Measures.	• Immunization for Influenza.
	• Immunization for Pneumonia.
Cost Efficiency	• Medicare Spending per Beneficiary.
Perinatal Care	• Elective delivery prior to 39 completed weeks of gestation.*

* New measures/items for FY 2015 payment determination and subsequent years.
** New measures for FY 2016 payment determination and subsequent years.

4. Possible New Quality Measures and Measure Topics for Future Years

We anticipate that, as EHR technology evolves and more infrastructure is put in place, we will have the capacity to accept electronic reporting of many of the clinical chart-abstracted measures that are currently part of the Hospital IQR Program or have been proposed for adoption into the program. We intend for this future progress to significantly reduce the administrative burden on hospitals under the Hospital IQR Program. We recognize that considerable work needs to be done by measure owners and developers to make this possible with respect to the clinical quality measures that we proposed. This includes completing electronic specifications for measures, pilot testing, reliability and validity testing, and implementing such specifications into EHR technology to capture and calculate the results, and implementing the systems. We believe that at a future date, such as 2015, CMS and hospitals will be able to use EHR-based reporting for many chart-abstracted measures for the Hospital IQR Program, and we intend to work diligently toward this goal. We believe this will simplify measure collection and submission for the Hospital IQR Program, and will reduce the burden on hospitals to report chart-abstracted measures.

Once the e-specifications and the EHR-based collection mechanism are available for the smoking and alcohol cessations measures developed by TJC, we intend to propose two TJC smoking and alcohol cessation measure sets for inclusion in the Hospital IQR Program.

Each of these TJC sets consists of four measures:

- Smoking Cessation Set—(1) TAM–1 Tobacco Use Screening; (2) TAM–2 Tobacco Use Treatment Provided or Offered; (3) TAM–3 Tobacco Use Treatment Management at Discharge; and (4) TAM–4 Assessing Status after Discharge, and
- Alcohol Cessation Set—(1) TAM–5 Alcohol Use Screening; (2) TAM–6 Alcohol Use Brief Intervention Provided or Offered; (3) TAM–7 Alcohol and Other Drug Use Disorder Treatment Provided or Offered at Discharge; and (4) TAM–8 Substance Use: Assessing Status after Discharge.

These measure sets were recommended by the MAP for inclusion in the Hospital IQR Program, provided they complete the NQF endorsement process prior to inclusion. We invited public comment on our intention to propose these measure sets.

Comment: Roughly equal numbers of commenters supported and opposed the two TJC smoking and alcohol cessation measure sets for inclusion in the Hospital IQR Program. A commenter did not support the TAM–4 Assessing Status after Discharge and TAM–8 Substance Use: Assessing Status after Discharge measures as data collection after discharge was perceived to be very labor intensive. A commenter urged CMS to align the Smoking and Alcohol Cessation measure names with TJC's measure names should CMS propose the measures in the future.

A few commenters highlighted some limitations of e-specifications and EHR-based collection and added that a high validation rates such as 95 percent, across electronic data capture method and manual chart-abstraction is crucial.

Response: We thank the commenters for their input on the prospective TJC alcohol and smoking cessation measure sets. We will take this input into consideration in future rulemakings.

We intend to propose the following measure domains in the Hospital IQR Program measure set in future measurement proposals for the Hospital IQR Program: clinical quality (for example, the AMI, HF, PN, STK, and VTE measures), care coordination (for example, the mortality measures), patient safety (for example, the SCIP and HAI measures), patient and caregiver experience of care (for example, the HCAHPS measure), population/community health (for example, the global immunization measures), and efficiency (for example, the Medicare Spending per Beneficiary measure). This approach will enhance better patient care while bringing the Hospital IQR Program in line with our other established quality reporting and pay-for-performance programs.

Comment: We received many suggestions for future measure domains or measure topics including:

- HAIs measures collected via NHSN
- Risk-adjusted, rate-based HAC measures
- Beta blockers prescribed to HF patients
- Beta blocker therapy for left ventricular systolic dysfunction
- Post-discharge appointment for HF patients
- AAA mortality measures
- Cardiac Rehabilitation Referral
- Discharge appointment measure for heart failure patients
- Coronary artery and heart disease
- Medication safety
- Surgical outcome measures
- Sepsis and septic shock
- Registry-based CABG composite score
- Potentially avoidable complication
- A comprehensive COPD measure set
- Pain assessment
- Alzheimer's disease/cognitive impairment quality measures
- Efficiency, resource use, and appropriateness of care measures
- Malnutrition
- Patient-reported outcomes and engagement
- Pediatric care

In addition, some commenters opposed the future inclusion of measures that require a global population. A commenter requested CMS to provide a detailed list of measures under consideration in the proposed rulemakings.

Response: We thank the commenters for their valuable input for the suggestions regarding future measures and will take them into consideration for future rulemakings.

We also noted that consistent with the updated NQF endorsements of the CLABSI (NQF #139) and CAUTI (NQF #138) measures, we intend to propose to collect data for non-ICU patients as well for these two measures when feasible at a future time, and we sought public comment on the feasibility and timing of expanding data collection to non-ICU locations for acute care hospitals.

Comment: A few commenters highlighted the prevalence of CLABSI in ICUs in hospitals and noted that the morbidity and mortality from these types of infections are preventable. The commenters strongly encouraged CMS to move forward with data collection from non-ICU locations as soon as possible.

Response: We thank the commenter for the encouragement to advance our goal to reduce central line associated blood-stream infections.

Comment: Many commenters stated that expansion of the CLABSI and CAUTI measures into the non-ICU locations in hospitals is a good long-term goal. However, commenters requested delaying the proposal to expand these two measures to include non-ICU locations until hospitals have gained several years of experience with data collection and validation in ICUs. Two commenters perceived the expansion of data collection to non-ICU locations as burdensome and strongly urged CMS not to expand data collection beyond ICU units. A commenter questioned the capability of the NHSN to handle the influx of data from the expansion of the CLABSI measures into non-ICU locations.

Response: We will take these comments into consideration in determining an appropriate time to propose to expand collection of these measures in non-ICU locations. As more and more acute care hospitals reduce CLABSI and CAUTI incidence in ICU locations and prioritize reductions of CLABSI and CAUTI incidence in other hospital locations, extending CLABSI and CAUTI reporting to those locations will yield benefits for prevention and quality improvement and will justify extending the scope of CLABSI and CAUTI reporting to non-ICU locations. We anticipate that NHSN infrastructure would be enhanced as needed to handle any expansion of CLABSI and CAUTI reporting requirements.

Comment: A commenter strongly supported using the NHSN as the core component of HAI data reporting. Another commenter expressed concerns that the functionality of the NHSN database as is not user-friendly. According to this commenter, there are significant limitations for uploading data. For example, a hospital may have an incomplete data set to upload into the surgical site infection application for colon and hysterectomy patients, but the data cannot be saved in a temporary file until it is complete. In addition, the database does not accept simple spreadsheets to be uploaded. The commenter urged CMS to collaborate with the CDC to improve the usability of the NHSN database.

Response: We thank the commenter for the support of using NHSN as the mechanism to collect HAI measure data. We understand that CDC continues to use input from users and systematic field studies of its own to improve the usability of NHSN's Web interface. CDC requires healthcare facilities to submit complete healthcare-associated infection data records via the NHSN system, to avoid storing volumes of incomplete records while substantial

back-and-forth communication between CDC and the reporting facility is pending during close out for the facility's reporting for a specified reporting interval. The importance of requiring complete records is heightened by the use of NHSN for mandatory healthcare-associated infection reporting in 29 states (including Washington, DC) and use of NHSN for CMS quality reporting programs. CDC informed us that NHSN accepts comma separated value (CSV) files for importation of patient demographic data, procedure data, and surgeon data. These CSV files can be readily created from spreadsheets and uploaded into NHSN, eliminating the need for manual data entry of patient demographic data, procedure data, and surgeon data.

We thank the commenters for their input on the feasibility and timing of expanding collection of these measures to include non-ICU locations in hospitals. We will take them into consideration in future rulemakings.

5. Form, Manner, and Timing of Quality Data Submission

a. Background

Sections 1886(b)(3)(B)(viii)(I) and (II) of the Act state that the applicable percentage increase, for FY 2007 and each subsequent fiscal year, shall be reduced by 2.0 percentage points (or, beginning with FY 2015, by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act)) for any subsection (d) hospital that does not submit quality data in a form and manner, and at a time, specified by the Secretary. CMS requires that hospitals submit data in accordance with the specifications for the appropriate discharge periods. The data submission requirements, Specifications Manual, and submission deadlines are posted on the QualityNet Web site at: *http://www.QualityNet.org/*. Hospitals submit quality data through the secure portion of the QualityNet (formerly known as QualityNet Exchange) Web site (*https://www.QualityNet.org*). This Web site meets or exceeds all current Health Insurance Portability and Accountability Act requirements for security of protected health information.

In order to participate in the Hospital IQR Program, hospitals must meet specific procedural requirements. Hospitals choosing to participate in the Hospital IQR Program must also meet specific data collection, submission, and validation requirements.

b. Procedural Requirements for the FY 2015 Payment Determination and Subsequent Years

The Hospital IQR Program procedural requirements are now codified in regulation at 42 CFR 412.140. Hospitals should refer to the regulation for participation requirements. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28051), for the FY 2015 payment determination and future years, we proposed to modify the following procedural requirements and the corresponding regulation text.

- In order to ensure that hospitals that participate in the Hospital IQR Program are submitting data for a full year, we proposed that hospitals that would like to participate in the Hospital IQR Program for the first time, or that previously withdrew from the Program and would like to participate again, must submit to CMS a completed Notice of Participation by December 31 of the calendar year preceding the first quarter of the calendar year in which the chart-abstracted Hospital IQR data submission is required for any given fiscal year. For example, if a hospital wishes to participate in FY 2015, it must submit a pledge by December 31, 2012, and submit data beginning with January 1, 2013 discharges. We also proposed to modify our regulations at 42 CFR 412.140(a)(3)(i) to reflect this proposed requirement.

- Currently, CMS will accept Hospital IQR Program withdrawal forms from hospitals on or before August 15 of the fiscal year preceding the fiscal year for which a Hospital IQR payment determination will be made. In order to decrease the time between final submission of Hospital IQR data and Hospital IQR payment determination notification for the hospitals, we proposed that a subsection (d) hospital may withdraw from the Hospital IQR Program by submitting to CMS a withdrawal form that can be found in the secure portion of the QualityNet Web site. The hospital must submit the withdrawal form by May 15 prior to the start of the payment year affected. For example, if a hospital seeks to withdraw from the FY 2015 payment determination, the hospital must submit the withdrawal form to CMS by May 15, 2014. If a hospital withdraws from the Program, it will receive a reduction until such time as it meets the participation requirements. This proposal will also align with the final abstraction data submission deadline, which will eliminate the burden of one extra deadline for providers and vendors. We also proposed to modify our regulations at 42 CFR 412.140(b) to reflect this proposed requirement.

Comment: A few commenters supported the proposed changes in the data submission requirements regarding the timing of notifications for participating in and withdrawing from the Hospital IQR Program.

Response: We would like to thank the commenters for their support.

After consideration of the public comments we received, we are finalizing these participation changes and modifying the associated regulation text at 42 CFR 412.140(a)(3)(i) and 42 CFR 412.140(b).

c. Data Submission Requirements for Chart-Abstracted Measures

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28051), for FY 2015 and subsequent years, we proposed to retain the 4½ months quarterly submission deadline for chart-abstracted quality measures. We also proposed to retain the aggregate population and sampling deadline of 4 months. Hospitals would continue to be required to submit aggregate population and sample size counts to CMS on a quarterly basis for Medicare and non-Medicare discharges for the topic areas for which chart-abstracted data must be submitted (76 FR 51640 through 51641). We proposed the same 14-day period after the aggregate population and sample size count deadline to submit the required patient-level records. For the FY 2015 payment determination and subsequent years, hospitals must submit data for four consecutive calendar year discharge quarters. For example, for FY 2015, the submission quarters are as follows: 1Q CY 2013, 2Q CY 2013, 3Q CY 2013 and 4Q CY 2013.

We received no comments on this proposal; therefore, we are finalizing our proposal to retain the 4½ months quarterly submission deadline for chart-abstracted quality measures and the aggregate population and sampling deadline of 4 months for the FY 2015 payment determination and subsequent years.

We proposed to collect a new chart-abstracted measure for FY 2015, Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation. Although this is a chart-abstracted measure, we proposed that this measure would be collected in aggregated numerator, denominator, exclusion counts and total population per hospital via a Web-Based Measure Tool. The complete data submission requirements, submission deadlines, and data submission mechanism, known as the Web-Based

Measure Tool, will be posted on the QualityNet Web site at: *http://www.qualitynet.org/*. The Web-Based Measure Tool will be an Internet database for hospitals to submit their aggregate data. We proposed that hospitals submit data in accordance with the specifications for the appropriate reporting periods to the Web-Based Measure Tool that will be found in the hospital section on the QualityNet Web site (*http://www.qualitynet.org/*).

Comment: One commenter opposed the use of aggregate reporting because many hospitals already report this measure to TJC in a patient-level format.

Response: We thank the commenter for the input and appreciate that hospitals that submit to TJC will need to submit their aggregate totals to the Web tool. However, we believe this aggregate submission will be less burdensome for hospitals that do not already collect this measure.

Comment: Several commenters supported the aggregate collection of the data for the Elective Delivery Prior to 39 Completed Weeks Gestation measure.

Response: We thank the commenters for their support.

Comment: Several commenters support the aggregate collection of the measure but wanted more details on the submission deadlines and requirements.

Response: We thank the commenters for their input and reiterate our statement from the proposed rule that we consider the Elective Delivery Prior to 39 Completed Weeks Gestation measure to be a chart-abstracted measure. Accordingly, we are clarifying that the deadlines that we are finalizing for submission of patient-level data for all of the chart-abstracted measures also apply to submission of aggregate numerator, denominator, exclusion counts and total population and sample size for this measure. The only difference between the submission requirements for this measure and the other chart-abstracted measures is that the method hospitals will follow will vary somewhat, while the actual deadlines will not.

In particular, we provide hospitals with the opportunity to begin submitting patient-level charts for the other chart-abstracted measures as candidate cases occur during the quarter at issue. It is not necessary for us to provide this same mechanism for the Elective Delivery Prior to 39 Completed Weeks Gestation measure because hospitals will not know their aggregate counts for a particular quarter until the quarter has ended. In addition, hospitals should need less time to submit data for this measure because, unlike the other chart-abstracted measures, hospitals are only required to submit several aggregate counts instead of potentially numerous patient-level charts. We note that submission of this measure places less burden on hospitals than the other chart-abstracted measures because of the ease with which hospitals can simply submit their aggregate counts using our Web-Based Measure Tool through the QualityNet Web site.

In summary, the data submission deadline for all of the chart-abstracted measures, including the Elective Delivery Prior to 39 Completed Weeks Gestation measure, is 4½ months after the end of the discharge quarter. For example, the deadline for submission of data for all chart-abstracted measures for the first calendar quarter of 2013 is August 15, 2013. The only difference in timing for submission of data for the Elective Delivery Prior to 39 Completed Weeks Gestation measure and the other chart-abstracted measures is the duration of the submission periods. For the Elective Delivery Prior to 39 Completed Weeks Gestation measure the submission period for the first quarter of 2013 will be July 1st, 2013–August 15th, 2013 and for the other chart-abstracted measures the submission period is for the first quarter of 2013 will be January 1, 2013–August 15, 2013. While the submission periods differ, the deadlines for each quarter will be the same for all chart-abstracted measures, including the Elective Delivery Prior to 39 Completed Weeks Gestation measure.

Comment: Several commenters were concerned about including this measure in the Hospital VBP Program because it is would be difficult to validate since there are no underlying patient records from which to pull the data.

Response: We thank the commenters for their input. We point out that the measure was not proposed for the Hospital VBP Program at this time. We also have not proposed to validate this measure.

After consideration of the public comments we received, we are finalizing the aggregate data collection and submission requirements for the Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation measure.

d. Sampling and Case Thresholds Beginning With the FY 2015 Payment Determination

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641), we continued, for the FY 2015 payment determination and subsequent years, the approach we adopted in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50230) regarding hospital submission of population and sampling data. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28051), we did not propose any changes to these requirements.

We strongly recommend that hospitals review the QIO Clinical Warehouse Feedback Reports and the Hospital IQR Program Provider Participation Reports that are available after patient-level data are submitted to the QIO Clinical Warehouse. We generally update these reports on a daily basis to provide accurate information to hospitals about their submissions. These reports enable hospitals to ensure that their data were submitted on time and accepted into the QIO Clinical Warehouse.

Comment: Several commenters expressed concern about changes to QualityNet feedback reports. In addition, several commenters expressed concern that QualityNet's role in validation is being expanded at a time when the system is not functioning properly.

Response: We thank the commenters for their concerns. The QualityNet reporting system recently underwent significant changes as a result of a Hospital IQR Program and Hospital OQR Program system alignment and re-design. The format of standard QualityNet reports should be consistent at this time, with changes being applied only to accommodate changes in data collection, updates necessary to support changes in program requirements. We believe QualityNet is reliable and that the system will continue to be capable of supporting the uploads necessary for validation.

Comment: One commenter expressed concern that electronic medical records owners be given assistance from vendors or have access to programming to assure correct documentation and obstetric reporting.

Response: We thank the commenter and encourage submitters to work with their vendors to assure correct documentation and obstetric reporting.

e. HCAHPS Requirements for the FY 2014, FY 2015, and FY 2016 Payment Determinations

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), beginning with discharges occurring in third quarter CY 2011, we established that hospitals will have about 13 weeks after the end of a calendar quarter to submit HCAHPS data for that quarter to the QIO Clinical Warehouse.

Other than this change, we did not make any other changes to the HCAHPS requirements for the FY 2013 and FY

2014 Hospital IQR Program payment determinations, which were adopted in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50220).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28051), for the FY 2016 Hospital IQR payment determinations, we proposed to continue these HCAHPS requirements. Under these requirements, a hospital must continuously collect and submit HCAHPS data in accordance with the current HCAHPS *Quality Assurance Guidelines* and the quarterly data submission deadlines, both of which are posted at *http://www.hcahpsonline.org*. In order for a hospital to participate in the collection of HCAHPS data, a hospital must either: (1) contract with an approved HCAHPS survey vendor that will conduct the survey and submit data on the hospital's behalf to the QIO Clinical Warehouse; or (2) self-administer the survey without using a survey vendor provided that the hospital attends HCAHPS training and meets Minimum Survey Requirements as specified on the HCAHPS Web site at: *http://www.hcahpsonline.org*. A current list of approved HCAHPS survey vendors can be found on the HCAHPS Web site. For the FY 2016 Hospital IQR Program, we proposed that the HCAHPS data would be based on discharges from January 1, 2014 through December 31, 2014.

Every hospital choosing to contract with a survey vendor must provide the sample frame of HCAHPS-eligible discharges to its survey vendor with sufficient time to allow the survey vendor to begin contacting each sampled patient within 6 weeks of discharge from the hospital. (We refer readers to the *Quality Assurance Guidelines* located at *http://www.hcahpsonline.org* for details about HCAHPS survey administration.) Hospitals are strongly encouraged to submit their entire patient discharge list, excluding patients who had requested ''no publicity'' status or who are excluded because of State regulations, in a timely manner to their survey vendor to allow adequate time for sample creation, sampling, and survey administration. We emphasize that hospitals must also provide the administrative data that is required for HCAHPS in a timely manner to their survey vendor. This includes the patient MS–DRG at discharge, or alternative information that can be used to determine the patient's service line, in accordance with the survey protocols in the most recent HCAHPS *Quality Assurance Guidelines*.

We note that the HCAHPS *Quality Assurance Guidelines* require that hospitals maintain complete discharge lists that indicate which patients were eligible for the HCAHPS survey, which patients were not eligible, and which patients were excluded, and the reason(s) for ineligibility and exclusion. (We refer readers to the *Quality Assurance Guidelines* located at *http://www.hcahpsonline.org* for details about HCAHPS eligibility and sample frame creation.) In addition, the hospital must authorize the survey vendor to submit data via My QualityNet, the secure part of the QualityNet Web site, on the hospital's behalf.

Hospitals must obtain and submit at least 300 completed HCAHPS surveys in a rolling four-quarter period unless the hospital is too small to obtain 300 completed surveys. We wish to emphasize that the absence of a sufficient number of HCAHPS eligible discharges is the only acceptable reason for obtaining and submitting fewer than 300 completed HCAHPS surveys in a rolling four quarter period. If a hospital obtains fewer than 100 completed surveys, the hospital's HCAHPS scores will be accompanied by an appropriate footnote on the *Hospital Compare* Web site alerting the Web site users that the scores should be reviewed with caution, as the number of surveys may be too low to reliably assess hospital performance.

After the survey vendor submits the data to the QIO Clinical Warehouse, we strongly recommend that hospitals employing a survey vendor promptly review the two HCAHPS Feedback Reports (the Provider Survey Status Summary Report and the Data Submission Detail Report) and the HCAHPS Review and Correction Report that are available. These reports enable a hospital to ensure that its survey vendor has submitted the data on time, the data has been accepted into the QIO Clinical Warehouse, and the data accepted into the QIO Clinical Warehouse are complete and accurate.

In order to ensure compliance with HCAHPS survey and administration protocols, hospitals and survey vendors must participate in all oversight activities. As part of the oversight process, during the onsite visits or conference calls, the HCAHPS Project Team will review the hospital's or survey vendor's survey systems and assess protocols based upon the most recent HCAHPS *Quality Assurance Guidelines.* All materials relevant to survey administration will be subject to review. The systems and program review includes, but is not limited to: (a) Survey management and data systems; (b) printing and mailing materials and facilities; (c) telephone and Interactive Voice Response (IVR) materials and facilities; (d) data receipt, entry and storage facilities; and (e) written documentation of survey processes. As needed, hospitals and survey vendors will be subject to follow-up site visits or conference calls. We point out that the HCAHPS *Quality Assurance Guidelines* state that hospitals should refrain from activities that explicitly influence how patients respond on the HCAHPS survey. If we determine that a hospital is not compliant with HCAHPS program requirements, we may determine that the hospital is not submitting HCAHPS data that meet the requirements of the Hospital IQR Program.

We continue to strongly recommend that each new hospital participate in an HCAHPS dry run, if feasible, prior to beginning to collect HCAHPS data on an ongoing basis to meet Hospital IQR Program requirements. New hospitals can conduct a dry run in the last month of a calendar quarter. The dry run will give newly participating hospitals the opportunity to gain first-hand experience collecting and transmitting HCAHPS data without the public reporting of results. Using the official survey instrument and the approved modes of administration and data collection protocols, hospitals/survey vendors will collect HCAHPS dry-run data and submit the data to My QualityNet, the secure portion of QualityNet.

We again are encouraging hospitals to regularly check the HCAHPS Web site at *http://www.hcahpsonline.org* for program updates and information. We invited public comment on our proposal to continue using these HCAHPS requirements for the FY 2016 payment determination.

We did not receive any public comments and we are adopting the HCAHPS requirements for the FY 2014, FY 2015, and FY 2016 payment determinations, as proposed.

f. Data Submission Requirements for Structural Measures

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 through 51644), beginning with FY 2013, we finalized the period of data collection for which hospitals will submit the required registry participation information once annually for the structural measures via a Web-Based Measure Tool. We finalized our proposal for FY 2014 for submission of structural measures between April 1, 2013 and May 15, 2013 with respect to the time period of January 1, 2012 through December 31, 2012. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28052), we

proposed to continue this policy for FY 2015 and subsequent years. For the FY 2015 payment determination, the period of data collection for which hospitals will submit the required registry participation information for the structural measures via a Web-Based Measure Tool will be between April 1, 2014 and May 15, 2014, with respect to the time period of January 1, 2013 through December 31, 2013. We invited public comment on this proposal.

Comment: One commenter supported the timing of collection for structural measures for FY 2015 and subsequent years.

Response: We thank the commenter for the support.

After consideration of the public comment we received, we are finalizing our proposal to align the structural measure submission with the final submission quarter for each fiscal year for FY 2015 and subsequent years.

g. Data Submission and Reporting Requirements for Healthcare-Associated Infection (HAI) Measures Reported via NHSN

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51644 through 51645), we adopted the data submission and reporting standard procedures that have been set forth by CDC for NHSN participation in general and for submission of the HAI measures to NHSN. The existing data collection and submission timeframes for the HAI measures for the FY 2014 payment determination align with the submission timeframes for chart abstracted measures. The data submission deadlines are posted on the QualityNet Web site at: *http://www.QualityNet.org/*.

Hospitals will have until the Hospital IQR Program final submission deadline to submit their quarterly data to NHSN. After the final Hospital IQR Program submission deadline has occurred for each calendar quarter of CY 2013, for FY 2015 quarters, CMS will obtain the hospital-specific calculations that have been generated by the NHSN for the Hospital IQR Program.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28052), we proposed to continue this policy, with the two exceptions discussed below, for the FY 2015 payment determination and subsequent years.

The HAI measures that will be included in the FY 2015 payment determination are included in the following chart:

Topic	FY 2015 Payment determination: Hospital associated infection measures (CDC/NHSN)
	Central Line Associated Blood Stream Infection. Surgical Site Infection. Catheter Associated Urinary Tract Infection. MRSA Bacterimia. Clostridium difficile. Healthcare Provider Influenza Vaccination.

We realize that some hospitals may not have locations that meet the NHSN criteria for CLABSI or CAUTI reporting, for example, when a hospital has no ICUs. We proposed to provide an exception for the CLABSI and CAUTI measures for hospitals that do not have an ICU, reducing the burden associated with reporting to NHSN. In addition, we recognize that some facilities may perform so few procedures requiring surveillance under the Surgical Site Infection (SSI) measure that the data may not be meaningful for *Hospital Compare* or sufficiently reliable to be utilized for payment determination.

We proposed to provide an exception for these hospitals from the reporting requirement in any given year if the hospital performed fewer than a combined total of 10 colon and abdominal hysterectomy procedures in the calendar year prior to the reporting year. For example, a hospital that performed only 2 colon surgeries and 4 abdominal hysterectomies in 2012 would not be required to report the SSI measure in 2014. We proposed to provide hospitals with a single HAI exception form, to be used for seeking an exception for any of the CLABSI, CAUTI and SSI measures, which will be available on QualityNet. We invited public comment on this proposal.

Comment: Several commenters supported the CMS proposal to provide an exception from NHSN reporting for hospitals without ICU locations or that perform a combined total of 10 or fewer colon and abdominal hysterectomy procedures.

Response: We thank these commenters for their support.

Comment: One commenter suggested that a combined total of 25 colon and abdominal hysterectomy procedures may be more appropriate.

Response: We proposed to exempt hospitals performing 10 or fewer colon or abdominal hysterectomy procedures because we believe that facilities performing this number of procedures may not have data for the Surgical Site Infection (SSI) measure that is sufficiently meaningful for a measure score to be displayed on *Hospital Compare* for this measure. However, we believe that setting the minimum number of procedures as low as is possible for SSI is essential to ensuring the availability of the most data possible for *Hospital Compare* reporting for this critical HAI measure. We thank the commenter for the suggestion and will re-evaluate this policy when more data are available.

After consideration of the public comments we received, we are finalizing the proposed exception process to provide hospitals with a single HAI exception form, to be used for seeking an exception for any of the CLABSI, CAUTI and SSI measures as defined above.

6. Supplements to the Chart Validation Process for the Hospital IQR Program for the FY 2015 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28053 through 28059), for the FY 2015 payment determination and subsequent years, we proposed to continue using, with some modifications, the validation requirements and methods we adopted in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50227 through 50229) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648). The modifications we proposed, explained in detail below, are as follows: (a) Using separate validation approaches for chart-abstracted clinical process of care and HAI measures; (b) changing the number of hospitals included in the base annual validation random sample; and (c) using targeted selection of supplemental hospitals to be added to the base sample. As described below, these proposals are intended to strengthen the Hospital IQR Program by validating a larger set of measures, increasing opportunities to detect poor reporting through different approaches to targeting and scoring, and increasing the rigor associated with our validation process, all while ensuring that the

wider scope and greater rigor only modestly increases the burden of validation activities on hospitals relative to prior years. We invited public comment on each of these proposals.

a. Separate Validation Approaches for Chart-Abstracted Clinical Process of Care and Healthcare Associated Infection (HAI) Measures

(1) Background and Rationale

We finalized reporting to the Hospital IQR Program of 25 chart-abstracted measures in 7 topic areas: Acute myocardial infarction (AMI); heart failure (HF); pneumonia (PN); surgical care improvement project (SCIP); emergency department throughput (ED); immunization (IMM); and HAIs for the FY 2014 payment determination and subsequent years in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51628 through 51629). In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28053), for the FY 2015 payment determination and subsequent years, we proposed to continue validating the chart-abstracted clinical process of care measures with the exception of the SCP–VTE–1 measure, which we proposed for removal from the Hospital IQR Program starting with the FY 2015 payment determination. We also proposed to continue validating the one HAI measure—CLABSI—that we finalized for validation in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51646). We also proposed to validate two additional HAI measures, catheter-associated urinary tract infection (CAUTI) and surgical site infection (SSI), which were finalized for inclusion in the Hospital IQR Program for the FY 2014 payment determination and subsequent years in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51628 through 61629). We proposed to add these two measures to those we validate so that we can ensure data reliability on all chart-abstracted measures on which hospitals will have been reporting data under the Hospital IQR Program for at least one year prior to the FY 2015 payment determination.

The inclusion of the three chart-abstracted HAI measures—CLABSI, CAUTI, and SSI—in the Hospital IQR Program reflects HHS' priority to increase patient safety by preventing HAIs. As finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51645), the mechanism for reporting HAI measures is different from the mechanism for reporting on the chart-abstracted clinical process of care measure sets (AMI, ED, IMM, HF, PN, SCIP). In addition, the infection events for which hospitals would report on the HAI measures occur rarely relative to the events for which hospitals would report on the clinical process of care measure sets. We cannot report a single number describing the national incidence for these three HAIs collectively or individually because infection rates vary by the type of hospital, their patient populations, device utilization rates, and performance of different types of surgeries.[96] However, we know that these events are sufficiently rare that if we did not find a way to target records with a higher probability of including an HAI, many hospitals would have to submit virtually all records per quarter to effectively validate the HAI measure set. For these reasons, we proposed, and we describe below in section VIII.A.6.a.(3) of this preamble to separate the approaches for targeting and sampling of records for HAI validation from the approaches finalized for validation of the chart-abstracted clinical process of care measure sets in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51647 through 51648), and summarized in VIII.A.6.a.(2) of this preamble, and we proposed to calculate separate scores for the group of clinical process of care measure sets and the HAI measure set as described in VIII.A.6.a.(4) of this preamble.

Comment: Several commenters expressed general support for the validation proposal. Many commenters acknowledged that validation of the chart-abstracted clinical process of care and HAI measures should be separated. In fact, many commenters suggested that CDC should manage HAI validation efforts because of its responsibility for defining and maintaining the NHSN system. Others encouraged CMS ''to work closely with NHSN in its validation development.''

Response: We appreciate these comments, and agree that CDC is responsible for defining and maintaining the NHSN system and is an important partner in validating HAI measures. However, we wish to clarify that validation of Hospital IQR Program data is our responsibility because the authority to perform this function is vested in us by statute. We also wish to clarify that QIO contractor regulatory authority (42 CFR 476.78(c)) is used to require hospitals to provide copies of medical record documentation. This regulatory authority is critical to ensuring complete submission of hospital documentation for validated hospitals. CDC is unable to use this same regulatory authority to gain access to records. Moreover, by retaining control over the HAI validation process, we are also able to reduce burden on hospitals by only requesting a record once in the event that a record is sampled for validation of both clinical process of care and HAI measure sets. We administer the Hospital IQR clinical process of care measure collection and validation without any CDC direct role, so CDC does not have any access to clinical process of care measure records submitted for validation. Accordingly, if CDC had sole responsibility for validating HAI measures, hospitals could potentially have to submit the same records twice for both clinical process of care and HAI measures. For all of these reasons, we do not agree that CDC should manage the Hospital IQR Program HAI validation process.

We emphasize that we have collaborated closely with CDC on all aspects of HAI reporting, including last year's final rule for CLABSI validation, the positive blood culture template distributed on QualityNet at: *http://www.qualitynet.org*, the instructions for CDAC abstractors performing validation, and this year's proposal for HAI validation.

In recognition that the HAI and clinical process of care measures are collected through different data collection systems, and after consideration of the public comments we received, we are finalizing our proposal for the FY 2015 payment determination and subsequent years to separate the approaches for HAI validation from the approaches finalized for validation of the chart-abstracted clinical process of care measure sets, with one exception. We will not require hospitals to receive separate passing scores on both clinical process of care and HAI measures. This policy is described further in response to comments in section VIII.A.6.a.(4) of this preamble.

(2) Selection and Sampling of Clinical Process of Care Measures for Validation

The approach to selection and sampling of clinical process of care measure sets for validation was finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648) for the 2014 payment determination and subsequent years. These measures and measure sets are shown in the table below.

[96] Dudeck MA, Horan TC, Peterson KD, *et al.* National Healthcare Safety Network (NHSN) Report, data summary for 2010, device-associated module. Am J Infect Control. 2011 Dec;39(10):798–816. Edwards JR, Peterson KD, Mu Y, *et al.* National Healthcare Safety Network (NHSN) report: Data summary for 2006 through 2008, issued December 2009. Am J Infect Control 2009 Dec; 37:783–805.

HOSPITAL INPATIENT QUALITY REPORTING (IQR) PROGRAM CHART-ABSTRACTED CLINICAL PROCESS OF CARE MEASURES TO BE VALIDATED FOR THE FY 2014 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Topic	Measures
Acute Myocardial Infarction (AMI) Measures.	• AMI–2 Aspirin prescribed at discharge. • AMI–7a Fibrinolytic (thrombolytic) agent received within 30 minutes of hospital arrival. • AMI–8a Timing of Receipt of Primary Percutaneous Coronary Intervention (PCI). • AMI–10 Statin Prescribed at Discharge.
Heart Failure (HF) Measures	• HF–1 Discharge instructions. • HF–2 Evaluation of left ventricular systolic function. • HF–3 Angiotensin Converting Enzyme Inhibitor (ACE–I) or Angiotensin II Receptor Blocker (ARB) for left ventricular systolic dysfunction.
Pneumonia (PN) Measures	• PN–3b Blood culture performed in the emergency department prior to first antibiotic received in hospital. • PN–6 Appropriate initial antibiotic selection.
Surgical Care Improvement Project (SCIP) Measures.	• SCIP INF–1 Prophylactic antibiotic received within 1 hour prior to surgical incision. • SCIP INF–2 Prophylactic antibiotic selection for surgical patients. • SCIP INF–3 Prophylactic antibiotics discontinued within 24 hours after surgery end time (48 hours for cardiac surgery). • SCIP INF–4 Cardiac surgery patients with controlled 6AM postoperative serum glucose. • SCIP INF–9 Postoperative urinary catheter removal on postoperative day 1 or 2 with day of surgery being day zero. • SCIP INF–10 Surgery patients with perioperative temperature management. • SCIP Cardiovascular-2 Surgery Patients on a Beta Blocker prior to arrival who received a Beta Blocker during the perioperative period. • SCIP INF–VTE–1 Surgery patients with recommended Venous Thromboembolism (VTE) prophylaxis ordered.* • SCIP–VTE–2 Surgery patients who received appropriate VTE prophylaxis within 24 hours pre/post surgery.
Emergency Department Throughput (ED) Measures.	• ED–1 Median time from emergency department arrival to time of departure from the emergency room for patients admitted to the hospital. • ED–2 Median time from admit decision to time of departure from the emergency department for emergency department patients admitted to the inpatient status.
Prevention: Global Immunization (IMM) Measures.	• Immunization for Influenza. • Immunization for Pneumonia.

*We are removing this measure from the Hospital IQR Program starting with the FY 2015 payment determination.

We describe the validation approach for these measures, which was finalized in FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648), for informational purposes only. A total of 15 records will be selected per quarter for the chart-abstracted clinical process of care measures. Three records per quarter will be sampled from among all records submitted to the Warehouse in each of four groups defined as part of the AMI, HF, PN, and SCIP measure sets. In addition, three records per quarter will be sampled from among the remaining submissions to the Warehouse and will be validated for the ED and IMM measure sets. CMS will also abstract data regarding the ED and IMM measure sets from records submitted for the AMI, HF, PN, and SCIP measure sets.

We finalized our proposal in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51648) to abstract ED and IMM data from all cases selected from other measure sets (AMI, HF, PN, SCIP, and CLABSI). In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28054), for the FY 2015 payment determination and subsequent years, we proposed to discontinue abstracting ED and IMM data from cases selected for the CLABSI measure. We proposed this change in order to be consistent with the policy described in section VIII.A.6.a.(1) of this preamble to calculate separate scores for HAI and chart-abstracted clinical process of care measure sets.

Comment: One commenter requested clarification as to whether a hospital is required to submit ED/IMM data on all AMI, HF, PN, and SCIP cases submitted to the warehouse to support the process wherein CDAC will abstract ED and IMM measures from all AMI, HF, PN, and SCIP cases selected for validation. The commenter further stated that ''the sampling methodology described in the specifications manual does not work if a hospital does 100 percent review of AMI, HF, PN, and SCIP cases on a weekly basis, but samples the global population at the end of the month, when all possible cases in the population are available for sampling.''

Response: We welcome the opportunity to clarify the sampling process for ED/IMM. The CDAC process to abstract ED and IMM data from all cases sampled for AMI, HF, PN, and SCIP validation does not necessitate that hospitals themselves submit ED and IMM data from *all* of their AMI, HF, PN, and SCIP cases in the Hospital IQR Program, only a sample of them. Operational guidance on how to sample records for submission of Hospital IQR data is provided in our Hospital IQR Program Specifications Manual on QualityNet at *http://www.qualitynet.org.* The Specifications Manual calls for a representative random sample of the global population; the AMI, HF, PN, and SCIP populations are subsets of this global population. Therefore, using random sampling methodology to identify the global population sample will also randomly sample AMI, HF, PN, and SCIP cases for which hospitals will provide ED and IMM data. The validation sample of AMI, HF, PN, and SCIP cases will not perfectly overlap with those AMI, HF, PN, and SCIP cases for which ED and IMM data are submitted. However, the ED/IMM data submitted and validated will be representative of the underlying global population, which is what matters for the global measures (ED/IMM). We anticipate that the validation approach will support adequate reliability assessment of the global measures. We intend to provide additional training on monthly sampling during 2012.

While we did not receive any comments specifically addressing our

proposal to discontinue abstracting ED and IMM data from records sampled for CLABSI, we did receive numerous comments supporting our proposal to separate the validation processes for the clinical process of care and HAI measure sets, which this proposal was intended to support. Accordingly, we are finalizing our proposal to discontinue abstraction of ED and IMM data from records sampled for CLABSI.

(3) Selection and Sampling of HAI Measures for Validation

As explained in section VIII.A.6.a.(1) of the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28053), we proposed separate selection, sampling, and validation scoring for HAI measures. The HAI measures we proposed to validate for the FY 2015 payment determination and subsequent years are CLABSI, CAUTI, and SSI (77 FR 28054).

HAI MEASURES IN THE HOSPITAL INPATIENT QUALITY REPORTING (IQR) PROGRAM TO BE VALIDATED FOR THE FY 2015 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Measures Continued for Validation for the FY 2014 Payment Determination
- Central line-associated blood stream infection (CLABSI) among intensive care unit (ICU) patients.

Additional Measures Proposed for Validation for the 2015 Payment Determination.
- Surgical Site Infection (SSI) among patients with procedures for colon surgery or abdominal hysterectomy.
- Catheter-associated urinary tract infection (CAUTI) among ICU patients.

Because the events reported in the HAI measure set occur rarely, they require a targeted approach to validation. For the FY 2015 payment determination and subsequent years, we proposed to validate these measures by identifying records that are ''candidate HAI events,'' which we define below. We would construct three separate lists of candidate events, one for each HAI measure. The proposed process to construct these lists is detailed further below. Each listing of candidate events will include both actual HAI events as well as many non-events. The purpose in creating these listings would be to identify records that are more likely to contain HAI events than CMS could obtain through a simple random sample of hospital discharges each quarter. In each case, this proposed process would minimize burden to hospitals while enriching the validation sample by targeting candidate events. As described later in this section, a combined list of candidate HAI events would be created from the three separate candidate HAI lists (for CLABSI, CAUTI, and SSI). The final list would be used to generate a random sample of medical records to be reviewed and evaluated for the presence or absence of one or more of the HAI events. We describe the proposed sample size later in this section and describe the scoring process in section VIII.A.6.a.(4) of this preamble.

Comment: Two commenters recommended that CMS should add no more than one new HAI measure to the validation process in a single year.

Response: We disagree with this recommendation. In response to our proposals regarding the Hospital VBP Program in section VIII.C.3.b. of the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28079), many commenters emphasized the need for rigorous validation of HAI measures before their inclusion in the Hospital VBP Program. Our validation efforts are designed to ensure accurate baseline data for potential future Hospital VBP Program years.

After consideration of the public comments we received, we are finalizing our proposal to validate the CLABSI, CAUTI, and SSI measures by producing a list of candidate HAI events as detailed below in this section.

(i) Selecting Cases for CLABSI and CAUTI Validation

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28055), we proposed to discontinue the practice finalized in FY 2012 IPPS/LTCH final rule (76 FR 51648) of abstracting CLABSI data from the records selected for the chart-abstracted clinical process of care measure sets (AMI, ED/IMM, HF, PN, SCIP). We proposed this change in order to be consistent with the policy described in section VIII.A.6.a.(1) of this preamble to calculate separate scores for HAI and chart-abstracted clinical process of care measure sets. We invited comments on this proposal.

Comment: A few commenters supported our proposal to discontinue abstracting CLABSI data from the clinical process of care measures.

Response: We agree that abstracting CLABSI data from the clinical process of care measures should be discontinued, as proposed.

After consideration of the public comments we received, we are finalizing our proposal to discontinue abstracting CLABSI data from records submitted for the clinical process of care measure sets for the FY 2015 payment determination and future years.

We finalized a two-phase process for identifying and constructing lists of candidate CLABSI events in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648). This process is summarized for the readers' information. In the first phase, each sampled hospital quarterly provides CMS with listings of positive blood cultures drawn from ICU patients. The listings include ''all blood cultures positive for infection status taken from ICU patients conducting CLABSI surveillance [97] during the discharge quarter'' (76 FR 51646). These listings are annotated to identify each ICU patient on this list who had a central venous catheter (CVC). The listings are then reviewed by a CMS contractor who produces a list of unique episodes of care for ICU patients with a CVC and that include either at least one positive blood culture for a known pathogen, or at least two positive blood cultures for the same common commensal. A blood culture which is positive for a common commensal may reflect a contaminated sample. Therefore, when the only positive blood culture result is for a common commensal, the second culture bearing the same result must be drawn from the patient within 48 hours of the first; this would confirm that the first positive common commensal result is not a consequence of contamination. A list of common commensals is provided by CDC.[98]

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28055), we proposed to modify this process for FY 2015 and subsequent years by requiring the Medicare health insurance claim (HIC) number to be added to the positive blood culture list if a patient has one. As explained further below, we proposed this addition specifically so that we may identify candidate CLABSIs that we also identify as candidate SSIs. Because the candidate SSIs would be identified through claims, the HIC number is needed to match patients from the candidate CLABSI list with those from the candidate SSI list. To

[97] *http://www.cdc.gov/nhsn/PDFs/FINAL-ACH-CLABSI-Guidance.pdf.*

[98] *http://www.cdc.gov/nhsn/XLS/Common-Skin-Contaminant-List-June-2011.xlsx.*

protect this sensitive information, we proposed that positive blood culture lists be submitted through the Secure Data Exchange on the QualityNet Web site. We invited public comment on each of these proposed modifications to the identification of candidate CLABSI events.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 20855) for the FY 2015 payment determination and subsequent years, we proposed to adapt the process finalized to identify candidate CLABSI events in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648) to identify candidate CAUTI events. In the first stage of this process, a CMS contractor would request a listing of positive urine cultures among ICU patients from the hospitals targeted for validation. The culture list would indicate the name of each pathogen detected and the number of colony forming units per ml. For the same reasons and following the same processes as those explained for CLABSI above, we proposed to require the hospital to report the Medicare HIC number for Medicare patients included on this list.

In the second stage of this process, the CMS contractor would apply NHSN criteria to eliminate those urine cultures that are not consistent with the definition of an ICU-associated CAUTI. The contractor would then remove duplicates from the same patient to produce a list which would include only one entry per ICU patient. Our intent is to target a set of patient discharges with a higher probability of having a CAUTI event than one could obtain from a simple random sample of patient discharges. We invited public comments on this proposal.

Comment: Numerous commenters supported rigorous HAI validation and separating the HAI validation process from the validation process for chart-abstracted measures. Commenters emphasized the value of validating CLABSI before including it in the Hospital VBP Program, and the importance of validating both CLABSI and CAUTI before expanding the specifications for these measures for the Hospital IQR Program beyond the ICU setting. In addition, several commenters specifically supported the 'individualized approach' to sampling each HAI included in validation.

Response: We agree that HAI validation is important and that a rigorous and individualized approach to HAI validation is needed, and have sought to take such an approach through our proposal.

Comment: Many commenters opposed both the current CLABSI process and CMS' specific proposals to expand it to CAUTI due to the level of burden. Some commenters opposed any data submission beyond submission to the NHSN. One commenter stated that CDC's process was ''strict enough.''

Response: We appreciate the many concerns related to the burden of HAI validation. We disagree with commenters who feel that no burden is appropriate above and beyond that associated with NHSN submission. Although the NHSN data entry process does provide users with feedback regarding consistency of information to minimize data entry errors, this process cannot replace the assessment of reliability made by comparing the hospital's submission with that of an independent abstraction.

Moreover, HAI reduction is a HHS priority, quality reporting is an important component of HAI reduction, and quality reporting is not meaningful if data quality have not been evaluated and shown to be reliable. Therefore, HAI validation is needed to support HAI reduction. We also note that section 1886(B)(3)(b)(viii)(XI) of the Act requires the Secretary to establish a process to validate Hospital IQR measures as appropriate. We believe that this proposal meets this statutory requirement and ensures the accuracy of publicly reported data for the HAI measures. Therefore, although we continuously work to minimize burden associated with validation under the Hospital IQR Program, we believe that the value of validation for these measures justifies some added burden.

Comment: A few commenters explained that burden arises from the requirement for submission of information from multiple data streams, which are difficult for hospitals to link, or that may require a manual process in some hospitals. One commenter specifically referenced the difficulty in correlating the dates that positive blood cultures are drawn with the dates of the patients' stays in the ICU to ensure that the positive blood cultures were obtained during the pertinent time period for the CLABSI measure during the ICU stay or within 48 hours thereafter.

Response: We understand that some hospitals' systems might not be set up to handle the current CLABSI and proposed CAUTI processes efficiently at this time. However, under the current process some hospitals already successfully submitted the required data for CLABSI validation an entire month before the first submission deadline. As hospitals become more familiar with our requirements for these validation activities, we anticipate that they will have better capabilities to support the required validation.

We recognize, however, as one commenter noted, that identifying the positive blood cultures that align with the correct timeframes for the CLABSI measure can be particularly challenging. Accordingly, in response to this comment, we are reducing the burden on hospitals associated with validating CLABSI by redefining ''positive blood cultures among ICU patients'' for purposes of validating CLABSI. According to NHSN specifications, ICU units are supposed to conduct surveillance on positive blood cultures attributable to an ICU patient if they are drawn within 48 hours of discharge or transfer from the ICU.[99] Therefore, CMS has previously interpreted the universe of ''positive blood cultures among ICU patients'' for purposes of CLABSI validation to include those cultures drawn within 48 hours of transfer from the ICU.[100] However, as the commenter noted, identifying the positive blood cultures that align with the correct timeframes may be especially challenging because finding those cultures can require that hospitals access different systems. If hospitals are not required to obtain blood cultures taken within the 48 hour period after discharge or transfer from the ICU, some hospitals may be able to use the patient's location at the time of the blood draw to identify positive blood cultures for ICU patients. For these hospitals, we believe using this location to identify the appropriate blood cultures and not having to access different systems will alleviate the burden associated with this process.

Therefore, we are redefining ''positive blood culture'' for purposes of CLABSI validation to include only those blood cultures drawn from ICU patients *during their actual ICU stay* during the discharge quarter for the FY 2014 payment determination and future years. Consistent with this change, hospitals would only be required to report on the positive blood culture list cultures identified during the ICU stay even if this means that our validation support contractor is unable to confirm, and therefore cannot include in the validation sample, a common commensal with a second culture that was drawn within 48 hours after ICU discharge. We recognize that this means excluding from validation sampling a limited number of cases that must be

[99] *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf.*

[100] Hospital Inpatient Quality Reporting (IQR) Program Quick Reference Guide: Central Line-Associated Bloodstream Infection (CLABSI), *www.qualitynet.org http://www.qualitynet.org.*

reported for the CLABSI measure. We believe, however, that the potential reduced burden for hospitals more than compensates for the potential inability to validate what we believe will be a limited number of CLABSI cases. We are adopting this change to the definition of ''positive blood culture'' beginning with the FY 2014 payment determination. However, for the FY 2014 payment determination only we will accept as submitted all templates either including or excluding positive blood cultures drawn within 48 hours of ICU discharge or transfer, and will not penalize hospitals during scoring for including cases drawn within 48 hours of ICU discharge. For the FY 2014 payment determination only, we will score these records but will not penalize hospitals if records submitted from this time frame do not match records in NHSN. Beginning with the FY 2015 payment determination, we will require hospitals to submit records consistent with the new definition of ''positive blood culture.''

One other way that we are reducing burden now is, as discussed further below, by reducing the base annual random sample size by 50 percent, which reduces total burden nationally even if burden may be somewhat higher for hospitals selected for validation in a given year.

We will also work with CDC to consider proposing the inclusion of the HIC number as a required field for Hospital IQR Program reporting of NHSN measures in the future. This may further alleviate some of the burden associated with the demographic data elements that we currently require hospitals to submit for CLABSI validation and that will be required as part of CAUTI validation. These elements are necessary to link records selected for CLABSI and CAUTI validation with records included in the NHSN database. Hospitals would no longer be required to include these elements with the other information that they submit for validation of CLABSI and CAUTI, however, if Medicare beneficiaries' records could be identified in NHSN through the HIC number provided when hospitals report the CLABSI and CAUTI measures.

Comment: Many commenters viewed the proposed HAI validation efforts as duplicative in States that already have validation, but supported a more rigorous process in States that have no validation process. Some commenters acknowledged the need for national validation because State-based CLABSI validation efforts are not standardized.

Response: We understand that some hospitals in States with their own rigorous validation methodologies will experience multiple validation activities, and that each activity has burden associated with it. However, as many commenters noted, State-based efforts are not standardized at this time, and therefore, we believe it is still very important to validate hospitals in these States. In addition, we note that section 1886(B)(3)(b)(viii)(XI) of the Act requires us to establish a process to validate Hospital IQR Program measures that includes the auditing of a number of randomly selected hospitals sufficient to ensure validity of the program as a whole. It is our responsibility to ensure that, through our validation process, we ensure the validity of the Hospital IQR Program.

Comment: One commenter indicated that only HAIs identified in NHSN should be validated.

Response: We do not agree that validation should be limited to events detected in NHSN. Evaluation of CLABSI and CAUTI events not reported to the NHSN is an important component of validation because of the rarity of these infection events relative to events to which the clinical process of care measures apply. If validation were restricted to events already included in the NHSN, we would have no capacity to evaluate under-reporting. Moreover, evaluation of unreported infection events is an important component of State validation efforts, which are coordinated by CDC. As noted by many commenters, to have a less rigorous process nationally would disadvantage hospitals in those States that have more rigorous infection control processes.

Comment: Some commenters specifically opposed the proposed additions of the data elements ''colony forming units (CFUs) per ml'' for CAUTI and ''HIC number'' for both CLABSI and CAUTI.

Response: Based on these comments, to reduce the burden associated with the validation process for CAUTI, we will not require hospitals to submit the ''colony forming units (CFUs) per ml'' data element for this measure. To eliminate this data element, we will restrict the proposed requirement for 'all positive urine cultures among ICU patients' to just those positive urine cultures with concentrations of greater than or equal to 10^3 CFUs/ml.

We believe that the inclusion of the HIC number is essential. As explained in the proposed rule (77 FR 28055), the HIC number is needed to align sampling for CLABSI and CAUTI with the proposed SSI validation process described further below. Moreover, as discussed above in this section, requiring hospitals to submit HIC numbers as part of validation may in the long run support a streamlined validation process by making it easier to link records selected for validation with records in the NHSN database.

Comment: Several commenters expressed opposition to the proposed CAUTI process because it was not sufficiently detailed to be evaluated, but stated that if we were proposing to use the same process as the one we adopted for CLABSI, they could not support it because of the burden. Another commenter stated more generally that the proposed HAI validation methodology was 'not well defined.''

Response: As we explained in the proposal, the methodology for validating CAUTI is an adaptation of the methodology we will use to validate CLABSI. The template for CLABSI is available at *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1228760487021*. The CAUTI process we proposed differed from the CLABSI process in two ways. First, positive urine cultures (defined $>=10^3$ colony forming units (CFUs) per ml) were to be reported instead of positive blood cultures. Second, the current process for CLABSI requires hospitals to annotate which patients had central lines, but we did not propose to require hospitals to annotate which patients had urinary catheters for CAUTI. By not requiring identification of patients with urinary catheters, the resulting process proposed for CAUTI is simpler than the process for CLABSI.

In addition, because we have proposed to utilize the same validation process for CAUTI that we use for CLABSI, we are making the same change to the definition of ''positive urine culture'' for purposes of validating the CAUTI measure that we made to the definition of ''positive blood culture'' for purposes of validating CLABSI. In particular, for purposes of validating the CAUTI measure for FY 2015 and subsequent years, we will not require hospitals to submit positive urine cultures drawn within 48 hours after discharge or transfer from the ICU for the same reasons we stated above for changing the definition of ''positive blood culture'' for CLABSI.

Comment: One commenter recommended pilot testing of CLABSI and CAUTI processes prior to finalization because so many steps are involved in validation. A few commenters indicated that HAI validation should not be expanded beyond CLABSI until hospitals had more experience with CLABSI.

Response: We do not agree that the CLABSI and CAUTI processes must be

piloted further before a process for validation can be finalized. The process proposed for CLABSI validation for the FY 2015 and future years' payment determinations is the same as that finalized for the FY 2014 payment determination with only the addition of HIC number.

CMS and hospitals have already begun to gain the kinds of experience that they might obtain from a pilot through the process that was finalized for the FY 2014 payment determination in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51648) for CLABSI. Some hospitals have already successfully submitted positive blood culture templates, and as reflected above in this section, we are already using our experience to reduce burden by eliminating the validation requirement to include positive blood cultures for patients discharged from the ICU within the past 48 hours. Moreover, because the validation process for CAUTI will be so similar to that for CLABSI, we believe that hospitals that have prepared themselves for CLABSI validation are prepared to handle the CAUTI validation process as well.

Comment: Some commenters observed that the proposed processes for CLABSI and CAUTI do not include validation of denominator data. These commenters described this limitation as ''a significant flaw'' because it ''allows for improper reporting by over-reporting denominators.'' These commenters argued that CLABSI cannot be included in the Hospital VBP Program until the validation process includes validation of the denominator, and similarly that the Hospital IQR Program should not expand the CLABSI and CAUTI measures to include non-ICU settings until the validation process includes validation of a denominator.

Response: We recognize that not validating denominator data is a limitation of the proposed CLABSI and CAUTI processes, but we disagree that it is such a significant flaw that validation is meaningless without it. Attribution of bloodstream and urinary tract infections to central lines and urinary catheters, respectively, is an extremely complex process that requires a significant amount of clinical judgment. In contrast, recognizing and reporting the number of device days associated with a particular patient is considerably easier. Therefore, hospitals need more detailed assessment and feedback on the process of numerator reporting than they need on denominator reporting. In addition, CLABSI and CAUTI are both very rare events. Therefore, an error made in reporting even one or two infections has the potential to greatly influence the total rate reported. In contrast, because central line and urinary catheter days are much more numerous, a misstatement of a few line [or catheter?] days makes a much smaller difference in terms of the overall accuracy of the rates reported for these measures. For both of these reasons, validation of numerator data is much more crucial to overall validation than validation of denominator data. In light of the many comments regarding burden associated with validating numerator data for CLABSI and CAUTI, we disagree that it would be appropriate to add any new burden at this time by adding denominator validation.

Comment: One commenter indicated that CMS should require the CMS auditors that review NHSN data be qualified with certification and proof of competency in the use of the NHSN module. Two other commenters ''hoped that CMS contractors will go through the same training as the field and comment to CMS on their experience because NHSN contractor feedback is critical to improvement processes.''

Response: We agree with the observation that personnel conducting HAI validation need specialized training in the use of NHSN. All CMS validation abstraction will be conducted by the employees of CMS' validation contractor, who will receive training similar to the training hospitals receive from CDC. In addition, some of our employees plan to attend this training and will monitor contractor feedback closely.

After consideration of the public comments we received, we are finalizing the proposals to identify candidate CLABSI as proposed. The differences between the policy we are finalizing and the policy finalized for the FY 2014 payment determination and subsequent years (76 FR 51645–51648) are the requirements that hospitals include the HIC number as a data element on the positive blood culture template [100] and that hospitals submit the blood culture template through the Secure Data Exchange on the QualityNet Web site, as well as the redefinition of ''positive blood culture'' for purposes of CLABSI validation to include only those cultures obtained during a patient's stay in the ICU.

In addition, for the FY 2015 payment determination and future years, we are finalizing the process to identify candidate CAUTI as proposed, including HIC number, except that we will restrict the list of positive urine cultures to those with >= 10^3 CFU/ml, and will not require hospitals to provide the concentration of CFUs in the urine on the urine culture template we provide. Moreover, consistent with the change we are making to the definition of ''positive blood culture'' for CLABSI validation, we are redefining positive urine cultures from ICU patients for CAUTI validation to include only those cultures sampled during the patient's actual ICU stay during the discharge quarter being validated, and not those cultures sampled during the 48 hour period following discharge from the ICU.

We will also consider proposing in future rulemaking that hospitals participating in the Hospital IQR Program must report the HIC number to their NHSN for CLABSI, CAUTI, SSI, MRSA, and Clostridium Difficile infection events. We believe that this information would reduce burden by allowing us to link NHSN information to demographic and clinical information on Medicare claims. We believe that this linkage would reduce burden to hospitals by reducing the number of data elements requested in blood and urine culture lists used in our validation process, which we could obtain directly from NHSN.

(ii) Targeting SSI for Validation

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28055–28056), the final HAI measure we proposed for targeted validation is SSI. Consistent with Hospital IQR Program reporting requirements for this measure, we proposed that validation will target SSIs among patients with colon surgeries and abdominal hysterectomy procedures.[101] We proposed a process for identifying candidate SSIs that is different from that which we proposed for candidate CLABSI and CAUTI both because post-discharge follow-up is so critical to proper ascertainment and because SSIs are reported more consistently in claims data than CLABSI and CAUTI. Thus, claims data provide a resource for selecting candidate events for SSI using a methodology which limits burden to hospitals.

Accordingly, we proposed to select candidate events from among Medicare FFS claims for patients who have had colon surgeries or abdominal hysterectomies as defined by NHSN.[5] For each Medicare FFS patient who had a relevant surgery in the period under validation, a CMS contractor would review the index claim (that is, the one denoting the surgery) and all subsequent readmissions to the index hospital within a 30 day post-discharge period. To identify ''candidate SSI events,'' we

[101] *http://www.cdc.gov/nhsn/PDFs/FINAL-ACH-SSI-Guidance.pdf.*

would look specifically for discharge diagnoses on the index claim and all inpatient claims in the 30 days post-discharge that might indicate infection. Examples of such diagnoses include ''post-operative shock'' (ICD–9–CM: 998.0), ''post-operative wound disruption (ICD–9–CM: 998.3), and postoperative infection (ICD–9–CM: 998.5). A description of our general approach, and a list of ICD–9–CM codes which we proposed to use to identify applicable candidate SSIs is included in Appendix 1 of ''Platt R, Kleinman K, Thompson K, *et al.* Using automated health plan data to assess infection risk from coronary artery bypass surgery. Emerg Infect Dis. 2002 Dec;8(12):1433–41,'' which may be accessed online at *http://www.cdc.gov/eid/content/8/12/pdfs/v8-n12.pdf.*[102]

Comment: Several commenters requested that the addition of SSI not add any new burden to the HAI validation process.

Response: The proposed process to target candidate SSI cases for validation requires only that hospitals submit HIC numbers for CLABSI and CAUTI. We will compile the list of candidate SSI events using claims data, and then we will be able to remove duplicates from the three lists of candidate HAI events using the HIC numbers that are reported for CLABSI and CAUTI. As discussed above, submission of HIC numbers may ultimately provide an opportunity to streamline CLABSI and CAUTI validation efforts. Therefore, we believe that the proposed sampling process introduces little new burden to hospitals.

Comment: Several commenters indicated that all of the denominator data necessary to validate SSI is available from the NHSN database, such that this measure could be validated ''in the customary way,'' which we interpret to mean using the same process as the clinical process of care measures.

Response: We understand that the SSI data differ from CLABSI and CAUTI in that it would be possible to draw a sample of data for patients who had the colon and abdominal hysterectomy procedures from within the NHSN database, and that therefore it would be possible to validate SSI reporting in the ''customary way,'' or the same way we validate chart-abstracted measures. However, like CLABSI and CAUTI, SSI is a rare event. Therefore, to effectively evaluate under-reporting, a sample rich in actual SSI events is needed. The ''customary sample'' from Medicare claims without using any targeting criteria would have a low yield of any actual SSI events (less than 6 percent for colon surgeries, less than 2 percent for abdominal hysterectomy surgeries),[103] and would therefore be ineffective in producing a sample rich in actual SSI events. We estimate that our proposal for identifying candidate SSIs for validation using targeted diagnosis and procedures codes for these procedures would generate a much richer yield (about 33 percent for colon and about 50 percent for abdominal hysterectomy).[104]

Comment: Two commenters objected to the proposal to introduce a process for SSI validation that differed from the process for CLABSI and CAUTI. These same commenters stated that CMS should only introduce one new validation process per year. In contrast, many commenters opposed making the SSI validation process the same as the proposed CLABSI and CAUTI validation processes.

Response: Although we appreciate the commenters' concerns about adding new processes, we also recognize that we must have a process to support validation of HAIs to ensure accuracy of hospital reported HAI quality data. Moreover, we agree with the many commenters who opposed making the SSI validation the same as the proposed CLABSI and CAUTI validation processes. Because the proposed process employs claims data and does not require submission of supplemental data other than the sampled records, we believe that the proposed process for SSI is less burdensome for hospitals than adopting a validation data collection process similar to the CLABSI or CAUTI process, which would impose an added burden by requiring hospitals to submit additional data such as culture results. We believe the process we proposed will validate SSI effectively while minimizing burden on hospitals.

Comment: A few commenters supported the SSI validation approach. One commenter expressed concern that the specific ICD–9 codes proposed to define candidate SSIs were not entirely appropriate for colon surgery and abdominal hysterectomy.

Response: We agree with the commenter who observed that it is possible to tailor the SSI process more specifically to the colon surgery and abdominal hysterectomy under surveillance. Since the release of the proposed rule, two new analyses have become available to inform our decision making process.[105,106] These analyses offer an improved evidence base focused more specifically on colon surgery and abdominal hysterectomy. Based on these studies and the commenter's concern, we have identified a set of ICD–9 diagnosis and procedure codes that more strategically target candidate SSIs for these two procedures.

Therefore, after consideration of the public comments we received, we are finalizing the proposal to identify ''candidate SSI events'' by using the process as proposed, except that instead of using the ICD–9 codes contained in the paper by Platt *et al.* (2002: referenced in text above), we will target Medicare claims data using the following set of ICD–9 codes:

ICD–9 Codes	Description
Abdominal Hysterectomy	
567.22	Peritoneal abscess.
682.2	Other cellulitis and abscess—Trunk.
998.31	Disruption of internal operation (surgical) wound.
998.32	Disruption of external operation (surgical) wound.

ICD–9 Codes	Description
998.51	Infected postoperative seroma.
998.59	Other postoperative infection.
Colon Surgery	
ICD–9 diagnoses:	
567.2	Peritonitis and retroperitoneal infections—other suppurative peritonitis.
567.21	Peritonitis (acute) generalized.
567.22	Peritoneal abscess.
567.29	Other suppurative peritonitis.
567.38	Other retroperitoneal abscess.
569.5	Abscess of intestine.
569.61	Infection of colostomy or enterostomy.
569.81	Fistula of intestine, excluding rectum and anus.
682.2	Other cellulitis and abscess—Trunk.
879.9	Open wound(s), (multiple) of unspecified site(s), complicated.
998.31	Disruption of internal (surgical) operation wound.
998.32	Disruption of external (surgical) operation wound.
998.51	Infected postoperative seroma.
998.59	Other postoperative infection.
998.6	Persistent postoperative fistula.
ICD–9 procedures:	
54.0	Incision of abdominal wall.
54.11	Exploratory laparotomy.
54.19	Other laparotomy.
86.04	Other incision with drainage of skin and subcutaneous tissue.
86.22	Excisional debridement of wound, infection, or burn.
86.28	Nonexcisional debridement of wound, infection, or burn.

Although diagnoses which identify candidate SSIs may also be identified during readmission to hospitals other than the index hospital, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28055) we proposed to exclude these candidate events for validation of SSI for the FY 2015 payment determination. We proposed this approach because we will be unable to distinguish between a candidate SSI that the index hospital determined was not an actual SSI because it did not meet properly applied NHSN case definitions, and an actual SSI that the index hospital failed to properly identify and document. Although records from the readmitting hospital may provide evidence as to the likelihood that a candidate SSI was an actual SSI, the index hospital may not have had access to this information. Therefore, if the index hospital does not report a candidate SSI event associated with a readmission to another hospital, and also does not document this event, we do not know what information, if any, the index hospital used to assess the candidate event.

This situation arises because although our regulation at 42 CFR 482.24 requires hospitals to maintain medical records that document HAI, it does not require hospitals to document that follow-up was performed. We understand that this represents a gap in our validation program for SSI, and solicited public comments on how we might fill this gap in the future.

Comment: Some commenters noted that hospitals rarely receive more than a phone call to document SSIs detected at readmission to hospitals other than their own, with no documentation in the medical record. Thee commenters requested clarification on CMS' intended approach to address this issue. Another commenter noted that there are other federal and State agencies actively working to identify standard practices for post-discharge surveillance and urged CMS to delay adoption of post-discharge surveillance methods until these groups are able to develop formal recommendations related to this specific issue. This commenter further suggested that CMS CoPs could be changed to incorporate post-discharge surveillance reporting once a preferred and valid methodology is identified.

Response: We thank the commenters for the information provided about the level of documentation available for SSI readmissions occurring other than at the index hospitals, and for providing the opportunity for us to clarify our plans regarding these readmissions. We will use claims data to assess how frequently this situation arises in hospitals sampled for validation. However, we do not intend to use our claims-based analysis of SSI readmissions to hospitals other than the index hospital for Hospital IQR validation-related payment determination at this time. We agree that it would be premature to develop validation procedures to address this situation. We believe that our best approach is to partner with other federal and State agencies interested in developing a valid methodology for post-discharge surveillance. We thank the commenters for the suggestion regarding using our CoP to require post-discharge surveillance and will consider this suggestion.

After consideration of the public comments we received, for the FY 2015 payment determination and future years we are finalizing as proposed our proposal to exclude from SSI validation cases identified during readmission to hospitals other than the index hospital.

(iii) Sample Size per Hospital for HAI Validation

After identifying the three separate sets of candidate events for CLABSI, CAUTI, and SSI, we will combine the lists and remove any duplicates for a given episode of care. Removing duplicates is a standard statistical practice which is important for the accuracy of the estimates.[107] Next, we proposed to draw a random sample of 12 candidate events per quarter from which to assess reliability of HAI reporting for the FY 2015 payment determination and subsequent years. Over four quarters, this would yield a sample size of 48 candidate events per year. Whenever a sample is used to estimate a statistic such as reliability for

[107] ''Duplicate listings'' in Kish L. *Survey Sampling*, John Wiley & Sons, New York: 1995, pp. 58–59.

the entire population of events, that estimate is said to be made with error, commonly referred to as the margin of error. For hospitals with 480 or more candidate HAI events each year, and assuming a relatively constant number of candidates per quarter, the annual sample size will be sufficient to estimate a score of 75 percent with a margin of error plus or minus 10 points with 90 percent confidence. We believe this is the smallest sample size that would be sufficient to identify hospitals that are reporting HAI data poorly and have 480 or more candidate events.

However, if there are fewer than 480 candidate events per year, the finite population correction applies, such that the margin of error will decrease as the total number of candidate events per year gets smaller.[108] Based on our analysis of CLABSI data previously reported under the Hospital IQR Program, estimating the relative occurrence of CLABSI, CAUTI, and SSI, and allowing for the fact that there may be many candidates for every confirmed HAI, we expect that most hospitals will have fewer than 480 candidate HAI events per year (or 120 per quarter), which will allow us to estimate a score of 75 percent for these hospitals with a margin of error even less than plus or minus 10 points with 90 percent confidence. In the event that a hospital has 12 or fewer candidate HAIs in a given quarter, it is still possible to produce accurate estimates of reliability. In quarters in which a hospital has 12 or fewer candidate HAI events, we proposed to select all candidates, which will allow us to measure reliability without any margin of error. These quarterly estimates will have no sampling error because we will not be drawing a sample, but rather will be using the entire population for that quarter. If a hospital has 12 or fewer cases in every quarter, we may estimate reliability of HAI reporting for the year without any margin of error. If a hospital has no candidate events in the year, we would not be able to estimate a reliability rate. Therefore, as discussed in section VIII.A.6.a.(4) of this preamble, we would not attempt to estimate an HAI score for hospitals with 0 cases. We invited public comment on these proposed sample sizes.

Comment: Some commenters stated that the sample size of 27 per quarter per hospital for validation, including 15 for the clinical process of care measures, which has not changed, and 12 for HAI measures, was excessive and diverted time which could be spent on quality improvement towards reporting and validation. One commenter requested clarification as to how increasing the sample size from 18 to 27 would reduce burden on hospitals.

Response: We did not mean to imply that increasing the quarterly sample size from 18 to 27 records would decrease burden for individual hospitals that participate in validation in a particular year. Instead, our proposal in section [insert reference] below to reduce the number of hospitals included in the targeted validation sample is intended to reduce the overall burden of our validation process because it will result in fewer hospitals being validation each year. We understand that some medical charts are voluminous, but given that we reimburse hospitals for the cost of photocopying, including labor (42 CFR 476.78(c)) we do not believe that the burden resulting from photocopying 27 records per quarter will be excessive, or divert resources from quality improvement to validation.

Comment: Two commenters expressed the opinion that selecting all candidate HAIs in hospitals with 12 or fewer candidate events per quarter is a flawed process that requires further study.

Response: We disagree with the commenters that selecting all candidate events when a hospital has 12 or fewer candidate HAI events for a particular quarter is a flawed process. Unlike selecting a sample of a population, which could result in sampling or random errors, selecting an entire population as we will do for hospitals with 12 or fewer candidate HAI events in a particular quarter has no such sampling or random error. Our statistical experts have no reservations about selecting the entire population of records with candidate HAIs when there are fewer than 12 per quarter. The discipline of sampling statistics was developed to address the problem that many populations are too large to study in their entirety, however, in the event the entire population is selected, as opposed to a sample of the population, the resulting estimate will have no sampling (random) error.[109] While every estimate suffers from potential inaccuracies arising from non-sampling errors such as incomplete enumeration of the population or simple variation from year to year,[15] the estimates obtained from studying all candidate episodes of care with HAIs will be at least as accurate as that obtained from a sample, and therefore this process is not flawed.

After consideration of the public comments we received, for the FY 2015 payment determination and subsequent years we are finalizing our proposal to use a sample size of 12 records per hospital per quarter for hospitals with more than 12 candidate events per quarter, and using all records with candidate events in hospitals with 12 or fewer records with candidate events in a quarter. We did not receive any public comments regarding our proposal not to estimate an HAI score for hospitals with 0 candidate events per year for the FY 2015 payment determination and subsequent years, and accordingly, we are finalizing that policy as proposed.

(4) Validation Scoring for Chart-Abstracted Clinical Process of Care Measures and HAI Measures

As noted in section VIII.A.6.a(1) of this preamble, HAIs occur rarely relative to the clinical process of care measures. The rarity of HAIs creates problems for validation scoring of this measure set. To produce an overall score that combines the scores for the individual measure sets, CMS computes a weighted average of each measure set score for each quarter.[110] The weight applied to each measure set is proportionate to the occurrence of records that were submitted to the Warehouse for that measure set. Because CLABSI, CAUTI, and SSI occur rarely, we anticipate that the total number of records targeted for validation of these measures will account for much less than 25 percent of the combined total of all records submitted to the Warehouse. Consequently, if the scores for HAI were combined with the other measure sets, a hospital could potentially report incorrectly for all HAI targeted records, and still meet our established reliability criterion of 75 percent, thus passing validation. This would mean that our process would fail to offer proper quality control for the HAI measure set. Although HAIs are rare, we believe that validation of HAI reporting is critical because it supports HHS' priority to reduce these infections.

For all of these reasons, we proposed separate scoring processes for the HAI and chart-abstracted clinical process of care measure sets, and to require hospitals to receive passing scores on both processes to pass validation for the FY 2015 payment determination and subsequent years. We proposed changes

[108] ''2.6 The finite population correction.'' Cochran WG. *Sampling Techniques,* third edition. John Wiley & Sons, New York, 1977, pp. 24–25.

[109] ''Population values and statistics'', in Kish L, *Survey Sampling,* Wiley Classics Library Edition, New York: 1995, page 9.

[110] ''Confidence Interval Calculation'', *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1138115987129*, last accessed March 19, 2012.

to our regulations at § 412.140(d)(2) to address this proposed requirement. In particular, our regulation currently states that ''A hospital meets the validation requirement with respect to a fiscal year if it achieves a 75-percent score as determined by CMS.'' We proposed to change this language to state: ''A hospital meets the validation requirement with respect to a fiscal year if it achieves a passing score, as determined by CMS, on applicable measure sets.'' We proposed to define ''passing score'' to mean a score of 75-percent on both of the chart-abstracted clinical process of care and HAI measure set groupings that apply to the hospital. The proposed computation and evaluation of passing for these separate scores are described further below.

Comment: Several commenters supported requiring hospitals to receive passing scores for both measure sets.

Response: We thank these commenters for their support, but have revised this proposal based on comments described below.

Comment: Two commenters expressed concern about the proposal to include two scores. While agreeing with the proposed approach of assessing the clinical process of care score separate from the HAI score, these commenters opposed a requirement to pass both scores on their own, particularly because the HAI score would be so new. The same commenters believed that the proposed process would give hospitals too many opportunities to fail.

Response: We agree that our proposal requiring hospitals to receive passing scores on the clinical process of care and HAI measure sets would provide too many opportunities for hospitals to fail validation. In particular, the proposed process would weigh the HAI measure and clinical process of care measures scores equally and require hospitals to pass both scores, even though only 3 of the 24 measures that will be validated for FY 2015 are HAI measures, while the remaining 21 measures are clinical process of care. The proposed requirement for two passing scores, even though one score would be based on validation of just 3 measures while another would be based on validation of 21 measures, would increase opportunities for failure by eliminating the chance for hospitals to compensate for poor performance on one set of measures with strong performance on the other set of measures.

Therefore, after consideration of the public comments we received, we are not finalizing the proposal to require hospitals to receive passing scores on each of the clinical process of care and HAI measure sets, nor are we changing our regulations at § 412.140(d)(2) to account for this proposal. Instead, for the FY 2015 payment determination and subsequent years, we will calculate a total score reflecting a weighted average of each of the two individual scores. Hospitals will be required to receive a total score of 75 percent, consistent with our regulations at § 412.140(d)(2), to pass validation.

For the FY 2015 payment determination and subsequent years, the HAI and clinical process of care measures sets' scores will be weighted proportionate to the number of measures validated in each set. For the FY 2015 payment determination, there are 24 total measures that will be validated, 21 of which are clinical process of care measures and 3 of which are HAI measures. Therefore, the clinical process of care measures would account for 87.5% (21/24) of the total validation score and the HAI measures would account for 12.5% (3/24) of the total validation score. We will adjust these percentages as necessary in future years to reflect the numbers and types of measures we are validating. We believe using this weighting scheme while also calculating separate scores for the HAI and clinical process of care measure sets will allow us to meaningfully validate both types of measures while avoiding unduly penalizing hospitals for their reporting on one of the two measure sets.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28057) for the chart-abstracted clinical process of care measures, we did not propose any changes to the methodology for reviewing charts, computing the score for each measure set, computing a summary score across all measure sets, or computing the variance around these summary scores. This process was described in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50226).

Comment: One commenter observed that the validation process for measures that assess time from admission to discharge ''seems very stringent.'' The commenter observed that if there is a discrepancy of even 1 minute between the time reported for the Hospital IQR Program by the hospital for those measures and the time identified when the measures are validated, the hospital would fail validation for these measures.

Response: We agree with the commenter that requiring time values to match exactly is not realistic based on our historical experience with clinical data abstraction, the recognition that hospital clocks may vary from system to system such that the same time may be recorded differently depending on the source, and the limited clinical significance of small deviations in time. We note that this particular concern affects the validation score for FY 2014 payment determination as well as for future years [because the ED throughput measures will be validated beginning with this year?].

Accordingly, after considering the public comments we received, for the FY 2014 payment determination and future years when scoring the ED throughput measures (ED–1: ''Median time from emergency department arrival to time of departure from the emergency room for patients admitted to the hospital'' and ED–2: ''Median time from admit decision to time of departure from the emergency department for emergency department patients admitted to the inpatient status''), we will not require these measures to have matching numerator and denominator states. Instead, for scoring of these ED throughput measures, we will allow a 5 minute variance between the time abstracted by the hospital and that abstracted by CDAC.

In the FY 2013 IPPS/LTCH PPS proposed rule, for the FY 2015 payment determination and subsequent years (77 FR 28057), we proposed to use the same basic approach to CLABSI scoring that we finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51647), but to modify this scoring process to include consideration of all three HAI measures simultaneously. For example, if a sampled record is determined to include a CLABSI event and no CAUTI or SSI events, and one CLABSI event was reported to NHSN, we proposed to assign the record a score of 1/1. If a sampled record had two independent episodes of CLABSI, CAUTI, or SSI, or a combination of infections, both events would have to be reported to NHSN to receive a score of 1/1. Similarly, if no events were reported to NHSN and the medical record indicated there were no events, we proposed that the record would receive a score of 1/1. We proposed to assign a score of 0/1 to a record if no event was reported to NHSN and at least one CLABSI, CAUTI, or SSI was detected, or if an event was reported but for the wrong infection. For example, if an SSI was reported to NHSN as a CLABSI, the record would receive a 0/1. We also proposed to assign a score of 0/1 to a record if an event was reported to NHSN for CLABSI, CAUTI, or SSI, and the CMS contractor determined that there was no such event.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28057) for the FY

2015 payment determination and subsequent years, we proposed a slightly different process for requesting medical records for SSI. Specifically, we proposed that when a candidate SSI is identified based on a readmission diagnosis, CDAC would request two records per candidate SSI event. This proposal is necessary because many SSIs are not diagnosed until after patient discharge. In these circumstances, the hospital might first become aware of the SSI upon readmission. Therefore, the information needed to evaluate the presence or absence of an SSI for these candidate events would be divided across two records: (1) the medical record for the hospitalization during which surgery was performed; and (2) the medical record for the readmission to treat the candidate infection. Therefore, we further proposed for the FY 2015 payment determination and subsequent years that when a candidate SSI is identified based on a readmission diagnosis, we evaluate the occurrence of an SSI event related to the index hospitalization using data in both records. In contrast, we proposed to limit evaluation of CLABSI and CAUTI to the record for the index hospitalization. We proposed these changes to incorporate CAUTI and SSI into HAI scoring, which were not part of previous validation efforts. We invited comments on these proposals.

Comment: A few commenters noted that hospitals need time and feedback to learn how to abstract new data elements, and that the proposed validation process does not provide hospitals with a grace period during which they may better learn the rules for abstracting new elements. A commenter urged CMS to release CLABSI validation results publicly so that all might learn from the experience.

Response: We agree that an important purpose of validation is to educate hospitals on how to improve their reporting processes. As with other Hospital IQR Program measures, CAUTI and SSI were added to the Hospital IQR Program in the year before are being added to the Hospital IQR Program validation program. Therefore, hospitals will have three quarters (Q1–Q3 2012) in which to develop experience reporting CAUTI and SSI before they will be validated on these measures. In addition, like all IQR program data, CAUTI and SSI data are publicly reported. It is therefore important to begin validation soon after new measures are added to the Hospital IQR Program.

In all years, we will work with CDC, our State QIOs, and our national validation support contractor to widely disseminate lessons learned from HAI validation efforts on a timely basis. Hospitals will benefit either from direct participation in the CLABSI validation process for the FY 2014 payment determination, or through dissemination of lessons learned to help them improve when reporting their CLABSI and other NHSN data for the FY 2015 payment determination. Similarly, hospitals not validated for the FY 2015 payment determination will receive education in the form of lessons learned to help them improve their own reporting processes on all three NHSN measures.

Comment: Two commenters expressed concern that a hospital's probability of failure is unfairly increased by giving hospitals a maximum of 1 point for each candidate HAI sampled instead of giving hospitals a maximum of 3 points per sampling candidate HAI, one for each properly reported infection.

Response: We agree that giving hospitals up to 3 points instead of 1 per record sampled would increase the probability of success on individual cases for particular hospitals, but disagree that we should adopt this approach on the grounds that it does not accurately reflect the incidence of these infections. Although a patient may conceivably acquire both a CLABSI and a CAUTI, this is very rare. An individual HAI event can either be CLABSI or CAUTI, but it can never be both. In addition, overlap between CLABSI and SSI and CAUTI and SSI is rare. Therefore, we anticipate that most records sampled will have at most one infection. Were we to give each record up to 3 points, we would essentially be offering hospitals a score of 2 for every opportunity that we have to evaluate them on reporting of the third infection. In other words, to adopt a denominator of 3 per sampled record would give hospitals a base score of 67 percent, without having to do anything correctly. Given that the requisite score for passing validation is 75%, we believe this would be an inappropriately lenient standard.

Comment: Some commenters supported the review of two medical records to assess SSI.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing as proposed, the scoring process for CLABSI, CAUTI, and SSI for the FY 2015 payment determination and subsequent years. We are also finalizing for the FY 2015 payment determination and future years, the proposal to request two medical records per candidate SSI event when a candidate SSI is identified based on a readmission diagnosis.

The process finalized above in this section will be used to create a mean HAI score for each hospital. The mean will equal the number of HAI records correctly classified divided by the total number of HAI records scored. As described in section VIII.A.6.a.(3) of this preamble, a sample of up to 12 records is to be drawn quarterly, for an annual sample of up to 48. The approach of dividing the year into 4 quarters and drawing an independent random sample from each is known as stratified random sampling. When the validation sample includes all of the candidate HAI events that a hospital generates in a year, reliability is measured without error. In this case, the upper bound of the confidence interval will be exactly the same as the estimate of reliability. However, when this score is based on only a sample of records containing candidate HAIs, we must compute a variance around this mean. We proposed to compute the confidence interval by applying the appropriate formula for the variance of a proportion in a stratified random sample.[111]

We received no comments directly on this proposal. However, this proposal is sensible only in the context of the earlier proposal to require hospitals to receive passing scores on both the clinical process of care and HAI measures. As we are not finalizing the proposal to receive two passing scores, we must also modify this one. Rather than computing a confidence interval for the HAI measure set specifically, we are finalizing the process to apply the appropriate formula for the variance of a proportion in a stratified random sample as proposed. We will then obtain a total variance for the combined clinical process of care and HAI scores using the appropriate formula for the variance of the weighted sum of two independent random variables.[112] A single confidence interval will be computed based on this total variance.

(5) Criteria To Evaluate Whether a Score Passes or Fails

Historically, we have used two criteria for passing validation in the Hospital IQR Program, which were described in FY 2011 IPPS/LTCH PPS final rule (75 FR 50226):

[111] ''Section 5.10 Stratified sampling for proportions'' in Cochran WG. Sampling Techniques, third edition. John Wiley and Sons, New York,1977, pp. 107–108.

[112] ''Equation 5–40, in Section, 5–4 Linear combination of two random variables'' in Wonnacott TH and Wonnacott RJ, ''Introductory Statistics for Business and Economics, second edition, John Wiley and Sons, New York, 1977, pp. 131.

• Require all Hospital IQR Program participating hospitals selected for validation to attain at least a 75-percent validation score per quarter to pass the validation requirement.

• Use the upper bound of a one-tailed 95 percent confidence interval to estimate the validation score.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28057), we proposed for the FY 2015 payment determination and subsequent years to compute validation scores for each of the chart-abstracted and HAI measure sets by combining the data across all four quarters, instead of by considering the quarters separately. We proposed what we believed was a change in our current policy because 4 quarters of data combined can provide a more accurate estimate of reliability than could be attained from a single quarter.

We would like to clarify that what we characterized in the FY 2013 IPPS/LTCH PPS proposed rule as a proposal is actually consistent with our current policy, which was finalized in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50226). We stated in that rule that we would require Hospital IQR Program ''participating hospitals selected for validation to attain at least a 75-percent validation score per quarter to pass the validation requirement,'' which could suggest that we are requiring hospitals to pass validation on a quarterly basis. In actuality, we finalized a policy in that rule to calculate ''an annual confidence interval,'' or to require hospitals to pass validation annually, not quarterly. Accordingly, what we presented in the FY 2013 IPPS/LTCH PPS proposed rule as a proposal—computing annual validation scores by combining data across all four quarters—is consistent with our current policy.

Comment: Some commenters expressed preference for a quarterly score, because the commenters valued receiving timely feedback regarding their hospitals' performance.

Response: We thank the commenters for the opportunity to clarify our current process. We will continue to provide hospitals with feedback regarding the performance on validation on a quarterly basis. However, we will also continue to evaluate a hospital's validation score by combining data across all quarters included in the validation year and by computing a confidence interval once annually for the basis of a payment determination only.

After consideration of the public comments we received, we are continuing for the FY 2015 payment determination and future years our current policy of providing hospitals with feedback quarterly and producing a single annual confidence interval per hospital.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28057) we proposed that if a hospital has no candidate CLABSI, CAUTI, or SSI in the year to be validated or a hospital has been excepted from NHSN reporting for all three HAIs, it will only be required to achieve a 75 percent score for the chart-abstracted clinical process of care measures to pass validation. We made this proposal because, in these instances, no HAI score can be computed.

We did not receive any public comments on this proposal and, therefore, we are finalizing this process as proposed.

In the FY 2013 IPPS/LTCH PPS proposed rule for the FY 2015 payment determination and subsequent years, we proposed to replace the use of a one-tailed 95 percent confidence interval with a two-tailed 90 percent confidence interval. The reason for this proposal is so that we may identify hospitals passing our annual 75 percent threshold that also have scores within the statistical margin of error for not passing this annual requirement. The upper bound of a two-tailed 90 percent confidence interval is exactly the same number as the upper bound of a one-tailed 95 percent confidence interval. Therefore, this proposal will have no impact on the number of hospitals in the base annual sample that pass or fail validation. The Government Accountability Office (GAO) has noted that CMS does not have a methodology to address hospitals, for which ''the statistical margin of error for their accuracy included both passing and failing levels.'' [113] For data included in the GAO report, one-quarter to one-third of hospitals fell into this category. CMS has subsequently taken steps to address other GAO concerns, which has reduced the percentage of hospitals that neither passed nor failed validation to 7 percent in the FY 2012 payment determination.

Nonetheless, we believe that there is value in looking more closely at the remainder of these hospitals. For the FY 2015 payment determination and subsequent years, we proposed to identify those hospitals which have neither passed nor failed, using a two-tailed confidence interval. In addition, for the purpose of payment determination in FY 2015 and subsequent years, we proposed to continue to pass these hospitals, while also targeting these hospitals for validation the next year, which we finalize in section VIII.C.6.c. of this preamble.

If, as in previous years, our only concern was in hospitals with an upper bound for the reliability rate below 75 percent, we would have 95 percent confidence in the upper bound. However, because we proposed to identify hospitals for which ''the statistical margin of error for their accuracy included both passing and failing levels,'' we must consider both an upper and lower confidence bound. Therefore, the same interval provides only 90 percent confidence (5 percent of samples will have lower interval bounds based on the sample that are higher than the actual reliability for the population and 5 percent will have upper interval bounds that are lower than the actual reliability rate for the population). Computing a two-tailed interval and adjusting its confidence level from 95 to 90 percent is the only way to maintain the computation for the upper bound using the same formula as that used in previous years and also calculate the lower bound[10,114] which will allow us to identify hospitals that would otherwise neither pass nor fail validation. We invited public comment on this proposal.

Comment: Two commenters expressed concern that the proposed change would make passing validation more difficult.

Response: As stated above, the formula for the proposed two-tailed 90 percent confidence interval is identical to the formula for the one-tailed 95 percent confidence interval now used. Therefore, this change will not negatively impact hospitals in any given year, but it will allow us to accomplish the other policy goals that we have outlined above.

After consideration of the public comments we received, we are finalizing this process as proposed for the FY 2015 payment determination and subsequent years.

b. Number and Manner of Selection for Hospitals Included in the Base Annual Validation Random Sample

As finalized in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50225–50227), validation of chart-abstracted measures in the Hospital IQR Program uses a base annual random sample of 800 hospitals. In the FY 2013 IPPS/

[113] Government Accountability Office. ''Hospital Quality Data. CMS needs more rigorous methods to ensure reliability of publicly released data''. GAO–06–54, January 2006.

[114] ''Chapter 8 Interval estimation'' in Wonnanut TH, Wonnacott RJ. Introductory statistics for business and economics, 2nd edition, 1977, John Wiley & Sons, New York, pp. 199–201, 231–232.

LTCH PPS proposed rule (77 FR 28058), for the FY 2015 payment determination and subsequent years, we proposed to reduce the total base sample size of hospitals included in the annual validation random sample from 800 to 400. One of our goals in targeting a certain number of hospitals for our base annual random sample is to estimate the total percentage of hospitals that have been reporting unreliable data for the Hospital IQR Program. The minimum sample size required to assess the percentage of hospitals in the Hospital IQR Program that have been reporting unreliable data depends on the expected percentage of hospitals that fail validation. Because a very high percentage of Hospital IQR Program hospitals pass validation (more than 99 percent of the hospitals in the FY 2012 payment determination), we believe that we can reduce burden on hospitals by selecting fewer hospitals for the base annual random sample without adversely affecting our estimate of this percentage. We did not propose to change the criteria for selecting the annual validation random sample because we believe that these criteria are appropriate for sample selection.

We proposed no change to the criteria for selecting the annual validation random sample, which we provided for informational purposes. The finalized definition of a hospital eligible for validation, as provided in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50227) are the subset of subsection (d) hospitals who successfully submitted ''at least one [IQR] case for the third calendar quarter of the year two years prior to the year to which the validation.'' For example, for the FY 2015 payment determination, we would select the sample in early 2013, and all Hospital IQR Program-eligible hospitals that submitted at least one Hospital IQR case for third quarter 2012 discharges would be eligible to be selected for validation. We invited comments on these proposals.

Comment: We received many comments in support of this proposal.

Response: We thank these commenters for their support.

Comment: A few commenters raised concern that hospitals already go too many years without feedback regarding their performance. In contrast, another commenter suggested that hospitals should not have to undergo validation at all more often than once every 3 years unless a problem was uncovered during the validation process.

Other commenters expressed concern that CMS could not guarantee reliability (for example, what the hospital submitted matches what is observed by CDAC) across all hospitals and asked for clarification regarding how CMS planned to approach this problem.

Response: Although we could conduct validation on every hospital every year, such an approach to reliability assessment uses significantly more CMS and hospital resources than necessary. Conducting validation on any individual hospital less frequently reduces burden, which we consider to be very important. The basic premise behind random sampling is that one can learn something about all hospitals by gathering data on just a subset of hospitals. Using an estimated passing rate of 99 percent, our power calculations indicate that with 400 hospitals, we can be highly confident that least 98 percent of all hospitals in the IPPS population are achieving the requisite reliability score. Hospitals that would like to learn more about common pitfalls associated with quality reporting may receive this from their QIO and Hospital IQR Program validation support contractor.

We cannot exclude hospitals from validation if they have been selected in the previous 3 years as suggested by one commenter, because we are required by section 1886(b)(3)(B)(xii) of the Act to randomly select hospitals to validate the Hospital IQR measures as a whole. We believe that random sampling requires all hospitals to review data accuracy, because all hospitals are eligible to be selected in our annual random sample. We have a validation support contractor who provides QIOs with feedback regarding common pitfalls identified during the validation process. Moreover, these QIOs have a contractual obligation with CMS to educate hospitals regarding Hospital IQR Program requirements. Therefore, each individual hospital has access to education about the Hospital IQR Program process, regardless of whether it is selected for validation.

After consideration of the public comments we received, we are finalizing the process to reduce the base annual random sample from 800 to 400 as described above for the FY 2015 payment determination and subsequent years.

c. Targeting Criteria for Selection of Supplemental Hospitals for Validation

We have established policies for supplementation to the base annual random sample of hospitals. In particular, our supplemental validation sample includes all hospitals that fail validation in the previous year (75 FR 50227 through 50229), a policy that we do not intend to change. We also finalized a policy in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51646), that the validation sample drawn for the FY 2015 payment determination and subsequent years will include in the fourth year all hospitals not randomly occurring in the sample in the previous 3 years. We have reassessed this policy.

We believe that we have identified an approach with comparable benefits to reliability which would have a smaller total burden to hospitals, and at less cost to CMS. Based on chance alone, we would expect that about 1,500 (slightly less than half of all IPPS-eligible) hospitals would not have been sampled in the previous 3 years. Of these, less than 200 would be expected to be randomly selected as part of the base validation sample of 400 hospitals for the FY 2015 payment determination. Accordingly, this means that for the FY 2015 payment determination, the supplemental sample size would be about 1,300 hospitals. To increase the sample size by 1,300 hospitals in a single year is unnecessarily burdensome; we believe we can have the same influence on hospitals that have not been recently validated simply by increasing their probability of selection through targeting in subsequent years. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28058), therefore, for the FY 2015 payment determination and subsequent years, we proposed to discontinue our policy of including hospitals in the supplemental validation sample in the fourth year that have not been validated in the previous 3 years. We proposed, however to use the lack of recent validation as one of several targeting criteria for a supplemental random sample described further below. For the FY 2015 payment determination and subsequent years, we proposed to add targeting criteria as a supplement to the base random sample of up to 200 additional hospitals. We believe that this proposal would improve data quality by increased targeting of hospitals with possible or confirmed past data quality issues. As finalized in the FY 2011 IPPS/LTCH PPS final rule, the supplement will include all hospitals that fail validation in the previous year. We invited public comment on the proposal to include a targeted sample, and to use the following as criteria for targeting the additional hospitals:

- Any hospital with abnormal or conflicting data patterns. An example of abnormal data pattern would be if a hospital has extremely high or extremely low values for a particular measure. Consistent with the Hospital OQR Program, we proposed to define an extremely high or low value as one that falls more than 3 standard deviations

from the mean (76 FR 74485). An example of a conflicting data pattern would be if two records were identified for the same patient episode of care but the data elements were mismatched for primary diagnosis. Primary diagnosis is just one of many fields that should remain constant across measure sets for an episode of care. Other examples of fields that should remain constant across measure sets are patient age and sex. Any hospital not included in the base validation annual sample and with statistically significantly more abnormal or conflicting data patterns per record than would be expected based on chance alone ($p < .05$), would be included in the population of hospitals targeted in the supplemental sample.

- Any hospital with rapidly changing data patterns. For this targeting criterion, we proposed to define a rapidly changing data pattern as a hospital which improves its quality for one or more measure sets (that is, AMI, HF, PN, SCIP, ED, IMM, or HAI) by more than 2 standard deviations from one year to the next, and also has a statistically significant difference in improvement (one-tailed $p < .05$).
- Any hospital that submits data to NHSN after the Hospital IQR Program data submission deadline has passed.
- Any hospital that joined the Hospital IQR Program within the previous 3 years, and which has not been previously validated.
- Any hospital that has not been randomly selected for validation in any of the previous 3 years.

Comment: Some commenters favored the proposal to target hospitals based on the criteria described above.

Response: We agree that these proposed policies will be useful.

Comment: Commenters expressed concern that for hospitals failing validation, the amount of time elapsing between the determination and the deadline for submitting records in the following year may not be sufficient to improve the hospital's performance.

Response: We disagree that the time between the determination that a hospital has failed and the time it has to submit data for the following year would present difficulties for hospitals, because a hospital has no reason to wait until it receives a failing payment determination to improve its reporting. As described above in this section, we provide feedback on validation quarterly, and QIOs are available to provide education and feedback to hospitals regardless of their quarterly scores. A poorly performing hospital should receive feedback after validation of the very first quarter in a validation year. This feedback would come long before the next year's reporting process would start. For example, a hospital will receive all feedback on data submitted in the 4th quarter of 2012 by the end of October 2013, but would not be required to complete submission of data for the 4th quarter of 2013 until May 2014.

Comment: One commenter questioned whether reserving one-third of the sample for targeted validation ''would diminish the randomization and thus diminish the validation process.''

Response: As described above, we approached the problem of sample size for the base annual random sample by considering the power needed to assess reliability, which we determined to be 400. The random sample size needed is unaffected by the size of our targeted validation sample. Compared with the current policy, which was finalized for the FY 2015 payment determinations and subsequent years in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51645 through 51646), and which targeted all hospitals not included in the three previous years, the new proposal to target up to 200 hospitals includes a much lower ratio of 'targeted' to random sampling. Moreover, the sample targeted under current policy is less informative than the proposed targeted sample because the current process does not identify and target hospitals most likely to need validation based on data previously submitted. Accordingly, we do not believe that reserving one third of the sample for targeted validation reduces the integrity of the validation process, and in fact, we believe it will strengthen validation.

After consideration of the public comments we received, we are finalizing this targeting proposal for the FY 2015 payment determination.

For the FY 2016 payment determination and subsequent years, we proposed to add to the targeting criteria proposed for the 2015 payment determination by identifying hospitals that passed validation in the previous year, but had a two-tailed confidence interval that included 75 percent. Relative to hospitals whose confidence interval lies entirely above the target reliability rate of 75 percent, a confidence interval that includes 75 percent would indicate a higher level of uncertainty as to the reliability of data for that particular hospital. This proposal is related to the proposal to produce a two-sided confidence interval (discussed in section VIII.A.6.b of this preamble). It is intended to respond to concerns that CMS does not have a methodology to address hospitals, for which ''the statistical margin of error for their accuracy included both passing and failing levels.'' The reason that we proposed implementation of this criterion beginning with the 2016 payment determination is that it is not feasible to implement this change until after we implement changes to the confidence interval, as described in section VIII.A.6.b. of this preamble.

We received no comments on this proposal, and therefore, we are finalizing this proposal to add a targeting criterion for the supplemental sample of hospitals that passed validation in the previous year, but had a two-tailed confidence interval that included 75 percent. This process will begin with the FY 2016 payment determination and continue in subsequent years.

As noted above, the established procedure for drawing the base random sample involves selection of hospitals ''early'' in the calendar year two years prior to the payment determination FY 2011 IPPS/LTCH PPS final rule (75 FR 50227). For example, the base sample for the FY 2015 payment determination will be drawn early in 2013. We proposed that the selection of hospitals targeted in the supplemental sample for the FY 2015 payment determination occur after the FY 2014 payment determination; this will separate the timing of selection of base and supplemental samples. We proposed to do so because CMS may need extra time to review hospital data before identifying the hospitals to include in the supplemental sample. Moreover, information regarding a hospital's status as failing or passing is not known at the time the base sample is drawn.

We received no comments on this proposal, and we are finalizing as proposed the process to separate the timing for drawing the base and supplemental samples. We provide the reader with the validation timeline for finalized in the FY 20111 IPPS/LTCH PPS final rule (75 FR 50219) for the FY 2013 payment determination and subsequent years for informational purposes only. We did not propose any changes or invite comment on this timeline. The quarters included in the validation effort for each year's payment determination will be the fourth calendar quarter of the year that occurs 2 years before the payment determination and the first 3 calendar quarters of the following calendar year. For example, for the FY 2015 payment determination, the quarters included in validation would be the fourth quarter of calendar year 2012 through the third quarter of calendar year 2013.

7. Data Accuracy and Completeness Acknowledgement Requirements for the FY 2015 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28059), we proposed to require hospitals to continue to electronically acknowledge their data accuracy and completeness once annually. For the FY 2014 payment determination, the submission deadline for the Data Accuracy and Completeness Acknowledgement was aligned with the final submission quarter for each fiscal year. We proposed to continue this approach for FY 2015 and subsequent years. For example, we proposed that the submission deadline for the Data Accuracy and Completeness Acknowledgement would be May 15, 2014, with respect to the time period of January 1, 2013, through December 31, 2013. We invited public comment on this proposal.

We received no comments on this proposal; therefore, we are finalizing our proposal to align the Data Accuracy and Completeness Acknowledgement with the final submission quarter for each fiscal year for FY 2015 and subsequent years.

8. Public Display Requirements for the FY 2015 Payment Determination and Subsequent Years

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650), we continued, for the FY 2014 payment determination and subsequent years, the approach we adopted in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50230) for public display requirements for the FY 2012 payment determination and subsequent years. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28059), we did not propose any changes to these requirements.

The Hospital IQR Program quality measures are typically reported on the *Hospital Compare* Web site at: *http://www.hospitalcompare.hhs.gov*, but on occasion are reported on other CMS Web sites. We require that hospitals sign a Notice of Participation form when they first register to participate in the Hospital IQR Program. Once a hospital has submitted a form, the hospital is considered to be an active Hospital IQR Program participant until such time as the hospital submits a withdrawal form to CMS (72 FR 47360). Hospitals signing this form agree that they will allow us to publicly report the quality measures included in the Hospital IQR Program.

We will continue to display quality information for public viewing as required by section 1886(b)(3)(B)(viii)(VII) of the Act. Before we display this information, hospitals will be permitted to review their information as recorded in the QIO Clinical Warehouse.

9. Reconsideration and Appeal Procedures for the FY 2015 Payment Determination

The Hospital IQR Program reconsideration and appeals requirements were adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51651) and are found at 42 CFR 412.140(e) of our regulations. The form for reconsiderations and a detailed description of the reconsideration process are available on the QualityNet Web site at: *http://www.qualitynet.org/* > Hospitals-Inpatient > Hospital Inpatient Quality Reporting Program > APU Reconsiderations.

10. Hospital IQR Program Disaster Extensions or Waivers

The Hospital IQR Program disaster extensions or waiver requirements were adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51652) and can be found at 42 CFR 412.140(e) and (c)(2), respectively. The forms and a detailed description of the extension or waiver process are available on the QualityNet Web site at: *http://www.qualitynet.org/* > Hospitals-Inpatient > Hospital Inpatient Quality Reporting Program.

11. Electronic Health Records (EHRs)

a. Background

Starting with the FY 2006 IPPS final rule, we have encouraged hospitals to take steps toward the adoption of EHRs (also referred to in previous rulemaking documents as electronic medical records) that will allow for reporting of clinical quality data from the EHRs directly to a CMS data repository (70 FR 47420 through 47421). We sought to prepare for future EHR submission of quality measures by sponsoring the creation of electronic specifications for quality measures under consideration for the Hospital IQR Program.

b. HITECH Act EHR Provisions

The HITECH Act (Title IV of Division B of the ARRA, together with Title XIII of Division A of the ARRA) authorizes payment incentives under Medicare for the adoption and use of certified EHR technology beginning in FY 2011. Hospitals are eligible for these payment incentives if they meet requirements for meaningful use of certified EHR technology, which include reporting on quality measures using certified EHR technology. With respect to the selection of quality measures for this purpose, under section 1886(n)(3)(A)(iii) of the Act, as added by section 4102 of the HITECH Act, the Secretary shall select measures, including clinical quality measures, that hospitals must provide to CMS in order to be eligible for the EHR incentive payments. With respect to the clinical quality measures, section 1886(n)(3)(B)(i) of the Act requires the Secretary to give preference to those clinical quality measures that have been selected for the Hospital IQR Program under section 1886(b)(3)(B)(viii) of the Act or that have been endorsed by the entity with a contract with the Secretary under section 1890(a) of the Act. All measures must be proposed for public comment prior to their selection, except in the case of measures previously selected for the Hospital IQR Program under section 1886(b)(3)(B)(viii) of the Act.

We continue to believe there are important synergies with respect to the two programs. We believe the financial incentives under the HITECH Act for the adoption and meaningful use of certified EHR technology by hospitals will encourage the adoption and use of certified EHRs for the anticipated future reporting of clinical quality measures under the Hospital IQR Program. Through the EHR Incentive Programs we expect that the anticipated future submission of quality data through EHRs will provide a foundation for establishing the capacity of hospitals to send, and for CMS to receive, quality measures via hospital EHRs for certain Hospital IQR Program measures in the future.

The HITECH Act requires that the Secretary seek to avoid redundant and duplicative reporting, with specific reference to the Hospital IQR Program for eligible hospitals. To the extent that quality measures are included in both the Hospital IQR Program and the EHR Incentive Programs, this would mean that the Hospital IQR Program would need to transition to use of certified EHR technology rather than manual chart abstraction. We are considering what the most practical approach to effect such a transition might be. One option is to select a date after which chart-abstracted data would no longer be used in the Hospital IQR Program where it is possible to report the data via certified EHR technology. This would require sufficient advance notice to hospitals for hospitals to report the data via certified EHR technology. At that point, we believe that it is likely that nearly all IPPS hospitals will have implemented certified EHR technology as incentivized by the HITECH Act. Another option would be to allow

hospitals to submit the same measure for the Hospital IQR Program based on either chart-abstraction or, when available, EHR-based reporting. This would require extensive testing to ensure equivalence given that the data for the Hospital IQR Program supports both the public reporting of such information and the Hospital VBP Program. We are concerned that this option would not be feasible.

Ultimately, we do not anticipate having two different sets of clinical quality measures for the EHR Incentive Programs and the Hospital IQR Program. Rather, we anticipate a single set of hospital clinical quality measures, most of which we anticipate would be electronically specified. We envision a reporting infrastructure for electronic submission as an additional reporting mechanism in the future, and will strive to align the hospital quality initiative programs to seek to avoid redundant and duplicative reporting of quality measures for hospitals. We note that some important Hospital IQR Program quality measures such as HCAHPS experience of care measures are based on survey data and do not lend themselves to EHR reporting. Similarly, certain outcome quality measures, such as the current Hospital IQR Program readmission measures, are based on claims data rather than clinical data. Thus, not all Hospital IQR Program quality measures will necessarily be capable of being submitted through EHRs. As a consequence, not all Hospital IQR Program quality measures would necessarily be appropriate for inclusion in the EHR Incentive Programs.

We note that the provisions in this proposed rule do not implicate or implement any HITECH statutory provisions. Those provisions are the subject of separate rulemaking and public comment.

Comment: Many commenters strongly supported CMS's direction to move toward EHR-based reporting for quality measures. Commenters shared our vision to implement a single set of hospital clinical quality measures, most of which would be electronically specified. Commenters supported the alignment of measures across public reporting programs using EHR technology. A commenter believed that use of certified EHR technology would be widespread by 2015 among hospitals. One commenter stated that some hospitals will still be unprepared for EHR-based reporting by 2015 and commenter noted that implementing EHR-based reporting prematurely may negate quality improvement efforts. One commenter recommended postponing EHR-based reporting until all hospitals have reached Stage 3 of meaningful use under the HITECH Act EHR Incentive Program.

Response: We appreciate the support of our intention to move toward EHR-based reporting for quality measures. We also believe that large numbers of hospitals would be able to report quality measures electronically from EHRs, which are currently chart-abstracted. We expect in the future to propose a specific date for transition from chart-abstracted to EHR-based measures for the Hospital IQR Program. We expect this to be facilitated by the EHR Incentive Program, which has proposed certain clinical quality measures that align with the Hospital IQR Program, and the related electronic reporting pilot for hospitals (see 75 FR 74489).

Comment: Many commenters supported a defined strategy to effect a transition from chart-abstraction to EHR-based submissions. Several commenters indicated that they would like to have the option to submit data either using chart-abstractions or via EHR but cautioned that extensive pre-implementation testing and validation of e-measures for accuracy are crucial. One commenter encouraged CMS to engage in more e-measure pilot testing. While many commenters supported EHR submission as the sole mechanism for data submission, commenters added that the existence of a transition period, which accommodates both of the data collection mechanism, is necessary.

Response: We have not decided the best approach to transitioning from chart-abstracted measures to EHR-based reporting. We agree that significant testing is needed to assure accuracy of EHR-based reporting. We do not believe that is practical to provide alternative options for the Hospital IQR Program with some hospitals reporting based on chart abstracted measures while others use EHR-based reporting, where such measures are publicly reported and are the basis for value based purchasing. Ultimately, we believe a transition, when feasible, needs to be accomplished by all hospitals for the Hospital IQR Program.

Comment: A few commenters suggested registry-based reporting as an alternative alongside with EHR-based technology for hospitals.

Response: We support the use of registries. As stated above, however, we do not believe it is practical to have alternative measures data sources due to the degree of testing that would be necessary to assure equivalence of results.

B. PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

1. Statutory Authority

Section 3005 of the Affordable Care Act added new subsections (a)(1)(W) and (k) to section 1866 of the Act. Section 1866(k) of the Act establishes a quality reporting program for a hospital described in section 1886(d)(1)(B)(v) of the Act (hereafter referred to as a ''PPS-Exempt Cancer Hospital'' or ''PCH''). Section 1866(k)(1) of the Act states that, for FY 2014 and each subsequent fiscal year, a PCH shall submit data to the Secretary in accordance with section 1866(k)(2) of the Act with respect to such a fiscal year. Section 1866(k)(2) of the Act provides that, for FY 2014 and each subsequent fiscal year, each hospital described in section 1886(d)(1)(B)(v) of the Act shall submit data to the Secretary on quality measures specified under section 1866(k)(3) of the Act in a form and manner, and at a time, specified by the Secretary.

Section 1866(k)(3)(A) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act, unless an exception under section 1866(k)(3)(B) of the Act applies. The National Quality Forum (NQF) currently holds this contract. The NQF is a voluntary, consensus-based, standard-setting organization with a diverse representation of consumer, purchaser, provider, academic, clinical, and other health care stakeholder organizations. The NQF was established to standardize healthcare quality measurement and reporting through its consensus development processes. We have generally adopted NQF-endorsed measures in our reporting programs. However, section 1866(k)(3)(B) of the Act provides an exception. Specifically, it provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Under section 1866(k)(3)(C) of the Act, the Secretary must publish the measure selection for PCHs no later than October 1, 2012, with respect to FY 2014.

Section 1866(k)(4) of the Act requires the Secretary to establish procedures for making public the data submitted by PCHs under the PCHQR Program. Such

procedures must ensure that a PCH has the opportunity to review the data that is to be made public with respect to the PCH prior to such data being made public. The Secretary must report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished by PCHs on the CMS Internet Web site.

Comment: Several commenters supported the PCHQR Program, and some commenters encouraged PCHs to participate in ''public reporting programs.''

Response: We appreciate the commenters for their support.

Comment: Several commenters stated that there will be a 2-percent point reduction to a PCH's rate-of-increase limit if the PCH fails to report the PCHQR quality measures.

Response: We did not propose in the FY 2013 IPPS/LTCH proposed rule to adopt a policy on what the consequence would be if a PCH failed to report the quality measures specified under the PCHQR Program. We plan to address this issue in future rulemaking.

2. Covered Entities

Section 1886(d)(1)(B)(v) of the Act excludes particular cancer hospitals from payment under the IPPS. This final rule covers only those PPS-excluded cancer hospitals meeting eligibility criteria specified in 42 CFR 412.23(f).

3. Quality Measures for PCHs for the FY 2014 Program and Subsequent Program Years

a. Considerations in the Selection of the Quality Measures

Section 1866(k)(3)(A) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act, unless section 1866(k)(3)(B) of the Act applies. Section 1866(k)(3)(B) of the Act states that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

We have taken a number of principles into consideration when developing measures for the PCHQR Program, and many of these principles are modeled on those we use for measure development under the Hospital IQR Program:

- Public reporting should rely on a mix of standards, outcomes, process of care measures, and patient experience of care measures, including measures of care transitions and changes in patient functional status.
- The measure set should evolve so that it includes a focused core set of measures appropriate to cancer hospitals that reflects the level of care and the most important areas of service furnished by those hospitals. The measures should address gaps in the quality of cancer care.
- We also considered input solicited from the public. For instance, CMS held a Listening Session on September 8, 2011 for the purpose of receiving input from consumers, advocacy groups, and providers on the measures under consideration for the PCHQR Program and other program implementation issues.
- We considered suggestions and input from a PCH Technical Expert Panel (TEP), convened by a CMS measure development contractor, which rated potential PCH quality measures for importance, scientific soundness, usability, and feasibility. The TEP membership includes health-care providers specializing in the treatment of cancer, cancer researchers, consumer and patient advocates, disparities experts, and representatives from payer organizations.

Like the Hospital IQR Program, the PCHQR Program also supports the National Quality Strategy, national priorities, HHS Strategic Plans and Initiatives, and CMS Strategic Plans, as well as takes into consideration the recommendations of the Measure Application Partnership (MAP) and strives for burden reduction whenever possible. We refer readers to the discussion of these topics in section VIII.A.3.a. of the preamble of this final rule on ''Additional Considerations in Expanding and Updating Quality Measures'' under the Hospital IQR Program.

Comment: For burden reduction purposes, a commenter encouraged the use of existing registries and data sources to expand the PCHQR Program.

Response: We appreciate the commenter for the suggestions. We took the issue of burden into consideration when selecting the measures to propose to include in the PCHQR Program for FY 2014 and subsequent program years, and if feasible, we will work to develop data collection methods that further minimize the burden on PCHs.

b. PCHQR Program Quality Measures for the FY 2014 Program and Subsequent Program Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28061), we proposed to adopt five quality measures for the FY 2014 program and subsequent program years. Specifically, we proposed to adopt two CDC/NHSN-based HAI quality measures (outcome measures): (1) Central Line-Associated Bloodstream Infection (CLABSI); and (2) Catheter-Associated Urinary Tract Infection (CAUTI); and three cancer process of care measures: (1) Adjuvant chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC III (lymph node positive) colon cancer; (2) Combination chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer; and (3) Adjuvant hormonal therapy.

All five of these proposed measures were reviewed by the MAP, and were recommended for inclusion in the PCHQR Program. For details regarding MAP input, please refer to the MAP Annual Pre-Rulemaking Final Report, which can be accessed at: *http://www.qualityforum.org/Setting_Priorities/Partnership/Measure_Applications_Partnership.aspx*.

(1) CDC/NHSN-Based Healthcare-Associated Infection (HAI) Measures

HAIs are among the leading causes of death in the United States. CDC estimates that as many as 2 million infections are acquired each year in hospitals and result in approximately 90,000 deaths per year.[115] It is estimated that more Americans die each year from HAIs than from auto accidents and homicides combined. HAIs not only put the patient at risk, but also increase the number of days of hospitalization required for patients and add considerable health care costs.

The reduction of HAIs is a priority for HHS, as evidenced by HHS's 2009 publication of an Action Plan to Prevent HAIs. This Plan is available on the HHS Web site at: *http://www.hhs.gov/ash/initiatives/hai/actionplan/*. To maximize the efficiency and improve the coordination of HAI prevention efforts across the Department, HHS established in 2008 a senior-level

[115] McKibben L, Horan T, Guidance on public reporting of healthcare-associated infections: Recommendations of the Healthcare Infection Control Practices Advisory Committee. AJIC 2005; 33:217–26.

Steering Committee for the Prevention of HAIs. In 2009, a Steering Committee, which included scientists and program officials across the Government, developed the HHS Action Plan to Prevent HAIs, providing a roadmap for HAI prevention in acute care hospitals. In the first iteration of the Action Plan, the Steering Committee chose to focus on infections in acute care hospitals because the associated morbidity and mortality were most severe in that setting and the scientific information on prevention and the capacity for measure improvement was most complete. Thus, prevention of HAIs in acute care hospitals became the first phase of the Action Plan, and it focuses on six high priority HAI-related areas.

HAIs are largely preventable with widely publicized interventions such as better hygiene and advanced scientifically tested techniques for surgical patients. Therefore, the public reporting of HAIs has been of great interest to many health care consumers and advocacy organizations because it promotes awareness and permits health care consumers to choose the hospitals with lower HAI rates, as well as gives hospitals an incentive to improve infection control efforts. We note that the House Committee on Appropriations asked in a 2009 Report that CMS include in its ''pay for reporting'' system for subsection (d) hospitals two infection control measures, one of which was a central line-associated bloodstream infections measure (H. Rep. No. 111–220, at 159 (2009)). In the Report, the Committee stated that ''[i]f the measures are included in *Hospital Compare,* the public reporting of the data is likely to reduce HAI occurrence, an outcome demonstrated in previous research.''

In the FY 2013 IPPS/LTCH proposed rule, we proposed to adopt two NQF-endorsed HAI measures for the FY 2014 PCHQR Program and subsequent program years: (1) National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure; and (2) National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure. These proposed measures were developed by the CDC and are currently collected by the CDC via the NHSN. We proposed to adopt these two measures for several reasons. First, we believe that these measures support the National Quality Strategy priority of patient safety as these measures focus on serious infections that can prolong patient hospital stays and increase the risk of mortality.[116] Second, the Technical Expert Panel (TEP) convened by our measure development contractor identified CLABSI and CAUTI as high priority quality issues for PCHs because they address an important area of quality measurement and have potential to promote improved outcomes. Third, the MAP reviewed these HAI measures and supported inclusion of them in the PCHQR Program because they address the National Quality Strategy's priority of safer care (see MAP Annual Pre-Rulemaking Final Report at: *http://www.qualityforum.org/Setting_Priorities/Partnership/Measure_Applications_Partnership.aspx*).

Fourth, these two HAI measures foster alignment with other our quality reporting programs. In the FY 2011 IPPS/LTCH PPS final rule, we adopted the CLABSI measure for the Hospital IQR Program. The CLABSI measure is currently being collected as part of the FY 2013 Hospital IQR Program measure set, and data submission on the measure began with January 2011 events.[117] In the Hospital IQR Program, collection of this measure is limited to ICU locations. This measure also has been adopted for the FY 2014 payment determination under the LTCHQR Program. For the LTCHQR Program, data collection for this measure extends to all inpatient locations in the LTCH.

In the FY 2012 IPPS/LTCH PPS final rule, we adopted the Catheter Associated Urinary Tract Infection (CAUTI) rate per 1,000 urinary catheter days for Intensive Care Unit Patients measure for both the FY 2014 Hospital IQR and LTCHQR measure sets. In the Hospital IQR Program, collection of this measure is limited to ICU locations; for the LTCHQR Program, collection of this measure extends to all inpatient locations except neonatal ICUs. This measure is a high priority HAI measure that is included among the prevention metrics established in the HHS Action Plan to Prevent HAIs, which, as we noted above, underscores the importance of reducing HAIs.

We proposed to collect data for these two HAI measures via the NHSN, which is a secure, Internet-based surveillance system maintained and managed by the CDC, and can be used by many types of health care facilities in the United States, including acute care hospitals, cancer hospitals, long term care hospitals, psychiatric hospitals, rehabilitation hospitals, outpatient dialysis centers, and ambulatory surgery centers. The NHSN enables health care facilities to collect and use data about HAIs, adherence to clinical practices known to prevent HAIs, the incidence or prevalence of multidrug-resistant organisms within their organizations, and other adverse events.

Some States use the NHSN as a means for health care facilities to submit patient-level data on measures mandated through their specific State legislation. Currently, 28 States require hospitals to report HAIs using the NHSN, and the CDC provides support to more than 5,000 hospitals that are using the NHSN.

NHSN data collection occurs via manual data entry into a Web-based tool hosted by the CDC provided without charge to providers and via electronic reporting by providers directly to NHSN. The NHSN Agreement to Participate and Consent Form specifies the purposes to which NHSN data are put, including enabling providers, such as cancer hospitals, to report data via NHSN to CMS in fulfillment of CMS's quality measurement reporting requirements for those data.

In addition, we understand from the CDC that data submission for HAI measures through electronic health record technology (EHRs) may be possible in the near future, and this would further reduce the reporting burden for PCHs.

Comment: Two commenters supported using the CDC/NHSN as a data collection mechanism for the two proposed HAI measures because it is less burdensome than chart abstraction.

Response: We agree that the NHSN data collection mechanism is less burdensome than chart abstraction and aligns with HAI measures in other quality reporting programs.

(A) Central Line-Associated Blood Stream Infections Measure ((CLABSI), NQF #0139)

The proposed CLABSI measure was originally developed by CDC to assess the percentage of ICU and high-risk nursery patients who, over a certain amount of days, acquired central line catheter-associated bloodstream infections. CDC recently updated this measure to expand the care setting to all inpatient settings (not just ICUs). As indicated previously, the measure has been renamed the National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure and we proposed to adopt this measure for use for the FY 2014 program and subsequent program years. This measure is considered an outcome measure by the

[116] CDC/NHSN Manual. Device-Associated Module, CLABSI Event. Available at *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf*, accessed on January 20, 2011.

[117] The CDC captures HAI data based on the onset of an event, rather than based on the discharge date.

NQF because it assesses the results of the quality of care provided to patients; it is risk-adjusted in that the observed infection rate for a particular location or locations in a hospital is compared to an expected infection rate for those locations (which is calculated using national NHSN data for those locations in a predictive model). Measure specifications may be accessed at: *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf.*

A central line is a catheter that health care providers often place in a large vein in the neck, chest, or groin to give medication or fluids or to collect blood for medical tests. Many patients are discharged from short-term acute care hospital intensive care units (ICUs) or ICU stepdown units with these central lines in place.

Bloodstream infections are usually serious infections typically causing a prolongation of hospital stay and increased cost and risk of mortality.[118] An estimated 248,000 bloodstream infections occur in U.S. hospitals each year.[119] Furthermore, despite the preventability of these infections, CLABSIs result in thousands of deaths each year and billions of dollars in added costs to the U.S. health care system. CDC is providing guidelines and tools to the health care community to help reduce central line catheter-associated bloodstream infections. CLABSIs can be prevented through proper management of the central line. CDC's Healthcare Infection Control Practices Advisory Committee (CDC/HICPAC) *Guidelines for the Prevention of Intravascular Catheter-Related Infections* recommends evidence-based central line insertion practices known to reduce the risk of subsequent central line-associated bloodstream infection.[120] These include hand-washing by inserters, use of maximal sterile barriers during insertion, proper use of a skin antiseptic prior to insertion, and allowing that skin antiseptic to dry before catheter insertion. Despite the scientific evidence supporting these practices, several reports suggest that adherence to these practices remains low in U.S. hospitals.

This measure is NQF-endorsed and, therefore, meets the requirement of section 1866(k)(3)(A) of the Act, which states that quality measures selected for the PCHQR Program must be endorsed by the entity with a contract under section 1890(a) of the Act.

We invited public comment on our proposal to adopt the NHSN Central Line-Associated Bloodstream Infection (CLABSI) outcome measure for the PCHQR Program for collection in both ICU and non-ICU locations for the FY 2014 program and subsequent program years.

Comment: Two commenters supported the inclusion of this measure in the PCHQR program. A commenter supported the recently updated measure specifications to include non-ICU locations.

Response: We thank the commenters for the support of the measure and its expansion into non-ICU locations. We believe the measure expansion beyond ICU locations will provide a more comprehensive picture of how prevalent CLABSIs are throughout a PCH.

Comment: One commenter opposed the inclusion of the CLABSI measure in its current form. The commenter was concerned that this measure may mislead consumers about the quality of care provided at cancer centers. The commenter asserted that cancer patients while under treatment often have comprised immune systems, which cause them to be more prone to contract HAIs such as CLABSI. The commenter also pointed out that stem cell transplantation can sometimes cause bacteria from the gastrointestinal tract to enter the bloodstream and cause infection. The commenter strongly urged CMS to delay the adoption of this measure until the measure is stratified and risk-adjusted based on stakeholder input.

Response: While we recognize the complexity of treating hospital-acquired infections in patients with compromised immune systems, we also believe it is important to track HAI rates at all hospitals for all patients—regardless of whether they are immune-compromised or not. The current NQF-endorsed CLABSI measure does not contain adjustments for immune-compromised patients. For all hospitals, CLABSI is stratified by CDC-specified ICU and Specialty Care Area (SCA) locations, and oncology locations would be included as SCAs, making the measure appropriate for PCHs.

After consideration of the public comments we received, we are finalizing the CLABSI measure (NQF #0139) for the PCHQR Program for FY 2014 and subsequent program years.

(B) Catheter Associated Urinary Tract Infection Measure ((CAUTI), NQF #0138)

The catheter-associated urinary tract infection (CAUTI) measure was developed by CDC to measure the percentage of patients with CAUTIs in the ICU context. CDC has recently updated the specifications of this measure to include all inpatient settings (not just ICUs). This measure has been renamed as National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure, and we proposed to adopt this measure for use in the FY 2014 program and subsequent program years. This measure is considered an outcome measure as it relates to the results of the quality of care provided to patients; it is risk adjusted by which the observed infection rate for a particular location in a hospital is compared to an expected infection rate calculated based on the specific location within other facilities that report to the NHSN. Measure specifications may be accessed at: *http://www.cdc.gov/nhsn/PDFs/pscManual/7pscCAUTIcurrent.pdf.*

The urinary tract is the most common site of HAIs, accounting for more than 30 percent of infections reported by acute care hospitals.[121] Healthcare-associated urinary tract infections (UTIs) are commonly attributed to catheterization of the urinary tract. CAUTI can lead to such complications as cystitis, pyelonephritis, gram-negative bacteremia, prostatitis, epididymitis, and orchitis in males and, less commonly, endocarditis, vertebral osteomyelitis, septic arthritis, endophthalmitis, and meningitis in all patients. Complications associated with CAUTI cause discomfort to the patient, prolonged hospital stay, and increased cost and mortality. Each year, more than 13,000 deaths are associated with UTIs.[122] Prevention of CAUTIs is discussed in the CDC/HICPAC document, *Guideline for Prevention of Catheter-associated Urinary Tract Infections,* which includes recommendations for proper insertion techniques, including hand washing, insertion by trained staff, use of sterile gloves, drapes, sponges and antiseptic

[118] CDC/NHSN Manual. Device-Associated Module, CLABSI Event. Available at *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf,* accessed on January 20, 2011.

[119] Klevens RM, Edward JR, *et al.* Estimating health care-associated infections and deaths in U.S. hospitals, 2002. Public Health Reports 2007; 122:160–166.

[120] O'Grady NP, Alexander M, Dellinger EP, Gerberding JL, Heard SO, Maki DG, *et al.,* Guidelines for the prevention of intravascular catheter-related infections. MMWR 2002; 51 (No. RR–10:1–26).

[121] Klevens RM, Edward JR, *et al.,* Estimating health care-associated infections and deaths in U.S. hospitals, 2002. Public Health Reports 2007; 122:160–166.

[122] Wong ES., Guideline for prevention of catheter-associated urinary tract infections. Infect Control 1981; 2:126–30.

or sterile solution for cleaning and lubricant jelly for insertion.[123]

UTIs are a major cause of morbidity and mortality. The HHS Action Plan to Prevent HAIs identified catheter associated urinary tract infections as the leading type of HAI that is largely preventable, and the occurrence of which can be drastically reduced in order to reduce adverse health care related events and avoid excess costs.

This measure is NQF-endorsed and, therefore, meets the requirement of section 1866(k)(3)(A) of the Act, which states that quality measures selected for the PCHQR Program be endorsed by the entity with a contract under section 1890(a) of the Act, unless section 1866(k)(3)(B) of the Act applies.

We invited public comment on our proposal to adopt the NHSN Catheter-Associated Urinary Tract Infection (CAUTI) outcome measure for the PCHQR Program for collection in both ICU and non-ICU locations within a facility to align with the recently-expanded NQF-endorsed measure specifications for the FY 2014 program and subsequent program years.

Comment: Two commenters supported the inclusion of this measure in the PCHQR program.

Response: We thank the commenters for the support of this measure.

Comment: One commenter opposed the inclusion of the CAUTI measure in its current form. The commenter was concerned that this measure may mislead consumers about the quality of care provided at cancer centers. The commenter asserted that cancer patients while under treatment often have comprised immune systems which cause them to be more prone to contract hospital-acquired infections such as CAUTI. The commenter strongly urged CMS to delay the implementation of this measure until the measure is stratified and risk-adjusted based on stakeholders input.

Response: While we recognize the complexity of treating HAIs in patients with compromised immune systems, such as those treated at PPS-exempt cancer hospitals, we also believe it is important to track HAI rates at all hospitals for all patients—regardless of whether they are immune-compromised or not. The current NQF-endorsed CAUTI measure does not contain adjustments for immune-compromised patients. For all hospitals, CAUTI is stratified by CDC-specified ICU and Specialty Care Area (SCA) locations, and oncology locations would be included as SCAs, making the measure appropriate for PCHs.

After consideration of the public comments we received, we are finalizing the CAUTI measure (NQF #0138) for the PCHQR Program for FY 2014 and subsequent program years.

(2) Cancer-Specific Measures

We proposed to adopt three measures related to the treatment of colon cancer and two types of breast cancer (hormone receptor-negative and hormone receptor-positive). Specifically, these proposed measures are: (i) Adjuvant chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC III (lymph node positive) colon cancer (NQF #0223); (ii) Combination chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer (NQF #0559); and (iii) Adjuvant hormonal therapy (NQF #0220). The proposed measures were developed by the American College of Surgeons/Commission on Cancer.

We proposed to adopt these three cancer treatment-related quality measures for several reasons. First, trends in national cancer incidence rates suggest that breast and colon cancer will become two of the more common diagnoses [124] and these cancers are highly prevalent among Medicare beneficiaries. We believe the high incidence of these types of cancer creates an opportunity for measurements to make an impact on the quality of cancer care. Second, these measures support the National Quality Strategy's priority to promote the most effective prevention and treatment practices for the leading causes of mortality due to cancer. Third, the TEP convened by our measure development contractor identified the treatment of breast and colon cancer as high priority quality issues for PCHs due to the high incidence of these types of cancers and rated these measures highest compared to other potential program measures based on an assessment of the importance, scientific acceptability, usability, and feasibility of these measures. Also, participants in a CMS-convened Listening Session on September 8, 2011 expressed support for the proposed measures. The transcript for this Listening Session can be found at: *http://www.cms.gov/HospitalQualityInits/05_HospitalHighlights.asp#TopOfPage*. Fourth, the MAP reviewed these cancer-specific measures and supported inclusion of these measures in the PCHQR Program. All of the three proposed cancer-specific measures are NQF-endorsed; therefore they satisfy the requirement of section 1866(k)(3)(A) of the Act relating to the selection of endorsed measures for the PCHQR Program. Furthermore, section 1866(k)(4) of the Act provides that quality measures reported in the PCHQR Program should assess process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to PCHs. We believe these three proposed cancer-specific measures meet the above statutory criteria, as they track important processes in the treatment of colon and breast cancer.

Although these measures are not currently reported in other HHS programs, they are reported by over 1,500 cancer programs as part of their accreditation by the Commission on Cancer, a program of the American College of Surgeons (see *http://www.facs.org/cancer/ncdb/index.html*), further indicating their importance as the Commission on Cancer has taken a leading role in establishing national standards to ensure quality in the provision of cancer care.

We proposed that PCHs would submit the data needed to calculate these measures to a CMS contractor.

(A) Adjuvant Chemotherapy Is Considered or Administered Within 4 Months (120 days) of Surgery to Patient Under the Age of 80 With AJCC III (Lymph Node Positive Colon Cancer) (NQF #0223)

This proposed measure examines whether adjuvant chemotherapy is delivered within a specified period of time after a diagnosis of colon cancer. Specifically, it looks at the proportion of patients 18–79 with AJCC Stage III (lymph node positive) colon cancer for whom adjuvant chemotherapy is considered or administered within 4 months of diagnosis. Stage III colon cancer is colon cancer that has spread outside the colon to one or more lymph nodes. The adjuvant chemotherapy measure is a process measure as it addresses whether a defined treatment was delivered to a patient; the measure is not risk adjusted. That is, the measure does not attempt to account for hospital patient populations or other differences between hospitals. Rather, it only assesses the specific process was performed. Detailed specifications for this proposed measure can be accessed on the Web site of the measure steward, the American College of Surgeons at:

[123] Gould CV, Umscheid CA, Agarwal RK, Kuntz G, Pegues DA, *et al.,* Guideline for prevention of catheter-associated urinary tract infections. Infect Control 2009; 31:319–326.

[124] Siegel R, Naishadham D, Jemal A. Cancer statistics, 2012. CA Cancer J Clin 2012; 62:10–29.

http://www.facs.org/cancer/ncdb/colonmeasures.pdf. Additionally, CMS will provide a link to the Specifications Manual on the QualityNet Web site.

Colorectal cancer plays a sizeable role in affecting both health and health care costs in the United States. The American Cancer Society estimates that 51,690 Americans will die of colorectal cancer in 2012 [125]. According to the National Cancer Institute, more than $14.1 billion was spent on colorectal cancer in 2010.[126]

Appropriate treatment may improve survival rates and reduce the likelihood of costly recurrence. Strong evidence suggests that treating Stage III colon cancer patients with adjuvant chemotherapy improves overall survival and disease-free survival.[127] In addition to being supported by evidence, this measure is consistent with the National Comprehensive Cancer Network's (NCCN) guidelines for the treatment of colon cancer (COL–4: T3–4, N1–2, MO), which recommend that colon cancer patients should receive adjuvant chemotherapy.

Section 1866(k)(3)(A) of the Act requires quality measures selected for the PCHQR Program to be endorsed by the entity with a contract under section 1890(a) of the Act, unless 1866(k)(3)(B) applies. This measure is NQF-endorsed and therefore, it meets the statutory endorsement requirements.

We invited public comment on our proposal to adopt the adjuvant chemotherapy is considered or administered within 4 months (120 days) of surgery to patient under the age of 80 with AJCC III (lymph node positive colon cancer) measure for the PCHQR Program for the FY 2014 program and subsequent program years.

Comment: Many commenters supported the inclusion of this measure and noted that it is already widely used in PCHs.

Response: We appreciate the support for this measure.

After consideration of the public comment we received, we are finalizing our adoption of the adjuvant chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC III (lymph node positive colon cancer) measure (NQF #0223) for FY 2014 and subsequent program years.

(B) Combination Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis for Women under 70 With AJCC T1c, or Stage II or III Hormone Receptor Negative Breast Cancer (NQF #0559)

This proposed measure assesses the proportion of women ages 18–69 who have their first diagnosis of breast cancer at AJCC Stage IC, II or III and whose primary tumor is hormone (estrogen and progesterone) receptor negative for whom combination chemotherapy is considered or administered within 4 months of diagnosis. Hormone receptor negative means that hormones, such as estrogen, do not drive tumor growth. This measure is a process measure as it addresses whether a defined treatment was delivered to a patient; the measure is not risk adjusted in that the measure does not attempt to account for differences in hospital patient populations or other differences between hospitals. Detailed specifications for this proposed measure can be accessed on the Web site of the measure steward, the American College of Surgeons, at: *http://www.facs.org/cancer/ncdb/breastmeasures.pdf*. In addition, CMS will provide a link to the Specifications Manual on the QualityNet Web site.

The number of deaths from breast cancer has declined while spending has increased. The American Cancer Society estimates that 39,510 Americans will die of breast cancer in 2012.[128] Spending on breast cancer care is higher than for any other type of cancer. According to the National Cancer Institute, more than $16.5 billion was spent on breast cancer care in 2010.[129] Evidence shows that treating hormone receptor negative breast cancer patients with combination chemotherapy is associated with a reduced risk of relapse or death.[130] This measure is also consistent with NCCN's guidelines for the treatment of invasive breast cancer (BINV–4, 7–8), which recommend adjuvant chemotherapy for patients with hormone receptor negative tumors, and therefore the measure aligns with recognized standards of treatment.

This measure is NQF-endorsed and, therefore, it meets the requirements under section 1866(k)(3)(A) of the Act which states that quality measures selected for the PCHQR Program be endorsed by the entity with a contract under section 1890(a) of the Act, unless section 1866(k)(3)(B) of the Act applies.

We invited public comment on our proposal to adopt the combination chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer (NQF #0559) quality measure for the PCHQR Program for the FY 2014 program and subsequent program years.

Comment: One commenter supported the inclusion of this measure and noted that it is already widely used in PCHs.

Response: We appreciate the support for this measure.

After consideration of the public comment we received, we are finalizing our adoption of the combination chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer measure (NQF #0559) for FY 2014 and subsequent program years.

(C) Adjuvant Hormonal Therapy (NQF #0220)

This proposed measure assesses whether recommended treatment is delivered within a specified period of time from a patient's breast cancer diagnosis. Specifically, it tracks the proportion of eligible women 18 years or older who have their first diagnosis of breast cancer at AJCC T1c or Stage II or III and whose primary tumor is hormone (estrogen or progesterone) receptor positive breast cancer for whom tamoxifen or a third generation aromatase inhibitor is considered or administered within 1 year of diagnosis. Hormone receptor positive means that estrogen or progesterone promotes the growth of cancer cells. This measure is a process measure as it relates to whether a defined treatment was furnished to a patient; it is not risk adjusted. Detailed specifications for this proposed measure can be accessed on the Web site of the measure steward, the American College of Surgeons, at: *http://www.facs.org/cancer/ncdb/breastmeasures.pdf*. Additionally, we will provide a link to the Specifications Manual on the QualityNet Web site.

The American Cancer Society estimates that two-thirds of breast cancer cases are hormone receptor

[126] Mariotto AB, Yabroff KR, Shao Y, Feuer EJ, and Brown ML. Projections of the Cost of Cancer Care in the United States: 2010–2020. JNCI 2011; 103:117–128.

[127] André T, Boni C, Navarro M, *et al.* Improved Overall Survival With Oxaliplatin, Fluorouracil, and Leucovorin as Adjuvant Treatment in Stage II or III Colon Cancer in the MOSIAC Trial. J Clin Onc 2009; 27:3109–3116.

[128] Siegel R, Naishadham D, Jemal A. Cancer statistics, 2012. CA Cancer J Clin 2012; 62:10–29.

[129] Mariotto AB, Yabroff KR, Shao Y, Feuer EJ, and Brown ML. Projections of the Cost of Cancer Care in the United States: 2010–2020. J Natl Cancer Inst 2011; 103:117–128.

[130] Fisher B, Jeong JH, Anderson S, *et al.:* Treatment of axillary lymph node-negative, estrogen receptor-negative breast cancer: Updated findings from National Surgical Adjuvant Breast and Bowel Project clinical trials. J Natl Cancer Inst 96 (24): 1823–31, 2004.

positive.[131] As stated previously, appropriate and effective treatment is important to both the health and cost outcomes of breast cancer care. The measure is consistent with NCCN's guidelines (BINV–5, 6 and 9 and BINV–E) for the treatment of invasive breast cancer, which recommend hormone therapy for patients with hormone receptor positive breast cancer, and with the American Society of Clinical Oncology's (ASCO) Update on adjuvant endocrine therapy for women with hormone receptor positive breast cancer. The ASCO guideline cites a wide body of supporting evidence for this method of treatment.

This measure is NQF-endorsed and therefore, it meets the requirement under section 1866(k)(3)(A) of the Act, which states that quality measures selected for the PCHQR Program be endorsed by the entity with a contract under section 1890(a) of the Act, unless section 1866(k)(3)(B) of the Act applies.

We invited public comment on our proposal to adopt the adjuvant hormonal therapy measure for the PCHQR Program for the FY 2014 program and subsequent program years.

Comment: Many commenters supported the inclusion of this measure and noted that it is already widely used in PCHs.

Response: We appreciate the support for this measure.

After consideration of the public comment we received, we are finalizing the adjuvant hormonal therapy measure (NQF #0220) for FY 2014 and subsequent program years.

After consideration of the public comments we received, we are finalizing all five measures as proposed for the FY 2014 PCHQR Program and subsequent program years. The measures we are adopted are shown below.

Topic	Final measures for PCHQR program beginning with FY 2014 program and subsequent program years
Safety and Healthcare Acquired Infections—HAI.	• (NQF#0139) NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure. • (NQF#0138) NHSN Catheter-Associated Urinary Tract Infections (CAUTI) Outcome Measure.
Cancer-Specific Treatments	• (NQF#0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC III (lymph node positive) colon cancer. • (NQF#0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer. • (NQF#0220) Adjuvant Hormonal Therapy.

4. Possible New Quality Measure Topics for Future Years

We seek to develop a comprehensive set of quality measures to be available for widespread use for informed decision-making and quality improvement in the cancer hospital setting. Therefore, through future rulemaking, we intend to propose new measures that help us further our goal of achieving better health care and improved health for Medicare beneficiaries who obtain cancer services through the widespread dissemination and use of performance information. In addition, we are considering initiating a call for input to assess the following measure domains: clinical quality of care, care coordination, patient safety, patient and caregiver experience of care, population/community health and efficiency. We believe this approach will promote better cancer care while bringing the PCHQR Program in line with other established quality reporting and pay for performance programs such as the Hospital IQR Program, the Hospital OQR Program, the ESRD QIP, and others within CMS' purview.

We welcomed public comment and suggestions for these, or other, measurement areas.

Comment: One commenter urged CMS to expand the PCHQR Program to include measures regarding patient-centered outcomes specific to oncology, quality of life, and functional assessment. Specifically, the commenter recommended the Comfortable Dying: Pain Brought to a Comfortable Level Within 48 Hours of Initial Assessment (NQF #0209) and Proportion Receiving Chemotherapy in the Last 14 Days of Life (NQF #0210) measures. Further, the commenter noted CMS should expand the PCHQR Program to include measures for additional cancer types. Specifically, the commenter recommended the Recording of Clinical Stage for Lung Cancer (and Esophageal Cancer Resection (NQF #0455) and Recording of Performance Status Prior to Lung Esophageal Cancer Resection (NQF #0457) measures.

Response: We appreciate the commenter for the suggestions and will take them into consideration for future measure selection.

Comment: One commenter recommended the development or adoption of a measure to address the risk of febrile neutropenia in cancer patients undergoing myelosuppressive chemotherapy since this is consistent with a measure gap identified by NQF.

Response: We thank the commenter for the suggestion and will take it into consideration for future measure selection.

Comment: One commenter suggested a measure to detect early diagnosis of cancer. Another commenter requested that CMS focus on measures that provide data on risk-adjusted state-specific survival curves for various types of cancer and report these measures in three separate perspectives: stage, overall survival, and disease-free survival.

Response: We agree with the commenters that these are important aspects in cancer detection and treatment. We thank the commenters for the suggestions and will take them into consideration for future measure selection.

5. Maintenance of Technical Specifications for Quality Measures

Many of the quality measures used in different Medicare and Medicaid reporting programs are NQF-endorsed. As part of its regular maintenance process for endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes to NQF on an annual basis. NQF solicits information from measure stewards for annual reviews and in order to review measures for continued endorsement in a specific 3-year cycle.

Through NQF's measure maintenance process, NQF endorsed measures are sometimes updated to incorporate

[131] American Cancer Society. Breast Cancer Hormone Therapy. *http://www.cancer.org/Cancer/BreastCancer/DetailedGuide/breast-cancer-treating-hormone-therapyLastrevised01/06/2012.*

changes that we believe do not substantially change the nature of the measure. Examples of such changes could be updated diagnosis or procedure codes, changes to exclusions to the patient population, definitions, or extension of the measure endorsement to apply to other settings. We believe these types of maintenance changes are distinct from more substantive changes to measures that result in what are considered new or different measures, and that they do not trigger the same agency obligations under the Administrative Procedure Act. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28066), we proposed that if the NQF updates an endorsed measure that we have adopted for the PCHQR Program in a manner that we consider to not substantially change the nature of the measure, we would use a subregulatory process to incorporate those updates to the measure specifications that apply to the program. Specifically, we would revise the Specifications Manual so that it clearly identifies the updates and provide links to where additional information on the updates can be found. We would also post the updates on the CMS QualityNet Web site at *https://www.QualityNet.org*. We would provide sufficient lead-time for PCHs to implement the changes where changes to the data collection systems would be necessary.

We would continue to use the rulemaking process to adopt changes to measures that we consider to substantially change the nature of the measure. We believe that this proposal adequately balances our need to incorporate NQF updates to NQF-endorsed PCH measures in the most expeditious manner possible, while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We invited public comment on this proposal.

We also proposed to provide a Specifications Manual that will contain links to measure specifications, data abstraction information, data submission information, and other information necessary for PCHs to participate in the PCHQR Program. This Specifications Manual would be posted on the QualityNet Web site at: *https://www.QualityNet.org*. We would maintain the technical specifications for the quality measures by updating this Manual periodically, which would include detailed instructions for PCHs to use when collecting and submitting data on the required measures. These updates would be accompanied by notifications to PCHQR Program-participating users, providing sufficient time between the change and effective dates in order to allow users to incorporate changes and updates to the measure specifications into data collection systems. We would revise the Specifications Manual and provide links to reflect such endorsement changes which also would be posted on the QualityNet Web site at: *https://www.QualityNet.org*. We invited public comment on the previously described proposed policy on maintenance of technical specifications for quality measures.

Comment: One commenter objected to the proposed subregulatory process to incorporate updates arising from NQF maintenance review on an endorsed measure adopted for the PCHQR Program. The commenter believed CMS should provide an opportunity for the public to comment on the updates.

Response: The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF making updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates made by the NQF into the measure specifications we have adopted for the PCHQR Program so that these measures remain up-to-date. We also recognize that some changes the NQF might make to is endorsed measures are substantive in nature and might not be appropriate for adoption using a subregulatory process. Therefore, after consideration of the public comments we received, we are finalizing a policy under which we will use a subregulatory process to make nonsubstantive updates to NQF-endorsed measures used for the PCHQR Program. With respect to what constitutes a substantive versus nonsubstantive change, we expect to make this determination on a case-by-case basis. Examples of nonsubstative changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures used in the Hospital IQR and Hospital VBP Programs). We also believe that nonsubstantive changes might include updates to NQF-endorsed measures based upon changes to guidelines upon which the measure are based.

We will continue to use rulemaking to adopt substantive updates made by the NQF to the endorsed measures we have adopted for the PCHQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent (for example, changes in acceptable timing of medication, procedure/process, or test administration). Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to hospice. We also note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process.

These policies regarding what is considered substantive versus nonsubstantive changes would apply to all PCHQR Program measures.

After consideration of the public comments we received, we are adopting a policy for making updates to PCHQR Program measures as explained in the response to the comment above.

6. Public Display Requirements for the FY 2014 Program and Subsequent Program Years

Section 1866(k)(4) of the Act requires the Secretary to establish procedures for making the data submitted under the PCHQR Program available to the public. Such procedures shall ensure that a PCH has the opportunity to review the data that is to be made public with respect to the hospital prior to such data being made public. Section 1866(k)(4) of the Act also provides that the Secretary shall report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished in such hospital on the CMS Web site. In order to meet these requirements, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28066), we proposed to publicly display the submitted data on the *Hospital Compare* Web site (*http://www.hospitalcompare.hhs.gov/*). Before the data are publicly displayed, we proposed that PCHs will have the opportunity to review their data prior to the public reporting of the measure rates consistent with section 1866(k)(4) of the Act. We proposed that PCHs have the opportunity to review their data 30 days prior to the public reporting of the measure rates because that aligns with our established preview process under the Hospital IQR Program.

The *Hospital Compare* Web site serves to encourage consumers to work with their doctors and hospitals to discuss the quality of care hospitals provide to patients, thereby providing an additional incentive to hospitals to

improve the quality of care that they furnish.

However, some information that may not be relevant to or easily understood by beneficiaries and information for which there are unresolved display issues or design considerations that may not make them suitable for inclusion on the *Hospital Compare* Web site may be made available on other CMS Web sites, such as *http://www.cms.gov* and/or *http://www.qualitynet.org*. In such circumstances, affected parties would be notified via CMS listservs, CMS email blasts, and QualityNet announcements regarding the release of confidential hospital-specific preview reports to individual hospitals followed by the posting of data on a CMS Web site other than *Hospital Compare.*

We invited public comment on the previously described proposals regarding the public display of quality measures.

After consideration of the public comments we received we are adopting our proposals, without modification, regarding the public display of data submitted under the PCHQR Program.

7. Form, Manner, and Timing of Data Submission for FY 2014 Program and Subsequent Program Years

a. Background

Section 1866(k)(2) of the Act requires that, for the FY 2014 program and each subsequent program year, each PCH must submit to the Secretary data on quality measures specified under section 1866(k)(3) of the Act in a form and manner, and at a time as specified by the Secretary.

The complete data submission requirements and submission deadlines will be posted on the QualityNet Web site at: *http://www.QualityNet.org/*. In general, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28067), we proposed that PCHs submit data to the CDC for the HAI measures (CLABSI and CAUTI), and the CMS contractor for the three cancer-specific measures (Adjuvant Chemotherapy for Stage III Colon Cancer; Combination Chemotherapy for AJCC T1c or Stage II or III Hormone Receptor-Negative Breast Cancer; and Adjuvant Hormonal Therapy). As described below, we proposed to utilize the data submission and reporting standard procedures that have been established by CDC for NHSN participation in general and for submission of the proposed HAI measures to NHSN. We refer readers to the CDC's Web site for detailed data submission and reporting procedures. We also proposed procedures for PCHs to follow when submitting data on the three proposed cancer-specific measures.

b. Procedural Requirements for FY 2014 Program and Subsequent Program Years

In order to participate in the PCHQR Program for the FY 2014 program and subsequent program years, we proposed that PCHs must comply with the procedural requirements outlined in this section. We stated that we have aligned these proposed procedural requirements with the Hospital IQR Program to the extent possible to streamline the procedural requirements across different types of providers. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28067), we proposed that PCHs must do the following:

- Register with QualityNet prior to reporting and regardless of the method used for submitting the data.
- Identify QualityNet Administrator(s) who will follow the registration process located on the QualityNet Web site (*http://www.QualityNet.org*).
- Complete an online Data Accuracy and Completeness Acknowledgement (DACA) via QualityNet, which states that the quality measure results and any and all data including numerator and denominator data provided, are accurate and complete. We proposed that, beginning with the FY 2015 program, the deadline for submitting the DACA would be August 31 of the preceding fiscal year. For more information on DACA, please refer to the section below entitled, ''Data Accuracy and Completeness Acknowledgement (DACA) Requirements for the FY 2014 Program and Subsequent Program Years.''
- Enroll in CDC/NHSN and register with the CMS contractor collecting the cancer-specific measures prior to reporting.

We strongly encouraged PCHs to complete an online Notice of Participation (NOP) via QualityNet. This form would grant CMS written authorization from the PCH to publicly report the PCH's measure rate on a CMS Web site. We believe that requiring PCHs to complete this form will inform and educate them about program and other related requirements.

PROPOSED CMS NOTICE OF PARTICIPATION TIMEFRAME

Program year (fiscal year)	Notice of Participation (NOP) deadline
FY 2014	August 15, 2013.
FY 2015	August 15, 2014.
Subsequent Fiscal Years.	August 15 of the preceding fiscal year.

Comment: One commenter supported NHSN and CMS QualityNet enrollment and registration prior to data submission.

Response: We appreciate the commenter for the support of our proposal.

Comment: Several commenters urged CMS to use American College of Surgeons (ACoS) to serve as the CMS contractor for the following reasons: 10 out of 11 PCHs are currently submitting the cancer-specific measures to ACoS; ACoS is the cancer-specific measures developer and maintains the rights to these measures; and ACoS has in place sound methodologies for data validation and measure calculations. One commenter stated that the PCHQR Program data submission requirement could pose a ''sizeable expense for each participating institution and a significant time investment.''

Response: We recognize the concerns surrounding the burden of participating in the PCHQR Program and the possibility that PCHs might be reporting similar or the same cancer-specific measure data to two different entities. We are currently procuring the services of a contractor to collect the cancer-specific measure data. We intend to align as much as possible with the ACoS data infrastructure and reporting format in an effort to minimize the reporting burden, because we recognize that this is the process already being used by the majority of PCHs to report this data.

Comment: Commenters asked for more information regarding registering with the CMS contractor and the flow of data from the PCHs to CMS' QualityNet Web site.

Response: We intend to procure a CMS contractor, which will collect the cancer-specific measure data from the PCHs, calculate the measure rates, and submit those rates to CMS. Once we have procured a contractor, PCHs will have to register with the contractor prior to the time when they begin to submit cancer-specific measure data. We anticipate awarding a contract in the fall of 2012, and will outline more detailed instructions at that time.

After consideration of the public comments we received, we are finalizing the procedural requirements for the FY 2014 program and subsequent program years.

c. Reporting Mechanisms for the FY 2014 Program and Subsequent Program Years

For the purpose of reporting quality measures under the PCHQR Program, we proposed to adopt the following data submission mechanisms. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28067), with respect to the proposed HAI measures (CLABSI and CAUTI), we proposed that PCHs submit the data to the CDC through the NHSN database. We proposed to use the data submission and reporting standard procedures that have been set forth by CDC for NHSN participation in general and for submission of the proposed HAI measures to NHSN. We refer readers to the CDC's Web site (*http://www.cdc.gov/nhsn/*) for detailed data submission and reporting procedures. After the final submission deadline has passed, CMS will obtain the PCH-specific calculations that have been generated by the NHSN for the PCHQR Program.

With respect to the three proposed cancer-specific measures, we proposed that PCHs submit the data to the CMS contractor. The CMS contractor would then calculate the quality measures rates and submit those rates to CMS on a quarterly basis.

We invited public comment on our proposed reporting mechanisms.

(1) Reporting Mechanism for the HAI Measures

We proposed to adopt a quarterly submission process for the proposed HAI measures—CLABSI AND CAUTI—that uses a reporting mechanism similar to the one finalized for the Hospital IQR program (75 FR 50223) starting with October 1, 2012 infection events. We have successfully implemented this reporting mechanism in the Hospital IQR program and intend to use similar reporting mechanism to collect data for the PCHQR Program. We welcomed public comment on this proposal.

Comment: One commenter supported reporting HAI measures to NHSN.

Response: We appreciate the commenter's support.

(2) Reporting Mechanism for the Cancer-Specific Measures

We proposed to collect the three cancer-specific measures data using a CMS contractor starting with the FY 2014 program. Similar to the reporting mechanism we proposed to adopt the proposed HAI measures, we anticipate that PCHs would report their measure data to the contractor, which would then calculate the measure rates and submit those rates to CMS. We stated that if these proposed measures were finalized, we would publish the technical specifications and file layouts necessary for reporting in enough time to enable PCHs to incorporate any necessary changes to their information systems. We invited public comment on our proposed reporting requirements.

Comment: A commenter suggested leveraging existing ACoS data reporting requirements to reduce financial burden because the PCHQR program could pose a ''sizeable expense for each participating institution and a significant time investment.''

Response: We understand that the PCHQR Program will create a new reporting burden for PCHs, and as we have stated above, one of our goals is to minimize that burden as much as possible. For that reason, we intend to align the data collection process for the cancer-specific measures after the process currently used by the ACoS, the measure steward for these measures, because we recognize that this is the process already being used by the majority of PCHs to report this data.

After consideration of the public comment we received, we are finalizing the data reporting mechanisms described above.

d. Data Submission Timelines for the FY 2014 Program and Subsequent Program Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28067 through 28068), we proposed that PCHs must adhere to certain timelines in reporting their measure data.

PROPOSED PCHQR DATA SUBMISSION TIMELINES

Time line (calendar year)	Quality measures *	CMS submission deadline
Q4 (October–December 2012)	(NQF #0139) NHSN CLABSI Outcome Measure **	May 15, 2013.
	(NQF #0138) NHSN CAUTI Outcome Measure **	May 15, 2013.
	(NQF #0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer+.	August 15, 2013.
	(NQF #0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer+.	August 15, 2013.
	(NQF #0220) Adjuvant Hormonal Therapy+	May 15, 2014.
Q1 (January–March 2013)	(NQF #0139) NHSN CLABSI Outcome Measure **	August 15, 2013.
	(NQF #0138) NHSN CAUTI Outcome Measure **	August 15, 2013.
	(NQF #0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer+.	November 15, 2013.
	(NQF #0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer+.	November 15, 2013.
	(NQF #0220) Adjuvant Hormonal Therapy+	August 15, 2014.
Subsequent calendar quarters	(NQF #0139)NHSN CLABSI Outcome Measure **	November 15 of each respective year.
	(NQF #0138) NHSN CAUTI Outcome Measure **	November 15 of each respective year.
	(NQF #0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer+.	February 15 of each respective year.

PROPOSED PCHQR DATA SUBMISSION TIMELINES—Continued

Time line (calendar year)	Quality measures *	CMS submission deadline
	(NQF #0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer+.	February 15 of each respective year.
	(NQF #0220) Adjuvant Hormonal Therapy+	November 15 of each respective year.

* Referred to as the HAI and Cancer-Specific Treatment Quality Measures.
** HAI event occurred in applicable quarter.
+ Initial diagnosis in applicable quarter.

We stated that our principal rationale for these proposed timeframes is to align the HAI measure submission deadlines with existing CMS deadlines to collect the same quality measure information. We also seek to align our timeframes with those of the ACoS, which separately collects the same type of cancer-specific measure data from many PCHs. By aligning these deadlines by measure, we strive to reduce the reporting burden by using information already collected by many PCHs in their own quality measurement and improvement efforts. The proposed quarterly CDC/NHSN submission timeframes and deadlines also match the existing Hospital IQR quarterly submission timeframes for the same HAI measures. In the case of the three cancer-specific quality measures, we also believe that these proposed submission timeframes will give PCHs enough time to measure follow-up chemotherapy (4 months following the cancer diagnosis) and hormone therapy visits (12 months following the cancer surgery), as well as identify and correct discordant submitted data (2 months for the two proposed chemotherapy measures, and 3 months for the proposed adjuvant hormone therapy measure).

We invited public comment on the proposed data submission methods and timelines.

Comment: One commenter pointed out that PCHs may not have adequate time to submit HAI data by May 15, 2013 because PCHs may not be familiar with the data reporting processes and the reliability and validity of measures will not be fully tested in the new settings such as the PCHs.

Response: In further assessing the proposed data submission timeline, we agree with the commenter's concerns. We have also been informed by CDC that modifications to its IT infrastructure (for example, defining and mapping new locations) are on-going and will not be completed in time for the proposed first quarter of data submission (Q4 of 2012 [October–December, 2012]). Therefore, in response to this comment, we will finalize a one quarter data collection period for the two HAI measures (CLABSI and CAUTI) for purposes of the FY 2014 PCHQR Program. PCHs will be required to report data on this measure for 1st quarter 2013 events (that is, January 1–March 31, 2013 events), and that data will be due to the CDC on or before August 15, 201.

We believe that the reliability and validity of these two HAI measures is sufficient for purposes of the PCHQR Program. This reliability and validity has been demonstrated through collection of these measures in the Hospital IQR Program, and existing HAI reporting mandates in over 20 States. The NQF also endorsed these measures, and the MAP recommended these measures for purposes of PCHQR data collection.

We also strive to align data collection processes, public reporting of data, outreach, and education to PCHs with the Hospital IQR Program and other quality reporting programs to the extent feasible and clinically appropriate.

Comment: One commenter believed that this proposed reporting timeline violates the statute and its intent. The commenter viewed two provisions of the statute authorizing the PCHQR Program as relevant: the provision in section 1866(k)(2) of the Act, which requires that for FY 2014 and each subsequent fiscal year, PCHs ''shall submit to the Secretary data on quality measures specified under paragraph (3)''; and the provision in section 1866(k)(3)(C) of the Act which requires the Secretary to publish the measures applicable with respect to fiscal year 2014 by October 1, 2012. The commenter believed that it was unreasonable for CMS to conclude that Congress, in enacting this provision, would require the Secretary to announce the measures on the date that the measurement would begin. The commenter believed that Congress intended for the measures to be announced with sufficient lead time—a minimum of two years—for the PCHs to begin reporting. The commenter urged CMS to adopt a delay in mandatory reporting and to start mandatory measurement reporting no earlier than October 1, 2014.

Response: We believe that our proposals are consistent with sections 1866(k)(2) and (k)(3)(C) of the Act, and note that they are consistent with our approach we have taken in a number of other new quality reporting programs, including the Long-Term Care Hospital Quality Reporting (LTCHQR) Program and the Inpatient Rehabilitation Hospital (IRF) Quality Reporting Program.

However, we recognize that it may be difficult for PCHs to start reporting the cancer-specific measure data starting with 4th calendar quarter 2012 data because we do not expected to award a contract for the collection of this data until fall 2012. We believe that deferring the initial data reporting period until January 1, 2013 for the cancer-specific measure data addresses this concern, as well as makes the starting quarter for data collection consistent with that we are finalizing for the HAI measures. Accordingly, we are finalizing that the reporting period will begin on January 1, 2013 for all measures. This change is reflected in the table below.

Comment: Some commenters asked CMS to provide more information about the timeline for data submission and the frequency of public data displayed under the PCHQR Program for all measures. Commenters also requested alignment of the data submission timeline with that used for the Hospital IQR Program measures.

Response: We agree that the quality information displayed on the *Hospital Compare* Web site increases the transparency of the quality of care provided at PCHs and we appreciate the commenters for their support.

We recognize that we update many measures, including the two HAI measures, on a quarterly basis under the Hospital IQR Program. Because acute care hospitals already report HAI data

on a quarterly basis for purposes of the Hospital IQR Program, we believe that quarterly reporting of HAI data is also feasible for PCHs. We seek to align our public reporting and data collection frequency of PCH HAI data with Hospital IQR Program quarterly updates of HAI data. We believe that requiring quarterly data submissions beginning with 1st calendar quarter 2013 discharges will provide the public with more current information on the *Hospital Compare* Web site than our current annual data submission proposal.

We also intend to provide the public with the most currently available information on the three cancer-specific measures. We recognize that the ACoS currently collects data for these measures on a quarterly basis. We believe that our data collection schedule for the cancer-specific measures should align with some of the measures currently reported on the *Hospital Compare* Web site, which is on a quarterly basis. Data for many Hospital IQR and OQR chart-abstracted process of care measures are collected using quarterly submission deadlines, and measure rates are publicly displayed on the *Hospital Compare* Web site using quarterly updates to reflect the most current data.

We believe that quarterly data collection of both HAI and cancer-specific measure data is not unduly burdensome for PCHs because we understand that the vast majority of PCHs are currently reporting these data to the CDC and ACoS on at least a quarterly basis. We believe that aligning the data collection frequency and deadlines with other programs collecting similar information has the potential to reduce the data reporting burden for PCHs.

Accordingly, we are finalizing that beginning with the FY 2014 PCHQR Program, PCHs will be required to submit data on a quarterly basis. For purposes of the FY 2014 program, the only data that we will require is 1st quarter 2013 data, with that data being due by August 15, 2013 for the two HAI measures, and November 15, 2013 for: (1) Adjuvant chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC III (lymph node positive) colon cancer measure; and (2) Combination chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative breast cancer measure. Data will be due on May 15, 2014 for the adjuvant hormonal therapy measure. We are changing the due date for the adjuvant hormonal therapy measure because the measure is specified to include an assessment of the 12-month therapeutic effect from the time of diagnosis to hormonal therapy.

PCHs will also be required to submit data on all measures on a quarterly basis, and data will be due on or before the deadlines shown in Table 1 below. We are revising these deadlines because the timelines are in alignment with some of the current measures reported on the *Hospital Compare* Web site. For purposes of determining whether a PCH has met the reporting requirements for a particular program year, we will look at the data quarters submitted during the 12 months preceding the applicable fiscal year. For example, CMS would assess only CLABSI and CAUTI data submitted by August 15, 2013, for purposes of the FY 2014 payment determination. For the FY 2015 payment determination, we would assess quarterly data submission deadlines occurring between October 1, 2013 and September 30, 2014. In subsequent payment determination years, we would assess quarterly submission deadlines occurring in the previous fiscal year. The applicable discharge quarters applicable to an annual payment determination would vary by measure because the quarterly submission deadlines vary by measure.

After consideration of the public comments we received, we are finalizing data submission timelines for the PCHQR Program for FY 2014 and subsequent program years. PCHs will submit the data on the HAI and cancer-specific measures beginning with Q1 of CY 2013 (January through March 2013). Information on the data submission timeline for both the HAI measures and cancer-specific measures is listed in the table below.

FINAL PCHQR DATA SUBMISSION TIMELINES

Time Line (calendar year)	Quality measures *	CMS submission deadline
Q1 2013 (January–March 2013)	(NQF #0139) NHSN CLABSI Outcome Measure **	August 15, 2013.
	(NQF #0138) NHSN CAUTI Outcome Measure **	August 15, 2013.
	(NQF #0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer +.	November 15, 2013.
	(NQF #0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer +.	November 15, 2013.
	(NQF #0220) Adjuvant Hormonal Therapy + ...	May 15, 2014.
Subsequent calendar quarters	(NQF #0139) NHSN CLABSI Outcome Measure **	4 and ½ months following last quarterly event date.
	(NQF #0138) NHSN CAUTI Outcome Measure **	4 and ½ months following last quarterly event date.
	(NQF #0223) Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer +.	7 and ½ months following last quarterly admission date.
	(NQF #0559) Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer +.	7 and ½ months following last quarterly admission date.
	(NQF #0220) Adjuvant Hormonal Therapy + ...	13 and ½ months following last quarterly admission date.

* Referred to as the HAI and Cancer-Specific Treatment Quality Measures.
** HAI event occurred in applicable quarter, begins on January 1, 2013 and beyond.
+ Initial diagnosis in applicable quarter, begins on January 1, 2013 and beyond.

e. Data Accuracy and Completeness Acknowledgement (DACA) Requirements for the FY 2014 Program and Subsequent Program Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28068), we proposed that PCHs acknowledge their data accuracy and completeness once annually. PCHs would submit an electronic acknowledgement that the data provided to meet the applicable annual PCHQR Program data submission requirement is accurate and complete to the best of the facility's knowledge at the time of data submission. We proposed to begin annual DACA submission starting with the FY 2015 program, and such submission deadline would be due to CMS no later than August 31, 2014. We proposed to begin the DACA with the FY 2015 program in an effort to provide ample opportunity for the PCHs to become familiar with the reporting processes. Therefore, we did not propose submission of a DACA for the PCHQR Program for FY 2014. We proposed that the DACA submission deadline for each program year, beginning with FY 2015, be August 31 preceding the respective PCHQR Program year. We proposed August 31 as the DACA deadline for two reasons. First, requiring PCHs to acknowledge their data's accuracy and completeness by August 31 preceding the respective PCHQR Program year provides us with sufficient time to ensure compliance with the program by October 1, the start of the fiscal year. Secondly, we proposed this date to align our DACA deadline with other quality reporting programs, such as the Hospital IQR Program.

We invited public comment on our proposed data accuracy and completeness acknowledgement requirements.

Comment: Several commenters supported the proposed DACA requirements for the PCHQR Program.

Response: We appreciate the commenters for their support of our proposal.

Comment: One commenter stated that the process by which PCHs complete the DACA form does not ensure that publicly reported quality measures will be accurate because CMS has not proposed to validate the data.

Response: We are finalizing a requirement that, beginning with the FY 2015 PCHQR Program, PCHs participating in the PCHQR Program acknowledge the accuracy and completeness of their data to their best knowledge, which will provide us with some assurance that the submitted data are accurate. We would like to provide PCHs with an opportunity to become familiar with the new program before we consider establishing a process to validate the quality measure data. This approach is consistent with our approach to validation in the Hospital OQR Program during the initial years of the program. Initially, we want to encourage PCHs to begin reporting quality data and using the quality measure information for quality improvement purposes.

After consideration of the public comments we received, we are finalizing the DACA requirements for the FY 2014 and subsequent program years. These timeframes are shown below.

FINAL CMS DATA ACCURACY AND COMPLETENESS ACKNOWLEDGEMENT (DACA) TIMEFRAMES

Program year (fiscal year)	Data accuracy and completeness acknowledgement (DACA) deadline
FY 2014	Not required.
FY 2015	August 31, 2014.
Subsequent Fiscal Years.	August 31 of the preceding fiscal year.

C. Hospital Value-Based Purchasing (VBP) Program

1. Statutory Background

Section 1886(o) of the Act, as added by section 3001(a)(1) of the Affordable Care Act, requires the Secretary to establish a hospital value-based purchasing program (the Hospital Value-Based Purchasing (VBP) Program) under which value-based incentive payments are made in a fiscal year to hospitals that meet performance standards established for a performance period for such fiscal year. Both the performance standards and the performance period for a fiscal year are to be established by the Secretary.

Section 1886(o)(1)(B) of the Act states that the Hospital VBP Program applies to payments for hospital discharges occurring on or after October 1, 2012. In accordance with section 1886(o)(6)(A) of the Act, we are required to make value-based incentive payments under the Hospital VBP Program to hospitals that meet or exceed performance standards for a performance period for a fiscal year. As further required by section 1886(o)(6)(C)(ii)(I) of the Act, we will base each hospital's value-based payment percentage on the hospital's Total Performance Score (TPS) for a specified performance period. In accordance with section 1886(o)(7) of the Act, the total amount available for value-based incentive payments for a fiscal year will be equal to the total amount of the payment reductions for all participating hospitals for such fiscal year, as estimated by the Secretary. For FY 2013, the available funding pool will be equal to 1.00 percent of the base-operating DRG payments to all participating hospitals, as estimated by the Secretary, and the size of the applicable percentage will increase to 1.25 percent for FY 2014, 1.50 percent for FY 2015, 1.75 percent for FY 2016, and 2.0 percent for FY 2017 and successive fiscal years.

Section 1886(o)(1)(C) of the Act generally defines the term ''hospital'' for purposes of the Hospital VBP Program as a subsection (d) hospital (as that term is defined in section 1886(d)(1)(B) of the Act), but excludes from the definition of the term ''hospital,'' with respect to a fiscal year: (1) A hospital that is subject to the payment reduction under section 1886(b)(3)(B)(viii)(I) of the Act (the Hospital IQR Program) for such fiscal year; (2) a hospital for which, during the performance period for the fiscal year, the Secretary has cited deficiencies that pose immediate jeopardy to the health or safety of patients; and (3) a hospital for which there are not a minimum number (as determined by the Secretary) of measures that apply to the hospital for the performance period for the fiscal year involved, or for which there are not a minimum number (as determined by the Secretary) of cases for the measures that apply to the hospital for the performance period for such fiscal year.

2. Overview of the FY 2013 Hospital VBP Program

In April 2011, we issued the Hospital Inpatient VBP Program final rule to implement section 1886(o) of the Act (76 FR 26490 through 26547). As described more fully in that final rule, for the FY 2013 Hospital VBP Program, we adopted 13 measures, including 12 clinical process of care measures and 8 dimensions from the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (HCAHPS), that we categorized into two domains (76 FR 26495 through 26511). We grouped the

12 clinical process of care measures into a Clinical Process of Care domain, and placed the HCAHPS survey measure into a Patient Experience of Care domain. We adopted a 3-quarter performance period from July 1, 2011 through March 31, 2012 for these measures (76 FR 26494 through 26495), and performance standards on which hospital performance will be evaluated. To determine whether a hospital meets or exceeds the performance standards for these measures, we will assess each hospital's achievement during this specified performance period, as well as its improvement during this period as compared with its performance during a 3-quarter baseline period from July 1, 2009 through March 31, 2010 (76 FR 26493 through 26495).

We will then calculate a TPS for each hospital by combining the greater of the hospital's achievement or improvement points for each measure to determine a score for each domain, weighting each domain score (for the FY 2013 Hospital VBP Program, the weights will be clinical process of care = 70 percent, patient experience of care = 30 percent), and adding together the weighted domain scores. We will convert each hospital's TPS into a value-based incentive payment percentage using a linear exchange function and will then convert the value-based incentive payment percentage into a per discharge value-based incentive payment amount. We will incorporate the reduction to each hospital's base operating DRG payment amount for each discharge, as well as the value-based incentive payment amounts that the hospital earned as a result of its performance (if applicable) into our claims processing systems in January 2013, and these adjustments will apply to FY 2013 discharges. We refer readers to the Hospital Inpatient VBP Program final rule for further explanation of the details of the FY 2013 Hospital VBP Program (76 FR 26490 through 26547).

We proposed to codify in our regulations at 42 CFR 412.160 a number of definitions that we previously finalized for the Hospital VBP Program in the Hospital Inpatient VBP final rule, including definitions of the terms achievement threshold, benchmark, domain, domain score, hospital, improvement threshold, performance period, and TPS. We did not receive any comments on the specific regulation text that we proposed with respect to these terms. In this final rule, we are making a number of technical, clarifying changes to these definitions and otherwise adopting them as final.

We also proposed to codify in our regulations at 42 CFR 412.164 that, as we previously finalized, we will select measures for purposes of the Hospital VBP Program, and that we will post data on each measure on the *Hospital Compare* Web site for at least one year prior to the beginning of the performance period for the measure under the Hospital VBP Program. We did not receive any comments on the specific regulation text that we proposed, and we are finalizing § 412.164 with one technical change.

We proposed to codify in our regulations at 42 CFR 412.165 and 42 CFR 412.166 the performance standards and performance scoring methodologies that we previously finalized for the Hospital VBP Program. We did not receive any comments on the specific regulation text that we proposed. We are finalizing this regulation text with a few technical changes, including combining the two provisions into one provision at 42 CFR 412.165.

3. FY 2014 Hospital VBP Program Measures

For FY 2014, we have adopted 17 measures for the Hospital VBP Program, including the 12 clinical process of care measures and the HCAHPS measure that we adopted for the FY 2013 Hospital VBP Program, 1 new clinical process of care measure (SCIP–Inf–9: Postoperative Urinary Catheter Removal on Postoperative Day 1 or 2), and 3 mortality outcome measures (Acute Myocardial Infarction (AMI) 30-Day Mortality Rate, Heart Failure (HF) 30-Day Mortality Rate, Pneumonia (PN) 30-Day Mortality Rate). The clinical process of care, HCAHPS, and mortality measures are discussed in more detail in the Hospital Inpatient VBP Program final rule (76 FR 26510 through 26511) and SCIP–Inf–9 is discussed in more detail in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74530).

Although we also previously adopted 8 HAC measures, 2 AHRQ composite measures, and a Medicare Spending per Beneficiary Measure for the FY 2014 Hospital VBP Program, we have suspended the effective date of these measures, with the result that these measures will not be included in the FY 2014 Hospital VBP Program (76 FR 74528 through 74530).

Set out below is a complete list of the measures adopted for the FY 2014 Hospital VBP Program:

CLINICAL PROCESS OF CARE, PATIENT EXPERIENCE OF CARE AND OUTCOME MEASURES FOR THE FY 2014 HOSPITAL VBP PROGRAM

IV. Measure ID	Measure Description
Clinical Process of Care Measures	
Acute myocardial infarction:	
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival.
Heart Failure:	
HF–1	Discharge Instructions.
Pneumonia:	
PN–3b	Blood Cultures Performed in the Emergency Department Prior to Initial Antibiotic Received in Hospital.
PN–6	Initial Antibiotic Selection for CAP in Immunocompetent Patient.
Healthcare-associated infections:	
SCIP–Inf–1	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision.
SCIP–Inf–2	Prophylactic Antibiotic Selection for Surgical Patients.
SCIP–Inf–3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time.
SCIP–Inf–4	Cardiac Surgery Patients with Controlled 6AM Postoperative Serum Glucose.
SCIP–Inf–9	Postoperative Urinary Catheter Removal on Post Operative Day 1 or 2.
Surgeries:	
SCIP–Card–2	Surgery Patients on a Beta Blocker Prior to Arrival That Received a Beta Blocker During the Perioperative Period.
SCIP–VTE–1	Surgery Patients with Recommended Venous Thromboembolism Prophylaxis Ordered.

CLINICAL PROCESS OF CARE, PATIENT EXPERIENCE OF CARE AND OUTCOME MEASURES FOR THE FY 2014 HOSPITAL VBP PROGRAM—Continued

IV. Measure ID	Measure Description
SCIP–VTE–2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery.
V. Measure ID	Measure description
Patient Experience of Care Measures	
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey*.
Outcome Measures	
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-Day Mortality Rate.
MORT–30–HF	Heart Failure (HF) 30-Day Mortality Rate.
MORT–30–PN	Pneumonia (PN) 30-Day Mortality Rate.

*The finalized dimensions of the HCAHPS survey for use in the FY 2014 Hospital VBP Program are: Communication with Nurses, Communication with Doctors, Responsiveness of Hospital Staff, Pain Management, Communication about Medicines, Cleanliness and Quietness of Hospital Environment, Discharge Information and Overall Rating of Hospital. These are the same dimensions that we adopted for the FY 2013 Hospital VBP Program.

4. Other Previously Finalized Requirements for the Hospital VBP Program

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74532 through 74547), we finalized a number of other policies for the FY 2014 Hospital VBP Program including: The minimum number of cases that a hospital must report to receive a score on a mortality measure; the minimum number of measures that a hospital must report in order to receive a score on the Outcome domain; the baseline and performance periods; the performance standards for the clinical process of care and patient experience of care measures (we previously finalized the performance standards for the 3 mortality outcome measures in the Hospital Inpatient VBP Program final rule (76 FR 26513)); the scoring methodology; and the domain weighting methodology. We also finalized for all years of the Program a process that will allow hospitals to review and correct the data that they submit to the QIO Clinical Warehouse on clinical process of care measures, their clinical process of care measure rates, their HCAHPS data, and their patient-mix and mode adjusted HCAHPS scores.

5. Hospital VBP Program Payment Adjustment Calculation Methodology

a. Definitions of the Term ''Base Operating DRG Payment Amount'' for Purposes of the Hospital VBP Program

Section 1886(o)(7)(D) of the Act generally defines the base operating DRG payment amount, with respect to a hospital for a fiscal year, as ''the payment amount that would otherwise be made under section 1886(d) (determined without regard to subsection (q) [the Hospital Readmissions Reduction Program]) for a discharge if [the Hospital VBP Program] did not apply; reduced by any portion of such payment amount that is attributable to payments under paragraphs (5)(A), (5)(B), (5)(F), and (12) of subsection (d); and * * * such other payments under subsection (d) determined appropriate by the Secretary.'' Paragraphs (5)(A), (5)(B), (5)(F), and (12) of section 1886(d) of the Act refer to outlier payments, indirect medical education (IME) payments, disproportionate share (DSH) payments, and low-volume hospital payments, respectively.

We stated in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28070) that the payment that would otherwise be made with respect to a discharge is the applicable average standardized amount adjusted for resource utilization by the applicable MS–DRG relative weight and adjusted for differences in geographic costs by the applicable area wage index (and by the applicable COLA for hospitals located in Alaska and Hawaii), which is often referred to as ''the wage-adjusted DRG operating payment.'' The payment amount that would otherwise be made with respect to a discharge also includes any adjustments to the wage-adjusted DRG operating payment that the hospital qualifies for, including an outlier adjustment (under section 1886(d)(5)(A) of the Act), an IME adjustment (under section 1886(d)(5)(B) of the Act), a disproportionate share payment adjustment (under section 1886(d)(5)(F) of the Act), a low-volume payment adjustment (under section 1886(d)(12) of the Act), an adjustment for new medical services or technologies under section 1886(d)(5)(K) of the Act (often referred to as ''new technology add-on payments''), and/or any other adjustment determined appropriate by the Secretary.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28070), consistent with section 1886(o)(7)(D) of the Act, we proposed to generally define the term ''base operating DRG payment amount'' for purposes of the Hospital VBP Program as the wage-adjusted DRG operating payment plus any applicable new technology add-on payment. We proposed to include the new technology add-on payment amount in the definition of base operating DRG payment amount for the Hospital VBP Program because the provision of a new technology to a Medicare beneficiary is a treatment decision, unlike the other add-on payments which are excluded by statute (for example, IME and DSH add-ons). We believe that it represents a cost to the Medicare program that should be subject to the applicable percent reduction to the base operating DRG payment amount which creates the funding pool for value-based incentive payments. We also note that this proposed definition is consistent with the definition of ''base operating DRG payment amount'' that we proposed to adopt for the Hospital Readmissions Reduction Program, and we believe that maintaining consistency to the extent possible with other Medicare incentive payment programs is an important goal for the Hospital VBP Program. There are no other subsection (d) payment adjustments that would otherwise apply to the discharge on a per-claim basis. As required by the statute, the ''base operating DRG payment amount'' would not include an outlier, IME, DSH, or

low-volume payment adjustment that would otherwise apply to the discharge.

We proposed to codify the definition of the term ''wage-adjusted DRG operating payment'' and the definition of the term ''base-operating DRG payment amount'' as it would apply to most subsection (d) hospitals in our regulations at 42 CFR 412.160. We welcomed public comment on these proposed definitions.

Comment: The majority of commenters supported our proposed general definition of base-operating DRG payment amount. A few commenters suggested that applicable new technology add-on payments should not be included in the definition. These commenters expressed the belief that new technology add-on payments are extrinsic to the base rate and that their inclusion in the base operating DRG payment amount definition would be in conflict with ensuring adequate payment for new technologies. Two commenters suggested that CMS clarify the handling of capital costs in defining the base operating DRG payment amount, with one suggesting they should be included in the definition and one suggesting they should be excluded.

Response: We thank the commenters for their support of our proposed general definition of base operating DRG payment amount for the Hospital VBP Program. With respect to the new technology add on payments, we disagree with the commenters who suggested that they should be excluded from the definition of the term ''base operating DRG payment amount.'' We acknowledge that new technology add on payments could be viewed as extrinsic to the base rate, but we disagree that their inclusion in the definition of the term base operating DRG payment amount would be in conflict with ensuring adequate payments for the provision of new technologies. Under the Hospital VBP Program, hospitals that perform well on the selected measures may earn back more than the applicable percent reduction used to fund the value based incentive payments. Therefore, a hospital that provides an effective new technology and performs well on the measures would be able to earn an additional payment under the Program. We continue to believe that these payments represent treatment decisions made by hospitals, and are therefore appropriately captured in our definition for this Program. Further, we value consistency with the definition being used for the Hospital Readmissions Reduction Program, which includes new technology add-on payments. With respect to capital payments, we did not propose to include them in the definition of base operating DRG payment amount because section 1886(o)(7)(D)(i) of the Act defines the base operating DRG payment amount, with respect to most subsection (d) hospitals as ''the payment amount that would otherwise be made under section 1886(d)'' with certain exclusions. Capital payments are paid to most acute care hospitals under section 1886(g) of the Act and, therefore, are not included in the payment amount that would otherwise be made under section 1886(d) of the Act.

Comment: One commenter suggested that the transfer payment adjustment should be included in the definition of base-operating DRG payment amount.

Response: We agree with this comment and are revising our definition of the term ''wage-adjusted DRG operating payment'' at 42 CFR 412.160 to include an applicable payment adjustment for a transfer under 42 CFR 412.4(f). The transfer adjustment is a reduction to the payment amount, which we apply when a patient leaves the hospital before the average length of stay for their DRG, and continues to receive treatment in either another acute hospital or a post acute setting. We believe that the transfer adjustment is appropriately included in the adjustment to the standardized amount for resource utilization because the transfer adjustment is applied in order to make the payment that would otherwise be made to a subsection (d) hospital that transfers a patient commensurate with the resources that the hospital used to treat that patient.

After consideration of the public comments we received, we are finalizing the definition of the term ''wage-adjusted DRG operating payment'' as the applicable average standardized amount adjusted for (i) Resource utilization by the applicable MS–DRG relative weight, (ii) differences in geographic costs by the applicable area wage index (and by the applicable COLA for hospitals located in Alaska and Hawaii), and (iii) an applicable transfer under 42 CFR 412.4(f). We are also finalizing the definition of the term ''base operating DRG payment amount'' as that term applies to most subsection (d) hospitals as the wage-adjusted DRG operating payment plus any applicable new technology add-on payments under 42 CFR 412.4(f). We are finalizing that this amount is determined without regard to any payment adjustments under the Hospital Readmissions Reduction Program, and that it does not include any additional payments for indirect medical education under § 412.105, the treatment of a disproportionate share of low-income patients under § 412.106, outliers, or a low volume of discharges under § 412.101. We are codifying these definitions in our regulations at 42 CFR 412.160.

Section 1886(o)(7)(D)(ii)(I) of the Act states that in the case of a Medicare-dependent, small rural hospital (MDH) (with respect to discharges occurring during FY 2012 or FY 2013) or a sole community hospital (SCH), the base operating DRG payment amount is defined as the payment amount that would otherwise be made under section 1886(d) of the Act without regard to certain factors that affect payments to these categories of hospitals (sections 1886(b)(3)(I) and (L) of the Act, and section 1886(d)(5)(D) of the Act for SCHs, and section 1886(d)(5)(G) of the Act for MDHs). In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28071), consistent with the definition we proposed to adopt for other subsection (d) hospitals, we proposed to define the term ''base operating DRG payment amount'' for MDHs and SCHs as the wage-adjusted DRG operating payment amount plus any applicable new technology add-on payment. The proposed base operating DRG payment amount for SCHs and MDHs would not include an outlier, IME, DSH, or low-volume payment adjustment that would otherwise apply to the discharge. Consistent with section 1886(o)(7)(D)(ii)(I) of the Act, we also proposed to exclude from this definition of base operating DRG payment amount the difference between the hospital-specific payment rate and the Federal payment rate. This proposed definition is consistent with that being proposed under the Hospital Readmissions Reduction Program (discussed in section IV.A. of this preamble). We proposed to codify this definition in our regulations at 42 CFR 412.160.

We welcomed public comment on this proposed definition of the base operating DRG payment amount for MDHs and SCHs under the Hospital VBP Program. We note that, under current law, the MDH program is set to expire at the end of FY 2012, after which all MDH hospitals would be paid in the same manner as other subsection (d) hospitals, unless they qualify for SCH status, as discussed in section VIII.C.5.b. of this preamble.

Comment: Commenters were supportive of our proposed definition of ''base operating DRG payment amount'' for SCHs and MDHs. One commenter asked that we clarify that we would exclude the difference between the applicable hospital-specific payment rate and the Federal payment rate for

both SCHs and for MDHs, should the MDH provision be extended beyond FY 2012.

Response: We thank the commenters for their support of the proposed definition of base operating DRG payment amount for SCHs and MDHs and are adopting it as final. If the MDH program is extended beyond FY 2012, we will continue to use this definition for MDHs. For an SCH or an MDH, the payment adjustment under the Hospital VBP Program for each discharge will be calculated by multiplying the SCH or MDH's value-based incentive payment adjustment factor by the base-operating DRG payment amount that is exclusive of the amount by which the hospital-specific payment rate exceeds the Federal payment rate. The resulting payment adjustment will then be added to or subtracted from the hospital's payment for the discharge, regardless of whether the hospital is paid based on the Federal rate or its hospital-specific rate. We finalize the methodology for calculating individual hospitals' value-based incentive payment adjustment factors below, in section VIII.C.5.c. of this preamble.

After consideration of the public comments we received, we are finalizing the definition of the term ''base operating DRG payment amount,'' with respect to a Medicare-dependent, small rural hospital that receives payments under § 412.108(c) or a sole community hospital that receives payments under § 412.92(d), as the wage-adjusted DRG operating payment plus any applicable new technology add-on payments under subpart F of 42 CFR Part 412. We are finalizing that this amount does not include any additional payments for indirect medical education under § 412.105, the treatment of a disproportionate share of low-income patients under § 412.106, outliers under subpart F of 42 CFR Part 412, or a low volume of discharges under § 412.101. This amount also does not include the difference between the hospital-specific payment rate and the Federal payment rate.

Section 1886(o)(7)(D)(ii)(II) of the Act states that in the case of a hospital that is paid under section 1814(b)(3) of the Act, ''the term 'base operating DRG payment amount' means the payment amount under that section.'' Acute care hospitals located in the State of Maryland are not paid under the IPPS but are, instead, paid under a special waiver provided by section 1814(b)(3) of the Act. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28071), for these hospitals, we proposed that the term ''base operating DRG payment amount'' means the payment amount under section 1814(b)(3) of the Act. This proposed definition is consistent with the definition we proposed under the Hospital Readmissions Reduction Program (discussed in section IV.A. of this preamble). We proposed to codify this definition in our regulations at 42 CFR 412.160. We welcomed public comment on the proposed definition of base operating DRG payment amount for Maryland hospitals under the Hospital VBP Program.

Comment: One commenter suggested that the definition of base operating DRG payment amount for Maryland hospitals should not be the payment made under section 1814(b)(3) of the Act because that payment is inclusive of payments for medical education, treatment of a disproportionate share of low income patients, uncompensated care, labor-market adjusters, and assessments to fund other initiatives. This commenter suggested that CMS should work with Maryland to develop an alternative definition. Another commenter also noted that the payment received by Maryland hospitals differs significantly from that received by other subsection (d) hospitals, urging that we continue to allow Maryland the flexibility to continue existing State-based initiatives for improvement in quality of care.

Response: Maryland hospitals are currently paid 94 percent of charges, and the Maryland Health Services Cost Review Commission includes IME, DSH, uncompensated care, and labor market adjusters in the charges that it submits to the Secretary for purposes of calculating the payment amounts for these hospitals under section 1814(b)(3) of the Act. We believe that as long as these amounts are included in the payment amounts made to these hospitals under section 1814(b)(3) of the Act, they are appropriately included in the definition of the base operating DRG payment amount for these hospitals under the Hospital VBP Program. With regard to the comment that Maryland should be allowed to continue existing State-based incentives, we note that acute care hospitals located in the State of Maryland have been granted an exemption from the Hospital VBP Program for FY 2013 based on the State's submission of a report describing how a similar State program achieves or surpasses the measured results in terms of patient health outcomes and cost savings established under the Hospital VBP Program. The State will also have the opportunity to request that these hospitals be exempted from future years of the Program, as discussed more fully in section VIII.C.13 of this preamble.

After consideration of the public comments we received, we are finalizing the definition of the term ''base operating DRG payment amount'' for hospitals that are paid under section 1814(b)(3) of the Act as the payment amount made under section 1814(b)(3) of the Act.

We are also codifying the definition of the term base-operating DRG payment amount, as that term is applied to SCHs, MDHs, and hospitals paid under section 1814(b)(3) of the Act, in our regulations at 42 CFR 412.160.

b. Calculating the Funding Amount for Value-Based Incentive Payments Each Year

Section 1886(o)(7)(B) of the Act instructs the Secretary to reduce the base operating DRG payment amount for a hospital for each discharge in a fiscal year by an applicable percent. Under section 1886(o)(7)(A) of the Act, the sum total of these reductions in a fiscal year must equal the total amount available for value-based incentive payments for all eligible hospitals for the fiscal year, as estimated by the Secretary. To implement these sections, and create the funding pool for value-based incentive payments for each fiscal year, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28071), we proposed that beginning with FY 2013 discharges, every hospital that meets the definition of a hospital in section 1886(o)(1)(C) of the Act (referred to here as an eligible hospital) would receive a reduction to its base operating DRG payment amount for each discharge in a fiscal year, regardless of whether we have determined that the hospital has earned a value-based incentive payment for that fiscal year. The total amount of the reductions across all eligible hospitals for a fiscal year would constitute the total amount available from which we could make value-based incentive payments for that fiscal year. We proposed to estimate the total amount of the reductions across all eligible hospitals and the size of the funding pool prior to the start of each fiscal year because that is the only way, operationally, that we can calculate each hospital's value-based incentive payment percentage in a manner such that the estimated sum total of the value-based incentive payments for hospitals for the fiscal year would be equal to the estimated total amount available for value-based incentive payments to all eligible hospitals.

The data we proposed to use to estimate these amounts is inpatient claims data from the Medicare Provider Analysis and Review (MedPAR) file. We believe that the use of MedPAR data is appropriate because we also use this

data to calculate other IPPS payment adjustment amounts, including the DRG relative weights, budget neutrality factors, outlier thresholds, and standardized amounts. The proposed use of claims data from the MedPAR file is also consistent with our proposal to determine applicable hospitals' base operating DRG payment amounts, for purposes of determining the readmissions payment adjustment factor under the Hospital Readmissions Reduction Program (section IV.A. of this preamble).

We proposed to run the MedPAR data for purposes of estimating the base operating DRG payment reduction amounts, as well as the size of the funding pool that will apply to a fiscal year, in December of the previous fiscal year so that we can provide preliminary estimates in the IPPS/LTCH PPS proposed rule. We also proposed to provide the final estimates in the IPPS/LTCH PPS final rule using the March update. The data will contain inpatient claims information related to discharges from the fiscal year that ended the previous September. For example, with respect to the FY 2014 Hospital VBP Program, we would run the MedPAR data in December, 2012 and that data would contain claims related to FY 2012 discharges. We would use that data to provide preliminary estimates in the FY 2014 IPPS/LTCH PPS proposed rule. The March 2013 update of this MedPAR data would then be used to provide final estimates in the FY 2014 IPPS/LTCH PPS final rule.

We believe that this proposed approach will enable us to gather the most recent Medicare utilization data available in order to estimate the total amount of the base operating DRG payment amount reductions and the size of the value based incentive payment funding pool for the applicable fiscal year. We also believe that this approach will enable us to calculate each hospital's value based incentive payment adjustment factor that will apply to its discharges in the applicable fiscal year, and to notify each hospital of such at the same time that we proposed to notify each hospital regarding its performance for purposes of making this information publicly available under section 1886(o)(10)(A) of the Act. In this way, hospitals will be able to consider this information during the review and correction period (which is discussed below). We believe that it is important to notify a hospital of its value-based incentive payment adjustment factor at the start of review and corrections, so that hospitals can consider the payment impact of the TPS in their determination of whether or not to request review and corrections.

In order to estimate the total base operating DRG payment reductions across all hospitals for a fiscal year, we proposed to sum the estimated total base operating DRG payment amount per discharge for each hospital in that fiscal year. We would then multiply that estimated total annual base operating DRG payment amount by the applicable percent, which we proposed to define in our regulations at § 412.160 as the percentages specified in section 1886(o)(7)(C) of the Act. The product of the estimated total annual base operating DRG amount for a hospital and the applicable percent would be equal to taking the applicable percent reduction from each individual base operating DRG payment amount per hospital and then summing those reductions. We welcomed public comment on this proposed approach to calculating the available pool of funds for value-based incentive payments.

Comment: Commenters were supportive of our proposals.

Response: We thank the commenters for their support of these proposals and we are adopting them as final.

After consideration of the public comments we received, we are finalizing our proposal to estimate the total amount of the reductions across all eligible hospitals and the size of the funding pool for value-based incentive payments under the Hospital VBP Program, prior to the start of each fiscal year, using MedPAR data. We are finalizing our proposal to use the December update to MedPAR for the purposes of providing the estimates in the IPPS/LTCH PPS proposed rule each year, and to utilize the March update to provide the final estimates in the IPPS/LTCH PPS final rule each year. We are also finalizing the definition of the term ''applicable percent'' in 42 CFR 412.160 of our regulations as the percentages specified in section 1886(o)(7)(C) of the Act. Finally, we are finalizing our proposal to sum the estimated total base operating DRG payment amount per discharge for each hospital in a fiscal year and then multiply that amount by the applicable percent in order to estimate the total base operating DRG payment reductions across all hospitals for a fiscal year.

For the purpose of estimating the total amount available for value-based incentive payments for a fiscal year, we proposed to apply an inflation factor so that our estimate of the available pool of funds will more accurately reflect estimated total base operating DRG payments in the fiscal year in which the value-based incentive payments will actually be made. For example, in estimating the size of the FY 2013 funding pool, we inflated the FY 2011 MedPAR data to FY 2013 dollars because the value-based incentive payment amounts will actually be paid in FY 2013.

Our actuaries provided us with this inflation factor, which included assumptions on changes in Medicare fee-for-service case mix and discharge levels. According to this proposed methodology, we originally estimated the available amount for FY 2013 value-based incentive payments to be $956 million. We then issued a correction notice, because reductions to base operating DRG payment amounts for Maryland hospitals had inadvertently been included in the total estimated amount available for FY 2013 when Maryland hospitals have been excluded from the Hospital VBP Program for FY 2013. The revised estimated available amount was $917 million (CMS–1588–CN). As noted above, under our proposed methodology, we proposed that we would update this estimate using the March 2012 update of the FY 2011 MedPAR data for purposes of finalizing it in the FY 2013 IPPS/LTCH PPS final rule.

We note that, for the purposes of calculating the value-based incentive payment adjustment factors under the Hospital VBP Program, we would be able to use FY 2011 claims to accurately calculate the value-based incentive payment percentage, without application of this inflation factor. This is because a constant inflation factor applied across all hospitals' total annual base-operating DRG payment amounts will not change the slope of the linear exchange function which we previously adopted for use in determining each hospital's value-based incentive payment amount. Application of an inflation factor would, therefore, not impact the amount of a hospital's value-based incentive payment amount under the Hospital VBP Program for the fiscal year.

We considered adopting a different approach that would apply only to the FY 2013 Hospital VBP Program because we do not anticipate beginning to make value-based incentive payments to hospitals for that program year until January 2013. Under this approach, we would have estimated the total amount of funding available to make the value-based incentive payments using the latest available FY 2011 claims data from MedPAR, with payment amounts modeled using the rates, factors and policies finalized in the FY 2013 IPPS/LTCH PPS final rule. This data would include claims information that was not

available at the time we ran the March update. However we did not propose to adopt this approach, because we believe that is important to establish a consistent process for annually estimating the total amount available to make value-based incentive payments to hospitals, as well determining the value-based incentive payment adjustments that will be made to hospitals as a result of their performance under the Hospital VBP Program. Beginning with the FY 2014 Hospital VBP Program, we intend to make the value-based incentive payments to hospitals as part of the claims payment process, beginning at the start of the fiscal year, so it would not be possible to use the modeled base-operating DRG payment amount estimates based on the finalized rates, factors and policies established in the IPPS/LTCH PPS final rule applicable to the fiscal year, as they will typically not be finalized in time to notify hospitals of their value-based incentive payment adjustments at the start of the review and corrections process.

Further, these factors, rates, and policies would not typically be finalized in time for us to notify hospitals of the net result of the base operating DRG payment amount reduction and the value-based incentive payment adjustment no later than 60 days prior to the start of the fiscal year, as required by section 1866(o)(8) of the Act. We also believe that our proposal to use the March update of the MedPAR file represents an accurate estimate of annual base operating DRG amounts because it reflects the most recently available utilization data, while preserving the interest in notifying hospitals of the payment impact in time for them to request review and correction.

We proposed to use a different methodology for purposes of estimating the reduced annual base operating DRG payment amounts for SCHs and MDHs. In general, eligible hospitals in the Hospital VBP Program include SCHs and current MDHs (we note that MDH status is set to expire under current law after FY 2012 and would, therefore, no longer exist in FY 2013), because they meet the definition of a ''subsection (d)'' hospital. SCHs are paid in the interim (prior to cost report settlement) on a claim by claim basis at the amount that is the higher of the payment based on the hospital-specific rate or the IPPS Federal rate based on the standardized amount. At cost report settlement, the fiscal intermediary or A/B MAC determines if the hospital would receive higher aggregate operating IPPS payments using the hospital-specific rate (for all claims) or the Federal rate (for all claims). MDHs are paid the sum of the Federal payment amount plus 75 percent of any amount by which the hospital-specific rate payment exceeds the Federal rate payment amount.

Although MDH status is to expire at the end of FY 2012, the payments reflected on FY 2011 claims for current MDHs may be based on the hospital-specific rate. As discussed above, we generally proposed to use historical MedPAR data to determine the base operating DRG payment amounts that would be used to estimate the amount of funding available for value-based incentive payments for the FY 2013 Hospital VBP Program. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28072), consistent with that proposal, for SCHs and hospitals that have MDH status in FY 2012, we proposed to use MedPAR data to model the reduced base operating DRG payment amount for each claim as if it were paid based on the Federal standardized amount, rather than using the payment information on the claim (that is, regardless of whether a claim was paid under the hospital-specific rate or the Federal rate, the reduced base operating DRG payment amounts for SCHs and current MDHs would be estimated using the Federal rate).

We welcomed public comment on these proposals. We also welcomed comment on other suggested approaches to most accurately estimate these amounts.

Comment: One commenter asked CMS to verify that Maryland hospitals had not been included in the estimated available funding pool for value-based incentive payments in FY 2013. One commenter questioned whether the amount stated in the proposed rule was correct, because they arrived at significantly different number.

Response: We inadvertently included reductions to payments for Maryland hospitals in the estimated total amount available for value-based incentive payments under the Hospital VBP Program for FY 2013, in the FY 2013 IPPS/LTCH PPS proposed rule. As noted above, we subsequently issued a correction notice (CMS–1588–CN; 77 FR 34326), including a new estimated $917 million total amount available for value-based incentive payments under the Hospital VBP Program for FY 2013. Both the original and the corrected estimates were calculated using the December 2011 update to the FY 2011 MedPAR data and with the application of an inflation factor of 9.75 percent. As stated in the proposed rule, this inflation factor was provided by CMS actuaries and included assumptions regarding changes in Medicare fee-for-service case-mix and discharge levels. We verified with our actuaries that the estimated $917 million total amount available was correct.

After consideration of the public comments we received, we are adopting our proposed methodology for estimating the total amount available for value-based incentive payments in a fiscal year under the Hospital VBP Program. The final estimate for FY 2013, based on the March, 2012 update to the FY 2011 MedPAR file, is $963 million.

c. Methodology to Calculate the Value-Based Incentive Payment Adjustment Factor

In accordance with section 1886(o)(6)(C)(i) of the Act, for each eligible hospital that receives a TPS greater than zero with respect to a fiscal year, we proposed to calculate a value-based incentive payment percentage for that hospital for that fiscal year. We proposed that, in accordance with section 1886(o)(6)(C)(ii) of the Act, the value-based incentive payment percentage that we calculate for the hospital will be based on that hospital's individual TPS, and the total amount of value-based incentive payments to all hospitals in the fiscal year will be equal to the total amount available for value-based incentive payments for the fiscal year, as estimated by the Secretary. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28073), we proposed to define the term ''value-based incentive payment percentage'' in § 412.160 as the percentage of the total base operating DRG payment amount that a hospital has earned back, based on its TPS for that fiscal year. The hospital may earn a value-based incentive payment percentage that is less than, equal to, or more than the applicable percent. The applicable percent that we will use to reduce the base operating DRG payment amount for each FY 2013 discharge is 1.0 percent.

A hospital may earn a value-based incentive payment percentage that is greater than the applicable percent, which would result in that hospital receiving a value-based incentive payment adjustment factor that is greater than one and a higher base operating DRG payment amount for each discharge than it would have received in the absence of the Hospital VBP Program. The proposed calculation of the value-based incentive payment adjustment factor is discussed in further detail below. A hospital may earn a value-based incentive payment percentage that is equal to the applicable percent, which would result in the hospital receiving a value based incentive payment adjustment factor of

1 and the same base operating DRG payment amount that it would have received for each discharge in the absence of the Hospital VBP Program. Alternatively, a hospital may earn a value-based incentive payment percentage that is less than the applicable percent, which would result in the hospital receiving a value-based incentive payment adjustment factor that is less than one and a lower base operating DRG payment amount for each discharge than it would have received in the absence of the Hospital VBP Program.

In order to convert a hospital's TPS into a value-based incentive payment factor that would be applied to each discharge in the applicable fiscal year, we proposed to use the linear exchange function that we finalized in the Hospital Inpatient VBP Program final rule (76 FR 26534). Under this proposed methodology, we would use the following computed amounts:

- The hospital's estimated total annual base-operating DRG amount for all discharges for the applicable fiscal year;
- The applicable percent for the fiscal year (1.0 percent in FY 2013);
- The (linear) exchange function slope; and
- The hospital's TPS.

The following six (6) steps illustrate our proposed methodology:

Step 1: Estimate the hospital's total annual base-operating DRG amount. First, we would estimate each hospital's total annual base operating DRG amount for all discharges in the applicable fiscal year. As we discussed above, we proposed to estimate this amount using Medicare inpatient claims data taken directly from the most recently available MedPAR files.

Step 2: Calculate the total annual estimated base operating DRG payment reduction amount across all eligible hospitals. Second, we proposed to estimate the total base operating DRG reduction amount across all eligible hospitals (which is the total amount available for value-based incentive payments) according to the following two steps:

Step 2a: Repeat Step 1 for all eligible hospitals, and multiply the estimated total amount for each hospital by the applicable percent. For FY 2013, the applicable percent is 1.0 percent; then

Step 2b: Add together the amount for each hospital calculated under Step 2a. This sum is the total amount available for value-based incentive payments, and the numerator of the linear exchange function slope that is calculated in Step 3 below.

Step 3: Calculate the linear exchange function slope. Third, we would calculate the linear exchange function slope. As noted above, we finalized the use of a linear exchange function for the purpose of converting a hospital's TPS into a value-based incentive payment percentage. We would calculate the linear exchange function slope using the following steps:

Step 3a: Convert the TPS for each hospital into a decimal by dividing it by 100. The TPS may range from zero to 100. In this step, we express it as a number between zero and 1.

Step 3b: Multiply each hospital's estimated total base-operating DRG payment reduction amount for the applicable fiscal year (from Step 2a above) by the hospital's TPS (decimal between zero and one from Step 3a above).

Step 3c: Add together the numbers computed in Step 3b above. This sum represents the denominator of the linear exchange function slope that is calculated in Step 3d below.

Step 3d: The exchange function slope equals the sum computed in Step 2b above divided by the sum computed in Step 3c above.

Step 4: For each hospital, calculate the hospital's value-based incentive payment percentage for the fiscal year. We proposed to use the exchange function slope (from Step 3) and the hospital's TPS to calculate the hospital's value-based incentive payment percentage that it earned as a result of its performance under the Hospital Inpatient VBP Program for the fiscal year. We could calculate the value-based incentive payment percentage by multiplying the applicable percent by the amount computed for the hospital in Step 3a and the exchange function slope as computed in Step 3d above. This is the mathematical approach to locating the place along the linear exchange function where a given hospital's TPS score would be located and identifying the corresponding value-based incentive payment percentage. As we note above, the value-based payment percentage could be greater than, equal to, or less than the applicable percent that is applied to reduce the base operating DRG payment amount for each discharge.

Step 5: Compute the net percentage change in the hospital's base-operating DRG payment amount for each discharge. Fifth, we proposed to calculate the net percentage change to the hospital's base operating DRG payment amount for each discharge in the applicable fiscal year. We would calculate the net change as an intermediate step, in order to determine the value-based incentive payment adjustment factor described in Step 6, below. The net percentage change in the hospital's base operating DRG payment amount for each discharge would be the difference between the applicable percent and the value-based incentive payment percentage. We would calculate this net change for each hospital by subtracting the applicable percent used in Step 2a (1 percent for FY 2013) from the value based incentive payment percentage computed for the hospital in Step 4. This net change in the base-operating DRG payment amount would be expressed as a percentage and could be positive, zero, or negative, depending on the hospital's TPS and the exchange function slope.

Step 6: Calculate the value-based incentive payment adjustment factor. To calculate this factor, we would convert the hospital's individual net percentage change in its base-operating DRG payment amount, from Step 5, from a percentage into a number (by removing the percent sign and dividing it by 100) and add it to 1. The 1 would reflect the base operating DRG payment amount that the hospital would have received for a discharge in the absence of the Hospital VBP Program. The result is that a hospital with a positive net percentage change to its total base operating DRG payment amount would have a value-based incentive payment adjustment factor that is greater than one. This means that we would multiply the hospital's base operating DRG payment amount for each discharge occurring in the applicable fiscal year by a number greater than one.

A hospital with no net percentage change to its total base operating DRG payment amount percentage would have a value-based incentive payment adjustment factor of one. This means that we would multiply its base operating DRG payment amount for each discharge occurring in the applicable fiscal year by 1, and its base-operating DRG payment amount would be equal to what it would have been in the absence of the Hospital VBP Program.

A hospital with a negative net percentage change to its total base-operating DRG payment amount percentage would have a value-based incentive payment adjustment factor that is less than one. This means that we would multiply the hospital's base operating DRG payment amount for each discharge occurring in the applicable fiscal year by a number less than one.

Example Calculation of the Value-Based Incentive Payment Adjustment Factor:

As an example, assume the following information:

- The hospital's estimated total annual base operating DRG payment amount for all discharges in the applicable fiscal year = $1,000,000;
- The applicable percent that is applied to all discharges of eligible hospitals in FY 2013 = 1.0 percent;
- The exchange function slope = 2.0;
- The hospital's TPS = 80

Under our proposal, we would replicate the six steps to convert a hospital's TPS into a value-based incentive payment adjustment factor as follows:

Step 1: Estimate the hospital's total annual base operating DRG payment amount. We would add together the estimated base-operating DRG payment amount for each FY 2013 discharge. In this example, we assume this total amount would be $1,000,000.

Step 2: Calculate the *total annual estimated* base operating DRG payment reduction amount across all eligible hospitals. Second, we would:

Step 2a: Repeat Step 1 for all eligible hospitals, and multiply the total amount for each hospital by the applicable percent, which is 1.0 percent in this example: $1,000,000 * 0.01 = $10,000; and

Step 2b: Add together the amount for each hospital calculated in Step 2a above. In this example, we assume this amount is a given. We note that computing this amount requires knowledge of all eligible hospitals' estimated total base operating DRG payment reduction amount.

Step 3: Calculate the linear exchange function slope, which we assume in this example to be 2.0. We note that computing the slope requires knowledge of all eligible hospitals' estimated total base operating DRG payment reduction amount and their TPS to compute the relevant sums that are used in the numerator and denominator of the slope.

Step 4: Calculate the hospital's value-based incentive payment percentage. The hospital's value-based payment percentage would be computed as follows: 0.01 (the applicable percent would be multiplied by 0.80 (the hospital's TPS divided by 100) and 2.0 (the exchange function slope)). Mathematically, 0.01 * 0.80 * 2.0 = 0.016, which can be written as 1.60 percent. Therefore, the hospital's value-based incentive payment percentage for the FY 2013 Hospital VBP Program would be 1.60 percent ($16,000 in this example).

Step 5: Compute the net percentage change in the hospital's base-operating DRG payment amount for each discharge by subtracting 1.0 percent (the applicable percent) from the value-based incentive payment percentage that the hospital earned based on its TPS.

In this example, the net percentage change would equal 1.60 percent minus 1.00 percent, or 0.60 percent. In this example, the net percentage change is positive and corresponds to a dollar amount of 0.60 percent of the estimated total annual base operating DRG payment amount for the hospital of $1,000,000(0.60 percent * $1,000,000 = $6,000).

Step 6: Compute the value-based incentive payment adjustment factor as equal to: the net percentage change (calculated in Step 5), expressed as a number, plus one. In this example, the hospital's value-based incentive payment adjustment factor would equal the sum of 0.006 (0.60 percent expressed as a number) plus one.

Therefore, this hospital's value-based incentive payment adjustment factor would equal 1.006, and this factor would be multiplied by the base operating DRG payment amount for each discharge occurring in FY 2013. This hospital had a positive net percentage change to its total base operating DRG payment amount and would have a value-based incentive payment adjustment factor that is greater than one, so we would multiply the hospital's base operating DRG payment amount for each discharge occurring in the applicable fiscal year by a number greater than one. In this example, the hospital would earn a total value-based incentive payment estimated at $16,000 for all discharges in the fiscal year), which is greater than the 1.0 percent base operating DRG payment reduction amount applied to each discharge in the fiscal year (estimated $10,000 total reduction), which would result in the hospital receiving a higher payment amount for each discharge occurring in FY 2013 than it otherwise would have received, in the absence of the Hospital VBP Program (an estimated $6000 total increase in base operating DRG payments for the fiscal year).

We welcomed comments on this proposal.

We proposed to codify in our regulations at § 412.160 definitions of value-based incentive payment adjustment factor and value-based incentive payment percentage.

We proposed to codify in our regulations at § 412.162 the process for reducing the base operating DRG payment amount and applying the value-based incentive payment amount adjustment under the Hospital Value-Based Purchasing (VBP) Program. We also proposed regulation text at § 412.162 regarding the value-based incentive payment amount for a discharge; the total amount available for value-based incentive payments; the methodology for calculating the value-based incentive payment amount; the methodology for calculating the value-based incentive payment percentage; and the methodology for calculation of the value-based incentive payment adjustment factor.

Comment: Commenters supported our proposed methodology to calculate the value-based incentive payment adjustment factor for each hospital. Some commenters requested that CMS provide hospitals with a statement at the beginning and end of each fiscal year. These commenters also suggested that this statement contain the hospital's TPS, estimated and actual payments withheld, estimated and actual gross incentive payments, and estimated and actual net incentive payments made.

Response: We appreciate the commenters' support of these proposals and appreciate their interest in receiving a summary report. We will provide each hospital with a hospital-specific report detailing its TPS and value-based incentive payment adjustment factor prior to implementation of payment adjustments, each fiscal year. We will provide this report after the end of the performance period for the applicable fiscal year. We do not intend to estimate the resulting payment differences, because these will vary, depending on the hospital's discharge volume and case mix in the applicable fiscal year. We may explore the possibility of providing a payment summary report at the end of the fiscal year, in the future.

Comment: Some commenters expressed concern that CMS or its contractors might inadvertently include payments for IME, DSH, and outliers in the base operating DRG payment amount to which value-based incentive payment adjustment factors are applied under this Program. The commenters further suggested that CMS articulate and allow comment on how we will instruct contractors to apply the payment adjustments, to ensure that these payments are not affected.

Response: We appreciate the importance of ensuring that the base operating DRG payment amounts are calculated correctly for purposes of applying the value-based incentive payment adjustment factor. We do not believe it is necessary to propose and solicit public comment on the operational instructions that we will provide to our contractors, but we will make every effort to ensure that the

payment adjustments under the Hospital VBP Program are appropriately processed.

Comment: One commenter noted that CMS did not indicate the performance period or exchange function slope used to calculate the proxy value-based incentive payment adjustment factors used in Table 16 of proposed rule.

Response: The value-based payment incentive adjustment factors that we used for purposes of generating Table 16 were based on baseline and performance periods of April 1 through December 31 of 2008 and 2010, respectively. We note that these are not actual Hospital VBP Program baseline or performance periods. We used these periods to calculate the FY 2013 Hospital VBP proxy adjustment factors because at the time we issued the proposed rule, they were the most recently available periods for which we had data to calculate hospital TPSs. We were unable to use the actual TPS scores for the FY 2013 performance period to calculate these factors for the final rule, because hospitals had not yet had the opportunity to review their own performance. We note that these proxy adjustment factors will not be used to adjust hospital payments. The exchange function slope, calculated based on the TPSs and base operating DRG payment reduction amounts for all hospitals eligible for this simulated performance period, was 1.931871792. As discussed above, we have updated the estimated total amount available for value-based incentive payments in FY 2013, using the March, 2012 update to the FY 2011 MedPAR file. The use of this MedPAR update affects the linear exchange function slope and the resulting proxy value-based payment incentive adjustment factors, and we have updated Table 16 to reflect these new figures. The new linear exchange function slope used for these calculations in this final rule is 1.93621799.

We are also taking this opportunity to clarify that the slope of the payment exchange function will be calculated before hospitals receive their initial confidential reports at the start of the review and corrections period. This slope will then be applied to each hospital's TPS, in order to calculate the hospital's value-based incentive payment adjustment factor for discharges occurring in a fiscal year. Should a hospital identify an error that requires us to recalculate its TPS, we will not recalculate the exchange function slope. Rather, we will apply the established payment exchange function slope for the fiscal year to the newly calculated TPS score. We believe that this is the most straightforward approach to calculating value-based incentive payment adjustment factors, taking into account the review and corrections and appeals periods.

Comment: One commenter suggested that CMS increase the applicable percent reduction to the base operating DRG payment amounts to 2 percent sooner than the FY 2017 program year, if CMS believes hospitals have met or exceeded current quality measure standards.

Response: We agree that incentivizing high performance on measures is an important goal; however, the applicable percent reduction for each fiscal year is specifically defined in section 1886(o)(7)(C) of the Act. We believe that this gradual increase in the applicable percent is valuable, because it allows hospitals time to gain experience with the Hospital VBP Program before their payments are more significantly impacted.

After consideration of the public comments we received, we are finalizing our proposal to calculate the value-based incentive payment adjustment factor for each eligible hospital each fiscal year under the Hospital VBP Program using the six steps detailed above.

We received no comments on our proposed regulatory definitions of value-based incentive payment adjustment factor and value-based incentive payment percentage, and we are finalizing them, with revisions. We are codifying in our regulations at § 412.160 that the value-based incentive payment adjustment factor is defined as the number by which we will multiply the base operating DRG payment amount for each discharge from a hospital, during a fiscal year, in order to adjust the hospital's payment, as a result of its performance under the Hospital VBP Program. We are also codifying in our regulations at § 412.160 that value-based incentive payment percentage is defined as the percentage of the base operating DRG payment amount for each discharge that a hospital has earned with respect to a fiscal year, based on its total performance score for that fiscal year.

We received no public comments on our proposed regulatory language at § 412.162, regarding the process for reducing the base operating DRG payment amount and applying the value-based incentive payment amount adjustment under the Hospital VBP Program; the value-based incentive payment amount for a discharge; the total amount available for value-based incentive payments; the methodology for calculating the value-based incentive payment amount; the methodology for calculating the value-based incentive payment percentage; or the methodology for calculation of the value-based incentive payment adjustment factor. We are codifying the proposed regulatory text, with technical revisions.

We are codifying in our regulations at § 412.162 that, in general, if a hospital meets or exceeds the performance standards that apply to the Hospital VBP Program for a fiscal year, we will make value-based incentive payments to the hospital under the requirements and conditions specified in this section.

We are codifying in our regulations at § 412.162 that the value-based incentive payment amount for a discharge is the portion of the payment amount that is attributable to the Hospital VBP Program and that the total amount available for value based incentive payments to all hospitals for a fiscal year is equal to the total amount of base-operating DRG payment reductions for that fiscal year, as estimated by the Secretary.

We are codifying in our regulations at § 412.162 that the value-based incentive payment amount is calculated by multiplying the base operating DRG payment amount by the value-based incentive payment percentage.

We are codifying in our regulations at § 412.162 that the value-based incentive payment percentage is calculated as the product of: the applicable percent as specified in this section, the hospital's TPS divided by 100, and the linear exchange function slope.

We are codifying in our regulations at § 412.162 that the value-based incentive payment adjustment factor is determined by subtracting the applicable percent as specified in paragraph (d) of this section from the value-based incentive payment percentage and then adding that difference to one.

Finally, we are codifying in our regulations at § 412.160 a definition of linear exchange function. We previously finalized this definition in the Hospital Inpatient VBP Program final rule (76 FR 26531) as the means to translate a hospital's TPS into a value-based incentive payment percentage such that:

(1) Each eligible hospital's value-based incentive payment percentage is based on its TPS; and

(2) The total amount of value-based incentive payments to all hospitals in a fiscal year is equal to the total amount available for value-based incentive payments in such fiscal year.

d. Timing of the Base Operating DRG Payment Amount Reduction and Value-Based Incentive Payment Adjustment for FY 2013 and Future Hospital VBP Program Years

The applicable percent reduction and the value-based incentive payment adjustment are distinct adjustments which we are required to make to base operating DRG payment amounts for eligible hospitals under the Hospital VBP Program. In this section, we outline our proposals for applying these adjustments to the base-operating DRG payment amounts.

In the Hospital Inpatient VBP Program final rule, for the FY 2013 Hospital VBP Program, we established that we would incorporate the value-based incentive payment adjustment into our claims processing system in January 2013, and that the adjustment would apply to all FY 2013 discharges, including those that occurred beginning on October 1, 2012 (76 FR 26536). Because of this January 2013 application of the value-based incentive payment adjustment, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28075), we proposed that we would not apply the 1.00 percent applicable reduction to the base operating DRG payment amount for each discharge until we apply the value-based incentive payment adjustment factor. In other words, we would add the value-based incentive payment amount to the hospital's reduced base-operating DRG payment amount for each FY 2013 discharge at the same time that we apply the 1.00 percent reduction to the base operating DRG payment amount. The simultaneous application of the 1.00 percent reduction to the base-operating DRG payment amounts and the value-based incentive payment amount (if applicable, based on the hospital's TPS) would prevent hospitals from receiving a 1.00 percent reduction to their base operating DRG payment amounts before they receive their value-based incentive payment amount adjustment. Accordingly, under our proposal, beginning in January 2013, a hospital would receive a base operating DRG payment amount for each discharge occurring in FY 2013 that is the net result of the application of the 1.00 percent reduction and the application of the hospital's individual value-based incentive payment amount adjustment.

In FY 2014 and future years of the Hospital VBP Program, we proposed to apply both the applicable percent reduction and the value-based incentive payment amount adjustment to the base operating DRG payment amount for a discharge during the regular claim payment process, beginning in October of each fiscal year. These adjustments would be made simultaneously with respect to each discharge.

We invited public comment on this proposal.

Comment: Commenters supported the proposal to delay application of the reduction to the base-operating DRG payment amounts in FY 2013 until those reductions can be applied simultaneously with the value-based incentive payment adjustments. Commenters also supported the proposal to apply the applicable percent reduction and the value-based incentive payment adjustment factor to the base operating DRG payment amount simultaneously, beginning in January 2013, when the adjustments are incorporated into the claims processing system.

Response: We thank the commenters for their support of these proposals and we are adopting them as final.

After consideration of the public comments we received, we are finalizing our proposal to delay the application of the 1.00 percent applicable reduction to the base operating DRG payment amount for each discharge occurring in FY 2013 until we apply the value-based incentive payment adjustment factor. We are also finalizing our proposal that beginning with the incorporation of value-based incentive payment adjustments into the claims processing system in January 2013, a hospital would receive a base operating DRG payment amount for each discharge occurring in FY 2013 that is the net result of the application of the 1.00 percent reduction and the application of the hospital's individual value-based incentive payment amount adjustment. We are also finalizing our proposal that, beginning with October 1, 2013 discharges, we will simultaneously apply both the applicable percent reduction and the value-based incentive payment adjustment to the base operating DRG payment amount for each discharge during the regular claim payment process.

e. Process for Reducing the Base Operating DRG Payment Amount and Applying the Value-Based Incentive Payment Adjustment for FY 2013

In developing our proposal for FY 2013, we considered two different methodologies for applying the 1.00 percent reduction to the base operating DRG payment amount for each discharge, and for applying the value-based incentive payment adjustment to the reduced base operating DRG payment amount: (1) Reprocessing the claims submitted prior to January 2013, which is when we expect to incorporate the value-based incentive payment adjustments into our claims processing system; and (2) modifying the exchange function slope in such a way as to redistribute the value-based incentive payment adjustments for discharges occurring prior to incorporating the adjustments into our claims processing system. Neither approach would require hospitals to resubmit claims.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28075), we proposed to reprocess the claims submitted by hospitals for discharges occurring between October 1, 2012 and such time as the value-based incentive payment adjustments are incorporated into the claims processing system. We believe that this approach is the most straightforward way to address the January implementation of FY 2013 value-based incentive payment adjustments. For the second methodology we considered, we would need to modify the exchange function slope, because adjustments would not have been made beginning on October 1, 2012, the start of FY 2013. As described in section VIII.C.5.c. of this preamble, calculation of the exchange function slope is based on the hospital's TPS and the estimated amount available for value-based incentive payments. The total amount available to make value based incentive payments to eligible hospitals is equal to the total of their base-operating DRG payment reduction amounts, as estimated by the Secretary, according to section 1886(o)(7)(A) of the Act.

Under this approach, we would account for this delay in implementation of applicable percent reductions and value-based incentive payment adjustment factors by modifying the computed exchange function slope so that we could use it to calculate a value-based incentive payment adjustment factor for each hospital that would distribute the total amount available for value based incentive payments between January and September 30, 2013. We would modify the exchange function to accomplish this by multiplying its slope by the following fraction: the total number of days in the fiscal year/(divided by) the number of days between the date we incorporate adjustments and the end of the fiscal year. For example, if the date the value-based adjustment is incorporated into the system is January 15, then the number of days between January 15, 2013 and September 30, 2013 is 258. Therefore, we would multiply the exchange function slope by 365/258, in

order to redistribute the value-based incentive payment adjustments that occur on or after January 15, 2013 in such a manner that they also account for discharges occurring between October 1, 2012 and January 15, 2013. For purpose of calculating the exchange function slope modification, we would assume that hospitals' base operating DRG payments are constant throughout the fiscal year (that is, DRG payments are not concentrated in the beginning or the end of the year, for example).

We believe that this alternative approach could cause confusion regarding payment amounts for discharges that occur between the beginning of the fiscal year and the implementation of the value-based incentive payment adjustments but are not billed until after the implementation of the value-based incentive payment adjustments. Those claims would be paid as though the applicable percent reduction and the value-based incentive payment adjustments were not in effect, because they would be based on date of discharge.

We invited public comment on our proposed approach to reprocess hospital inpatient claims that are billed between October 1, 2012 and such time as we are able to incorporate the value-based incentive payment adjustments into our claims processing system in January 2013. We recognize that hospitals would be responsible for maintaining their own internal accounting systems in order to accommodate the reprocessing of these claims in January 2013; therefore, we also invited public comment on the alternative approach described above of modifying the exchange function slope to redistribute the value-based incentive payment adjustments, or any other approaches which might minimize the administrative burden imposed upon hospitals.

Comment: The majority of commenters supported the proposal to reprocess claims, in order to account for the January 2013 implementation of FY 2013 value-based incentive payment adjustment factors, because they believed that the approach is the most straightforward and least burdensome to hospitals. Many of these commenters noted that reprocessing does pose some administrative burden to hospitals, and they requested that CMS perform a timely reprocess or even a dedicated one.

Response: We thank the commenters for their support of the proposal to reprocess claims in January 2013 and acknowledge the concern that this places an administrative burden on hospitals. We appreciate the importance of timely reprocessing hospital claims to reflect the adjustment. While we are unable to guarantee a dedicated reprocess for payment adjustments under the Hospital VBP Program, we will make every effort to reprocess claims as quickly as practicable.

Comment: Some commenters stated that they did not support our proposal to reprocess claims. A few of these commenters expressed a preference for settlement at cost report. One commenter stated that a lump sum adjustment would be preferable, that adjusting the value-based incentive payment adjustments across the remainder of the year would be next in order of preference, and that claims reprocessing would be the least preferred option, indicating that it places a burden on hospitals to track, validate, and reconcile claims, long after the services were furnished. This commenter expressed concern with the amount of time CMS might take to reprocess these claims, asking that it be completed no later than March 31, 2013, should this option be selected. Another commenter expressed preference for an adjustment to the linear exchange function slope, in order to distribute the payment adjustments across the remainder of the fiscal year, stating that this approach would alleviate financial, operational, and administrative challenges associated with reprocessing.

Response: We do not believe a lump sum adjustment or cost report settlement will be feasible, because neither of these adjustments would be reflected in Medicare claims history. Either a lump sum adjustment or the cost report settlement would be made outside of the claims processing system. This would mean that the claim would appear in Medicare claims history to have been paid without any value-based incentive payment adjustment factor when, in reality, an adjustment would have been made outside of the claims system. Given that we use Medicare claims data for a number of programs and initiatives across the agency, we believe that reprocessing claims is the most straightforward approach and that it allows us to maintain an accurate claims history. Further, we do not wish to delay high-performing hospitals' receipt of their value-based incentive payment amounts or delay low-performing hospitals incurring payment reductions until the cost report is finalized. We believe that delaying the settlement of these value-based incentive payments until cost report settlement would add a degree of uncertainty to hospital payments, which might not be reconciled for several years.

We appreciate the comment that an adjustment to the linear exchange function might alleviate some administrative burden; however, we believe that such an adjustment might create confusion regarding the payment amounts made for discharges occurring prior to the January 2013 implementation of the value-based incentive payment adjustments but processed after the implementation. Further, as noted above, we are concerned that this result might create an inaccurate claims history that would impact other CMS programs for which this claims history is used. If we were to adjust claims paid after the January incorporation of value-based incentive payment adjustment factors into the claims processing system, then the claims history would show a portion of the year during which claims were not subject to any value-based incentive payment adjustments. The claims paid during the remainder of the year would then reflect an adjustment that distributes incentives across less than a full fiscal year. The concentration of a fiscal year's worth of incentives across less than the full fiscal year might skew calculations done under other CMS programs that rely on Medicare claims data.

Comment: A few commenters expressed general concern that CMS would not have the value-based incentive payment adjustment factors for FY 2013 in place, in the claims processing system, until January 2013.

Response: As noted above, we finalized the January 2013 application of the value-based incentive payment adjustment factors, for discharges occurring in FY 2013, in the Hospital Inpatient VBP Program final rule (76 FR 26536). We acknowledge that this results in additional complexities; however, we previously finalized this policy in order to meet the statutory posting and notification deadlines of the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing our proposal to reprocess the claims submitted by hospitals for discharges occurring between October 1, 2012 and the January 2013 incorporation of the value-based incentive payment adjustments into the claims processing system.

6. Review and Corrections Processes

a. Background

Section 1886(o)(10)(A)(i) of the Act requires that the Secretary make information available to the public regarding individual hospital performance in the Hospital VBP

Program, including: (1) The performance of the hospital on each measure that applies to the hospital; (2) the performance of the hospital with respect to each condition or procedure; and (3) the hospital's TPS. To comply with this requirement, we stated in the Hospital Inpatient VBP Program final rule that we intended to publish hospital scores with respect to each measure, each hospital's condition-specific score (that is, the performance score with respect to each condition or procedure, for example, AMI, HF, PN, and SCIP), each hospital's domain-specific score, and each hospital's TPS on the *Hospital Compare* Web site (76 FR 26534 through 26536).

Section 1886(o)(10)(A)(ii) of the Act requires the Secretary to ensure that each hospital has the opportunity to review, and submit corrections for, the information to be made public with respect to each hospital under section 1886(o)(10)(A)(i) of the Act prior to such information being made public. In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74545), we finalized procedures that will enable hospitals to review and correct both the underlying data and measure rates for the clinical process of care measures and HCAHPS dimensions under the Hospital VBP Program (76 FR 74545 through 74547).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28076), we made additional proposals that will enable hospitals to review and correct their claims-based measure rates, as well as their condition-specific scores, domain-specific scores, and TPSs.

b. Review and Corrections Process for Claims-Based Measure Rates

We use claims/administrative data to calculate measure rates for measures that we have adopted for a number of pay for reporting and pay for performance programs, such as the Hospital VBP Program. For claims-based measures used in the Hospital IQR Program, we currently provide hospitals with confidential reports containing the measure rate calculations and accompanying confidential detailed discharge-level information prior to making the rates available to the public. With respect to the claims-based measures we adopt for the Hospital VBP Program, we proposed to deliver the same type of confidential reports and accompanying confidential detailed discharge-level information for purposes of providing hospitals an opportunity to review and submit corrections for their claims-based measure rates under section 1886(o)(10)(A)(ii) of the Act.

The confidential reports would contain the claims-based measure rate calculations and would be accompanied by additional confidential discharge-level information based on the most recent administrative data available at the time we run the data for purposes of calculating the rates. As we discuss below, we proposed to create extracts of the data to be used for measure rate calculation purposes approximately 90 days after the last discharge date in the performance period for the measure. Our intent in providing the confidential reports and accompanying discharge-level data to hospitals is twofold: (1) To provide hospitals with an opportunity to review and submit corrections for the measure rates that we will make available to the public; and (2) to facilitate hospitals' quality improvement efforts with respect to the measures. The discharge-level information would contain data derived from claims and administrative data that were used in the calculation of the measure rates. Depending on the measure, this discharge level information might include data elements such as dates of admission, dates of discharge, patient risk factors, primary and secondary diagnoses, procedures, dates of death, dates of service after discharge by the same or other providers/suppliers, and provider/supplier numbers. The confidential reports and accompanying discharge level data would be delivered to each hospital via its secure QualityNet account.

We proposed to provide hospitals a period of 30-days to review and submit corrections for the claims-based measure rates contained in their confidential reports. This 30-day period would begin the day hospitals' confidential reports and accompanying discharge-level data are posted to QualityNet. These measure rates will be used for performance scoring, value-based incentive payment amount calculations, and public reporting for the Hospital VBP Program. Based on our previous experience with public reporting of measures under the Hospital IQR Program, including the 30-day risk standardized mortality rates and the AHRQ Patient Safety Indicators, we believe this 30-day period will allow enough time for hospitals to review their data and notify us of suspected errors in the measure rate calculations, and for us to incorporate appropriate corrections to the calculations. During the review and correction period, hospitals should notify us of suspected errors using the technical assistance contact information provided in their confidential reports.

The review and correction process we proposed to adopt for the claims-based measure rates would not allow hospitals to submit corrections related to the underlying claims data we used to calculate the measure rates, or allow hospitals to add new claims to the performance period data set that we ran to calculate the rates. This is because it is necessary to take a static ''snapshot'' of the claims in order to perform the calculations. For purposes of this Program, we would calculate the claims-based measures using claims and corrections to claims submitted by hospitals that were incorporated into our claims database during the approximately 90 day period following the last date of discharge to be included in the measure calculation.

We recognize that under our current timely claims filing policy, hospitals have up to one year from the date of discharge to submit a claim. However, in using claims and other administrative data to calculate measure rates for the Hospital VBP Program, we proposed to create data extracts using claims information as it exists in our Common Working File (CWF) approximately 90 days after the last discharge date in the performance period for the measures. For example, if the last discharge date in the performance period for a measure is June 30, 2011, we would create the data extraction on or about September 30, 2011 and use that data to calculate the measure rates for that performance period. Hospitals would then receive the measure rates in their confidential reports and accompanying data, and they would have an opportunity to review and submit corrections to those rates. As we stated above, hospitals would not be able to submit corrections to the underlying data that we extracted on or about September 30, 2011, and would also not be able to add claims to the data set. We would consider the underlying claims and administrative data to be complete for purposes of the Hospital VBP Program claims-based measure rate calculations at the conclusion of the approximately 90 day period following the last date of discharge used in the performance period.

We considered a number of factors in determining that an approximately 90 day ''run-out'' period is appropriate for purposes of calculating the claims-based measure rates. First, we seek to provide timely quality data to hospitals for the purpose of quality improvement, and to the public for the purpose of transparency. Next, we seek to make payment adjustments to hospitals as close in time to the applicable performance period as possible. Finally,

we seek to have as complete a data set as possible, recognizing that hospitals have up to one year from the date of discharge to submit a claim under our timely claims filing policy.

After we run the data and create the data extract for purposes of calculating the measure rate for a claims-based measure, it takes several months to incorporate other data needed to complete the rate calculation (particularly in the case of a risk-adjusted and/or episode based measure). We then need to generate and check the rate calculations, as well as program, populate, and deliver the confidential reports and accompanying data to hospitals. We are also aware that hospitals would like to receive performance information under the Hospital VBP Program as close in time to the performance period as possible. If we were to wait to run the data for purposes of calculating the claims-based measure rates until at least 12 months after the last discharge date in the performance period, we would not, for operational reasons, be able to provide the measure rates to hospitals 18 to 24 months after the performance period ended. We believe that this would create an unacceptably long delay both for hospitals that are interested in receiving timely measure rate calculations for their own quality improvement efforts, and for us to (1) calculate TPSs for a program year and (2) publicly report hospital performance on the *Hospital Compare* Web site. Therefore, we proposed to extract the data needed to calculate a claims-based measure rate approximately 90 days after the last discharge date for the measure's performance period so that we can best balance our need to provide timely program information to hospitals against the need to calculate the claims-based measures using as complete a data set as possible.

During the 30-day review and correction period, hospitals should notify us of suspected errors in our calculation of the measure rates using the technical support contacts provided in the hospital's confidential report. We would investigate the validity of each submitted correction and notify hospitals of the results. Should we confirm that we made an error in calculating one or more claims-based measure rates included in a hospital's confidential report, we would correct the calculation(s) and issue a new confidential report to the hospital. We proposed that once the 30-day review and corrections period has concluded, we would not accept any additional corrections submitted by a hospital.

We invited public comment on the proposed review and correction process for claims-based measure rates to be used in the Hospital VBP Program.

Comment: A number of commenters supported our proposals on review and correction of claims-based performance measure data.

Response: We thank commenters for their support.

Comment: Some commenters urged us to allow up to 60 days for hospitals to review and correct their claims-based measure data under the Hospital VBP Program, noting that hospitals will receive discharge-level information on claims-based measures for the first time.

Response: We believe that the proposed 30 day review and correction period is adequate for reviewing Hospital VBP measure rates and performance scores. This 30 day time period is the same amount of time used in *Hospital Compare* measure rate previews, and this time period has proved to be adequate for hospitals to review their measure rates. We are also concerned about the delay that would result in making value-based incentive payments if we allowed hospitals 60 days to review and correct their claims-based measure data. We believe that we have a responsibility to provide hospitals with timely reimbursements, and allowing 60 days for review and corrections would unacceptably further delay our ability to make incentive payments under the Program. Our experience with delivering similar reports to hospitals on similar measures indicates that 30 days is sufficient time for hospitals to download their reports and verify the accuracy of the measure calculations and troubleshoot any suspected discrepancies with the help of our contractor. In light of the fact that we will be providing even more detailed information than we have previously provided to hospitals under the Hospital IQR Program, we believe that 30 days is sufficient time for hospitals to review and submit corrections to the claims-based measure rates that will be used in the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing the claims-based measure rate review and correction process as proposed for FY 2014 and all subsequent payment determinations.

c. Review and Correction Process for Condition-Specific Scores, Domain-Specific Scores and Total Performance Scores

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28077), we proposed to adopt a review and corrections process that will enable hospitals to review and submit corrections with respect to their performance on each condition (the condition-specific score), their performance on each domain (the domain-specific score) and their TPSs. Under this proposed process, we would provide each hospital with a TPS Report (this would be a different report than the hospital confidential report and accompanying data described above, and the reports described in previous rules that will enable hospitals to review and correct their chart-abstracted and HCAHPS measure data). A hospital would have 30 days from the date we post the report on its QualityNet account to review the TPS Report and submit any necessary corrections to us via QualityNet. This proposed requirement will enable us to evaluate corrections requests and provide decisions on those requests in a timely manner. As discussed further below, we also proposed that the submission of a correction through this process be a prerequisite to a hospital being able to submit an appeal of the calculation of its performance assessment with respect to the performance standards and/or its TPS under section 1886(o)(11)(A) of the Act.

Hospitals would not be able to use this proposed review and correction process to ask us to reconsider a hospital's eligibility under section 1886(o)(1)(C) of the Act to participate in the Hospital VBP Program for a fiscal year. However, we sought public comment on whether our determination regarding a hospital's eligibility should be subject to correction.

We believe that this proposed review and corrections process will ensure that hospitals are able to fully and fairly review their condition-specific scores, domain-specific scores, and TPS. We invited public comment on this proposal. We note that we anticipate posting FY 2013 hospital performance information on *Hospital Compare* in April 2013. We proposed to codify the process for posting hospital-specific information under the Hospital VBP Program in our regulations at 42 CFR 412.163.

We view the review and corrections process as separate and distinct from the appeals process. Each process is aimed at allowing hospitals to seek certain reconsiderations from CMS. The review and corrections process is aimed at correcting data that will be made public on the *Hospital Compare* Web site, while the appeals process allows hospitals to seek reconsideration for errors that may have been introduced during the TPS calculation that may affect hospitals' payments.

Comment: Many commenters urged us to allow up to 60 days for hospitals to review and correct their TPSs under the Hospital VBP Program.

Response: As discussed above, we are concerned about the delay in making value-based incentive payments to hospitals that would result if we allowed hospitals 60 days to review and correct their TPSs. The proposed 30 day review and correction period is the same length of time that we have long allowed hospitals to preview the data to be made public under the Hospital IQR Program, and we believe that this time period has proven to be adequate for hospitals to review their measure rates. We believe that we have a responsibility to provide hospitals with timely reimbursements, and allowing 60 days for review and corrections of TPSs would, in our view, unacceptably further delay incentive payments under the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing our proposals on review and corrections as proposed. We are also codifying these policies at 42 CFR 412.163.

7. Appeal Process Under the Hospital VBP Program

a. Background

Section 1886(o)(11)(A) of the Act requires the Secretary to establish a process by which hospitals may appeal the calculation of a hospital's performance assessment with respect to the performance standards (section 1886(o)(3)(A) of the Act) and the hospital performance score (section 1886(o)(5) of the Act).

Under section 1886(o)(11)(B) of the Act, there is no administrative or judicial review under section 1869 of the Act, section 1878 of the Act, or otherwise of the following: (1) The methodology used to determine the amount of the value-based incentive payment under section 1886(o)(6) of the Act and the determination of such amount; (2) the determination of the amount of funding available for the value-based incentive payments under section 1886(o)(7)(A) of the Act and the payment reduction under section 1886(o)(7)(B)(i) of the Act; (3) the establishment of the performance standards under section 1886(o)(3) of the Act and the performance period under section 1886(o)(4) of the Act; (4) the measures specified under section 1886(b)(3)(B)(viii) of the Act and the measures selected under section 1886(o)(2) of the Act; (5) the methodology developed under section 1886(o)(5) of the Act that is used to calculate hospital performance scores and the calculation of such scores; or (6) the validation methodology specified in section 1886(b)(3)(B)(viii)(XI) of the Act.

b. Appeal Process

We solicited public comments on the general structure and procedures we should consider when developing an appeals process for the Hospital VBP Program in the Hospital Inpatient VBP Program proposed rule (76 FR 2484). We took these comments into consideration when we developed the proposed appeals process that appears below. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28077), we proposed to implement an administrative appeals process that provides hospitals with the opportunity to appeal the calculation of their performance assessment with respect to the performance standards, as well as their TPS.

We proposed to codify this proposed appeals process and the limitations on administrative and judicial review in our regulations at 42 CFR 412.167.[132]

Under our proposed appeals process, if a hospital is seeking to appeal a calculation of the TPS, measure/dimension score, condition-specific score, domain specific score, or measure rate/data for which the hospital could have submitted a correction during the review and correction process we have both previously finalized (with respect to chart-abstracted and HCAHPS data) and proposed to adopt in this proposed rule, we would require that the hospital first submit a correction to that calculation, and receive an adverse determination from us, as part of that process before the hospital could challenge it under the appeals process. We proposed to adopt this requirement because we believe that we will be able to resolve many hospital claims through the review and corrections process, and thus eliminate the need for an appeal. To the extent that a hospital seeks to appeal a calculation that was the subject of a correction request, we proposed that the deadline for the hospital to submit an appeal under section 1886(o)(11)(A) of the Act would be 30 days from the date we informed the hospital through QualityNet of our decision on the correction request. For any other appeals requests, we proposed that hospitals have up to 30 days after the conclusion of the review and corrections period specified above to submit an appeal. We sought public comment on the appropriateness of this proposed appeals timeline and whether we should consider any other possible deadlines.

We proposed that all appeals be submitted through QualityNet and that they contain the following information:

- Hospital's CMS Certification Number (CCN)
- Hospital Name
- Hospital's basis for requesting an appeal. This must identify the hospital's specific reason(s) for appealing the hospital's TPS or performance assessment with respect to the performance standards.
- CEO contact information, including name, email address, telephone number, and mailing address (must include the physical address, not just the post office box).
- QualityNet System Administrator contact information, including name, email address, telephone number, and mailing address (must include the physical address, not just the post office box).

Consistent with sections 1886(o)(11)(A) and (B) of the Act, we proposed that hospitals would be able to submit an appeal on the following issues:

- CMS' decision to deny a hospital's correction request that the hospital submitted under the review and corrections process;
- Whether the achievement/improvement points were calculated correctly;
- Whether CMS properly used the higher of the achievement/improvement points in calculating the hospital's measure/dimension score;
- Whether CMS correctly calculated the domain scores, including the normalization calculation;
- Whether CMS used the proper lowest dimension score in calculating the hospital's HCAHPS consistency points;
- Whether CMS calculated the HCAHPS consistency points correctly;
- Whether the correct domain scores were used to calculate the TPS;
- Whether each domain was weighted properly;
- Whether the weighted domain scores were properly summed to arrive at the TPS; and
- Whether the hospital's open/closed status (including mergers and acquisitions) is properly specified in CMS' systems.

We invited public comment on this proposed administrative appeal process.

Comment: Commenters generally expressed support for CMS' proposed appeals process for the Hospital VBP Program. Some commenters requested additional detail on CMS' timeframe for resolving appeals.

[132] We inadvertently also proposed to include regulation text on the limitations on review at 42 CFR 412.162(e).

Response: We thank the commenters for their support. We regret that we are not able to provide further detail on a timeframe for resolving appeals requests at this time. The Hospital VBP Program is new, and we therefore have no basis on which to estimate the number or magnitude of appeals requests that we will need to review. We intend to resolve all appeals requests under the Hospital VBP Program as quickly as possible given available resources.

Comment: Some commenters opposed CMS' proposed appeals process, arguing that, despite their best efforts, hospitals miss errors during their own internal accuracy reviews and do not believe that the proposed timeframe provides hospitals the ability to fully review their scoring reports. Commenters argued that hospitals should have every opportunity to correct mistakes once they are identified, even if hospitals identify those mistakes after the review and corrections process.

Response: We remind commenters that they have ample opportunity to review and correct patient level HCAHPS and process of care measure data submission prior to quarterly data submission deadline as part of our review and correction process. We also believe that the proposed limitation on the appeals process encourages hospitals to review their score reports as thoroughly as possible in order to ensure that we make accurate, timely value-based incentive payments through this program.

After consideration of the public comments we received, we are finalizing the appeals process for the Hospital VBP Program as proposed. We are also codifying this process and the limitations on review in our regulations at 42 CFR 412.167.

8. Measures for the FY 2015 Hospital VBP Program

a. Relationship Between the National Strategy and the Hospital VBP Program

Section 399HH of the Public Health Service Act, as added and amended by sections 3011 and 10302 of the Affordable Care Act, requires the Secretary to establish a national strategy to improve the delivery of health care services, patient health outcomes, and population health. The Secretary published the ''National Strategy for Quality Improvement in Health Care'' on March 21, 2011. The strategy is available at: *http://www.healthcare.gov/law/resources/reports/nationalqualitystrategy032011.pdf.*

We believe we can incorporate the goals of the National Quality Strategy into our policies under the Hospital VBP Program. We view the strategy as an important driver in revamping how Medicare services are paid for, moving increasingly towards rewarding hospitals that deliver better outcomes in health and health care at lower cost to the beneficiaries and communities they serve. Over time, the strategy is also helping us align the goals for quality measurement and improvement in hospitals with those of other providers and suppliers in the health system, promoting shared accountability across care settings for beneficiary care and quality improvement.

We believe that, given the availability of endorsed measures and the need to balance the number and scope of the measures against the burden on participating hospitals, as well as ensuring that the Hospital VBP Program's measure set reflects our quality improvement priorities, the Hospital VBP Program measures should as fully as possible reflect the six measurement domains that arise from the National Quality Strategy's six priorities: Clinical Care; Person- and Caregiver-Centered Experience and Outcomes; Safety; Efficiency and Cost Reduction; Care Coordination; and Community/Population Health. We believe that measure sets should generally rely on a mix of standards, outcome, process of care measures, and patient-reported measures including measures of care transitions, patient experience, and changes in patient functional status, with an emphasis on measurement as close to the patient-centered outcome of interest as possible. We took all of these factors into consideration when developing our measure proposals for the FY 2015 Hospital VBP Program.

In addition, we believe that measure sets should evolve to include a focused set of measures that reflect the most important areas of service and quality improvement for hospitals as well as a core set of measure concepts that align quality improvement objectives across all provider types and settings.

b. FY 2015 Measures

In the Hospital Inpatient VBP Program final rule (76 FR 26496 through 26497), we adopted a policy under which we would examine whether any clinical process of care measures that were otherwise eligible for inclusion in a Hospital VBP Program measure set were topped-out, and thus, should be excluded because measuring hospital performance on a topped-out measure would have no meaningful effect on a hospital's TPS. Our methodology for evaluating whether a measure is topped-out focuses on two criteria: (1) National measure data show statistically indistinguishable performance levels at the 75th and 90th percentiles, and (2) National measure data show a truncated coefficient of variation (TCV) less than 0.10.

We analyzed the clinical process of care measures that we believe are eligible for the FY 2015 Hospital VBP Program based on their prior inclusion in the Hospital IQR Program and posting on *Hospital Compare* for ''topped out'' status, and concluded that one of the candidate measures for the FY 2015 Program—SCIP–Inf–10: Surgery Patients with Perioperative Temperature Management—is now ''topped-out.'' Therefore, we did not propose to include this measure in the FY 2015 Hospital VBP Program.

We welcomed public comments on whether any other existing Hospital VBP measures may be ''topped out'' and should therefore be considered for removal from the proposed measure set. We also noted that we do not believe it is appropriate at this time to test or re-test proposed outcome measures for ''topped-out'' status because such measures allow CMS to reward hospitals for high-quality outcomes, which is a central aim of quality improvement efforts in the health care system. We further believe that these measures are critical to providing patients with better care and believe it is important to hold hospitals accountable for the clinical outcomes captured by these measures. We invited public comments on this policy, including whether we should examine the proposed outcome measure set for ''topped-out'' status at this time.

Comment: A number of commenters supported our continued exclusion of ''topped-out'' measures from the Hospital VBP Program.

Response: We thank commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to remove SCIP–Inf–10: Surgery Patients with Perioperative Temperature Management in the FY 2015 Hospital VBP Program because it is topped-out.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28079), for the FY 2015 Hospital VBP Program, we proposed to retain 12 of the 13 clinical process of care measures that we have adopted for the FY 2014 Hospital VBP Program. We proposed to remove SCIP–VTE–1 from the FY 2015 measure set because this measure is very similar to another measure we have adopted for the Program (SCIP–VTE–2) but, in our view, is not as closely linked to better surgical outcomes because it assesses

the ordering of VTE prophylaxis, as opposed to the patient's actual receipt of such prophylaxis within 24 hours of surgery. We also note that, during a recent maintenance review of SCIP–VTE–1, the NQF concluded that it would no longer endorse this measure, and we proposed in this proposed rule to remove the measure from the Hospital IQR Program beginning with the FY 2015 payment determination. Therefore, we also proposed to remove SCIP–VTE–1 from the Hospital VBP Program measure set beginning with the FY 2015 Hospital VBP Program. We note that in the future, we anticipate proposing to adopt surgical outcome measures, including one or more measures that assess complications arising from VTE prophylaxis medications, first into the Hospital IQR Program and then into the Hospital VBP Program.

We proposed to adopt one additional clinical process of care measure—AMI–10: Statin Prescribed at Discharge. This measure has been specified under the Hospital IQR Program for the FY 2013 payment determination (75 FR 50200). AMI–10 measure data were posted on the *Hospital Compare* Web site on January 26, 2012, so as discussed further below, we proposed a 9-month performance period for this measure for FY 2015. We intend to align the performance period for AMI–10 with the other clinical process measures' performance period in future years. The measure is NQF-endorsed (#0639) and we did not find it to be ''topped-out'' when we examined the list of candidate measures as described above. We also note that current American College of Cardiology (ACC)/American Heart Association (AHA) guidelines place a strong emphasis on the initiation or maintenance of statin drugs for patients hospitalized with AMI, particularly those with LDL-cholesterol levels at or above 100 mg/dL. Therefore, we believe that this measure is appropriate for use in the Hospital VBP Program.

However, after examining the most recently-available data, we have concluded that the AMI–10 measure meets our definition of ''topped-out.'' Therefore, we are not finalizing this measure for the FY 2015 Hospital VBP Program.

For the Patient Experience of Care domain, we proposed to retain the eight dimensions of the HCAHPS survey that we adopted for the FY 2013 and FY 2014 Hospital VBP Program. We believe that the 8 HCAHPS dimensions finalized for the FY 2013 and FY 2014 Hospital VBP Programs are well-understood by hospitals and the public and capture important aspects of the patient's experience in the acute care environment.

For the Outcome domain, we proposed to retain the three 30-day mortality measures that we finalized for the FY 2014 Hospital VBP Program. As described above, we continue to believe that these measures are important to quality improvement efforts because outcome measures allow us to reward hospitals for high-quality outcomes, which is a central aim of quality improvement efforts in the health care system. We further believe that these measures are critical to providing patients with better care and believe it is important to hold hospitals accountable for the clinical outcomes captured by these measures. We also proposed to adopt two additional outcome measures—PSI–90, the AHRQ PSI composite measure, and the CLABSI: Central Line-Associated Blood Stream Infection measure—for the Outcome domain.

We initially adopted the CLABSI measure for the FY 2013 Hospital IQR Program in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50200 through 50202) and refer readers to that final rule for further discussion of the measure. CLABSI is a HAI measure that assesses the rate of laboratory-confirmed cases of bloodstream infection or clinical sepsis among ICU patients. This measure was first NQF-endorsed in 2004, and adopted by the HQA in 2007. The measure can be stratified by the type of ICU and is aggregated to the hospital level by the NHSN. We first posted hospital performance on this measure on *Hospital Compare* on January 26, 2012.

We believe that adoption of the CLABSI measure for the Hospital VBP Program is consistent with the intention captured in the Hospital VBP Program's statutory requirement that we consider measures of HAIs for the FY 2013 Hospital VBP Program's measure set. This measure was also included in the HHS Action Plan to Prevent HAIs, which is referenced in section 1886(o)(2)(B)(i)(I)(ee) of the Act.

We initially adopted the AHRQ PSI composite measure (PSI–90) for the FY 2010 Hospital IQR Program in the FY 2009 IPPS/LTCH PPS final rule (73 FR 48602 through 48603) and refer readers to that final rule for further discussion of that measure. PSI–90 is a composite measure of patient safety indicators developed and maintained by AHRQ and measure data were posted on *Hospital Compare* on October 14, 2011. We believe that its use in the Hospital VBP Program is appropriate in order to encourage hospitals to take all possible steps to avoid threats to patient safety that may occur in the acute care environment.

For the Efficiency domain, we proposed to adopt one new measure: The Medicare Spending per Beneficiary measure. The proposed measure is inclusive of all Part A and Part B payments from 3 days prior to a subsection (d) hospital admission through 30 days post discharge with certain exclusions. It is risk adjusted for age and severity of illness, and the included payments are standardized to remove differences attributable to geographic payment adjustments and other payment factors. We submitted the measure to the NQF for endorsement on July 2, 2012.

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618 through 51627) for a detailed description of the measure. Additional information on the measure, including a detailed specification document can be found at: *http://qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772053996.* This measure has been specified under the Hospital IQR Program, and performance data was posted on the *Hospital Compare* Web site on April 21, 2012. As discussed further below, we proposed that the performance period for this measure for the FY 2015 Hospital VBP Program would begin on May 1, 2013, which will be more than one year after the performance data was publicly posted. Further, section 1886(o)(2)(B)(ii) of the Act requires us to ensure that measures selected for the Hospital VBP Program include measures of efficiency, including measures of Medicare spending per beneficiary, for FY 2014 or a subsequent fiscal year. We believe that this proposed measure fulfills that requirement.

The proposed FY 2015 Hospital VBP Program measures appear below:

PROPOSED QUALITY MEASURES FOR FY 2015 HOSPITAL VBP PROGRAM

Measure ID	Description
Clinical Process of Care Measures	
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival.
AMI–10	Statin Prescribed at Discharge.
HF–1	Discharge Instructions.
PN–3b	Blood Cultures Performed in the Emergency Department Prior to Initial Antibiotic Received in Hospital.
PN–6	Initial Antibiotic Selection for CAP in Immunocompetent Patient.
SCIP–Inf–1	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision.
SCIP–Inf–2	Prophylactic Antibiotic Selection for Surgical Patients.
SCIP–Inf–3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time.
SCIP–Inf–4	Cardiac Surgery Patients with Controlled 6AM Postoperative Serum Glucose.
SCIP–Inf–9	Urinary Catheter Removed on Postoperative Day 1 or Postoperative Day 2.
SCIP–Card–2	Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.
SCIP–VTE–2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxes Within 24 Hours Prior to Surgery to 24 Hours After Surgery.
Patient Experience Measures	
HCAHPS*	Hospital Consumer Assessment of Healthcare Providers and Systems Survey.
Outcome Measures	
AHRQ PSI composite	Complication/patient safety for selected indicators (composite).
CLABSI	Central Line-Associated Blood Stream Infection.
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate.
MORT–30–HF	Heart Failure (HF) 30-day mortality rate.
MORT–30–PN	Pneumonia (PN) 30-day mortality rate.
Efficiency Measures	
MSPB–1	Medicare Spending per Beneficiary.

* Proposed dimensions of the HCAHPS survey for use in the FY 2015 Hospital VBP Program are: Communication with Nurses, Communication with Doctors, Responsiveness of Hospital Staff, Pain Management, Communication about Medicines, Cleanliness and Quietness of Hospital Environment, Discharge Information and Overall Rating of Hospital. These are the same dimensions of the HCAHPS survey that have been finalized for prior Hospital VBP Program years.

We invited public comment on the proposed measure set for the FY 2015 Hospital VBP Program.

Comment: Some commenters asked that CMS seek the MAP's evaluation of stroke measures for possible inclusion in future Hospital VBP Program years, arguing that such measures are strongly aligned with the Hospital VBP Program's goals of rewarding better care value and patient outcomes. Other commenters suggested that CMS consider adopting pain assessment measures for the Hospital VBP Program.

Response: We thank commenters for the suggestions. We will consider adopting additional measures for the Hospital VBP Program as they become available under the statutory requirements, as they align with the National Quality Strategy, and as they fit within our other quality improvement priorities.

Comment: Many commenters applauded the clinical process of care measure proposals for the FY 2015 Hospital VBP Program. Other commenters suggested that CMS should move away from chart-abstracted measures for future program years in favor of more robust measures of quality that impose less reporting burden on hospitals.

Response: We thank the commenters that supported the clinical process of care measure proposals. With regard to the suggestion that we move away from using chart-abstracted measures in the future, we are aware of the burden that chart abstraction imposes on hospitals and intend to move the Hospital VBP measure set towards measures of outcomes and efficiency, rather than clinical processes, which we believe represent the next steps in quality measurement and will provide better incentives to hospitals to manage care quality and contain costs.

Comment: Commenters generally supported the proposal to remove SCIP–VTE–1 from the Hospital VBP Program, citing agreement with CMS' rationale that the SCIP–VTE–2 measure is more closely linked to outcomes than SCIP–VTE–1.

Response: We thank commenters for their support.

Comment: Some commenters objected to further use of the PN–3b measure (blood cultures performed in the Emergency Department prior to initial antibiotic received in the hospital) in the Hospital VBP Program, arguing that the measure is not directly linked to improved patient outcomes for pneumonia patients. Commenters also noted that NQF is considering withdrawing its endorsement of this measure.

Response: To the extent that the NQF issues updated guidance with respect to the PN–3b measure, we will take that guidance into consideration as we determine whether the measure remains appropriate for the Hospital VBP Program. In the meantime, we continue to believe that the PN–3b measure should remain in the Hospital VBP Program measure set because it captures important clinical quality information. Given the threat of antibiotic resistance, we believe that blood cultures prior to antibiotic administration remains an important point for quality improvement in the hospital setting.

Comment: Some commenters argued that the SCIP–Card–2 measure has undergone major changes for discharges

beginning January 1, 2012. Commenters argued that the changes to the measure's specifications are significant and that the measure should not be used for value-based purchasing. Commenters also called on CMS to adopt a transparent process to indicate when a VBP measure has changed and to ensure that changes do not arbitrarily affect hospitals' scores.

Response: We disagree with commenters' assertion that the changes made to the SCIP–Card–2 measure's specifications are significant enough to warrant the measure's exclusion from the Program. The specifications change extended the perioperative window in order to measure hospitals' continued administration of beta blockers for surgery patients on those drugs prior to arrival. While we understand that this change occurred during the FY 2013 Program's performance period, we do not believe that change to be so significant as to fundamentally alter the measure. We further note that NQF did not consider the change substantive during its maintenance review. We view this change as a necessary improvement to the measure's specifications to ensure that the measure aligns with best clinical practices and the highest quality standards.

We intend to closely monitor changes to the Hospital VBP Program, including the effects of updates to measures, and should we find that such changes warrant revisions to our scoring methodology, we will address the issue in future rulemaking.

Comment: Some commenters opposed our proposal to adopt HF–1 for the FY 2015 Program, noting that MAP recommended its removal. Other commenters argued that we should not adopt SCIP–Inf–2, as the Hospital IQR Program is adopting a surgical site infection outcome measure.

Response: We view HF–1 as an important measure of care coordination and therefore do not believe it appropriate to remove the measure from the Hospital VBP measure set at this time. We note that MAP recommended removing the HF–1 measure because the measure has not been recommended for continued NQF endorsement. If the NQF issues further guidance with respect to HF–1, we will take that guidance into consideration as we evaluate whether it is appropriate to retain HF–1 in the measure set.

While we are aware that the Hospital IQR Program is adopting a Surgical Site Infection (SSI) measure collected through the National Health Safety Network (NHSN), we may not consider that measure for the Hospital VBP Program until such time as it meets the requirements specified in section 1886(o)(2) of the Act. We therefore believe it is appropriate to continue to include SCIP–Inf–2 in the Hospital VBP Program measure set at this time.

Comment: Some commenters requested that we clarify that the Regulatory Impact Analysis included in the proposed rule correctly omitted the SCIP–Inf–10 measure, which we stated is ''topped-out.''

Response: We thank commenters for raising this matter. While the proposed rule referred to the SCIP–Inf–10 measure in its description of the Regulatory Impact Analysis, the measure was properly omitted in the calculations that appear in the Regulatory Impact Analysis.

Comment: Some commenters expressed concern about further use of the HCAHPS survey in the Hospital VBP Program, arguing that the survey is biased against urban and safety-net hospitals. Commenters suggested that the ''degree of quietness'' item is unfair to urban hospitals, as is the survey's policy of not adjusting results for very low-income patients. Other commenters argued that HCAHPS scores vary systematically based on factors unrelated to quality of care and urged CMS to account for those variables in HCAHPS scoring.

Response: We have examined the association between safety net status and the Patient Experience of Care (HCAHPS) domain score in the Hospital VBP Program. We analyzed Patient Experience of Care scores during the Hospital VBP Program Dry Run period (Baseline Period: April–December 2008; Performance Period: April to December 2010), both overall and among urban hospitals.

Although we do not have an official definition or designation of ''safety net'' hospital, safety net status typically entails one or more of three criteria: high Medicaid share; high proportion of uncompensated patients; and high county-associated poverty rate. During the Hospital VBP Program Dry Run, 28 hospitals (7 of them urban) met all three criteria, 157 hospitals (83 of them urban) met two of the three criteria, 625 hospitals (391 urban) met one of the three criteria, and 2,219 hospitals (1,718 urban) met none of the three criteria.

In general, during the Hospital VBP Program Dry Run, after all HCAHPS adjustments are applied (patient mix and survey mode), safety net hospitals perform similarly to other hospitals. For example, 24 percent of the hospitals that meet any of the three safety net criteria (198/810) scored in the top quartile of Hospital VBP Patient Experience of Care domain (versus 25 percent (550/2219) of hospitals that met none of the safety net criteria). For urban hospitals, the figures are 110/481 safety net hospitals (23 percent) vs. 454/1718 other hospitals (26 percent). If we consider only those hospitals that meet two of the three safety net criteria, then 36/185 safety net hospitals (20 percent) and 12/90 urban safety net hospitals (13 percent) are in the top quartile (with 5 of these 12 in the top decile).

The HCAHPS patient mix adjustment model controls for patient characteristics not under the control of the hospital that directly impact response tendencies. It also controls for socioeconomic status of the patient population through education, which is a well-accepted method for controlling for socioeconomic status, in particular, in the elderly population. Other characteristics, such as hospital characteristics or geographic location, are not included in the adjustment models because controlling for hospital characteristics would mask potential quality differences across different types of hospitals.

Comment: Some commenters strongly supported the inclusion of the Medicare Spending per Beneficiary measure in the FY 2015 Hospital VBP Program. These commenters noted that cost information is valuable when combined with other quality measures, in assisting patients, purchasers, and policymakers in identifying value in healthcare. Some commenters suggested that the Medicare Spending per Beneficiary measure's inclusion in the Hospital VBP Program not be further delayed, citing their belief that it was important to Congress, because it is the only measure specifically required for inclusion in the Hospital VBP Program.

Response: We thank the commenters for their support and we agree that the Medicare Spending per Beneficiary measure is an important first step toward identifying value in healthcare. Further, we believe that the Medicare Spending per Beneficiary measure provides an incentive for hospitals to build stronger relationships with and better understand the providers and suppliers that furnish care for their patients before and after an acute care hospitalization.

Comment: Some commenters supported the inclusion of the Medicare Spending per Beneficiary measure in the Hospital VBP Program as a first efficiency measure and encouraged CMS to work toward building a more robust efficiency measure set and to focus on efficiency measures that are connected to clinical process and outcomes.

Response: We appreciate these comments and acknowledge the

potential for building a more robust Efficiency domain in the Hospital VBP Program. We will consider these comments as we evaluate whether to propose to adopt additional efficiency measures in the Hospital VBP Program.

Comment: Some commenters commended CMS for its efforts to develop a spending measure but suggested that the Medicare Spending per Beneficiary measure requires further development before it should be included in the Hospital VBP Program.

Response: We appreciate that the Medicare Spending per Beneficiary measure is new to hospitals, but we disagree that the measure is not fully developed. This measure was developed and tested by CMS with the help of expert contractors. We originally described the measure in depth in the FY 2012 IPPS/LTCH PPS proposed rule (76 FR 25896 through 258997). We considered all public comments received on the measure and revised it accordingly. We publicly posted detailed specifications on February 1, 2012. We also invited public comment on the measure during a National Provider Call held in February 2012. Subsequently, we have conducted extensive additional testing on the measure, in preparation for the July 2, 2012 submission to the NQF for endorsement.

Comment: Some commenters expressed concern with the Medicare Spending per Beneficiary measure in general. A few of those commenters stated that the Medicare Spending per Beneficiary measure was a measure of cost, not efficiency. One commenter expressed general concern with rewarding or penalizing providers based on expenditures per patient. A few commenters stated that the measure should be delayed until other value-based purchasing programs establish parallel incentives. A few commenters suggested that the measure should assess not only cost, but also quality and expressed concern that a cost-only measure might have the unintended consequences of incentivizing cost reduction at the expense of quality or access to care. One commenter stated that smaller hospitals could be unfairly disadvantaged due to referrals occurring during the 30 days post discharge, and one commenter stated that the measure could unfairly disadvantage urban hospitals serving large populations of dual-eligible beneficiaries. One commenter requested that CMS post ICD–10 measure specifications in the final rule.

Response: For the purposes of inclusion of the Medicare Spending per Beneficiary measure in the Efficiency domain, we define ''efficiency'' in the sense of ''cost efficiency.'' This definition is consistent with existing approaches to measuring cost in the healthcare setting (Pacific Business Group on Health. Hospital Cost Efficiency Measurement: Methodological Approaches. January 2006, available at *http://www.pbgh.org/storage/documents/reports/PBGHHospEfficiencyMeas_01-2006_22p.pdf*). Efficiency refers to the relative cost of clinical resources used to achieve a measured level of quality; as such, the Medicare Spending per Beneficiary measure gauges efficiency by calculating hospitals' relative costs to Medicare after adjusting for case mix differences and other factors.

We also agree that it is beneficial to view a cost measure in light of other quality measures. As we stated in the FY 2012 IPPS/LTCH PPS final rule, for purposes of the Hospital VBP Program, we will weight and combine the Efficiency domain with the other domain scores, in order to calculate each hospital's TPS. This procedure for calculating a hospital's TPS ensures that Medicare spending per beneficiary makes up only a portion of the TPS and that the remainder is based on hospitals' performance on the other measures (76 FR 51622). We further emphasize that section 1886(o)(2)(B)(ii) of the Act expressly requires the inclusion of ''measures of Medicare spending per beneficiary'' in the Hospital VBP Program. We do not believe that the Medicare Spending per Beneficiary measure itself should assess both cost and quality. We believe that a distinct measure of cost, independent of quality, enables us to identify hospitals involved in the provision of high quality care at a lower cost to Medicare.

With regard to some commenters' suggestions that the implementation of the Medicare Spending per Beneficiary measure should be delayed until parallel incentives are established under other CMS programs, we disagree. While we acknowledge the value in provision of consistent incentives, we believe that the prompt implementation of this measure is an important step to incentivizing care coordination, improving more effective post acute care delivery and follow up, and reducing unnecessary services and preventable readmissions for Medicare beneficiaries. We will work with other incentive programs within CMS in an attempt to align future incentives to the extent possible.

We acknowledge that a hospital with fewer discharges during the performance period could see its measure performance more notably impacted by a high-cost episode. We note that although the measure is reliable using a minimum of 10 cases, we proposed a minimum of 25 cases and sought comment on a minimum of 50. Further, we exclude high-cost outlier episodes from this measure, so that these types of high cost cases will not unduly affect a hospital's Medicare Spending per Beneficiary measure performance. We also do not believe that the measure unfairly disadvantages urban hospitals serving dual-eligible beneficiaries. We have included an adjustment for severity of illness during the 90 days preceding the Medicare Spending per Beneficiary episode, in order to capture chronic conditions that may be experienced by any Medicare beneficiaries. Further, as we stated in the FY 2012 IPPS/LTCH PPS final rule, we do not believe that a socioeconomic risk adjustment factor is appropriate. This policy is consistent with the NQF's stated position on not adjusting for potential demographic (sex or race) or socioeconomic factors. Because an adjustment for dual-eligibility could be considered a proxy for socioeconomic status, we are not adjusting for this factor.

With regard to the request that we include ICD–10 measure specifications in this final rule, we are unable to accommodate this request. We do not currently have ICD–10 specifications for the Medicare Spending per Beneficiary measure, but to the extent that future implementation of ICD–10 affects the measure specifications already publicly posted, we will provide updated specifications to the public as soon as possible.

Comment: Several commenters submitted comments related to the post-discharge window in the Medicare Spending per Beneficiary measure. Some commenters expressed concern that the care provided to Medicare beneficiaries during the 30 days post hospital discharge is outside of hospitals' control, with one noting that follow-up care may be provided in a geographically distant location, relative to a transplant center. One commenter stated that a 30-day post-discharge period may be insufficient to capture long term savings achieved through the provision of technologies with higher upfront cost. A few commenters stated that a 30-day post discharge window was too long.

One commenter stated that the length of the post discharge window could, in some cases, be longer than 30 days because the total cost of the care that started within the 30 day period, but extended longer than 30 days, would be captured in the measure. This

commenter suggested that this fact precludes hospitals from being able to compare their performance with other hospitals. One commenter suggested that planned admissions to other facilities should be excluded, and one commenter suggested that the measure should be limited to services related to the reason for original index admission. One commenter expressed concern with the inclusion of readmissions in this measure, suggesting that hospitals could be penalized twice for them.

Response: We do not believe that the care furnished to beneficiaries after they are discharged from an acute care hospital is wholly outside of the hospital's control. As we stated in the FY 2012 IPPS/LTCH PPS final rule, we believe that hospitals that provide quality inpatient care, conduct appropriate discharge planning, and work with providers and suppliers on appropriate follow-up care will realize efficiencies and perform well on the measure, because the Medicare beneficiaries they serve will have a reduced need for excessive post-discharge services (76 FR 51621). We believe that hospitals can work effectively to improve care coordination, even if the post-discharge care is furnished in a geographically distant location. We finalized a 30-day post discharge period for the Medicare Spending per Beneficiary measure under the Hospital IQR Program in the FY 2012 IPPS/LTCH PPS final rule. This post discharge window is consistent with other agency initiatives, including the post-discharge period that applies to the readmission measures under the Hospital IQR Program and the Hospital Readmissions Reduction Program (76 FR 51619). As we indicated in that final rule, we will consider extending the length of the post-discharge period in future rulemaking, as suggested by one commenter, as both we and hospitals gain experience with the measure.

We recognize that the measure might capture Medicare payments for services initiated during the 30 days following discharge and continuing beyond them, but we do not believe that this is a disadvantage to any particular hospital. These payments represent actual costs to Medicare incurred during the Medicare Spending per Beneficiary episode surrounding a hospitalization, and we do not believe it would be appropriate to sever payments made under prospective payment systems into smaller units that are not what Medicare actually paid. We also disagree that inclusion of payments for services extending beyond the 30 day post-discharge window precludes meaningful comparison between hospitals, as all hospitals are subject to the same methodology in calculating their Medicare Spending per Beneficiary amounts and comparing them to the national median.

We disagree that planned admissions to other facilities should be excluded from the Medicare Spending per Beneficiary measure, because we seek to incentivize planning for appropriate and efficient post-discharge care through the use of this measure. With regard to the suggestion that services unrelated to the index admission should be excluded from the Medicare Spending per Beneficiary measure, we acknowledge that unforeseen events which are unrelated to the hospital stay could occur. As we stated in the FY 2012 IPPS/LTCH PPS final rule, this facet of the measure is consistent with the all cause readmission measure CMS is finalizing for the Hospital IQR Program and that determinations of the degree of relatedness of each subsequent hospital stay to an initial hospitalization could be subjective (76 FR 51621). We continue to believe that attributing all services provided during the episode is the best way to encourage quality inpatient care, care coordination, and care transitions. As we noted in that final rule, all hospitals will be subject to the same method of calculation of their Medicare spending per beneficiary amounts, as compared to the median Medicare spending per beneficiary amount across all hospitals, so we do not believe that inclusion of services which could be determined to be unrelated to the index admission will notably disadvantage any individual hospital (76 FR 51621).

With regard to the comment that hospitals could be doubly penalized by the inclusion of readmissions in this measure, we reiterate, as stated in the FY 2012 IPPS/LTCH PPS final rule, that we believe the Medicare payments made for readmissions must be attributable to the index hospital stay, in order: To fully capture Medicare spending relative to a hospital stay; to encourage the provision of comprehensive inpatient care, discharge planning, and follow-up; and to strengthen incentives to reduce readmissions (76 FR 51621). The Medicare spending per beneficiary measure is not a measure of readmission rates, but rather is a measure of total Medicare spending per beneficiary relative to a hospital stay.

Comment: Several commenters expressed views related to the risk adjustment methodology for the Medicare Spending per Beneficiary measure. One commenter expressed support for the methodology. Some commenters suggested that the risk adjustment methodology was not sufficient and should include adjustments for factors including comorbidities, severity of illness, age, sex, race, socioeconomic factors, concurrent treatments, transplant status, education level, ambulation status, functional status, and range of motion. One commenter suggested that the measure should be adjusted for differences in patients treated in an academic medical center versus those treated in community hospitals. One commenter suggested that the risk adjustment methodology should use a hierarchical, rather than a linear regression.

Response: We agree that the Medicare Spending per Beneficiary measure should be adjusted for comorbidities, severity of illness, and age. Accordingly, we are utilizing the hierarchical condition categories (HCCs) applied to conditions billed during the 90 days preceding the Medicare Spending per Beneficiary episode, the beneficiaries' age, and their institutional status, to risk adjust the expected spending during the episode. We believe that concurrent treatments and transplant status will be captured in the expected spending for Medicare beneficiaries with the same HCCs.

As we indicated in the FY 2012 IPPS/LTCH PPS final rule, we disagree with the comments that risk-adjustment for the Medicare Spending per Beneficiary measure should include further adjustment for socioeconomic factors, beneficiary sex, or beneficiary race. Consistent with NQF's position on not adjusting for potential demographic (sex or race) or socioeconomic factors, we believe that the best adjustment for a payment measure is based on the beneficiaries' underlying health status, not demographic or socioeconomic factors. (76 FR 51624). In order to minimize the burden on hospitals, we have finalized the Medicare Spending per Beneficiary measure as a claims-based measure (76 FR 51622). As such, we would be unable to apply an adjustment for ambulation status, functional status, or range of motion. With regard to the use of a hierarchical regression, we note that the HCC categories are calculated in a hierarchical fashion. The risk adjustment methodology also allows for differing relationships between comorbidities and different MS–DRG admission diagnoses, with the understanding that a given comorbidity may affect a given MS–DRG more or less than another MS–DRG. As also stated in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51624), we intend to analyze the risk-adjustment methodology, as we

gain experience with this measure, to evaluate whether it could be further refined.

Comment: Some commenters were opposed to the inclusion of the Medicare Spending per Beneficiary measure in the Hospital VBP Program for FY 2015 because they stated that hospitals had been given insufficient time to become familiar with the measure. These commenters noted that the measure was posted on *Hospital Compare* in April 2012, stating that this allowed them less than one calendar quarter to become familiar with the measure. One commenter added that hospitals have only an early understanding about how hospitals might make an impact on the cost without affecting quality. A few commenters stated that the Medicare Spending per Beneficiary measure rates were difficult to interpret.

Response: The Medicare Spending per Beneficiary measure data was added to the *Hospital Compare* Web site on April 19, 2012, after the measure was finalized for inclusion in the Hospital IQR Program through notice and comment rulemaking. We note that this posting followed a 30-day data preview in February 2012, during which we hosted a National Provider Call as well as accepted public comments via email. The proposed performance period for this measure would begin more than a full year after the April 2012 data posting. We provided information on how to interpret the Medicare Spending per Beneficiary measure data on *Hospital Compare,* and we remain cognizant of the measure's complexity. We will make every attempt to respond to inquiries and further clarify to the extent necessary how the measure is calculated as we move forward in utilizing this measure. When viewed in conjunction with other quality measures, the Medicare Spending per Beneficiary measure enables the public to recognize hospitals involved in providing high-quality care at a lower cost to Medicare.

Comment: Some commenters were opposed to the inclusion of the Medicare Spending per Beneficiary measure in the Hospital VBP Program, because they believed that CMS had not provided hospitals with sufficient data to understand or improve their performance on the measure. Some of these commenters stated that CMS had provided only information regarding whether the hospitals did better than, worse than, or the same as the national average, and some stated that hospitals would appreciate the raw data so that they could validate the calculations.

Response: We disagree with the commenters who stated that we did not provide hospitals with specific information to enable them to understand or improve their Medicare Spending per Beneficiary measure performance. During the February 2012 data preview period, hospitals were provided with an index admission file that detailed every inpatient admission at the hospital during the performance period and whether or not it was counted as an index admission for the Medicare Spending per Beneficiary measure; a beneficiary risk score file, which identified the beneficiaries whose hospitalizations were counted as index admissions, their index admission DRG, and data regarding health status based on the beneficiary's claims history in the 90 days prior to the start of an episode; and an episode file, which contains information on the care provided during the stay as well as what type of care was provided in the episode. The episode file also provided the hospitals with the top five providers of both inpatient and outpatient services, as defined by actual Medicare dollars paid, so that the hospitals could work to better coordinate care. We note that although we have made the risk adjustment methodology available, we are unable to provide the raw data used for risk adjustment, as that would entail providing every single claim line submitted during the 90 days preceding the episode and throughout the episode, for every beneficiary hospitalized nationwide during the performance period. This amount of data would be unusable to most of the public and could have privacy implications.

Comment: Several commenters expressed their views regarding the data provided to the public with regard to the Medicare Spending per Beneficiary measure. One commenter stated that CMS had provided ample opportunity for public comment. Some commenters expressed concern that CMS had provided data only to hospitals through confidential reports, so hospitals were unable to compare their performance to other hospitals, and others requested a public use file that would allow outside organizations to verify calculations, analyze potential unintended consequences, or assist hospitals in identifying opportunities for hospitals to reduce spending.

Response: We appreciate the public interest in data regarding the Medicare Spending per Beneficiary measure. We note that some information could only be provided directly to hospitals, through confidential reports, because it contains Medicare beneficiaries' personally identifiable information. That level of data was only provided to the hospitals that treated the beneficiaries during the period of performance. In response to the request for data, we have posted a file on *Hospital Compare* that provides data on the makeup of the average Medicare Spending per Beneficiary episodes at the individual hospital, state, and national levels. The file is entitled ''MSPB_Spending_Breakdowns_by_Claim_Type_051510–021411.csv,'' and it can be accessed at: *http://hospitalcompare.hhs.gov/Data/spending-per-hospital-patient.aspx*. We have also published an additional file entitled, ''MSPB_Spending_Breakdowns_by_Claim_Type_051510–021411_File_Description.docx'' which provides a detailed explanation of the data fields contained in the ''MSPB_Spending_Breakdowns_by_Claim_Type_051510–021411.csv'' file. This file can be accessed in the ''downloads'' section of the Hospital VBP Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/Hospital-Value-Based-Purchasing/*. We believe that the provision of these files satisfies the public's need for data while protecting beneficiary privacy.

Comment: Several comments expressed views regarding the reliability of the Medicare spending per beneficiary measure. Commenters stated that reliability testing was not published and should be before the measure is finalized.

Response: We appreciate the value of reliability analyses for the Medicare Spending per Beneficiary measure, as it is a new measure type for the Hospital VBP Program. We proposed to include the Medicare Spending per Beneficiary measure in the Hospital VBP Program for FY 2015, based on our belief that it would be reliable. This belief was based not only on the nature of the measure, in that it captures almost all discharges during the performance period and is calculated using payment amounts obtained from Medicare claims data, but also on a body of published research and historical NQF findings related to claims-based resource use measures. Because the Medicare Spending per Beneficiary measure is not condition-specific, but captures nearly all discharges from eligible hospitals during a performance period, most hospitals were expected to have a large sample size of Medicare Spending per Beneficiary episodes. Larger sample sizes increase the reliability of the measure.

There is also published research that indicates that spending for an episode of

care varies ''greatly'' among hospitals (N Engl J Med. 2008; 359: 3–5) and measures for which there is a larger inter-hospital variability are more likely to be reliable. Other studies, such as the one conducted by Jha and colleagues, also found statistically significant differences in the cost of care among hospitals using a predictive cost model (Health Aff. 2009; 28(3): 897–906), and another study found significant variation in Medicare spending per discharge for five common conditions (Healthcare Financial Management Association. Data Trends. Mar 2011. Available at *http://www.ahd.com/news/HFM_DataTrends_2011_March.pdf*). Furthermore, MedPAC found that measures of spending per beneficiary were an appropriate means of assessing variation in cost and that ''much of the variation [remaining] after removing the effects of input price adjusters is attributable to the quantity of services beneficiaries use.'' The study showed that even with aggregation at the county level, only 87.3 percent of beneficiaries nationally are between 85 percent and 115 percent of average cost per beneficiary, even after adjusting for health status, participation in Medicare Parts A and B, and payment to hospitals that reflect hospital costs for providing uncompensated care to the poor and teaching hospital costs for graduate medical education. After all such adjustments, the standard deviation at the beneficiary level was greater than 10 percent of the average cost per beneficiary (MedPAC. Report to Congress: Variation and Innovation in Medicare, Jun 2003). While these studies do not explicitly test the reliability of a beneficiary-level episode-based cost measure, they clearly establish significant variation in spending per beneficiary and show that provider choices drive that part of that variation.

In addition to this research, the NQF has found other resource use measures that are based on Medicare claims data, such as all-cause readmission measure (NQF #1789), to be highly reliable. For the all-cause readmission measure, ''reliability and validity [at the data element level and at the measured score level] was generally received as adequate by the steering committee'' (NQF: 2012 Proc. Feb 2012, available at *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=70455*). Further, in a memorandum to the NQF Board of Directors, the NQF's Senior Vice President for Performance Measures report noted that the majority of NQF committee members stated that the Hospital-wide All Cause Readmission Measure was highly reliable (Burston, 2012: Appeal of Hospital-wide All Cause Readmission Measure, 95pp. Available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=71398*). To further confirm our expectation that the Medicare Spending per Beneficiary measure is sufficiently reliable for inclusion in the Hospital VBP Program, we elected to obtain an analysis similar to that performed for certain other Hospital VBP measures. That analysis concluded that the Medicare Spending per Beneficiary measure has an overall reliability of 0.951 with a minimum number of 10 cases. The overall reliability of the Medicare Spending per Beneficiary Measure increases by 0.0002 when the minimum number of episodes increases from 10 to 25. The reliability analysis may be accessed publicly in the ''Downloads'' section of our Hospital VBP Web page, located at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/Hospital-Value-Based-Purchasing/*.

Comment: One commenter noted that the MAP identified measures of cost as a high-priority gap area for the Hospital VBP Program and strongly supported the measure's direction, in its February 2012 Final Report to the Department of Health & Human Services. Some commenters suggested that CMS should not finalize the measure until it is endorsed by the NQF, and some said that the measure must go through the NQF endorsement process. Many of these commenters also noted that that the MAP did not support inclusion of the Medicare Spending per Beneficiary measure at the time of its report.

Response: We appreciate the value of the NQF's endorsement of performance measures. We also agree with the commenter's assessment that the MAP ''strongly'' supported the measure's direction pending additional specification and testing. We have since made the measure specifications public and allowed comment through a National Provider Call held in February 2012. In the FY 2013 IPPS/LTCH PPS proposed rule, we expressed our intent to submit the Medicare Spending per Beneficiary measure to the NQF for endorsement consideration, and we did so on July 2, 2012. We disagree with the commenters who contended that the measure must go through the NQF endorsement process before it may be included in the Hospital VBP Program and note that we were only required by statute to give due consideration to any measures of Medicare spending per beneficiary currently endorsed by the NQF or any other consensus organizations under section 1886(b)(3)(B)(viii)(IX) of the Act. We have met that requirement and have also submitted the measure to the NQF for consideration for endorsement.

Comment: Some commenters argued that the proposed AHRQ PSI composite measure is not sufficiently reliable to distinguish differences in patient safety among health care institutions. Other commenters suggested that this type of safety measure is not appropriate for use in a payment program like the Hospital VBP Program. Some commenters argued that the measure calculation is too complex for hospitals and their vendors to attempt to replicate, and is therefore difficult as a focus of quality improvement.

Response: We believe that the proposed AHRQ PSI composite measure is sufficiently reliable for purposes of the Hospital VBP Program when using the minimum number of cases as proposed. We believe that one principal contributor to measure reliability is measure denominator size. While reliability will vary for individual hospitals based on the denominator size that applies to each hospital, we are finalizing a minimum number of cases for this measure that we believe is sufficiently reliable and appropriately balances our priorities of including hospitals in the Program and excluding hospitals from a measure when their performance on that measure may not be meaningfully captured.

We also believe that adopting the AHRQ PSI composite measure, with the minimum number of cases specified by the measure steward, provides strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, which is a critical consideration for quality improvement. We further believe that adopting the minimum number of cases as proposed enables those incentives to be extended to as many hospitals as possible, thus ensuring that as many patients as possible will benefit should hospitals take steps to improve their performance on the measure.

Further, we are particularly concerned about the effects that not finalizing the AHRQ PSI composite might have on hospitals' quality performance. We believe that the PSI measure, as a composite measure of patient safety, appropriately encourages robust hospital attention to patient safety events. As we have stated in prior rulemaking, we believe that the Hospital VBP Program exists to drive quality improvement in the acute inpatient setting, and we believe strongly that

measures of patient safety such as the AHRQ PSI measure and the CLABSI measure are important metrics on which hospitals should focus their quality improvement efforts.

Finally, while we are sympathetic to commenters' concerns about the composite measure's complexity, we note that the measure is composed of underlying safety indicators on which hospitals may focus their attention. We encourage hospitals that are unsure how to improve their performance on the AHRQ PSI measure or on any other measure finalized for the Hospital VBP Program to contact their QIO for assistance.

Comment: Two commenters assumed that because CMS proposed the removal of several individual AHRQ PSI measures from the Hospital IQR Program, we would also remove these indicators from the calculation of the AHRQ PSI–90 Composite measure for both Hospital IQR and the Hospital VBP Programs. Furthermore, these commenters believed that the statutory display requirement for the AHRQ PSI–90 Composite has not been met because CMS did not display data for all eight of the individual AHRQ indicators that are used in the composite.

Response: We wish to clarify that our removal of several individual AHRQ indicators from the Hospital IQR Program does not in any way change the composition of the AHRQ PSI–90 composite measure for either the Hospital IQR or Hospital VBP Programs. No changes have been proposed for the AHRQ PSI–90 composite for the Hospital IQR or Hospital VBP Programs. We adopted and displayed the NQF-endorsed AHRQ PSI–90 Composite measure for the Hospital IQR Program (NQF#531) which is comprised of the following individual indicators: PSI–03, PSI–06, PSI–07, PSI–08, PSI–12, PSI–13, PSI–14, and PSI–15. We will continue to use/display this NQF-endorsed version of the PSI composite for the Hospital VBP Program.

Regarding the 1 year display requirement for the PSI-composite for the Hospital VBP Program, we have proposed to use the AHRQ PSI–90 Composite calculation in its totality for Hospital VBP Program scoring. We displayed this composite score in its totality on *Hospital Compare* beginning October 2011. Therefore, the PSI–90 Composite meets the display requirement for use in the Hospital VBP Program regardless of how many individual AHRQ indicators were displayed.

Comment: Some commenters opposed our proposal to adopt the CLABSI measure for the FY 2015 Hospital VBP Program, arguing that the measure should be validated before its use in the Hospital VBP Program. Other commenters argued that the relatively limited CLABSI data posted on *Hospital Compare* in early 2012 did not meet the requirement for public display prior to the measure's use in the Hospital VBP Program. Some commenters suggested that it is not appropriate to adopt the CLABSI measure for both HAC payment policy and under the Hospital VBP Program. Some commenters argued that CMS should not include HAC measures in the Hospital VBP Program.

Response: We do not believe that we should wait until after the measure is validated before adopting it for the Hospital VBP Program. The CLABSI measure captures important information about infections that present substantial harm to patients. We believe that measuring and rewarding hospitals on their work at curbing CLABSI incidents is vital to rewarding the provision of high-quality health care, which is the central point of the Hospital VBP Program.

We believe that baseline and performance period CLABSI data are sufficiently reliable for purposes of the Hospital VBP Program. At least 20 State health departments validated CLABSI data reported to the NHSN during the baseline period, which gives us some assurance that the data is accurate. We also believe that our CLABSI minimum case threshold of at least one expected CLABSI event in the performance period (discussed more fully below) contributes to this measure's reliability, since we exclude hospitals with the lowest measure reliability from receiving a measure score. Our Hospital IQR Program CLABSI validation process starting with January 2012 CLABSI events was finalized through rulemaking (76 FR 51646 through 51648) to ensure data accuracy during the performance period. We believe that commenters may have erroneously concluded that CMS is adopting identical quality measures in two separate programs—in this case, the Hospital VBP Program, and HAC payment policy under section 1886(d)(4)(D) of the Act. We do not believe this to be the case. HAC measures are based on Medicare claims and capture only the Medicare population, while the CLABSI measure that we have proposed to adopt for the FY 2015 Hospital VBP Program is a surveillance measure reported to the NHSN and captures non-Medicare patients as well. We view the measures for each program as complementary and believe that adoption of these measures in each program should indicate to hospitals the high priority that we place on curbing infections and the harm they represent to patients.

We disagree with commenters' assertion that the measure data posted on *Hospital Compare* did not meet the statutory requirement for public display under the Hospital VBP Program. Section 1886(o)(2)(C)(i) of the Act prohibits the Secretary from selecting a measure for the Hospital VBP Program with respect to a performance period unless that measure has been specified under the Hospital IQR Program and included on *Hospital Compare* for at least one year prior to the beginning of the performance period. We posted CLABSI data on *Hospital Compare* in January 2012 in satisfaction of that requirement.

We believe that current *Hospital Compare* data provides a broad national snapshot of CLABSI performance. Although the initial January 2012 posting of *Hospital Compare* data included only 1 quarter of CLABSI information, we expect the number of hospitals for which data is posted on *Hospital Compare* to increase to the majority. In the most recent May 2012 posting, we posted over 1,500 hospitals' CLABSI data on the *Hospital Compare* Web site. This posting included January through June 2012 CLABSI data. An additional 500 hospitals submitted reports that they had insufficient intensive care unit (ICU) beds, and were not required in the Hospital IQR Program to submit CLABSI data. These hospitals did not treat a sufficient number of patients eligible to be included in the CLABSI measure. This measure exclusion, coupled with the large number of hospitals that are reporting CLABSI data, indicates broad understanding of the measure and sufficient data for public reporting.

In addition, as described further below, because we believe that including more data in the CLABSI measure calculations will alleviate commenters' concerns about the relatively small number of hospitals that reported on the measure initially, we will finalize a 12-month baseline period for the CLABSI measure for FY 2015 (this is discussed more fully below). By including all available data from CY 2011 in the resulting performance standards calculations, we believe we can ensure that the finalized performance standards accurately reflect national performance benchmarks.

Comment: Some commenters expressed support for CMS' proposals to adopt the AHRQ patient safety composite measure and the CLABSI measure.

Response: We thank commenters for their support.

Comment: Some commenters asked CMS to wait before adopting the CLABSI measure that includes both ICU and non-ICU patients.

Response: We believe that this measure supports making care safer, one of the National Quality Strategy's goals. We intend to solicit comments from the MAP and solicit comment on the expanded measure in future rulemaking.

Comment: Some commenters supported CMS' proposal to include mortality measures in the FY2015 Hospital VBP Program, though commenters also suggested that CMS consider additional risk-adjustment to include socioeconomic status and clinical factors.

Response: We thank commenters for their support. We believe the existing risk-adjustment methodology is sufficient. These measures were endorsed by the National Quality Forum, and the NQF extensively reviewed the risk adjustment methodology as part of their overall review. The 30-day mortality measures are currently risk-adjusted to include clinical factors, and we believe that risk adjustment model to be well-understood by hospitals and sufficiently robust for quality measurement. The Hierarchical Condition Category (HCC) grouping of clinical conditions and hospital case-mix are used for risk adjustment. The HCC model makes use of all physician and hospital encounter diagnoses and was designed to predict a beneficiary's expenditures based on the total clinical profile represented by all of his/her assigned HCCs. Additionally, there are several exclusions to the mortality measures, such as enrollment in a hospice program. We refer commenters to the extensive documentation of the mortality measure methodology at *http://www.qualitynet.org*.

Comment: Some commenters expressed strong opposition to further use of the 30-day mortality measures in the Hospital VBP Program, arguing that the measures are unreliable and should be the subject of a validity study. Some commenters also argued that the risk adjustment process applied to these measures is insufficient. Commenters also requested that we pursue a validation study of the mortality measures as soon as possible.

Response: We believe that the three 30-day mortality measures are sufficiently reliable for inclusion in the Hospital VBP Program. One principal contributor to measure reliability is measure denominator size, and the reliability of a measure is going to vary for individual hospitals, based on the denominator size that applies to each hospital. Our proposed FY 2015 minimum case threshold increase from 10 to 25 cases for the mortality measures improves reliability by excluding an additional estimated 376 to 682 hospitals in FY 2015 with the lowest number of cases in the measure denominators and, thus, lowest level of reliable measure scores. This analysis was performed subsequent to the reliability analysis posted on the CMS Web page *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/Downloads/HVBP_Measure_Reliability-.pdf* in February 2012. Our proposed FY 2016 expansion of the performance period to 21 months also improves reliability by increasing the number of cases in the mortality measure denominator. We believe that the previously finalized FY 2014 Hospital VBP mortality measures are sufficiently reliable, since the 12 month performance period is expected to increase the denominator counts for most hospitals, relative to the 9 month FY 2015 mortality measure performance period.

We believe that our increase in the minimum number of cases for the mortality measures for FY 2015 improves overall reliability, since we excluded hospitals with the lowest reliability from receiving a score on the mortality measures. We proposed the 25 case minimum for each of the three 30-day mortality measures because we recognize that each of these measures are risk adjusted to estimate differences in hospital patient case mix. Our process of care measures included in the Hospital VBP program do not utilize risk adjustment estimation techniques, and we believe that our proposal to increase the minimum case threshold to 25 cases incorporates the increased reliability necessary for the three mortality measures using risk adjustment estimation techniques. We believe that our 25 case minimum threshold is also supported by the central limit theorem, a commonly used statistical theorem used in sampling theory and statistical estimation. According to Rice's *Mathematical Statistics and Data Analysis* (2nd edition, 1995), this theorem states that under certain conditions, the mean of a sufficiently large number of independent random variables, each with a finite mean and variance, will be approximately normally distributed. For these mortality measures, a 25 case minimum threshold should be sufficient to create an approximate normal distribution of hospital TPSs. We believe that the distribution of mortality measures is sufficiently reliable for inclusion in the program, based on this information and the relatively small contribution of the mortality measures to the total performance score. We also proposed to set the the Outcome domain weight at 30 percent for the FY 2015 program so that the total performance score continues to be normally distributed and reliable with the inclusion of the mortality measures. We also view the TPS's reliability is an important factor when considering performance periods, minimum numbers of cases and measures, and other policies for the Hospital VBP Program, as the TPS is the basis for value-based incentive payments.

We also weighed our policy goal to link payment to patient outcomes for the vast majority of hospitals in our proposal to include the 3 mortality measures with a 25 case minimum. For the FY 2015 proposed 9 month performance period and 25 case threshold, we estimate that about 1,566 hospitals would be included for the AMI 30-day mortality measure, 2,514 hospital would be included for the HF 30-day mortality measure, and 2,690 hospitals would be included for the PN 30-day mortality measure. Increasing the minimum case threshold would dramatically decrease the number of hospitals receiving a score for these measures, and would dramatically reduce the impact on patient health outcomes that the 3 mortality measures promote. We further believe that the 3 mortality measures are valid through their very strong link to patient health outcomes. The National Quality Forum endorsed these measures and one fundamental criterion in their assessment was a demonstrated link to patient health outcomes. We believe that the inclusion of mortality measures improves the Total Performance Score's validity by adding measures with relatively high correlation with patient outcomes. We further believe that these measures, which capture outcomes data, enable us to provide incentives to hospitals focusing on a broader picture of health care quality, rather than simply rewarding hospitals for completing clinical processes.

Comment: Some commenters suggested that we consider additional HAC measures for the Hospital VBP Program, including CAUTI and vascular catheter-associated infection. Commenters urged us to retain the HAC measures that we suspended in the CY 2012 OPPS/ASC final rule with comment period for the FY 2014 Hospital VBP Program and suggested

that we consider additional HAI measures for the FY 2015 VBP Program.

Response: We thank commenters for these suggestions. As stated above, we will consider additional measures for the Hospital VBP Program as they become available under the requirements set forth in section 1886(o)(2) of the Act and if they are consistent with the National Quality Strategy and the agency's other quality improvement priorities.

After consideration of the public comments we received, we are finalizing the FY 2015 Hospital VBP Program measure set as proposed, with the exception, as described further above, of AMI–10, which we have concluded is ''topped-out.''

c. General Process for Hospital VBP Program Measure Adoption for Future Program Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28080), in order to facilitate measure adoption for the Hospital VBP Program for future years, as well as further align the Hospital VBP Program with the Hospital IQR Program, we proposed to re-adopt measures from the prior program year for each successive program year, unless proposed and finalized otherwise (for example, because one or more of the clinical process of care measures is topped-out). We intend to continue monitoring Hospital VBP measures for topped-out status and will propose to remove topped-out measures from the program as appropriate in future rulemaking. We will therefore generally re-adopt the prior program year's measure set unless we propose to add or remove measures through rulemaking and in response to public comments. However, under this policy, once measures are finalized, we would not separately re-propose them for each program year. We invited public comments on this proposal.

Comment: Some commenters supported the proposal to re-adopt Hospital VBP measures automatically for each program year, noting that the policy will give stability and predictability to the program while still affording CMS flexibility to make needed changes.

Response: We agree and thank commenters for their support.

Comment: Some commenters opposed the proposal to re-adopt measures for future program years unless CMS proposes to remove them. Commenters suggested that new measures may make older measures redundant or unnecessary, and argued that stakeholders should be able to comment on the entire measure set annually.

Response: We intend to re-evaluate the entire Hospital VBP measure set each year, and to propose to remove any measures that we conclude would be redundant or unnecessary due to the addition of other, newer measures. We also intend to solicit comments on an annual basis on the entire measure set, including both newly proposed and previously finalized measures, and we will consider and respond to all of these comments. We view the proposal to automatically re-adopt measures as a way to ensure consistency across Hospital VBP Program years. This proposal also seeks to assist hospitals in their planning and quality improvement efforts through more advanced notice about Hospital VBP measures to be included in future program years.

After consideration of the public comments we received, we are finalizing our policy enabling automatic re-adoption of quality measures from prior program years as proposed.

9. Measures and Domains for the FY 2016 Hospital VBP Program

a. FY 2016 Measures

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28080), we proposed to retain the three 30-day mortality measures that were finalized for the FY 2014 Hospital VBP Program, and which we are finalizing for the FY 2015 Hospital VBP Program, for the FY 2016 Hospital VBP Program. We also proposed to retain PSI–90, which is the AHRQ PSI composite measure that we are finalizing for the FY 2015 Hospital VBP Program, for the FY 2016 Hospital VBP Program. By proposing to adopt these measures now, we believe we will be able to adopt a longer performance period and collect more data for performance scoring than would be possible if we waited to make this proposal until the FY 2014 IPPS/LTCH PPS proposed rule. We also proposed to adopt these measures at this time because we recognize that under section 1886(o)(3)(C) of the Act, we must establish and announce performance standards not later than 60 days prior to the beginning of the performance period for the fiscal year involved. Accordingly, we proposed that the performance period for these measures would begin October 1, 2012, for purposes of the FY 2016 Hospital VBP Program. Because we are finalizing our proposal above to automatically re-adopt measures from year to year, the other proposed FY 2015 measures will also become part of the FY 2016 measure set (with the exception of the CLABSI measure) unless we propose otherwise in future rulemaking. We also anticipate adopting additional measures for the FY 2016 Hospital VBP Program in future rulemaking.

The proposed FY 2016 Hospital VBP Program 30-day mortality measures and AHRQ PSI composite measure are shown below:

PROPOSED OUTCOME MEASURES FOR FY 2016 HOSPITAL VBP PROGRAM

Measure ID	Description
AHRQ PSI composite	Complication/patient safety for selected indicators (composite).
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate.
MORT–30–HF	Heart Failure (HF) 30-day mortality rate.
MORT–30–PN	Pneumonia (PN) 30-day mortality rate.

We did not propose to adopt the CLABSI measure for the FY 2016 Hospital VBP Program at this time, but stated that we may propose it in future rulemaking.

We invited public comment on these proposals.

Comment: Some commenters urged us to clarify whether CMS will propose to adopt the CLABSI measure for the FY 2016 Hospital VBP Program.

Response: We anticipate proposing to adopt CLABSI for the FY 2016 Hospital VBP Program.

Comment: Some commenters urged CMS to exclude patients identified as needing only hospice or palliative care from Hospital VBP Program calculations, arguing that inconsistent access to these services may result in unfair penalties to hospitals in areas without those services.

Response: As patients needing hospice or palliative care will still require resources from hospitals, we do not believe it would be appropriate to exclude them from Hospital VBP Program calculations, nor do we believe it would be consistent with measure specifications. We intend to monitor the effects of the Hospital VBP Program on care quality in the acute inpatient setting and will examine this issue in the future.

After consideration of the public comments we received, we are finalizing our proposal to include the 30-day mortality measures, AHRQ PSI composite measure, and other measures finalized for the FY 2015 Hospital VBP measure set (with the exception of the CLABSI measure) in the FY 2016 measure set. As stated above, we might propose in future rulemaking to adopt additional measures beginning with the FY 2016 Hospital VBP Program.

b. Quality Measure Domains for the FY 2016 Hospital VBP Program

Currently, measure domains are defined by the measure type rather than by measure function. At the time of the Hospital VBP Program's development, we believed this type of measure classification, which was included in the 2007 Report to Congress, was appropriate for the program based on its clarity and simplicity compared to alternative scoring models. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26513 through 26514) for further discussion of our decision to finalize the Three-Domain Performance Scoring Model for the Hospital VBP Program with appropriate modifications for additional domains as necessary. The FY 2014 Hospital VBP Program's domains are clinical process of care, outcomes, and patient experience of care. The FY 2015 Hospital VBP Program's proposed domains are clinical process of care, outcomes, patient experience of care, and efficiency.

We strive to align quality measurement and value-based purchasing efforts with the National Quality Strategy and across programs. Value-based purchasing programs in particular allow us to link the National Quality Strategy with Medicare reimbursements to providers and suppliers on a national scale. Given this objective, as well as our objective to focus quality measurement on the patient-centered outcome of interest to the extent possible, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28081), we proposed to reclassify the Hospital VBP measures into domains based on the six priorities of the National Quality Strategy, beginning with the FY 2016 Hospital VBP Program. We made this proposal in this proposed rule to ensure that we have ample time to consider all public comments and finalize any policies in advance of the FY 2016 program year.

We proposed that the following six domains serve as a framework for measurement and TPS calculations for the Hospital VBP Program beginning with the FY 2016 program year: Clinical Care; Person- and Caregiver-Centered Experience and Outcomes; Safety; Efficiency and Cost Reduction; Care Coordination; and Community/Population Health.

To illustrate how CMS would classify measures into the proposed new domains, we offered the following example using the proposed FY 2015 Hospital VBP measure set:

Proposed FY 2015 measures	Proposed FY 2016 domain	Proposed FY 2015 domain
HF–1 Discharge Instructions	Care Coordination	Clinical Process of Care.
AMI–10 Statin Prescribed at Discharge	Clinical Care	Clinical Process of Care.
AMI–7a Fibrinolytic Agent Received Within 30 Minutes of Hospital Arrival.	Clinical Care	Clinical Process of Care
AMI–8a Primary PCI Received Within 90 Minutes of Hospital Arrival	Clinical Care	Clinical Process of Care.
Mortality–30–AMI: Acute Myocardial Infarction (AMI) 30-day Mortality Rate.	Clinical Care	Outcomes.
Mortality–30–HF: Heart Failure (HF) 30-day Mortality Rate	Clinical Care	Outcomes.
Mortality–30–PN: Pneumonia (PN) 30-Day Mortality Rate	Clinical Care	Outcomes.
PN–3b Blood Cultures Performed in the Emergency Department Prior to Initial Antibiotic Received in Hospital.	Clinical Care	Clinical Process of Care.
PN–6 Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients.	Clinical Care	Clinical Process of Care.
SCIP Card-2 Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.	Clinical Care	Clinical Process of Care.
SCIP–Inf–01 Prophylactic antibiotic received within 1 hour prior to surgical incision.	Clinical Care	Clinical Process of Care.
SCIP–Inf–02 Prophylactic antibiotic selection for surgical patients	Clinical Care	Clinical Process of Care.
SCIP–Inf–03 Prophylactic antibiotics discontinued with 24 hours after surgery end time.	Clinical Care	Clinical Process of Care.
SCIP–Inf–04 Cardiac Surgery Patients with Controlled 6AM Postoperative Serum Glucose.	Clinical Care	Clinical Process of Care.
SCIP–VTE–2 Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery.	Clinical Care	Clinical Process of Care.
Medicare spending per beneficiary	Efficiency and Cost Reduction	Efficiency.
HCAHPS—Hospital Consumer Assessment of Healthcare Providers and Systems Survey.	Person- and Caregiver-Centered Experience and Outcomes.	Patient Experience of Care.
Central Line-Associated Blood Stream Infection (CLABSI)	Safety	Outcome.
PSI 90 Complication/Patient Safety for Selected Indicators (Composite).	Safety	Outcome.

We acknowledge that some of the measures noted above could appropriately be placed in more than one domain because the quality improvement characteristics they seek to measure, especially for outcome measures, are multifaceted. We believe that the measure classification by domain should reflect the primary measurement objective and the type of quality improvement goal the measure seeks to capture. For example, although

a reduction in CLABSIs may reflect improved clinical care, we believe that it better reflects an improvement in patient safety because such infections often cause harm to patients.

We proposed that the TPS would continue to be determined by aggregating each hospital's scores across all domains. A hospital's score on each domain would also continue to be calculated based on the hospital's score on each measure within the domain, which is based on the higher of its achievement or improvement during the applicable performance period.

We welcomed public comment on our proposal to regroup the Hospital VBP Program's quality measures into six domains that better reflect the National Quality Strategy, beginning with the FY 2016 Hospital VBP Program.

We also solicited comments on how to properly weight the domains in FY 2016. We believe that domain weighting should primarily balance two factors. First, it should reflect our concept of quality as it relates to the National Quality Strategy and the most critical needs for quality improvement in caring for beneficiaries. Second, it should reflect the relative depth and maturity of measures in each domain. For example, although improvement in the proposed Care Coordination domain is a priority, we would want to take into consideration whether the care coordination measures available for inclusion in that domain in a particular year capture multiple aspects of care coordination. If we did not believe that the measures within a domain captured enough aspects of care, we would consider proposing a relatively lower weight for the domain. We anticipate that the domain weights will evolve over time as the measure set changes.

We also recognize that the current domain weighting system allows us to place higher value on measures closer to the patient-centered outcome of interest by grouping outcome measures into a single domain. In the proposed domain reclassification, the 30-day mortality measures would be grouped with process measures. Although we anticipate that the measure set will evolve over time to be more focused on outcomes, the current measure set continues to emphasize clinical processes. We sought public comment on whether CMS should continue to group all outcome measures in a single domain. In addition, we sought public comment on the implications of and alternatives to the proposed approach of including both clinical process of care measures and outcome measures in the proposed Clinical Care domain under the proposed domain reclassification.

Comment: Some commenters expressed support for our proposal to realign the Hospital VBP measure scoring domains around the priorities articulated in the National Quality Strategy.

Response: We thank commenters for their support.

Comment: Some commenters expressed concerns about the proposed domain reclassification for FY 2016, suggesting that the proposed structure could dilute hospitals' focus on outcome measures. Commenters preferred that outcome measures continue to be grouped together and given substantial domain weight to reflect the relatively greater importance of outcomes to patients and taxpayers. Other commenters were concerned about adopting domains based on the National Quality Strategy with relatively few measures.

Response: We understand the commenters' concern and agree that the Hospital VBP Program should, over time, focus its measure set on measures of outcomes and efficiency rather than clinical processes. We intend to continue shifting the focus of the Hospital VBP Program's measure set from clinical processes to measures of outcomes and efficiency, and will consider the commenters' concerns about diluting hospitals' focus on outcome measures in the future.

We are also concerned about adopting domains with relatively few measures, but we note that such a policy serves to focus hospitals' attention on the measures captured in such domains. As noted above, we finalized the FY 2015 Program's Efficiency domain with one measure, which we believe shows the relative importance of efficiency in the health care sector.

Comment: Some commenters urged CMS to proceed cautiously in reclassifying Hospital VBP measure scoring domains for the FY 2016 Hospital VBP Program. Some commenters suggested that the National Quality Strategy's priorities are more appropriate for Accountable Care Organizations or as guiding principles for quality rather than as quality domains. Commenters suggested that CMS allow Hospital VBP Program scoring previews before completing any domain reclassification in order to allow hospitals to evaluate the impact on their scores. Some commenters also suggested that CMS wait until hospitals have actual experience with the Hospital VBP Program before fundamentally reshaping its structure.

Response: We thank commenters for their input. We will consider the feasibility of providing hospitals with scoring previews in the future. As we are not finalizing this domain reclassification at this time, we believe we are meeting commenters' request that we wait until hospitals have actual experience with the Program before reshaping it. We will consider re-proposing this domain reclassification when we have more information to evaluate hospitals' performance under the Program.

After consideration of the public comments we received, we are not finalizing our proposal to reclassify the Hospital VBP measures into domains based on the six priorities of the National Quality Strategy in FY 2016. We will maintain the existing four-domain structure in FY 2016. We will consider these comments should we address this issue again in future rulemaking.

10. Performance Periods and Baseline Periods for the FY 2015 Hospital VBP Program

Section 1886(o)(4) of the Act requires the Secretary to establish a performance period for the Hospital VBP Program for a fiscal year that begins and ends prior to the beginning of such fiscal year.

a. Clinical Process of Care Domain Performance Period and Baseline Period for FY 2015

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74534), for the FY 2014 Hospital VBP Program, we finalized a 9-month (3-quarter) performance period from April 1, 2012 through December 31, 2012 for the clinical process of care domain measures.

As we stated in that final rule with comment period, adopting a 3-quarter performance period for this domain for the FY 2014 Hospital VBP Program would enable us to consider adopting a 12-month performance period for this domain for FY 2015. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28082), we proposed to adopt CY 2013 (January 1, 2013 through December 31, 2013) as the performance period for all but one of the clinical process of care domain measures for the FY 2015 Hospital VBP Program. This proposed performance period for FY 2015 would begin immediately after the end of the FY 2014 performance period and will enable us to begin to make value-based incentive payments to hospitals beginning October 1, 2014. A 12-month performance period would also give us more data on which to score hospital performance, which is an important goal both for CMS and for stakeholders. We also note that a 12-month performance

period is consistent with the periods used for the Hospital IQR Program.

However, as noted above, AMI–10 measure data were posted on *Hospital Compare* on January 26, 2012. Therefore, we stated that we did not believe we could begin a performance period for this measure on January 1, 2013, which would align with the proposed performance period for all other clinical process of care measures. We considered the most appropriate way to include this measure in the FY 2015 Hospital VBP Program and concluded that we should propose a 9-month performance period from April 1, 2013 through December 31, 2013. As we have stated for prior program years, we believe that a 9-month performance period provides sufficiently reliable quality measure data for clinical process of care measures. We also stated that we intend to align the AMI–10 measure's performance period with all other clinical process measures for future program years.

As we explained in the Hospital Inpatient VBP Program final rule (76 FR 26511), we believe that baseline data should be used from a comparable prior period for purposes of calculating the performance standards. However, we also strive to balance that belief with our desire to use the most recently-available data in order to calculate performance standards, as we believe that more recent data more closely reflects current performance on measures. Therefore, we proposed to adopt CY 2011 (January 1, 2011 through December 31, 2011) as the baseline period for all but one of the Clinical Process of Care domain measures for the FY 2015 Hospital VBP Program. As noted above, we proposed to adopt a 9-month performance period for the AMI–10 measure. In accordance with our preference for adopting a comparable prior period for purposes of calculating the performance standards, we proposed to adopt a 9-month baseline period of April 1, 2011 through December 31, 2011 for the AMI–10 measure.

We welcomed public comment on these proposals.

Comment: Commenters generally supported CMS' clinical process of care performance period proposals for the FY 2015 Hospital VBP Program, including proposing to use a full calendar year for most clinical process measures and a slightly shorter performance period for AMI–10 consistent with its posting date on *Hospital Compare.*

Response: We thank commenters for their support. However, as described further above, because we have concluded that AMI–10 is ''topped-out,'' we are not finalizing that measure for the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing the FY 2015 performance period and baseline period for the Clinical Process of Care domain as proposed, with the exception of the proposed periods for the AMI–10 measure.

b. Patient Experience of Care Domain Performance Period and Baseline Period for FY 2015

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74534), for the FY 2014 Hospital VBP Program, we finalized a 9-month (3-quarter) performance period from April 1, 2012 through December 31, 2012 for the Patient Experience of Care domain measure.

As we stated in that final rule with comment period, adopting a 3-quarter performance period for this domain for the FY 2014 Hospital VBP Program would enable us to consider adopting a 12-month performance period for this domain for FY 2015. Consistent with our goal of adopting a full 12-month period for this domain in order to collect a larger amount of HCAHPS survey data compared to a 9-month period, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28083) we proposed to adopt CY 2013 (January 1, 2013 through December 31, 2013) as the performance period for the Patient Experience of Care domain measure for the FY 2015 Hospital VBP Program. This proposed performance period for FY 2015 would begin immediately after the end of the FY 2014 performance period and would enable us to begin making value-based incentive payments to hospitals beginning on October 1, 2014. We also note that a 12-month performance period is consistent with the periods used for the Hospital IQR Program.

As we explained in the Hospital Inpatient VBP Program final rule (76 FR 26511), we believe that baseline data should be used from a comparable prior period for purposes of calculating the performance standards. Therefore, we proposed to adopt CY 2011 (January 1, 2011 through December 31, 2011) as the baseline period for the Patient Experience of Care domain measure for the FY 2015 Hospital VBP Program.

We welcomed public comment on these proposals.

Comment: Commenters generally supported the proposal to adopt 12-month baseline and performance periods for the Patient Experience of Care Domain for the FY 2015 Hospital VBP Program.

Response: We thank commenters for their support.

After consideration of the public comments we received, we are finalizing the FY 2015 Patient Experience of Care performance period and baseline period as proposed.

c. Efficiency Domain Measure Performance Period and Baseline Period for FY 2015

We posted performance data for the Medicare Spending Per Beneficiary measure on *Hospital Compare* on April 21, 2012. We therefore concluded that the earliest we could begin a performance period for FY 2015 is one year from the date on which the data was posted. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28083), we proposed an end date of December 31, 2013 for this measure's performance period. This end date is consistent with the end dates proposed for the Clinical Process of Care domain and for the HCAHPS measure in the Patient Experience of Care domain.

In the interest of maintaining consistency across domains, to the extent possible, and in order to ensure that data have been posted for at least 1 year prior to the beginning of the measure performance period, we proposed to adopt an 8-month performance period (May 1, 2013 through December 31, 2013) for the Medicare spending per beneficiary measure for the FY 2015 Hospital VBP Program. We believe this proposed performance period enables us to collect as much measure data as possible and the time necessary to process claims and incorporate measure data into Hospital VBP Program scores. We further proposed to adopt a corresponding prior period (May 1, 2011 through December 31, 2011) as the baseline period for purposes of calculating the performance standards. This proposed baseline period would be consistent with the baseline period proposed for other Hospital VBP Program measures in that it precedes the performance period by two years.

We welcomed public comment on the proposed FY 2015 performance and baseline period for the Medicare spending per beneficiary measure.

Comment: Some commenters argued that the proposed performance period for the Medicare Spending per Beneficiary measure is not long enough to produce reliable data on which to base performance scores.

Response: We disagree. We believe that the proposed performance period will enable us to make robust comparisons of hospitals' spending levels, which we note are important

considerations for quality improvement. As described in the FY 2013 IPPS/LTCH PPS proposed rule, we conducted an independent analysis of the minimum number of cases necessary for hospitals to receive a reliable score on the Medicare Spending per Beneficiary measure (77 FR 28089–90), and we believe that the 25 case minimum finalized below appropriately ensures that hospitals are being compared using reliable measure data. In addition, in order to confirm our expectation that the Medicare Spending per Beneficiary measure would be reliable, an expectation that was based on the large number of discharges included in the measure and the body of literature supporting the ability of cost measures to assess variability between hospitals, we have conducted comprehensive reliability testing of the measure. As discussed in section VIII.C.8.b of this preamble, that analysis found the measure to be reliable with a minimum of 10 cases. We discuss and finalize our minimum case number for the Medicare Spending per Beneficiary measure in section VIII.C.14.c. of this preamble.

After consideration of the public comments we received, we are finalizing the FY 2015 performance period for the Medicare Spending per Beneficiary measure as proposed.

d. Outcome Domain Performance Periods for FY 2015

(1) Mortality Measures

In the Hospital Inpatient VBP Program final rule (76 FR 26495), we finalized a 12-month performance period (July 1, 2011–June 30, 2012) for the Outcome domain for the FY 2014 Hospital VBP Program. We also finalized a comparable prior period as the baseline period (July 1, 2009 through June 30, 2010) for purposes of calculating improvement points as well as the performance standards.

Due to the lengthy time needed for us to compile certain claims-based measure data at the individual hospital level and calculate the measure rates and scores (discussed more fully in section VIII.C.6.b. of this preamble in the context of our review and corrections proposal for claims-based measures), we must conclude the performance period for the mortality and AHRQ PSI measures for FY 2015 by June 30, 2013.

We are concerned about the difficulty that varied performance periods impose on participating hospitals. While we believe the public recognizes the need for different performance periods due to varied measure types and collection methods, we strive to propose performance periods that are as consistent as possible from one program year to the next. We believe this consistency is important for all hospitals that are working to improve the quality of care they provide to Medicare beneficiaries and to the entirety of the patient population. However, we are also aware that the Hospital VBP statute requires that we establish and announce performance standards for Hospital VBP measures at least 60 days in advance of the performance period. Because we proposed to adopt these measures for FY 2015 in the FY 2013 IPPS/LTCH PPS proposed rule, which will not be effective until 60 days after it is finalized, we did not believe we could propose a performance period for these measures beginning earlier than October 1, 2012.

We note that this proposed performance period is less than 12 months, which may raise seasonality concerns with regard to these measures. We note further that we examined the independent analysis of these measures' reliability provided by Mathematica Policy Research, entitled, ''Reporting Period and Reliability of AHRQ, CMS 30-day and HAC Quality Measures—Revised,'' which is available on our Web site (*http://cms.hhs.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/Downloads/HVBP_Measure_Reliability-.pdf*), and which concluded that the measures may not achieve total reliability for all hospitals for reporting periods as short as 6 months. However, we believe that holding all hospitals accountable using the same period will fairly alleviate those concerns, particularly because these measures are risk-adjusted using a methodology that does not penalize hospitals for poor performance on the measure without a relatively larger sample size. As described further below, while we are concerned about these measures' reliability when adopting a performance period of less than 12 months, we believe that increasing the required minimum number of cases will assure sufficient reliability for these measures for value-based purchasing. Based on our stated objective to include outcome measures in the Hospital VBP Program, we believe that the proposed 9-month performance period for these measures will produce sufficiently reliable results for hospitals.

Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28083), we proposed to adopt a 9-month performance period for the three 30-day mortality measures for FY 2015 from October 1, 2012 through June 30, 2013. We further proposed a comparable baseline period from October 1, 2010 through June 30, 2011.

We welcomed public comment on our proposal to adopt a performance period for the proposed FY 2015 mortality measures that runs from October 1, 2012 through June 30, 2013, and a baseline period that runs from October 1, 2010, through June 30, 2011.

Comment: Many commenters expressed concern about the proposed performance period for mortality measures, arguing that the proposed period is too short to provide reliable measure scores on which to base TPSs. Commenters noted that a statistical report released by CMS concluded that the mortality measures do not appear to be reliable even with up to 24 months of performance information.

Response: As stated above, we believe that holding all hospitals accountable using the same time period alleviates any significant concerns about seasonal variation in measure performance. We believe that our proposal is responsive to concerns about outcome measure reliability. Our proposals are designed to increase overall reliability of these measures, and exclude hospitals with the most unreliable measure rates from receiving a score in the outcome domain. We also considered the improved validity resulting from outcome measures that include a higher correlation with patient outcomes, relative to process of care measures. As stated previously, we assessed measure reliability, TPS reliability and validity, and alignment with our policy goal to reduce cost and improve patient health outcomes when we developed our proposals.

Comment: Some commenters expressed concern about the proposed performance periods, suggesting that CMS should wait until it can adopt 12-month performance and baseline periods before adopting measures into the Hospital VBP Program. Commenters argued that 12-month performance periods represent the minimum length that CMS should consider finalizing.

Response: While we are also concerned about requiring hospitals to improve on quality metrics during varied performance periods, as stated above, we believe the proposed performance periods enable us to adopt robust quality measures covering important clinical topics as quickly as possible, thereby encouraging hospitals to improve their performance on the measures. We believe that the Hospital VBP Program's shifting focus from measures of clinical processes to outcome and efficiency measures rightly ensures that hospitals consider how to improve every aspect of the care

provided to Medicare beneficiaries, an aim that we achieve by adopting new measures into the Hospital VBP Program as soon as possible.

After consideration of the public comments we received, we are finalizing the FY 2015 performance period and baseline period for the 30-day mortality measures as proposed.

(2) AHRQ PSI Composite Measure

We posted hospital performance data on the AHRQ PSI composite measure on *Hospital Compare* on October 14, 2011. Based on that posting date, we believe the earliest we could begin a performance period for FY 2015 is October 14, 2012. As discussed above, we must conclude the performance period for certain claims-based measures by June 30, 2013 in order to allow sufficient time to calculate the measure rates and scores. We note that we did not specify which measures' performance period we must end by June 30, 2013 in the proposed rule; we intended to refer specifically to the mortality measures and the AHRQ PSI composite measure.

Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28084), we proposed to adopt a nearly 9-month performance period (October 15, 2012 through June 30, 2013) for the AHRQ PSI composite measure for FY 2015. We believe that this performance period will provide us with sufficiently reliable data on which to base hospitals' scores. We further proposed to adopt a comparable prior period from October 15, 2010 through June 30, 2011 as the baseline period for purposes of calculating the performance standards.

While we would prefer to adopt a performance period longer than nearly 9-months in order to provide the most reliable measure data possible, we believe that the proposed period enables us to ensure that this measure, which assesses hospital performance on the critical topic of patient safety, is included in hospitals' FY 2015 TPSs and, therefore, will become a focus of quality improvement efforts. We note further that we examined the independent analysis of this measure's reliability provided by Mathematica Policy Research, entitled, ''Reporting Period and Reliability of AHRQ, CMS 30-day and HAC Quality Measures—Revised,'' which is available on our Web site (*http://cms.hhs.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/Downloads/HVBP_Measure_Reliability-.pdf*), and which concluded that the AHRQ PSI composite measure achieves moderate reliability for the majority of hospitals for reporting periods of 6 months or longer. Based on our objective to include patient safety measures in the Hospital VBP Program, we believe that the proposed nearly 9-month performance period for this measure will produce reliable results for hospitals.

We welcomed public comment on these proposals.

Comment: Many commenters opposed the proposed performance period for the AHRQ PSI composite measure, arguing that CMS' standard for reliability testing for the measure is not sufficient for a payment program. Some commenters urged CMS to review measure reliability at 0.9 or higher to ensure that value-based incentive payments have high reliability rates.

Response: As described above, we believe that the AHRQ PSI composite measure is sufficiently reliable for purposes of the Hospital VBP program. The median reliability level of this measure is estimated to be 0.7 for a 9 month performance period. In our measure selection and performance period assessment, we also assessed the validity of the measure through its correlation with patient health outcomes, and the reliability of the TPS as indicative of hospital performance. We do not believe that focusing on the individual measure's reliability, to the exclusion of its contribution to the reliability of the TPS, is the sole criterion for assessing the appropriateness of adopting measures to the Hospital VBP Program. We note that the AHRQ PSI composite measure is a measure of patient safety, a critical topic for quality measurement and improvement, and we believe strongly that adopting this measure for the Hospital VBP Program will ensure that hospitals focus on the topic of patient safety when working towards quality improvement.

We do not believe that commenters' suggestion of adopting 0.9 as the standard for measure reliability to the exclusion of other criteria is advisable. We further note that we assess quality measures for adoption in the Hospital VBP Program in many ways, including reliability, the number of hospitals receiving a score on the measure, the measure topic, and alignment with quality priorities.

After consideration of the public comments we received, we are finalizing the FY 2015 performance period and baseline period for the AHRQ PSI composite measure as proposed.

(3) CLABSI Measure

We posted CLABSI measure data on *Hospital Compare* on January 26, 2012. Pursuant to our commitment to post measure data on *Hospital Compare* at least one year prior to the beginning of a performance period for the Hospital VBP Program, the earliest we can begin a performance period for this measure is January 26, 2013. Because, as described above, we believe this measure captures important patient safety data, in this case related to infections that present the possibility of significant harm to hospitalized patients, we believe it is appropriate to adopt the measure as soon as possible for as lengthy a performance period as possible. Adopting an approximately 11-month performance period for this measure will not, in our view, appreciably harm the measure's statistical reliability for purposes of value-based purchasing scoring, particularly because (as described below) we also proposed to adopt the measure steward's criteria for minimum number of cases to receive a measure score.

Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28084), we proposed to adopt an approximately 11-month performance period for the CLABSI measure from January 26, 2013 through December 31, 2013 with a comparable baseline period of January 26, 2011 through December 31, 2011 for purposes of calculating the performance standards.

We welcomed public comment on these proposals.

Comment: Many commenters were concerned about the proposed performance period for the CLABSI measure. Commenters were specifically concerned about the quality of CLABSI data that is being reported publicly, as they argued that less than 25 percent of hospitals met the minimum case threshold for reporting on *Hospital Compare* during the first quarter of public reporting. Commenters asserted that the relatively small sample is not representative of hospitals around the country.

Response: We understand commenters' concerns about the robustness of the CLABSI measure data. However, we believe that the best way to address these concerns is to include as much data from as many participating hospitals as possible. While the January 2011 *Hospital Compare* display included data for a relatively small number of hospitals, approximately 2,300 hospitals reporting CLABSI data were suppressed on the January 2011 *Hospital Compare* due to insufficient volume of reported data. In

total, over 2,600 hospitals submitted CLABSI data during the first quarter 2011 to the NHSN to comply with our Hospital IQR Program reporting requirement. An additional 600 hospitals reported to CMS that they did not treat a sufficient volume of ICU patients, and were not required to report CLABSI data to CMS. We also note that the May 2012 display of *Hospital Compare* included over 1,500 hospitals' CLABSI data, an increase of over 1,000 hospitals from the January posting. We anticipate the number of hospitals posted on *Hospital Compare* will increase to over 2,000 hospitals when we collect 12 months of CLABSI data. We do not believe it is appropriate to drop January 2011 reported data because we believe that the increased reliability using a 12 month performance period and we believe that any sampling bias that may have been introduced by the relatively small number of reporting hospitals in the first quarter is eliminated by adopting a 12-month baseline period and including as many hospitals as possible. We believe that adopting a 12-month baseline period enables us to calculate performance standards that fully and fairly reflect national performance on the CLABSI measure without including the effects of seasonal variation.

We also wish to provide hospitals with baseline performance period data as soon as feasible to promote hospital quality improvement efforts. We anticipate that hospitals will also see their 12 month baseline performance period CLABSI data on *Hospital Compare* by January 2013. These same data are posted on *Hospital Compare* as part of our Hospital IQR program. We expect to provide *Hospital Compare* preview reports containing this information to hospitals during fall 2012 calendar year.

In addition, CDC advised us that CLABSI measure data may not be easily disaggregated to incident day, but rather, may only be reduced to incident month. For that reason, we are finalizing that instead of beginning the performance period for the CLABSI measure for FY 2015 with January 26, 2013 events, the performance period will begin with February 1, 2013 events.

After consideration of the public comments we received, we are finalizing an FY 2015 performance period for the CLABSI measure of February 1, 2013 through December 31, 2013 infection event data, with a baseline period of January 1, 2011 through December 31, 2011 infection event data.

The final performance and baseline periods for all of the FY 2015 measures appear below:

Domain	Baseline period	Performance period
Clinical Process of Care	January 1, 2011–December 31, 2011	January 1, 2013–December 31, 2013.
Patient Experience of Care	January 1, 2011–December 31, 2011	January 1, 2013–December 31, 2013.
Outcome		
• Mortality	• October 1, 2010–June 30, 2011	• October 1, 2012–June 30, 2013.
• AHRQ PSI	• October 15, 2010–June 30, 2011	• October 15, 2012–June 30, 2013.
• CLABSI	• January 1, 2011–December 31, 2011	• February 1, 2013–December 31, 2013.
Efficiency		
• Medicare Spending Per Beneficiary-1	• May 1, 2011–December 31, 2011	• May 1, 2013–December 31, 2013.

e. Performance Periods for FY 2016 Measures

In order to provide relatively more reliable data for the three proposed 30-day mortality measures and the AHRQ PSI composite measure, we considered how we could adopt a 24-month performance period for the FY 2016 Hospital VBP Program. We do not believe it is feasible to do so at this time given the statutory requirement that we establish and announce performance standards at least 60 days in advance of the applicable performance period. However, we intend to propose to adopt a 24-month performance period for these measures as soon as is practicable and will consider a 24-month performance period in future rulemaking.

Given the time constraints associated with the annual IPPS/LTCH PPS rulemaking schedule, we believe that the longest performance period we can propose for FY 2016 at this time is 21 months. We believe that this performance period will provide relatively more reliable measure data and will enable us to consider adopting a 24-month performance period in the future.

Therefore in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28084), we proposed to adopt a 21-month performance period for the three proposed 30-day mortality measures and the AHRQ PSI composite measure for the FY 2016 Hospital VBP Program, from October 1, 2012 through July 30, 2014. We further proposed a baseline period of October 1, 2010 through July 30, 2011, for purposes of calculating performance standards and measuring improvement. We note that this baseline period is identical to the proposed baseline period for these measures for FY 2015. We also note that this baseline period is shorter than the proposed performance period. We believe it is appropriate to use the most recently-available data to calculate performance standards and are concerned about the possibility of using data from several years prior to the performance period for performance standards. However, we sought public comment on whether we should adopt a 24-month baseline period.

We welcomed public comment on this proposal. We also sought comments on the possibility of adopting a ''rolling'' 2-year performance period for certain claims-based measures during which we would score hospitals using 24 months of data. As an example, under such a policy for mortality measures, hospitals could be scored for the FY 2018 Hospital VBP Program using data from the performance periods for FY 2017 (while not yet proposed, one possibility for that year could be July 1, 2013 through June 30, 2015). For subsequent fiscal years, we would drop the oldest 12 months of data from that period and add the next 12 months. The performance period for the FY 2019 Hospital VBP Program under that policy could be July 1, 2014 through June 30, 2016.

Comment: Many commenters applauded CMS' proposal to move towards a 24-month performance period for outcome measures in the future. However, some commenters argued that CMS should not finalize shorter performance periods for these measures in the interim, citing reliability concerns.

Response: We thank commenters for their support. We believe that our proposal is responsive to concerns about outcome measure reliability, since we proposed a 21 month FY 2016 performance period and a 25 case minimum threshold for including

mortality measures for the FY 2015 Hospital VBP Program. Both proposals are designed to increase the overall reliability of these measures. We also considered the improved validity resulting from more outcome measures that include a higher correlation with patient outcomes, relative to process of care measures. As stated previously, we assessed measure reliability, TPS reliability and validity, and alignment with our policy goal to reduce cost and improve patient health outcomes when we developed our proposals. We disagree that we should exclude these measures from the TPS until we can adopt lengthier performance periods. We believe that scoring hospitals on these measures, even with relatively shorter performance periods, ensures that the topics covered by these measures remain important components of hospitals' quality improvement efforts.

Comment: Some commenters opposed the proposal to adopt longer performance periods for certain measures in FY 2016. Commenters argued that the varied performance periods are confusing for hospitals, and that using longer timeframes results in hospitals being held accountable for old data.

Response: We understand commenters' concerns about the varied performance periods finalized for the Hospital VBP Program and about using relatively older data. However, we make every effort to communicate with hospitals about the time periods during which their performance will be assessed. We will continue to work to notify hospitals about the measures, performance periods, performance standards, and other components of the Hospital VBP Program.

We view the use of relatively older data as a necessary component of the Hospital VBP Program given the current state of quality measurement. Many measures in the Hospital VBP Program are claims-based, which often require more time to compile and calculate, and require relatively longer performance periods than other types of measures to maximize reliability. While this may result in hospitals' being held accountable for data from prior fiscal years, we do not believe this policy to be avoidable at this time.

After consideration of the public comments we received, we are finalizing the FY 2016 performance period and baseline period for the 30-day mortality measures as proposed. However, based on the AHRQ PSI measure's posting on *Hospital Compare* on October 14, 2011, we do not believe we can finalize a performance period for that measure beginning on October 1, 2012. Based on the date of the posting, we believe that the longest performance period we could adopt would run from October 15, 2012 to June 30, 2014, with a corresponding baseline period from 2 years prior.

The table below displays the final performance periods and baseline periods for the FY 2016 mortality and AHRQ PSI composite measures.

Measure	Baseline period	Performance period
Mortality	October 1, 2010–June 30, 2011	October 1, 2012–June 30, 2014.
AHRQ PSI	October 15, 2010–June 30, 2011	October 15, 2012–June 30, 2014.

11. Performance Standards for the Hospital VBP Program for FY 2015 and FY 2016

a. Background

Section 1886(o)(3)(A) of the Act requires the Secretary to establish performance standards for the measures selected under the Hospital VBP Program for a performance period for the applicable fiscal year. The performance standards must include levels of achievement and improvement, as required by section 1886(o)(3)(B) of the Act, and must be established and announced not later than 60 days before the beginning of the performance period for the fiscal year involved, as required by section 1886(o)(3)(C) of the Act. Achievement and improvement standards are discussed more fully in the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513). In addition, when establishing the performance standards, section 1886(o)(3)(D) of the Act requires the Secretary to consider appropriate factors, such as: (1) Practical experience with the measures, including whether a significant proportion of hospitals failed to meet the performance standard during previous performance periods; (2) historical performance standards; (3) improvement rates; and (4) the opportunity for continued improvement. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28085), we proposed to codify this for performance standards in our regulations at § 412.165.

b. Performance Standards for the FY 2015 Hospital VBP Program Measures

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28085), we proposed to establish performance standards that apply to the FY 2015 Hospital VBP Program using the same methodologies that we previously adopted for the FY 2013 and FY 2014 Hospital VBP Programs. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513) for a detailed discussion of the methodology we adopted for the clinical process of care, patient experience of care, and outcome measures, and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656) for a discussion of the methodology we adopted for the Medicare spending per beneficiary measure.

We continue to believe that the finalized methodology for calculating performance standards is appropriate for the Hospital VBP Program given that the Program remains relatively new to hospitals and the public. The proposed performance standards for the clinical process, outcome, and Medicare spending per beneficiary measures appear in the first table below, while the proposed performance standards for the patient experience of care (HCAHPS survey) measure appears in the second table below. We note that the performance standards displayed below represent estimates based on the most recently-available data; we are updating the standards in this final rule. We also note that the performance standards for the CLABSI measure and the AHRQ PSI composite measure are calculated with lower values representing better performance, in contrast to other measures, on which higher values indicate better performance. We note further that we inadvertently omitted the benchmark for the AMI–10 measure and the achievement threshold and benchmark for the HF–1 measure in the proposed rule. We corrected those omissions in the FY 2013 IPPS/LTCH PPS proposed rule correction notice (77 FR 34327 through 34328) and the corrected table appears below.

PROPOSED PERFORMANCE STANDARDS FOR THE FY 2015 HOSPITAL VBP PROGRAM CLINICAL PROCESS OF CARE AND OUTCOME DOMAINS, AND THE MEDICARE SPENDING PER BENEFICIARY MEASURE

[Corrected]

Measure ID	Description	Achievement threshold	Benchmark
Clinical Process of Care Measures			
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	0.72727	1.00000.
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival.	0.92857	1.00000.
AMI–10	Statin Prescribed at Discharge	0.90474	1.00000.
HF–1	Discharge Instructions	0.92090	1.00000.
PN–3b	Blood Cultures Performed in the Emergency Department Prior to Initial Antibiotic Received in Hospital.	0.97129	1.00000.
PN–6	Initial Antibiotic Selection for CAP in Immunocompetent Patient.	0.93671	0.99832.
SCIP–Card–2	Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.	0.95122	1.00000.
SCIP–Inf–1	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision.	0.97872	1.00000.
SCIP–Inf–2	Prophylactic Antibiotic Selection for Surgical Patients.	0.97882	1.00000.
SCIP–Inf–3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time.	0.96154	0.99905.
SCIP–Inf–4	Cardiac Surgery Patients with Controlled 6AM Postoperative Serum Glucose.	0.94799	0.99824.
SCIP–Inf–9	Urinary Catheter Removed on Postoperative Day 1 or Postoperative Day 2.	0.93333	1.00000.
SCIP–VTE–2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxes Within 24 Hours Prior to Surgery to 24 Hours After Surgery.	0.94118	0.99938.
Outcome Measures			
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-Day Mortality Rate.	0.8477	0.8673.
MORT–30–HF	Heart Failure (HF) 30-Day Mortality Rate	0.8861	0.9042.
MORT–30–PN	Pneumonia (PN) 30-Day Mortality Rate	0.8818	0.9021.
PSI–90	Patient safety for selected indicators (composite).	0.4006	0.2754.
CLABSI	Central Line-Associated Blood Stream Infection.	0.442	0.000.
Efficiency Measures			
MSPB–1	Medicare Spending per Beneficiary	Median Medicare spending per beneficiary ratio. across all hospitals during the performance period.	Mean of the lowest decile of Medicare spending per beneficiary ratios across all hospitals during the performance period.

PROPOSED PERFORMANCE STANDARDS FOR THE FY 2015 HOSPITAL VBP PROGRAM PATIENT EXPERIENCE OF CARE DOMAIN

HCAHPS Survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	49.23	76.28	85.56
Communication with Doctors	57.31	79.61	88.72
Responsiveness of Hospital Staff	34.83	62.75	78.59
Pain Management	43.05	69.24	78.24
Communication about Medicines	28.11	60.46	71.72
Hospital Cleanliness & Quietness	40.35	63.79	78.46
Discharge Information	55.10	83.29	89.60
Overall Rating of Hospital	29.26	67.73	83.13

We welcomed public comment on these proposed performance standards.

Comment: Some commenters noted that the performance standards table in the FY 2013 IPPS/LTCH PPS proposed rule omitted the achievement thresholds and benchmarks for HF–1 and AMI–10.

Response: We thank commenters for their attention to this matter. As noted above, we published the proposed performance standards values for those two measures in the FY 2013 IPPS/LTCH PPS proposed rule correction notice (77 FR 34327 through 34328).

Comment: Some commenters expressed support for the proposed performance standards for FY 2015.

Response: We thank commenters for their support.

Comment: Some commenters noted a slight decline in the Clinical Process of Care performance standards for the FY 2015 Program compared to the finalized standards for FY 2014. Commenters suggested that CMS should analyze these differences and ascertain whether this decline was the result of a true decline in quality performance or other factors. Other commenters urged CMS to monitor the Hospital VBP Program closely, particularly as the first year of full implementation looms, to ensure that the program's goals are met and that no unintended consequences result.

Response: We thank commenters for their input. We intend to monitor hospitals' performance under the Hospital VBP Program closely, with particular attention to changes in hospitals' quality performance over time.

Comment: Some commenters argued that CMS should display the numerical values of the performance standards for the Medicare Spending per Beneficiary measure rather than the descriptions (''Median Medicare spending per beneficiary ratio across all hospitals during the performance period'' and ''Mean of the lowest decile of Medicare spending per beneficiary ratios across all hospitals during the performance period''). These commenters did not support the methodology for calculating Medicare Spending per Beneficiary performance standards because those numerical values were not provided.

Response: We disagree. We finalized the methodology we would use to assess hospital performance on the Medicare Spending per Beneficiary measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51655) and believe that we have met the requirement to notify hospitals of the performance standards. We will provide the numerical equivalents when they are available, after the conclusion of the performance period. Further, the Medicare Spending per Beneficiary measure is constructed as a measure of costs attributable to patient care during the specified episode of care. We do not believe it is helpful for hospitals to be compared against performance standards constructed from baseline period data, on this payment-based measure, given potential changes in Medicare payment policy, changes in market forces, and changes in utilization practices. The national median Medicare Spending per Beneficiary ratio will be 1.0, because it is the ratio of the hospital's score to the national median.

For hospitals' information, we are providing historical benchmark and achievement threshold information during the period May 15, 2010–February 14, 2011. For hospitals' information, we are providing historical benchmark and achievement threshold information during the period May 15, 2010–February 14, 2011, in addition to the measure rates for this period, which were displayed on Hospital Compare on April 19, 2012. During this historical performance period, this median ratio was associated with a Medicare Spending per Beneficiary amount of $17,988.04. Hospitals were given this national median Medicare Spending per Beneficiary amount on a Hospital Open Door Forum. We would also like to provide hospitals with the amount that corresponds to what would have been the benchmark for the measure, were this an actual Hospital VBP performance period. The benchmark Medicare Spending per Beneficiary ratio, or mean of the lowest decile, was 0.806. This ratio corresponds to a Medicare Spending per Beneficiary amount of $14,495.

After consideration of the public comments we received, we are finalizing the FY 2015 performance standards. As described further above, we are not finalizing performance standards for AMI–10 because we are not including it in the FY 2015 measure set.

The final performance standards for the clinical process, outcome, and Medicare spending per beneficiary measures appear in the first table below, while the final performance standards for the patient experience of care (HCAHPS survey) measure appears in the second table below.

FINAL PERFORMANCE STANDARDS FOR THE FY 2015 HOSPITAL VBP PROGRAM CLINICAL PROCESS OF CARE, OUTCOME, AND EFFICIENCY DOMAINS

Measure ID	Description	Achievement threshold	Benchmark
Clinical Process of Care Measures			
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	0.80000	1.00000.
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival.	0.95349	1.00000.
PN–3b	Blood Cultures Performed in the Emergency Department Prior to Initial Antibiotic Received in Hospital.	0.94118	1.00000.
PN–6	Initial Antibiotic Selection for CAP in Immunocompetent Patient.	0.97783	1.00000.
SCIP–Card–2	Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.	0.95918	1.00000.
SCIP–Inf–1	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision.	0.97175	1.00000.
SCIP–Inf–2	Prophylactic Antibiotic Selection for Surgical Patients.	0.98639	1.00000.
SCIP–Inf–3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time.	0.98637	1.00000.
SCIP–Inf–4	Cardiac Surgery Patients with Controlled 6AM Postoperative Serum Glucose.	0.97494	1.00000.

FINAL PERFORMANCE STANDARDS FOR THE FY 2015 HOSPITAL VBP PROGRAM CLINICAL PROCESS OF CARE, OUTCOME, AND EFFICIENCY DOMAINS—Continued

Measure ID	Description	Achievement threshold	Benchmark
SCIP–Inf–9	Urinary Catheter Removed on Postoperative Day 1 or Postoperative Day 2.	0.95798	0.99767.
SCIP–VTE–2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxes Within 24 Hours Prior to Surgery to 24 Hours After Surgery.	0.94891	0.99991.
Outcome Measures			
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-Day Mortality Rate.	0.847472	0.862371.
MORT–30–HF	Heart Failure (HF) 30-Day Mortality Rate	0.881510	0.900315.
MORT–30–PN	Pneumonia (PN) 30-Day Mortality Rate	0.882651	0.904181.
PSI–90	Patient safety for selected indicators (composite).	0.622879	0.451792.
CLABSI	Central Line-Associated Blood Stream Infection.	0.437	0.000.
Efficiency Measures			
MSPB–1	Medicare Spending per Beneficiary	Median Medicare spending per beneficiary ratio. across all hospitals during the performance period.	Mean of the lowest decile of Medicare spending per beneficiary ratios across all hospitals during the performance period.

FINAL PERFORMANCE STANDARDS FOR THE FY 2015 HOSPITAL VBP PROGRAM PATIENT EXPERIENCE OF CARE DOMAIN

HCAHPS Survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	47.77	76.56	85.70
Communication with Doctors	55.62	79.88	88.79
Responsiveness of Hospital Staff	35.10	63.17	79.06
Pain Management	43.58	69.46	78.17
Communication about Medicines	35.48	60.89	71.85
Hospital Cleanliness & Quietness	41.94	64.07	78.90
Discharge Information	57.67	83.54	89.72
Overall Rating of Hospital	32.82	67.96	83.44

We are also aware that once the ICD–10–CM/PCS coding transition is completed, we will be faced with comparing hospitals' performance from baseline periods coded using ICD–9–CM with performance periods coded using ICD–10–CM/PCS. We note that constructing performance standards from such baseline periods could produce unforeseen consequences for quality measurement and performance scoring. Therefore, we sought comments on how to fairly compare hospitals' performance on quality measures when captured in different coding sets.

Comment: Some commenters expressed concern about how to measure hospitals' performance when measures or coding sets change. Commenters argued that it would be unfair to compare hospitals' performance using ICD–9–CM in the baseline period and ICD–10–CM/PCS in the performance period. Commenters urged us to re-run the data using the same coding set for both periods in order to ensure fair comparisons.

Response: We thank commenters for their input. We will consider these comments in future rulemaking and closely monitor future measure specification updates incorporating ICD–10 codes into our future measure proposals. We will also closely monitor how measure rates change following ICD–10 adoption in our future performance standards and measure proposals.

c. Performance Standards for FY 2016 Hospital VBP Program Measures

As described further above, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28086), we proposed to adopt the three 30-day mortality measures and the AHRQ PSI composite measure for the FY 2016 Hospital VBP Program. We also proposed to adopt performance standards for these measures based on the proposed baseline periods outlined above. Proposed performance standards for these measures appear in the table below. We noted that the performance standards displayed below represent estimates based on the most recently-available data, and stated that we would update the standards in this final rule. We also note that the performance standards for the AHRQ PSI composite measure are calculated with lower values representing better performance, in contrast to the mortality measures, on which higher values indicate better performance.

PROPOSED PERFORMANCE STANDARDS FOR FY 2016 HOSPITAL VBP PROGRAMS OUTCOME DOMAIN: MORTALITY/PSI COMPOSITE MEASURES

Measure ID	Description	Achievement threshold	Benchmark
Outcome Measures			
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate	0.8477	0.8673
MORT–30–HF	Heart Failure (HF) 30-day mortality rate	0.8861	0.9042
MORT–30–PN	Pneumonia (PN) 30-day mortality rate	0.8818	0.9021
PSI–90	Patient safety for selected indicators (composite)	0.4006	0.2754

Comment: Many commenters expressed general opposition to the proposed performance standards for the FY 2016 Program based on their opposition to further adoption of the proposed measures for that program year.

Response: We responded to comments opposing the adoption of these measures above and are finalizing our adoption of those measures. We do not interpret the comments as objecting specifically to the proposed FY 2016 performance standards if we finalized the measures themselves.

After consideration of the public comments we received, we are finalizing the FY 2016 performance standards as proposed. Set out below are the final performance standards for the three 30-day mortality measures and the AHRQ PSI composite measure.

FINAL PERFORMANCE STANDARDS FOR FY 2016 HOSPITAL VBP PROGRAMS OUTCOME DOMAIN: MORTALITY/PSI COMPOSITE MEASURES

Measure ID	Description	Achievement threshold	Benchmark
Outcome Measures			
MORT–30–AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate	0.847472	0.862371
MORT–30–HF	Heart Failure (HF) 30-day mortality rate	0.881510	0.900315
MORT–30–PN	Pneumonia (PN) 30-day mortality rate	0.882651	0.904181
PSI–90	Patient safety for selected indicators (composite)	0.622879	0.451792

d. Adopting Performance Periods and Standards for Future Program Years

For prior program years, with the exception of the Hospital Inpatient VBP Program proposed and final rules, we have proposed and finalized policies for the Hospital VBP Program in the IPPS/LTCH PPS and OPPS/ASC regulations. However, we do not believe these two rulemaking vehicles are ideally suited for additional Hospital VBP proposals. While we are aware that it is convenient for the public when additional proposals are made in a relatively limited number of rulemaking vehicles, we are concerned about the limitations that these regulations' schedules place on our ability to propose and finalize quality measures, performance periods, and performance standards in a timely manner.

In order to facilitate quality measure adoption for the Hospital VBP Program and ensure that hospitals are kept fully aware of the performance standards to which we intend to hold them accountable and the performance periods during which their performance will be measured, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28087), we proposed to update performance periods and performance standards for future program years via notice on our Web site or another publicly-available Web site. We would establish future performance standards for the clinical process of care, outcome, and patient experience of care measures using the same methodology that we first finalized in the Hospital Inpatient VBP Program final rule (76 FR 26510 through 26513). We would establish future performance standards for the Medicare spending per beneficiary measure using the same methodology that we finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656). In the case of other types of measures whose scoring would not be appropriately described by the methodologies outlined above, we intend to propose and finalize additional scoring methodologies.

We believe that this proposal will enable us to adopt measures representing the best in medical practice into the Hospital VBP Program more quickly and will allow us to establish and announce performance standards and performance periods when necessary outside the annual IPPS/LTCH PPS and OPPS/ASC rulemaking schedules. We believe this flexibility is especially necessary as the Hospital VBP Program continues to evolve and incorporate new types of quality measures.

We welcomed public comment on this proposal.

Comment: Many commenters expressed support for the proposal to adopt performance standards and performance periods for future program years via notice on the CMS Web site or other publicly-available forum.

Response: We thank commenters for their support.

Comment: Some commenters expressed opposition to the proposal to adopt performance periods and performance standards outside of the rulemaking process. Commenters argued that the annual IPPS rulemaking process is the most transparent, understood venue for hospitals to track changes to Medicare's programs.

Response: We believe that adopting performance periods and performance standards outside the rulemaking process provides us with more flexibility than the annual rulemaking processes allow. We intend to consider fully any comments we receive on the Hospital VBP Program each year, and we do not believe that finalizing this policy precludes stakeholders from providing valuable input for our consideration.

Comment: Some commenters were concerned about CMS' proposal to adopt performance periods and performance standards outside the rulemaking process as they believed that stakeholders would no longer be able to comment on the proposals.

Response: As stated above, we intend to consider fully any public comments we receive on the Hospital VBP Program when developing our policies for future program years. Since we would be updating performance standards and performance periods under this policy, not changing the underlying finalized methodology in either case, we believe this policy provides us additional flexibility without compromising the public's ability to provide input.

We also believe that our proposal would improve quality because it would enable us to use more recent baseline information for the performance standard calculations. Currently, we are only able to use the most recent data available at the time we issue the IPPS/LTCH PPS proposed and final rules. This proposal would allow us to use more current data extracts because we would not be limited by the rulemaking calendar when posting performance standards.

Comment: To the extent that CMS uses rulemaking to adopt requirements for the Hospital VBP Program in the future, some commenters urged us to use a stand-alone regulation, as was done with the Program's initial rulemaking. Commenters suggested that the proposal and finalization of new policies in the IPPS and OPPS rules has been confusing for hospitals and other stakeholders.

Response: We believe that hospitals and the public are well aware of the annual IPPS and OPPS rulemaking schedules, though we understand that including Hospital VBP proposals in both IPPS and OPPS rules may have been confusing. We believe it is appropriate to update the Hospital VBP Program, which generally applies to IPPS hospitals, in the annual IPPS rule as necessary because hospitals are generally aware of that regulation and monitor it closely. However, we reserve the right to adopt Hospital VBP policies in other rulemaking vehicles as necessary.

After consideration of the public comments we received, we are finalizing our proposal to adopt performance standards and performance periods via notice on our Web site or another publicly-available Web site.

12. FY 2015 Hospital VBP Program Scoring Methodology

a. General Hospital VBP Program Scoring Methodology

In the Hospital Inpatient VBP Program final rule, we adopted a methodology for scoring clinical process of care, patient experience of care, and outcome measures. As noted in that rule, this methodology outlines an approach that we believe is well understood by patient advocates, hospitals, and other stakeholders because it was developed during a lengthy process that involved extensive stakeholder input, and was based on a scoring methodology we presented in a report to Congress. We also noted in that final rule that we had conducted extensive additional research on a number of other important methodology issues to ensure a high level of confidence in the scoring methodology (76 FR 26514). In addition, we believe that, for reasons of simplicity, transparency, and consistency, it is important to score hospitals using the same general methodology each year, with appropriate modifications to accommodate new domains and measures. We finalized a scoring methodology for the Medicare spending per beneficiary measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28087), for the FY 2015 Hospital VBP Program, we proposed to use these same scoring methodologies to score hospital performance. We believe these scoring methodologies continue to appropriately capture hospital quality as reflected by the finalized quality measure sets. We also note that re-adopting the finalized scoring methodology from prior program years represents the simplest and most consistent policy for providers and the public.

Comment: Some commenters suggested that CMS should consider suspending any further changes to the Hospital VBP Program for at least two years in order to allow hospitals to implement quality improvement policies. Other commenters argued that the Hospital VBP Program is challenging to hospitals due to the burden of chart abstraction. Commenters argued that preparing for new measures requires substantial work by hospital staff, and further suggested that the complicated calculations involved in Hospital VBP Program payments could be simplified by adding measure scores together and calculating confidence intervals.

Response: We do not believe it would be appropriate to suspend further changes to the Hospital VBP Program at this time. While we are aware that chart abstraction is a burden to hospitals, we note that, because the Hospital VBP Program is built on the quality measures already adopted for the Hospital IQR Program, the Hospital VBP Program in this regard does not impose an additional reporting burden on hospitals.

We note further that the finalized Hospital VBP Program scoring methodology is based on research dating back to the 2007 Report to Congress, as further described in the Hospital Inpatient VBP Program final rule (76 FR 26493). We do not believe that simply adding measure scores together and calculating confidence intervals fully and fairly represents hospitals' performance on quality measures, nor does it enable objective comparisons between hospitals' scores.

Comment: Some commenters argued that the Hospital VBP Program TPS should be risk-adjusted to account for the challenges faced by urban safety-net hospitals, including the increased follow-up and post-discharge care required by beneficiaries living in poverty and with limited access to care. Commenters noted that patients who choose urban safety-net hospitals are sicker than typical hospitals patients and more complicated to treat.

Response: We intend to monitor closely the effects of the Hospital VBP Program on hospitals, including any systemic disparities that may result. We note that many of the finalized measures for the Hospital VBP Program are risk-adjusted, but we do not believe it is appropriate to separately risk-adjust hospitals' TPSs at this time. We believe the TPS, as calculated according to the finalized scoring methodology, is sufficiently reliable for purposes of awarding value-based incentive payments under the Hospital VBP Program.

Comment: Some commenters urged CMS to analyze Hospital VBP Program scores to determine whether events such as tropical storms Irene and Lee had any effect on hospitals' scores. Commenters noted that the storms interrupted many services provided by hospitals, including data collection, and argued that hospitals should not be penalized for effects resulting from those extreme weather events.

Response: As stated above, we intend to closely monitor the impact of the Hospital VBP Program on hospitals. We do not believe that the Hospital VBP Program requires an additional mechanism for disaster waivers than is

provided in the Hospital IQR Program. We encourage hospitals in areas affected by tropical storms Irene and Lee, or other types of natural disasters, to seek disaster extensions or waivers under the Hospital IQR Program. Hospitals waived from Hospital IQR Program data reporting during applicable Hospital VBP performance periods and not meeting Hospital VBP minimum case, measure, and domain thresholds would be excluded from the applicable Hospital VBP Program year and would not be subject to the base operating DRG payment amount reduction for that fiscal year.

Comment: Some commenters argued that the Hospital VBP Program should also apply to Medicare Advantage (MA) beneficiaries in order to reward quality provided by hospitals more fully. Other commenters specifically argued that the AHRQ PSI composite measure should capture both fee-for-service and Medicare Advantage beneficiaries.

Response: The Hospital VBP Program would apply to MA beneficiaries in cases in which the hospital did not have an agreement governing payment with the MA organization, as the hospital would be entitled, under section 1866(a)(1)(O) of the Act to the same payment from the MA organization as it would receive from us if the beneficiary were not enrolled in a MA plan. In the case of a hospital that does have an agreement governing payment with the MA organization, that agreement would govern the payment amount, and it would be up to the parties to that agreement whether to take the Hospital VBP Program into account in establishing payment amounts.

With respect to whether the AHRQ PSI composite measure should capture MA beneficiaries, based on the methodology currently used to collect this measure (it is claims-based), data involving MA beneficiaries would not be captured because claims for those beneficiaries' services are handled by their MA plans.

After consideration of the public comments we received, we are finalizing the scoring methodology for the FY 2015 Hospital VBP Program as proposed.

b. Domain Weighting for the FY 2015 Hospital VBP Program for Hospitals That Receive a Score on All Four Domains

As we stated in the Hospital Inpatient VBP Program final rule (76 FR 26491), we believe that domains need not be given equal weight, and that over time, scoring methodologies should be weighted more towards outcomes, patient experience of care, and functional status measures (for example, measures assessing physical and mental capacity, capability, well-being and improvement). We took these considerations into account when developing the domain weighting proposal outlined below.

As discussed above, we proposed to add the Efficiency domain to the Hospital VBP Program beginning with the FY 2015 Hospital VBP Program. Therefore, we proposed the following domain weights for the FY 2015 Hospital VBP Program for hospitals that receive a score on all four proposed domains:

PROPOSED DOMAIN WEIGHTS FOR THE FY 2015 HOSPITAL VBP PROGRAM FOR HOSPITALS RECEIVING A SCORE ON ALL PROPOSED DOMAINS

Domain	Weight (percent)
Clinical Process of Care	20
Patient Experience of Care	30
Outcome	30
Efficiency	20

We believe this domain weighting appropriately reflects our priorities for quality improvement in the inpatient hospital setting and aligns with the National Quality Strategy's priorities. We believe that the proposed domain weighting will continue to improve the link between Medicare payments to hospitals and patient outcomes, efficiency and cost, and the patient experience. We note that the proposed domain weighting places the strongest relative emphasis on outcomes and the patient experience, which we view as two critical components of quality improvement in the inpatient hospital setting. We further note that the proposed domain weighting, for the first time, incorporates a measure of efficiency and continues to provide substantial weight to clinical processes. We welcomed public comment on this proposed weighting methodology.

Comment: Some commenters supported the proposed domain weighting for FY 2015, arguing that it represents an appropriate balance between quality and efficiency domains.

Response: We thank commenters for their support.

Comment: Some commenters opposed the proposed domain weighting for FY 2015, arguing that the proposed outcome measures and the Medicare Spending per Beneficiary measure should not be included in the Hospital VBP Program and should therefore not be given any domain weight. Other commenters specifically opposed the proposed weighting for the Efficiency domain, arguing that 20 percent is too high for a domain containing one measure and suggesting that placing such weight on a spending measure may result in unintended consequences for patient care.

Response: We appreciate the comment, but disagree for several reasons. Since first implementing the Hospital VBP Program, we have signaled our intent to move the Program from measures of clinical processes to measures of outcomes and efficiency. We signaled this intention because we believe that outcome and efficiency measures provide the most direct incentives for hospitals to improve their quality performance in ways that are directly applicable to patients. Further, efficiency measures provide additional incentives for hospitals to control costs, which is an important goal for the Medicare program and for the health system at large. We do not believe that lowering the domain weighting proposed for outcome or efficiency measures will sufficiently encourage hospitals to strive for improvements in the quality of care provided to Medicare beneficiaries and to all of their patients. As we explain in more detail in responses to comments above, we believe that it is appropriate to include the 30-day mortality measures and the Medicare spending per beneficiary measure in the Hospital VBP Program.

Comment: Some commenters called on CMS to revisit our finalized domain weighting for FY 2014.

Response: We do not believe it is appropriate to revisit the details of the finalized FY 2014 Hospital VBP Program at this time. We have strived to provide hospitals as many details about each program year as far in advance of the applicable performance periods as possible. We do not believe it would be equitable to hospitals that strove to improve their quality performance on FY 2014 measures during the FY 2014 performance periods to change the finalized FY 2014 domain weights.

Comment: Some commenters noted the drop in weighting for clinical process of care measures over program years. Other commenters argued that clinical processes should receive more weight than outcomes until broader risk adjustment is perfected.

Response: As stated above, we signaled our intention to move the Hospital VBP Program from its initial focus on measures of clinical processes, which are not risk adjusted, towards measures of outcomes and efficiency. Shifting the program's focus would necessarily mean reducing the domain weighting for the Clinical Process of

Care domain over time. We believe that this reduction is appropriate given the need for quality improvement efforts to more closely include measures of outcomes and efficiency.

We do not believe that further risk adjustment to the finalized outcome measures is appropriate at this time. As described further above, the mortality measures currently use the Hierarchical Condition Category (HCC) grouping of clinical conditions and hospital case-mix for risk adjustment. The HCC model makes use of all physician and hospital encounter diagnoses and was designed to predict a beneficiary's expenditures based on the total clinical profile represented by all of his/her assigned HCCs. Additionally, there are several exclusions to the mortality measures, such as enrollment in a hospice program. We refer commenters to the extensive documentation of the mortality measure methodology at *http://www.qualitynet.org.* However, as we have described above, we intend to monitor the effects of the Hospital VBP Program on hospitals and will propose other programmatic changes as necessary.

Comment: Some commenters expressed concerns with the weighting of the Patient Experience of Care domain, arguing that patients' severity of illness negatively affects their HCAHPS scores. A few commenters mentioned a Cleveland Clinic analysis that shows a greater than expected impact of severity of illness on HCAHPS scores.

Response: We adjust the HCAHPS data for patient characteristics that are not under the control of the hospital and that may affect patient reports of hospital experiences. The goal of adjusting for patient-mix is to estimate how different hospitals would be rated if they all provided care to comparable groups of patients. In developing the HCAHPS patient-mix adjustment (PMA) model, we sought important and statistically significant predictors of patients' HCAHPS ratings that also vary meaningfully across hospitals (O'Malley *et al.,* 2005). The PMA model includes self-reported health status, education, service line (medical, surgical, or maternity care), age, response percentile order (also known as ''relative lag time,'' which is based on the time between discharge and survey completion), service by linear age interactions, and primary language other than English.

With respect to a Cleveland Clinic analysis mentioned by a few commenters that shows a greater than expected impact of severity of illness on HCAHPS scores, our understanding is that this analysis does not examine associations between those patient characteristics and HCAHPS scores *after* standard CAHPS PMA is applied, which would be expected to remove most or all of that association. We also note that this study is not based on national data.

We are aware of no data suggesting that patient characteristics result in bias in the HCAHPS patient-mix adjusted data used in the Hospital VBP Program. We therefore do not believe that the proposed weighting for the Patient Experience of Care domain is too high or penalizes hospitals with relatively sicker patients.

Comment: Some commenters supported the proposed Efficiency domain weight of 20 percent, and two commenters suggested that CMS consider increasing it to 30 percent over time. One commenter supported a 30 percent weight for the Efficiency domain at the outset. Some commenters suggested that 20 percent was too high, because the measure is the sole measure in an Efficiency domain or because the commenters do not support inclusion of the Medicare Spending per Beneficiary measure in the Hospital VBP Program for FY 2015. These commenters suggested that the Efficiency domain be excluded or given a weight of no more than 5 percent.

Response: We appreciate the comments in support of an initial weight of 20 percent for the Efficiency domain. We will consider increasing the domain weight for future years, as hospitals gain experience with the domain and build stronger relationships with the providers and suppliers who care for their patients before and after hospitalization to maintain high quality while controlling costs. We disagree with the commenters who stated that a 20 percent Efficiency domain weight is too high. We believe that attributing significant weight to this domain is critical to ensuring that hospitals make efforts to provide effective care on an inpatient basis and build stronger relationships with the providers and suppliers who care for their patients before and after the hospitalization.

Comment: Some commenters argued that the changing domain weights over time make it difficult to evaluate a hospital's performance over time.

Response: While we are aware that direct comparisons between program years become more difficult with the changes we have proposed in domain weights over time, we believe that such changes are necessary to continue shifting the program from its initial focus on clinical processes and the patient experience to accommodate outcome and efficiency measures as well.

After consideration of the public comments we received, are finalizing the FY 2015 domain weighting as proposed. The final domain weights are set out below.

FINAL DOMAIN WEIGHTS FOR THE FY 2015 HOSPITAL VBP PROGRAM FOR HOSPITALS RECEIVING A SCORE ON ALL PROPOSED DOMAINS

Domain	Weight (percent)
Clinical Process of Care	20
Patient Experience of Care	30
Outcome	30
Efficiency	20

c. Domain Weighting for Hospitals Receiving Scores on Fewer Than Four Domains

In prior program years, we finalized a policy that hospitals must have received domain scores on all finalized domains in order to receive a TPS. However, since the Hospital VBP Program has evolved from its initial two domains to an expanded measure set with four quality domains, we considered whether it was appropriate to continue this policy.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28088), as described further below, we proposed a higher minimum number of cases for the three 30-day mortality measures for FY 2015 than was finalized for the FY 2014 Hospital VBP Program in order to improve these measures' reliability given the relatively shorter proposed performance period described above. However, we are concerned that the relatively higher minimum number of cases could result in a substantially larger number of hospitals being excluded from the Hospital VBP Program. We believe that we should make a concerted effort to include as many hospitals as possible in the Program in order to offer quality incentives to as many hospitals as possible and encourage quality improvement as broadly as possible throughout the health care system while maintaining our focus on measure and scoring reliability.

Therefore, we proposed that, for the FY 2015 Hospital VBP Program and subsequent fiscal years, hospitals with sufficient data to receive at least two domain scores (that is, sufficient cases and measures to receive a domain score on at least two domains) will receive a TPS. We also proposed that, for hospitals with at least two domain scores, TPSs would be reweighted proportionately to the scored domains to ensure that the TPS is still scored out

of a possible 100 points and that the relative weights for the scored domains remain equivalent to the weighting outlined above. We believe that this proposal allows us to include relatively more hospitals in the Hospital VBP Program while continuing to focus on reliably scoring hospitals on their quality measure performance.

We welcomed public comment on this proposal.

Comment: Some commenters supported the proposal to provide a TPS to hospitals with sufficient data in at least two domains rather than requiring that hospitals receive a score in all four domains to receive a TPS. Commenters acknowledged CMS' effort to ensure that as many hospitals as possible participate in the Hospital VBP Program and suggested that CMS monitor the effects of this proposed change on included and excluded hospitals.

Response: We thank commenters for their support. We intend to closely monitor this policy's effects on hospitals' scores.

Comment: Some commenters expressed concerns about the proposal to provide hospitals with TPSs for FY 2015 if they receive domain scores on at least 2 of the 4 domains. Commenters were concerned that low-volume hospitals could be penalized under this policy and noted that comparing hospitals' TPSs would become more difficult.

Response: We disagree with the commenters' characterization of our proposal. By enabling hospitals to receive a TPS with domain scores on just two domains out of four, we believe we are allowing low-volume hospitals to participate more broadly in the Hospital VBP Program than they might have otherwise. We note that the Hospital VBP Program's incentive payments depend entirely on the relative distribution of TPSs. Therefore, we believe that comparisons between hospitals' scores are incomplete without the full context provided by national TPS information and corresponding value-based incentive payment information. We acknowledge that comparisons among hospitals with different numbers of domain scores may become more difficult, but we view this compromise as necessary in order to ensure broad participation in the program by hospitals.

After consideration of the public comments we received, we are finalizing our policy to provide a TPS to hospitals receiving domain scores on at least 2 of the 4 finalized domains for the FY 2015 Hospital VBP Program.

13. Applicability of the Hospital VBP Program to Hospitals

a. Background

Section 1886(o)(1)(C) of the Act specifies how the Hospital VBP Program applies to hospitals. Specifically, the term ''hospital'' is defined under section 1886(o)(1)(C)(i) of the Act as a ''subsection (d) hospital (as defined in section 1886(d)(1)(B [of the Act]))." Section 1886(o)(1)(C)(ii) of the Act sets forth a list of exclusions to the definition of the term ''hospital'' with respect to a fiscal year, including a hospital that is subject to the payment reduction under section 1886(b)(3)(B)(viii)(I) of the Act (the Hospital IQR Program), a hospital for which, during the performance period for the fiscal year, the Secretary has cited deficiencies that pose immediate jeopardy to the health or safety of patients, a hospital for which there are not a minimum number of measures that apply to the hospital for the applicable performance period for the fiscal year, and a hospital for which there are not a minimum number of cases for the measures that apply to the hospital for the performance period for the fiscal year.

In addition, section 1886(o)(1)(C)(iv) of the Act states that in the case of a hospital that is paid under section 1814(b)(3) of the Act, the Secretary may exempt the hospital from the Hospital VBP Program if the State submits an annual report to the Secretary describing how a similar program in the State for a participating hospital or hospitals achieves or surpasses the measured results in terms of patient health outcomes and cost savings established under the Hospital VBP Program. We interpret the reference to section 1814(b)(3) of the Act to mean those Maryland hospitals that are paid under section 1814(b)(3) of the Act and that, absent the ''waiver'' specified by section 1814(b)(3) of the Act, would have been paid under the IPPS.

b. Exemption Request Process for Maryland Hospitals

Acute care hospitals located in the State of Maryland are not currently paid under the IPPS in accordance with a special waiver provided by section 1814(b)(3) of the Act. In the Hospital Inpatient VBP Program final rule (76 FR 26527 through 26530), we finalized our policy that the Hospital VBP Program would apply to acute care hospitals located in the State of Maryland unless the Secretary exercises discretion pursuant to section 1886(o)(1)(C)(iv) of the Act. We also finalized a procedure for the State to submit a report pursuant to section 1886(o)(1)(C)(iv) of the Act in a timeframe that would allow it to be received no later than October 1, 2011, which is the beginning of the fiscal year prior to FY 2013.

We received an FY 2013 exemption request from the Maryland Health Services Cost Review Commission on September 30, 2011 and the Secretary approved the exemption request in December 2011. This request included a discussion on how the State program achieved or surpasses the measured results in terms of patient health outcomes and cost savings established under the Hospital VBP Program. When evaluating the Maryland Health Services Cost Review Commission's request, we considered the relevant health outcomes for the State's hospitals as described in the Maryland Health Services Cost Review Commission's request and noted that they achieve or surpass the current national results for Hospital VBP FY 2013 clinical process of care and HCAHPS dimensions. We also assessed closely-related clinical outcomes as measured by quality data reported through the Hospital IQR Program. For the FY 2013 Hospital VBP Program, however, we did not assess the criterion ''cost savings'' as required by the statute, as the FY 2013 Hospital VBP Program does not use any efficiency measures and is a budget-neutral program pursuant to section 1886(o)(7)(A) of the Act. Maryland hospitals are therefore exempt from the FY 2013 Hospital VBP Program.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28088), beginning with the FY 2014 Hospital VBP Program, we proposed to adopt a new procedure for submission of the report in order for a hospital within the State to be exempt from the Hospital VBP Program. Under this proposed procedure, if the State seeks an exemption with respect to a particular program year, it would need to submit a report that meets the requirements of section 1886(o)(1)(C)(iv) of the Act in a timeframe that allows it to be received by the Secretary on or before November 15 prior to the effective fiscal year (for example, the report seeking an exemption from the FY 2014 Hospital VBP Program would have to be received by the Secretary no later than November 15, 2012). We anticipate notifying the State, as well as each hospital for which the State has requested an exemption, of our decision whether to grant the request no later than 90 days following the exemption request deadline.

We will evaluate each exemption request to see if the State has demonstrated that it has implemented a similar program for participating

hospitals that achieves or surpasses the measured results in terms of patient health outcomes and cost savings relative to the Hospital VBP Program.

We welcomed public comment on our proposals.

Comment: Some commenters asked that we clarify that the exemption request process for hospitals paid under section 1814(b)(3) of the Act will apply to all such hospitals within a State, rather than to requesting hospitals.

Response: Future exemptions, if requested by the Maryland Health Services Cost Review Commission and granted by the Secretary, would apply to all hospitals paid under section 1814(b)(3) of the Act.

We proposed to codify the applicability of the Hospital VBP Program to hospitals paid under section 1814(b)(3) of the Act in 42 CFR 412.162(d). We did not receive any comments on the specific regulatory text that we proposed. We are finalizing this provision with minor revisions in a new 42 CFR 412.161(b). We are also codifying at 42 CFR 412.161(a) that the Hospital VBP Program applies to hospitals, as that term is defined in our regulations at § 412.160.

After consideration of the public comments we received, we are finalizing our exemption request process as proposed.

14. Minimum Numbers of Cases and Measures for the FY 2015 Hospital VBP Program

a. Background

Section 1886(o)(1)(C)(ii)(III) of the Act requires the Secretary to exclude for the fiscal year hospitals that do not report a minimum number (as determined by the Secretary) of measures that apply to the hospital for the performance period for the fiscal year. Section 1886(o)(1)(C)(ii)(IV) of the Act requires the Secretary to exclude for the fiscal year hospitals that do not report a minimum number (as determined by the Secretary) of cases for the measures that apply to the hospital for the performance period for the fiscal year.

In the Hospital Inpatient VBP Program final rule (76 FR 26527 through 26531), we finalized minimum numbers of 10 cases and 4 measures in the Clinical Process of Care domain and 100 completed HCAHPS surveys for the Patient Experience of Care domain. In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74532 through 74534), we finalized a minimum number of 10 cases for the three 30-day mortality measures. We also finalized a minimum number of 2 measures with respect to the Outcome domain. In both rules, we finalized a policy that hospitals must have sufficient cases and measures in all domains in order to receive a TPS.

b. Minimum Numbers of Cases and Measures for the FY 2015 Outcome Domain

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28089), as described further above, we proposed a 9-month performance period for the three 30-day mortality measures for the FY 2015 Hospital VBP Program. We have reassessed the previously finalized 10 case minimum threshold for the three 30-day mortality measures (76 FR 74533 through 74534), as well as reexamined the independent analyses by Brandeis University and Mathematica Policy Research, when considering these three measures' proposed addition. We recognize that the proposed 9-month performance period for these measures, in combination with a minimum number of 25 cases per measure, would increase the number of hospitals with insufficient cases on the measure to several hundred hospitals, based on past information.

In order to ensure that the mortality measure scores remain sufficiently reliable, we proposed to adopt a 25-case minimum for the three 30-day mortality measures for FY 2015. We believe that this proposal will ensure relatively more reliable measure data than could be obtained with the 10-case minimum that was previously finalized for FY 2014 given the relatively shorter proposed performance period in FY 2015. As described above, while this may result in fewer hospitals receiving scores on the mortality measures, we have proposed to reallocate domain weighting for hospitals with fewer domain scores than the total number of finalized domains. By doing so, we believe we are appropriately allowing as many hospitals as possible to participate in the Hospital VBP Program while also ensuring reliable quality measure and quality domain data.

We note that this proposed minimum number of cases is higher than has been finalized for other types of measures such as clinical process of care measures. However, we note that clinical process of care measures are not risk-adjusted and are not outcome-based. Because those measures do not require statistical adjustment to estimate hospital-specific differences in case mix, we believe that the relatively smaller case minimum is acceptable for clinical process of care measures.

For the AHRQ PSI composite measure, we proposed to adopt AHRQ's methodology, which uses three cases for any of the underlying indicators as a case minimum. For the CLABSI measure, we proposed to adopt CDC's minimum case criteria, which calculates a standardized infection ratio for a hospital on the CLABSI measure if the hospital has 1 predicted infection during the applicable period. We believe that the measure stewards' methodologies for constructing reliable measure data are most appropriate for use in the Hospital VBP Program. Further information on these measures may be found on the QualityNet Web site.

In the CY 2012 OPPS/ASC final rule with comment period we concluded, based on an independent analysis, that the minimum number of measures that a hospital must report in order to receive a score on the Outcome domain is two measures. We continue to believe that this minimum number is appropriate for the expanded Outcome domain because adding measure scores beyond the minimum number of measures has the effect of enhancing the domain score's reliability. For that reason, we proposed to adopt it for the FY 2015 Hospital VBP Program.

We welcomed public comment on these proposals.

Comment: Many commenters expressed support for the proposal to raise the minimum number of cases for mortality measures to 25, though some expressed concern that this proposed minimum may not be reliable enough for performance scoring.

Response: We thank commenters for their support. We believe that the higher minimum number of cases provides sufficiently reliable mortality measure data for performance scoring. We believe that our proposal is responsive to concerns about outcome measure reliability, since we proposed a 21 month FY 2016 performance period and a 25 case minimum threshold for including mortality measures in the FY 2015 Hospital VBP Program. Both proposals are designed to increase the overall reliability of these measures, and exclude hospitals with the most unreliable measure rates from receiving measure scores. As stated previously, we assessed measure reliability, TPS reliability and validity, and alignment with our policy goal to reduce cost and improve patient health outcomes in our proposals.

Comment: Some commenters opposed the proposed minimum numbers of cases and measures for the AHRQ PSI composite and CLABSI measures, arguing that the measures are unreliable at the proposed numbers of cases.

Response: We disagree. As stated above, we believe that the AHRQ PSI measure is sufficiently reliable for the purposes of the Hospital VBP Program. Our proposal is responsive to concerns about outcome measure reliability, since we proposed a nearly 21 month FY 2016 performance period to include the AHRQ PSI composite measure in the FY 2016 TPS. That proposal is designed to increase overall reliability of the measure and to exclude hospitals with the most unreliable measure rates from FY 2016 TPSs. We also considered the improved validity resulting from more outcome measures that include a higher correlation with patient outcomes, relative to process of care measures. As stated previously, we assessed measure reliability, TPS reliability and validity, and alignment with our policy goal to reduce cost and improve patient health outcomes in our proposals. As we stated further above, we strive to improve both validity of the TPS through improved correlation with patient health outcomes, and its reliability to accurately incentivize health outcomes, patient experience of care, and reduced cost. We also considered both validity and reliability is of the TPS, in addition to alignment with policy goals to improve patient outcomes, as well as of the individual measure reliability contributing to the TPS. We also believe that adopting the minimum numbers of cases specified by the measure stewards in the case of the AHRQ PSI and CLABSI measures is both fully transparent and fair, as hospitals may apply their current experience with these measures to their use in the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing the minimum numbers of cases for outcome measures as proposed.

c. Medicare Spending per Beneficiary Measure Case Minimum

As required by section 1886(o)(1)(C)(iii) of the Act, we obtained an independent analysis to help us determine the appropriate minimum number of cases for the Medicare spending per beneficiary measure. For this measure, we proposed to interpret the term ''case'' in section 1886(o)(1)(C)(ii)(IV) of the Act as a Medicare spending per beneficiary episode. A Medicare spending per beneficiary episode is inclusive of all Part A and Part B payments from 3 days prior to a subsection (d) hospital admission through 30 days post discharge with certain adjustments and exclusions. The independent analysis examines the tradeoff between increasing the minimum number of episodes, which shrinks the confidence interval; and reducing the minimum number of episodes, which widens the confidence interval but enables more hospitals to receive a Medicare spending per beneficiary measure score. Because the distribution of Medicare spending per beneficiary episodes is skewed towards higher cost episodes, creating confidence intervals using statistical techniques that assume spending is normally and symmetrically distributed will not accurately describe the likelihood a hospital's true efficiency level falls within the confidence interval bounds.

To account for these statistical issues, the independent analysis uses a simulation-based (''non-parametric bootstrap'') methodology to measure how the confidence interval of the Medicare spending per beneficiary measure changes when the minimum episode threshold increases. Medicare spending per beneficiary is measured for an ''average'' hospital, where the ''average'' hospital case is considered one with a Medicare spending per beneficiary episode distribution that mimics that of the entire population of Medicare spending per beneficiary episodes. This methodology simulates the process of randomly drawing Medicare spending per beneficiary episodes from the population, and thus approximates the actual shape of the Medicare spending per beneficiary measure distribution from which confidence intervals are determined. By repeatedly calculating (in this case, 10,000 times for each minimum episode threshold) a Medicare spending per beneficiary measure for this simulated hospital under differing assumptions on the number of episodes observed, one can create a confidence interval for the Medicare spending per beneficiary measure of this ''average'' hospital. The upper and lower bounds of the 95 percent confidence interval indicates that 95 percent of the time, the hospital's Medicare spending per beneficiary measure will fall within this range when the minimum number of cases (the minimum episode threshold) is set at different levels. As the minimum episode threshold increases, the width of the confidence interval becomes narrower, but the number of hospitals receiving a Medicare spending per beneficiary measure score decreases.

In developing our proposal, we considered two options for setting the minimum number of cases for the Medicare spending per beneficiary measure: (1) setting the minimum number of cases at 25; and, (2) setting the minimum number of cases at 50.

We focused on these minimums because we believe that either of them provides a sufficiently narrow range at the 95 percent confidence interval. The independent analysis concludes that if the minimum number of cases is set at 25, then 95 percent of the time a hospital with an average underlying efficiency level (that is, 1.0) would receive a Medicare spending per beneficiary measure score between 0.81 and 1.23. Further, a minimum number of 25 cases would enable 97.8 percent of hospitals to receive a Medicare spending per beneficiary measure score, based on historical data. The analysis also showed that the alternative minimum of 50 cases would result in a 95 percent confidence interval range of 0.86 to 1.16 and would enable 95.9 percent of hospitals to receive a Medicare spending per beneficiary measure score, based on historical data.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28090), after considering the options outlined above, we proposed to use 25 as the minimum number of cases required in order to receive a score for the Medicare spending per beneficiary measure. We believe that using a minimum number of 25 cases achieves an appropriate balance of our interest in allowing the maximum possible number of hospitals the opportunity to receive a score on the Medicare spending per beneficiary measure and maintaining a sufficiently narrow range for the 95 percent confidence interval. Additionally, although we proposed to use a minimum of 25 cases for the Medicare spending per beneficiary measure, we also sought comment on whether using a minimum of 50 cases better reaches our goal of maintaining a meaningful measure of Medicare spending across hospitals.

Comment: A few commenters stated that they were unable to meaningfully comment on the proposed minimum number of cases, because there was not a reliability study posted. Some commenters pointed to the reliability of the mortality measures, suggesting that 100 cases may not be a high enough minimum for a claims-based measure.

Response: In addition to the minimum number of cases analysis described above, we have obtained a more robust reliability analysis, in order to confirm our expectation that the Medicare Spending per Beneficiary measure would be reliable. As noted above, the analysis found the Medicare Spending per Beneficiary measure to have a reliability of 0.951, with a minimum of 10 cases, and an increase in reliability of 0.0002 when the minimum number of episodes increases

from 10 to 25. Because we believe this analysis supports our expectation that a minimum number of 10 cases for the measure would be sufficient, we are confident that the minimum number of 25 cases proposed will produce sufficient measure reliability. The analysis may be accessed at *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/Hospital-Value-Based-Purchasing/*, in the ''Downloads'' section.

Comment: Many commenters urged CMS to begin the legislatively required demonstrations on value-based purchasing for hospitals not meeting the minimum numbers of cases and measures and for Critical Access Hospitals as soon as possible.

Response: We plan to begin those demonstrations when possible within our resource constraints.

After consideration of the public comments we received, we are finalizing our minimum number of cases for the Medicare Spending per Beneficiary measure as proposed.

15. Immediate Jeopardy Citations

Under section 1886(o)(1)(C)(ii)(II) of the Act, a hospital is excluded from the Hospital VBP Program if it has been cited by the Secretary during the performance period for deficiencies that pose immediate jeopardy to the health or safety of patients. In the Hospital Inpatient VBP Program final rule (76 FR 26528 through 26530), we finalized our interpretation of this provision to mean that any hospital that we cite through the Medicare State Survey and Certification process for deficiencies during the performance period that pose immediate jeopardy to patients will be excluded from the Hospital VBP Program for the fiscal year. We also finalized our proposal to use the definition of the term ''immediate jeopardy'' that appears in 42 CFR 489.3.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28090), in proposed § 412.160, we proposed to define ''immediate jeopardy'' in the same way as that term is defined in 42 CFR Part 489, which governs provider agreements and supplier approval. We believe that the language in section 1886(o)(1)(C)(ii)(II) of the Act referring to a hospital having been ''cited'' for deficiencies posing an immediate jeopardy is a reference to the process by which CMS, through agreements with State survey agencies, surveys or inspects hospitals for compliance with the hospital CoPs at 42 CFR Part 482 or Emergency Medical Treatment and Labor Act (EMTALA) regulations at § 489.24, and issues deficiency citations for non-compliance with Federal health, safety and quality standards. The survey process is governed by provisions found in 42 CFR Part 488, Survey, Certification and Enforcement Procedures. Further, provisions at 42 CFR Part 489, Provider Agreements and Supplier Approval, define the term ''immediate jeopardy'' at § 489.3; authorize us at § 489.53(a)(3) to terminate the Medicare provider agreement for the hospital's failure to meet the CoP; authorize us at § 489.53(b) to terminate the Medicare provider agreement of a hospital that fails to meet the EMTALA regulatory requirements; and provide at § 489.53(d)(2)(i) for a shortened advance notice to the public of the termination when a hospital with an emergency department is in violation of EMTALA requirements and the violation poses immediate jeopardy. Therefore, we believe that the term ''immediate jeopardy'' should be defined in our Hospital VBP Program regulations in the same manner as it is defined for the purpose of survey, certification, enforcement, and termination procedures.

In proposed § 412.160, we proposed to define the phrase ''cited for deficiencies that pose immediate jeopardy.'' We proposed a definition in order to avoid potential ambiguities about the terms ''cited'' and ''deficiencies.'' There are several ways in which a hospital might be found to have an immediate jeopardy situation. Appendix Q of the State Operations Manual (SOM), Pub. No. 100–07, provides guidance to the State survey agencies on our policies concerning the identification and citation of immediate jeopardy and subsequent enforcement actions. A common way in which an immediate jeopardy situation is identified is when a surveyor or team of surveyors is in the process of conducting a survey of compliance with the Medicare CoP at the hospital and accurately identifies those situations which immediately jeopardize the health and safety of patients. Surveyors may be expected, according to State protocols, to consult immediately with their supervisors before declaring an immediate jeopardy, and in cases involving hospitals deemed to meet the CoP based on their accreditation, the State must first consult with the CMS Regional Office (RO). In the case of EMTALA surveys, only the CMS Regional Office may determine, after reviewing the State Survey Agency's report, whether there was an EMTALA violation and, if so, whether it constituted an immediate jeopardy.

Once an immediate jeopardy situation is declared, the hospital's management is informed and expected to take steps to remove the immediate jeopardy, preferably before the survey team concludes the on-site portion of its survey. If the hospital does not remove the immediate jeopardy while the survey team is on-site, it has 23 days to submit an acceptable plan of correction and have an onsite follow-up survey to confirm removal. If the hospital fails to remove the immediate jeopardy in a timely manner, we may terminate the hospital's Medicare provider agreement. There are also situations where a survey team does not declare an immediate jeopardy while on-site, but a subsequent supervisory or CMS RO review of the survey team's findings identifies an immediate jeopardy situation that should have been declared. In such cases, the hospital is promptly advised of the immediate jeopardy and given 23 days to submit an acceptable plan of correction and have an onsite follow-up survey to confirm removal of the immediate jeopardy. It can also happen that a supervisory or CMS RO review will conclude that the survey documentation does not support a finding of an immediate jeopardy, and in such cases no official immediate jeopardy citation will be issued.

We note that removal of an immediate jeopardy is not necessarily the same as correction of the hospital's noncompliance deficiencies. Removal may be accomplished by an interim measure while the hospital works to create a systematic and permanent correction of its deficient practices.

The Form CMS–2567, Statement of Deficiencies and Plan of Correction, is issued after each survey of a hospital, even if only to indicate that no deficiencies were found during the survey (SOM Section 2728 and SOM Exhibit 7A, Principles of Documentation, Principle #1). The CMS–2567 form constitutes the official notice to a healthcare facility of the survey findings. Statements made by surveyors to the facility while they are on-site are always preliminary in nature. After surveyors have exited the facility, they prepare the Form CMS–2567 based on their observations and survey documentation. Their draft Form CMS–2567 is then subjected to a supervisory review and, in the case of hospitals that are deemed to meet the CoP via accreditation and are being cited for serious noncompliance (that is, condition-level or immediate jeopardy citation), to a CMS RO review. The Form CMS–2567 is not considered final until it is transmitted to the healthcare facility, either by the State survey agency or, in certain cases, the CMS RO.

In the case of a survey where an immediate jeopardy situation was found, the Form CMS–2567 must state that the facility was found to have immediate jeopardy. This is the case regardless of whether the immediate jeopardy was removed while the survey team was still on-site at the facility, although on-site removal will be noted if it occurred. Furthermore, it is standard survey practice to cite on the Form CMS–2567 all noncompliance deficiencies identified during a survey even when the healthcare facility corrects those deficiencies after they have been identified by a surveyor, but before the survey team exits the facility (SOM Exhibit 7A, Principles of Documentation, Principle #4).

We considered whether it would be reasonable to treat only those hospitals that failed to remove immediate jeopardy while a survey team was still on-site as having been ''cited for an immediate jeopardy'' solely for the purposes of the Hospital VBP Program. However, we concluded that this would not be equitable, since there are cases where an immediate jeopardy is identified after the survey team has left the hospital through a supervisory or CMS RO review, as described above. We also concluded this approach would not be consistent with the statutory requirement given that the Form CMS–2567 is the official notice to a healthcare facility of deficiencies found during a survey and in light of the fact that CMS includes references to the identification of an immediate jeopardy on the CMS–2567, regardless of when or if it was removed by the facility. We have, therefore, concluded that ''citation'' of an immediate jeopardy within the context of the Hospital VBP Program means the identification of an immediate jeopardy noted on the CMS–2567 that is issued to the hospital after a survey.

We also note that section 1886(o)(1)(C)(ii)(II) of the Act refers to the citation of plural ''deficiencies'' that pose immediate jeopardy and that this requires interpretation of its application to the Hospital VBP Program. We use an Automated Survey Processing Environment (ASPEN) system to catalog deficient practices identified during a survey and to generate the CMS–2567 that is issued to the hospital after the survey. To facilitate processing in the ASPEN system, we have subdivided the regulations applicable to each type of certified healthcare facility into specific ''tags,'' each one of which has corresponding interpretive guidelines in the applicable appendix of the SOM. Hospital tags are found in Appendix A. The ASPEN system also differentiates between ''condition'' and ''standard'' level tags for non-long term care enforcement, since it is essential to know whether or not identified noncompliance is found at the condition-level, that is, whether it is considered substantial noncompliance. Each hospital condition of participation has its own condition tag. There are also a varying number of ''standard'' tags within each condition. The number of standard-level tags identified in the SOM Appendix does not correspond to the number of individual ''standards'' required in the regulations; usually there are more tags than actual standards, because standards may involve multiple items or requirements under specific CoP that lend themselves to separate evaluation.

While we understand that each tag identified in a CMS–2567 may be viewed as a separate deficiency, we also recognize that the division of the regulations for each ''condition'' and ''standard'' into individual tags was to facilitate the survey and certification process for surveyors. Moreover, in general a set of documented deficient practices that constitute immediate jeopardy would be cited at least in two tags, since there must be a citation at the condition-level to indicate substantial noncompliance, along with citation of any pertinent standard-level tags, which are subsets of the condition tags. We do not believe it was the intent of the statute to count each of these tags related to the same set of circumstances or practices as separate deficiencies under the Hospital VBP Program.

We have concluded, therefore, that a more reasonable interpretation of the Hospital VBP statute is to view each hospital survey for which the CMS–2567 form cited immediate jeopardy as a deficiency, for Hospital VBP purposes only. Thus, a hospital would have to have been cited on a CMS–2567 for immediate jeopardy on at least two surveys during the performance period in order to be considered as having multiple deficiencies that pose immediate jeopardy. Accordingly, we proposed to define in our regulations the term ''cited for deficiencies that pose immediate jeopardy'' under the Hospital VBP Program to mean that, during the applicable performance period, the hospital had more than one survey for which it was cited for an immediate jeopardy on the Form CMS–2567, Statement of Deficiencies and Plan of Correction.

As required by the statute, hospitals cited during the performance period for multiple deficiencies that pose immediate jeopardy to the health or safety of patients would be excluded from the Hospital VBP Program for the applicable fiscal year. Because we sometimes adopt different performance periods for different measures for purposes of the same program year, we proposed to exclude hospitals cited for such deficiencies during any of the finalized performance periods for the applicable program year for purposes of that interpretation.

We welcomed public comment on this interpretation of the immediate jeopardy exclusion and on our proposals.

Comment: A majority of commenters expressed their support for the proposal to define the phrase ''cited for deficiencies that pose immediate jeopardy'' as meaning that, during the applicable performance period a hospital was cited for immediate jeopardy on at least two surveys using the Form CMS–2567, Statement of Deficiencies and Plan of Correction. One commenter indicated this approach was reasonable and strikes an appropriate balance between the importance of ensuring high quality care and the punitive nature of disqualifying a hospital from value-based purchasing incentives.

Response: We thank those commenters who support our proposal and agree that it allows for an appropriate balance in the Hospital VBP Program between assuring high quality care and not unreasonably excluding a hospital from participation in the Hospital VBP Program.

Comment: A number of individual commenters associated with one hospital, as well as several other commenters, objected to the proposed definition for the term ''cited for deficiencies that pose immediate jeopardy.'' The commenters suggested that there is variation in immediate jeopardy citation practices which raises legitimate concerns about the validity of the citations. One commenter suggested that CMS eliminate use of immediate jeopardy citations in the Hospital VBP Program. Several others suggested the term be defined to include only those hospitals whose Medicare provider agreement is actually terminated as a result of the inability to remove an immediate jeopardy within 23 days. Two commenters suggested that immediate jeopardy citations based on violations of the Life Safety Code be excluded from consideration under the Hospital VBP Program. These commenters believed that variations in Life Safety Code citations are wide and that these types of deficiencies often are not related to patient safety. Another commenter suggested that any immediate jeopardy that is corrected

while the surveyors are on-site not be included in the definition, since a deficiency that can be corrected in that timeframe does not warrant the severity of the punishment related to the Hospital VBP Program. This commenter also suggested revising the definition of ''immediate jeopardy'' given the linkage to the Hospital VBP Program. The commenter believes that immediate jeopardy citations are limited in scope to single patient occurrences, unlike the Hospital VBP Program performance measures that consider a hospital's overall performance. This commenter indicated that such citations in the case of hospitals previously made them subject to loss of deemed status, loss of Medicare certification and civil monetary penalties, and with this proposal the penalty of exclusion from the Hospital VBP Program would be added. The commenter believes the definition should reflect the serious nature of the penalties.

Response: With respect to the suggestion that we eliminate the use of the immediate jeopardy exclusion in the Hospital VBP Program, we do not have the discretion to do so. Section 1886(o)(1)(C)(ii)(II) of the Act specifies that a hospital is excluded from the Hospital VBP Program if it has been cited by the Secretary during the performance period for deficiencies that pose immediate jeopardy to the health or safety of patients. We believe that the statute is clearly referring to our longstanding definition of ''immediate jeopardy'' and to citations in connection with Federal surveys, or inspections, of hospitals, most of which are conducted on CMS' behalf by State Survey Agencies as part of the Medicare survey and certification process. We do not believe the statute refers only to hospitals whose provider agreements were terminated as a result of their failure to correct their cited immediate jeopardy deficiencies, since the term ''cited'' is not equivalent to ''terminated.'' Moreover, any hospital not participating in the Medicare program as a result of a termination action would not be eligible for the Hospital VBP Program, so it is unlikely that the statute was intended for such cases. Likewise, we see no basis for revising the definition of ''immediate jeopardy, '' which is defined at 42 CFR 489.3 as ''a situation in which a provider's noncompliance with one or more requirements of participation has caused, or is likely to cause, serious injury, harm, impairment, or death to a resident,'' or not considering certain types of immediate jeopardy citations applicable. The definition and the criteria for all immediate jeopardy citations are the same for all types of certified providers and suppliers, not just subsection (d) hospitals. As specified in Appendix Q, Guidelines for Determining Immediate Jeopardy, (Rev. 1, 05–21–04), of the SOM, there are three components that must be present to support an immediate jeopardy citation: actual or potential serious harm, injury, impairment or death of patients; immediacy of the harm, that is, its likelihood to occur in the very near future; and culpability, that is, the hospital knew or should have known about the situation and taken appropriate action prior to the survey. It is not correct to say that immediate jeopardy citations are limited in scope to single patient occurrences, since often such citations reflect serious systemic problems within a hospital that could put many patients at risk of serious harm. Likewise, the issue of being able to ''remove'' an immediate jeopardy while the survey team is on site should not be confused with the seriousness of the underlying problem or the extent of systemic corrections needed. An immediate jeopardy may be removed while the survey team is on-site when the hospital takes interim measures that remove the immediacy of the threat of future harm,. However, the substantial noncompliance with the Medicare health and safety standards in such cases remains and must be corrected through systemic changes. Our survey protocol calls for the immediate jeopardy to be noted on the Form CMS–2567 regardless of whether it was removed while the survey team was on-site or not. We do not believe it would be appropriate to modify either the regulatory definition of immediate jeopardy or our longstanding protocols for citing immediate jeopardy for one type of provider, namely subsection (d) hospitals, now that such citations are linked to another Medicare program.

Comment: Multiple commenters stated that there is wide variation among States and CMS Regional Offices and that they can reach differing opinions on similar facts as to whether there is an immediate jeopardy finding. One commenter asserted that CMS Regional Offices are unlikely to overturn an immediate jeopardy citation that is issued by a State surveyor. Several commenters urged that, given the additional payment impact under VBP of immediate jeopardy citations, CMS should ensure that there is uniform guidance for State surveyors and that the definition of immediate jeopardy is well understood and consistently applied by CMS and State Survey Agencies.

Response: In addition to the regulatory definition of immediate jeopardy, we have longstanding, detailed, uniform guidance in Appendix Q of the SOM for determining an immediate jeopardy situation. We also note that the standard protocol for non-EMTALA surveys requires the surveyor or survey team which suspects an immediate jeopardy while they are on-site conducting a survey to call their State Survey Agency management, per State protocol. In the case of deemed hospitals, the CMS Regional Office must also be consulted before an immediate jeopardy may be declared. In the case of an EMTALA survey, only the CMS Regional Office may determine whether there was an EMTALA violation and, if so, whether it constitutes immediate jeopardy. This necessity for multiple individuals to agree that an immediate jeopardy citation is warranted helps to mitigate the risk of subjectivity in the determination. In addition, with the advent of the statutory linkage between the Hospital VBP Program and immediate jeopardy citations, we recognized the importance of increasing our efforts to ensure consistency across CMS regions and States in issuing immediate jeopardy citations. We have conducted special training for surveyors and regional office staff on identifying immediate jeopardy situations related to the hospital CoP, and will be doing the same with respect to immediate jeopardy situations related to the EMTALA requirements for hospitals. In addition, now that we have begun collecting data on immediate jeopardy citations, we will use the data to support further education and training as needed. For the first Hospital VBP performance period and part of the second performance period we utilized a manual process to collect hospital immediate jeopardy citation information from each CMS Regional Office. In addition, the Automated Survey Processing Environment (ASPEN), an electronic system that supports our survey and certification activity, has been revised to include information about immediate jeopardy citations in surveys entered into ASPEN after July, 2012, enabling automated collection of this data.

We note as a point of information that over eighty percent of subsection (d) hospitals are ''deemed'' to be in compliance with the Medicare hospital CoP on the basis of their accreditation under a CMS-approved hospital accreditation program. Although we have the authority to do so, as a matter of policy we do not take enforcement

actions based on the results of an accrediting organization's survey of a deemed facility. Accordingly, there are no Medicare immediate jeopardy citations based on an accrediting organization's survey findings. However, this does not mean that deemed hospitals would never be cited for immediate jeopardy, nor does it mean that they are not subject to Medicare hospital surveys conducted either by State Survey Agencies or Federal surveyors. With respect to the Hospital VBP, therefore, there is no advantage to being deemed versus non-accredited. In accordance with section 1864(c) of the Act, the Secretary may authorize State Survey Agencies to conduct validation surveys of deemed facilities. There are two types of validation surveys: (1) Representative sample validation surveys, where CMS selects a sample of deemed providers and suppliers to be surveyed under a standard survey (i.e., a survey of compliance with all applicable CoP or Conditions for Coverage) by the State Survey Agencies as part of our annual assessment of the performance of CMS-approved accreditation programs; and (2) substantial allegation validation surveys, more generally known as complaint surveys. The latter are conducted in response to an allegation which, if found to be true, would indicate that a provider or supplier is not in substantial compliance with one or more of the applicable Conditions. In the case of hospitals, the majority of the Medicare surveys conducted are validation surveys involving deemed hospitals. In FY 2010, for example, there were over 4,200 Medicare complaint surveys and over 400 standard surveys of subsection (d) hospitals, and fewer than 500 of these complaint surveys and roughly 100 of the standard surveys were of non-accredited hospitals. Finally, we also note that accrediting organizations are required to notify CMS promptly if they identify a situation during a survey of a deemed facility which constitutes an immediate jeopardy. Upon receiving such notification, CMS reviews the information the accrediting organization provides and, if it agrees that the situation as described would constitute an immediate jeopardy, either instructs the State Survey Agency to promptly conduct a substantial allegation validation survey or conducts such a survey with a team of Federal surveyors.

Comment: One commenter interpreted the discussion in the proposed rule of the use of the Form CMS–2567, Statement of Deficiencies and Plan of Correction, as implying that State Agency surveyors could issue immediate jeopardy findings using some other form. The commenter urged CMS to clarify that only immediate jeopardy findings issued by CMS or its Regional Offices on the Form CMS–2567 can serve as the basis for an immediate jeopardy determination that will have payment impact under the Hospital VBP Program.

Response: Nothing in the proposed rule indicated that an official notice of immediate jeopardy could be conveyed to a hospital via any form other than the Form CMS–2567. We believe that the commenter may be confused by the fact that, in some instances, the Form CMS–2567 containing the findings of the Federal survey may be issued or transmitted to a hospital by the State Survey Agency rather than the CMS Regional Office. This could happen in the following cases: When the survey was of CoP compliance in a hospital that does not have Medicare ''deemed'' status on the basis of its accreditation by a CMS-approved Medicare accreditation program; when the survey was of a hospital whose deemed status was previously removed by the CMS Regional Office, as a result of substantial noncompliance found on a previous survey; or in the case of a hospital with deemed status where the CMS Regional Office has authorized the State Survey Agency to transmit the specific Form CMS–2567 to the hospital.

We are also taking this opportunity to clarify that we will consider only those Form CMS–2567s which are issued to a hospital based on a Federal survey, both for our general enforcement purposes and for determining immediate jeopardy citations for the Hospital VBP Program. We recognize that it is not uncommon for States to also use the Form CMS–2567 as a template for them to issue reports of surveys conducted under their State licensure authority. Even though the report may appear on a Form CMS–2567, and even when the report may refer to an immediate jeopardy, if it is not a report resulting from a Federal survey to assess compliance with Federal standards, it will not be considered applicable for our general enforcement purposes or for the Hospital VBP Program.

Comment: One commenter asked that CMS clarify what the operative date will be for determining the appropriate performance period to which an immediate jeopardy citation will be applied. The commenter noted that the issuance of the Form CMS 2567 to the hospital may occur a lengthy time after surveyors exited the hospital. Another commenter noted that sometimes the same event can result in multiple immediate jeopardy citations which is a cause for concern. Another commenter recommended that CMS apply the definition in the proposed regulation to the FY 2013 Hospital VBP Program.

Response: It is possible for several Federal surveys to be conducted simultaneously in a hospital. This could happen, for example, if a particular complaint warranted an investigation under both the hospital CoP, 42 CFR Part 482, and the EMTALA requirements found in 42 CFR 489. We recognize that it is more an artifact of our survey process and the ASPEN electronic system which supports Federal surveys that separate Form CMS 2567s are generated when such simultaneous surveys occur. We have therefore adopted as part of our protocol that two Form CMS–2567s with immediate jeopardy citations and with the same survey end date are to be counted as one instance of an immediate jeopardy citation. However, use of the survey end date will enable us to identify those cases where multiple surveys were conducted simultaneously.

The survey end date generated in ASPEN will be the date used for assignment to a performance period. We acknowledge that this date will often be earlier than the date on which the Form CMS–2567 is issued to the hospital. In the case of EMTALA surveys, it will always be earlier, since only the CMS Regional Office may determine whether there has been an EMTALA violation, usually after obtaining a Quality Improvement Organization (QIO) physician review of the clinical aspects of the case when required by the statute. The survey end date is a date that can be tracked in ASPEN in an automated fashion, increasing the accuracy of identification of all immediate jeopardy citations for the applicable performance period.

This final rule concerning the Hospital VBP Program will be effective for FY 2013. Therefore, although the performance period for the FY 2013 Hospital VBP Program occurred prior to October 1, 2013, the definition of immediate jeopardy citations will be in effect and applied to the FY 2013 Hospital VBP performance period.

Comment: Several commenters indicated that, given their concerns about the variation they perceive in immediate jeopardy citation practices among States and Regional Offices, they believe that they should be able to appeal any immediate jeopardy citation issued to them. One commenter noted that all appeals should be exhausted before a hospital would be excluded from the Hospital VBP Program.

Response: ''Immediate jeopardy'' is one of several levels of noncompliance that may be cited in a hospital, with the other two being substantial noncompliance (that is, so-called ''condition-level'' noncompliance) and standard-level deficiencies. In accordance with 42 CFR 498.3(b)(14), the level of noncompliance found by CMS is an initial determination (and therefore appealable) only in the case of a skilled nursing facility or nursing facility, and then only in certain circumstances. The level of citations issued to a hospital is, therefore, not appealable under the current regulation. Among other things, a hospital may appeal deficiency findings that lead to the termination of a provider agreement under 42 CFR 489.53, which is an initial determination defined at 42 CFR 498.3(b)(8). Appeals procedures for providers, including hospitals, and certified suppliers are found in 42 CFR Part 498. We will consider future rulemaking on this issue.

Comment: Several commenters objected to our proposal that, because we sometimes adopt different performance periods for different measures for purposes of the same Hospital VBP Program year we would exclude hospitals cited for immediate jeopardy during any of the finalized performance periods for the applicable program year. Several commenters noted that the mortality measurements performance period is 3 years long and indicated that it is unreasonable to exclude a hospital from the Hospital VBP Program for 3 years due to two immediate jeopardy citations in one portion of this performance period.

Response: We believe commenters erred in describing a 3-year performance period for the 30-day mortality measures. We finalized above a 21-month performance period for these measures for the FY 2016 VBP Program, but have not proposed to adopt a performance period of 3 years. We interpret the commenters to express concern about the possibility of immediate jeopardy citations during a relatively wide date range resulting in hospitals' being excluded from a Hospital VBP Program year.

Section 1886(o)(1)(C)(i) of the Act defines the term ''hospital'' for purposes of the Hospital VBP Program as ''a subsection (d) hospital (as defined in subsection (d)(1)(B),'' subject to certain exclusions outlined in section 1886(o)(1)(C)(ii) of the Act. One of those exclusions, found in subparagraph (II), excludes from the definition of the term hospital any hospitals ''for which, during the performance period for such fiscal year, the Secretary has cited deficiencies that pose immediate jeopardy to the health or safety of patients.''

We do not believe that we have the statutory authority to include hospitals in the Hospital VBP Program when they have been cited for such deficiencies during any of the finalized performance periods described further above. Subject to our interpretation of the term, ''cited for deficiencies that pose immediate jeopardy'' described further above, we believe that we must exclude hospitals so cited during any finalized performance period for a fiscal year regardless of the length of the applicable performance period. While we recognize that, for certain types of measures, the length of time during which immediate jeopardy citations may result in exclusion from the Hospital VBP Program may be longer than for others, we believe that the Hospital VBP statute requires us to exclude those cited hospitals.

After consideration of the public comments we received, we are finalizing our proposed immediate jeopardy definitions and exclusion processes without modification, including our codification of the definitions of ''cited for deficiencies that pose immediate jeopardy'' and ''immediate jeopardy'' for purposes of the Hospital VBP Program in 42 CFR 412.160.

D. Long-Term Care Hospital Quality Reporting (LTCHQR) Program

1. Statutory History

In accordance with section 1886(m)(5) of the Act, as added by section 3004 of the Affordable Care Act, the Secretary established the Long-Term Care Hospital Quality Reporting (LTCHQR) Program. Under the LTCHQR Program, for rate year 2014 and each subsequent rate year, in the case of a long-term care hospital (LTCH) that does not submit data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a rate year, any annual update to a standard Federal rate for discharges for the hospital during the rate year, and after application of section 1886(m)(3) of the Act, shall be reduced by two percentage points.

Section 1886(m)(5)(D)(iii) of the Act requires the Secretary to publish the selected measures for the LTCHQR Program that will be applicable with respect to the FY 2014 payment determination no later than October 1, 2012.

Under section 1886(m)(5)(D)(i) of the Act, the quality measures for the LTCHQR Program are measures selected by the Secretary that have been endorsed by an entity that holds a contract with the Secretary under section 1890(a) of the Act, unless section 1886(m)(5)(D)(ii) of the Act applies. This contract is currently held by the National Quality Forum (NQF). Section 1886(m)(5)(D)(ii) of the Act provides that an exception may be made in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity that holds a contract with the Secretary under section 1890(a) of the Act. In such a case, section 1886(m)(5)(D)(ii) of the Act authorizes the Secretary to specify a measure(s) that is not so endorsed, as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. The LTCHQR Program was implemented in section VII.C. of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756).

2. LTCH Program Measures for the FY 2014 Payment Determination and Subsequent Fiscal Years Payment Determinations

a. Process for Retention of LTCHQR Program Measures Adopted in Previous Payment Determinations

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28092), for the LTCHQR Program, we proposed that once a quality measure is adopted, it is retained for use in subsequent fiscal year payment determinations, unless otherwise stated. For the purpose of streamlining the rulemaking process, we proposed that when we initially adopt a measure for the LTCHQR Program for a payment determination, this measure will be automatically adopted for all subsequent payment determinations or until we propose to remove, suspend, or replace the measure. Quality measures may be considered for removal by CMS if: (1) Measure performance among LTCHs is so high and unvarying that meaningful distinctions in improvements in performance can be no longer be made; (2) performance or improvement on a measure does not result in better patient outcomes; (3) a measure does not align with current clinical guidelines or practice; (4) a more broadly applicable measure (across settings, populations, or conditions) for the particular topic is available; (5) a measure that is more proximal in time to desired patient outcomes for the particular topic is available; (6) a measure that is more strongly associated with desired patient outcomes for the particular topic is available; or (7) collection or public

reporting of a measure leads to negative unintended consequences other than patient harm. For any such removal, the public will be given a chance to comment through the annual rulemaking process. However, if there is reason to believe continued collection of a measure raises potential safety concerns, we will take immediate action to remove the measure from LTCHQR Program and will not wait for the annual rulemaking cycle. Such measures will be promptly removed and we will promptly notify LTCHs and the public of such a decision through the usual LTCHQR Program communication channels, including listening sessions, memos, email notification, and Web postings and their removal will be formally announced in the next annual rulemaking cycle.

We invited public comment on our proposal that once a quality measure is adopted, it is retained for use in the subsequent fiscal year payment determinations unless otherwise stated.

Comment: Several commenters supported CMS' approach to retaining measures. Other commenters expressed appreciation for CMS' proposal to streamline the process for quality measure retention and to use the same process proposed in the Hospital IQR Program.

Response: We thank the commenters for their support of our proposed approach for retaining adopted measures for use in subsequent fiscal year payment determinations.

Comment: Many commenters objected to CMS' approach to retain quality measures and suggested that CMS re-propose measures each year and invite public comment before measures are finalized for use. Another commenter noted that measures when implemented may produce unintended consequences and that stakeholders should have the opportunity in the rulemaking process to raise these issues.

Response: Our proposal to retain previously finalized LTCHQR Program measures for subsequent fiscal year determinations aligns with our proposal to retain measures in other Medicare quality reporting programs such as the Hospital IQR Program. We believe this policy will help streamline the rulemaking process and that, in most cases, the comment process during the year we initially propose to adopt a measure is sufficient to identify any potential problem with the measure. However, if we have any indication that the continued use of a measure is causing potential safety concerns, which includes causing unintended consequences, we will take immediate action to remove that measure from the program. To the extent that stakeholders identify other types of unintended consequences (that is, unintended consequences that would not raise patient safety concerns), we also welcome and would consider comments on these issues at any time. We also plan to work with technical experts and solicit public input through venues such as technical expert panel meetings, listening sessions, special open door forums, and our helpdesk for the LTCHQR Program to ensure that each of the adopted measures remains appropriate for continued inclusion in the LTCHQR Program.

After consideration of the public comments we received, we are finalizing our proposal to retain adopted quality measures for subsequent fiscal year payment determinations unless we propose to remove, suspend, or replace the measure.

b. Process for Adopting Changes to LTCHQR Program Measures

As mentioned previously, quality measures selected for the LTCHQR Program must be endorsed by the NQF unless they meet the statutory criteria for exception. The NQF is a voluntary consensus standard-setting organization with a diverse representation of consumer, purchaser, provider, academic, clinical, and other healthcare stakeholder organizations. The NQF was established to standardize healthcare quality measurement and reporting through its consensus development process (*http://www.qualityforum.org/About_NQF/Mission_and_Vision.aspx*). The NQF undertakes review of: (a) New quality measures and national consensus standards for measuring and publicly reporting on performance, (b) regular maintenance processes for endorsed quality measures, (c) measures with time limited endorsement for consideration of full endorsement, and (d) ad hoc review of endorsed quality measures, practices, consensus standards, or events with adequate justification to substantiate the review (*http://www.qualityforum.org/Measuring_Performance/Ad_Hoc_Reviews/Ad_Hoc_Review.aspx*).

The NQF solicits information from measure stewards for annual reviews and in order to review measures for continued endorsement in a specific 3-year cycle. In this measure maintenance process, the measure steward is responsible for updating and maintaining the currency and relevance of the measure and for confirming existing specifications to NQF on an annual basis. As part of the ad hoc review process, the ad hoc review requester and the measure steward are responsible for submitting evidence for review by a NQF Technical Expert panel which, in turn, provides input to the Consensus Standards Approval Committee which then makes a decision on endorsement status and/or specification changes for the measure, practice, or event.

Through NQF's measure maintenance process, NQF-endorsed measures are sometimes updated to incorporate changes that we believe do not substantially change the nature of the measure. Examples of such changes could be updated diagnosis or procedure codes, changes to exclusions to the patient population, definitions, or extension of the measure endorsement to apply to other settings. We believe these types of maintenance changes are distinct from more substantive changes to measures that result in what are considered new or different measures, and that they do not trigger the same agency obligations under the Administrative Procedure Act. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28092), we proposed that if the NQF updates an endorsed measure that we have adopted for the LTCHQR Program in a manner that we consider to not substantially change the nature of the measure, we would use a subregulatory process to incorporate those updates to the measure specifications that apply to the Program. Specifically, we would revise the LTCHQR Program Manual so that it clearly identifies the updates and provide links to where additional information on the updates can be found. We proposed posting updates on our LTCH Quality Reporting Web site at: *http://www.cms.gov/LTCH–Quality-Reporting/*, with the provision of sufficient lead time for LTCHs to implement the changes where changes to the data collection systems would be necessary.

We proposed continuing to use the rulemaking process to adopt changes to measures when the changes substantially change the nature of the measure. We believe that our proposal adequately balances our need to incorporate NQF updates to NQF-endorsed LTCHQR Program measures in the most expeditious manner possible, while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the measure we originally adopted. We invited public comment on this proposal.

Comment: Commenters noted that standards of quality may change from year to year and believed that it was not clear how CMS will determine what a ''substantial'' change is, requiring public

input, versus an ''unsubstantial'' change, not requiring public input. One commenter noted that ''even minor changes to the definitions and exceptions [of a measure] can result in a substantive change to a quality measure.'' Several commenters suggested that CMS set out the process for adopting NQF measure updates that arise from the NQF review process and the process for determining what is a ''substantive'' versus ''non-substantive'' measure change. Some commenters stated that CMS should solicit public comments to adopt these changes.

Response: The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF making updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate non-substantive updates made by the NQF into the measure specifications we have adopted for the LTCHQR Program so that these measures remain up-to-date. We also recognize that some changes the NQF might make to its endorsed measures are substantive in nature and might not be appropriate for adoption using a subregulatory process.

Therefore, after consideration of the public comments received, we are finalizing a policy under which we will use a subregulatory process to make non-substantive updates to NQF-endorsed measures used for the LTCHQR Program. With respect to what constitutes a substantive versus a non-substantive change, we expect to make this determination on a measure-by-measure basis. Examples of non-substantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures used in the Hospital IQR and Hospital VBP Programs). We also believe that non-substantive changes might include updates to NQF-endorsed measures based upon changes to guidelines upon which the measures are based.

We will continue to use rulemaking to adopt substantive updates made by the NQF to the endorsed measures we have adopted for the LTCHQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent (for example: changes in acceptable timing of medication, procedure/process, or test administration). Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to the LTCH setting. We also note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance and measure review process.

These policies regarding what is considered substantive versus non-substantive changes would apply to all LTCHQR Program measures.

3. CLABSI, CAUTI, and Pressure Ulcer Measures

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756), we adopted three quality measures for the FY 2014 payment determination as listed in the following table:

PREVIOUSLY FINALIZED LTCHQR QUALITY MEASURES FOR THE FY 2014 PAYMENT DETERMINATION

NQF #0138	Urinary Catheter-Associated Urinary Tract Infection [CAUTI] rate per 1, 000 urinary catheter days, for Intensive Care Unit [ICU] Patients.
NQF #0139	Central Line Catheter-Associated Blood Stream Infection [CLABSI] Rate for ICU and High-Risk Nursery [HRN] Patients.
Application of NQF #0678	Percent of Residents with Pressure Ulcers That are New or Worsened (Short-Stay).

The three measures finalized for FY 2014 payment determination were NQF-endorsed at the time of the FY 2012 IPPS/LTCH PPS final rule, although not for the LTCH setting. We also stated that we expected the NQF would review some of these measures for applicability to the LTCH setting and we anticipated this review might result in modifications to one or more of the measures.

As part of its endorsement maintenance process, under NQF's Patient Safety Measures Project (*http://www.qualityforum.org/projects/patient_safety_measures.aspx*), the NQF reviewed the CAUTI and CLABSI measures previously adopted and expanded the scope of endorsement to include additional care settings, including LTCHs. The original NQF-endorsed numbers were retained for these two expanded measures, but the measures were re-titled to reflect the expansion of the scope of endorsement. NQF #0138 (Urinary Catheter-Associated Urinary Tract Infection [CAUTI] Rate Per 1,000 Urinary Catheter Days, for Intensive Care Unit [ICU] Patients) is now titled National Health Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure. NQF #0139 (Central Line Catheter-Associated Blood Stream Infection [CLABSI] Rate for ICU and High-Risk Nursery (HRN) Patients is now titled National Health Safety Network (NHSN) Central Line-Associated Blood Stream Infection (CLABSI) Outcome Measure (*http://www.qualityforum.org/News_And_Resources/Press_Releases/2012/NQF_Endorses_Patient_Safety_Measures.aspx*). These expanded measures allow for the calculation of a Standardized Infection Ratio (SIR).[133,134,135,136] For the remainder of this rule, we refer to these measures as the CAUTI measure and CLABSI measure, respectively. We proposed adopting the changes to the NQF-endorsed CAUTI and CLABSI measures that we previously finalized for the FY 2014 payment determination, consistent with our stated intention to update these measures with changes resulting from NQF's review of the measures. Further, we proposed adopting the NQF-endorsed CAUTI measure and CLABSI measure for the FY 2015 payment determination and all subsequent fiscal year payment determinations. We also proposed incorporating any future changes to the CAUTI measure and CLABSI measure to

[133] Centers for Disease Control and Prevention. (2012, January). Central Line-Associated Bloodstream Infection (CLABSI) Event. Retrieved from *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf.*

[134] National Quality Forum (2012). National Healthcare Safety Network (NHSN) Central line-associated Bloodstream Infection (CLABSI) Outcome Measure. Retrieved from *http://www.qualityforum.org/QPS/0139.*

[135] Centers for Disease Control and Prevention. (2012, January). Catheter Associated Urinary Tract Infection Event. Retrieved from: *http://www.cdc.gov/nhsn/PDFs/pscManual/7pscCAUTIcurrent.pdf.*

[136] National Quality Forum (2012). National Healthcare Safety Network (NHSN) Catheter Associated Urinary Tract Infection (CAUTI) Outcome Measure. Retrieved from *http://www.qualityforum.org/QPS/0138.*

the extent these changes are consistent with our proposal to update measures.

We proposed retaining an application to the LTCH setting of the measure Percent of Residents with Pressure Ulcers that are New or Worsened (Short-Stay) (NQF #0678), as finalized in the FY 2012 IPPS/LTCH PPS final rule for the FY 2014 payment determination, for FY 2015 and all subsequent fiscal year payment determinations. We also noted that the Percent of Residents with Pressure Ulcers that are New or Worsened (Short-Stay) (NQF #0678) measure was undergoing NQF review for expansion in the scope of endorsement to include additional care settings, including LTCHs and, to the extent that the measure is updated in a manner that does not substantially change the nature of the measure, we would incorporate the updates consistent with our previous proposal to update measures.

This measure underwent review for expansion by the NQF Consensus Standards Approval Committee (CSAC) on July 11, 2012 (*http://www.qualityforum.org/About_NQF/CSAC/Meetings/2012_CSAC_Meetings.aspx*). The CSAC recommended that the NQF expand its endorsement of the measure to the LTCH setting. For the remainder of this final rule, we refer to this measure as the Pressure Ulcer measure. For more information on the history of this measure in the LTCHQR Program, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51753 through 51756).

We invited public comment on our proposal to adopt the revised CAUTI measure (NQF #0138) and CLABSI measure (NQF #0139) beginning with the FY 2014 payment determination. We also invited public comment to retain an application to the LTCH setting of the Pressure Ulcer measure (NQF #0678) (which was finalized last year in the FY 2012 IPPS/LTCH PPS final rule for the FY 2014 payment determination) for the FY 2015 payment determination and subsequent fiscal year payment determinations.

Comment: Many commenters strongly supported CMS' use of the HAI measures CAUTI and CLABSI in the LTCHQR Program for the FY2014 payment determination and subsequent fiscal years' payment determinations. One commenter noted that although it is important to move forward with including these HAI measures, they specifically expressed concerns related to the validation of the data pertaining to these measures.

Response: We appreciate the commenters' support of these measures for use in the LTCHQR Program. We interpret the comment expressing concern related to data validation to be recommending that we validate HAI data. We intend to work with the CDC to develop an efficient, and accurate, data validation approach, and will address this issue in future rulemaking. Furthermore, we recognize that the validation methods currently being used by States that have conducted some level of validation are not standardized or consistent. We will take these additional concerns under consideration as we consider CAUTI and CLABSI data validation.

Comment: One commenter believed that the CAUTI rate is open to observer bias due to a lack of education regarding colonization versus infection. As a result, the commenter believed that almost all facilities will show progressively improving outcomes in this measure over time as they improve the education of staff on the colonization/infection issue. The commenter believed that this demonstrated improvement will be misleading because, instead of representing an actual decrease in the CAUTI rate, it will reflect a decrease in false positive infection reporting due to colonization. The commenter believed that effects of such a distortion would likely be significant, potentially rendering the first year or two or reporting worthless.

Response: Education is always an important, ongoing component of surveillance. We agree that a better distinction by clinicians between true UTI and asymptomatic bacteriuria may result from CAUTI surveillance. While this result could affect reported CAUTI rates, it would also lead to improved patient outcomes such as reduction of unnecessary antimicrobial usage, reduction in antimicrobial-resistant organisms and decreased adverse reactions to unnecessary medications. Therefore, we do not believe that delaying CAUTI surveillance so that LTCHs might better educate clinicians before implementing the CAUTI measure is the best method to improve patient outcomes.

Comment: One commenter expressed concern about the LTCHQR Program's proposal to use the CAUTI measure. The commenter noted that although the proposed CAUTI measure intended to harmonize measures across the SNF, IRF, and LTCH settings, it did not take into account the significant differences between these healthcare settings. Specifically, the commenter argued that this proposed measure failed to account for higher frequency of urinary catheter use in LTCHs and that this factor had the potential of severely distorting quality measure reporting data. The commenter believed that, for example, because the measure denominator is derived in part from ''the number of urinary catheter days for each location,'' disproportionately high LTCH denominators may significantly skew interpretations of the data.

Response: Under the LTCHQR Program, CAUTI data will be analyzed solely for LTCHs. LTCHQR Program CAUTI data will not be compared to any data collected from hospitals, IRFs or SNFs. We believe that the use of a CAUTI measure in the Hospital IQR Program and the IRFQR Program harmonizes this measure across care settings and will not skew interpretations of the measure under the LTCHQR Program.

We note that, at this time, we do not require SNF CAUTI surveillance.

Comment: One commenter recommended not finalizing the CAUTI measure or at least excluding Asymptomatic, Bacteremic, Urinary Tract Infection (ABUTI) from the measure. The commenter added that data relating to ABUTI patients is not relevant to LTCH quality and performance improvement because there is no reason for an LTCH to submit blood cultures for an asymptomatic patient.

Response: We appreciate the commenter's recommendation to exclude Asymptomatic Bacteremic Urinary Tract Infection (ABUTI) from the CAUTI measure or not finalize the use of the CAUTI measure. However, we disagree that ABUTI is irrelevant to the LTCH patient population. Bacteremic urinary tract infections do occur among LTCH patients, and these infections may occur in patients without fever or localizing urinary tract symptoms. What is required to meet ABUTI criteria is presence of the same microorganism(s) in blood and urine cultures obtained from the same patient. These microbiologic findings are indicative of severe infection, and excluding these infections from the LTCH measure would mean omitting what may be important information about LTCH quality. The inclusion of ABUTI in the measure is also part of the NQF-endorsed specifications for the measure.

Comment: Several commenters noted support for the clinical relevance of the CAUTI measure for the LTCH patient population.

Response: We appreciate the commenters' recognition of the clinical importance of the CAUTI measure for the LTCH patient population. We agree with the importance of catheter associated urinary tract infections and role of infection control measures to

prevent these infections. According to the CDC, CAUTI is the most common healthcare-associated infection (HAI) and is reported 30 percent more frequently than all other infections reported through NHSN. As an HAI, the CDC estimates that there are 449,334 CAUTIs and 13,000 deaths per year with an estimated associated cost of $340,000,000.[137] Furthermore, as indicated in the HHS National Action Plan to Prevent HAIs (*http://www.hhs.gov/ash/initiatives/hai/actionplan/index.html*), catheter-associated urinary tract infection is also a leading type of preventable HAI.[138]

Comment: Some commenters expressed concern with the Pressure Ulcer measure's NQF endorsement status. At the time of proposal, commenters noted that the measure was NQF-endorsed for the nursing home patient population, and was undergoing NQF review for re-specification and expansion to additional settings. Commenters suggested there be more transparency in the NQF endorsement process, and that CMS provide links to NQF documents and measure specifications. One commenter expressed a preference to not submit pressure ulcer quality measure data until the NQF has completed its review. Some commenters noted that CMS failed to provide information pertaining to this measure's specifications, and that LTCHs would also like the opportunity to review the re-specified measure for appropriateness before determining whether it should be finalized for FY2015 LTCHQR Program.

Response: We thank the commenters for their input. On July 11, 2012, the NQF CSAC recommended that the NQF expand its endorsement of the Pressure Ulcer measure to other settings, including the LTCH setting without changes to the specifications. We expect that the measure will be ratified for endorsement by the NQF Board of Directors, as the final step in the NQF endorsement process.

Therefore, we expect the measure, if endorsed for the LTCH setting, will be the same as the measure that we previously finalized. We note, however, that because the NQF has not yet expanded its endorsement of the Pressure Ulcer measure to the LTCH setting, we cannot adopt the NQF-endorsed version of that measure. For that reason, we are retaining the measure that we previously finalized in FY 2012 IPPS/LTCH PPS final rule for the 2014 LTCHQR Program, which is an application of this measure to the LTCH setting.

We do not agree with the commenters' assertion that we failed to provide information pertaining to the measure's specifications. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51754 through 51755), we provided the link to the CMS Web site (*http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/NursingHomeQualityInits/index.html?redirect=/NursingHomeQualityInits/45_NHQIMDS30TrainingMaterials.asp*) where the Pressure Ulcer measure's specifications, as applicable to the nursing home setting (setting for which the measure was endorsed and in use at the time of the FY 2012 IPPS/LTCH PPS final rule), were publically available. We further noted that for additional information related to this measure, including definitions related to worsening, unstageable and the staging of the pressure ulcers, as well as topics such as the inability to stage pressure ulcers with eschar or slough (unstageable), the public could view the Minimum Data Set 3.0 (MDS 3.0) Resident Assessment Instrument Manual, page 24 of Section M, Skin Conditions, which describes the NPUAP approach.

Further, on January 31, 2012, we posted on CMS LTCHQR Program Web site an initial LTCHQR Program guidance document, which was followed by an updated guidance document on March 8, 2012. These guidance documents included measure specifications for the Pressure Ulcer measure and clearly identified data elements from the LTCH CARE Data Set proposed for use in the LTCH-setting. The March 8, 2012 guidance document was incorporated into the draft LTCHQR Program Manual and can be found on the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html*, Appendix E, Titled: *Centers for Medicare & Medicaid Services Long-Term Care Hospital Quality Reporting Program Guidance.*

Comment: Two commenters expressed concern that LTCHs would be held responsible for pressure ulcers that develop during the time that an LTCH patient receives care in an acute care hospital before being transferred back to the LTCH within three days (also known as an ''interrupted [LTCH] stay''). One commenter recommended that the discharge form be modified to exclude pressure ulcers that were acquired during an interrupted stay from the calculation.

Response: LTCH patients that are transferred from an LTCH for three days or less are considered to have had an ''interrupted stay,'' are not discharged from the LTCH, and are still considered to be LTCH patients. With respect to these patients, we believe that LTCHs should be taking quality of care issues into account when they arrange for transfers. However, we also acknowledge that there might be times when, despite efforts made by the LTCH, a patient develops a worsening pressure ulcer during the time spent in the other care setting. We are continuing to evaluate this issue and intend to address it in future rulemaking. We note that the LTCHQR Program is a pay-for-reporting program, which means that LTCHs will satisfy their reporting requirements based on whether or not they report the existence of a worsening pressure ulcer, not based on whether the pressure ulcer actually worsens.

Comment: One commenter expressed concern regarding the presence of a pressure ulcer that cannot be staged and stated that such an ulcer should not be classified as ''unstageable simply because it was not examined.'' This commenter further noted that patients being admitted to an LTCH would be expected to have their wounds assessed within the 48 hour window and that it is highly unlikely that a dressing applied before admission would be left in place for more than 48 hours on any wound after admission to a hospital. This commenter stated that ''it would border on negligent if a dressing was not removed from a known wound on an admission to an LTCH within the 3 days assessment.''

The commenter further noted that a device applied over a known pressure ulcer, such as a NPWT pump or cast would never be utilized for a superficial, partial-thickness stage II pressure ulcer. An orthopedic device applied near/over a known pressure ulcer may not be removable to allow observation of a pressure ulcer on admission to an LTCH. However, the patient hospital discharge information would have identified the presence of an ulcer and typically its stage. If a dressing, wound device or cast was not removed, it would highly likely be due to the complexity of the wound, indicating the ulcer is at least full-thickness.'' Commenters also stated that it was unclear whether pressure ulcers that cannot be examined due to the placement of a medical device, a cast, or

[137] Scott, RD. The Direct Medical Costs of Healthcare-Associated Infections in U.S. Hospitals and the Benefits of Prevention. March 2009. Available at: *http://www.cdc.gov/ncidod/dhqp/pdf/Scott_CostPaper.pdf*.

[138] Klevens RM, Edwards JR, Richards CL, Horan TC, Gaynes RP, Pollock DA, Cardo DM. Estimating healthcare-associated infection and deaths in U.S. hospitals, 2002. Public Health Reports 2007: 122:160–166. Available at *http://www.cdc.gov/ncidod/dhqp/pdf/hicpac/infections_deaths.pdf*.

a non-removable dressing can be coded as ''unstageable'' on the LTCH CARE Data Set(s).

Response: We appreciate this feedback related to the assessment and coding of unstageable pressure ulcers in the LTCH setting. The LTCH CARE Data Set includes data elements to allow LTCHs to record, at admission and discharge, the presence of pressure ulcers that are unstageable due to a medical device, a cast or non-removable dressing, or the presence of non-viable tissue such as slough or eschar. The instructions for the coding of pressure ulcers that are unstageable can be found in the draft LTCHQR Program Manual located at the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html*. For additional information related to this measure, including definitions related to worsening, unstageable and the staging of the pressure ulcers, as well as topics such as the inability to stage pressure ulcers with eschar or slough, we refer readers to the draft LTCHQR Program Manual located at the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html*.

Further, as noted in the FY 2012 IPPS/LTCH PPS final rule, unstageable wounds include deep tissue injuries and pressure ulcers covered by non-removable dressings, or non-viable tissue such as slough or eschar. These are not currently included in this NQF-endorsed measure since unstageable wounds cannot be measured, and therefore the presence of worsening cannot be determined. For example, a pressure ulcer that presents with slough or eschar cannot be staged, and is not considered worsened. Only after, and if, debridement occurs, and the dead tissue is removed, can such a wound be properly staged. If after wound debridement, the wound is staged and subsequently evaluated to have increased in the stage, the wound is considered worsened. However, such a wound may not be considered worsened if the stage remains unchanged after debridement and staging.

After consideration of the public comments we received, we are retaining an application to the LTCH setting of the Pressure Ulcer measure for the FY 2015 payment determination and subsequent fiscal year payment determinations. Further, we are finalizing the adoption of the updated NQF endorsed CAUTI (*http://www.qualityforum.org/QPS/0138*) and CLABSI (*http://www.qualityforum.org/QPS/0139*) measures for the FY 2014 payment determination and subsequent fiscal year payment determinations.

Set out below are the quality measures for the FY 2014, FY 2015, and subsequent fiscal year payment determinations.

QUALITY MEASURES FOR THE FY 2014, FY 2015 AND SUBSEQUENT FISCAL YEAR PAYMENT DETERMINATIONS

NQF #0138	National Health Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.
NQF #0139	National Health Safety Network (NHSN) Central line-associated Blood Stream Infection (CLABSI) Outcome Measure.
Application of NQF #0678	Percent of Residents with Pressure Ulcers That are New or Worsened (Short-Stay).

We proposed using the same data collection and submission methods finalized for these measures (CAUTI, CLABSI and Pressure Ulcer) in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51752 through 51756). We proposed that data collection for these measures, if they are adopted in the FY 2013 IPPS/LTCH PPS final rule, would remain the same for the FY 2014 payment determination and all subsequent fiscal year payment determinations.

For the proposed CAUTI measure and CLABSI measure, descriptions of the measures are available on the NQF Web site at: *http://www.qualityforum.org/QPS/0138* and *http://www.qualityforum.org/QPS/0139,* respectively. Further, the measure specifications, data collection and reporting requirements for CAUTI and CLABSI are available at *http://www.cdc.gov/nhsn/PDFs/pscManual/7pscCAUTIcurrent.pdf* and *http://www.cdc.gov/nhsn/PDFs/pscManual/4PSC_CLABScurrent.pdf*, respectively. Links to the CDC sites listed above are also provided in the LTCHQR Program Manual, which is available for download on the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.*

For the Pressure Ulcer measure, the data collection instrument is the Long-Term Care Hospital (LTCH) Continuity Assessment Record & Evaluation (CARE) Data Set available for download at *http://www.cms.gov/Regulations-and-Guidance/Legislation/PaperworkReductionActof1995/PRA-Listing-Items/CMS1252160.html.* Because there are no mandatory standardized data sets being used in LTCHs, we created a new data set, the LTCH CARE Data Set, for use in LTCHs for data reporting for the Pressure Ulcer measure beginning October 1, 2012. This data set incorporates data items contained in other, standardized and clinically established pressure ulcer data sets, including but not limited to the Minimum Data Set 3.0 (MDS 3.0) and CARE tool (Continuity Assessment Records & Evaluation). Beginning on October 1, 2012, we proposed that LTCHs will begin to use a data collection document entitled the ''LTCH CARE Data Set'' as the vehicle by which to collect and electronically submit the data for the Pressure Ulcer measure for the LTCHQR Program. This data set consists of the following components: (1) Pressure ulcer documentation; (2) selected covariates related to pressure ulcers; (3) patient demographic information; and (4) a provider attestation section.

Specific details related to the LTCH CARE Data Set(s) are available on our Web site for the LTCHQR Program at *http://www.cms.gov/LTCH-Quality-Reporting/*. The Technical Submission Specifications Final Version 1.00.3 for the electronic submission of the data set(s) is also available on the LTCH Quality Reporting Technical Information Web page *http://www.cms.gov/LTCH-Quality-Reporting/05_LTCHTechnicalInformation.asp#TopOfPage.*

Comment: Some commenters encouraged CMS to refrain from implementing the use of the LTCH CARE Data Set for the FY 2014 and FY 2015 data collection, citing LTCHs' concern that LTCHs have not been properly prepared, and might not be ready to submit the LTCH CARE Data Set, and that CMS will not be ready to receive this data.

Response: We appreciate the commenters' concerns related to the readiness of the LTCH CARE Data Set. However, we believe that the data set will be ready for use on October 1, 2012. Furthermore, we believe that we are able to receive this data beginning on October 1, 2012.

We note that, since September 2011, we have undertaken ongoing activities, with input from stakeholders such as LTCHs, technical experts, and measure developers to support LTCHQR Program implementation. Further, since we issued the FY 2012 IPPS/LTCH PPS final rule, we have undertaken several key implementation activities including: The development of the LTCH CARE Data Set; posting of public notice for its use (September 21, 2011); issuing a guidance document (January 31, 2012); issuing an updated guidance document (March 8, 2012); and the issuing of a draft LTCHQR Program Manual (April 27, 2012) which includes coding instructions, terms and definitions, and measure specifications for the Pressure Ulcer measure.

Further, we posted draft technical submission specifications for the LTCH CARE Data Set (October 28, 2011) and final technical submission specifications (posted on May 31, 2012). The guidance document, the draft LTCHQR Program manual, and data submission specifications as well as updates and announcements related to the LTCHQR Program are located and maintained on the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.* Further, through our measure development contractor RTI International, a technical expert panel was convened that was comprised of clinical experts in the care of LTCH patients that sought input on the implementation of pressure ulcer items through the LTCH CARE Data Set (March 8, 2012), as well as technical expert panels in January 2011 and July 2011. We also conducted a National Train-the-Trainer LTCH-focused training conference (May 1–2, 2012), held provider-focused special open door forums (December 16, 2010, September 21, 2011, and April 13, 2012) and software developer/vendor-focused open calls (November 16, 2011 and June 28, 2012) to support the implementation of the LTCHQR Program.

We also received OMB approval for the use of the LTCH CARE Data Set for collection of data for the Pressure Ulcer measure on April 24, 2012 in accordance with the Paperwork Reduction Act. The OMB Control Number is 0938–1163. We believe that these actions have prepared LTCHs to implement the LTCHQR Program; including using the LTCH CARE Data Set for data submission.

Comment: We received specific support from MedPAC stating that they were encouraged by our efforts to implement the LTCH CARE Data Set, applauding CMS' efforts to collect data in a uniform manner. MedPAC further stated that the CARE (Continuity Assessment Record and Evaluation) Tool, from which data elements used in the LTCH CARE Data Set are derived, performed reliably in LTCHs, Skilled Nursing Facilities, and Inpatient Rehabilitation Facilities, as did earlier testing efforts using other setting-specific instruments.

Several commenters expressed various concerns about the requirement to submit quality data using the LTCH CARE Data Set for the LTCHQR Program. While many commenters supported the development of a LTCH-specific tool, they disagreed that the LTCHQR Program was the appropriate mechanism for its development. A commenter noted that LTCHs are at the extreme end of the acute care spectrum and should not be included when discussing sub-acute care settings. This commenter believed that it would be more accurate to group LTCHs with general acute care hospitals than to group them in the same space with skilled nursing facilities or nursing homes. Other commenters expressed concerns that an assessment tool specifically for LTCHs would enable a better understanding of the medical complexity of patients treated in LTCHs. One commenter noted that the LTCH CARE Data Set is not NQF-endorsed for use as an LTCH quality measure.

Several commenters noted that requiring LTCHs to submit an assessment tool goes beyond what was required or intended in section 3004 of the Affordable Care Act. Several commenters were concerned that the LTCH CARE Data Set requirements were established in a subregulatory manner. Another commenter noted that the CARE Tool has only been used in a demonstration program and has not been tested or validated and several noted that it should incorporate input from stakeholders.

Response: We thank MedPAC for its support and recognition of the importance of uniform and standardized data collection methods. We interpret the commenter to mean that although LTCHs are a post-acute setting, they are more similar to acute care hospitals, and that LTCHs should not be included in discussions or comparisons to skilled nursing facilities or nursing homes, but rather be considered more within the acute care spectrum of care than within the post-acute realm. We further interpret this commenter to be suggesting that quality measures used in LTCHs should not be of the same measure construct as those used in the post-acute setting, and should not use the same data elements or data collection submission method, such as a method similar to the MDS 3.0. We note that for the purpose of LTCHQR Program, we acknowledge that LTCHs are a unique setting and while LTCHs share similarities to acute and post-acute settings, we do not intend to undertake comparisons of data for the Pressure Ulcer measure across post-acute or acute settings.

We acknowledge the commenters' concern regarding some of the data elements that are included on the LTCH CARE Data Set. In response to these concerns, we are clarifying that with respect to the pressure ulcer measure, LTCHs will only be required to complete a subset of the data elements from the LTCH CARE Data Set. These elements are: (1) A limited set of administrative items that are necessary in order to identify each LTCH and properly attribute patients to it for purposes of calculating the measure rate, (2) the data elements necessary to populate the pressure ulcer measure, consistent with application of the NQF-endorsed specifications for that measure to the LTCH setting, and (3) the data elements necessary to enable CMS to validate that the pressure ulcer measure data elements were accurately reported. All other data elements on the LTCH CARE Data Set can be completed on a voluntary basis by LTCHs and will have no impact on the measure calculations for the Pressure Ulcer measure or on our determination of whether the LTCH has met the reporting requirements under the LTCHQR Program. We will post on our Web site a detailed matrix that identifies which data elements will be required, and which will be voluntary, and this matrix will also be incorporated into the final LTCHQR Program Manual which will be posted on CMS LTCHQR Program Web site and available for download from *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.*

Comment: Several commenters expressed concern that the LTCH CARE Data Set was being implemented in its entirety for the LTCHQR Program and that items not required for calculation of the Pressure Ulcer measure were being collected unnecessarily. One commenter also noted that the data on the Pressure Ulcer measure could be collected without the LTCH CARE Data Set. One commenter noted that the only data elements needed to collect data on the Pressure Ulcer measure are hospital and patient identifying information, number of pressure ulcers (stage 2 or higher) at admission and discharge. One

commenter suggested that CMS refrain from collecting data elements required for covariate risk-adjustment until such risk adjustment is to be used to calculate LTCH performance.

Response: We thank the commenters for their input. As we note above, we are limiting the data elements that an LTCH must complete for purposes of reporting the Pressure Ulcer measure to those described above. We note that the covariate data elements, which enable the measure rate to reflect a risk adjustment, are part of the NQF-endorsed specifications for the measure and are also part of the specifications we have adopted for the application of this measure to the LTCH setting.

Comment: One commenter stated that CMS needs to put into place a number of additional policies before it can implement the LTCHQR Program. These policies include clear administrative requirements; contact information for a quality administrator; a clear and reliable data submission process; a preview period for quality reports prior to their being made public, an appeals and reconsideration process; a quality support infrastructure, a data validation methodology, and standards for the minimum number of cases needed to be reported per measure.

Response: We provide information specific to the data submission requirements, for example, administrative related requirements, in the LTCH CARE Data Submission Specifications Overview Document provided in the downloadable *Final LTCH CARE Data Submission Specifications (v1.00.3),* on the CMS Web Site *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCHTechnicalInformation.html,* and will be providing additional administrative requirements in mid August, 2012. In addition, we are working to provide final guidance related to program requirements in the LTCHQR Program Manual provided on the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.* Specific details related to NHSN HAI reporting and administrative-related requirements for the CAUTI measure and CLABSI measure can be found on the CDC Web site: *http://www.cdc.gov/nhsn.*

Comment: Several commenters urged CMS to propose use of the Quality Improvement and Evaluation System (QIES) Assessment Submission and Processing (ASAP) System as the submission mechanism through the regulatory process so that the public can be afforded a proper notice and comment period. One commenter was concerned with whether the QIES ASAP System has been pilot tested or validated and whether the burden of reporting into them has been explored.

Response: The QIES ASAP System is a secure, intranet-based data submission and data storage system that we have adopted for a variety of purposes at CMS, including the storage of data used for Home Health Compare and Nursing Home Compare. The QIES ASAP System permits information to be shared securely, quickly, and conveniently with providers. It has been successfully used by CMS for 15 years. As part of our implementation plan for the LTCHQR Program, we considered various options for data submission and storage.

We specifically selected the QIES ASAP System because it is already a successfully proven system that provides facilities with the ability to submit standardized patient-level data into the QIES National Repository. Examples of current use include Inpatient Rehabilitation Facilities (IRF) submission of the IRF Patient Assessment Instrument (IRF PAI) data; Home Health Agencies submission of the Outcome and Assessment Information Set (OASIS) data; and nursing facilities and swing beds submission of the Minimum Data Set (MDS) data. Therefore, we selected the QIES ASAP System to support the data submission of LTCHQR quality measures into the QIES national data base.

Selection of the QIES ASAP System for data submission and storage was publically announced on October 2011, in our LTCH CARE Data Set Data Submission Specifications Overview Document, found on the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCHTechnicalInformation.html.* Since October 2011, we have undertaken numerous efforts to educate stakeholders on the QIES ASAP System. These efforts include hosting LTCH software developer/vendor calls on November 2011 and June 28th, 2012. During these calls we provided details on the QIES ASAP System our data submission method. Similarly, we presented data submission information at the May 1, 2012 LTCH National Train-the-Trainer Conference as well as on our public vendor and software developer calls, and on the LTCH Special Open Door Forums. Since October 2011, through our training and use of email listservs to the LTCHs and their vendor community, we have invited participation on the vendor calls, using these calls to alert both LTCHs and their vendors of the data submission specifications and to request comments and questions related to the LTCH submission methods and specifications. Lastly, we posted a link to the CMS technical issues mail box on the CMS Web site which is: *LTCHTechIssues@cms.hhs.gov.*

Comment: Many commenters supported the use of the NHSN for reporting and believe it is capable of handling LTCHQR Program data collection. However, some commenters expressed concern at the ability of NHSN to handle LTCHQR Program data collection. These commenters encouraged CMS to work with CDC to determine NHSN's readiness to handle additional programs.

Response: The CDC has assured us that the NSHN system is adequate and will be able to handle the LTCHQR Program HAI data reporting. We also note that of the 450 LTCHs in the nation, over 300 are already enrolled and reporting into NHSN.

For detailed discussions of the history of the LTCHQR Program, including the statutory authority and further details on the three measures previously finalized for FY 2014 payment determination, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756). We have reproduced a portion of the data collection and submission timeline finalized for FY 2014 payment determination in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756) in the following table.

TIMELINE FOR SUBMISSION OF DATA FOR THE LTCHQR PROGRAM FOR THE FY 2014 PAYMENT DETERMINATION

Data collection timeframe: Calendar year (CY) 2012	Final submission deadline for data related to the LTCH Quality Reporting Program FY 2014 payment determination
Q4 (October 1–December 31, 2012).	May 15, 2013

We refer readers to section VIII.D.5. of the preamble to this final rule for the timeline for data submission under the LTCHQR Program for the FY 2015 payment determination.

Comment: Many commenters expressed concern that key components of the LTCHQR Program were not yet in place, yet data collection is to begin on October 1. Several commenters urged CMS to delay submission of the LTCH CARE Data Set. Commenters noted that CMS did not include details on the

LTCH CARE Data Set in previous rules. These commenters also noted that the data set was not released until April 27, 2012 and the May 1 Provider Training was the first formal opportunity the details of the LTCHQR Program were communicated to the public. One commenter noted that, given the continuing revisions to the LTCH CARE Data Set, the LTCH community will have insufficient time to prepare and train. Another commenter suggested that LTCHs be granted a 90-day deferral for reporting admissions and discharges between October 1 and December 31, 2012 (with submissions via NHSN continuing as finalized).

Response: We thank the commenters for their input and recommendations. As we explain in our response to previous comments, we believe that we have made substantial and ongoing efforts to educate LTCHs on the data submission process and the data elements in advance of the October 1, 2012 data submission start date. Although we have made some changes to the LTCH CARE Data Set since we first made information about it publicly available, we advised stakeholders of the changes and do not consider them to be significant in nature. In addition to the training provided on May 1–2, 2012, we have also engaged in informative and educational communication with LTCHs and stakeholders on reporting mechanisms and submission timeframes through open door forums, and vendor/software developer calls, since September, 2011.

We disagree that we provided insufficient notice to the public regarding the LTCH CARE Data Set. Such information was provided during open door forums, vendor calls, and publically posted on the CMS Web site for LTCHs dating back to October 2011. Further, the Data Set was posted for public comments under the Paperwork Reduction Act in the September 2, 2011 **Federal Register** (76 FR 54776) *http://www.cms.gov/Regulations-and-Guidance/Legislation/PaperworkReductionActof1995/PRA-Listing-Items/CMS1252160.html,* file number CMS–10409). From comments received at the live National Train-the-Trainer conference, we are working to integrate additional language, coding clarification, and corrections that attendees provided. We intend to issue these changes in early August 2012.

Comment: Many commenters requested that CMS release the free, downloadable LTCH Assessment Submission Entry & Reporting (LASER) software no later than August 1, 2012 so that LTCHs can have at least two months to implement and practice using the software and CMS' consultant can have time to correct any problems with the system.

Response: LASER software is a free, Java-based application that provides an option for facilities to collect and maintain their LTCH CARE Data Set for subsequent submission to the QIES ASAP System. We will release a demonstration-version of LASER in middle of August to provide LTCHs the opportunity to familiarize themselves with the LASER software and the features of the tool. This demonstration version of the software tool will give LTCHs sufficient time to practice using the software before data submission begins on October 1, 2012. We will also offer training on the LASER software in August and will release the production version of LASER on the QIES Technical Support Office Web site by end of August.

We interpret the reference to ''CMS' consultant'' as meaning the CMS contractor who will be responsible for supporting LASER. The LASER software is currently undergoing multi-level and quality assurance testing to identify issues, which we anticipate will reduce the risk of data submission problems.

We do not believe that we should move up the LASER release dates as some commenters suggested. The LASER software is currently undergoing critical and rigorous testing by quality assurance (QA) staff. It is vital that the QA testing of the actual production version of the software tool continue up until the end of August to ensure there are no defects in the final version. In addition, we released the Validation Utility Tool (VUT) to allow LTCHs and their vendors to test their software to ensure it meets our minimum requirements for successful completion and submission of a LTCH CARE Data Set record. For information related to LASER and the LTCH CARE Data Set Data Submission Specifications, please use the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCHTechnicalInformation.html.*

Comment: Several commenters noted that CMS never finalized the FY 2014 data collection timeline for the Pressure Ulcer measure. The commenters believed that CMS only finalized the data collection period for the CAUTI and CLABSI measures.

Response: We believe that we finalized the FY 2014 data collection period for the Pressure Ulcer measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51756). We specified that ''we were adopting as final the proposed timeline for data submission for the New or Worsened Pressure Ulcers measure and in accordance with the timetable and schedule set forth in section VII.C.4.b. of the preamble, with data collection to begin October 1, 2012, for the FY 2014 payment determination.'' In section VII.C.4.b we specified that the HAI measure submission timeframe would be October 1, 2012 through December 31, 2012 events for the FY 2014 payment determination, and that LTCHs would have to submit their data no later than May 15, 2013.

We also included the FY 2014 data submission timetable for the Pressure Ulcer measure in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28094), and we believe that the public has been given ample opportunity to comment on it. Therefore, for FY 2014 payment determination, the data submission timeframe for the three quality measures (CAUTI, CLABSI and the Pressure Ulcer measure) will begin October 1, 2012 and reporting will include quality data from October 1, 2012 through December 31, 2012. LTCHs will have until May 15, 2013 to submit the data.

Comment: One commenter expressed concern about the timeframes for completing and submitting the LTCH CARE Data Set. The commenter also noted that there are several instances of conflicting directions for its completion as outlined in the draft LTCHQR Program Manual and provided specific examples regarding conflicting directions. The commenter noted that the industry was concerned about a potential conflict between the 3-day rule for the CARE tool and other reporting timeframes. The commenter further noted that the submission time will not impact patient safety and that the data entered into LTCH CARE Data Set and NHSN will not be completely accurate since neither is risk adjusted.

Response: We thank the commenter for providing feedback on the draft LTCHQR Program Manual and for making recommendations to improve the clarity of our guidance for completing the LTCH CARE Data Set pertaining to assessment of patient's ''usual status,'' assessment time frame for admission assessment, and relevant approaches to completing each item. In addition, we have invited the public to submit questions and comments related to the LTCHQR Program and the draft LTCHQR Program Manual to the email address for the LTCHQR Program at *LTCHQualityQuestions@cms.hhs.gov*.

As a result of this commenter's feedback we agree that we have given conflicting information, specifically regarding conflicting guidance given in Chapter 2 of the draft LTCHQR Program

Manual. In light of this and additional comments from the public sent to our LTCH help desk, we have revised relevant language in Chapter 2 of the draft LTCHQR Program Manual to provide further clarification to LTCH providers on the completion of the LTCH CARE Data Set. Specifically, we have clarified language pertaining to assessment of patient's ''usual status'', assessment time frame for admission assessment, and relevant approaches to completing each item on the LTCH CARE Data Set.

Further, we have clarified language pertaining to other aspects of the draft LTCHQR Program Manual, specifically about the type of staff required to complete the LTCH CARE Data Set and timing of data submission requirements for the LTCH CARE Data Set for the FY 2014 payment update determination. CMS will be posting this revised manual for download at the CMS Web site: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCHTechnicalInformation.html*. We continue to welcome comments from the public and appreciate the need for clarity and communication with providers to ensure successful implementation of LTCHQR Program. Hence, we are continuing to provide additional clarification and guidance through our Web site, open door forums, and training material postings. Information related to these free resources is provided on the CMS LTCHQR Program Web site.

We disagree that the current time frame and guidance will result in inaccurate and inconsistent data being entered into the database. We further disagree that whether or not data is submitted within these timeframes, it will have no impact on patient safety. In the draft LTCHQR Program Manual, we encourage all providers to follow CDC recommendations related to the submission of HAI related data. Although an absolute end date of May 15th for the submission of HAI data is given, the purpose of that ultimate deadline is to allow LTCH facilities time to submit any corrections or missing data. Further, data collection approach and timeframes were set in line with the NQF-endorsed CAUTI measure, CLABSI measure and Pressure Ulcer measure. In our FY 2012 IPPS/LTCH PPS final rule, we stated that reporting for CAUTI measure and CLABSI measure should be in accordance with the CDC guidelines and reporting should occur as close to the time of the event as possible.

We also disagree with the commenter's suggestion that these measures are not risk adjusted. The HAI measures are risk adjusted and use the SIR rather than a rate. This is the preferred form of risk adjustment, will include stratification at the unit-level for the CAUTI measure and CLABSI measure and reflect the NQF-endorsed CAUTI measure and CLABSI measure specifications. The NQF-endorsed Pressure Ulcer measure includes risk adjustment for factors such as body mass index, presence of diabetes mellitus, presence of peripheral vascular disease/peripheral arterial disease, bowel incontinence, and mobility.

After consideration of the public comments we received, we are finalizing the use of the data collection and submission methods finalized for the CAUTI, CLABSI and Pressure Ulcer measures for the LTCHQR Program.

4. LTCHQR Program Quality Measures for the FY 2016 Payment Determinations and Subsequent Fiscal Years Payment Determinations

a. Considerations in Updating and Expanding Quality Measures Under the LTCHQR Program for FY 2016 and Subsequent Payment Update Determinations

We believe that development of a LTCHQR Program that is successful in promoting the delivery of high quality healthcare services in LTCHs is paramount. We seek to adopt measures for the LTCHQR Program that promote better, safer, and more efficient care. Our measure development and selection activities for the LTCHQR Program take into account national priorities, such as those established by the National Priorities Partnership (*http://www.nationalprioritiespartnership.org/*), HHS Strategic Plan (*http://www.hhs.gov/secretary/about/priorities/priorities.html*), and the National Strategy for Quality Improvement in Healthcare (*http://www.healthcare.gov/center/reports/quality03212011a.html*). To the extent practicable, we have sought to adopt measures that have been endorsed by a national consensus organization, recommended by multi-stakeholder organizations, and developed with the input of providers, purchasers/payers, and other stakeholders.

In addition, we consider input from the multi-stakeholder group, the Measures Application Partnership (MAP) (*http://www.qualityforum.org/Setting_Priorities/Partnership/Measure_Applications_Partnership.aspx*), in selecting measures for the LTCHQR Program. Section 1890A(a)(1) of the Act, as added by section 3014(a) of the Affordable Care Act, requires the entity with a contract under section 1890(a) of the Act, currently the NQF, to convene multistakeholder groups to provide input to the Secretary on the selection of quality and efficiency measures. Under section 1890A(a)(2) of the Act, as added by section 3014(b) of the Affordable Care Act, the Secretary must make available to the public a list of quality and efficiency measures described in section 1890(b)(7)(B) that the Secretary is considering under title XVIII of the Act. Section 1890A(a)(3) of the Act further requires the entity with a contract under section 1890(a) of the Act to transmit the input of the multistakeholder groups to the Secretary not later than February 1 of each year, beginning in 2012. Section 1890A(a)(4) of the Act requires the Secretary to take into consideration the input of the multistakeholder groups in selecting quality and efficiency measures. The MAP is the public-private partnership comprised of multi-stakeholder groups convened by the NQF for the primary purpose of providing input on measures as required by section 1890A(a)(3) of the Act. The MAP's input on quality and efficiency measures was transmitted to the Secretary and is available at (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=69885*). As required by section 1890A(a)(4) of the Act, we considered the MAP's recommendations in selecting quality and efficiency measures for the LTCHQR Program.

Comment: Several commenters noted that CMS should, in its selection of measures, more closely align with the recommendations of MAP. Some commenters noted that the MAP did not recommend any of the measures proposed for the FY 2016 LTCHQR Program, but rather, ''supported the direction'' of these measures.

Response: While submission of measures to the MAP and consideration of their recommendations are part of our measure selection process, we also consider the input of stakeholders, subject matter and industry experts through the technical expert panels periodically convened by our measure development contractor, as well as national healthcare priorities suggested by groups such as MedPAC, and as set forth in the National Quality Strategy.

Comment: Several commenters encouraged CMS to seek input on measures from stakeholders such as LTCH associations as well as technical expert panels.

Response: Throughout the measure selection process, we have sought input from a variety of stakeholders, including technical experts, stakeholders, and LTCHs. A CMS Listening Session was

held on November 15, 2010, Special Open Door Forums were held on December 16, 2010, September 21, 2011 and April 13, 2012; and our measure developer contractor convened LTCHQR technical expert panels on January 31, July 6, September 27, December 13 2011, and March 8, 2012. We will continue to solicit input from stakeholders throughout the development and expansion of the LTCHQR Program.

Comment: One commenter suggested that CMS consider the MAP recommendations to pursue measures of Experience of Care, Care Planning, Patient/Family/Caregiver Goals, and Avoiding Unnecessary Hospital and ED Admissions.

Response: We will continue to work with the MAP as well as LTCH stakeholders to identify measure concepts and measures that address HHS priorities, align with quality initiatives in other settings, are evidence-based, have a low probability of unintended adverse consequences, and may drive quality improvement.

Comment: Several commenters encouraged CMS to adopt only measures that are NQF-endorsed for the LTCH setting. One commenter noted that the NQF needs to add an LTCH provider to its panel. Several commenters expressed uncertainty as to whether the expansion of existing measures to the LTCH setting would be a good approach to creating LTCH measures, and one commenter encouraged CMS to adopt only measures that have been specified and tested in the LTCH setting.

Response: We have generally adopted NQF-endorsed measures whenever possible. However, where such measures do not exist, we may adopt measures that are not NQF-endorsed under the Secretary's exception authority set out in section 1886(m)(5)(D)(ii) of the Act. We have, where possible, actively worked with the NQF to expand endorsement of measures to LTCH setting, and the NQF has expanded its endorsement of the CAUTI and CLABSI measures to LTCHs. We believe that the NQF endorsement process is public and transparent and would encourage LTCHs and stakeholders to participate in that process. Furthermore, we are also working to develop measures on readmissions and functional status that are specific to the LTCH setting and will be seeking NQF endorsement for these measures.

b. New LTCHQR Program Quality Measures Beginning With the FY 2016 Payment Determination

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28094), for the FY 2016 payment determination and subsequent fiscal year payment determinations, we proposed to adopt five additional quality measures for the LTCHQR Program in addition to the three previously discussed measures (CAUTI measure, CLABSI measure and Pressure Ulcer measure), see table below. Our proposal to add these five measures is part of our effort to promote overarching health care aims and goals in an effective and meaningful manner. We also seek to minimize the burden of data collection for LTCHs.

We indicated that we would respond to public comments on this proposal in this final rule.

PROPOSED NEW QUALITY MEASURES FOR THE FY 2016 LTCHQR PROGRAM PAYMENT DETERMINATION AND SUBSEQUENT PAYMENT DETERMINATIONS

NQF Measure ID	Measure title
Application of NQF #0680	Percent of Nursing Home Residents Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay).
NQF #0682	Percent of Residents Who Were Assessed and Appropriately Given the Pneumococcal Vaccine (Short-Stay).
NQF #0431	Influenza Vaccination Coverage among Healthcare Personnel.
Application of NQF #0302	Ventilator Bundle.
Not NQF endorsed	Restraint Rate per 1,000 Patient Days.

(1) New Quality Measure #1 for the FY 2016 Payment Determination and Subsequent Fiscal Years Payment Determinations: Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay) (NQF #0680)

According to the CDC, as of 2011, there is on average over 200,000 hospitalizations due to influenza every year.[139] The Agency for Healthcare Research and Quality (AHRQ) reports that in 2004, there were more than 37,000 hospitalizations in which influenza was noted during the stay. For over 21,000 of these hospitalizations, influenza was listed as the primary diagnosis. The aggregate hospital costs for these roughly 21,000 hospitalizations were estimated at $146 million.[140]

Although influenza is prevalent among all population groups, the rates of death and serious complications related to influenza are highest among those ages 65 and older and those with medical complications that put them at higher risk. The CDC reports that an average of 36,000 Americans die annually from influenza and its complications, and most of these deaths are among people 65 years of age and over.[141] In 2004, 70,000 deaths were caused by influenza and pneumonia, and more than 85 percent of these were among the elderly.[142] Given that many individuals receiving health care services in LTCHs are elderly and/or have several medical conditions, many LTCH patients are within the target population for the influenza vaccination.[143,144] Healthy People 2010 (Objective 14–29) and Healthy People 2020 (Objective IID–12.8) each set a goal of 90 percent of adults vaccinated against influenza in long-term care

[144] Zorowitz, RD. Stroke Rehabilitation Quality Indicators: Raising the Bar in the Inpatient Rehabilitation Facility. Topics in Stroke Rehabilitation 2010; 17 (4):294–304.

facilities.[145,146] However, among adults age 65 years and older, only 72.1 percent were vaccinated during the 2006–2007 influenza season and only 69.6 percent of adults age 65 years and older were vaccinated during the 2009–2010 influenza season.[147,148] According to information currently available on the *Nursing Home Compare* Web site (*http://www.medicare.gov/NHCompare*), the national average for the percentage of short-stay residents given the influenza vaccine is roughly 82 percent.[149] No comparable information is currently available on patients in the LTCH setting.

In light of the evidence outlined previously, particularly that many individuals receiving care in the LTCH setting are within the target population for influenza vaccination, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28095), we proposed NQF #0680, Percent of Nursing Home Residents Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay), for application in the LTCHQR Program for the FY 2016 payment determination and subsequent fiscal year payment determinations. We noted that at the time of our proposed rule this measure was endorsed for short-stay nursing home residents, but believed this measure was highly relevant for the LTCH setting because, as stated above, many patients receiving care in the LTCH setting are elderly and within the target population for influenza vaccination. The MAP supports the direction of this measure and believes it is an important aspect of care in LTCHs.[150]

Section 1886(m)(5)(D)(ii) of the Act, the exception authority provides that ''in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.'' We reviewed NQF's consensus endorsed measures and were unable to identify any NQF-endorsed measures for influenza vaccination in the LTCH setting. We are unaware of any other measures for influenza vaccination in the LTCH setting that have been approved by a voluntary consensus standards body and endorsed by NQF. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28096), we proposed adopting the NQF-endorsed measure the Percent of Nursing Home Residents Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay) (NQF #0680) for application in the LTCH setting for the LTCHQR Program under the Secretary's authority to select non-NQF measures. This proposal was also consistent with the 2008 NQF steering committee recommendation that ''in the interest of standardization and minimizing the burden for those implementing and using measures, measure harmonization is an important consideration in evaluating and recommending measures for endorsement'' [151] Data on this measure as it applies to nursing home residents are currently collected and reported as part of the Nursing Home Quality Initiative.

We proposed that data for this measure be collected using the same data collection and submission framework that we finalized for the FY 2014 payment determination.[152] We intend to revise the LTCH CARE data set to include new items which assess patient's influenza vaccination status should this proposed measure be adopted. These items will be based on the items from the MDS 3.0 items.[153] Further, the draft LTCHQR Program Manual will be updated with specifications and data elements once this measure is finalized. At the current time, we refer readers to the MDS 3.0 QM User's Manual available on our Web site at: *https://www.cms.gov/NursingHomeQualityInits/Downloads/MDS30QM-Manual.pdf* [154] for technical specifications and data elements for this measure as it is currently implemented in the nursing home setting until we provide guidance for LTCHs in the LTCHQR Program Manual.

By building on the existing reporting and submission infrastructure for LTCHs, such as the LTCH CARE Data Set, which will be used for data collection beginning October 1, 2012, we intend to reduce the administrative burden related to data collection and submission for this measure under the LTCHQR Program. We proposed that the data collection would cover the period from October 1 through March 31 of each year, which corresponds with how NQF specifies this measure as well as other endorsed influenza vaccination measures. We refer readers to section VIII.D.6. of this preamble to this final rule for more information on data collection and submission.

We invited public comment on this proposed measure for the FY 2016 payment determination and subsequent FYs payment determinations.

Comment: Several commenters expressed support for the expansion of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-stay) to the LTCHQR Program. Commenters noted that LTCH patients are often part of the elderly and/or vulnerable population, in which influenza disease is especially prevalent, and that the measure, which was originally developed for the nursing home setting, would be relevant to the LTCH population and would ensure appropriate vaccination practice amongst these vulnerable patients. Commenters encouraged CMS to move forward with recommendations to the

MAP and development of specifications and testing for use of the measure in LTCHs.

Response: We appreciate the commenters' support for our proposal to include the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-Stay) in the LTCHQR Program. We agree that influenza is a serious concern amongst the elderly and vulnerable LTCH patients and that appropriate vaccination is important in this population. The MAP supported the direction of this measure for use in the LTCH setting.[155]

In addition, we applied to the NQF for expansion of this measure to the LTCH setting and the expansion was approved by the NQF Consensus Standards Approval Committee (CSAC) on April 9, 2012 and ratified by the NQF Board of Directors on May 2, 2012. Therefore, this measure is now NQF-endorsed for use in the LTCH setting. At the time of NQF endorsement, the title was changed to reflect that the measure now applies to other settings, including the LTCH setting. The title of the measure is now Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-Stay). An updated description of the measure is available on the NQF Web site at: *http://www.qualityforum.org/QPS/0680*.

Comment: Several commenters expressed concern that the introduction of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-stay) to the LTCHQR Program is redundant, given its inclusion in the Hospital IQR Program. Commenters remarked that approximately 83 percent of LTCH discharges had a preceding stay at an inpatient facility and are likely to have been vaccinated in the inpatient facility. Commenters believed that inclusion of this measure in both quality reporting programs would result in wasted resources and inefficiencies. Commenters also expressed concern that the inclusion of the measure in both quality reporting programs could result in multiple vaccinations of the same patient, leading to patient safety concerns.

Response: We appreciate the comments and acknowledge the commenters' concern for redundancy and over-vaccination. The specifications of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-stay) are written to ensure that patients are not double counted, resources are not wasted and patients are only given one vaccine per influenza season. Because the numerator statement of the measure includes patients who received the influenza vaccine during the most recent hospital stay (either inside or outside the facility/hospital), LTCHs can report that a patient received the vaccine at another facility prior to arriving at the LTCH and is not pressured to re-vaccinate the patient for purposes of being able to properly report the measure. The measure is designed to act as a safe guard for patients who did not receive a vaccine in another setting. We acknowledge that facilities will need to adhere to the principles of proper care coordination, and documentation to avoid over-immunization, as well as under-immunization. However, the specifications of the measure are designed to encourage facilities to only vaccinate when the patient has not already received the vaccination in another setting.

Comment: A few commenters believed that this measure was not appropriate for patients in the LTCH setting, due to the severity of illness of the patients in the LTCH setting. Commenters recommended further testing to determine the risk of complications from the vaccine and the appropriateness of the measure in this setting.

Response: We appreciate the comment and agree that patients in LTCHs are especially vulnerable. However, because these populations are older and more vulnerable they have higher rates of death and complications due to influenza and are in greater need of protection. CDC reports that pneumonia and influenza were the fifth leading cause of death amongst individuals ≥65 years and that between 1997 and 2007 deaths among people aged ≥65 years accounted for 87.9 percent of deaths related to pneumonia and influenza.

Due to their increased vulnerability, these patients, as the commenters suggest, are also at increased risk for complications from the vaccination. For this reason, the specifications for this measure were developed in accordance with current guidelines issued by the CDC Advisory Committee on Immunization Practices (ACIP) available at *http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6033a3.htm*. By taking into account the ACIP guidelines, the measure is designed to balance the risk of complications with the susceptibility to and mortality from influenza in this high risk population.

In addition, our measure development contractor convened a LTCH technical expert panel and introduced the Percentage of Nursing Home Residents Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-stay) (NQF #0680) measure for discussion. Our measure development contractor advised us that the panel identified appropriate preventative vaccination as an important concept and good practice in LTCHs. Finally, as noted above, this measure was recently NQF-endorsed for the LTCH setting.

Comment: Several commenters requested clarifications of and changes to the specifications of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (short-stay) quality measure. Commenters specifically asked for clarification of the definition of ''appropriately given'' as mentioned in the title of the measure. Commenters also expressed concern that the measure does not allow providers to utilize clinical judgment and withhold the vaccine from patients with contraindications. Some commenters believed that LTCHs should not be penalized if a patient refuses the vaccine. Finally, several commenters requested that CMS change the name of the measure to reflect that it is to be used in the LTCH setting (in addition to the SNF setting).

Response: We appreciate the comments and the suggestions for further clarification. As we noted above, the title of this measure changed when the NQF expanded its endorsement to other settings, including the LTCH setting.

This measure is designed to encourage providers to assess vaccination status and when medically appropriate, vaccinate the patient. The term ''appropriately given'' as used in the measure specifications indicates that the vaccination should be given in accordance with the ACIP guidelines and LTCHs are directed to the guidelines in the specifications.

The measure specifications are written to account for cases when the patient refuses the vaccine or when the medical provider documents that the vaccine was not given due to a contraindication. The numerator of the measure includes: those who received the influenza vaccine during the most recent influenza vaccine season, either in the facility/hospital or outside the facility/hospital; those who were offered but declined the influenza vaccine; or those who were ineligible due to

[155] National Quality Forum (2012) Input on Measures for Consideration by HHS for 2012 Rulemaking. Available; *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=69885*. pp. 105; Accessed February 03, 2012.

contraindication(s) (for example, previous severe allergic reaction to influenza vaccine, history of Guillain-Barré Syndrome within 6 weeks after a previous influenza vaccination, or bone marrow transplant within the past 6 months).

Comment: Several commenters were concerned about obtaining documentation for patients who received the vaccine outside of the LTCH. One commenter remarked that an LTCH should not be penalized if it cannot obtain records from outside facilities reflecting whether and/or when a patient received the influenza vaccine, as long as it has made a reasonable effort to do so. Another commenter requested that CMS adopt a regulation which requires other types of facilities (such as acute care hospitals and SNFs) to document in the patient's chart whether an influenza vaccine has been administered and the date of the vaccine and that this documentation be contained in the transfer form.

Response: We refer commenters to the description of the NQF-endorsed measure of at the NQF Web site *http://www.qualityforum.org/QPS/0680*. Further, we refer commenters to the technical specifications for this measure as currently implemented for the nursing home setting and are available in the MDS 3.0 QM User's Manual on our Web site at: *https://www.cms.gov/NursingHomeQualityInits/Downloads/MDS30QM–Manual.pdf*.[156]

Further, to the extent that the commenters are asking us to issue guidance on proper vaccine documentation for purposes of ensuring that the receiving facility has an accurate immunization history, we agree that care-coordination is essential to avoid over- as well as under-immunization. The influenza vaccination measure, however, was not designed to offer guidance to providers on how to vaccinate. The measure is specified to assess if the patient was vaccinated, where the patient was vaccinated (if they were vaccinated), or why the vaccination was not given (if the patient was not vaccinated). Patients who were not vaccinated due to a contraindication and patients who refused the vaccination are both counted as numerator hits and are accounted for separately in the numerator of the measure.

To that end, and in response to the comment that ''an LTCH should not be penalized if it cannot obtain records from outside facilities,'' LTCHs will not be held accountable for their inability to obtain a patient's current vaccination status. In a situation where the vaccination status is unknown, we would expect that the LTCH provider would make a clinical judgment whether or not to vaccinate a patient taking into account the patient's medical history and current health status, as well as the policy of their LTCH surrounding vaccination. The LTCH must only report the decision that is made, that is, whether the vaccination was or was not given. The measure does not require an LTCH to provide a vaccination that was not appropriate due to a contraindication or a patient refusal, or to provide a vaccination to a patient who was already given a vaccination outside of the LTCH. We encourage all LTCHs to vaccinate according to their facilities policies and the best clinical judgment of the medical providers treating each individual patient and to document the reason for the vaccination decision.

Comment: One commenter suggested that this measure could be better addressed through a change in Medicare CoP. Further, the commenter noted that CMS can require minimum thresholds for organizational compliance with the measure and the measure is better for CoPs rather than as quality measure.

Response: We thank this commenter and will take into consideration this input during our work on the Medicare CoP. However, at this time, we note that in light of the evidence outlined previously and in the FY 2013 IPPS/LTCH PPS proposed rule, particularly that many individuals receiving care in the LTCH setting are elderly and within the target population for influenza vaccination, we continue to believe the measure is highly relevant for the LTCH setting and appropriate to include in the LTCHQR Program. Further, the MAP supports the direction of this measure and believes it is an important aspect of care in LTCHs.[157]

After consideration of the public comments we received, and in light of the recent NQF endorsement approval for the expansion of this measure to the LTCH setting, we are finalizing the Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (NQF #680), which is endorsed and specified for the LTCH setting, for the FY 2016 payment determination and subsequent payment determinations.

(2) LTCH Quality Measure #2 for the FY 2016 Payment Determination and Subsequent Fiscal Years Payment Determinations: Percent of Residents Assessed and Appropriately Given the Pneumococcal Vaccine (Short-Stay) (NQF #0682)

According to the CDC, pneumococcal disease kills more people in the United States each year than all other vaccine-preventable diseases combined.[158] In 2006, all possible pneumonia diagnoses (including viral, bacterial, and unspecified organisms) killed 55,477 people in the United States and were responsible for 1,232,999 hospital discharges.[159]

Older people and those with chronic health conditions are at higher risk for pneumococcal disease. In 2011 there were more than 40,000 cases of invasive pneumococcal disease in the United States, and approximately one-third of these occurred among persons ages 65 years and older.[160] A 2011 MedPAC report found that pneumonia is among the top 20 most common Medicare Severity Long-Term Care Diagnosis-Related Groups (MS–LTC–DRG).[161] In 2005, Medicare paid an average of $6,342 per hospital discharge for pneumonia-related short-stay hospitalizations.[162] Death related to pneumonia also affects the elderly at a higher rate. In 2004, 70,000 deaths were caused by influenza and pneumonia, and more than 85 percent of these were amongst the elderly.[163]

Individuals in the LTCH setting are at especially high risk of contracting pneumonia as a complication of another

medical condition, such as stroke, previous or recent surgery, or ventilation—all of which are conditions for which patients may spend some of their recovery time in the LTCH.[164,165,166]

Healthy People 2010 (Objective 14–29f) and Healthy People 2020 (Objective IID–13.3) each set a goal of 90 percent of adults vaccinated against pneumococcal disease in long-term care facilities.[167,168] However, estimated pneumococcal vaccination coverage remains below 50 percent in recommended high-risk groups.[169] No comparable information is currently available on patients in the LTCH setting.

In light of the previously described data which we believe reflects the significant impact pneumonia has on Medicare beneficiaries in the LTCH setting, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28096), we proposed a quality measure on the pneumococcal vaccine. Specifically, we proposed the measure Percent of Residents Assessed and Appropriately Given the Pneumococcal Vaccine (Short-Stay) (NQF #0682) for application in the LTCHQR Program for the FY 2016 payment determination and subsequent fiscal year payment determinations. We recognized that at the time of our proposed rule, the NQF had endorsed this measure for short stay nursing home residents but we believed this measure was highly relevant to LTCHs as described previously. This measure reports the percentage of short-stay nursing home residents who were assessed and appropriately given the pneumococcal vaccine (PPV) during a 12-month reporting period. We proposed this measure because, as stated previously, patients in LTCHs are at high risk of contracting pneumonia as a complication of another medical condition. The MAP supports the direction of this measure and believes it is an important aspect of care in LTCHs.[170]

As indicated previously, section 1886(m)(5)(D)(ii) of the Act provides the Secretary with authority to adopt non-NQF-endorsed measures. We reviewed the NQF's consensus-endorsed measures and were unable to identify any NQF-endorsed measures for pneumococcal vaccination in the LTCH setting. We are unaware of any other measures for pneumococcal vaccination in the LTCH setting that have been approved by voluntary consensus standards bodies and endorsed by NQF. We proposed adopting an application of the Percent of Residents Assessed and Appropriately Given the Pneumococcal Vaccine (Short-Stay) (NQF #0682) for application in the LTCHQR Program. This application is also consistent with the 2008 NQF steering committee recommendation that ''in the interest of standardization and minimizing the burden for those implementing and using measures, measure harmonization is an important consideration in evaluating and recommending measures for endorsement.'' [171] Data for this measure as it applies to nursing home residents are currently collected and reported as part of the Nursing Home Quality Initiative.

A description of this measure's technical specifications and the data elements that are currently used for the Nursing Home Quality Initiative are available in the MDS 3.0 QM User's Manual available on our Web site at: *http://www.cms.gov/NursingHomeQualityInits/Downloads/MDS30QM-Manual.pdf*.[172]

We proposed that submission of data for this measure will be incorporated into the existing data collection and submission framework for LTCHs adopted for the FY 2014 payment determinations.[173] We intended to revise the LTCH CARE data set to include new items which assess patient's pneumococcal vaccination status should this proposed measure be adopted. These items will be based on the items from the Minimum Data Set (MDS) 3.0 items.[174]

By building on the existing LTCH reporting and submission infrastructure, such as the LTCH CARE data set, which will be used by LTCHs for data collection beginning October 1, 2012, we intend to reduce the administrative burden related to data collection and submission for this measure under the LTCHQR Program. We invited public comment on this proposed measure for the FY 2016 payment determination and subsequent fiscal years.

Comment: Several commenters expressed support for the expansion of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Pneumococcal Vaccine (short-Stay) to the LTCHQR Program. Commenters remarked that patients in LTCHs often come from elderly and/or vulnerable populations, in which pneumococcal disease is especially prevalent. As such, the measure, which was originally developed for the nursing home setting, would be relevant to the LTCH population and would ensure appropriate vaccination practice among these vulnerable patients. Commenters encouraged CMS to move forward with recommendations to the MAP and development of specifications and testing for use of the measure in LTCHs.

Response: We appreciate the commenters' support for our proposal to include the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Pneumococcal Vaccine (short-stay) in the LTCHQR Program. We agree that pneumococcal disease is a serious concern amongst the elderly and vulnerable patients in LTCHs and that appropriate vaccination is important in this population. As of May 2, 2012, the NQF expanded its endorsement of this measure to the LTCH setting and changed the title to Percent of Residents or Patients Who

Have Been Assessed and Appropriately Given the Pneumococcal Vaccine.

Comment: Several commenters expressed concern that the introduction of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Pneumococcal Vaccine (short-stay) to the LTCHQR Program was redundant, given its inclusion in the Hospital IQR Program. Commenters stated that approximately 83 percent of LTCH discharges had a preceding stay at an inpatient facility and are likely to have been vaccinated in the inpatient facility. Commenters believed that inclusion of this measure in both quality reporting programs would result in wasted resources and inefficiencies. Some commenters were concerned that the inclusion of this measure in both quality reporting programs could result in patients getting repeat vaccinations resulting in patient safety concerns. One commenter requested more information regarding the number of residents receiving more than one vaccination per season due to lack of documentation and if this will be further investigated in the future. One commenter suggested that CMS track patients' pneumococcal vaccination information across settings, so that multiple doses (which can be contraindicated, add an unnecessary cost to patients' care, and present potential health risks) can be avoided. The commenter noted that this is especially important for patients who require two doses of the vaccine.

Response: We appreciate the comments and acknowledge the commenters' concerns regarding redundancy and repeat vaccination. The specifications of the quality measure are designed to ensure that patients are not double counted, resources are not wasted and patients are only given vaccine according to CDC ACIP guidelines for adult and pediatric pneumococcal vaccination. Since the proposal of this measure for the LTCHQR Program, the CDC has advised CMS that the ACIP guidelines for adult and pediatric pneumococcal vaccination are currently being re-evaluated, and that the measure specifications might change as a result. For that reason, we are not finalizing this measure for the LTCHQR Program at this time. Once we receive further guidance from the CDC, we will consider whether to re-propose this measure and will take the commenters' concerns into account at that time.

Comment: A few commenters believed that this measure was not appropriate for patients in the LTCH setting. Commenters remarked that this measure is only NQF endorsed for the SNF setting and it is not appropriate to expand a measure to a new setting without appropriate testing and NQF endorsement.

Response: We appreciate the comment and agree that patients in LTCHs are not identical to SNF residents. This measure was recently NQF-endorsed for the LTCH setting. Because LTCH patients are often elderly and more vulnerable they have higher rates of death and complications due to pneumococcal disease. CDC reports that pneumonia and influenza were the fifth leading cause of death amongst individuals 65 years of age and older.[175] Patients in the LTCH setting are especially at high risk of contracting pneumonia as a complication of another medical condition, such as stroke, previous or recent surgery, or ventilation—all of which are conditions for which patients may spend some of their recovery time in the LTCH.[176,177,178] CDC reports that pneumonia is the third-most-frequent HAI among post-surgical patients, with a prevalence of 15 percent.[179] The specifications for this measure instruct providers to deliver the pneumococcal vaccine in accordance with CDC ACIP guidelines for adult and pediatric pneumococcal vaccination. We have recently learned from the CDC, however, that these guidelines are currently being re-evaluated and that the results of this evaluation could affect this measure. For this reason, we are not finalizing this measure for the LTCHQR Program at this time.

Comment: Several commenters requested clarifications of and changes to the specifications of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Pneumococcal (short-stay) quality measure. Commenters specifically asked for clarification of the definition of ''appropriately given'' and wanted information regarding whether the measure focused on assessment and education or on delivery of the vaccine. Commenters expressed that providers should be able to use medical judgment in delivering the vaccine and that facilities should not be penalized for withholding the vaccine from patients with contraindications. Some commenters believed that facilities should not be penalized if a patient refuses the vaccine. Finally, several commenters requested that we change the name of the measure to reflect the applicability to the LTCH setting.

Response: As we noted above, the CDC has advised that the ACIP guidelines for adult and pediatric pneumococcal vaccination are currently being re-evaluated, and that the measure specifications might change as a result. For that reason, we are not finalizing this measure for the LTCHQR Program at this time. Once we receive further guidance from the CDC, we will consider whether to re-propose this measure and will take the commenters' concerns into account at that time.

Comment: One commenter suggested that CMS take responsibility for tracking vaccinations and sharing this information across facilities. Several commenters were concerned about patients who received the vaccine outside of the facility, especially for those who require two doses of the vaccine. Other commenters expressed concerns related to exclusions and requested that patients for whom the vaccination was contraindicated or refused to be excluded. A few commenters remarked that LTCHs should not be penalized if they cannot obtain records from outside facilities or if patient or family cannot remember this information, as long as it has made a reasonable effort to obtain information. One commenter suggested that this measure could be better addressed through a change in Medicare CoP. Further, the commenter noted that CMS can require minimum thresholds for organizational compliance with the measure and the measure is better for CoPs rather than as quality measure.

Response: As we noted above, the CDC has advised that the ACIP guidelines for adult and pediatric pneumococcal vaccination are currently being re-evaluated, and that the measure specifications might change as a result. For that reason, we are not finalizing this measure for the LTCHQR Program at this time. Once we receive further guidance from the CDC, we will consider whether to repropose this measure and will take the commenters' concerns into account at that time.

Therefore, after consideration of the public comments we received, we are not adopting the proposed measure

Percent of Residents or Patients Assessed and Appropriately Given the Pneumococcal Vaccination for the LTCHQR Program at this time.

(3) LTCH Quality Measure #3 for the FY 2016 Payment Determination and Subsequent Fiscal Years Payment Determinations: Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431)

For the FY 2016 payment determination and subsequent fiscal years, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28097 through 28098), we proposed to adopt the CDC-developed Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431) that is currently collected by the CDC via the NHSN: Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431). This measure reports on the percentage of health care personnel who receive the influenza vaccination.

As previously noted, influenza virus infections are a major source of preventable mortality in the Medicare population. Between 1976 and 2007, influenza virus infections resulted in an average of 23,607 influenza-related deaths with a yearly range of 3,349 to 48,615 deaths, with approximately 90 percent of these deaths occurring among persons aged 65 or older.[180] Health care personnel are at risk for both acquiring influenza from patients and transmitting it to patients, and health care personnel often come to work when ill.[181] One early report of health care personnel influenza infections during the 2009 H1N1 influenza pandemic estimated 50 percent of infected health care personnel had contracted the influenza virus from patients or coworkers in the healthcare setting.[182]

The CDC ACIP guidelines recommend that all health care personnel get an influenza vaccine every year to protect themselves and patients.[183] Even though levels of influenza vaccination among health care personnel have slowly increased over the past 10 years, less than 50 percent of health care personnel each year received the influenza vaccination until the 2009–2010 season, when an estimated 62 percent of health care personnel got a seasonal influenza vaccination. In the 2010–2011 season, 63.5 percent of health care personnel reported influenza vaccination. Healthy People 2020 (Objective IID–12.9) set a goal of 90 percent for health care personnel influenza vaccination.[184] It is important to measure influenza vaccination of health care personnel every season to track progress toward this objective and to make sure that health care personnel and their patients are protected from influenza.[185]

Increased influenza vaccination coverage among health care personnel is expected to result in reduced morbidity and mortality related to influenza virus infection among patients, aligning with the National Quality Strategy's aims of better care and healthy people/communities. Further, the MAP supported the direction of this measure and believes it is an important aspect of care in LTCHs.[186]

In light of the previously described data which we believe reflects the significant impact influenza has on Medicare beneficiaries in the LTCH setting, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28097), we proposed adopting an influenza measure. Specifically, we proposed to adopt the CDC-developed Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431) measure for the FY 2016 payment determination and subsequent fiscal year payment determinations.

We also noted that this measure was undergoing NQF review as part of measure maintenance. As a result of this NQF review, the measure is NQF-endorsed and specified for use for all acute care hospital settings (which includes LTCHs). We proposed this measure because, as stated previously, it aligns with national initiatives. This measure has been finalized for reporting in the Hospital IQR Program and the ASCQR Program.

This measure reports on the percentage of health care personnel who receive the influenza vaccination. Health care personnel refers to all paid and unpaid persons working in health care settings, contractual staff not employed by the healthcare facility, and persons not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from health care personnel. This measure is applicable to LTCHs (we refer readers to the CDC/NHSN Manual, Healthcare Personnel Safety Component Protocol Module, Influenza Vaccination and Exposure Management Modules, which is available at the CDC Web site at: *http://www.cdc.gov/nhsn/PDFs/HSPmanual/HPS_Manual.pdf* for measure specifications and additional details).

We proposed that data collection for this measure would be through the CDC/NHSN (*http://www.cdc.gov/nhsn/*). It is a secure Internet based surveillance system maintained by the CDC, and can be utilized by all types of health care facilities in the United States, including LTCHs. NHSN collects data via a Web-based tool hosted by the CDC and available at: *http://www.cdc.nhsn.* For FY 2016 and subsequent fiscal year payment determinations, we proposed that the data collection would cover the period from October 1 through March 31 of each year, which corresponds with how NQF specifies this measure as well as other endorsed influenza vaccination measures.

CDC/NHSN is also the proposed data collection and submission framework for reporting on CAUTI and CLABSI measures for the FY 2015 payment determination.[187] Details related to the procedures for using the NHSN for data submission and information on definitions, numerator data, denominator data, data analyses, and measure specifications for the Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431) measure can be found at *http://www.cdc.gov/nhsn/hps_fluVacc.html*. By building on the CDC/NHSN reporting and submission infrastructure, we intend to reduce the administrative burden related to data collection and submission for this measure under the LTCHQR Program. For additional information on data collection and submission, we refer

readers to section VIII.D.6. of this preamble to this final rule.

We invited public comment on this proposed measure for the FY 2016 payment determination and subsequent fiscal years.

Comment: Many commenters fully supported the inclusion of the proposed measure in the LTCHQR Program, stating that the measure has been tested in multiple settings, and supported its extension to the LTCH setting. A commenter encouraged the development of an infrastructure to allow facilities to submit summarized data on HCP influenza rates to avoid submission of information unrelated to the measure. Another commenter encouraged CMS to develop the specifications and conduct testing for use in LTCHs.

Response: We appreciate the commenters' strong support for the use of this measure. CDC added aggregate reporting of healthcare personnel influenza vaccination coverage to NHSN. The measure is NQF-endorsed for use in acute care hospital settings including LTCHs.

Comment: One commenter expressed concern that this measure is not an indicator of the quality of care provided by LTCHs, and noted that LTCH patients do not expire due to health care-acquired influenza.

Response: We believe that healthcare personnel vaccination is relevant to the issue of patient safety. Healthcare personnel are at risk for both acquiring influenza from patients and exposing patients to influenza, and health care personnel often come to work when ill.[188] Further, influenza virus infection is common among healthcare personnel. One study suggested that nearly one-quarter of healthcare personnel were infected during influenza season, but few of these personnel recalled having influenza.[189] In the 2010–11 season, 63.5 percent of healthcare personnel reported influenza vaccination. Healthy People 2020 (Objective IID–12.9) set a goal of 90 percent for health care personnel influenza vaccination.[190] It is important to measure influenza vaccination of health care personnel every season to track progress toward this objective and to make sure that healthcare personnel and their patients are protected from influenza.[191]

Comment: One commenter expressed concern that a LTCH should not be penalized if a healthcare worker is offered, but declines, to receive the influenza vaccine and suggested that refusals be counted in the numerator.

Response: We thank the commenter for this comment. We acknowledge that there may be vaccination refusals. In addition to including healthcare personnel who received a vaccine (at the facility or documented elsewhere), personnel who did not receive the vaccine due to contraindications, and personnel with unknown vaccination status, the numerator statement of the measure includes healthcare personnel who ''declined influenza immunization.'' A description of the measure is available on the NQF Web site at: *http://www.qualityforum.org/QPS/0431.* Measure specifications are available for download under Candidate Consensus Standards Review: Immunizations: 0431—Influenza Vaccination Coverage Among Healthcare Personnel on the NQF Web site at: *http://www.qualityforum.org/Projects/n-r/Population_Health_Prevention/Population_Health__Prevention_Endorsement_Maintenance_-_Phase_1.aspx#t=2&s=&p=&e=1* and as part of the Final Report of NQF's Population Health—Prevention Endorsement Maintenance Phase 1 on the NQF Web site at: *http://www.qualityforum.org/Projects/n-r/Population_Health_Prevention/Population_Health__Prevention_Endorsement_Maintenance_-_Phase_1.aspx#t=1&s=&p=.*

Comment: One commenter suggested that, rather than through the LTCHQR Program, this measure could be better addressed through a change in Medicare CoPs. Further, the commenter noted that CMS can require minimum thresholds for organizational compliance with the measure and the measure is better for CoPs rather than as quality measure.

Response: We thank this commenter and will take into consideration this input during our work on the Medicare CoP. However, at this time, we note that in light of the evidence outlined previously and in the FY 2013 IPPS/LTCH PPS proposed rule, particularly that many individuals receiving care in the LTCH setting are elderly and within the target population for influenza vaccination, we continue to believe the measure is highly relevant for the LTCH setting and appropriate to include in the LTCHQR Program. Our use of this measure also aligns with the MAP's support of the direction of this measure and belief that it is an important aspect of care in LTCHs.

Further, as outlined previously and in the FY 2013 IPPS/LTCH PPS proposed rule, this measure has been finalized for reporting in the Hospital IQR Program and the Ambulatory Surgical Centers Quality Reporting Program. Hence, we assert that this measure is an important aspect of patient safety in all care settings including LTCHs as outlined previously and in the FY 2013 IPPS/LTCH PPS proposed rule.

After consideration of the public comments we received, we are finalizing the Influenza Vaccination Coverage among Healthcare Personnel measure as proposed (NQF #0431) for the FY 2016 payment determination and subsequent fiscal years.

(4) LTCH Quality Measure #4 for the FY 2016 Payment Determination and Subsequent Fiscal Years Payment Determinations: Ventilator Bundle (Application of NQF #0302)

In 2009, the most frequently occurring diagnosis in the LTCHs was MS–LTC–DRG 207 (Respiratory Diagnosis with Ventilator Support for 96 or more Hours).[192] Ventilator-Associated Pneumonia (VAP) is a costly, often deadly infection. A systematic review of VAP found: (1) Between 10 percent and 20 percent of patients receiving greater than 48 hours of ventilation will develop VAP; (2) ill patients who develop VAP are twice as likely to die as compared with similar patients without VAP; (3) patients with VAP have significantly longer lengths of stay; and (4) patients who have VAP incur over $10,000 in additional hospital costs.[193]

In light of the previously described data on VAP which we believe reflects the significant impact VAP has on Medicare beneficiaries, our measure development contractor introduced the VAP measure for discussion at a technical expert panel it convened on January 31, 2011. The TEP identified VAP as important for the LTCH setting due to the high percentage of patients

on ventilators. However, the panel noted concerns about measuring the rate of VAP due to lack of a consistent definition, concerns of inter-rater reliability, subjective interpretation of VAP, and variability in diagnosing VAP.

Our measure development contractor reviewed this concept again and introduced the Ventilator Bundle (NQF #0302) measure developed by Institute of Healthcare Improvement (IHI) for discussion to address some the concerns noted previously at a July 7, 2011 TEP meeting. This comprehensive ventilator care-bundle process measure is designed to facilitate protocols such as weaning, and mitigate ventilator-related infections, such as VAP. The NQF-endorsed ventilator bundle measure consists of four components: (1) Head of the bed elevation ≥30°; (2) daily sedation interruption and assessment of readiness to wean; (3) peptic ulcer disease (PUD) prophylaxis; and (4) deep vein thrombosis (DVT) prophylaxis. The measure steward, IHI, also recommends a fifth element be added to the ventilator bundle-process measure: daily oral care with Chlorhexidine (*http://www.ihi.org/offerings/MembershipsNetworks/MentorHospitalRegistry/Pages/VentilatorBundle.aspx*). A meta-analysis of oral decontamination found a statistically significant reduction in VAP with use of antiseptic oral decontamination, which supports such an addition.[194]

We recognize that the Ventilator Bundle (NQF #0302) measure is currently endorsed for ICU patients in the acute care hospital setting; however, we believe this measure is highly relevant for the LTCH setting because ventilator patients are a large segment of the LTCH patient population and a process measure to reduce VAP is important and relevant for the LTCH setting. In addition, the MAP supports the direction of this measure, and stated that it is an important aspect of care in LTCHs.[195] Further, we proposed this measure because it supports the National Quality Strategy by supporting better and safer care that prevents infection among patients at risk for VAP. For the above-described reasons, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28099), we proposed to adopt the Ventilator Bundle measure (NQF #0302) for application in the LTCH setting.

As indicated previously, section 1886(m)(5)(D)(ii) of the Act provides the Secretary with authority to adopt non-NQF-endorsed measures. We reviewed the NQF's consensus-endorsed measures and were unable to identify any NQF-endorsed measures for the ventilator bundle in the LTCH setting. We are unaware of any other measures for the ventilator bundle in the LTCH setting that have been approved by voluntary consensus standards bodies and endorsed by NQF. Therefore, under the authority of section 1886(m)(5)(D)(ii) of the Act, we proposed adopting the Ventilator Bundle (NQF #0302) measure for application in the FY 2016 LTCHQR Program payment determination and subsequent fiscal year payment determinations.

We further noted that this measure is undergoing endorsement maintenance review at the NQF under the Patient Safety Measures-Complications Project. (*http://www.qualityforum.org/Projects/n-r/Patient_Safety_Measures_Complications/Patient_Safety_Measures_Complications.aspx#t=2&s=&p=*).

We proposed that data collection and submission of this measure will be through the LTCH CARE Data Set. We intend to revise the LTCH CARE Data Set to include new items to evaluate LTCHs' compliance with each element of the ventilator bundle measure. These items will be based on the data elements of the ventilator bundle in use within hospitals implementing the ventilator bundle process measure (NQF #0302). A description of this measure, as it applies to the acute care setting, is available on the NQF Web site at: *http://www.qualityforum.org/QPS/0302.*

By building on the existing LTCH reporting and submission infrastructure, such as the LTCH CARE Data Set, which will be used by LTCHs for data collection beginning October 1, 2012, we intend to reduce the administrative burden related to data collection and submission for this measure under the LTCHQR Program.

We invited public comment on this proposed measure for the FY 2016 payment determination and subsequent fiscal years.

Comment: Many commenters supported use of the Ventilator Bundle, and appreciated CMS' recognition of ventilator-associated pneumonia as a costly and deadly infection that is highly prevalent in LTCHs.

Response: We agree with the commenters that ventilator-associated pneumonia is both a deadly and costly infection that is highly relevant to the LTCH setting. We appreciate the commenters' support of this measure.

Comment: Many commenters expressed concern over the lack of NQF endorsement of the measure in the LTCH setting and it not being fully supported by MAP. One commenter recommended the measure be further researched in the LTCH setting. Commenters also expressed concern regarding the measure being under maintenance review under NQFs infections disease project, which has not begun yet.

Response: While we realize that the MAP did not fully support this measure, it supported the direction of the measure and stated that it is an important aspect of care in LTCHs. We also agree with the value of the NQF endorsement process. We proposed an application of the Ventilator Bundle measure (NQF #0302) with the understanding that the measure was being submitted to NQF for maintenance review and update. Our expectation was that the measure would be re-endorsed to include a fifth element (oral cleansing with Chlorhexidine solution), added medical exceptions for each of the five components of the bundle, and expansion to settings beyond the ICU. While the public comments included many concerns related to this proposal, it was our expectation that many of these concerns would be allayed by the update and expansion of the measure.

Subsequent to the proposed rule, we learned that the measure steward, the Institute for Healthcare Improvement (IHI), made a decision to withdraw the Ventilator Bundle measure from consideration for NQF re-endorsement.

After consideration of the public comments we received, and in light of the IHI's withdrawal of this measure from the NQF re-endorsement process, we have decided to not finalize the Ventilator Bundle measure for the LTCHQR Program at this time. We plan to propose an updated version of this measure during future rulemaking.

Comment: Some commenters were concerned about the measure requiring peptic ulcer disease prophylaxis, specifically that this requirement may put patients at risk of clostridium difficile infections.

Response: We appreciate and are aware of the concerns posed these commenters; however there is also evidence that such prophylaxis is beneficial to ventilated patients. A prospective cohort study found patients on mechanical ventilation more than 48 hours had 15.6 times the odds of developing clinically important gastrointestinal bleeding. A multiple

[194] Chan, E., Ruest, A., Meade, M., Cook, D. ''Oral decontamination for prevention of pneumonia in mechanically ventilated adults: systematic review and meta-analysis''. *BMJ.* 2007; 334: 889.

[195] National Quality Forum (2012)Input on Measures for Consideration by HHS for 2012 Rulemaking. Available; *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=69885.*. pp. 105.

regression analysis demonstrated such ventilation to be an independent risk factor. The same study further demonstrated that clinically important gastrointestinal bleeding is associated with an increase in mortality [196]. The Institute for Health Improvement, the steward of this measure, also notes that peptic ulcer disease is a risk factor that increases the mortality and morbidity of ventilator patients and should be maintained in the bundle. They have further specified that if a patient has a medical contraindication to any element of the bundle, as evidenced in the medical record, the patient is considered compliant for that element.[197] However, for the reasons we noted above, we are not adopting this measure in this final rule.

Comment: One commenter noted that daily sedation vacations and assessment or readiness to wean would not be applicable to LTCH patients because they are usually not orally intubated and often may not be sedated. Another commenter noted that there is no standard definition of ''wean.'' Additional commenters noted this measure is intended for short-term ventilator patients.

Response: While we appreciate this comment, we disagree that this measure is solely intended for the short-term ventilator patient that is orally intubated. We believe that this measure is intended for patients dependent on ventilators, regardless of airway tube placement and length of ventilator use. Our interpretation of the intention of this measure is to support processes that mitigate complications commonly associated with ventilator use, and that it is not solely for ''ventilator weaning.'' However, for the reasons we noted above, we are not adopting this measure in this final rule.

Comment: One commenter requested that each element of the ventilator bundle be modified to allow for the treating physician to determine if it is warranted and in the patient's best interest. Specifically, the commenter requested that an element of the bundle should only be applicable if it is not medically contraindicated. Another commenter noted that failure to accommodate for such contraindications means the measure is not patient-centered.

Response: We thank the commenters for the measure revision recommendations. For the reasons we noted above, we are not adopting this measure in this final rule. We will take the commenter's concerns into account if we consider proposing to adopt an updated version of this measure in future rulemaking.

Comment: Some commenters noted that the CDC has ''decertified the traditional VAP measure used within NHSN and is currently monitoring the development and use of ventilator-associated events'' and requested that we delay implementation of this measure until CDC releases an updated definition of pertaining to ventilator-associated pneumonia.

Response: We are aware of the work the CDC is doing relative to the VAP measure and ventilator associated events, and we are encouraged by its efforts. For the reasons we noted above, we are not adopting this measure in this final rule. We will take the commenters' concern into account if we consider proposing to adopt an updated version of this measure in future rulemaking.

Comment: Several commenters believed CMS has not ''clearly communicated the methods by which the data will be measured and interpreted'' for the ventilator bundle measure. Further, another commenter noted that data collection for this measure ''would be significant.''

Response: We appreciate the concerns expressed by the commenters and will take them into account if we consider proposing to adopt this measure in future rulemaking.

Comment: One commenter noted that CMS failed to identify whether the measure is an outcome measure or a process measure. Another commenter encouraged use of an outcome-based measure.

Response: We noted in the proposed rule that the ventilator bundle is comprehensive process measure designed to mitigate ventilator-related infections, such as VAP. As we also noted, an outcome-based measure based on ventilator-associated pneumonia was not supported by technical experts due to the difficulty in defining and diagnosing the condition.

Comment: One commenter noted that while CMS convened a technical expert panel to opine on a ventilator associated pneumonia measure, no additional technical expert panels was held to discuss the ventilator bundle.

Response: Both a ventilator associated pneumonia measure and ventilator bundle were discussed at a technical expert panel held on July 11, 2011. The panel was supportive of the ventilator bundle measure compared to the ventilator-associated pneumonia measure.

After consideration of the public comments we received, as noted above, we are not adopting this measure in this final rule.

(5) LTCH Quality Measure #5 for the FY 2016 Payment Determination and Subsequent Fiscal Year Payment Determinations: Restraint Rate per 1,000 Patient Days

Restraints are used to control behavior for people who exhibit disruptive, aggressive, or dangerous behavior in health care settings. [198,199,200,201] The negative outcomes of restraints may include strangulation, loss of muscle tone, decreased bone density (with greater susceptibility for fractures), pressure sores, increased infections, decreased mobility, depression, agitation, loss of dignity, social isolation, incontinence, constipation, functional decline, abnormal changes in body chemistry and muscular function, and in some cases, patient death.[202,203,204,205,206,207,208,209,210,211]

[211] Inouye SK, Wagner DR, Acompara D, et al A predictive index for functional decline in hospitalized elderly medical patients. J Gen Intern Med. 1993; 8(12):645–652.

The use of physical restraints also often constitutes a disproportionate infringement on an individuals' autonomy.[212,213]

Research suggests that other clinical interventions are more effective than restraints in preventing injuries from falls. Interventions involving physiologic care, psychosocial care and environmental manipulation, have been shown to be more effective than restraints, generally without increasing staff time or overall cost of treatment.[214,215,216,217,218,219]

The principle of freedom from physical or pharmacological restraint is generally understood and accepted by professional and academic organizations. Groups such as the National Citizens' Coalition for Nursing Home Reform (NCCNHR), the Alzheimer's Association, and the American Physical Therapy Association, as well as numerous nursing homes and academic medical research institutions are involved in limiting the use of restraints. The Untie the Elderly campaign has been working since 1989 to raise public awareness of restraint abuse,[220] and the Advancing Excellence in America's Nursing Homes has recently embedded reduction of the use of restraints in nursing homes as part of an overall goal to increase resident mobility to help nursing home staff address mobility issues including the use of restraints, walking, range of motion, transfer, and prevention of falls.[221]

CMS and other Federal agencies have issued several regulations regarding restraint use in healthcare settings. In the 2006 Medicare and Medicaid Programs; Hospital Conditions of Participation: Patients' Rights final rule (71 FR 71378 through 71428), we stated that the use of restraints or seclusion ''may only be imposed to ensure the immediate physical safety of the patient, a staff member, or others'' (71 FR 71382).[222] Additionally, in 2010, the Food and Drug Administration's Hospital Bed Safety workgroup released clinical guidance for limiting the use of bed rails, reflecting concern about the safety of restraints.[223] To better align with our guidelines, The Joint Commission updated its standards to establish guidelines limiting the use of restraints and seclusion, and clarifying the documentation and usage protocols for hospitals in 2009.[224]

Recognizing the importance of a restraint rate measure, our measure development contractor convened a technical expert panel to review restraint measures for potential use in the LTCHQR Program. The TEP reviewed several NQF-endorsed measures for restraint use, including Restraint Prevalence (vest and limb only) (NQF #0203) endorsed for short-term acute care hospitals, HBIPS–2 Hours of Physical Restraint Use (NQF #0640) endorsed for inpatient psychiatric facilities, HBIPS–3 Hours of Seclusion Use (NQF #0641) endorsed for inpatient psychiatric facilities, and Percent of Residents who were Physically Restrained (Long-Stay) (NQF # 0687) endorsed for residents who have been in the nursing home for over 100 days. We note the measures are NQF-endorsed, although not for the LTCH setting. We submitted NQF #0687 mentioned above to the MAP for consideration. While the MAP supported the direction of this measure, it also advised the measure needed to tested in and specified for the LTCH setting. Subsequently, we also determined that all four of the above-referenced NQF measures were limited in their potential to produce a meaningful measurement in the LTCH setting since these measures have look back and monitoring periods that are problematic for the LTCH setting.

Upon further investigation, we identified the ''Restraint Rate per 1,000 Patient Days'' measure which was developed by the National Association of Long Term Hospitals (NALTH) and is a non-core measure for The Joint Commission ORYX Initiative. This measure is not NQF-endorsed but it is currently specified for and is in use by some LTCHs that submit data for this measure to the NALTH Health Information System. Thus, this measure is a feasible and practical measure for LTCH setting. Therefore we believe it addresses the concerns raised by MAP with respect to NQF #0687 which is the need for specification and use in the LTCH setting.

After review of the previously referenced NQF-endorsed restraint measures, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28100), we proposed the Restraint Rate per 1,000 Patient Days measure for the FY 2016 LTCHQR Program payment determination and subsequent fiscal year payment determinations under the authority in section 1886(m)(5)(D)(ii) of the Act. We proposed to use the exception authority because there are no NQF endorsed measures on restraints for the LTCH setting. Further, as explained previously, we have given due consideration to the existing NQF measures on restraints (although not endorsed for the LTCH setting) and we believe they are not appropriate for the LTCHQR Program. We proposed this measure because we believe it is a relevant, scientifically sound, valid, and an important measure which is also feasible for data collection in the LTCH setting compared to the existing NQF-endorsed restraint measures previously discussed. For this measure, the measure specifications will be made available on the LTCHQR Program Web site at *http://www.cms.gov/LTCH-Quality-Reporting/.*

We proposed that the data collection and submission of this measure will be through the LTCH CARE Data Set. This is the same data collection and submission framework which we would use to support LTCHs for reporting on the Percent of Residents with Pressure Ulcers That Are New or Worsened (Short-Stay) (NQF #0678) measure.[225]

[225] The LTCH CARE Data Set, the data collection instrument that will be used to submit data on this measure, is currently approved under Paperwork Reduction Act (PRA) review by the Office of

By building on existing data reporting and submission infrastructure, we intend to reduce the administrative burden related to data collection and submission for this measure under the LTCHQR Program.

We invited public comment on this proposed measure for the FY 2016 payment determination and subsequent fiscal year payment determinations.

Comment: Several commenters expressed support for inclusion of Restraint Rate per 1,000 Patient Days measure in the LTCHQR Program.

Response: We appreciate the commenters' support of this measure.

Comment: Several commenters stated that this measure is not appropriate for the LTCH setting because restraint use is often necessary and medically appropriate in this setting. Commenters added that this measure has not been tested in the LTCH setting and that support for this measure relies heavily on data obtained regarding restraint use in other settings. Commenters remarked that restraints are needed to prevent harm to the patient caused by removing necessary tubes and lines and that patients in LTCHs more frequently receive more invasive and lifesaving treatments when compared to SNFs and other healthcare settings on which the data supporting this measure is based.

Response: We appreciate the commenters' concerns that restraint use is often medically appropriate in the LTCH setting and that a measure of restraint use would thus not be appropriate in the LTCH setting. We agree that there are occasions in which restraint use is appropriate, and do not intend that a quality measure evaluating restraint use eliminate all uses of restraint. However, there are many potential negative outcomes of restraints (strangulation, loss of muscle tone, decreased bone density, pressure sores, increased infections, decreased mobility, depression, agitation, loss of dignity, social isolation, incontinence, constipation, functional decline, abnormal changes in body chemistry and muscular function, patient death, and the loss of autonomy [226,227,228,229,230,231,232,233,234,235,236,237,238]) and research suggests that other clinical interventions such as psychosocial care and environmental manipulation [239,240,241,242,243] are more effective than restraints in preventing injuries from falls, including physiologic care. Therefore, we cannot ignore the patient safety risks introduced by the use of restraints and the need to reduce their use. Our goal is to implement a measure which encourages providers to think more carefully when using restraints and only use restraints when absolutely necessary.

Comment: A few commenters expressed concerns regarding the definition and specifications of this measure. One commenter was specifically concerned that this measure does not exclude patients who were restrained for acute anxiety or delirium and does not clearly define whether restrains would be mechanical, chemical or both. Another commenter suggested that this measure would compare the number of incidents of restraint per 1,000 days and should instead record the amount of time spent in restraint as incidents can vary widely.

Response: We appreciate the comment and the concern for ensuring that the measure allows for the proper use of restraints. The specifications of the Restraint Rate per 1,000 Patient Days measure clarify that the numerator includes ''physical restraints according to the CMS and NQF definition—'a physical restraint is any manual method or physical or mechanical device, material, or equipment attached or adjacent to the patient's body that he or she cannot easily remove that restricts freedom of movement or normal access to one's body.' '' The measure excludes ''Restraints that are only associated with medical, dental, diagnostic or surgical procedures and are based on the standard practice for the procedure.''

In developing the specifications for a quality measure that measures restraints, we do appreciate that some restraints are necessary and that it is not possible to avoid using restraints at all times. As we explain below, we are not finalizing our proposal to adopt this measure for the LTCHQR Program at this time. We intend to implement a quality measure which reflects the commenters' concerns and encourages reduced use of restraints and frequent re-evaluation of necessity.

Comment: Several commenters expressed concern that this measure is not NQF-endorsed and encouraged CMS to use measures which have been vetted through the NQF process. Commenters encouraged CMS to harmonize across settings and consider using the Hours of Physical Restraint Use measure proposed for inclusion in the IPFQR Program.

Response: We appreciate the comments and understand the commenters' concerns that this measure is not NQF-endorsed. A technical expert panel hosted by our development contractor on January 31, 2011 and September 27, 2011 recommended the use of the Restraint Rate per 1,000 Patient Days in the LTCH setting. However, we also value the guidance of NQF and appreciate the importance of measures that help us achieve our goal of harmonizing measures across settings.

After consideration of the public comments we received, we are not

---

Management and Budget. It is discussed in a PRA notice that appeared in the September 2, 2011 **Federal Register** (76 FR 54776). The OMB Control Number is 0938–1163. The file number for the LTCH PRA package is CMS–10409.

adopting the Restraint Rate per 1,000 Patient Days in the LTCHQR Program. We intend to further consider this and other measures of restraint use, including the HBIPS–2 Hours of Physical Restraint Use (NQF #0640). We intend to propose a patient restraint measure for the LTCHQR Program in future rulemaking.

Set out below are the quality measures for the FY 2016 payment determination and subsequent payment determinations.

NEW QUALITY MEASURES FOR THE FY 2016 LTCHQR PROGRAM PAYMENT DETERMINATION AND SUBSEQUENT PAYMENT DETERMINATIONS

NQF Measure ID	Measure title
NQF #0138	National Health Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.**
NQF #0139	National Health Safety Network (NHSN) Central line-associated Blood Stream Infection (CLABSI) Outcome Measure.**
Application of NQF #0678	Percent of Residents with Pressure Ulcers That are New or Worsened (Short-Stay).**
NQF #0680	Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay).*
NQF #0431	Influenza Vaccination Coverage among Healthcare Personnel.*

** Adopted for the FY 2014 payment determination and subsequent payment determinations.
* Adopted for the FY 2016 payment determination and subsequent payment determinations.

5. Timeline for Data Submission Under the LTCHQR Program for the FY 2015 Payment Determination

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28100), for the FY 2015 payment determination, we proposed requiring data submission on LTCH discharges occurring from January 1, 2013 through December 31, 2013 (CY 2013). We proposed that LTCHs would follow the deadlines presented in the table below to complete submission of data for each quarter for each proposed measure for the FY 2015 payment determination. For each quarter outlined in the table below during which LTCHs are required to collect data, we proposed a final submission deadline occurring approximately 135 days after the end of each quarter by which all data collected during that quarter must be submitted. We believe that this is a reasonable amount of time to allow providers to submit data and make any necessary corrections given that this is a new quality reporting program.

We invited public comment on a proposed submission timeline for the FY 2015 payment determination.

We did not receive any public comments. We are finalizing the FY 2015 timeline for data submission, as proposed.

Set out below is the timeline for submission of LTCHQR Program quality data for the FY 2015 payment determination.

TIMELINE FOR SUBMISSION OF LTCHQR PROGRAM QUALITY DATA FOR THE FY 2015 PAYMENT DETERMINATION

Data collection timeframe: CY 2013	Final submission deadline for data related to the LTCH Quality Reporting Program FY 2015 payment determination
Q1 (January–March 2013)	August 15, 2013.
Q2 (April–June 2013)	November 15, 2013.
Q3 (July–September 2013)	February 15, 2014.
Q4 (October–December 2013)	May 15, 2014.

6. Timeline for Data Submission Under the LTCHQR Program for the FY 2016 Payment Determination

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28101), for the FY 2016 payment determination, we proposed to require data submission on LTCH discharges occurring from January 1, 2014 through December 31, 2014 (CY 2014). We proposed this timeframe because we believe this will provide sufficient time for LTCHs and CMS to put processes and procedures in place to meet the additional quality reporting requirements. We proposed that LTCHs would follow the deadlines presented in the table below to complete submission of data for each quarter. For each quarter outlined in the table below during which LTCHs are required to collect data, we proposed a final deadline occurring approximately 45 days after the end of each quarter by which all data collected during that quarter must be submitted. We believe that this is a reasonable amount of time to allow LTCHs to submit data and make any necessary corrections. We also proposed that similar calendar year collection and submission deadlines would apply to future years payment determinations.

We invited public comment on a proposed submission timeline for the FY 2016 payment determination.

Comment: One commenter objected to the reduction of the submission timeframe from 135 days to 45 days after each quarter.

Response: During the early phase of LTCHQR Program, recognizing that LTCHQR Program is a new reporting requirement for LTCHs, we are allowing 135 days after each quarter for submission of data for the FY 2014 and FY 2015 payment update determinations. For the FY 2016 payment determination, we will allow 45 days and believe this is sufficient time for LTCHs to submit data because they will have had an opportunity to become familiar with the data submission requirements.

After consideration of the public comments we received, we are finalizing the timeline for FY 2016, as proposed. Set out below is the timeline for submission of LTCHQR Program

quality data for the FY 2016 payment determination.

TIMELINE FOR SUBMISSION OF LTCHQR PROGRAM QUALITY DATA FOR THE FY 2016 PAYMENT DETERMINATION AND SUBSEQUENT FISCAL YEAR PAYMENT DETERMINATIONS

Data collection timeframe: CY 2014	Final submission deadlines for the LTCHQR Program FY 2016 payment determination
Q1 (January–March 2014)	May 15, 2014
Q2 (April–June 2014)	August 15, 2014
Q3 (July–September 2014)	November 15, 2014
Q4 (October–December 2014)	February 15, 2015

7. Public Display of Data Quality Measures

Under section 1886(m)(5)(E) of the Act, the Secretary is required to establish procedures for making any quality data submitted by LTCHs under section 1886(m)(5)(C) of the Act available to the public. In addition, section 1886(m)(5)(E) of the Act requires that such procedures shall ensure that a LTCH has the opportunity to review the data that is to be made public with respect to its facility, prior to such data being made public. In addition, the statute requires that the Secretary shall report quality measures that relate to services furnished in LTCHs on our Internet Web site. Therefore, the Secretary will publicly report quality measure data that is reported under the LTCHQR Program. We did not propose procedures or timelines for public reporting of LTCHQR Program data in the proposed rule.

Comment: One commenter urged CMS to publicly report the LTCHQR Program data on *Hospital Compare.* This commenter further noted that the lack of established procedures or timelines for public reporting of these data is inappropriate and does not reflect the commitment to accountability and transparency CMS has shown in other quality reporting programs. Another commenter noted that a preview period of quality reports prior to their being made public must be present.

Response: We agree with these commenters. We appreciate the need for accountability and transparency for the LTCHQR Program similar to our other quality reporting programs. To this end, we are continuing to undertake efforts to establish procedures and a timeline for the public reporting of data for the LTCHQR Program and we will communicate this information as soon as it is available. Further, similar to our other quality reporting programs, we will provide for a preview period of quality reports under the LTCHQR Program prior to making quality data public.

E. Quality Reporting Requirements Under the Ambulatory Surgical Center Quality Reporting (ASCQR) Program

1. Background

Section 109(b) of the Medicare Improvements and Extension Act of 2006, under Division B, Title I of the Tax Relief and Health Care Act of 2006, Public Law 109–432 (MIEA–TRHCA) amended section 1833(i) of the Act by redesignating clause (iv) as clause (v) and adding new clause (iv) to paragraph (2)(D) and by adding new paragraph (7). Section 1833(i)(2)(D)(iv) of the Act authorizes, but does not require, the Secretary to implement the revised ASC payment system ''in a manner so as to provide for a reduction in any annual update for failure to report on quality measures in accordance with paragraph (7).'' Paragraph (7) contains subparagraphs (A) and (B). Subparagraph (A) of paragraph (7) states the Secretary may provide that an ASC that does not submit ''data required to be submitted on measures selected under this paragraph with respect to a year'' to the Secretary in accordance with this paragraph will incur a 2.0 percentage point reduction to any annual increase provided under the revised ASC payment system for such year. It also specifies that this reduction applies only with respect to the year involved and will not be taken into account in computing any annual increase factor for a subsequent year.

Subparagraph (B) of paragraph (7) states ''[e]xcept as the Secretary may otherwise provide,'' the provisions of subparagraphs (B) through (E) of paragraph (17) of section 1833(t) of the Act, which contain requirements for quality reporting for hospital outpatient services, ''shall apply with respect to services of [ASCs] under this paragraph in a similar manner to the manner in which they apply under such paragraph'' and any reference to a hospital, outpatient setting, or outpatient hospital services is deemed a reference to an ASC, the setting of an ASC, or services of an ASC, respectively. Pertinent to this proposed rule are subparagraphs (B) and (E) of section 1833(t)(17) of the Act. Subparagraph (B) of section 1833(t)(17) of the Act requires subsection (d) hospitals to ''submit data on measures selected under this paragraph to the Secretary in a form and manner, and at a time, specified by the Secretary for purposes of this paragraph.'' Subparagraph (E) of section 1833(t)(17) of the Act requires the Secretary to ''establish procedures for making data submitted under this paragraph available to the public.'' Further, these procedures shall ensure that hospitals have the opportunity to review the data before these data are made public. Additionally, the Secretary must ''report quality measures of process, structure, outcome, patients' perspectives on care, efficiency, and costs of care that relate to services furnished in outpatient settings in hospitals'' on CMS' Internet Web site.

Thus, subsections (i)(7)(B) and (t)(17)(B) of section 1833 of the Act, read together, require that ASCs submit quality data in a form and manner, and at a time, that the Secretary specifies. Pertinent to this final rule, subsections (i)(7)(B) and (t)(17)(B) of section 1833 of the Act, read together, require the Secretary to establish procedures for making data submitted available to the public and to report quality measures of process, structure, outcome, patients' perspectives on care, efficiency, and cost of care that relate to services furnished in ASCs on CMS' Internet Web site. Subsection (i)(7)(B) of section 1833 of the Act also specifies that these provisions apply except as the Secretary may otherwise provide.

In the CY 2012 OPPS/ASC final rule with comment period, we finalized our proposal to implement the ASC Quality Reporting (ASCQR) Program beginning

with the CY 2014 payment determination (76 FR 74492 through 74517). We adopted claims-based measures for the CY 2014 payment determination for services furnished between October 1, 2012 and December 31, 2012. For the CY 2015 payment determination, we adopted the same claims-based measures as adopted for the CY 2014 payment determination and two structural measures. We did not specify the data collection period for the claims-based measures for the CY 2015 payment determination, but specified that reporting for the structural measures would be between July 1, 2013 and August 15, 2013, for services furnished between January 1, 2012 and December 31, 2012, using an online measure submission Web page available at: *http://www.QualityNet.org*. For the CY 2016 payment determination, we adopted the same claims-based and structural measures as adopted for the CY 2015 payment determination and one process of care measure. We did not specify the data collection period for the claims-based or structural measures, but specified that data collection for the process of care measure would be via the National Healthcare Safety Network beginning on October 1, 2014, and continuing through March 31, 2015.

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74515), we indicated our intent to issue proposals for administrative requirements, data validation and completeness requirements, and reconsideration and appeals processes in the FY 2013 IPPS/LTCH PPS proposed rule rather than in the CY 2013 OPPS/ASC proposed rule because the FY 2013 IPPS/LTCH PPS proposed rule is scheduled to be finalized earlier and before data collection for the CY 2014 payment determination, which is to begin with services furnished on October 1, 2012.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28101 through 28105), we issued proposals for administrative requirements, data completeness requirements, extraordinary circumstance waiver or extension requests, and a reconsideration process. As discussed below, we did not propose to validate claims-based and structural measures. Further, we intend to address appeals of reconsideration decisions in a future rulemaking. To be eligible to receive the full annual increase, we proposed that ASCs must comply with the requirements specified below for the respective payment determination year.

We invited public comment on these proposals.

2. Requirements for Reporting Under the ASCQR Program

a. Administrative Requirements

(1) Requirements Regarding QualityNet Account and Administrator for the CYs 2014 and 2015 Payment Determinations

A QualityNet account is required to submit quality measure data to the QualityNet Web site and, in accordance with CMS policy, a QualityNet administrator is necessary to set-up a user account for the purpose of submitting this information to the QualityNet Web site. The main purpose of a QualityNet administrator is to serve as a point of contact for security purposes for quality reporting programs. We believe from our experience that a QualityNet administrator typically fulfills a variety of tasks related to quality reporting, such as creating, approving, editing, and terminating QualityNet user accounts within an organization, and monitoring QualityNet usage to maintain proper security and confidentiality measures. Thus, we highly recommend that ASCs have and maintain a QualityNet administrator. However, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28102), we did not propose that ASCs be required to do so for the CY 2014 payment determination because ASCs are not required to submit data to the quality data warehouse for the CY 2014 payment determination (76 FR 74504) and we do not want to unduly burden ASCs by requiring ASCs to have a QualityNet administrator. We note that a QualityNet account is not necessary to access information that is posted to the QualityNet Web site, such as specifications manuals and educational materials.

As finalized in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74504 through 74509), for the CY 2015 payment determination, we require ASCs to submit structural measure data to the QualityNet Web page. To enter these data into our data system, we proposed that ASCs will need to identify and register a QualityNet administrator who follows the registration process located on the QualityNet Web site and submits the information as specified on this site. Because submission of structural measure data is not required until the July 1, 2013 to August 15, 2013 time period, we proposed that ASCs would be required to have a QualityNet administrator at the time facilities submit structural measure data in 2013 for the CY 2015 payment determination, which is no later than August 15, 2013. ASCs may have a QualityNet administrator prior to this date, but we did not propose that ASCs be required to do so.

We note that there are necessary mailing and processing procedures for having a QualityNet administrator assigned by CMS separate from completion of the forms by the ASC that can require significant time to complete and we strongly caution ASCs to not wait until the deadline to apply; instead, we recommend allowing a minimum of 2 weeks, while strongly suggesting allowing additional time prior to the deadline to submit required documentation in case of unforeseen issues. Because ASCs will need a QualityNet administrator only to have the ability to set up a user account for the purpose of submitting structural measure data once a year, we proposed that ASCs would not be required to maintain a QualityNet administrator after the entry of the structural measure data in 2013 for the CY 2015 payment determination. Although we highly recommend that ASCs have and maintain a QualityNet administrator, we believe that requiring an ASC to maintain a QualityNet administrator throughout the year would increase the burden on ASCs.

We invited public comment on these proposals.

Comment: Some commenters supported not requiring ASCs to maintain a QualityNet administrator until 2013, but recommended that the inactivity deactivation window be extended to one year because many ASCs will need to access their accounts solely on an annual basis.

Response: We appreciate the commenters' support. We understand the commenters' concerns that the QualityNet accounts may be deactivated because ASCs would not be submitting data frequently. As a commenter noted in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74515), QualityNet accounts are automatically deactivated after a 120-day period of inactivity in accordance with CMS security policy. Both the length of this timeframe and the requirement to maintain a QualityNet administrator when a facility is submitting data to a CMS system are dictated by our security policy. If an account is deactivated due to inactivity, it can be reactivated by contacting the QualityNet Help Desk; contact information for the QualityNet Help Desk is located on the QualityNet Web site.

After consideration of the public comments we received, we are finalizing our proposals without modification that ASCs will need to identify and register a QualityNet

administrator who follows the registration process located on the QualityNet Web site and submits the information as specified on this site and that ASCs would be required to have a QualityNet administrator at the time facilities submit structural measure data in 2013 for the CY 2015 payment determination, which is no later than August 15, 2013.

(2) Requirements Regarding Participation Status for the CY 2014 Payment Determination and Subsequent Payment Determination Years

We finalized in the CY 2012 OPPS/ASC final rule with comment period a policy to consider an ASC as participating in the ASCQR Program for the CY 2014 payment determination if the ASC includes Quality Data Codes (QDCs) specified for the Program on their CY 2012 claims relating to the finalized measures (76 FR 74516).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28103), we proposed that once an ASC submits any quality measure data, it would be considered as participating in the ASCQR Program. Further, we proposed that, once an ASC submits any quality measure data and is considered to be participating in the ASCQR Program, an ASC would continue to be considered participating in the Program, regardless of whether the ASC continues to submit quality measure data, unless the ASC withdraws from the Program by indicating on a participation form that it is withdrawing, as discussed below. For example, if an ASC includes any QDCs on its claims for the CY 2014 payment determination, it would be considered participating in the ASCQR Program for the CY 2014 payment determination and for every subsequent payment determination unless the ASC withdraws. Likewise, if an ASC did not submit any QDCs for the CY 2014 payment determination, but submitted quality measure data for the CY 2015 payment determination, the ASC would be considered participating in the ASCQR Program starting with the CY 2015 payment determination and continuing for subsequent payment determinations unless the ASC withdraws from the Program.

We considered whether to propose that an ASC be required to complete and submit a notice of participation form for the CY 2015 payment determination or subsequent payment determination years to indicate that the ASC is participating in the ASCQR Program as we require for hospitals, but decided against this proposal because we were concerned about the burden on ASCs. We believe these proposals will reduce burden on ASCs while accomplishing the purpose of notifying CMS of an ASC's participation in the ASCQR Program.

We proposed that any and all quality measure data submitted by the ASC while participating in the ASCQR Program could be made publicly available. This policy would allow us to provide information on the quality of care provided to Medicare beneficiaries which promotes transparency.

We proposed that, once an ASC submits quality measure data indicating its participation in the ASCQR Program, an ASC must complete and submit an online participation form indicating withdrawal to withdraw from the Program. This form would be located on the QualityNet Web site starting in July 2013. We proposed that an ASC would indicate on the form the initial payment determination year to which the withdrawal applies. We proposed a different process for ASCs to withdraw from participation than the process we proposed for an ASC to participate in the ASCQR Program because of the payment implications of withdrawal. We proposed that, in withdrawing from the Program, the ASC would incur a 2.0 percentage point reduction in its annual payment update for that payment determination year and any subsequent payment determination year(s) in which it is withdrawn.

We will not make quality measure data publicly available for that payment determination year and any subsequent payment determination year(s) for which the ASC is withdrawn from the Program.

We proposed that an ASC would continue to be deemed withdrawn unless the ASC starts submitting quality measure data again. Once an ASC starts submitting quality measure data, the ASC would be considered participating unless the ASC withdraws, as discussed above. Again, we believe that these proposals would reduce the burden on ASCs of having to notify CMS as to when they are participating.

We proposed that an ASC can withdraw from the Program at any time up to August 31, 2013 for the CY 2014 payment determination; we anticipate that this will be the latest date possible to allow an ASC to withdraw before payment determinations affecting CY 2014 payment are made. We proposed that an ASC can withdraw from the Program at any time up to August 31, 2014, for the CY 2015 payment determination. We will propose withdrawal dates for later payment determinations in future rulemakings.

We proposed that these administrative requirements would apply to all ASCs designated as open in the CASPER system before January 1, 2012, for the CY 2014 payment determination. Because ASCs are not required to include QDCs on claims until October 2012 for the CY 2014 payment determination, an ASC designated as open in the CASPER system before January 1, 2012, would be operating for at least 10 months before having to report any data. We believe this would be a sufficient amount of time for ASCs to be established to report quality data for the CY 2014 payment determination.

For the CY 2015 payment determination, we proposed that these administrative requirements would apply to all ASCs designated as open in the CASPER system for at least 4 months prior to January 1, 2013. We believe that this date and length of operations experience would provide new ASCs sufficient time before having to meet quality data reporting requirements after the ASCQR Program's initial implementation year.

We invited public comment on these proposals.

Comment: Commenters supported the CMS proposal that ASCs would indicate their participation in the ASCQR Program solely by beginning to submit QDCs to CMS because they believe this is the least burdensome means for ASCs to indicate their participation status.

Response: We appreciate the commenters' support. We believe this is the least burdensome means for ASCs to indicate their participation status.

Comment: Commenters supported the CMS proposal to have an active mechanism for ASCs to withdraw from the ASCQR Program. Commenters also agreed quality measure data should not be publicly available for a payment determination year and any subsequent payment determination year(s) for which an ASC is withdrawn from the Program. One commenter stated that this active mechanism will help distinguish those ASCs who are aware of the requirements, but choose not to participate, from those that are participating unsuccessfully or who are not aware of the Program, and could allow for more targeted educational efforts.

Response: We appreciate the commenters' support.

Comment: Commenters agreed that CMS had the right to make any data collected under the ASCQR Program publicly available, but made suggestions regarding various facets of public reporting including the ability of facilities to preview data, delaying public reporting, the ability of facilities to resolve accuracy concerns, limiting

the information reported for the first years of the Program to whether the ASC successfully participated in the ASCQR Program, and including explanatory narrative for individual measures.

Response: We thank the commenters for their views and suggestions. Regarding public reporting, we only proposed that any and all quality measure data submitted by the ASC while participating in the ASCQR Program could be made publicly available; commenters agreed with this proposal. We did not make any other proposals regarding public reporting. We will consider these additional comments addressing public reporting of ASCQR Program data in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposals without modification regarding participation in and withdrawing from the ASCQR Program as discussed above.

b. Requirements Regarding Form, Manner, and Timing for Claims-Based Measures for CYs 2014 and 2015 Payment Determinations

(1) Background

In the CY 2012 OPPS/ASC final rule with comment period, we adopted claims based measures for the CYs 2014 and 2015 payment determinations (76 FR 74504 through 74509). We also finalized that, to be eligible for the full CY 2014 ASC annual payment update, an ASC must submit complete data on individual quality measures through a claims-based reporting mechanism by submitting the appropriate QDCs on the ASC's Medicare claims (76 FR 74515 through 74516). Further, we finalized the data collection period for the CY 2014 payment determination, as the Medicare fee-for-service ASC claims submitted for services furnished between October 1, 2012 and December 31, 2012. We did not finalize a date by which claims would be processed to be considered for CY 2014 payment determinations.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28104), we proposed that claims for services furnished between October 1, 2012 and December 31, 2012 would have to be paid by the administrative contractor by April 30, 2013 to be included in the data used for the CY 2014 payment determination. We believe that this claim paid date would allow ASCs sufficient time to submit claims while allowing sufficient time for CMS to complete required data analysis and processing to make payment determinations and to supply this information to administrative contractors.

We did not finalize a data collection and processing period for the CY 2015 payment determination, but stated that we intended to do so in the CY 2013 OPPS/ASC proposed rule.

We invited public comments on these proposals.

Comment: Some commenters agreed with the CMS proposal that claims for services furnished between October 1, 2012 and December 31, 2012 that are paid by April 30, 2013 be included in the data used for the CY 2014 payment determination stating that they believed that this April 30, 2013 date would allow for sufficient time for claims processing. However, other commenters believed the proposed period for the collection of claims data may be too abbreviated to capture all pertinent data. Because ASCs have up to 1 year to submit claims for services rendered, some commenters suggested that the period for the collection of claims data be as close to 1 year from the date the service was provided to be included in a payment determination. Some of the commenters that suggested that a longer time period for claims be included, suggested that claims for services furnished between January 1, 2013 and December 31, 2013 be processed by June 30, 2014 for the CY 2015 payment determination.

Response: We appreciate the commenters' support of our proposals that claims for services furnished between October 1, 2012 and December 31, 2012 that are paid by April 30, 2013 be included in the data used for the CY 2014 payment determination. We agree that sufficient time should be allowed for claims processing to obtain complete data. We have conducted an internal analysis of claims submission by ASCs and have found that over 90 percent of ASC claims are submitted and paid in our proposed timeframe. Therefore, we believe that our proposed April 30 paid date provides sufficient time for claims to be submitted. In addition, while we appreciate that a longer timeframe, for example to June 30, may be desirable, we believe that April 30 is the latest date that would still allow us to acquire and analyze the claims data, make payment determinations, and importantly, allow sufficient time for the administrative contractors to program their systems.

We did not make any proposals regarding a data collection and processing period for the CY 2015 payment determination, but have done so in the CY 2013 OPPS/ASC proposed rule.

Comment: One commenter expressed concern with the lag between the quality data reporting period and the payment reductions in the ASCQR Program, noting that CMS finalized its proposal to reduce ASC payments in 2014 based on data submitted in 2012. This commenter believed that CMS should align the penalty reporting period with the penalty year.

Response: We understand the commenter's concern with the lag between when data are reported and when payment is affected, and we will strive to reduce this lag without significant adverse effects on data completeness and quality. We interpret the commenter's desire to align the penalty reporting period with the penalty year to mean that, for example, claims for services furnished in CY 2014 would be used to affect CY 2014 payment. This could only be accomplished if we applied any reduction retroactively and recouped funds for any such reduction. We do not believe this a feasible approach because it could cause undue financial hardship on an ASC to have to refund monies and it would be administratively burdensome for us.

After consideration of the public comments we received, we are finalizing our proposal, without modification, that claims for services furnished between October 1, 2012, and December 31, 2012 be paid by the administrative contractor by April 30, 2013, to be included in the data used for the CY 2014 payment determination.

(2) Minimum Threshold for Claims-Based Measures Using QDCs

In the CY 2012 OPPS/ASC final rule with comment period, we finalized that data completeness for claims-based measures would be determined by comparing the number of claims meeting measure specifications that contain the appropriate QDCs with the number of claims that would meet measure specifications, but did not have the appropriate QDCs on the submitted claim. In other words, the numerator will be the total number of claims meeting measure specifications that have QDCs and the denominator will be the total number of claims meeting measure specifications. We stated our intent to propose how we would assess data completeness for claims-based measures in this proposed rule (76 FR 74516). For the initial reporting years, we believe that a lower threshold for data completeness should be established for data collection because ASCs are not familiar with how to report quality data under the ASCQR Program, and because many ASCs are relatively small and they

may need more time to set up their reporting systems.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28104), for the CYs 2014 and 2015 payment determinations, we proposed that the minimum threshold for successful reporting be that at least 50 percent of claims meeting measure specifications contain QDCs. We believe 50 percent is a reasonable minimum threshold based upon the considerations discussed above for the initial implementation years of the ASCQR Program. We intend to propose to increase this percentage for subsequent payment determination years as ASCs become more familiar with reporting requirements for the ASCQR Program.

As stated in CY 2012 OPPS/ASC final rule with comment period (76 FR 74516), ASCs will add the appropriate QDCs on their Medicare Part B claim forms, the Form CMS–1500s submitted for payment, to submit the applicable quality data. A listing of the codes with long and short descriptors is available in transmittal 2425, Change Request 7754 released March 16, 2012 which can be found on our Web site at: *http://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Downloads/R2425CP-.pdf*. Details on how to use these codes for submitting numerators and denominator information has been available since April 2012 in the ASCQR Program Specifications Manual and the QualityNet Web site at *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetBasic&cid=1228772323772*.

We invited public comment on these proposals.

Comment: Several commenters strongly supported the proposed 50 percent minimum threshold for data completeness of claims-based measures for the CYs 2014 and 2015 payment determinations. Some commenters recommended that claims where Medicare is the secondary payer should be excluded from calculations of data completeness for the CY 2014 payment determination because private payers will not be fully informed of the G-codes until the January 2013 tape release.

Response: We appreciate the commenters' support. We understand that, although CMS issued the G-codes for the ASCQR Program with the April 2012 HCPCS release, private payers will not have the files for use until January 1, 2013. When we finalized our policy for calculating data completeness for the CY 2014 payment determination in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74516), we did not specify whether claims where Medicare is the secondary payer would be included for data completeness. However, in the CY 2013 OPPS/ASC proposed rule, we stated that we were proposing to use the same method for determining data completeness that was finalized for the CY 2014 payment determination for the CY 2015 payment determination and subsequent payment determination years and specified that, in calculating data completeness, claims where Medicare is the primary or secondary payer would be included. However, because private payers will not have the QDCs in their required HCPCS data files until January 1, 2013, claims with QDCs received prior to January 1, 2013, can be rejected for having invalid codes. As it is not possible for ASCs to submit differing codes on primary versus secondary payer claims for at least some payers, we are specifying that only claims where Medicare is the primary payer—not the secondary payer—will be used in the calculation of data completeness for the CY 2014 payment determination. We intend to finalize what claims would be included in calculating data completeness for the CY 2015 payment determination in the CY 2013 OPPS/ASC final rule with comment period.

Comment: One commenter claimed that statistics from the PQRS Program, which uses G-codes on claims for quality measure reporting, show that claims-based reporting is much less accurate than registry-based reporting. This commenter recommended that ASCs not be subject to payment reductions for CY 2014, the first year when payment can be reduced under the ASCQR Program.

Response: We thank the commenter for this information. However, we do not know of any analysis for claims-based and registry-based data collected under the PQRS to support the claim that statistics from the PQRS Program show that claims-based reporting is less accurate than registry-based reporting. We are aware of a recently released competitive Request for Proposal (RFP) entitled ''Physician Quality Reporting System and Electronic Prescribing Incentive Program Data Assessment, Accuracy and Improper Payments Identification Support'' where we seek, among other purposes, to validate and verify the accuracy of Group Practice Reporting Option claims and registry data submitted by or on behalf of eligible professionals. This RFP is currently available and results from any connected work have not yet been initiated.

We do not agree that all ASCs should not be subject to payment reductions for the first year of the Program. We delayed the start of required data collection for the CY 2014 payment determination until October 1, 2012 (76 FR 74516) as suggested by public comments. We have provided time for ASCs to practice using QDCs. QDCs for ASCQR Program reporting may be used beginning with April 2012 services. Based upon an internal analysis, ASCs are successfully submitting these codes on their Medicare claims. Therefore, we did not propose and are not delaying the implementation of the payment reduction under the ASCQR Program.

Comment: Many commenters expressed their views on and made suggestions for ASCQR Program measures and measure specifications.

Response: We thank the commenters for taking the time to express these views and suggestions. However, we did not make any proposals regarding measures or measure specifications. We will consider these comments when we make proposals regarding ASCQR Program measures or measure specifications.

After consideration of the public comments we received, we are finalizing our proposal that the minimum threshold for successful reporting for the CYs 2014 and 2015 payment determinations be that at least 50 percent of claims meeting measure specifications contain QDCs. As discussed above, only claims where Medicare is the primary payer will be used in the calculation of data completeness for the CY 2014 payment determination.

c. ASCQR Program Validation of Claims-Based and Structural Measures

We received comments on the CY 2012 OPPS/ASC proposed rule requesting that rules for data validation be adopted as soon as possible (76 FR 74515). We noted that structural measures historically have not been validated through independent medical record review in our quality reporting programs for hospitals due to the lack of relevant information in medical record documentation for specific data elements of the measures, such as use of a safe surgery checklist. Likewise, we have not historically validated claims-based measures for hospitals. Thus, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28104), consistent with other CMS quality reporting programs, we did not propose to validate claims-based measures (beyond the usual claims validation activities conducted by our administrative contractors) and structural measures for the ASCQR Program.

Comment: Several commenters urged CMS to reconsider the need for data validation to ensure standardization and accuracy. Some of these commenters believed that such a data validation process should involve independent review of medical records. One commenter stated that, although it may be acceptable at this time to not perform validity testing on the data, it recommended that prior to using ASC measures for accountability purposes (for example, public reporting, pay for performance), CMS develop and deploy a plan for such testing. The commenter believed that scientific acceptability of the measure is, in part, based on the quality of the data that is used. Having taken such a validation step would be informative in both refining the measure and arriving upon a set of ASC measures.

Response: We appreciate and share the commenters' concern about standardization and the desire for accuracy. We agree that, before using data collected for a quality data reporting program for such activities as public reporting, it is preferable to be able to assess the accuracy of the data reported (we note that the ASCQR Program is a pay for reporting program and not pay for performance program). However, this preference is counterbalanced by the feasibility of being able to do so. Structural measures historically have not been validated through independent medical record review in our quality reporting programs for hospitals (the Hospital IQR and Hospital OQR Programs). We have not validated structural measures due to the lack of relevant information in medical record documentation for specific data elements of the measures, such as use of a safe surgery checklist. Because we do not believe at this time that there is a method for us to effectively validate structural measure data, we are not requiring a data validation process for our current structural measures under the ASCQR Program.

In regard to the current ASCQR Program claims-based measures, the number of events expected to be reported is small because most of the measures are for adverse or rare events. In this situation, any random selection of cases would require a burdensome sample size. Further, we expect the accuracy for reported adverse events to be high. Because we do not believe at this time that any results that could be obtained justify the burden associated with a data validation process which would necessitate an independent validation effort, we also are not requiring a data validation process for our current claims-based measures.

As we gain more experience with the ASCQR Program, we will reassess whether a data validation process for claims-based and structural measures is needed.

3. Extraordinary Circumstances Extension or Waiver for the CY 2014 Payment Determination and Subsequent Payment Determination Years

In our experience, there have been times when facilities have been unable to submit information to meet program requirements due to extraordinary circumstances that are not within their control. It is our goal to not penalize such entities for such circumstances and we do not want to unduly increase their burden during these times. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28104 through 28105), we proposed procedures for extraordinary circumstance extension or waiver requests for the submission of information, including but not limited to, QDCs submitted on claims, required under the ASCQR Program.

In the event of extraordinary circumstances, such as a natural disaster, that is not within the control of the ASC, we proposed to adopt a process for an extension or waiver for submitting information for meeting program requirements that is similar to the one adopted for the Hospital OQR Program because this process has been effective for hospitals, and we believe such a process also would be effective for ASCs. We proposed that an ASC would complete a request form that would be made available on the QualityNet Web site and submit the request to CMS. We proposed that the following information must be noted on the form:

- ASC CMS Certification Number (CCN) and related National Provider Identifier(s) [NPI(s)];
- ASC Name;
- Contact information for a person at the ASC with whom CMS can communicate about this request, including name, email address, telephone number, and mailing address (must include a physical address, a post office box address is not acceptable);
- ASC's reason for requesting an extension or waiver;
- Evidence of the impact of the extraordinary circumstances, including but not limited to photographs, newspaper and other media articles; and
- A date when the ASC would be able to submit required ASCQR Program information, and a reasonable basis for the proposed date.

We proposed that the request form would be signed by a person who has authority to sign on behalf of the ASC and a request form would be required to be submitted within 45 days of the date that the extraordinary circumstance occurred.

Following receipt of such a request, we proposed that CMS would—

(a) Provide a written acknowledgement using the contact information provided in the request, notifying the ASC contact that the ASC's request has been received;

(b) Provide a formal response to the ASC contact using the contact information provided in the request notifying the ASC of our decision; and

(c) Complete its review of any request and communicate its response within 90 days following CMS's receipt of such a request.

We proposed that we would also have discretion to grant waivers or extensions to ASCs that have not been formally requested by them when we determine that an extraordinary circumstance, such as an act of nature (for example, hurricane) affects an entire region or locale. We proposed that, if we make the determination to grant a waiver or extension to ASCs in a region or locale, we would communicate this decision to ASCs and vendors through routine communication channels, including, but not limited to, emails and notices on the QualityNet Web site.

We invited public comment on this proposed process for granting extraordinary circumstances extensions or waivers for the submission of information for the ASCQR Program.

Comment: Many commenters supported having a process for ASCs to apply for an extension or waiver of the submission of information under the ASCQR Program in the event of extraordinary circumstances. Some of these commenters recommended that the period of time an ASC can apply be extended, for example, to 90 days after such an event, rather than 45 days as proposed.

Response: We appreciate the commenters' support. Regarding the timeframe to request an extension or waiver, we have found that 45 days is sufficient time for hospitals to make such a request under the Hospital OQR Program. We believe that 45 days also would be sufficient time for ASCs to make such requests. We believe that more than 45 days to complete and submit a form will only serve to delay the process. We also proposed and are finalizing a policy that we would have discretion to grant waivers or extensions to ASCs that have not been formally requested by them when we determine

that an extraordinary circumstance, such as an act of nature (for example, hurricane) affects an entire region or locale.

Comment: Some commenters noted unforeseen issues related to information technology failures that could prevent ASCs from participating in the ASCQR Program. Examples of such included clearinghouses stripping the QDCs from claims before the claims go to the MAC for processing and problems with billing software not allowing the reporting of a code with a zero dollar charge.

Response: We are aware of situations where clearinghouses are removing QDCs from claims as well as of non-Medicare payers rejecting claims with QDCs as having invalid codes. We note that we issue an update tape containing all valid HCPCS codes and that clearinghouses should abide by the complete listing of HCPCS codes and should not remove these HCPCS codes from claims. However, we would consider inappropriate removal or rejection of QDCs by clearinghouses as well as private payers an extraordinary circumstance if the ASC was able to sufficiently document refusal by a clearinghouse or private payer to follow our HCPCS usage standards that could result in the ASC suffering substantial risk of having a payment reduction under the ASCQR Program. This documentation must include substantive efforts made by the ASC to inform the clearinghouse or private payer of the need to follow our HCPCS usage standards. We also are aware of the need for the placement of a nominal value in the payment field for some billing software and we have issued guidance on this issue. This guidance is currently available in the Question and Answer Tool on the QualityNet Web site located at *http://www.Qualitynet.org* under the question with Answer ID 158904 entitled ''What are the G-codes for the ASC measures, and where and how do I use them?''

After consideration of the public comments we received, we are finalizing our proposals without modification regarding a process for an extension or waiver of the submission of information required under the ASCQR Program.

4. ASCQR Program Reconsideration Procedures for the CY 2014 Payment Determination and Subsequent Payment Determination Years

We have established similar processes by which participating hospitals can submit requests for reconsideration of quality reporting program payment determinations for the Hospital IQR Program and the Hospital OQR Program. We believe these reconsideration processes have been effective in the hospital quality reporting programs and such a process would be effective for ASC quality reporting. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28105), we proposed to implement a reconsideration process for the ASCQR Program modeled after the reconsideration processes we implemented for the Hospital IQR and Hospital OQR Programs.

We proposed that an ASC seeking reconsideration would be required to submit to CMS a Reconsideration Request form that would be made available on the QualityNet Web site. We proposed that the request form would be signed by a person who has authority to sign on behalf of the ASC and that this form must be submitted by March 17 of the affected payment year (for example, for the CY 2014 payment determination, the request must be submitted by March 17, 2014).

We proposed to use a deadline of March 17 to provide sufficient time for an ASC to see the effects of a payment reduction on its January claims. Administrative contractors have 30 days to process (pay or deny) clean claims. Administrative contractors have 45 days to process claims other than clean ones (that is, claims that require the contractor to query for more information, look at medical documentation, among others) (Claims Processing Manual, Chapter 1, Section 80; sections 1869(a)(2), 1816(c)(2) and 1842(c)(2) of the Act). We proposed March 17 because this date is 45 days after an ASC would have had the opportunity to provide one full month of services (that is, March 17 is 45 days after January 31).

This Reconsideration Request form would contain the following information:

- ASC CCN and related NPI(s);
- ASC Name;
- CMS-identified reason for not meeting the affected payment year's ASCQR Program requirements as provided in any CMS notification to the ASC;
- ASC basis for requesting reconsideration. We proposed that the ASC must identify the ASC's specific reason(s) for believing it met the affected payment year's ASCQR Program requirements and should receive the full ASC annual payment update;
- Contact information for a person at the ASC with whom CMS can communicate about this request, including name, email address, telephone number, and mailing address (must include physical address, not just a post office box); and,
- A copy of all materials that the ASC submitted to comply with the affected payment year's ASCQR Program requirements. With regard to information submitted on claims, we proposed that ASCs would not be required to submit copies of all submitted claims, but instead would focus on the specific claims at issue. Thus, ASCs would submit relevant information, which could include copies of the actual claims at issue.

Following receipt of a request for reconsideration, we proposed that we would:

- Provide an email acknowledgement, using the contact information provided in the reconsideration request, to the ASC contact notifying the ASC that the ASC's request has been received; and
- Provide a formal response to the ASC contact, using the contact information provided in the reconsideration request, notifying the ASC of the outcome of the reconsideration process.

We stated that we intend to complete any reconsideration reviews and communicate the results of these determinations within 90 days following the deadline for submitting requests for reconsideration.

We stated that we intend to issue proposals regarding appeals of ASCQR Program reconsideration decisions in a future rulemaking.

We invited public comment on our proposed reconsideration procedures.

Comment: Several commenters supported the CMS proposal to have a reconsideration process. Some of these commenters recommended longer timeframes for an ASC to submit a request than the proposed March 17th deadline, including April 15th and a minimum of 90 days.

Response: We appreciate the commenters' support. We also appreciate suggestions by some commenters to extend the time to submit a reconsideration request. However, we believe the March 17 deadline to submit a reconsideration request provides ASCs with sufficient time to assess the effects of a payment reduction on their January claims. We also note that the March 17 deadline is later than the February 2 deadline that the Hospital OQR Program allows and the Hospital OQR Program also involves a calendar year payment determination.

Comment: Some commenters believed that the need for appeals could be mitigated if CMS incorporates a reporting feedback program that periodically updates ASCs on their reporting status.

Response: We thank these commenters for expressing this view. An automated reporting system with feedback reports as is supplied for the Hospital IQR and OQR Programs will be available for the ASCQR Program. We plan to begin a reporting feedback program during 2013. We intend to provide feedback on the October 1, 2012, to December 31, 2012 claims-based measures, via a report that will be supplied via an ASC's QualityNet account. ASCs will be able to access these automated reports via their QualityNet accounts beginning in 2013. Information regarding feedback reports will be available on the QualityNet Web site (*http://www.QualityNet.org*).

After consideration of the public comments we received, we are finalizing our proposals regarding ASCQR Program reconsideration procedures for the CY 2014 payment determination and subsequent payment determination years.

Comment: Commenters expressed views and suggestions regarding additional topics including mechanisms to increase ASC awareness of the ASCQR Program and alternate reporting mechanisms.

Response: We thank these commenters for their suggestions for improving the ASCQR Program. Although we did not make proposals on these topics, we will consider these views for future rulemaking and program development. We have been making efforts to supply information to ASCs regarding the ASCQR Program including information posted on the QualityNet Web site (*http://www.QualityNet.org*), an educational mailing to ASCs, and an online question and answer tool (*http://cms-ocsq.custhelp.com*) which is also accessible via the QualityNet Web site.

F. Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program

1. Statutory Authority

Section 1886(s)(4) of the Act, as added and amended by sections 3401(f) and 10322(a) of the Affordable Care Act, requires the Secretary to implement a quality reporting program for inpatient psychiatric hospitals and psychiatric units. Section 1886(s)(4)(A)(i) of the Act requires that, for rate year (RY) 2014 and each subsequent rate year, the Secretary shall reduce any annual update to a standard Federal rate for discharges occurring during such rate year by 2.0 percentage points for any inpatient psychiatric hospital or psychiatric unit that does not comply with quality data submission requirements with respect to an applicable rate year.

We note that section 1886(s)(4)(A)(i) of the Act uses the term ''rate year.'' Beginning with the annual update of the inpatient psychiatric facility prospective payment system (IPF PPS) that took effect on July 1, 2011 (RY 2012), we aligned the IPF PPS update with the annual update of the ICD–9–CM codes, which are effective on October 1 of each year. The change allows for annual payment updates and the ICD–9–CM coding update to occur on the same schedule and appear in the same **Federal Register** document, thus making updating rules more administratively efficient. To reflect the change to the annual payment rate update cycle, we revised the regulations at 42 CFR 412.402 to specify that, beginning October 1, 2012, the 12-month period of October 1 through September 30 is referred to as a fiscal year (76 FR 26435). For more information regarding this terminology change, we refer readers to section III. of the RY 2012 IPF PPS final rule (76 FR 26434 through 26435). For purposes of the discussion below, the term ''rate year'' and ''fiscal year'' both refer to the period beginning October 1 and ending September 30. To avoid any confusion that may be caused by using the term ''rate year'' with respect to the inpatient psychiatric hospitals and psychiatric units quality reporting program, we will use the term ''fiscal year'' rather than ''rate year'' throughout this proposed rule, even when we are referring to statutory provisions that refer to ''rate year.''

As provided in section 1886(s)(4)(A)(ii) of the Act, the application of the reduction for failure to report under section 1886(s)(4)(A)(i) of the Act may result in an annual update of less than 0.0 percent for a fiscal year, and may result in payment rates under section 1886(s)(1) of the Act being less than such payment rates for the preceding year. In addition, section 1886(s)(4)(B) of the Act requires that the application of the reduction to a standard Federal rate update be noncumulative across fiscal years. Thus, any reduction applied under section 1886(s)(4)(A) of the Act will apply only with respect to the fiscal year rate involved and the Secretary shall not take into account such reduction in computing the payment amount under the system described in section 1886(s)(1) of the Act for subsequent years.

Section 1886(s)(4)(C) of the Act requires that, for FY 2014 (October 1, 2013 through September 30, 2014) and each subsequent year, each psychiatric hospital and psychiatric unit shall submit to the Secretary data on quality measures as specified by the Secretary. Such data shall be submitted in a form and manner, and at a time, specified by the Secretary. Under section 1886(s)(4)(D)(i) of the Act, measures selected for the quality reporting program must have been endorsed by the entity with a contract under section 1890(a) of the Act. The NQF currently holds this contract. The NQF is a voluntary, consensus-based, standard-setting organization with a diverse representation of consumer, purchaser, provider, academic, clinical, and other health care stakeholder organizations. The NQF was established to standardize health care quality measurement and reporting through its consensus development process. We generally prefer to adopt NQF-endorsed measures in our reporting programs with some exceptions as provided by law.

For purposes of the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program, section 1886(s)(4)(D)(ii) of the Act provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Finally, pursuant to section 1886(s)(4)(D)(iii) of the Act, the Secretary shall publish the measures applicable to the FY 2014 IPFQR Program no later than October 1, 2012.

Section 1886(s)(4)(E) of the Act requires the Secretary to establish procedures for making public the data submitted by inpatient psychiatric hospitals and psychiatric units under the quality reporting program. Such procedures must ensure that a facility has the opportunity to review its data prior to such data being made public. The Secretary must report quality measures that relate to services furnished by the psychiatric hospitals and units on a CMS Web site.

2. Application of the Payment Update Reduction for Failure To Report for FY 2014 Payment Determination and Subsequent Years

Beginning in FY 2014, section 1886(s)(4)(A)(i) of the Act requires the application of a 2.0 percentage point reduction to the applicable annual update to a Federal standard rate for those psychiatric hospitals and psychiatric units that fail to comply with the quality reporting requirements implemented in accordance with

section 1886(s)(4)(C) of the Act, as detailed below. The application of the reduction may result in an annual update for a fiscal year that is less than 0.0 percent and in payment rates for a fiscal year being less than the payment rates for the preceding fiscal year. Pursuant to section 1886(s)(4)(B) of the Act, any such reduction is not cumulative and it will apply only to the fiscal year involved. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28106), we proposed to add new regulatory text at 42 CFR 412.424 to codify these requirements.

We invited public comment on the proposed application of the payment reduction to the annual update of the standard Federal rate for failure to report data on measures selected for FY 2014 and subsequent years. We did not receive any public comments on this issue.

We are finalizing the policy for the application of the payment reduction to the annual update of the standard Federal rate for failure to report quality data for FY 2014 and subsequent years as proposed.

3. Covered Entities

The quality reporting requirements in this final rule cover those psychiatric hospitals and psychiatric units that are reimbursed under Medicare's IPF PPS (42 CFR 412.404(b)). For more information on the application of and exceptions to the IPF PPS reimbursement, we refer readers to the section IV. of the November 15, 2004 IPF PPS final rule (69 FR 66926). In this final rule, we are using the term ''inpatient psychiatric facility'' (IPF) to refer to both inpatient psychiatric hospitals and psychiatric units. This usage follows the terminology we have used in the past in our IPF PPS regulations (42 CFR 412.402).

Comment: A few commenters requested that CMS clarify the applicability of the IPFQR Program. One commenter recommended that CMS indicate the applicable patient population and facilities for the IPFQR Program. One commenter asked for clarification on the applicability of the IPFQR Program to acute care hospitals containing psychiatric units that are paid under the IPF PPS. A few commenters requested clarification on whether the program applies to an inpatient psychiatric unit within a children's hospital, where both have the same CCN number, and whether the payment reduction applies to that unit's patients or to the entire hospital.

Response: As we note in the above section, the IPFQR Program applies to all IPFs paid under the IPF PPS. The IPF PPS is applicable to freestanding psychiatric hospitals, including government-operated psychiatric hospitals, and distinct part psychiatric units of acute care hospitals and critical access hospitals (CAHs). The IPFQR Program does not apply to inpatient psychiatric units within a children's hospital because children's hospitals are paid under a different payment system. More specifically, the IPF PPS applies to inpatient hospital services furnished by Medicare participating entities in the United States [244] that are classified as psychiatric hospitals or psychiatric units as specified in § 412.22, § 412.23(a), §§ 482.60 through 82.62, § 412.25, and § 412.27. However, hospitals paid under the provisions specified in § 412.22(c) are not paid under the IPF PPS.[245] If a person is an inpatient of an IPF, then all services (both physical and psychiatric) must be provided by the IPF and are bundled into the IPF payment.[246]

Comment: One commenter suggested that CMS partner with the American Hospital Association (AHA) to educate IPFs about IPFQR Program applicability and to consider delaying the implementation of the IPFQR Program until outreach and education has been conducted.

Response: We thank the commenter for their suggestions and will consider collaborating with the AHA and other entities in future outreach and education efforts. We note that we conducted two Listening Sessions on June 2, 2011 and June 8, 2011 for outreach and educational purposes. The transcript is available on the CMS Web site at: *http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/HospitalHighlights.html.*

We believe these public listening sessions have provided stakeholders adequate information to implement the IPFQR Program within their respective entities/organizations. We considered the burden associated with quality data reporting, the comments received in this rule and during these public listening sessions, and the statutory mandate to begin this program effective with the FY 2014 payment determination. Based on the general overall support in this rule and the public listening sessions, we believe that the public benefit of reporting of quality data outweighs the burden associated with quality data reporting. We are implementing the IPFQR Program in accordance with the proposed schedule.

4. Quality Measures

a. Considerations in Selecting Quality Measures

For purposes of the IPFQR Program, section 1886(s)(4)(D)(i) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act. The statutory requirements under section 1886(s)(4)(D)(ii) of the Act provide an exception that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

In implementing the IPFQR Program, our overarching objective is to support the HHS National Quality Strategy's three-part aim of better health care for individuals, better health for populations, and lower costs for health care services (*http://www.ahrq.gov/workingforquality/nqs/#aims*). Implementation of the IPFQR Program will help achieve the three-part aim by creating transparency around the quality of care provided at IPFs to support patient decision-making and quality improvement. Over time, the IPFQR Program will help align the goals for quality measurement and improvement at IPFs with those of other providers in the health care system.

We seek to collect data in a manner that balances the need for information related to the full spectrum of quality performance and the need to minimize the burden of data collection and reporting. We have focused on measures that have high impact and support CMS and HHS priorities for improved quality and efficiency of care provided by IPFs. We applied the following considerations for the development and selection of measures:

[244] As specified in § 400.200, the United States means the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands.

[245] These include Department of Veterans Affairs hospitals, hospitals that are reimbursed under State cost control systems approved under 42 CFR Part 403, hospitals that are reimbursed in accordance with demonstration projects specified in section 402(a) of Public Law 90–248 (42 U.S.C. 1395b–1) or section 222(a) of Public Law 92–603 (42 U.S.C. 1395b–1(note)), and nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

[246] Section 412.404 states that the IPF must furnish all the necessary covered services to a Medicare beneficiary who is an inpatient of the IPF, either directly or under arrangement.

• Given the availability of well-validated measures and the need to balance breadth with minimizing burden, the measures should address, as fully as possible, the six domains of measurement that arise from the six priorities of the National Quality Strategy (NQS): Clinical care; person- and caregiver-centered experience and outcomes; safety; efficiency and cost reduction; care coordination; and community/population health.

• Public reporting should rely on a mix of standards, outcomes, process of care measures, and patient experience of care measures, including measures of care transitions and changes in patient functional status, with an emphasis on measurement as close to the patient-centered outcome of interest as possible.

• The measure sets should evolve so that they include a focused set of measures appropriate to IPFs that reflects the level of care and the most important areas of service and measures for IPFs as well as measures addressing a core set of measure concepts that align quality improvement objectives across all provider and supplier types and settings.

• Measures should address gaps in quality of inpatient psychiatric care.

• As part of our burden reduction efforts, we continuously seek to weigh the relevance and utility of the measures compared to the burden on hospitals in submitting data under the IPFQR Program. As appropriate, we will align our measures with other Medicare and Medicaid quality programs and may consider how we can incorporate data reporting by means of electronic reporting mechanisms, so that the collection of performance information is part of care delivery.

• To the extent practicable, measures used by CMS should be nationally endorsed by a multistakeholder organization. Measures should be aligned with best practices among other payers and the needs of the end users of the measures. We take into account widely accepted criteria established in medical literature. We consider suggestions and input from technical expert panels (TEPs), convened by CMS contractors, which evaluate IPFQR quality measures for importance, scientific soundness, usability, and feasibility.

We also take into account national priorities and HHS Strategic Plans and Initiatives:

• HHS engaged a wide range of stakeholders to develop the National Quality Strategy, as required by the Affordable Care Act, which pursues three aims (better care, healthy people, and affordable care) that establish a framework with six identifiable priorities (*http://www.hhs.gov/secretary/about/priorities.html* and *http://www.ahrq.gov/workingforquality/ngs*):

•• Ensuring that each person and family is engaged as partners in their care.

•• Promoting effective communication and coordination of care.

•• Promoting the most effective prevention and treatment practices for the leading causes of mortality, starting with cardiovascular disease.

•• Working with communities to promote wide use of best practices to enable healthy living.

•• Making quality care more affordable for individuals, families, employers, and governments by developing and spreading new health care delivery models.

•• Making care safer by reducing harm caused in the delivery of care.

• We consider recommendations of the MAP for the inclusion of clinical quality measures (*http://www.qualityforum.org.map/*). The MAP is a public-private partnership convened by the NQF for the primary purpose of providing input to HHS on selecting performance measures for quality reporting programs and pay-for-reporting programs.

• HHS is the United States Government's principal department for protecting the health of all Americans. HHS accomplishes its mission through programs and initiatives. The goals of the HHS Strategic Plan for FYs 2010 through 2015 are: Strengthen Health Care; Advance Scientific Knowledge and Innovation; Advance the Health, Safety, and Well-Being of the American People; Increase Efficiency, Transparency, and Accountability of HHS Programs; and Strengthen the Nation's Health and Human Services Infrastructure and Workforce (*http://www.hhs.gov/secretary/about/priorities.html*). HHS will update this strategic plan every 4 years and measure its progress in addressing specific national problems, needs, or mission-related challenges.

HHS prioritizes policy and program interventions to address the leading causes of death and disability in the United States, including heart disease, cancer, stroke, chronic lower respiratory diseases, unintentional injuries, and preventable behaviors. Initiatives such as the HHS Action Plan to Reduce Healthcare-Associated Infections in clinical settings and the Partnership for Patients exemplify these programs.

• CMS Strategic Plan—CMS strives: (1) To ensure measures for different Medicare and Medicaid quality programs are aligned with priority quality goals, measure specifications are aligned across settings, and outcome measures are used whenever possible; and (2) to move towards the collection of quality measures from electronic health records (EHRs) as appropriate.

We invited public comments on the considerations used for the development and selection of quality measures for the IPFQR Program.

Comment: Two commenters believed that measures adopted for the IPFQR Program should be evidence-based, nationally endorsed, mirror the NQS, and measure high cost, high volume, and problem prone areas. Additionally, the commenters stated that the methodology for adding and removing measures should mirror that of the Hospital IQR Program. Also, the commenters recommended that CMS not add new measures in the near future while IPFs are acquiring more experience with the IPFQR Program.

Response: We thank the commenters for the input on the IPFQR Program quality measures. As indicated in the proposed rule and moving forward in future rulemakings, we intend to consider widely accepted measure criteria established in medical literature, adopt measures that are endorsed by multi-stakeholders, address the priorities of the NQS, and address high cost, high volume and problem prone areas. Our goal is to align the administrative requirements of the IPFQR Program with other quality reporting programs such as the Hospital IQR Program.

After consideration of the public comments we received, we are finalizing the considerations which we will use for the development and selection of the quality measures for the IPFQR Program in the future.

b. Quality Measures Beginning with FY 2014 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28107), we proposed to adopt six quality measures for FY 2014 and subsequent fiscal years. In selecting the proposed quality measures discussed below, we strived to achieve several objectives. First, we believe the measures we proposed relate to the general aims of better care, better health, and lower cost and address the six domains of quality measurement as fully as possible. Second, we believe the measures are tailored to the needs of improved quality in IPFs; thus, the measures selected are those most

relevant to IPFs. Third, we believe the measures promote alignment of quality improvement objectives across provider settings. Finally, we believe the measures are minimally burdensome to IPFs.

We recognize that any quality reporting program will impose certain data collection and reporting requirements on participating facilities. However, we believe that the proposed measures minimize the collection and reporting burden on IPFs because, under Medicare's IPF CoPs (42 CFR 482.61), IPFs must maintain documentary evidence of detailed treatment approaches and aftercare considerations. Further, under 42 CFR 482.21, IPFs are required to develop, implement, and maintain an effective, ongoing, hospital-wide data-driven quality assessment and performance improvement (QAPI) program as well as documentary evidence of such program for purposes of demonstrating their operation to CMS. More importantly, § 482.21 requires that IPFs measure, analyze, and track certain quality indicators, including adverse patient events, and other aspects of performance that enable the hospital to assess processes of care, hospital services, and operations as part of their QAPI Program. Because the proposed IPFQR Program measures cover processes that IPFs are currently recording as Medicare CoPs, we do not believe that reporting on the proposed measures under the IPFQR Program would impose a significant additional burden on IPFs. We note that over one-quarter of IPFs [247] are also already reporting data needed to calculate the proposed measures to The Joint Commission (TJC) for purposes of TJC accreditation. Thus, the IPFQR Program will impose little additional burden for those IPFs.

After considering the recommendations and feedback from content area experts and multiple stakeholders, we proposed, for the FY 2014 payment determination and subsequent years, six NQF-endorsed, Hospital-Based Inpatient Psychiatric Services (HBIPS) measures, which have been developed by and are maintained by TJC for purposes of assessing the quality of inpatient psychiatric services. These measures are: (1) HBIPS–2: Hours of Physical Restraint Use (NQF #0640); (2) HBIPS–3: Hours of Seclusion Use (NQF #0641); (3) HBIPS–4: Patients Discharged on Multiple Antipsychotic Medications (NQF #0552); (4) HBIPS–5: Patients Discharged on Multiple Antipsychotic Medications with Appropriate Justification (NQF #0560); (5) HBIPS–6: Post Discharge Continuing Care Plan Created (NQF #0557); and (6) HBIPS–7: Post-Discharge Continuing Care Plan Transmitted to Next Level of Care Provider Upon Discharge (NQF #0558).[248]

These six proposed process measures are NQF-endorsed and were recommended by the MAP [249] for inclusion in the IPFQR Program. The six proposed measures align with three of the six priorities of the National Quality Strategy: Patient safety, promoting effective prevention and treatment practices (clinical quality of care), and promoting effective communication and coordination of care. Technical specifications for these measures can currently be found on the Web site of TJC, the measure steward, at: *http://www.manual.jointcommission.org/releases/TJC2012B/HospitalBasedInpatientPsychiatricServices.html.*

As noted earlier, these six HBIPS measures are currently in use by an estimated 450 TJC-accredited IPFs, thereby posing minimal collection burden for these facilities. We note that an estimated 1,100 facilities, which do not routinely report to TJC, will incur some data collection burden. In addition, summary analyses of current measure results provided to CMS by TJC demonstrate variation in performance among the facilities currently reporting results for these measures, suggesting continued opportunity for quality improvement.

Section 1886(s)(4)(D)(i) of the Act requires that quality measures selected for the IPFQR Program be endorsed by the entity with a contract under section 1890(a) of the Act. As discussed earlier, the current holder of this contract is NQF. The proposed measures are currently NQF-endorsed for reporting overall performance rates and rates for four age groups (children, adolescents, adults, and older adults). We proposed to require reporting of data for all four age groups for which the measures are currently endorsed. More details regarding this proposal are included in section VIII.F.7. of the preamble of this final rule. In addition to aligning with previous collection and reporting of these measures by TJC, our proposal reflects the feedback provided by the subject-matter TEP convened by the CMS measure development contractor for this program and focus groups of hospitals and vendors involved in providing inpatient psychiatric services.

We proposed to collect aggregate data rather than patient-level data for FY 2014 and subsequent years in recognition of the considerable burden to IPFs not accustomed to reporting patient-level data. Hospitals are free to use our paper abstraction tool and utilize commonly available software, like spreadsheets, to enter and compute measure rates. We intend to provide a template using a commonly available spreadsheet format used by many hospitals which will be available on the QualityNet Web site (*http://www.qualitynet.org/*). Further, IPFs are free to procure services from TJC vendors to assist them with data collection. However, we note that we do not require the use of TJC vendors. Proposals for collection requirements and submission timeframes are included in section VIII.F.7. of the preamble of this final rule. The six proposed measures for FY 2014 and subsequent years are described in more detail below.

Comment: Many commenters strongly supported the six proposed measures for the IPFQR Program. The commenters believed that these measures are appropriate and will make these data available on behavioral health public and will provide opportunities for national benchmarking and maximizing performance improvement.

Response: We appreciate the encouragement and support of the measures. We are committed to promoting and improving the quality of care for Medicare beneficiaries with mental illnesses.

(1) HBIPS–2 (Hours of Physical Restraint Use)

The use of physical restraints increases a patient's risk of physical injury as well as psychological harm.[250,251] This intervention is intended for use only if a patient is in imminent danger to him/herself or others and if less restrictive interventions have failed. It is not intended to address staff shortages or to

[247] Out of the 1,741 existing IPFs, 450 are currently reporting the proposed measures to TJC. This equates to approximately 26 percent of IPFs that already report the measures on a regular basis.

[248] TJC has developed seven Hospital-Based Inpatient Psychiatric Services (HBIPS) measures. Only six of these seven measures were proposed for the FY 2014 payment determination; HBIPS–1 was not proposed.

[249] Measure Application Partnership, *Pre-Rulemaking Final Report: Input on Measures under Consideration by HHS for 2012 Rulemaking,* pages 95–96,. Available at: *http://www.qualityforum.org/map/.*

be used as a form of discipline or coercion. The President's New Freedom Commission on Mental Health [252] explicitly recommends the reduction of restraint use to improve quality of care. A measure designed to reduce the use of restraints will also help achieve the National Quality Strategy's goal to improve patient safety and reduce the risk of harm from care.

In addition to initiatives to reduce the use of restraints, the subject-matter TEP convened by our measure development contractor identified patient safety as an important measure concept and recommended the use of the measure HBIPS–2 (Hours of Physical Restraint Use) in a national IPF quality reporting program. HBIPS–2 is a process measure that is reported as the total number of hours of physical restraint (HBIPS–2) use for all patients admitted to an inpatient psychiatric facility. We believe that fewer reported hours of physical restraint use suggest higher quality of care because reduced restraint time lowers patient risk for physical injury and psychological harm.

The numerator is defined as the total number of hours that all psychiatric inpatients were maintained in physical restraint. The denominator is defined as the number of psychiatric inpatient hours overall. Total leave days are excluded from the denominator.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–2 also meets a number of additional considerations we take into account when proposing quality measures for the IPFQR Program. The measure assesses the quality of care provided for inpatient psychiatric patients at the facility level. Approximately 450 IPFs are already collecting data on the measure for purposes of TJC accreditation. HBIPS–2 received support from the MAP and is aligned with the National Quality Strategy priority for providing safer care.

We invited public comments on the inclusion of the proposed quality measure HBIPS–2, Hours of Physical Restraint Use, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We thank the commenters for the support of this measure.

Comment: One commenter recommended that HBIPS–2 be revised to reduce provider burden and data variability.

Response: We thank the commenter for the feedback on the measure. The NQF submission materials for HBIPS–2 submitted by TJC included data from a sample of pilot hospitals that demonstrated that the data elements for the measure can be collected in a standardized and reliable manner. As we have mentioned, data on this measure are currently reported by approximately 450 TJC-accredited IPFs. During focus groups with representatives of these facilities, convened by our measure development contractor, respondents reported that burden of reporting data on the HBIPS–2 measure was not unreasonable as it is already reported by a subset of IPFs, and is consistent with the level of burden associated with other quality measures. We recognize that some reporting burden may occur; however, we believe that the significance and importance of the measurement of hours of physical restraints use in IPFs outweighs the burden of reporting.

Comment: One commenter recommended risk adjusting or stratifying the measure by diagnosis category and admission characteristics (for example, voluntary versus involuntary) to increase its usefulness and interpretability. The commenter further recommended excluding the day of admission when assessing the number of hours of restraint to control for variation related to diagnosis category and admission characteristics.

Response: We appreciate the commenter's feedback. This measure is consistent with current treatment guidelines, endorsed by NQF, and currently reported, as specified, to TJC. We note that in making its endorsement decision, NQF carefully considered the measurement period that includes the day of admission and the need to risk adjust or stratify performance on HBIPS–2. TJC is currently monitoring reported performance to further assess the use of physical restraints.

Comment: One commenter recommended modifying the measure to assess the amount of time spent in restraint in minutes rather than in hours.

Response: We appreciate the commenter's feedback. During focus groups sessions with both TJC-accredited IPFs and nonaccredited IPFs, our measure development contractor found that the current practice of reporting HBIPS–2 in hours is useful and understandable to them. We believe that reporting HBIPS–3 in minutes would require additional user testing before it could be implemented.

After consideration of the public comments we received, we are finalizing the HBIPS–2, Hours of Physical Restraint Use measure for the FY 2014 payment determination and subsequent years.

(2) HBIPS–3 (Hours of Seclusion Use)

The use of seclusion increases a patient's risk of physical injury as well as psychological harm.[253,254] This intervention is intended for use only if a patient is in imminent danger to him/herself or others and if less restrictive interventions have failed. It is not intended to address staff shortages or to be used as a form of discipline or coercion. The President's New Freedom Commission on Mental Health explicitly recommends the reduction of seclusion use to improve quality of care.[255] Measures designed to reduce the use of seclusion will also help achieve the National Quality Strategy's goal to improve patient safety and reduce the risk of harm from care.

The subject-matter TEP convened by our measure development contractor identified patient safety as an important measure concept and recommended the use of HBIPS–3 (Hours of Seclusion Use) in a national IPF quality reporting program. HBIPS–3 is a process measure that is reported as the total number of hours of seclusion use for all patients admitted to an IPF. We believe that fewer reported hours of seclusion use suggest higher quality of care because reducing seclusion time lowers patient risk for physical injury and psychological harm.

The numerator is defined as the total number of hours all psychiatric inpatients were held in seclusion. The denominator is defined as the number of psychiatric inpatient hours overall. Total leave days are excluded from the denominator.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–3 also meets a number of additional considerations we take into

account when proposing quality measures for the IPFQR Program. The measure assesses the quality of care provided for inpatient psychiatric patients at the facility level. Approximately 450 IPFs are already collecting the measure for purposes of TJC accreditation. HBIPS–3 received support from the MAP and is aligned with the National Quality Strategy priority for providing safer care.

We invited public comment on the inclusion of the proposed quality measure HBIPS–3, Hours of Seclusion Use, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We thank the commenters for the support of this measure.

Comment: One commenter suggested that HBIPS–3 should be revised to reduce provider burden and data variability.

Response: We thank the commenters for their feedback on the measure.

The NQF submission materials for HBIPS–3 submitted by TJC included data from a sample of pilot hospitals that demonstrated that the data elements for the measure can be collected in a standardized and reliable manner. As we have mentioned, this measure is currently reported by approximately 450 TJC-accredited IPFs. During focus groups with representatives of these facilities, convened by our measure development contractor, respondents reported that burden of reporting HBIPS–3 was not unreasonable as it is already reported by a subset of IPFs, and is consistent with that associated with other quality measures. We recognize there may be some reporting burden. However, we believe that the significance and importance of the measurement of hours of seclusion use in IPFs outweighs the burden of reporting.

Comment: One commenter recommended risk adjusting or stratifying the measure by diagnosis category and admission characteristics (for example, voluntary versus involuntary) to increase its usefulness and interpretability. The commenter further recommended excluding the day of admission when assessing the number of hours of seclusion to control for variation related to diagnosis category and admission characteristics.

Response: We appreciate the commmenter's feedback. This measure is consistent with current treatment guidelines, endorsed by NQF, and reported, as specified, to TJC. We note that in making its endorsement decision, NQF carefully considered the measurement period that includes the day of admission and the need to risk adjust or stratify performance on HBIPS–3. TJC is currently monitoring reported performance to further assess the use of seclusion.

Comment: One commenter recommended modifying the measure to assess the amount of time spent in seclusion in minutes rather than in hours.

Response: We appreciate the commenter's recommendations. During focus group sessions with TJC-accredited IPFs and non-accredited IPFs, our measure development contractor found that the current practice of reporting HBIPS–2 in hours is useful and understandable to them. We believe that reporting HBIPS–3 in minutes would require additional user testing before it could be implemented.

After consideration of the public comments we received, we are finalizing the HBIPS–3 (Hours of Seclusion Use) measure for the FY 2014 payment determination and subsequent years

(3) HBIPS–4 (Patients Discharged on Multiple Antipsychotic Medications)

An estimated 30 percent to 50 percent of patients in IPFs are treated with two or more antipsychotic medications, which can lead to serious side effects. Among patients without a history of treatment failure on a single antipsychotic, there is insufficient evidence to conclude that patients experience better outcomes if they are prescribed multiple antipsychotics compared to a single antipsychotic. Given the risk of side effects, stakeholders such as the National Association of State Mental Health Program Directors have called for the reduction of unnecessary use of multiple antipsychotics.[256] The American Psychiatric Association recommends the use of multiple antipsychotics only if a patient has had failed attempts on single antipsychotics. In efforts to promote effective treatment practices, a National Quality Strategy priority, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28109), we proposed to include the process measure HBIPS–4, Patients Discharged on Multiple Antipsychotic Medications, in the FY 2014 IPFQR Program. The MAP and the subject-matter TEP convened by our measure development contractor support the inclusion of this measure in the IPFQR Program.

TJC designed HBIPS–4 as part of a paired set with HBIPS–5 (described below), meaning they were developed to be used together. HBIPS–4 is reported as the rate of patients discharged on multiple antipsychotics among patients discharged on at least one antipsychotic medication. We believe that lower rates are indicative of higher quality of care because reducing the use of multiple antipsychotics reduces the potential risks of harmful side effects to patients. However, there is no expectation that zero percent is the desired outcome because it is recognized that in some circumstances, use of multiple antipsychotics may be appropriate.

The numerator is defined as psychiatric inpatients discharged on two or more routinely scheduled antipsychotic medications. The denominator is defined as all psychiatric inpatient discharges in which the patient was discharged on one or more antipsychotic medications. The measure excludes patients who died, patients with an unplanned departure resulting in discharge due to elopement, and patients with an unplanned departure resulting in discharge due to failing to return from leave.

Taken together, HBIPS–4 and HBIPS–5 are intended to help reduce unnecessary use of multiple antipsychotics and to promote better clinical outcomes and reduced side effects for patients.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–4 also meets a number of additional considerations we take into account when proposing quality measures for the IPFQR Program. The measure assesses the quality of care provided for inpatient psychiatric patients at the facility level. Approximately 450 IPFs already are collecting and reporting the measure for purposes of TJC accreditation. HBIPS–4 received support from the MAP and is aligned with the National Quality Strategy priority for promoting effective prevention and treatment practices.

We invited public comment on the inclusion of the proposed quality measure HBIPS–4, Patients Discharged on Multiple Antipsychotic Medications, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission

[256] National Association of State Mental Health Program Directors. Technical report on polypharmacy. Alexandria, VA: 2001. Retrieved from *http://www.nasmhpd.org/general_files/publications/med_directors_pubs/Polypharmacy.PDF*.

timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We appreciate the commenters' support of the measure.

Comment: One commenter objected to the paired measures HBIPS–4 and HBIPS–5, as they are currently specified, citing the potential for misinterpretation since a low performance rate on HBIPS–4 indicates higher quality care while a high performance rate on HBIPS–5 indicates higher quality care. The commenter suggested combining HBIPS–4 and HBIPS–5 into a single measure.

Response: We appreciate the commenter's input on HBIPS–4 and HBIPS–5. Currently, these two measures are endorsed by NQF as paired measures; the measure specifications are consistent with medical guidelines and are currently reported, as specified, to TJC. Consistent with our experience with other reporting programs, we understand that some consumers may misinterpret low rates on HBIPS–4 as poor performance. In order to minimize confusion and misunderstanding, we intend to test displays with target audiences and incorporate feedback into the display before public reporting.

Comment: Two commenters believed that the denominator for HBIPS–4 is defined as ''psychiatric inpatients discharged on one or more routinely scheduled antipsychotic medications'' as opposed to ''all psychiatric inpatient discharges.''

Response: We inadvertently did not correctly describe the denominator in the proposed rule. We clarify that the denominator is all psychiatric inpatient discharges ''in which a patient was discharged on one or more antipsychotic medications.'' We will ensure that the language is accurate in future documents.

After consideration of the public comments we received, we are finalizing the HBIPS–4 (Patients Discharged on Multiple Antipsychotic Medications) measure for the FY 2014 payment determination and subsequent years. We note that the denominator is defined as all psychiatric inpatient discharges in which a patient was discharged on one or more antipsychotic medications.

(4) HBIPS–5 (Patients Discharged on Multiple Antipsychotic Medications With Appropriate Justification)

In efforts to promote effective treatment practices, a National Quality Strategy priority, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28109), we proposed to include the process measure HBIPS–5, Patients Discharged on Multiple Antipsychotic Medications with Appropriate Justification, in the FY 2014 IPFQR Program. The MAP and the subject-matter TEP convened by our measure development contractor support the inclusion of this measure in the IPFQR Program.

TJC designed HBIPS–5 as part of a paired set with HBIPS–4, meaning they were developed to be used together. HBIPS–5 is collected on those patients discharged on multiple antipsychotics and is reported as the rate of patients discharged on multiple antipsychotics with appropriate justification. This measure was designed in recognition that there is a subsample of patients for whom multiple antipsychotic use may be appropriate. TJC has identified the following justifications as appropriate reasons for discharging a patient on multiple antipsychotics: (1) The medical record contains documentation of a history of a minimum of three failed trials of monotherapy; (2) the medical record contains documentation of a recommended plan to taper to monotherapy or documentation of a plan to decrease the dosage of one or more antipsychotic medications while increasing the dosage of another antipsychotic medication to a level that manages the patient's symptoms with one antipsychotic medication (that is, cross-taper); and (3) the medical record contains documentation of augmentation of Clozapine. Higher rates on HBIPS–5 indicate higher quality of care because documenting the reasons for assigning two or more antipsychotics suggests that careful consideration of the benefits of this course of treatment were weighed against the potential patient side effects.

The numerator statement is defined as psychiatric inpatients discharged on two or more routinely scheduled antipsychotic medications with appropriate justification. The denominator is defined as psychiatric inpatients discharged on two or more routinely scheduled antipsychotic medications. The measure excludes patients who died, patients with an unplanned departure resulting in discharge due to elopement, patients with an unplanned departure resulting in discharge due to failing to return from leave, and patients with a length of stay less than or equal to 3 days.

Taken together, we believe that HBIPS–4 and HBIPS–5 will help reduce unnecessary use of multiple antipsychotics and will lead to better clinical outcomes and reduced side effects for patients.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–5 also meets a number of additional considerations we take into account when proposing quality measures for the IPFQR Program. The measure assesses the quality of care provided for inpatient psychiatric patients at the facility level. Approximately 450 IPFs are already collecting and reporting the measure for purposes of TJC accreditation. HBIPS–5 received support from the MAP and is aligned with the National Quality Strategy priority for promoting effective prevention and treatment practices.

We invited public comment on the inclusion of the proposed quality measure HBIPS–5, Patients Discharged on Multiple Antipsychotic Medications with Appropriate Justification, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We appreciate the commenters' support of the measure.

After consideration of the public comments we received, we are finalizing the HBIPS–5 (Patients Discharged on Multiple Antipsychotic Medications with Appropriate Justification) measure for the FY 2014 payment determination and subsequent years.

(5) HBIPS–6 (Post-Discharge Continuing Care Plan Created)

When patients are discharged from the hospital, they may benefit from communication of information regarding the care they received or recommendations for their continued care. For a seamless transition from one treatment setting to another, providers that receive patients from inpatient settings need to know information regarding the patient's treatment during hospitalization, recommendations for post-discharge care, and any medications the patient was discharged on. A discharge plan facilitates this transition of information from one setting to another and has been shown to have positive effects on readmissions.

The promotion of effective care coordination is a National Quality Strategy priority. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28110), we proposed process measure HBIPS–6, Post-Discharge Continuing Care Plan Created, to promote care coordination for patients in inpatient psychiatric

settings. TJC designed HBIPS–6 as part of a paired set with HBIPS–7; they were developed to be used together. HBIPS–6 measures whether a post-discharge continuing care plan is created. However, the creation of a care plan does not necessarily mean the plan is communicated to the patient's next provider. Therefore, HBIPS–7 measures whether a post-discharge continuing care plan is created and transmitted to the next level of care provider. Together, these two measures can assist facilities in determining where breakdowns in care processes occur. Quality care under HBIPS–6 is indicated by patients who are discharged with a continuing care plan that includes the reason for the hospitalization, the principal discharge diagnosis, discharge medications, and the next level of care recommendations. HBIPS–6 is collected on all patients admitted to IPFs. We believe that higher rates on this measure suggest better quality of care because greater numbers of post-discharge plans indicate greater opportunities for improved patient-provider and provider-provider communication, thus leading to improved patient care and health.

The numerator is defined as psychiatric inpatients for whom the post-discharge continuing care plan is created and contains all of the following: reason for hospitalization, principal discharge diagnosis, discharge medications, and next level of care recommendations. The denominator is defined as all psychiatric inpatient discharges. Populations excluded from the denominator include patients who died, patients with an unplanned departure resulting in discharge due to elopement, patients or their guardians who refused aftercare, patients or guardians who refused to sign authorization to release information, and patients with an unplanned departure resulting in discharge due to failing to return from leave.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–6 also meets a number of additional considerations we take into account when proposing quality measures for the IPFQR Program. It is appropriate to facility-level assessment of quality of care provided by IPFs. Approximately 450 IPFs are already collecting and reporting the measure for purposes of TJC accreditation. HBIPS–6 received support from the MAP and is aligned with the National Quality Strategy priority for promoting better care coordination.

We invited public comment on the inclusion of the proposed quality measure HBIPS–6, Post-Discharge Continuing Care Plan Created, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We appreciate the commenters' support for the measure.

Comment: One commenter stated that for this measure, patient lab results and pending tests should be included in care plans.

Response: We thank the commenters for the input for this measure. We agree that, when appropriate, this information should be provided in care plans. However, for purposes of this measure, these are not required data elements.

Comment: One commenter objected to HBIPS–6 because the commenter believed that it is simply a ''check-box'' measure that does not advance quality of care.

Response: We disagree with the commenter's characterization of this measure. We believe that assessing the creation of a continuing care plan that includes important post-discharge information is an important step in improving care coordination and quality of care. Furthermore, the measure specifications are consistent with clinical guidelines and have been endorsed by NQF.

Comment: Two commenters recommended expanding the exclusion for the measure to cover other possible reasons for a lack of post-discharge care, such as out of jurisdiction, no psychiatric care required, and admission for observation with pre-arranged discharge back to sending provider or to another facility, such as a jail.

Response: We appreciate the helpful feedback from the commenters. This measure is endorsed by NQF, and the measure specifications are consistent with medical guidelines; it is currently reported as specified. We regularly review measure specifications and consider whether they continue to be consistent with best medical practices. We will consider these suggestions during the measure maintenance process.

After consideration of the public comments we received, we are finalizing the HBIPS–6 (Post-Discharge Continuing Care Plan Created) measure for the FY 2014 payment determination and subsequent years.

(6) HBIPS–7 (Post-Discharge Continuing Care Plan Transmitted to the Next Level of Care Provider Upon Discharge)

The promotion of effective care coordination is a National Quality Strategy priority. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28110), we proposed process measure HBIPS–7, Post-Discharge Continuing Care Plan Transmitted to Next Level of Care Provider upon Discharge, to promote care coordination for patients in inpatient psychiatric settings. TJC designed HBIPS–7 as part of a paired set with HBIPS–6; they were developed to be used together. While the creation of a discharge care plan (as measured in HBIPS–6) is an important part of providing coordinated care, simply creating the plan does not ensure that the necessary information is transferred to the patient's next provider. HBIPS–7 measures both aspects of coordinated care—the creation of a discharge plan and the transmittal of that plan to the next provider. Together, these two measures can assist facilities in determining where breakdowns in care processes occur. As specified by TJC, the discharge plan should be transmitted by the fifth post-discharge day. This measure is collected on all patients admitted to IPFs. We believe that higher rates on this measure suggest better quality care because the greater the number of post-discharge plans created and transmitted, the greater opportunities for improved patient-provider and provider-provider communication and understanding of what is necessary to improve patient health.

The numerator is defined as psychiatric inpatients for whom the post-discharge continuing care plan was transmitted to the next level of care. The denominator statement is defined as all psychiatric inpatient discharges. Populations excluded from the denominator include patients who died, patients with an unplanned departure resulting in discharge due to elopement, patients who refused (or whose guardians refused) aftercare, patients who refused to sign (or whose guardians refused to sign) authorization to release information, and patients with an unplanned departure resulting in discharge due to failing to return from leave.

In addition to meeting the statutory requirements as provided in section 1886(s)(4)(D) of the Act, we believe HBIPS–7 also meets a number of additional considerations we take into account when proposing quality measures for the IPFQR Program. The measure assesses the quality of care

provided for inpatient psychiatric patients at the facility level. Approximately 450 IPFs are already collecting and reporting the measure for purposes of TJC accreditation. HBIPS–7 received support from the MAP and is aligned with the National Quality Strategy priority for promoting better care coordination.

We invited public comment on the inclusion of the proposed quality measure HBIPS–7, Post-Discharge Continuing Care Plan Transmitted to Next Level of Care Provider upon Discharge, in the IPFQR Program beginning with the FY 2014 payment determination. We discuss our proposals for collection requirements and submission timeframes in section VIII.F.7. of the preamble of this final rule.

Comment: Several commenters supported the inclusion of this proposed measure.

Response: We appreciate the commenters' support for the measure.

Comment: One commenter recommended changing the timeframe for transmittal of the discharge plan from ''by the fifth post-discharge day'' to ''within one post-discharge day.'' One commenter suggested an exclusion be added to the specifications for instances where the next level of care is unavailable; for instance, effective follow-up care may not be obtainable for uninsured homeless patients. Two commenters recommended expanding the exclusion for the measure to cover other reasons for a lack of post-discharge care such as out of jurisdiction, no psychiatric care required, and admission for observation with pre-arranged discharge back to sending provider or to another facility, such as a jail.

Response: We appreciate the suggestions for this measure. We believe that the timeframe and exclusions currently included in the NQF-endorsed measure are valid as specified.

After consideration of the public comments we received, we are finalizing the HBIPS–7 (Post-Discharge Continuing Care Plan Transmitted to the Next Level of Care Provider upon Discharge) measure for the FY 2014 payment determination and subsequent years.

In summary, we are finalizing six quality measures to be reported in aggregate form for FY 2014 and subsequent years. These six measures are shown in the table below. Measures adopted for the IPFQR Program will remain in the quality program for all subsequent years unless specifically stated otherwise (for example, through removal or replacement). We discuss the adopted collection requirements and submission timeframes for these measures in section VIII.F.7. of the preamble of this final rule.

QUALITY MEASURES BEGINNING WITH THE FY 2014 IPFQR PROGRAM

National quality strategy priority	NQF No.	Measure ID	Measure description
Patient Safety	0640	HBIPS–2	Hours of Physical Restraint Use.
	0641	HBIPS–3	Hours of Seclusion Use.
Clinical Quality of Care	0552	HBIPS–4	Patients Discharged on Multiple Antipsychotic Medications.
	0560	HBIPS–5	Patients Discharged on Multiple Antipsychotic Medications with Appropriate Justification.
Care Coordination	0557	HBIPS–6	Post-Discharge Continuing Care Plan Created.
	0558	HBIPS–7	Post-Discharge Continuing Care Plan Transmitted to Next Level of Care Provider Upon Discharge.

c. Maintenance of Technical Specifications for Quality Measures

We will provide a user manual that will contain links to measure specifications, data abstraction information, data submission information, a data submission mechanism known as the Web-based Measure Tool, and other information necessary for IPFs to participate in the IPFQR Program. This manual will be posted on the QualityNet Web site at: *https://www.QualityNet.org*. We will maintain the technical specifications for the quality measures by updating this manual periodically and including detailed instructions for hospitals to use when collecting and submitting data on the required measures. These updates will be accompanied by notifications to IPFQR Program participants, providing sufficient time between the change and effective dates in order to allow users to incorporate changes and updates to the measure specifications into data collection systems.

Many of the quality measures used in different Medicare and Medicaid reporting programs are NQF-endorsed. As part of its regular maintenance process for NQF-endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes to NQF on an annual basis. NQF solicits information from measure stewards for annual reviews, and it reviews measures for continued endorsement in a specific 3-year cycle.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28111), we stated that, through NQF's measure maintenance process, NQF-endorsed measures are sometimes updated to incorporate changes that we believe do not substantially change the nature of the measure. Examples of such changes could be updated diagnosis or procedure codes, changes to exclusions to the patient population, definitions, or extension of the measure endorsement to apply to other settings. We stated in the proposed rule that we believe these types of maintenance changes are distinct from more substantive changes to measures that result in what are considered new or different measures, and that they do not trigger the same agency obligations under the Administrative Procedure Act. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28111), we proposed that if the NQF updates an endorsed measure that we have adopted for the IPFQR Program in a manner that we consider to not substantially change the nature of the measure, we would use a subregulatory process to incorporate those updates to the measure specifications that apply to the program. Specifically, we would revise the Specifications Manual so that it clearly identifies the updates and provide links to where additional information on the updates can be found. We also would post the updates on the CMS QualityNet Web site at *https://www.QualityNet.org*. We would provide sufficient lead time for IPFs to implement the changes where changes

to the data collection systems would be necessary.

We would continue to use the rulemaking process to adopt changes to measures that we consider to substantially change the nature of the measure. We believe that this proposal adequately balances our need to incorporate NQF updates to NQF-endorsed IPFQR Program measures in the most expeditious manner possible, while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We invited public comment on this proposal.

We did not receive any public comments on our proposal to use a subregulatory process to incorporate updates that do not substantially change the nature of the measure. However, we proposed the same approach for incorporating measure updates across the various quality reporting programs in the FY 2013 IPPS/LTCH PPS proposed rule, and we did receive public comments on that approach for other systems. We are making changes here in response to those public comments in order to adopt consistent policy for the IPFQR program.

Comment: Many commenters supported the proposed subregulatory process to update the measure specifications of adopted NQF-endorsed measures in the Specifications Manual for nonsubstantive changes that arise from the NQF maintenance review, as well as the continuation of the rulemaking process for substantive changes that arise from NQF review. Several commenters objected to these proposals, and expressed concern that there is no clear definition of nonsubstantive updates. These commenters believed that changes such as conversion of measures to ICD–10 codes and eMeasures format, and exclusions to the patient population should be considered substantive changes that would warrant rulemaking. Some commenters stated that all changes to measures that are not NQF-endorsed measures should be subject to the rulemaking process.

Response: We thank those commenters that supported our proposal to update NQF-endorsed measures using a subregulatory process. The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF making updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates made by the NQF into the measure specifications we have adopted for the IPFQR Program so that these measures remain up-to-date. We also recognize that some changes the NQF might make to its endorsed measures are substantive in nature and might not be appropriate for adoption using a subregulatory process. Therefore, we are finalizing a policy under which we will use a subregulatory process to make nonsubstantive updates to NQF-endorsed measures used for the IPFQR Program. With respect to what constitutes substantive versus nonsubstantive changes, we expect to make this determination on a case-by-case basis. Examples of nonsubstantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure. We believe that nonsubstantive changes may include updates to NQF endorsed measures based upon changes to guidelines upon which the measures are based.

We will continue to use notice-and-comment rulemaking to adopt substantive updates made by the NQF to the endorsed measures we have adopted for the IPFQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent (for example: changes in acceptable timing of medication, procedure/process, or test administration). Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to hospice. These policies regarding what is considered substantive versus nonsubstantive would apply to all measures in the IPFQR program. We note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process. We will revise the Specifications Manual so that it clearly identifies updates and provide links to where additional information on the updates can be found.

5. Possible New Quality Measures for Future Years

We seek to develop a comprehensive set of quality measures to be available for widespread use for informed decision-making and quality improvement in the inpatient psychiatric setting. Therefore, through future rulemaking, we intend to propose new measures that will help us further our goal of achieving better health care and improved health for Medicare beneficiaries who obtain inpatient psychiatric services, through the widespread dissemination and use of performance information. Additionally, we are considering initiating a call for future measures to solicit input to assess the following measure domains: clinical quality of care; care coordination; patient safety; patient and caregiver experience of care; population/community health; and efficiency. This approach will enhance better psychiatric care while bringing the IPFQR Program in line with other established quality reporting and performance improvement programs such as the Hospital IQR Program, the Hospital OQR Program, and the ESRD QIP.

We welcomed public comment on considerations of additional measure topics for the IPFQR Program in future rulemaking.

Comment: One commenter asserted that measures with regard to the monitoring of patients on antipsychotic medications for metabolic syndrome, primary care follow-up, treatment adherence post-acute care, and coordination of care between psychiatric care and alcohol/substance abuse treatment are needed. The commenter also suggested that CMS include measures assessing patients' experience with care, such as the National Association of State Mental Health Program Directors' Inpatient Consumer Survey, in the IPFQR Program. Another commenter recommended risk-adjustment models be considered in the measures for the IPFQR Program to address patient characteristic differences. A commenter suggested including the HBIPS–1: Admission Screening for Violence Risk, Substance Use, Psychological Trauma History and Patient Strengths Completed, which was developed by TJC in conjunction with the other six HBIPS measures.

Response: We thank the commenters for the valuable input and will take it into consideration for future measure development and selection.

6. Public Display Requirements for the FY 2014 Payment Determination and Subsequent Years

Section 1886(s)(4)(E) of the Act requires the Secretary to establish procedures for making the data submitted under the IPFQR Program available to the public. Such procedures shall ensure that an IPF has the opportunity to review the data that is to

be made public with respect to the psychiatric hospital or unit prior to such data being made public. The data collected will be displayed on the CMS Web site. Under these requirements, for each payment determination year, we proposed to publicly display the submitted data on the CMS Web site beginning in the first quarter of the calendar year following the respective payment determination year. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28112), we proposed that, before the data are publicly displayed, IPFs will have the opportunity to preview their data between September 20 and October 19 of the respective payment determination year.

We believe the proposed timeframe allows sufficient time for both IPFs and CMS to correct any potential mistakes and fulfill the preview requirement in section 1886(s)(4)(E) of the Act.

We welcomed public comment on the proposed preview and public display procedures for FY 2014 and subsequent years.

Comment: Some commenters suggested that a footnote should be used in cases where a hospital has a small sample size (n) and that rates should not be reported. One commenter recommended that CMS establish a minimum number of cases.

Response: We thank the commenters for the suggestions for the footnote and the minimum number of cases and will take them into consideration when we gain experience from this coming year's data.

After consideration of the public comments we received, we are finalizing the public display requirements for preview and public display procedures for the FY 2014 payment determination and subsequent years as proposed. Set out below are the preview and public display timeframes for FY 2014 through FY 2016.

PUBLIC DISPLAY FOR FY 2014, FY 2015, AND FY 2016

Payment determination year (Fiscal year)	30-day Preview period	Public display (Calendar year)
FY 2014	September 20, 2013–October 19, 2013	2014
FY 2015	September 20, 2014–October 19, 2014	2015
FY 2016	September 20, 2015–October 19, 2015	2016

7. Form, Manner, and Timing of Quality Data Submission for the FY 2014 Payment Determination and Subsequent Years

a. Background

Section 1886(s)(4)(C) of the Act requires that, for the FY 2014 payment determination and each subsequent year, each IPF submit to the Secretary data on quality measures as specified by the Secretary. Such data shall be submitted in a form and manner, and at a time, specified by the Secretary. As required by section 1886(s)(4)(A) of the Act, for any IPF that fails to submit quality data in accordance with section 1886(s)(4)(C) of the Act, the Secretary will reduce any annual update to a standard Federal rate for discharges occurring during such fiscal year by 2.0 percentage points. The complete data submission requirements, submission deadlines, and data submission mechanism known as the Web-Based Measure Tool will be posted on the QualityNet Web site at: *http://www.qualitynet.org/*. The Web-Based Measure Tool is an Internet database for IPFs to submit their aggregate data. We proposed that IPFs submit data in accordance with the specifications for the appropriate proposed reporting periods to the Web-Based Measures Tool found in the IPF section on the QualityNet Web site (*http://www.qualitynet.org/*).

b. Procedural Requirements for the FY 2014 Payment Determination and Subsequent Years

In order to participate in the IPFQR Program for the FY 2014 payment determination and subsequent years, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28112), we proposed that IPFs must comply with the procedural requirements outlined below. We have aligned these procedural requirements with the Hospital IQR Program to avoid imposing additional burden on providers and to increase efficiencies by virtue of allowing providers to use similar submission requirements across programs. We proposed that facilities must do the following:

- Register with QualityNet before the IPF begins reporting, regardless of the method used for submitting the data.
- Identify a QualityNet Administrator who follows the registration process located on the QualityNet Web site (*http://www.qualitynet.org/*).
- Complete a Notice of Participation (NOP). IPFs that wish to participate in the IPFQR Program must complete an online NOP. Submission of an NOP is an indication that the IPF agrees to participate in the IPFQR Program and public reporting of their measure rates. The timeframe for completing the NOP is between January 1 and August 15 before each respective payment determination year. Accordingly, for the FY 2014 payment determination year, we proposed that the timeframe for completing the NOP would be between January 1, 2013 and August 15, 2013.
- Any IPF that receives a new CMS Certification Number (CCN) on or after the beginning of the respective payment determination year and wishes to participate in the IPFQR Program but has not otherwise submitted a NOP using the new CCN must submit a completed NOP no later than 180 days from the date identified as the open date (that is, the Medicare acceptance date) on the approved CMS Quality Improvement Evaluation System to participate in the IPFQR Program.
- Withdrawals from the IPFQR Program will be accepted no later than August 15 before the beginning of each respective payment determination year. We believe the August 15 deadline will give us sufficient time to update payment determinations for each respective year. Accordingly, we proposed that the withdrawal period for the FY 2014 payment determination year be between January 1, 2013 and August 15, 2013. If in a given payment determination year, an IPF withdraws from the program, it will receive a reduction of 2.0 percentage points to that year's applicable percentage increase. Once an IPF has submitted a NOP, it is considered to be an active IPFQR Program participant until such time as the IPF submits a withdrawal form to CMS.
- We will determine if an IPF has complied with our data submission requirements by validating each IPF's CCN and their aggregated data submission on the QualityNet Web site.

• IPFs must submit the aggregated numerator and denominator data for all age groups, for all measures, to avoid the 2.0 percentage point reduction.

As previously noted, we believe that this proposed aggregated data collection mode using a Web page will reduce burden to IPFs. We anticipate that IPFs already reporting de-identified patient-level data to TJC would be able to easily aggregate and report these data on a secure Web page to CMS.

We welcomed public comment on the proposed procedural requirements for the FY 2014 payment determination and subsequent years.

Comment: One commenter supported the proposal regarding the registration process.

Response: We appreciate the commenter' support.

After consideration of the public comment we received, we are finalizing the procedural requirements for the FY 2014 payment determination and subsequent years as proposed.

c. Reporting and Submission Requirements for the FY 2014 Payment Determination

IPFs choosing to participate in the IPFQR Program must meet the specific data collection and submission requirements as described on the QualityNet Web site (*http://www.qualitynet.org/*) and TJC's Specifications Manual for Joint Commission National Quality Measures (Specifications Manual) at: *http://www.manual.jointcommission.org/releases/TJC2012B/HospitalBasedInpatientPsychiatricServices.html*. We note that the Specifications Manual is updated at least twice a year (and may be updated more often as necessary), and IPFs are responsible for using the requirements in the most recent manual. The most current version can be found on the Web site at: *https://manual.jointcommission.org/bin/view/Manual/WebHome*. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28113), we proposed that IPFs submit aggregate data on the measures on an annual basis, beginning in FY 2014. As noted earlier, IPFs must submit the data to the Web-Based Measures Tool found in the Inpatient Psychiatric Facility section on the QualityNet Web site. However, the data input forms on the QualityNet Web site for such submission will require aggregate data for each separate quarter. Therefore, IPFs will need to track and maintain quarterly records for their data.

For the FY 2014 payment determination, we proposed that IPFs report on the proposed measures for services provided between Q4 of CY 2012 and Q1 of CY 2013. These two quarters' data constitute the expected data available to CMS when we assess reporting compliance. The 6-month timeframe will allow us to establish a full calendar year of reporting by FY 2016 as discussed below. We proposed that IPFs submit their aggregated data between July 1, 2013 and August 15, 2013. The following table summarizes this information.

We welcomed public comment on the proposed reporting and data submission requirements for the FY 2014 payment determination.

Comment: Some commenters requested that CMS allow data file submission from vendors to the QualityNet Web site because it will be in alignment with existing data submission of the Hospital IQR and OQR Programs.

Response: We thank the commenters for their input. We intend to align the data submission practice with the Hospital IQR and Hospital OQR Programs. Based on these comments, we have decided that IPFs may choose to delegate to a vendor the submission of the following two requirements only: (1) Aggregate measure data; and (2) population and sample size data. IPFs may choose to submit their own data to CMS and forego any costs associated with paying vendors to submit data on their behalf. If an IPF decides to use a vendor, it is important to note that the IPF, not the vendor, is responsible for all data submitted to CMS and for meeting all the procedural requirements established in this rule.

Comment: A few commenters expressed concern that the start of the program, which is on October 1, 2012, may prove to be unattainable for some facilities, therefore they recommended we delay and implement incremental phases beginning with FY 2014. A few commenters considered April 1, 2013 as a reasonable date to implement the IPFQR Program and several commenters suggested that CMS consider allowing IPFs to only attest or agree to participate instead of reporting data for FY 2014, the first payment year.

Response: We thank the commenters for their input. We recognize that some facilities, especially those facilities that are not currently reporting quality measures, may face challenges. However, we are not requiring facilities to begin submitting data until July 1, 2013 through August 15, 2013. The lag time between October 1, 2012 and the beginning of the data submission period is approximately 9 months which we think provides IPFs sufficient time to be prepared.

Comment: One commenter considered the CMS data collection proposal as duplicative because some IPFs are already submitting the data to TJC. The commenter urged CMS to grant ''deemed'' status to those IPFs that are already submitting the data to TJC.

Response: We thank the commenter for the input. However, the purpose of the IPFQR Program is to ensure facility-wide quality reporting and ultimately improve quality of care for Medicare beneficiaries receiving behavioral services in the IPF settings. The granting of ''deemed'' status to some IPFs will make our data collection incomplete and does not meet our intended objectives to obtain all quality measure data from each IPF, apply the appropriate payment, and display the measure rates on the CMS Web site.

Comment: One commenter urged CMS to work with TJC to establish a process for automatic data exchange between CMS and TJC in order to reduce the reporting burden for accredited IPFs. Another commenter recommended using the same process for data submission used by TJC to avoid burden to IPFs.

Response: We thank the commenters for their input. We strive to work closely with TJC to attain maximum alignment in current reporting practices, reporting requirements, and reporting format. We will consider establishing a process for automatic data exchange between CMS and TJC for future efforts through the rulemaking process. We also recognize that approximately 1,500 IPFs are not reporting any IPF quality data to TJC. The vast majority of these IPFs are not hospital-based, and use a different process for accreditation than the TJC.

Comment: One commenter supported the CMS proposal requiring IPFs to submit aggregate versus patient-level data. A few commenters supported the proposed electronic submission of data and expressed concern that the burden of collection occurs at the patient-level of reporting.

Response: We appreciate the commenters' support and input. We recognize there will be some challenges when a new program is initiated. We believe that requiring IPFs to submit aggregate versus patient-level data will prove less burdensome and will allow more time for IPFs to become familiar with our reporting processes, especially for those IPFs that are not currently reporting the measures.

Furthermore, the selected measures minimize the collection and reporting burden on IPFs because, under Medicare's IPF CoPs (42 CFR 482.61), IPFs must maintain documentary evidence of detailed treatment

approaches and aftercare considerations. In addition, under 42 CFR 482.21, IPFs are required to develop, implement, and maintain an effective, ongoing, hospital-wide data-driven quality assessment and performance improvement (QAPI) program as well as documentary evidence of such program for purposes of demonstrating their operation to CMS.

Comment: A few commenters requested clarification on whether the IPFQR Program requires data validation.

Response: We are requiring IPFs to submit aggregated data. We did not propose any data validation approach and, therefore, are not requiring one. However, we encourage the IPFs to use a validation method and conduct their own analysis. In future years, should we modify the program to require patient-level data, we will consider proposals for an appropriate validation method via rulemaking.

Comment: One commenter objected to the collection of aggregate data because it does not allow for validation of data accuracy. The commenter was concerned that consumers could potentially be making healthcare decisions about the quality of care at IPFs based on unvalidated and inaccurate data.

Response: We thank the commenter for the input. We considered both the reduced burden of collecting aggregate data for IPFs, and the challenges in validating aggregate data. We recognize that we cannot feasibly validate aggregate data using a random sample of medical records for all proposed measures because we cannot sample from a list of records submitted by the IPF. We intend to assess accuracy of aggregate reported data to other sources, including TJC. At this time, we believe that the reduced burden of collecting aggregate data outweighs the need to validate patient-level records. We seek to maximize quality reporting among all facilities, including the facilities not currently reporting to TJC. We believe that IPFs will submit accurate data, and base this belief in part on the requirement that IPFs participating in the IPFQR Program acknowledge the accuracy and completeness of their data. This acknowledgement will provides us with some assurance that the submitted data are validated and accurate. We believe that not establishing a validation process at this time will enable IPFs to learn these measures during the initial reporting year. This approach is consistent with our approach to validation requirements in the Hospital OQR and ASCQR Programs during the initial years of these programs. Initially, we want to encourage IPFs to begin reporting quality data and using the quality measure information for quality improvement purposes.

Comment: One commenter inquired about the possibility of requiring patient-level data in future years and, if so, whether CMS would offer an on-line tool for patient-level data.

Response: In the future, we may consider modifying the IPFQR Program to require patient-level data; if we do pursue such a change, we would do so through rulemaking. We intend to host National Provider Calls to conduct outreach and education sessions and will consider providing educational materials during the sessions. Please check the QualityNet Web site (*http://qualitynet.org//*) periodically for updates.

Comment: One commenter expressed its inability to comment on the data submission for FY 2014 because the forms have not been posted on QualityNet.

Response: We regret the commenter could not comment on our data submission method. However, although the forms are not yet available, we believe we provided sufficient description of the data submission process in the proposed rule to enable meaningful comment.

After consideration of the public comments we received, we are finalizing the reporting and submission requirements for the FY 2014 payment determination as proposed. IPFs must ensure that all the reporting and submission requirements are followed by their vendors (if data are submitted by vendors on their behalf) because IPFs remain responsible for all submitted data regardless if data are submitted by a vendor or by the entity/organization themselves. Set out below are the final quality reporting periods and submission timeframes for FY 2014.

QUALITY REPORTING PERIODS AND SUBMISSION TIMEFRAMES FOR FY 2014

Payment determination (Fiscal year)	Reporting period for services provided (Calendar year)	Data submission timeframe
FY 2014	Q4 2012 (October 1, 2012–December 31, 2012) Q1 2013 (January 1, 2013–March 31, 2013).	July 1, 2013–August 15, 2013.

d. Reporting and Submission Requirements for the FY 2015 and FY 2016 Payment Determinations

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28113), we proposed that IPFs report on measures for services provided in Q2, Q3, and Q4 of CY 2013 for the FY 2015 payment determination and in Q1, Q2, Q3, and Q4 of CY 2014 for the FY 2016 payment determination. For FY 2014 and FY 2015, we proposed that IPFs report data on the proposed measures for inpatient psychiatric services provided for 6 and 9 months, respectively, to move towards data reporting of services provided within a full calendar year (12 months) by FY 2016.

The reporting of data within the timeframes outlined previously will allow us to align the IPFQR Program with other quality reporting programs that base their data reporting on a calendar year.

We welcomed public comment on the proposed reporting and data submission requirements for the FY 2015 and FY 2016 payment determinations.

Comment: One commenter agreed with the CMS proposed reporting period for FY 2015. Although the commenter agreed with the proposed reporting period for FY 2016, the commenter urged CMS to delay finalizing the proposed reporting requirements for FY 2016 until the FY 2014 rulemaking cycle in order to be more flexible if the data collection efforts do not go as planned.

Response: We thank the commenter for the input. We recognize that as the IPFQR Program evolves, lessons learned from each payment year will be valuable to improve our reporting processes. We will consider these lessons in future proposals through rulemaking.

After consideration of the public comments we received, we are finalizing the reporting and submission requirements for the FY 2015 and FY

2016 payment determinations as proposed. Set out below are the final quality reporting periods and submission timeframes for FY 2015 and FY 2016.

QUALITY REPORTING PERIODS AND SUBMISSION TIMEFRAMES FOR FY 2015 AND FY 2016 PAYMENT DETERMINATIONS

Payment determination (Fiscal year)	Reporting period for services provided (Calendar year)	Data submission timeframe
FY 2015	Q2 2013 (April 1, 2013–June 30, 2013)	July 1, 2014–August 15, 2014.
	Q3 2013 (July 1, 2013–September 30, 2013).	
	Q4 2013 (October 1, 2013–December 31, 2013).	
FY 2016	Q1 2014 (January 1, 2014–March 31, 2014)	July 1, 2015–August 15, 2015.
	Q2 2014 (April 1, 2014–June 30, 2014).	
	Q3 2014 (July 1, 2014–September 30, 2014).	
	Q4 2014 (October 1, 2014–December 31, 2014).	

e. Population, Sampling, and Minimum Case Threshold for FY 2014 and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28114), we proposed that participating IPFs must meet specific population, sample size, and minimum reporting case threshold requirements as specified in TJC's Specifications Manual. The Specifications Manual is updated at least twice a year (and may be updated more often as necessary), and IPFs must follow the requirements in the most recent manual. The most current version can be found on the Web site at: *https://manual.jointcommission.org/bin/view/Manual/WebHome*.

We proposed that the target population for the proposed measures include all patients, not solely Medicare beneficiaries, to improve quality of care. We believe it is important to require IPFs to submit measures on all patients because quality improvement is of industry-wide importance and should not be focused exclusively on a certain subset of patients. In addition, we need this scope of data in order to be able to assess the quality of care being provided to Medicare beneficiaries. We proposed that IPFs use the applicable sample size requirements found in the Specifications Manual. We noted that the Specifications Manual gives IPFs the option of sampling their data quarterly or monthly. We erroneously noted that the Specifications Manual does not require sampling procedures for measures HBIPS–2 and HBIPS–3. As noted below, the correct language should have been that ''the Specifications Manual does not allow sampling procedures for measures HBIPS–2 and HBIPS–3.'' Therefore, IPFs are required to submit data on all cases for these two measures.

The Specifications Manual uses the term ''minimum required stratum sample size'' to refer to the required sample size for a given initial patient population stratum.[257] To comply with our proposed reporting requirements, if the initial patient population stratum size is below a certain number of cases,[258] for measures HBIPS–4, HBIPS–5, HBIPS–6, and HBIPS–7, IPFs must submit all applicable measure data rather than sample data. More details on sampling procedures are located in the Specifications Manual available at the Web site: *https://manual.jointcommission.org/bin/view/Manual/WebHome*.

IPFs that have no data to report for a given measure must enter zero for the population and sample counts. For example, an IPF that has no hours of physical restraint use (HBIPS–2) to report for a given quarter is still required to submit a zero for its quarterly aggregate population for HBIPS–2 in order to meet the reporting requirement. We believe it is important for IPFs to submit data on all measures even when the population size for a given measure is zero or small because it provides us with the opportunity to identify, assess, and evaluate the baseline for the number of cases for each measure in future years. This will also assist us in determining the minimum case threshold for future years in the rule. In cases where the measure rates are calculated based on low caseloads, when the submitted data are publicly displayed on the QualityNet Web site, we proposed to clearly note that the affected measure rates were calculated based on low caseloads that may affect the result.

We invited public comment on the proposed population, sampling, and case thresholds and welcomed any comments on methods and approaches for future years.

Comment: One commenter applauded the CMS sampling proposal and recognized that requiring data on all patients, not just Medicare patients, is important for the program.

Response: We appreciate the commenter's support.

Comment: One commenter recommended that CMS continue to maintain consistency with TJC's requirements on the population, sampling, case threshold, and other technical aspects to ensure future ability to perform benchmarking and quality improvement assessment across the TJC program and IPFQR Program.

Response: We thank the commenter for the input. We seek to align efforts as much as possible, but must also recognize that the IPFQR Program is a separate and distinct program from TJC's program. The IPFQR Program's population of patients includes only inpatient psychiatric facility patients. We expect that IPFs will submit data on Medicare and non-Medicare patients treated under the IPFs CCN, not acute care hospital CCNs. For Medicare fee-for-service patients, the IPF should require their Medicare claims processing department or contractor to correctly identify patients treated and

[257] For example, for initial population stratum size of 211–877, the most current version of the Specifications Manual requires a minimum stratum sample size of 20 percent of the initial population stratum size. If the initial population size is 44–220, the minimum required stratum sample size is 44.

[258] In the most current version of the Specifications Manual this number is 44.

billed under the IPF PPS. We also clarify that the IPFs will identify their applicable non-Medicare patient population by accessing their claims for inpatient psychiatric services submitted to non-Medicare payers, such as Blue Cross Blue Shield. By maintaining consistency in reporting, these efforts will serve to stabilize the data and set benchmarks for future years.

Comment: One commenter noted that the Specifications Manual indicates that it does not ''allow'' sampling procedures for HBIPS–2 and HBIPS–3 rather than ''require'' sampling procedures, which is the term CMS used, and which implies that a hospital may choose to require their vendor to implement sampling procedures.

Response: We thank the commenter for pointing out this issue. We have addressed the issue in the introductory discussion above to correctly reflect the Specifications Manual.

After consideration of the public comments we received, we are finalizing the population, sampling, and minimum case threshold for FY 2014 and subsequent years as proposed.

f. Data Accuracy and Completeness Acknowledgement Requirements for the FY 2014 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28114), we proposed to require IPFs to acknowledge their data accuracy and completeness once annually using a QualityNet Web site Web page. To affirm that the data provided to meet the FY 2014 IPFQR Program data submission requirement is accurate and complete to the best of a facility's knowledge, an IPF would be required to submit the Data Accuracy and Completeness Acknowledgment (DACA) form. We would provide a link to this form once IPFs have completed entry of all aggregated measure data. Data submission would not be complete until the IPF submits the DACA form. We proposed that the deadline for submission of both measure data and the DACA form would be no later than August 15 prior to the applicable IPFQR Program payment determination year.

For the FY 2014 payment determination, for which participating IPFs are required to report data for discharges occurring between Q4 of CY 2012 and Q1 of CY 2013, we proposed to make the submission deadline for the DACA no later than August 15, 2013. We proposed that the DACA submission deadlines for FY 2015 and FY 2016 would be August 15 of CY 2014 and CY 2015, respectively. We proposed August 15 as the DACA submission deadline for several reasons. First, requiring IPFs to acknowledge their data's accuracy and completeness by August 15 of the year before the respective payment determination year provides us with sufficient time to ensure compliance with the program by October 1, the start of the fiscal year, and, therefore, with sufficient time to calculate and apply the annual payment update. Second, we believe that it is reasonable to make the deadline for the DACA the same as the data submission deadline in order to reduce the reporting burden to IPFs. Lastly, using August 15 as the DACA deadline allows us to align our data acknowledgment deadline with other quality reporting programs, such as the Hospital IQR Program.

We invited public comment on our proposed DACA requirements.

Comment: One commenter recommended aligning the DACA deadlines among the Hospital IQR, Hospital OQR, and IPFQR Programs to make it easier for hospitals and IPFs to keep track when completing these tasks.

Response: We thank the commenter for the input regarding the DACA deadline. We strive to align our quality reporting programs across settings to make quality reporting as efficient as possible for the stakeholders. As noted in our proposed rule, we have made every effort to align the IPFQR Program with the Hospital IQR and Hospital OQR Programs. Any differences in the DACA deadlines among the programs result from the inherent differences in the nature of the programs, the kind of measures used, and the timing of the statutorily mandated implementation. In the future, we will continue to work to align DACA deadlines to the extent possible.

After consideration of the public comments we received, we are finalizing the DACA requirements for the FY 2014 payment determination and subsequent years as proposed. Set out below are the DACA deadlines for the FY 2014 through FY 2016 payment determinations.

DATA ACCURACY AND COMPLETENESS ACKNOWLEDGMENT (DACA) DEADLINES FOR FY 2014, FY 2015, AND FY 2016 PAYMENT DETERMINATIONS

Payment determination (Fiscal year)	Reporting period for services provided (Calendar year)	Data accuracy and completeness acknowledgement deadline
FY 2014	Q4 2012 (October 1, 2012–December 31, 2012) Q1 2013 (January 1, 2013–March 31, 2013).	August 15, 2013.
FY 2015	Q2 2013 (April 1, 2013–June 30, 2013) Q3 2013 (July 1, 2013–September 30, 2013). Q4 2013 (October 1, 2013–December 31, 2013).	August 15, 2014.
FY 2016	Q1 2014 (January 1, 2014–March 31, 2014) Q2 2014 (April 1, 2014–June 30, 2014). Q3 2014 (July 1, 2014—September 30, 2014). Q4 2014 (October 1, 2014–December 31, 2014).	August 15, 2015.

8. Reconsideration and Appeals Procedures for the FY 2014 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28115), we proposed a reconsideration process whereby IPFs can request a reconsideration of their payment update reduction in the event an IPF believes that its annual payment update has been incorrectly reduced for failure to report quality data under the IPFQR Program. We proposed to institute an annual reconsideration process similar to the Hospital IQR Program (74 FR 43892). We would not utilize reconsideration policies and procedures related to the Hospital IQR Program validation requirement because the IPFQR Program does not currently include an annual validation requirement for IPFs. For FY 2014 and subsequent years, we proposed that the deadline for IPFs to submit a request for reconsideration of their payment determination would be 30 days from the date identified on the

payment determination notification letter. While we want to ensure that IPFs have an opportunity to request reconsiderations when warranted, we also need to balance this goal with our need to complete the reconsideration process in a timely manner and with the IPFs' need to obtain final decisions on their requests in a timely manner. We believe that a 30-day timeframe best achieves this balance.

We believe that requiring IPFs to submit a request for reconsideration prior to filing an appeal before the Provider Reimbursement Review Board (PRRB) is more efficient for both CMS and IPFs because it decreases the number of appeals by resolving issues earlier in the process. We proposed that, together with a request for reconsideration, an IPF must submit all documentation and evidence that supports its request for reconsideration. The documentation should include copies of any communication, such as emails, that the IPF believes demonstrates its compliance with the program requirements, as well as any other records that may support the IPF's rationale for seeking reconsideration. We proposed to codify the reconsideration procedures that IPFs must follow at new § 412.434 under 42 CFR Part 412, Subpart N. Under these procedures, an IPF must submit to CMS, no later than 30 days from the date identified on the IPFQR Program payment determination notification letter provided to the IPF, a Reconsideration Request form containing the following information:

- The IPF's CMS Certification Number (CCN).
- The name of the IPF.
- Contact information for the IPF's chief executive officer and QualityNet system administrator, including each individual's name, email address, telephone number, and physical mailing address.
- A summary of the reason(s), as set forth in the IPFQR Program Annual Payment Update Notification Letter, that CMS concluded the IPF did not meet the requirements of the IPFQR Program.
- A detailed explanation of why the IPF believes that it complied with the requirements of the IPFQR Program for the applicable fiscal year.
- Any evidence that supports the IPF's reconsideration request, such as emails and other documents.

Following receipt of a request for reconsideration, we will provide—

- An email acknowledgment, using the contact information provided in the reconsideration request, to the CEO and the QualityNet Administrator that the request has been received; and
- Written notification to the hospital CEO, using the contact information provided in the reconsideration request, regarding our decision. We expect the process to take approximately 90 days from the receipt of the reconsideration request.

We proposed that IPFs must submit a request for reconsideration, as described previously, and receive a decision on that request from CMS before they can file an appeal with the PRRB. If dissatisfied with the decision rendered at the reconsideration level, IPFs can appeal the decision with the PRRB under 42 CFR Part 405, Subpart R. We proposed to codify this requirement at new § 412.434(c).

We intend to work with our Medicare administrative contractors to process updated IPF claims in an expeditious manner to pay IPFs when our annual payment update reduction decision is overturned in reconsideration or PRRB review. The timeframe for updating payment through retroactive claims processing widely varies, and is dependent on the number of IPFs, the number of affected claims, and the advance time needed by the Medicare administrative contractor.

We invited public comment on the proposed procedures for reconsideration and appeals.

Comment: One commenter supported the CMS proposal for reconsideration whereby IPFs are afforded 30 days from the date identified on the payment determination notification letter to file a request for reconsideration.

Response: We appreciate the commenter' support.

After consideration of the public comment we received, we are finalizing the policy on reconsideration and appeals procedures for the FY 2014 payment determination and subsequent years as proposed.

9. Waivers From Quality Reporting Requirements for the FY 2014 Payment Determination and Subsequent Years

In our experience with other quality reporting and/or performance programs, we have noted occasions when IPFs have been unable to submit required quality data due to extraordinary circumstances that are not within their control (for example, natural disasters). It is our goal to avoid penalizing IPFs in such circumstances or to unduly increase their burden during these times. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28115), we proposed that, for FY 2014 and subsequent years, IPFs may request and we may grant waivers with respect to the reporting of required quality data when extraordinary circumstances beyond the control of the facility may warrant. When waivers are granted, IPFs will not incur payment reductions for failure to comply with the requirements of the IPFQR Program.

Under the proposed process, in the event of extraordinary circumstances not within the control of the IPF, such as a natural disaster, the IPF may request a reporting extension or a complete waiver of the requirement to submit quality data for one or more quarters. Such facilities would submit a request form to CMS that would be made available on the QualityNet Web site. The following information should be noted on the form:

- The IPF's CCN;
- The IPF's name;
- Contact information for the IPF's CEO and any other designated personnel, including name, email address, telephone number, and mailing address (the address must be a physical address, not a post office box);
- The IPF's reason for requesting an extension or waiver;
- Evidence of the impact of extraordinary circumstances, including but not limited to photographs, newspaper and other media articles; and
- A date when the IPF will again be able to submit IPFQR Program data, and a justification for the proposed date.

We proposed that the request form must be signed by the IPF's CEO, and must be submitted within 30 days of the date that the extraordinary circumstances occurred. Following receipt of the request form, we would: (1) Provide a written acknowledgement, using the contact information provided in the request, to the CEO and any additional designated IPF personnel, notifying them that the IPF's request has been received; and (2) provide a formal response to the CEO and any additional designated IPF personnel, using the contact information provided in the request, notifying them of our decision.

We indicated in the proposed rule that this proposal would not preclude us from granting waivers or extensions to IPFs that have not requested them when we determine that an extraordinary circumstance, such as an act of nature (for example, a hurricane or other natural disaster that could reasonably affect a facility's ability to compile or report data), affects an entire region or locale. If we make the determination to grant a waiver or extension to IPFs in a region or locale, we proposed to communicate this decision through routine communication channels to IPFs and vendors, by means of memoranda, emails, and notices on the QualityNet Web site, among other means.

We invited public comment on this proposal.

Comment: Some commenters supported providing waivers when there are extraordinary circumstances beyond the IPF's control.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing the requirements for waivers from the quality reporting requirements for the FY 2014 payment determination and subsequent years as proposed.

10. Electronic Health Records (EHRs)

Although for initial reporting, the opportunity to utilize EHRs for automatic data collection is not applicable because the proposed measures will be submitted as aggregate data, we encourage IPFs to take steps towards adoption of EHRs (also referred to as electronic medical records) that will allow for reporting of clinical quality data from EHRs directly to a CMS repository. We encourage IPFs that are implementing, upgrading, or developing EHR systems to ensure that the technology obtained, upgraded, or developed conforms to standards adopted by HHS. Although the IPFQR Program is in its initial implementation stages, we suggest that IPFs take due care and be diligent to ensure that their EHR systems accurately capture quality data and that, ideally, such systems provide point-of-care decision support that promotes optimal levels of clinical performance.

In the future, we will continue to work with standard-setting organizations and other entities to explore processes through which EHRs could speed the collection of data and minimize the resources necessary for quality reporting.

We welcomed public comment on the adoption of EHRs for the IPFQR Program in the future.

Comment: One commenter urged CMS to encourage Congress to fund an extension of the EHR incentives to behavioral health in order to improve care coordination across mental health providers.

Response: We thank the commenter for the input. We will continue our efforts to minimize burden and at the same time, improve quality of care across all behavioral health settings by supporting innovative strategies such as the EHR in future years when funding is available.

Comment: Some commenters suggested that CMS not collect the IPFQR measure data on all patients until eMeasures are available because the proposed data collection and reporting would ''add burden of already strapped resources at the local level.''

Response: We thank the commenters for the input. We are committed to improving quality of care and health outcomes for Medicare beneficiaries who suffer from behavioral/mental conditions. We cannot meet the statutory requirements if we delay the implementation of the IPFQR Program.

We thank the commenters for their input on the EHRs and IPFQR Program.

IX. MedPAC Recommendations and Other Related Studies and Reports for the IPPS and the LTCH PPS

A. MedPAC Recommendations for the IPPS for FY 2013

Under section 1886(e)(4)(B) of the Act, the Secretary must consider MedPAC's recommendations regarding hospital inpatient payments. Under section 1886(e)(5) of the Act, the Secretary must publish in the annual proposed and final IPPS rules the Secretary's recommendations regarding MedPAC's recommendations. We have reviewed MedPAC's March 2012 ''Report to the Congress: Medicare Payment Policy'' and have given the recommendations in the report consideration in conjunction with the policies set forth in this final rule. MedPAC recommendations for the IPPS for FY 2013 are addressed in Appendix B to this final rule.

For further information relating specifically to the MedPAC reports or to obtain a copy of the reports, contact MedPAC at (202) 653–7226, or visit MedPAC's Web site at: *http://www.medpac.gov*.

B. Studies and Reports on Reforming the Hospital Wage Index

1. Secretary's Report to Congress on Wage Index Reform

Section 3137(b) of the Affordable Care Act requires the Secretary of Health and Human Services to submit to Congress a report that includes a plan to comprehensively reform the Medicare wage index applied under section 1886(d) of the Act relating to the IPPS. In developing the plan, the Secretary was directed to take into consideration the goals for reforming the wage index that were set forth by MedPAC in its June 2007 report entitled ''Report to Congress: Promoting Greater Efficiency in Medicare.'' This report is available via the Internet at: *http://www.medpac.gov/documents/jun07_entirereport.pdf*, and was discussed in the FY 2009 IPPS final rule (73 FR 48567 through 48574), the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43824 and 43825), and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50158 and 50159).

In developing the Report to Congress required by section 3137(b) of the Affordable Care Act, CMS contracted with Acumen L.L.C. (Acumen) to review the June 2007 MedPAC report and recommend a methodology for an improved Medicare wage index system. (The Acumen reports are available via the Internet at: *http://www.acumenllc.com/reports/cms*. After consultation with relevant parties during the development of the plan (which included an April 12, 2011 special wage index reform open door forum, along with a review of electronically submitted comments and concerns), the Secretary submitted a ''Report to Congress—Plan to Reform the Medicare Hospital Wage Index'' that describes the concept of a Commuting Based Wage Index (CBWI) as a potential replacement to the current Medicare wage index methodology. The following is a summary of the highlights of the report. The complete report can be accessed on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Reform.html*.

As discussed in section III.B. of the preamble of this final rule, the current wage index methodology relies on labor markets that are based on statistical area definitions (Core-Based Statistical Areas (CBSAs)) established by the Office of Management and Budget (OMB). Hospitals are grouped by geographic location into either an urban labor market (that is, a metropolitan statistical area (MSA) or metropolitan division) or a statewide rural labor market (any area of a State that is not defined as urban). The current system establishes wage indexes for hospital labor market areas, not for individual hospitals. Many parties have argued that these definitions, in many instances, are not reflective of the true cost of labor for any given hospital, particularly for hospitals located on the periphery of labor markets or at labor market boundaries. Multiple exceptions and adjustments have been put into place in attempts to correct perceived inequities. However, many of these exceptions and adjustments may create or further exacerbate distortions in labor market values. The issue of ''cliffs,'' or significant differences in wage index values between proximate hospitals, can often be attributed to one hospital benefiting from such an exception and adjustment when another hospital cannot.

On April 11, 2012, the Secretary submitted to Congress a report, ''Plan to

Reform the Medicare Hospital Wage Index.'' This broad-based plan for reforming the hospital wage index included a fundamental change in the description and definition of labor market areas. The concept, referred to as the commuting based wage index (CBWI), would improve upon Medicare's existing wage index method by using commuting data to define hospital labor market areas. The CBWI is based on data on the number of hospital workers commuting from home to work to define a hospital's labor market. To derive the CBWI, commuting flows would be used to identify the specific areas (for example, zip code or census tracts) from which a hospital hires its workers and to determine the proportion of its workers hired from each area. A CBWI system could use either current hospital cost report data or other alternative sources, such as the Bureau of Labor Statistics (BLS) Occupational Employment Survey data, to calculate labor market area average wage values. While the current wage index system aggregates wage data within geographic CBSA-based areas where hospitals are located, the CBWI would aggregate wage data based upon where the hospital workers reside.

Once the hiring proportions by area and area wage levels are determined, the hospital's benchmark wage level would be calculated as the weighted average of these two elements. This value would then be divided by the national average. This calculation would result in a hospital-specific value, which reflects wage levels in the areas from which a hospital hires, accounting for variation in the proportion of workers hired from each area.

Using more precisely-defined labor markets, the CBWI values can vary for hospitals within the same CBSA or county and, thus, more precisely reflect wage differences within and across CBSA boundaries and address intra-area variation more precisely than the current system. Although the CBWI would allow wage index values to vary *within* a CBSA, the CBWI is less likely to produce large differences—or ''cliffs''—between wage index values for nearby hospitals in adjacent CBSAs because nearby hospitals likely hire workers from areas in similar proportions.

Acumen found in its analysis that the CBWI system would more closely reflect hospitals' actual wages than the current CBSA-based system and the MedPAC proposal. As MedPAC suggested in its proposal, the exceptions and adjustments to the wage index system are the primary cause of the often significant ''cliffs'' between wage indexes of nearby hospitals. Acumen suggested the CBWI has the potential to reduce the need for exceptions and adjustments and further manipulation of wage index values (as is central to the MedPAC proposal) to prevent these ''cliffs'' between labor market areas.

The Report to Congress detailed several findings relevant to implementation of a CBWI:

- Because the CBWI accounts for specific differences in hospitals' geographic hiring patterns, it would yield wage index values that more closely correlate to actual labor costs than either the current wage index system (with or without geographic reclassification) or a system that attempts to reduce wage index differences across geographic boundaries, such as MedPAC's proposed wage index based on Bureau of Labor Statistics (BLS) data for health care industry workers.
- While a CBWI could be constructed with the most recent Census commuting data, were the CBWI to be adopted, a more up-to-date reporting system for collecting commuting data from hospitals would have to be established so that the wage index calculations would accurately reflect the commuting patterns of hospital employees. We believe that creating a system of more up-to-date commuting data could be achieved with a modest addition to the current reporting requirements.
- Concerns about a CBWI leading to hospitals altering hiring patterns and distorting labor markets do not appear to be worse than under the current system and could be managed with minimal policy adjustments.
- As current statutory provisions governing the Medicare wage index and exceptions to that wage index were designed for the current MSA-based wage index system, their applicability would need to be reviewed if a CBWI were to be adopted.
- The Medicare statute has traditionally applied payment changes in a budget neutral manner. If a CBWI were to be adopted in a budget neutrally manner, payments for some providers would increase while payments for other providers would decrease.

The Secretary was directed to ''consult with relevant affected parties'' during the development of the plan. In a special Medicare wage index open door forum held on April 12, 2011, hospital and hospital association representatives presented several concerns, which included issues with commuting data availability, the continuation of certain exceptions and adjustment policies, and the impacts of the CBWI upon other nonhospital payment systems. Several commenters expressed concern that a CBWI could encourage providers to alter or manipulate hiring practices in order to improve wage index calculations. However, based upon our findings and analysis, we believe it is dubious whether any alteration of a hospital's employment patterns would improve its competitive advantage over other hospitals that employ workers in the same area. We also share a concern expressed by multiple commenters regarding whether a CBWI should be applied to other nonhospital payment systems. Currently, several other payment systems are based upon the Medicare pre-reclassified hospital wage index. It is not clear whether it would be advantageous, or even possible, to apply a CBWI to these provider types.

2. Institute of Medicine (IOM) Study on Medicare's Approach To Measuring Geographic Variations in Hospitals' Wage Costs

In addition to submitting the aforementioned Report to Congress, in April 2010, the Secretary commissioned the Institute of Medicine (IOM) to evaluate Medicare's approach for measuring geographic variation in the wage costs faced by hospitals. The IOM's Phase I report, published in September 2011, is available via the Internet at: *http://iom.edu/Reports/2011/Geographic-Adjustment-in-Medicare-Payment-Phase-I-Improving-Accuracy.aspx*. In that report, IOM's Committee on Geographic Adjustment Factors in Medicare Payment proposed a set of recommendations for modifying the hospital wage index in both the method used in its construction and the data used in its calculation.

In constructing the wage index, the IOM recommends altering the current labor market definitions to account for the out-commuting patterns of health care workers who travel to a place of employment in an MSA other than the one in which they live. The IOM's recommendation is based on its theory that county-to-MSA commuting patterns reveal the degree of integration of labor markets across geographically drawn boundaries (that is, MSAs) and a commuting-based smoothing adjustment to the wage index would more accurately measure the market wage each hospital faces. The IOM model uses workers' out-commuting patterns to smooth wage index values for hospitals in different counties, similar to the out-migration adjustment used in the current wage index system. The IOM also suggests that using out-commuting shares in the smoothing adjustment creates an index based on the wage

levels of workers *living* in that area in which a hospital is located, as opposed to wage levels of workers *employed* in that area, as in the CBWI model. In calculating its smoothed wage index, the IOM uses the following four steps:

- Step 1—Compute a wage index for each MSA, adhering to Medicare's current approach for calculating the average hourly wage (AHW) paid by all IPPS hospitals located in the MSA (this step replicates the current pre-reclassification wage index).
- Step 2—Compute an area wage for each county equal to a weighted average of MSA-level AHWs, where the weight for each MSA measures the share of all hospital workers living in the county who commute to hospitals located in that MSA.
- Step 3—Assign all hospitals located in the county a hospital wage index value equal to the county area wage index.
- Step 4—Normalize wage indices to ensure budget neutrality, similar to the approach currently implemented by Medicare.

In addition, the IOM's wage index model uses hourly wage data from the BLS Occupational Employment Survey rather than from hospital cost reports. The IOM also recommends measuring hourly wages using data for all health care workers rather than only hospital workers and using a fuller set of occupations incorporated in the hospital wage index occupational mix adjustment. The IOM suggests that BLS data would reduce administrative burdens placed upon hospitals and, by broadening the array of reported occupations from what is currently covered in the hospital cost report, would achieve more accurate labor market definitions and reduce year-to-year volatility. The IOM encourages CMS to establish an ongoing agreement with the BLS to use occupational survey data specific to health care workers to calculate average hourly wage values. The IOM suggests, for instance, that the 5-year American Community Survey is a potential source of the necessary commuting information, assuming CMS can arrange to obtain certain nonpublic ''micro-data'' from the BLS.

Preliminary findings demonstrate that the IOM hospital wage index method would result in the reduction in wage index ''cliffs,'' and would diminish the need to maintain current wage index exceptions and adjustments. The IOM also recommends that the hospital wage values should be applied to other nonhospital health care providers, shifting to a single measurement of geographic variation to be used in multiple Medicare provider payment systems. However, we believe that, by creating a wage index that measures the wage level only of workers who live near a hospital rather than of all workers who could potentially work at the hospital (including those who live far away from the hospital), IOM's approach may have some problematic implications. First, some of the wage information used by the IOM index is based on workers employed outside of the hospital's pertinent labor market. Second, the IOM index neglects market-relevant information regarding the wages of workers employed at the hospital who live outside the county of the hospital's location. If the in-commuting workers come from high wage areas, this information should contribute to increasing the hospital's wage index values. Likewise, if such workers live in low wage areas, they should contribute to decreasing the hospital's wage index values.

We are aware of numerous concerns from hospital and hospital association representatives regarding whether the BLS Occupational Employment Survey data is an acceptable source for hospital wage index calculations. (We refer readers to a discussion of the BLS occupational survey data in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43824 and 43825).) While the IOM proposal suggested a more refined use of BLS data than did the previous MedPAC recommendation, there may be significant operational challenges in accessing and compiling health care sector specific wage, occupational mix, and commuting data from the available datasets. Additional research would be required to determine whether the IOM recommendation for applying its hospital wage index to nonhospital providers would be appropriate.

Comment: The AHA commented that, in June 2011, the AHA Board of Trustees created the AHA Area Wage Index Task Force to further review the CMS, MedPAC, and IOM reports, as well as examine other design issues around the wage index. The AHA anticipates issuing a report on the subject by early 2013. Most other commenters indicated they were withholding opinion pending an analysis of the AHA study. Many commenters supported the concept of significant wage reform, and some commenters indicated that an ideal wage index system would reduce or eliminate the need for wage index reclassifications.

Response: We look forward to reviewing the findings of the upcoming AHA report, and appreciate the commenters' continued interest and support in the wage index reform process.

Comment: MedPAC expressed concerns regarding several aspects of the CBWI methodology. MedPAC favored a methodology that includes a broader definition of labor inputs than one limited to hospital workers and is concerned that the CBWI could potentially create a ''great circularity risk'' due to its reliance on hospital-specific employment patterns.

MedPAC stated that the CBWI contradicts the following principles contained in the IOM report:

- Geographic adjustment for input price differences is intended to reflect the input prices faced by providers, not the costs incurred by providers.
- Geographic adjustment, where possible, should reflect the areawide input prices for labor faced by all employers operating in the same local market and should not be drawn exclusively from data on the prices paid by hospitals or health care practitioners.

Response: We disagree with MedPAC's assertion that the CBWI contradicts these certain key principles. The IOM principles refer to the characteristics of the wage data used in constructing the wage index, not the method used to group those data into wage areas that attempt to reflect the boundaries of labor markets. The advantage of the CBWI is its method for refining the boundaries of labor markets. The CBWI can be constructed with many different sources of wage data—the more closely the data reflect input prices faced by providers, the better; CBWI does not require that the wage data be limited to data from hospitals or health care practitioners. The empirical application of the CBWI described in the proposed rule was constructed with the CMS wage survey data that are currently used for the Medicare wage index. That choice facilitates comparisons of the CBWI to the current wage index by isolating the effect of the method for defining labor markets from the effect of the wage data. The CMS wage survey data are based on wages paid solely by hospitals, but they are adjusted for differences in the occupational mix of nurses, in an attempt to make the reported wages more closely reflect input prices.

Regarding the increased risk of ''circularity'' and distortions in labor markets, MedPAC provides an example of a town with one hospital, with that hospital essentially setting its own wage index. MedPAC expresses its preference for methods that ''draw on a bigger pool of workers (all workers in an entire MSA) and are therefore less influenced by an individual hospital's wages.''

However, we believe that these statements do not acknowledge that much of the impetus for geographic reclassification and other modifications of the current Medicare wage index result from inaccuracies in current MSA-based labor market boundaries. These boundary problems rarely would occur in areas where there are few hospitals, but in areas where many hospitals draw their employees from overlapping areas. By defining wage areas on the basis of areas from which hospitals draw their employees, the CBWI provides a method for refining boundaries that offers potential for addressing the central problem of the current wage index. We further point out that circularity issues exist within the current wage index system, as well as the existent current single provider MSAs. However, as discussed in the Report to Congress, we believe relatively minor policy revisions can be implemented to mitigate any related effects within a CBWI system, including expanding ZIP or census tract areas to ensure a minimum number of different hospital employees are represented in any given labor market.

Comment: MedPAC stated that ''CMS should publish simulated data on a hospital-by-hospital basis to make sure that hospitals in the same city would not have materially different wage indexes under the proposed wage index system.''

Response: The empirical application of the CBWI based on commuting data from the 2000 Census examined this relationship and found that the closer together two hospitals were, the more similar were their CBWI values (''Report to Congress: Plan to Reform the Medicare Wage Index—Technical Appendix A,'' April 2012, p. 6). We agree with MedPAC that further simulations would be helpful, but only if more up-to-date commuting pattern data were to be made available. We note that data are available to simulate or reconstruct the CBWI in the ''Wage Index Reform'' section of the CMS Web page at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/*.

Comment: MedPAC asserted that the CBWI is not consistent with how hospital labor markets work because it ''ignores well understood relationships between wage rates and commuting costs and implicitly assumes that workers will demand the same wage from a job with an hour commute as a job with a 10 minute commute.''

Response: It is possible to adjust the CBWI for commuting costs, but it might be impractical to do so and would certainly add considerable complexity to the CBWI. Commuting times and costs may vary widely within an MSA, and we are not convinced that failing to account for commuting costs would be more of a problem for the CBWI than it is for an MSA-based wage index.

Comment: MedPAC stated that using the correlation of the wage index and actual wages is a poor measure of the validity of a wage index, noting that an index set equal to the hospital wage would have a correlation of 1.0.

Response: We agree that candidate wage index methodologies should not be measured solely based on their correlation with a hospital's observed wage, but the correlation does provide useful information describing the relationship between a hospital's wage index values and reported wages. The correlation coefficient assists in identifying whether sharp differences exist between actual and fitted wages; sizable differences would arise if a wage index induces artificial cliffs across boundaries that do not mirror actual circumstances. An R-squared statistic in a regression model would serve a similar role.

Comment: MedPAC stated that CMS erroneously reported the properties of the three proposals (CMS', IOM's and MedPAC's). MedPAC noted that the table in the proposed rule at 77 FR 28119 failed to include its recommendation that MedPAC's proposed hospital compensation index should be used in the home health and skilled nursing facility prospective payment systems. MedPAC also stated that ''contrary to the claims in the table at * * * [77 FR] 28119, no occupational mix adjustment is necessary under MedPAC's proposal or the IOM proposal.''

Response: We agree that we made an error in not including MedPAC's recommendation for nonhospital providers in the table in the proposed rule. Therefore, we have corrected this error in the table below. The ''Occupational Mix'' section of the table is intended to show how each of the wage index proposals would incorporate occupational data, including those established in the BLS Occupational Employment Survey. We did not intend to imply that a separate occupational mix adjustment would be necessary under the MedPAC or IOM methodology. We have added a footnote in the table below to clarify this point.

COMPARISON OF WAGE INDEX REFORM PROPOSALS

	Current wage index	IOM	MedPAC	CBWI
Labor Market Definition				
Labor Market Area	MSAs or Metropolitan Divisions/rural ''rest of State'' areas.	MSAs or Metropolitan Divisions/rural ''rest of State'' areas.	Blend of county and MSA labor market definitions (50/50).	Creates separate but linked labor-market for each hospital using small geographic areas (for example, zip codes).
Commuting Adjustment	Section 505 Out-Commuting Adjustment.	Adjusts hospitals' wage index values based on the out-commuting patterns of health care workers.	None	Uses in-commuting patterns relevant for individual hospitals to weight benchmark wages constructed for small geographic areas.

COMPARISON OF WAGE INDEX REFORM PROPOSALS—Continued

	Current wage index	IOM	MedPAC	CBWI
Other Adjustments	Multiple Reclassifications and/or Floors (for example, Frontier State floor, Lugar counties, MGCRB, and Section 508 reclassifications and special exceptions).	IOM proposes three smoothing specifications: (1) Apply to all counties; (2) Apply only to counties to which at least 10 percent of workers commute; (3) Apply only to counties to which at least 10 percent of workers commute and hospital wage index is higher than home-county hospital wage index.	Smoothing algorithm uses iterative process to eliminate large differences in index values across county boundaries.	None.
Measurement of Worker Wages				
Wage Data Source	Hospital cost reports	BLS Occupational Employment Survey.	BLS Occupational Employment Survey.	Any source of establishment wage data could potentially be used (for example, hospital cost reports, BLS Occupational Employment Survey).
Industry Sectors Used to Measure Wages.	Hospitals	Health care sector	All Industries (for example, hospitals, other health care and nonhealth care sectors).	The CBWI could be implemented using any industry sector.
Occupational Mix*	Occupational mix adjustment based on occupational categories of nurses reported on cost reports.	Occupational mix adjustment based on all occupations.	Occupational mix adjustment based on 30 occupations with the highest wage share in the hospital industry.	Occupational mix adjustment based on all occupations available in the wage data source selected.
Other Provider Settings				
Wage Index for Nonhospital Providers.	Pre-floor, pre-reclassification version of the current hospital wage index. A version of this index with an occupational mix adjustment has also been used for payments for other specialized hospital inpatient services.	Use identical hospital wage index methodology, except create an industry-specific occupational mix adjustment for each provider type.	Use hospital compensation index for home health and skilled nursing facility prospective payment systems.	Considerations include: (1) Collect commuting data for each provider type and apply CBWI; (2) Apply CBWI framework, but use hospital wage and commuting data; or (3) Measure using a weighted average of nearby-hospital CBWI values.

* ''Occupational Mix'' refers to any occupationally weighted adjustment that is performed as a separate process during the wage index development process, or is included in an established wage data set (for example, BLS Occupational Employment Survey)

X. Quality Improvement Organization (QIO) Regulation Changes Related to Provider and Practitioner Medical Record Deadlines and Claims Denials

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28119 through 28120), we explained that QIOs have historically experienced difficulty in obtaining medical information in a timely manner from providers and even more difficulty obtaining this information in a timely manner from practitioners. Although the regulations at 42 CFR Part 476 refer to practitioners' responsibilities in certain instances, § 476.78, which relates to the submission of medical information, addresses only the obligations of providers and not practitioners. Moreover, we explained that while § 476.90 addresses steps that a QIO may take when providers *or practitioners* fail to cooperate with the QIO, § 476.90(b) limits the QIO's authority to deny claims to providers for failing to respond to a QIO's request for information, and no similar provision exists for practitioners.

In light of the issues discussed above, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28119 and 28120), we proposed several changes to the regulations at §§ 476.1, 476.78, and 476.90 to more clearly convey the responsibilities of providers and practitioners in submitting medical information and to specify the QIO's authority should the information not be received.

- We proposed to add a definition of ''providers'' under § 476.1 to clearly denote that certain requirements in Part 476 apply to health care facilities, institutions, and organizations involved in the delivery of health care services to Medicare beneficiaries.
- We proposed to change the section heading of § 476.78 from

''Responsibilities of health care facilities'' to ''Responsibilities of providers and practitioners''. In addition, we proposed to add references to ''practitioners'' in § 476.78(b)(2) so that the 21-day and 30-day timeframes for submittal of information apply equally to practitioners and providers. We also proposed one minor technical change to § 476.78 that is unrelated to the application of timeframes to providers or practitioners. We proposed to remove the sentence, ''QIOs pay providers paid under the prospective payment system for the costs of photocopying records required by the QIO in accordance with the payment rate determined under the methodology described in paragraph (c) of this section and for first-class postage for mailing the records to the QIO'', because it is merely a reference to paragraph (c) of § 476.78.

• We proposed changes to § 476.90 that will provide improved instructions to QIOs when attempting to resolve issues associated with practitioners and providers that fail to submit medical information within the timeframes set forth in § 476.78. These proposed changes included: changing the section heading from ''Lack of cooperation by a health care facility or practitioner'' to ''Lack of cooperation by a provider or practitioner''; incorporating the broader term ''provider'' (as reflected in our proposed change to § 476.1) within § 476.90, as well as references to ''practitioners'', where appropriate. We proposed to add references to ''practitioners'' in § 476.90(a)(2) to denote that the QIO's authority includes the ability to make financial liability determinations for both providers and practitioners, and we proposed to add the word ''may'' to clarify that the QIO has the discretion to report a provider's or practitioner's failure to provide evidence of the medical necessity or quality of care provided to the Inspector General. In addition, we proposed modifications to § 476.90 (b) to denote that QIOs will also deny claims if practitioners fail to submit medical information as requested. We also proposed to add new language to § 476.90(b) to convey the right of providers and practitioners to request a reconsideration by the QIO of its decision to deny the claim based on the failure to receive the medical information, and that no further appeal rights exist beyond the QIO.

• We proposed to make a technical correction to a cross-reference to ''§ 474.30(c)'' that appears in § 476.90(a)(1). This cross-reference is to the Office of Inspector General regulations that convey the obligations of providers and practitioners; these regulations are now located in 42 CFR 1004.10(c).

We invited public comment on our proposals, including the definition of ''providers'', the timeframes for practitioners and providers to follow in submitting medical information, the QIO's authority when medical information is not received, as well as the technical corrections. We did not receive any public comments on these proposed changes. Therefore, in this final rule, we are adopting the proposed changes as final.

XI. Other Required Information

A. Requests for Data From the Public

In order to respond promptly to public requests for data related to the prospective payment system, we have established a process under which commenters can gain access to raw data on an expedited basis. Generally, the data are now available on compact disc (CD) format. However, many of the files are available on the Internet at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We listed the data files and the cost for each file, if applicable, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28120 through 28122).

Commenters interested in discussing any data used in constructing this final rule should contact Nisha Bhat at (410) 786–5320.

B. Collection of Information Requirements

1. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act of 1995, we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 requires that we solicit comment on the following issues:

• The need for the information collection and its usefulness in carrying out the proper functions of our agency.

• The accuracy of our estimate of the information collection burden.

• The quality, utility, and clarity of the information to be collected.

• Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28122), we solicited public comment on each of these issues for the following sections of this document that contain information collection requirements (ICRs). We discuss and respond to any public comments we received in the relevant sections.

2. ICRs for Add-On Payments for New Services and Technologies

Section II.I.1. of the preamble of the proposed rule and this final rule discusses add-on payments for new services and technologies. Specifically, this section states that applicants for add-on payments for new medical services or technologies for FY 2014 must submit a formal request. A formal request includes a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement. In addition, the request must contain a significant sample of the data to demonstrate that the medical service or technology meets the high-cost threshold. We believe the burden associated with this requirement is exempt from the PRA under 5 CFR 1320.3(c), which defines the agency collection of information subject to the requirements of the PRA as information collection imposed on 10 or more persons within any 12-month period. This information collection does not impact 10 or more entities in a 12-month period. In FYs 2008, 2009, 2010, 2011, 2012, and 2013, we received 1, 4, 5, 3, 3, and 5 applications, respectively.

We did not receive any public comments regarding these information collections.

3. ICRs for the Occupational Mix Adjustment to the FY 2013 Index (Hospital Wage Index Occupational Mix Survey)

Section II.F. of the preamble of the proposed rule and this final rule discusses the occupational mix adjustment to the FY 2013 wage index. While the preamble does not contain any new ICRs, we note that there is an OMB approved information collection request associated with the hospital wage index.

Section 304(c) of Public Law 106–554 amended section 1886(d)(3)(E) of the Act to require CMS to collect data at least once every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program in order to construct an occupational mix adjustment to the wage index. We

collect the data via the occupational mix survey.

The burden associated with this information collection requirement is the time and effort required to collect and submit the data in the Hospital Wage Index Occupational Mix Survey to CMS. The aforementioned burden is subject to the PRA; however, it is currently approved under OCN 0938–0907, with an expiration date of February 28, 2013.

We did not receive any public comments regarding these information collections.

4. Hospital Applications for Geographic Reclassifications by the MGCRB

Section III.H.3. of the preamble of the proposed rule and this final rule discusses proposed revisions to the wage index based on hospital redesignations. As stated in that section, under section 1886(d)(10) of the Act, the MGCRB has the authority to accept short-term IPPS hospital applications requesting geographic reclassification for wage index or standardized payment amounts and to issue decisions on these requests by hospitals for geographic reclassification for purposes of payment under the IPPS.

The burden associated with this application process is the time and effort necessary for an IPPS hospital to complete and submit an application for reclassification to the MGCRB. While this requirement is subject to the PRA, the associated burden was previously approved under OCN 0938–0573. However, the information collection expired on December 31, 2011. We are currently seeking to reinstate the information collection and, as required by the PRA, will announce public notice and comment periods in the **Federal Register** separate from this rulemaking.

5. ICRs for Application for GME Resident Slots

The information collection requirements associated with the distribution of additional residency positions under section 5503 of the Affordable Care Act, addressed under section IV.I.3. of this preamble, are not subject to the Paperwork Reduction Act (44 U.S.C. Chapter 35), as stated in section 5503(c) of the Affordable Care Act. The information collection requirements associated with the preservation of resident cap positions from closed hospitals, addressed under section IV.I.4. of this preamble, also are not subject to the Paperwork Reduction Act, as stated in section 5506 of the Affordable Care Act.

We did not receive any public comments regarding these information collections.

6. ICRs for the Hospital Inpatient Quality Reporting (IQR) Program

The Hospital Inpatient Quality Reporting (IQR) Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment (RHQDAPU) Program) was originally established to implement section 501(b) of the MMA, Public Law 108–173. This program expanded our voluntary Hospital Quality Initiative. The Hospital IQR Program originally consisted of a ''starter set'' of 10 quality measures. The collection of information associated with the original starter set of quality measures was previously approved under OMB control number 0938–0918. We are currently seeking reinstatement of the information collection and will publish the required 60-day and 30-day notices in the **Federal Register** to solicit public comments.

We added additional quality measures to the Hospital IQR Program and submitted the information collection request to OMB for approval. This expansion of the Hospital IQR measures was part of our implementation of section 5001(a) of the DRA. New section 1886(b)(3)(B)(viii)(III) of the Act, added by section 5001(a) of the DRA, requires that the Secretary expand the ''starter set'' of 10 quality measures that were established by the Secretary as of November 1, 2003, to include measures ''that the Secretary determines to be appropriate for the measurement of the quality of care furnished by hospitals in inpatient settings.'' The burden associated with these reporting requirements was previously approved under OMB control number 0938–1022. We are currently seeking reinstatement of the information collection and will publish the required 60-day and 30-day notices in the **Federal Register** to solicit public comments.

For the FY 2015 payment updates, we are seeking OMB approval for a revised information collection request using the same OMB control number (0938–1022). In the revised request, we will add 1 chart-abstracted measure (Elective Delivery Prior to 39 Weeks Gestation), 1 survey-based measure, and 3 claims-based measures. In addition, we will remove 1 chart-abstracted measure (SCIP–VTE–1: Surgery patients with recommended venous thromboembolism prophylaxis) and 16 claims-based measures. We estimate that the changes to our FY 2015 payment determination measure set will result in a total collection burden to IPPS hospitals of approximately 6,750,000 hours per year.

With respect to the new chart-abstracted measure for the FY 2015 payment determination, we are adding add a chart-abstracted measure: Elective delivery Prior to 39 Completed Weeks Gestation: Percentage of babies electively delivered prior to 39 completed weeks gestation. Hospitals will be required to submit data on patients with elective vaginal deliveries or elective cesarean sections at >=37 and <39 weeks of gestation completed. We estimate that IPPS hospitals will incur an additional 170,000 burden hours resulting from the addition of this measure. We estimate that hospitals will submit approximately 1,006,917 cases annually for this measure, and the information needed to calculate these measures requires an average of 10 minutes to abstract from medical records for each case.

We are also adding three new claims-based measures for the FY 2015 payment determination. We do not believe that these claims-based measures will create any additional burden for hospitals because they will be collected and calculated by CMS based on the Medicare FFS claims the hospitals have already submitted to CMS.

One additional survey measure will be added to the existing HCAHPS survey measures for the FY 2015 payment determination. Burden for HCAHPS data collection is approved through OMB No. 0938–0981.

We believe that the overall burden on hospitals will be reduced to some extent by the policy we finalized in the FY 2011 IPPS/LTCH PPS final rule to remove one chart-abstracted measures, SCIP–VTE–1: Surgery patients with recommended venous thromboembolism prophylaxis beginning with the FY 2015 payment determination. In addition, beginning with the FY 2015 payment determination, we are removing 16 claims-based measures. We estimate that the removal of these measures will reduce the total burden to hospitals by a total of 150,000 hours.

We are adding a structural measure for the FY 2016 payment determination, the Safe Surgery Checklist Use measure. This measure will require hospitals to report their yes/no response regarding use of a safe surgery checklist. We estimate that 3,300 hospitals will spend about 2 minutes each to answer this question each year, resulting in an estimated total increase of 110 hours in terms of the total burden to hospitals each year.

7. ICRs for PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

As discussed in section VIII.B. of the preamble of this final rule, section 1866(k) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. To comply with the statutory mandate, we are implementing the PCHQR Program in an effort to improve the quality of care for inpatient cancer patients. It is our aim and goal to encourage PCHs to furnish high quality care in a manner that is effective and meaningful, while remaining mindful of the reporting burden created by the implementation of this new program. Therefore, we intend to reduce and avoid duplicative reporting efforts, whenever possible, by leveraging existing infrastructure.

For the FY 2014 program year, as we proposed, we are adopting five NQF-endorsed quality measures, two of which were developed by the CDC and three of which were developed by the American College of Surgeons' Commission on Cancer (ACoS/CoC).

Topic	Quality meassures
Cancer-Specific Treatments	Adjuvant Chemotherapy is considered or administered within 4 months (120 days) of surgery to patients under the age of 80 with AJCC Stage III (lymph node positive) colon cancer (NQF #0223).
	Combination Chemotherapy is considered or administered within 4 months (120 days) of diagnosis for women under 70 with AJCC T1c, or Stage II or III hormone receptor negative Breast Cancer (NQF #0559).
	Adjuvant Hormonal Therapy (NQF #0220).
Healthcare Acquired Infections (HAIs).	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139).
	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138).

We estimate that 11 PCHs will submit data on approximately 27,273 cases annually for these measures, and it will require, on average, 2.5 hours for a PCH to abstract the information from medical records and submit it for each case.

Although PCHs have not previously reported data on quality measures to CMS, they have some familiarity and experience with the reporting of quality data. More specifically, out of the 11 existing PCHs, 10 (or 91 percent) are currently reporting the proposed cancer-specific measures to the ACoS/CoC. Likewise, a majority of the PCHs are currently submitting data on the HAI measures to the CDC. We believe that because the majority of the PCHs have demonstrated the ability to report these measures, the reporting requirements we are finalizing in this final rule for the PCHQR Program will not significantly impact PCHs.

Furthermore, we estimate that reporting the quality data to the CDC and the CMS contractor will not be costly to PCHs. In our burden calculation, we have included the time used for chart abstraction and for training personnel on collection of chart-abstracted data, as well as training for submitting the data through these entities (CDC and the CMS contractor). We estimate that the annual hourly burden to each PCH for the collection, submission, and training of personnel for submitting all quality measure data will be approximately 6,293.5 hours per year for each PCH. The average hourly burden to each PCH will be approximately 524 hours per month. This final rule would affect all PCHs participating in Medicare. The facilities would have to register with QualityNet and take the proper training in order to be adequately prepared to use the QualityNet system to submit the Notice of Participation form. The anticipated burden to these providers consists of the following: (1) The initial registration with the CDC, CMS contractor, and CMS QualityNet; (2) training of the appropriate staff members on how to use the QualityNet reporting program; (3) the time required for collection of data; and (4) the time required for entry of the data to the CDC and the CMS contractor database by the PCH's representative.

Comment: Commenters urged CMS to leverage with the ACoS/CoC infrastructure because the PCHQR Program could pose a ''sizeable expense for each participating institution and a significant time investment.''

Response: We are appreciative of the commenters' concerns surrounding administrative burden and duplicative reporting. We intend to align closely with the ACoS/CoC data infrastructure and apply consistent reporting format in an effort to minimize burden.

8. ICRs for the Hospital Value-Based Purchasing (VBP) Program

In section VIII.C. of the preamble of the proposed rule and this final rule, we discuss requirements for the Hospital VBP Program. Specifically, in this final rule, for the FY 2015 program, we are removing a measure from the Clinical Process of Care domain. We are adding two additional measures in the Outcome domain, an AHRQ Patient Safety Indicators composite measure and CLABSI: Central Line-Associated Blood Stream Infection. We also are adding a measure, Medicare Spending per Beneficiary, in the Efficiency domain. All of these additional measures are required for the Hospital IQR Program; therefore, their inclusion in the Hospital VBP Program does not result in any additional burden because the Hospital VBP Program uses data that are required for the Hospital IQR Program.

9. ICRs for the Long Term Care Hospital Quality Reporting (LTCHQR) Program

In section VIII.D. of the preamble of this final rule, we discuss the implementation of section 3004(a) of the Affordable Care Act, which added section 1886(m)(5) to the Act. Section 1886(m)(5) of the Act provides that, for rate year 2014 and each subsequent rate year, in the case of an LTCH that does not submit data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a rate year, any annual update to a standard Federal rate for discharges for the hospital during the rate year, and after application of section 1886(m)(3) of the Act, shall be reduced by 2 percentage points. The initial requirements for the LTCH Quality Reporting (LTCHQR) Program were finalized in section VII.C. of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756).

In section VIII.D.3.d. of the preamble of this final rule, for FY 2015, we have finalized the use of three quality measures that were previously finalized for use in the LTCHQR Program in the FY 2012 IPPS/LTCH PPS final rule. These measures are: (1) Catheter-Associated Urinary Tract Infections (CAUTI); (2) Central Line Catheter-

Associated Blood Stream Infection Event (CLABSI); and (3) Pressure Ulcers that are New or Have Worsened. We stated that the NQF had expanded the scope of endorsement of the CAUTI and CLABSI measures to additional care settings, including LTCHs. The revision of these measures has not changed the way that the data for these measures is to be collected.

In this final rule, we are finalizing our adoption of the expanded versions of the CAUTI and CLABSI measures for the FY 2014 payment determination and all subsequent fiscal year payment determinations. We are also retaining an application of the Pressure Ulcer measure for the FY 2014 and subsequent years payment determinations.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51780 through 51781), we estimated that the total yearly cost to all LTCH that are paid under the LTCH PPS to report these data (including: NHSN registration and training for the CAUTI and CLABSI quality measures; data submission for all three measures, and monitoring data submission) will be approximately $756,326. We believe that this remains a valid estimation of the total financial burden that all LTCHs will incur as a result of the LTCHQR Program, even considering that the CAUTI and CLABSI measures were reviewed and expanded by the NQF.

We do not believe that the burden estimate we made in the FY 2012 IPPS/LTCH PPS final rule is affected by the NQF's expansion of the CAUTI and CLABSI measures because these expanded measures are essentially the same measures that were adopted in the FY 2012 IPPS/LTCH PPS final rule. While the measures will now be calculated using a standardized infection ratio (SIR), the expansion of the CAUTI and CLABSI measures has made no differences in the way that these data are to be collected and reported by LTCHs. Thus, use of the expanded CAUTI and CLABSI measures will place no additional burden on LTCHs. In addition, we believe that this burden should remain relatively stable over the first several years of this quality reporting program, subject to normal inflationary increases, such as increased labor wage rates.

As stated in section VIII.D.3.d. of the preamble of this final rule, for the FY 2016 LTCHQR Program, we had proposed the addition of five new quality measure but are finalizing the addition of only two of these new quality measures to the LTCHQR Program measure set. The quality measures that we have finalized in this rule are: (1) Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay) (NQF #0680); and (2) Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431).

Data for three of the LTCH measures, namely Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure, NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure, and Influenza Vaccination Coverage among Healthcare Personnel, will be collected via the CDC's NHSN online data submission system (*http://www.cdc.gov/nhsn/*). As we proposed, LTCHs will report data on these measures according to measure specifications of these NQF-endorsed measures.

The NHSN is a secure, Internet-based surveillance system that is maintained and managed by CDC. Many LTCHs already submit data to the NHSN either voluntarily or as part of mandatory State reporting requirements for HAIs. There are currently 442 LTCHs in operation in the United States and, according to CDC, over 200 of these LTCHs already submit HAI data to NHSN. For these LTCHs, we believe the burden related to complying with the requirements of the quality reporting program will be reduced because of pre-existing familiarity with the NHSN submission process.

Further, the initial setup and acclimation to the NHSN system will have already occurred through the implementation of the NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure and the NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure for the FY 2014 LTCHQR Program payment determination. Even though these measures have been recently reviewed by the NQF and expanded to postacute care settings, including LTCHs, there has been no change in the way that the data for these measures is to be collected and reported to NHSN. Likewise, there has been no change in the registration and training requirements for providers that are new to the NHSN reporting system. In addition, LTCH providers will begin to use the NHSN system to report CAUTI and CLABSI data on October 1, 2012. By the time that any new measures are finalized and reporting of the same begins, LTCH providers should be very familiar and comfortable with the NHSN reporting system.

The burden associated with these quality measures is the time and effort associated with collecting and submitting the data concerning CAUTI, CLABSI, and Influenza Vaccination Coverage among Healthcare Personnel to NHSN for LTCHs that are not currently reporting such data. As we have stated above, for LTCHs that already submit data regarding these measures to NHSN, we believe there should be little, if any, additional burden. For LTCHs that submit data to NHSN for other HAIs, but not data for these three proposed measures, there may be some added burden. However, we believe that this burden will be significantly decreased because these LTCHs will already be enrolled in the NHSN system and will be already familiar with the NHSN data submission process. The CDC reports that 321 LTCHs are presently enrolled and are reporting data through the NHSN system and that 198 of these LTCHs are presently submitting data on the CAUTI measure, for example.

There are currently 442 LTCHs in the United States paid under the LTCH PPS. We estimate that each LTCH will submit approximately 12 NHSN submissions (6 CAUTI events and 6 CLABSI events) per month (144 events per LTCH annually). This equates to a total of approximately 63,648 submissions of HAI data to NHSN from all LTCHs per year. We estimate that each NHSN assessment will take approximately 25 minutes to complete. This time estimate consists of 10 minutes of clinical (for example, nursing time) needed to collect the clinical data and 15 minutes of clerical time necessary to enter the data into the NHSN database. Based on this estimate, we expect each LTCH will expend 300 minutes (5 hours) per month and 60 hours per year reporting to NHSN. Therefore, the total estimated annual hourly burden to all LTCHs in the United States for reporting to NHSN is 26,520 hours.

The estimated cost per submission is estimated at $12.07. These costs are estimated using an hourly wage for a registered nurse of $41.59 and a medical billing clerk/data entry person of $20.57 (U.S. Bureau of Labor Statistics data). Therefore, we estimate that the annual cost per each LTCH provider will be $1,739 and the total yearly cost to all LTCHs for the submission of CAUTI and CLABSI data to NHSN will be $768,497.[259] While these requirements are subject to the Paperwork Reduction Act, we believe the associated burden hours are accounted for in the

[259] Nursing Time—24 hours @ $41.59 per hour = $998.16; $998.16 × 442 LTCHs = approximately $441,187.

Admin Time—36 hours @ $20.57 per hour = $740.52; $740.52 × 442 LTCHs = approximately $327,310.

TOTAL = $441,187 + $327,310 = $768,497.

information collection request currently approved, OCN 0920–0666.

We analyzed the information collection requirements for the FY 2014 LTCHQR Program quality reporting measure ''Percent of Residents with Pressure Ulcers that are New or Worsened (NQF #0678)'' in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51781). This same estimate applies to the measures affecting the FY 2015 payment determination as they are the same three (3) measures.

As stated in section VIII.D.3.d. of this final rule, the other new quality measure that we have finalized for addition to the LTCHQR Program is the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine. This measure is to be collected using the LTCH CARE Data Set. In order to do so, the LTCH CARE Data Set will require modification with the addition of the item sets necessary to collect the data needed for this measure.

In the FY 2013 IPPS/LTCH PPS proposed rule collection of information section, we proposed that we would post the specific additional data elements that would need to be added to the LTCH CARE Data set in order to collect the data necessary to calculate the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine measure. We further proposed to post the corresponding modified technical data specifications at a later date, on our LTCH Quality Reporting Program Web site. We made this proposal because, we had not yet completed the necessary technical development of the data items and the modifications to the data collection instrument that LTCHs will use to submit the data for this new measure. Because the forms are still under development, we cannot make a complete burden estimate at this time. We proposed that reporting and submission of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine measure be incorporated into the existing data collection and submission framework of the LTCH CARE Data Set. This is the same data collection and submission framework that will be used by CMS to support providers for reporting on the Percent of Residents with Pressure Ulcers That Are New or Worsened measure.[260]

By building upon preexisting resources for data collection and submission, we intend to foster alignment between measures that helps to reduce the administrative burden related to data collection and submission. We anticipate that the initial setup and acclimation to the data collection by the LTCH CARE Data Set will have already occurred with the adoption of the Pressure Ulcer measure for the LTCHQR Program for the FY 2014 payment determination. Therefore, we believe the transition to reporting the four measures via the LTCH CARE Data Set may be less burdensome.

The delivery of high quality care in the LTCH setting is imperative. We believe that collecting quality data on all patients in the LTCH setting supports CMS' mission to ensure quality care for Medicare beneficiaries. Collecting data on all patients provides the most robust and accurate reflection of quality in the LTCH setting.

At this time, we have not completed development of the information collection instrument that LTCHs would have to submit to comply with the aforementioned reporting requirements regarding the measures proposed for data collection by the LTCH CARE Data Set for the FY 2016 LTCHQR payment determination. Because the forms are still under development, we cannot make a complete burden estimate at this time. Once the forms are available, we will prepare and submit the required Paperwork Reduction Act (PRA) package which will fully set forth the anticipated burden to LTCH providers as a result of the new data items (questions) that need to be added to the LTCH CARE Data Set. The PRA process provides for the publication of two PRA notices in the **Federal Register** which are followed by 60 and 30 day comment periods respectively. The PRA notice and comment process is similar to that provided for with the proposed and final rule notice and comment process. Therefore, even though it is not possible, at this time, for CMS to provide all of the necessary burden estimate information related to the new measures that we proposed to add to the LTCHQR Program, stakeholders will still be afforded opportunities to submit public comments in accordance with the PRA rules and guidelines.

Comment: Several commenters expressed concern about CMS' burden estimate. They believed that 50 hours per LTCH per year (or roughly 20 minutes per patient) for submission of the pressure ulcer measure is unrealistic. Several commenters estimated that data collection and submission would take closer to 2 hours per patient. One commenter noted that in order for LTCHs to achieve the 20 minute estimate, CMS needs to reduce the amount of data collected for calculating the pressure ulcer measure. Several commenters noted that CMS' conclusion that reporting four measures via the LTCH CARE Data Set will not be burdensome because data collection using this data collection mechanism is a preexisting tool is flawed because CMS' burden estimate for the pressure ulcer measure is underestimated. Several commenters noted that LTCHs believe it will be necessary to hire at least one additional staff member in order to meet the reporting requirements. One commenter added that CMS was incorrect in its assumption that clerical staff will be able to collect these data, when many data will need to be collected by wound care or nursing staff (both of whom generally have higher wages). Another commenter argued that it is not necessary to complete the LTCH CARE Data Set for all patients and all care transitions.

Response: We acknowledge the commenters' concern regarding the number of data elements that are included on the LTCH Care Data Set and the amount of time that it may take to complete the LTCH CARE Data Set. We are sensitive to the commenters' concern for the amount of time and money that they will have to expend to comply with the reporting pressure ulcer data.

In response to those concerns, we have carefully reviewed the LTCH CARE Data Set and our rationale for the collection quality measure data in the LTCH setting. We have given much consideration to the benefits of collecting quality measure data versus the burden that will be placed upon LTCH providers when required to report this data to CMS using the LTCH CARE Data Set or the National Healthcare Safety Network (NHSN). In addition, we considered the number and types of LTCHs that are present in the United States today and the effect that size, financial status, access to technical vendor services, and other factors that may have an impact upon each LTCHs abilities to comply with the demands of reporting quality data using the LTCH CARE Data Set. We further considered the likelihood of and degree of burden to which LTCHs of various sizes, corporate structure, financial status and varying specialties would be able to successfully comply with the requirements of the section 3004 of the

[260] The LTCH CARE Data Set, the data collection instrument that will be used to submit data on this measure, is currently under Paperwork Reduction Act (PRA) review by the Office of Management and Budget. It is discussed in a PRA Notice which appeared in the **Federal Register** on September 2, 2011 (Volume 76, Issue 171). The file number for the LTCH PRA package is CMS–10409.

Affordable Care Act for the LTCHQR Program.

For reasons that we explain in section VIII.D.3.a. of the preamble of this final rule, we are finalizing that certain data elements contained on the LTCH CARE Data Set will be voluntary. What we mean by this is that failure to submit data on these items will not cause CMS to find an LTCH provider to be in noncompliance with the rules and regulations of the LTCHQR Program. LTCHs can submit data on these items on a voluntary basis, and we strongly encourage this.

Under this policy, LTCHs will only be required to complete a subset of the data elements that comprise the LTCH CARE Data Set. For purposes of this discussion, we have broken down the items which make up the LTCH CARE Data Set into three categories and have deemed them to be either required or voluntary. These elements are: (1) A limited set of administrative items that are necessary in order to identify each LTCH and properly attribute patients to it for purposes of calculating the measure rate; (2) the data elements necessary to populate the pressure ulcer measure, consistent with the NQF-endorsed specifications for that measure; (3) the data elements necessary to enable CMS to validate that the pressure ulcer measure data elements were accurately reported. All other data elements on the LTCH Care Data Set can be completed on a voluntary basis but will have no impact on the measure rate calculations or on our determination of whether the LTCH has met the reporting requirements under the LTCHQR Program. We will post on the CMS Web site a detailed matrix that identifies which data elements will be required and which will be voluntary.

As noted above, we have decided to make a portion of the LTCH CARE Data Set voluntary. However, we are required by the Paperwork Reduction Act of 1995 to report the burden for information collection requests that are voluntary. Therefore, even though our position has changed with respect to how many of the LTCH CARE Data Set items are now considered to be required for successful reporting, this will not affect the burden estimate that we must render.

Although we have reviewed and made some adjustments to our policy related to the mandatory or voluntary nature of each item in the LTCH CARE Date set, we believe that these adjustments have no effect on our previously stated burden estimates. Upon review of the burden calculations that we previously put forth in the proposed rule, we were not able to find any information that would lead us to believe that it will take close to 2 hours per patient to complete the full LTCH CARE Data Set (including all required and voluntary items). Furthermore, we have not been able to find any facts that would lead us to believe that LTCHs would have to dedicate one full-time staff position to the responsibility for completion of a full LTCH CARE Data Set assessment for each patient, or for an assessment that does not include all of the voluntary items. The likelihood of the need for a dedicated staff person is further reduced by our decision to make a portion of the items on the LTCH CARE Data Set voluntary in nature. We have several rationales in support of our conclusions, which we will discuss below.

First, we note that the full LTCH CARE Data Set Admission Assessment consists of 29 data items (which shall now be divided into required and voluntary categories). When we originally calculated our burden estimate for the LTCH CARE Data set, we considered burden information data pertaining to how long it took to complete similar data items on similar assessment instruments. Data obtained during the Post Acute Care Payment Reform Demonstration (PAC–PRD) included estimates of the response time necessary for each CARE tool item. PAC–PRD data revealed that it took approximately 0.7 minutes to complete each question on the CARE tool that was being used during this demonstration.

In addition, we also considered burden estimates from other data collection tools such as the Outcome and Assessment Information Set (OASIS–C). The OASIS–C is a data collection instrument which is approved under OMB control number 0938–0760. The OASIS–C is used by home health providers for Medicare payment and quality reporting purposes. We have estimated that the time required to complete this information collection is estimated to average 0.7 minutes per response, including the time to review instructions, search existing data resources, gather the data needed and complete and review the information collection. The time estimates for these quality data collection instruments are consistent with our previously stated time estimate of approximately 20 minutes for completion of the LTCH CARE Data Set or 0.7 minutes per response (either voluntary or required).

Second, the first 20 data items on the LTCH CARE Data Set consist of basic patient demographic information typically collected by most providers. A portion of these items, while not necessary for the calculation of the pressure ulcer measure, are required in order for the record to be accepted by the CMS online data submission system. Often, this information is provided to the LTCH by the transferring facility, or by the patient and/or their family members upon admission. Only rarely should the person responsible for the completion of the LTCH CARE Data Set have to elicit this information directly from the patient or their family members. Because the patient's demographic information should be readily available in the patient's medical records, we believe that it should take no more that the estimated 0.7 minutes per item to complete these particular data items, whether these items are required or voluntary (A0050 to A1820).

Third, many LTCHs are now using EHRs. With the recent movement towards use of EHRs and the advancement of this technology, those LTCHs using EHR technology may gain additional time efficiencies in the completion of the LTCH CARE Data Set by working with their vendors to pull the specified patient demographic data (A0050 to A1820) from their EHRs to populate the corresponding field of the LTCH–CARE data set. We are in the process of obtaining Logical Observation Identifiers Names & Codes (LOINC) codes for all LTCH–CARE data items to facilitate electronic interoperability.

Fourth, a review of the remaining nine data items of the LTCH CARE Data Set reveal that these are items related to a clinical physical assessment of various body systems or functions. Several of these items on the LTCH CARE Data Set that are necessary for the calculation of the pressure ulcer measure as well as matching of patient data at admission and discharge for the calculation of the pressure ulcer measure remain mandatory items, while others (items that are not necessary for the calculation of the pressure ulcer measure) are considered voluntary. We will post on our Web site a detailed matrix that identifies which data elements of the LTCH CARE Data Set are mandatory (that is, will be required), and which will be voluntary. This matrix will also be incorporated into the final LTCHQR Program Manual which will be posted on CMS LTCHQR Program Web site and available for download from *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html*. Each of these sections contain data items that are assessment-based and should be performed on an ongoing basis by clinical staff for each patient as a routine part of safe and effective patient care, and irrespective of the requirements for completion of the

LTCH CARE Data Set. Therefore, most, if not all LTCHs, should be assessing their patients for the information that is captured in the LTCH CARE Data Set [261] and documenting their findings in the medical record as part of their normal patient care.

As with the patient demographic questions, completion of the patient physical assessment data items may be possible through the use of EHR technology. Data required for the LTCH CARE Data Set could be electronically captured directly from the patient's electronic medical records and placed into the LTCH CARE Data Set to populate the data item fields. The time required for the LTCHs with the capability to complete the entire LTCH CARE Data Set in this manner may be significantly less than that for those LTCHs that do not use this type of technology.

Finally, we do not believe that it should take more than 20 minutes to complete a full LTCH CARE Data Set assessment on each LTCH patient because, pursuant to PRA requirements, we are not required to include in our burden estimates, any time that a provider would spend in the performance of normal patient care. Nor are we required to factor into our burden estimate any other work that an LTCH provider would perform in the normal course of business (that is, if they had not been asked to collect the information that is the LTCH CARE Data Set). This principle would apply to all data items, whether they are voluntary or required, because pursuant to the Paperwork Reduction Act of 1995, we are obligated to report the burden for all information collection requests, whether they be voluntary or mandatory.

Collection of patient demographic information is done in the normal course of business, typically when a patient is received into an LTCH facility. Patient assessment, and more particularly, the skin assessments are performed and the results documented by the LTCH clinical staff on an ongoing basis during the patient's stay. To the extent that we ask LTCHs to provide any of this information to us on the LTCH CARE Data Set, this information is already being collected and documented during the normal course of business and in the normal course of patient care, and we are not required to factor it into our burden assessment.

Comment: Several commenters noted that CMS provided a burden estimate for NHSN data submission but did not provide data for the estimated level of burden for submission of LTCH CARE Data Set data for the newly proposed measures.

Response: In the FY 2013 IPPS/LTCH PPS proposed rule, we noted that we could not provide a burden estimate for the time that it will take to complete the LTCH CARE Data Set given the newly proposed measures selected for use in the LTCHQR Program, as the LTCH CARE Data set has not yet been updated to include the data items needed for the measures CMS is finalizing. We further explained that the data for four of these new measures is to be collected using the LTCH CARE Data Set. However, since the time of the publication of the proposed rule, we have elected not to proceed with three of the new measures that we had named in the proposed rule. We instead decided to proceed with the addition of two new measures (that is, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay) (NQF #0680); and Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431), in addition to the three measures that were previously finalized for use in the LTCHQR Program.

The data for the staff influenza vaccination measure will be reported by LTCHs to NHSN. However, the addition of the inpatient influenza vaccination measure has required us to add additional item sets to the LTCH CARE Data Set. We are currently in the process of developing these new item sets but this work has not yet been completed. We cannot provide an accurate burden estimate for revised LTCH CARE Data Set which incorporates the new item sets until these new items have been completely developed.

We also stated in the FY 2013 IPPS/LTCH PPS proposed rule that, upon completion of the revised LTCH CARE Data Set (which will contain the new item sets), we will file a PRA package in which we will provide a complete burden estimate for the revised LTCH CARE Data Set. This PRA process will supply LTCH providers with not only one, but two separate notices and comment periods which will afford them with the opportunity to view PRA documents that we file and to submit public comments related to these PRA documents.

The PRA process provides for the publication of an initial 60 day PRA notice in the **Federal Register**. LTCHs will have 60 days from the date of publication of this 60 day PRA notice in which to file their public comments in response to the PRA documents that we file. These PRA documents will be posted on the CMS PRA Web site. After the expiration of the 60-day notice and comment period, we will respond to any comments that we receive. Thereafter, a second, 30 day PRA notice will be posted in the **Federal Register** which will begin the 30-day notice and comment period. This is an additional opportunity to file public comments in response to the second PRA publication and posting.

Comment: One commenter expressed concern regarding the burden of inputting data into LASER because LASER was developed without user input.

Response: While the LTCHQR Program and the LASER program are new, the LASER program was developed by CMS contractors who have had extensive experience with the design, development, and implementation of similar data collection programs. These computer programs correspond to data collection instruments that are used by CMS to obtain data for payment and quality measurement purposes. One such program is the JIRVEN program that is used to collect data from the Inpatient Rehabilitation Facility Assessment-Patient Assessment Instrument (IRF–PAI). This instrument is used to determine IRF PPS payments and will also be used for the collection of IRF quality reporting program data beginning on October 1, 2012. Another such program is the RAVEN software, which is used to collect data for the Minimum Data Set, 3.0 (MDS 3.0). The MDS 3.0 data collection instrument is used in skilled nursing facilities to collect information that is used for payment and quality measurement purposes. CMS also offers another free software program to stakeholders, known as HAVEN, which is used to collect data for OASIS–C.

We believe that the CMS contractors who created the LASER program have used the past knowledge and experience, which they gained from development of similar data collection programs when creating the LASER program. In addition, during the design process for the LASER program, the contractors were in frequent contact with the various CMS subject matter experts and technical advisors, who provided them with information about the LTCH setting, so that the LASER

[261] Mandatory data elements are the administrative section, skin conditions section, and assessment of risk factors used as covariates for the NQF-endorsed Pressure Ulcer measure (NQF)678) of the LTCH CARE Data Set. The covariate items include: functional status assessment, bowel continence, active diagnosis such as diabetes and peripheral vascular disease, documentation of height and weight to calculate patient body mass index, and skin assessment to capture new or worsening of pressure ulcers (Stage 2, 3 or 4) between admission and discharge assessment.

program would be customized to fit the needs of the LTCH setting.

We disagree with the contention that we did not get user input during the creation of the LASER program, or that lack of input will cause increased burden to LTCHs. When the LASER program was being created, we made numerous attempts to reach out to the LTCH community to educate the community about the LTCHQR Program and to also seek input about various areas of the LTCHQR Program, including the development of the LASER program. We held vendor calls on November 16, 2011 and June 28, 2012, during which the LTCH community and their vendors were invited to participate and share their questions and concerns about the LASER program.

We have also reached out to the LTCH community through the use of several different types of activities, including Open Door Forums, the posting of information on the LTCH Quality Reporting Program Web page (*https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCHTechnicalInformation.html* and a 2-day in-person training conference. LTCH Special Open Door Forums were held on September 21, 2011 and April 13, 2012. Open Door Forums provided an opportunity for LTCHs to receive information about selected topics and to ask questions and seek information about the LTCH quality reporting program. A tape recording of each of these Open Door Forums was made available for a short period of time following the date of the presentation. Also, a transcript of each Open Door Forum is available at the CMS Open Door Forum Web site and the LTCHQR Program Web page.

Finally, we have posted informational updates about the status of the LTCHQR Program on an ongoing basis to the LTCHQR Program Web page. Information about the LASER data collection program for the LTCHQR Program also has been posted, including draft and final technical specifications.

In summary, we believe that the LASER Program was created by experienced CMS contractors with input from the LTCH vendors and provider community, as well as CMS subject matter experts, taking into account provider and vendor comments and interactions as outlined above, so we do not foresee any increased burden to providers caused by the method in which this program was created.

10. ICRs for the Ambulatory Surgical Center (ASC) Quality Reporting Program

In section VIII.E. of the preamble of the proposed rule and this final rule, we discuss the requirements for the ASCQR Program for payment determinations affecting CY 2014 and subsequent years. In section XIV.K. of the CY 2012 OPPS/ASC final rule with comment period (76 FR 74492 through 74517), we finalized our proposal to implement a quality reporting program for ASCs beginning with the CY 2014 payment determination. We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74554) for a detailed discussion of the ASCQR Program collection of information requirements for the claims-based and structural measures for the CY 2014 and CY 2015 payment determinations.

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74516), we finalized our proposal to consider an ASC to be participating in the ASCQR Program for the CY 2014 payment determination if the ASC includes Quality Data Codes (QDCs) specified for the program on their CY 2012 claims relating to the finalized measures.

For the CY 2015 payment determination and subsequent payment determination years, we proposed and are finalizing that once an ASC submits any quality measure data, it would be considered to be participating in the ASCQR Program. For the CY 2014 payment determination and subsequent payment determination years, if the ASC submits quality measure data, there is no additional action required by the ASC to indicate participation in the Program. Once an ASC submits quality measure data indicating its participation in the ASCQR Program, in order to withdraw, an ASC must complete and submit an online form indicating that it is withdrawing from the quality reporting program.

The burden associated with the requirements to withdraw from the program is the time and effort associated with accessing, completing, and submitting the online form. Based on the number of hospitals that have withdrawn from the Hospital OQR Program over the past 4 years, we estimate that 2 ASCs would withdraw per year and that an ASC would expend 30 minutes to access and complete the form, for a total burden of 1 hour per year.

For the CY 2015 payment determination, we proposed and are finalizing the requirement that ASCs identify and register a QualityNet administrator in order to set up accounts necessary to enter structural measure data. We estimate that, based upon previous experience with the Hospital OQR Program, it would take an ASC 10 hours to obtain, complete, and submit an application for a QualityNet administrator and then set up the necessary accounts for structural measure data entry. We estimate the total burden to meet these requirements to be 51,750 hours (10 hours $\times$ 5,175 ASCs). We previously discussed the burden associated with the data entry of structural measure information for the ASCQR Program in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74554).

We proposed and are finalizing a process for an extension or waiver for submitting information required under the ASCQR Program due to extraordinary circumstances that are not within the ASC's control for the CY 2014 payment determination and subsequent payment determination years. We proposed and are finalizing that an ASC would complete a request form that would be available on the QualityNet Web site, supply requested information, and submit the request. The burden associated with these requirements is the time and effort associated with gathering required information as well as accessing, completing, and submitting the form. Based on the number of hospitals that have submitted a request for an extension or waiver from the Hospital OQR Program over the past 4 years, we estimate that 1 ASC per year would request an extension or waiver and that an ASC would expend 2 hours to gather required information as well as access, complete, and submit the form, for a total burden of 2 hours per year.

We also proposed and are finalizing a reconsideration process that would apply to the CY 2014 payment determination and subsequent payment determination years under the ASC Quality Reporting Program. While there is burden associated with an ASC filing a reconsideration request, the regulations at 5 CFR 1320.4 for the Paperwork Reduction Act of 1995 exclude collection activities during the conduct of administrative actions such as redeterminations, reconsiderations, and/or appeals.

We requested public comments on these information collection requirements.

We did not receive any public comments regarding these information collections.

11. ICRs for the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program

In section VIII.F. of the preamble of the proposed rule and this final rule, we discuss the implementation of the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program.

Historically, IPFs have not been required to report quality data to CMS. However, they have been required to report quality measures to other entities such as TJC or State survey and certification organizations. Therefore, although IPFs have not reported on quality measures to CMS, they have some familiarity with and experience in reporting of quality data. More specifically, out of the 1,741 existing IPFs, 450 are currently reporting the proposed measures to TJC. This equates to 26.02 percent of IPFs that already report the measures on a regular basis. The fact that over one-quarter of the IPFs have demonstrated the ability to report the measures indicates the proposed regulation would not significantly impact IPFs.

Furthermore, we estimate that reporting aggregated-level data on QualityNet will not be costly to IPFs. In our burden calculation, we have included the time used for chart abstraction and for training personnel on collection of chart-abstracted data, aggregation of the data, as well as training for submitting the aggregate-level data through QualityNet. We estimate that the annual hourly burden to each IPF for the collection, submission, and training of personnel for submitting all quality measures is approximately 821 hours in a year for each IPF. The average hourly burden to each IPF is approximately 68 hours per month.

This rule would affect all IPFs participating in Medicare. The facilities would have to register with QualityNet and take the proper training in order to be adequately prepared to use the QualityNet system to submit the data. The anticipated burden to these providers consists of the following: (1) The initial registration of the facility with QualityNet; (2) training of the appropriate staff members on how to use the QualityNet reporting program; (3) the time required for collection and aggregation of data; and (4) the time required for entry of the data into the QualityNet database by the IPF's representative.

This rule would affect all IPFs that currently do not already report data to CMS. These facilities will have to register with CMS and take the proper training in order to be adequately prepared to use the CMS QualityNet System for data submission.

Those IPFs that already report quality measures to the TJC will be minimally affected because the abstraction methods, population, sampling, and reporting approaches are similarly adopted by CMS. Therefore, IPFs that report the proposed IPFQR Program quality measures will experience a minimum burden.

We requested public comments on these information collection requirements.

We did not receive any public comments regarding these information collections.

List of Subjects

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 413

Health facilities, Kidney diseases, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 424

Conditions for Medicare payment.

42 CFR Part 476

Health care, Health professional, Health record, Peer Review Organization (PRO), Penalties, Privacy, Reporting and recordkeeping requirements.

For the reasons stated in the preamble, the Centers for Medicare & Medicaid Services is amending 42 CFR Chapter IV as follows:

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 1. The authority citation for Part 412 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh), and sec. 124 of Pub. L. 106–113 (113 Stat. 1501A–332).

■ 2. Section 412.1 is amended by adding new paragraphs (a)(5) and (a)(6) to read as follows:

§ 412.1 Scope of part.

(a) * * *

(5) This part implements section 1886(q) of the Act, which provides that, effective for discharges from an ''applicable hospital'' beginning on or after October 1, 2012, payments to those hospitals under section 1886(d) of the Act will be reduced to account for certain excess readmissions, under the Hospital Readmissions Reduction Program. This reduction will be made through an adjustment to the hospital's base operating DRG payment amounts under the prospective payment system for inpatient operating costs.

(6) This part implements section 1886(o)(1)(B) of the Act, which directs the Secretary to begin to make value-based incentive payments under the Hospital Value-Based Purchasing Program to hospitals for discharges occurring on or after October 1, 2012, through an adjustment to the base operating DRG payment amounts under the prospective payment system for inpatient operating costs.

* * * * *

■ 3. Section 412.64 is amended—
■ a. Revising paragraph (d)(1)(iv).
■ b. Revising the introductory text of paragraph (h)(4).
■ c. Revising paragraph (h)(4)(v).
■ d. Adding a new paragraph (h)(4)(vi).

The revisions and addition read as follows:

§ 412.64 Federal rates for inpatient operating costs for Federal fiscal year 2005 and subsequent fiscal years.

* * * * *

(d) * * *

(1) * * *

(iv) For fiscal years 2012 and 2013, the percentage increase in the market basket index less a multifactor productivity adjustment (as determined by CMS) and less 0.1 percentage point for prospective payment hospitals (as defined in § 413.40(a) of this subchapter) for hospitals in all areas.

* * * * *

(h) * * *

(4) For discharges on or after October 1, 2004 and before October 1, 2013, CMS establishes a minimum wage index for each all-urban State, as defined in paragraph (h)(5) of this section. This minimum wage index value is computed using the following methodology.

* * * * *

(v) The product determined under paragraph (h)(4)(iv) of this section is the minimum wage index value for the State, except as provided under paragraph (h)(4)(vi) of this section;

(vi) For discharges on or after October 1, 2012 and before October 1, 2013, the minimum wage index value for the State is the higher of the value determined under paragraph (h)(4)(iv) of this section or the value computed using the following alternative methodology:

(A) CMS estimates a percentage representing the average percentage increase in wage index for hospitals receiving the rural floor due to such floor.

(B) For each all-urban State, CMS makes a onetime determination of the lowest hospital wage index in the State (including all adjustments to the hospital's wage index, except for the rural floor, the rural floor budget neutrality, and the outmigration adjustment) and increases this wage index by the percentage determined under paragraph (h)(4)(vi)(A) of this section, the result of which establishes the alternative minimum wage index value for the State.

* * * * *

■ 4. Section 412.92 is amended by—

■ a. Revising paragraph (b)(2)(i).

■ b. Adding paragraphs (b)(2)(v) and (b)(3)(iv).

The revision and additions read as follows:

§ 412.92 Special treatment: Sole community hospitals.

* * * * *

(b) * * *

(2) * * * (i) Sole community hospital status is effective 30 days after the date of CMS' written notification of approval, except as provided in paragraph (b)(2)(v) of this section.

* * * * *

(v) If a hospital that is classified as an MDH under § 412.108 applies for classification as a sole community hospital because its status under the MDH program expires with the expiration of the MDH program, and that hospital's sole community hospital status is approved, the effective date of approval of sole community hospital status is the day following the expiration date of the MDH program if the hospital—

(A) Applies for classification as a sole community hospital prior to 30 days before the expiration of the MDH program; and

(B) Requests that sole community hospital status be effective with the expiration of the MDH program.

(3) * * *

(iv) A sole community hospital must report to the fiscal intermediary or MAC any factor or information that could have affected its initial classification as a sole community hospital.

(A) If CMS determines that a sole community hospital has failed to comply with the requirement of paragraph ((b)(3)(iv) of this section, CMS may cancel the hospital's classification as a sole community hospital effective with the date the hospital failed to meet the criteria for such classification, consistent with the provisions of § 405.1885 of this chapter.

(B) Effective on or after October 1, 2012, if a hospital reports to CMS any factor or information that could have affected its initial determination and CMS determines that the hospital should not have qualified for sole community hospital status, CMS will cancel the sole community hospital status effective 30 days from the date of the determination.

* * * * *

■ 5. Section 412.105 is amended by revising paragraph (b)(4) to read as follows:

§ 412.105 Special treatment: Hospitals that incur indirect costs for graduate medical education programs.

* * * * *

(b) * * *

(4) Beds otherwise countable under this section used for outpatient observation services, skilled nursing swing-bed services, or inpatient hospice services.

* * * * *

■ 6. Section 412.140 is amended by revising paragraphs (a)(3)(i) and (b) to read as follows:

§ 412.140 Participation, data submission, and validation requirements under the Hospital Inpatient Quality Review (IQR) Program.

(a) * * *

(3) * * *

(i) A hospital that would like to participate in the program for the first time (and to which paragraph (a)(3)(ii) of this section does not apply), or that previously withdrew from the program and would now like to participate again, must submit to CMS a completed Notice of Participation Form by December 31 of the calendar year preceding the first quarter of the calendar year in which data submission is required for any given fiscal year.

* * * * *

(b) *Withdrawal from the Hospital IQR Program.* A subsection (d) hospital may withdraw from the Hospital IQR Program by submitting to CMS a withdrawal form that can be found in the secure portion of the QualityNet Web site. The hospital must submit the withdrawal form by May 15 prior to the start of the payment year affected. For example, if a hospital seeks to withdraw from the FY 2015 payment determination, the hospital must submit the withdrawal form to CMS by May 15, 2014.

* * * * *

■ 7. Subpart I is added to part 412 to read as follows:

Subpart I—Adjustments to the Base Operating DRG Payment Amounts Under the Prospective Payment Systems for Inpatient Operating Costs

Sec.

412.150 Basis and scope of subpart.

Payment Adjustments Under the Hospital Readmissions Reduction Program

412.152 Definitions for the Hospital Readmissions Reduction Program.

412.154 Payment adjustments under the Hospital Readmissions Reduction Program.

412.155–412.159 [Reserved]

Incentive Payments Under the Hospital Value-Based Purchasing Program

412.160 Definitions for the Hospital Value-Based Purchasing (VBP) Program.

412.161 Applicability of the Hospital Value-Based Purchasing (VBP) Program

412.162 Process for reducing the base operating DRG payment amount and applying the value-based incentive payment amount adjustment under the Hospital Value-Based Purchasing (VBP) Program.

412.163 Process for making hospital-specific performance information under the Hospital Value-Based Purchasing (VBP) Program available to the public.

412.164 Measure selection under the Hospital Value-Based Purchasing (VBP) Program.

412.165 Performance standards under the Hospital Value-Based Purchasing (VBP) Program.

412.167 Appeal under the Hospital Value-Based Purchasing (VBP) Program.

412.168–412.169 [Reserved]

Subpart I—Adjustments to the Base Operating DRG Payment Amounts Under the Prospective Payment Systems for Inpatient Operating Costs

§ 412.150 Basis and scope of subpart.

(a) Section 1886(q) of the Act requires the Secretary to establish a Hospital Readmissions Reduction program, under which payments to applicable hospitals are reduced in order to account for certain excess readmissions, effective for discharges beginning on October 1, 2012. The rules for determining the payment adjustment under the Hospital Readmission Reductions Program are specified in §§ 412.152 and 412.154.

(b) Section 1886(o) of the Act requires the Secretary to establish a Value-Based Purchasing (VBP) Program for inpatient hospitals (Hospital VBP Program), which requires CMS to make value-based incentive payments to hospitals that meet performance standards for applicable performance periods, effective for discharges beginning on October 1, 2012. The rules for determining the payment adjustment under the Hospital Value-Based

Purchasing Program are specified in §§ 412.160 through 412.167.

Payment Adjustments Under the Hospital Readmissions Reduction Program

§ 412.152 Definitions for the Hospital Readmissions Reduction Program.

As used in this section and in § 412.154, the following definitions apply:

Aggregate payments for all discharges is, for a hospital for the applicable period, the sum of the base operating DRG payment amounts for all discharges for all conditions from such hospital for such applicable period.

Aggregate payments for excess readmissions is, for a hospital for the applicable period, the sum, for the applicable conditions, of the product for each applicable condition of:

(1) The base operating DRG payment amount for the hospital for the applicable period for such condition;

(2) The number of admissions for such condition for the hospital for the applicable period; and

(3) The excess readmission ratio for the hospital for the applicable period minus 1.

Applicable condition is a condition or procedure selected by the Secretary among conditions and procedures for which:

(1) Readmissions represent conditions or procedures that are high volume or high expenditures; and

(2) Measures of such readmissions have been endorsed by the entity with a contract under section 1890 and such endorsed measures have exclusions for readmissions that are unrelated to the prior discharge (such as a planned readmission or transfer to another applicable hospital).

Applicable hospital is a hospital described in section 1886(d)(1)(B) of the Act or a hospital in Maryland that is paid under section 1814(b)(3) of the Act and that, absent the waiver specified by section 1814(b)(3) of the Act, would have been paid under the hospital inpatient prospective payment system.

Applicable period is, with respect to a fiscal year, the 3-year period (specified by the Secretary) from which data are collected in order to calculate excess readmission ratios and adjustments under the Hospital Readmissions Reduction Program.

Base operating DRG payment amount is the wage-adjusted DRG operating payment plus any applicable new technology add-on payments under subpart F of this part. This amount is determined without regard to any payment adjustments under the Hospital Value-Based Purchasing Program, as specified under § 412.162. This amount does not include any additional payments for indirect medical education under § 412.105, the treatment of a disproportionate share of low-income patients under § 412.106, outliers under subpart F of this part, and a low volume of discharges under § 412.101.

Excess readmissions ratio is a hospital-specific ratio for each applicable condition for an applicable period, which is the ratio (but not less than 1.0) of risk-adjusted readmissions based on actual readmissions for an applicable hospital for each applicable condition to the risk-adjusted expected readmissions for the applicable hospital for the applicable condition.

Floor adjustment factor is the value that the readmissions adjustment factor cannot be less than for a given fiscal year. The floor adjustment factor is set at 0.99 for FY 2013, 0.98 for FY 2014, and 0.97 for FY 2015 and subsequent fiscal years.

Readmission is the case of an individual who is discharged from an applicable hospital, the admission of the individual to the same or another applicable hospital within a time period of 30 days from the date of such discharge.

Readmissions adjustment factor is equal to the greater of:

(1) 1 minus the ratio of the aggregate payments for excess readmissions to aggregate payments for all discharges; or

(2) The floor adjustment factor.

Wage-adjusted DRG operating payment is the applicable average standardized amount adjusted for resource utilization by the applicable MS–DRG relative weight and adjusted for differences in geographic costs by the applicable area wage index (and by the applicable cost-of-living adjustment for hospitals located in Alaska and Hawaii). This amount includes an applicable payment adjustment for transfers under § 412.4(f).

§ 412.154 Payment adjustments under the Hospital Readmissions Reduction Program.

(a) *Scope.* This section sets forth the requirements for determining the payment adjustments under the Hospital Readmissions Reduction Program for applicable hospitals to account for excess readmissions in the hospital.

(b) *Payment adjustment.* (1) *General.* To account for excess readmissions, except as provided for in paragraph (d) of this section, an applicable hospital's base operating DRG payment amount is adjusted for each discharge occurring during the fiscal year. The payment adjustment for each discharge is determined by subtracting the product of the base operating DRG payment amount (as defined in § 412.152) for such discharge by the hospital's readmission payment adjustment factor for the fiscal year (determined under paragraph (c) of this section) from the base operating DRG payment amount for such discharge.

(2) *Special treatment for sole community hospitals.* In the case of a sole community hospital that receives payments under § 412.92(d) based on the hospital-specific rate, the difference between the hospital-specific rate payment and the Federal rate payment determined under subpart D of this part is not affected by this payment adjustment.

(c) *Methodology to calculate the readmissions payment adjustment factor.* A hospital's readmissions payment adjustment factor is the higher of the ratio described in paragraph (c)(1) of this section or the floor adjustment factor set forth in paragraph (c)(2) of this section.

(1) *Ratio.* The ratio is equal to 1 minus the ratio of the aggregate payments for excess readmissions as defined in § 412.152 and the aggregate payments for all discharges as defined in § 412.152.

(2) *Floor adjustment factor.* The floor adjustment factor is:

(i) For FY 2013, 0.99;

(ii) For FY 2014, 0.98; and

(iii) For FY 2015 and subsequent fiscal years, 0.97.

(d) *Hospitals paid under section 1814(b)(3) of the Act (certain Maryland hospitals).* The Secretary will consider whether to exempt Maryland hospitals that are paid under section 1814(b)(3) of the Act and that, absent the provisions of section 1814(b)(3) of the Act, would be paid under section 1886(d) of the Act from the Hospital Readmissions Reduction Program, provided that the State submits an annual report to the Secretary describing how a similar program to reduce hospital readmissions in that State achieves or surpasses the measured results in terms of health outcomes and cost savings for the Hospital Readmissions Reduction Program as applied to hospitals described in section 1886(d)(1)(B) of the Act.

(1) CMS will establish criteria for evaluation of Maryland's annual report to the Secretary to determine whether Maryland will be exempted from the program for a given fiscal year.

(2) Maryland's annual report to the Secretary and request for exemption from the Hospital Readmissions

Reduction Program must be resubmitted and reconsidered annually.

(e) *Limitations on review.* There is no administrative or judicial review under this subpart of the following:

(1) The determination of base operating DRG payment amounts.

(2) The methodology for determining the adjustment factor under paragraph (c) of this section, including the excess readmissions ratio, aggregate payments for excess readmissions, and aggregate payments for all discharges.

(3) The applicable period.

(4) The applicable conditions.

(f) *Reporting of hospital-specific information.* CMS will make information available to the public regarding readmissions rates of each applicable hospital (as defined in § 412.152) under the Hospital Readmissions Reduction Program.

(1) To ensure that an applicable hospital has the opportunity to review and submit corrections for its excess readmission ratios for the applicable conditions for a fiscal year that are used to determine its readmissions payment adjustment factor under paragraph (c) of this section, CMS will provide each applicable hospital with confidential hospital-specific reports and discharge level information used in the calculation of its excess readmission ratios.

(2) Applicable hospitals will have a period of 30 days after receipt of the information provided in paragraph (f)(1) of this section to review and submit corrections for the excess readmission ratios for each applicable condition that are used to calculate the readmissions payment adjustment factor under paragraph (c) of this section for the fiscal year.

(3) The administrative claims data used to calculate an applicable hospital's excess readmission ratios for the applicable conditions for a fiscal year are not subject to review and correction under paragraph (f)(1) of this section.

(4) CMS will post the excess readmission ratios for the applicable conditions for a fiscal year for each applicable hospital on the *Hospital Compare* Web site.

§§ 412.155–412.159 [Reserved]

Incentive Payments Under the Hospital Value-Based Purchasing Program

§ 412.160 Definitions for the Hospital Value-Based Purchasing (VBP) Program.

As used in this section and in §§ 412.161 through 412.167:

Achievement threshold (or achievement performance standard) means the median (50th percentile) of hospital performance on a measure during a baseline period with respect to a fiscal year.

Applicable percent means the following:

(1) For FY 2013, 1.0 percent;

(2) For FY 2014, 1.25 percent;

(3) For FY 2015, 1.50 percent;

(4) For FY 2016, 1.75 percent; and

(5) For FY 2017 and subsequent fiscal years, 2.0 percent.

Base operating DRG payment amount means the following:

(1) With respect to a subsection (d) hospital (as defined in section 1886(d)(1)(B) of the Act), the wage-adjusted DRG operating payment plus any applicable new technology add-on payments under subpart F of this part. This amount is determined without regard to any payment adjustments under the Hospital Readmissions Reduction Program, as specified under § 412.154. This amount does not include any additional payments for indirect medical education under § 412.105, the treatment of a disproportionate share of low-income patients under § 412.106, outliers under subpart F of this part, or a low volume of discharges under § 412.101.

(2) With respect to a Medicare-dependent, small rural hospital that receives payments under § 412.108(c) or a sole community hospital that receives payments under § 412.92(d), the wage-adjusted DRG operating payment plus any applicable new technology add-on payments under subpart F of this part. This amount does not include any additional payments for indirect medical education under § 412.105, the treatment of a disproportionate share of low-income patients under § 412.106, outliers under subpart F of this part, or a low volume of discharges under § 412.101. This amount also does not include the difference between the hospital-specific payment rate and the Federal payment rate determined under subpart D of this part.

(3) With respect to a hospital that is paid under section 1814(b)(3) of the Act, the payment amount under section 1814(b)(3) of the Act.

Benchmark means the arithmetic mean of the top decile of hospital performance on a measure during the baseline period with respect to a fiscal year.

Cited for deficiencies that pose immediate jeopardy means that, during the applicable performance period, the Secretary cited the hospital for immediate jeopardy on at least two surveys using the Form CMS–2567, Statement of Deficiencies and Plan of Correction.

Domain means a grouping of measures used for purposes of calculating the Total Performance Score for each hospital with respect to a fiscal year.

Domain score means the total number of points awarded to a hospital for a domain.

Hospital means a hospital described in section 1886(d)(1)(B) of the Act, but does not include a hospital, with respect to a fiscal year, for which one or more of the following applies:

(1) The hospital is subject to the payment reduction under section 1886(b)(3)(B)(viii)(I) of the Act for the fiscal year;

(2) The Secretary cited the hospital for deficiencies that pose immediate jeopardy to the health or safety of patients during the performance period that applies with respect to the fiscal year;

(3) There are not a minimum number of measures that apply to the hospital for the performance period for the fiscal year; or

(4) There are not a minimum number of cases for the measures that apply to the hospital for the performance period for the fiscal year.

Immediate jeopardy has the same meaning as that term is defined in § 489.3 of this chapter.

Improvement threshold (or improvement performance standard) means an individual hospital's performance level on a measure during the baseline period with respect to a fiscal year.

Linear Exchange Function is the means to translate a hospital's total performance score into a value-based incentive payment percentage such that:

(1) Each eligible hospital's value-based incentive payment percentage is based on its total performance score; and

(2) The total amount of value-based incentive payments to all hospitals in a fiscal year is equal to the total amount available for value-based incentive payments in such fiscal year.

Performance period means the time period during which data are collected for the purpose of calculating hospital performance on measures with respect to a fiscal year.

Performance standards are the levels of performance that hospitals must meet or exceed in order to earn points under the Hospital VBP Program.

Total Performance Score means the numeric score ranging from 0 to 100 awarded to each hospital based on its performance under the Hospital VBP Program with respect to a fiscal year.

Value-based incentive payment adjustment factor is the number that

will be multiplied by the base operating DRG payment amount for each discharge from a hospital, during a fiscal year, in order to adjust the hospital's payment as a result of its performance under the Hospital VBP Program.

Value-based incentive payment percentage means the percentage of the base operating DRG payment amount for each discharge that a hospital has earned with respect to a fiscal year, based on its Total Performance Score for that fiscal year.

Wage-adjusted DRG operating payment is the applicable average standardized amount adjusted for—

(1) Resource utilization by the applicable MS-DRG relative weight;

(2) Differences in geographic costs by the applicable area wage index (and by the applicable cost-of-living adjustment for hospitals located in Alaska and Hawaii); and

(3) Any applicable payment adjustment for transfers under § 412.4(f).

§ 412.161 Applicability of the Hospital Value-Based Purchasing (VBP) Program

(a) *General rule.* Except as provided in paragraph (b) of this section, the Hospital VBP Program applies to hospitals, as that term is defined in § 412.160.

(b) *Special rule for hospitals paid under section 1814 of the Act.* The Secretary may exempt hospitals paid under section 1814 of the Act from the requirements of the Hospital VBP Program for a fiscal year if the State submits an annual report to the Secretary describing how a similar program in the State for a participating hospital or hospitals achieves or surpasses the measured results in terms of patient health outcomes and cost savings established under the Hospital VBP Program.

§ 412.162 Process for reducing the base operating DRG payment amount and applying the value-based incentive payment amount adjustment under the Hospital Value-Based Purchasing (VBP) Program.

(a) *General.* If a hospital meets or exceeds the performance standards that apply to the Hospital VBP Program for a fiscal year, CMS will make value-based incentive payments to the hospital under the requirements and conditions specified in this section.

(b) *Value-based incentive payment amount.* (1) *Available amount.* The value-based incentive payment amount for a discharge is the portion of the payment amount that is attributable to the Hospital VBP Program. The total amount available for value based incentive payments to all hospitals for a fiscal year is equal to the total amount of base-operating DRG payment reductions for that fiscal year, as estimated by the Secretary.

(2) *Calculation of the value-based incentive payment amount.* The value-based incentive payment amount is calculated by multiplying the base operating DRG payment amount by the value-based incentive payment percentage.

(3) *Calculation of the value-based incentive payment percentage.* The value-based incentive payment percentage is calculated as the product of: the applicable percent as defined in § 412.160, the hospital's Total Performance Score divided by 100, and the exchange function slope.

(c) *Methodology to calculate the value-based incentive payment adjustment factor.* The value-based incentive payment adjustment factor for each discharge is determined by subtracting the applicable percent as specified in § 412.160 from the value-based incentive payment percentage and then adding that difference to one.

§ 412.163 Process for making hospital-specific performance information under the Hospital Value-Based Purchasing (VBP) Program available to the public.

(a) CMS will make information available to the public regarding the performance of each hospital under the Hospital VBP Program.

(b) To ensure that a hospital has the opportunity to review and submit corrections for the information to be made public under this section, CMS will provide each hospital with confidential hospital-specific reports and discharge level information used in the calculation of its performance with respect to each measure, condition, and domain, and the calculation of its Total Performance Score.

(c) Hospitals will have a period of 30 days after CMS provides the information specified in paragraph (b) of this section to review and submit corrections for the information.

(d) CMS will post the information specified in paragraph (b) for each hospital on the *Hospital Compare* Web site.

§ 412.164 Measure selection under the Hospital Value-Based Purchasing (VBP) Program.

(a) CMS will select measures, other than measures of readmissions, for purposes of the Hospital VBP Program. The measures will be a subset of the measures specified under section 1886(b)(3)(B)(viii) of the Act (the Hospital Inpatient Quality Reporting Program).

(b) CMS will post data on each measure on the *Hospital Compare* Web site for at least 1 year prior to the beginning of a performance period for the measure under the Hospital VBP Program.

§ 412.165 Performance scoring under the Hospital Value-Based Purchasing (VBP) Program.

(a) *Points awarded based on hospital performance.* (1) CMS will award points to hospitals for performance on each measure for which the hospital reports the applicable minimum number of cases during the applicable performance period.

(2) CMS will award from 1 to 9 points for achievement to each hospital whose performance on a measure during the applicable performance period meets or exceeds the achievement threshold but is less than the benchmark for that measure.

(3) CMS will award from 0 to 9 points for improvement to each hospital whose performance on a measure during the applicable performance period exceeds the improvement threshold but is less than the benchmark for that measure.

(4) CMS will award 10 points to a hospital whose performance on a measure during the applicable performance period meets or exceeds the benchmark for that measure.

(b) *Calculation of the Total Performance Score.* The hospital's Total Performance Score for a program year is calculated as follows:

(1) CMS will calculate a domain score for a hospital when it reports the minimum number of measures in the domain.

(2) CMS will sum all points awarded for each measure in a domain to calculate an unweighted domain score.

(3) CMS will normalize each domain score to ensure that it is expressed as a percentage of points earned out of 100.

(4) CMS will weight the domain scores with the finalized domain weights for each fiscal year.

(5) The sum of the weighted domain scores is the hospital's Total Performance Score for the fiscal year.

§ 412.167 Appeal under the Hospital Value-Based Purchasing (VBP) Program.

(a) A hospital may appeal the following issues:

(1) CMS' decision to deny a hospital's correction request that the hospital submitted under the review and corrections process;

(2) Whether the achievement/improvement points were calculated correctly;

(3) Whether CMS properly used the higher of the achievement/improvement points in calculating the hospital's measure/dimension score;

(4) Whether CMS correctly calculated the domain scores, including the normalization calculation;

(5) Whether CMS used the proper lowest dimension score in calculating the hospital's HCAHPS consistency points;

(6) Whether CMS calculated the HCAHPS consistency points correctly;

(7) Whether the correct domain scores were used to calculate the Total Performance Score;

(8) Whether each domain was weighted properly;

(9) Whether the weighted domain scores were properly summed to arrive at the Total Performance Score; and,

(10) Whether the hospital's open/closed status (including mergers and acquisitions) is properly specified in CMS' systems.

(b) Appeals must be submitted within 30 days of CMS' decision to deny a corrections request under § 412.163 or within 30 days of the conclusion of the review and corrections period, as applicable, and must contain the following information:

(1) Hospital's CMS Certification Number (CCN).

(2) Hospital name.

(3) Hospital's basis for requesting an appeal. This must identify the hospital's specific reason(s) for appealing the hospital's Total Performance Score or performance assessment with respect to the performance standards.

(4) CEO contact information, including name, email address, telephone number, and mailing address (must include the physical address, not just the post office box).

(5) QualityNet System Administrator contact information, including name, email address, telephone number, and mailing address (must include the physical address, not just the post office box).

(c) *Limitations on review.* There is no administrative or judicial review of the following:

(1) The methodology used to determine the amount of the value-based incentive payment under section 1886(o)(6) of the Act and the determination of such amount.

(2) The determination of the amount of funding available for value-based incentive payments under section 1886(o)(7)(A) of the Act and the payment reduction under section 1886(o)(7)(B)(i) of the Act.

(3) The establishment of the performance standards under section 1886(o)(3) of the Act and the performance period under section 1886(o)(4) of the Act.

(4) The measures specified under section 1886(b)(3)(B)(viii) of the Act and the measures selected under section 1886(o)(2) of the Act.

(5) The methodology developed under section 1886(o)(5) of the Act that is used to calculate hospital performance scores and the calculation of such scores.

(6) The validation methodology that is specified under section 1886(b)(3)(B)(viii)(XI) of the Act.

§§ 412.168–412.169 [Reserved].

■ 8. Section 412.424 is amended by adding a new paragraph (d)(1)(vi) to read as follows:

§ 412.424 Methodology for calculating the Federal per diem payment amount.

* * * * *

(d) * * *

(1) * * *

(vi) *Applicable percentage change for fiscal year 2014 payment determination and for subsequent years.* (A) In the case of an inpatient psychiatric facility that is paid under the prospective payment system in § 412.1(a)(2) that does not submit quality data to CMS, in the form and manner and at a time specified by CMS, the applicable annual update to a Federal standard rate is reduced by 2.0 percentage points.

(B) Any reduction in the applicable annual update to a Federal standard rate will apply only to the fiscal year involved and will not be taken into account in computing the annual payment update for a subsequent year.

* * * * *

■ 9. Section 412.434 is added to subpart N to read as follows:

§ 412.434 Reconsideration and appeals procedures of Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program decisions.

(a) An inpatient psychiatric facility may request reconsideration of a decision by CMS that the inpatient psychiatric facility has not met the requirements of the IPFQR Program for a particular fiscal year. An inpatient psychiatric facility must submit a reconsideration request to CMS no later than 30 days from the date identified on the IPFQR Program Annual Payment Update Notification Letter provided to the inpatient psychiatric facility.

(b) A reconsideration request must contain the following information:

(1) The inpatient psychiatric facility's CMS Certification Number (CCN);

(2) The name of the inpatient psychiatric facility;

(3) Contact information for the inpatient psychiatric facility's chief executive officer and QualityNet system administrator, including each individual's name, email address, telephone number, and physical mailing address;

(4) A summary of the reason(s), as set forth in the IPFQR Program Annual Payment Update Notification Letter, that CMS concluded the inpatient psychiatric facility did not meet the requirements of the IPFQR Program;

(5) A detailed explanation of why the inpatient psychiatric facility believes that it complied with the requirements of the IPFQR Program for the applicable fiscal year; and

(6) Any evidence that supports the inpatient psychiatric facility's reconsideration request, such as emails and other documents.

(c) An inpatient psychiatric facility that is dissatisfied with a decision made by CMS on its reconsideration request may file an appeal with the Provider Reimbursement Review Board under part 405, subpart R of this chapter.

■ 10. Section 412.523 is amended by—

■ a. Adding a new paragraph (c)(3)(ix).

■ b. Revising paragraph (d)(3).

The addition and revision read as follows:

§ 412.523 Methodology for calculating the Federal prospective payment rates.

* * * * *

(c) * * *

(3) * * *

(ix) *For long-term care hospital prospective payment system fiscal year beginning October 1, 2012, and ending September 30, 2013.* (A) The standard Federal rate for the long-term care hospital prospective payment system beginning October 1, 2012, and ending September 30, 2013, is the standard Federal rate for the previous long-term care hospital prospective payment system fiscal year updated by 1.8 percent, and further adjusted, as appropriate, as described in paragraph (d) of this section.

(B) With respect to discharges occurring on or after October 1, 2012 and before December 29, 2012, payments are based on the standard Federal rate in paragraph (c)(3)(ix)(A) of this section without regard to the adjustment provided for under paragraph (d)(3)(ii) of this section.

* * * * *

(d) * * *

(3)(i) *General.* The Secretary reviews payments under this prospective payment system and may make a one-time prospective adjustment to the long-term care hospital prospective payment system rates no earlier than December 29, 2012, so that the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not

perpetuated in the prospective payment rates for future years.

(ii) *Adjustment to the standard Federal rate.* The standard Federal rate determined in paragraph (c)(3) of this section is permanently adjusted by 3.75 percent to account for the estimated difference between projected aggregate payments in FY 2003 made under the prospective payment system implemented under this subpart and the projected aggregate payments that would have been made in FY 2003 under Part 413 of this chapter without regard to the implementation of the prospective payment system implemented under this subpart, excluding the effects of sections 1886(b)(2)(E) and (b)(3)(J) of the Act. This adjustment is transitioned over 3 years beginning in FY 2013.

(iii) *Special rule for certain discharges occurring during FY 2013.* The adjustment applied under paragraph (d)(3)(ii) of this section is not applicable when making payments under this subpart for discharges occurring on or after October 1, 2012, and on or before December 28, 2012.

* * * * *

■ 11. Section 412.529 is amended by revising paragraph (d)(4)(i)(C) to read as follows:

§ 412.529 Special payment provisions for short-stay outliers.

* * * * *

(d) * * *

(4) * * *

(i) * * *

(C) The payment amount specified under paragraph (d)(4)(i)(B) of this section may not exceed the full amount comparable to what would otherwise be paid under the hospital inpatient prospective payment system determined under paragraph (d)(4)(i)(A) of this section.

* * * * *

■ 12. Section 412.534 is amended by—

■ a. In the following paragraphs, removing the date ''October 1, 2012'' and adding in its place the date ''October 1, 2013'':

■ 1. Paragraph (c)(1) heading;

■ 2. Paragraph (c)(1)(i);

■ 3. Paragraph (c)(1)(ii);

■ 4. Paragraph (c)(2) heading;

■ 5. Paragraph (d)(1) heading;

■ 6. Paragraph (d)(1)(i);

■ 7. Paragraph (d)(2) heading;

■ 8. Paragraph (e)(1) heading;

■ 9. Paragraph (e)(1)(i); and

■ 10. Paragraph (e)(2) heading.

■ b. Revising paragraph (c)(3).

■ c. Revising paragraph (d)(3).

■ d. Revising paragraph (e)(3).

■ e. Revising paragraphs (h)(4) and (h)(5).

■ f. Adding a new paragraph (h)(6).

The revisions and addition read as follows:

§ 412.534 Special payment provisions for long-term care hospitals within hospitals and satellites of long-term care hospitals.

* * * * *

(c) * * *

(3) For a long-term care hospital satellite facility described in § 412.22(h)(3)(i), payments are determined as follows:

(i) For cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting period beginning on or after October 1, 2012 and before October 1, 2013, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 50 percent.

(ii) For cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012, for discharges occurring on or after October 1, 2012, and before the beginning of the next cost reporting period, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 50 percent.

(iii) In determining the percentage of patients admitted to a satellite from the co-located hospital, patients on whose behalf an outlier payment was made to the co-located hospital are not counted toward the 50-percent threshold.

(d) * * *

(3) For cost reporting periods beginning on or after July 1, 2007, and before July 1, 2012, and beginning on or after October 1, 2012, and before October 1, 2013, payment for a long-term care hospital satellite facility described in § 412.22(h)(3)(i) are determined as follows:

(i) For cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting period beginning on or after October 1, 2012 and before October 1, 2013, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 75 percent.

(ii) For cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012, for discharges occurring on or after October 1, 2012, and before the beginning of the next cost reporting period, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 75 percent.

(iii) In determining the percentage of patients admitted to a satellite from the co-located hospital, patients on whose behalf an outlier payment was made to the co-located hospital are not counted toward the 75-percent threshold.

(e) * * *

(3) For cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012 and for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013, payments for a long-term care hospital satellite facility described in § 412.22(h)(3)(i) are determined as follows:

(i) For cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting period beginning on or after October 1, 2012 and before October 1, 2013, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 75 percent.

(ii) For cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012, for discharges occurring on or after October 1, 2012, and before the beginning of the next cost reporting period, payment will be determined using the methodology specified in paragraph (c)(1) of this section, except that the applicable percentage threshold for Medicare discharges is 75 percent.

(iii) In determining the percentage of patients admitted to a satellite from the co-located hospital, patients on whose behalf an outlier payment was made to the co-located hospital are not counted toward the 75-percent threshold.

* * * * *

(h) * * *

(4) Except as provided in paragraph (h)(6) of this section, for a long-term care hospital described in § 412.23(e)(2)(i) that meets the criteria in § 412.22(f), the policies set forth in this paragraph (h) and in § 412.536 do not apply for discharges occurring in cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting periods beginning on or after October 1, 2012 and before October 1, 2013.

(5) Except as provided in paragraph (h)(6) of this section, for a long-term care hospital or satellite facility that, as of December 29, 2007, was co-located with an entity that is a provider-based, off-campus location of a subsection (d) hospital which did not provide services payable under section 1886(d) of the Act at the off-campus location, the policies set forth in this paragraph (h) and in § 412.536 do not apply for discharges

occurring in cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting periods beginning on or after October 1, 2012 and before October 1, 2013.

(6) For long-term care hospitals and satellite facilities with cost reporting periods beginning on or after July 1, 2012 and before October 1, 2012.

(i) Payments to long-term care hospitals and satellite facilities described in paragraphs (h)(4) and (h)(5) of this section are determined using the methodology specified in paragraph (c)(1) of this section for discharges occurring prior to October 1, 2012 during the hospital's or satellite facility's cost reporting period beginning on or after July 1, 2012 and before October 1, 2012. Such policies will not be applied to discharges occurring on or after October 1, 2012 and before the beginning of the hospital's or satellite facility's next cost reporting period.

(ii) In determining the percentage of Medicare discharges admitted from the co-located hospital under this paragraph, patients on whose behalf a Medicare high-cost outlier payment was made at the co-located referring hospital are not counted toward that threshold.

■ 13. Section 412.536 is amended by revising the introductory text of paragraph (a)(2) and adding a new paragraph (a)(3) to read as follows:

§ 412.536 Special payment provisions for long-term care hospitals and satellites of long-term care hospitals that discharged Medicare patients admitted from a hospital not located in the same building or on the same campus as the long-term care hospital or satellite of the long-term care hospital.

(a) * * *

(2) For cost reporting periods beginning on or after July 1, 2007 and before July 1, 2012, and for cost reporting periods beginning on or after October 1, 2012 and before October 1, 2013, the policies set forth in this section are not applicable to discharges from:

* * * * *

(3) For certain long-term care hospitals with cost reporting periods beginning on or after July 1, 2012 and before October 1, 2012—

(i) Payments to long-term care hospitals described in paragraph (a)(1)(iv) of this section are determined using the methodology specified in either paragraph (b)(1) or paragraph (b)(2) of this section, except that such policies will not be applied to discharges occurring on or after October 1, 2012, and before October 1, 2012.

(ii) In determining whether the percentage of long-term care hospital discharges during a long-term care hospital's cost reporting period beginning on or after July 1, 2012 and before July 1, 2013 exceeds the 25 percent threshold, those discharges occurring on or after October 1, 2012, and before October 1, 2013, will not be counted towards that threshold.

(iii) In determining the percentage of Medicare discharges admitted to the long-term care hospital from any referring hospital not co-located with the long-term care hospital or with the satellite facility of a long-term care hospital under paragraphs (b)(1) and (b)(2) of this section, patients on whose behalf a Medicare high cost outlier payment was made to the referring hospital are not counted toward the 25 percent threshold from that referring hospital.

* * * * *

PART 413—PRINCIPLES OF REASONABLE COST REIMBURSEMENT; PAYMENT FOR END–STAGE RENAL DISEASE SERVICES; OPTIONAL PROSPECTIVELY DETERMINED PAYMENT RATES FOR SKILLED NURSING FACILITIES

■ 14. The authority citation for Part 413 continues to read as follows:

Authority: Secs. 1102, 1812(d), 1814(b), 1815, 1833(a), (i), and (n), 1861(v), 1871, 1881, 1883, and 1886 of the Social Security Act (42 U.S.C. 1302, 1395d(d), 1395f(b), 1395g, 1395l(a), (i), and (n), 1395x(v), 1395hh, 1395rr, 1395tt, and 1395ww); and sec. 124 of Pub. L. 106–133 (113 Stat. 1501A–332).

■ 15. Section 413.24 is amended by revising paragraph (a) to read as follows:

§ 413.24 Adequate cost data and cost finding.

(a) *Principle.* Providers receiving payment on the basis of reimbursable cost must provide adequate cost data. This must be based on their financial and statistical records which must be capable of verification by qualified auditors. The cost data must be based on an approved method of cost finding and on the accrual basis of accounting, except for—

(1) Governmental institutions which operate on a cash basis method of accounting. Cost data based on such basis of accounting will be acceptable, subject to appropriate treatment of capital expenditures.

(2) Costs of qualified defined benefit pension plans shall be reported on a cash basis method of accounting, as described at § 413.100(c)(2)(vii)(D) for cost reporting periods beginning on or after October 1, 2011.

* * * * *

■ 16. Section 413.79 is amended by—
■ a. Revising paragraphs (e)(1), (e)(2), (e)(3), and (e)(4).
■ b. Adding a new paragraph (e)(5).
■ c. Revising paragraph (f)(7)(i)(B).
■ d. Redesignating paragraphs (n)(2)(ii) and paragraph (n)(2)(iii) as paragraphs (n)(2)(iii) and paragraph (n)(2)(iv), respectively.
■ e. Adding new paragraph (n)(2)(ii).
■ f. Revising newly redesignated paragraphs (n)(2)(iii) and (n)(2)(iv).

The revisions and addition read as follows:

§ 413.79 Direct GME payments: Determination of the weighted number of FTE residents.

* * * * *

(e) * * *

(1) If a hospital had no allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, and it begins training residents in a new medical residency training program(s) for the first time on or after January 1, 1995, but before October 1, 2012, the hospital's unweighted FTE resident cap under paragraph (c) of this section may be adjusted for new residency training programs based on the sum of the products of the highest number of FTE residents in any program year during the third year of the first new program's existence and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program. The adjustment to the cap may not exceed the number of accredited slots available to the hospital for the new program. If a hospital had no allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, and it begins training residents in a new medical residency training program(s) for the first time on or after October 1, 2012, the hospital's unweighted FTE resident cap under paragraph (c) of this section may be adjusted for new residency training programs based on the sum of the products of the highest number of FTE residents in any program year during the fifth year of the first new program's existence and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program. The adjustment to the cap may not exceed the number of accredited slots available to the hospital for the new program.

(i) If a hospital begins training residents in a new medical residency

training program(s) for the first time on or after January 1, 1995, but before October 1, 2012, and if the residents are spending portions of a program year (or years) at one hospital and the remainder of the program at another hospital(s), the adjustment to each qualifying hospital's cap for a new medical residency training program(s) is equal to the sum of the products of the highest number of FTE residents in any program year during the third year of the first new program's existence and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program and the number of years the residents are training at each respective hospital. If a hospital begins training residents in a new medical residency training program(s) for the first time on or after October 1, 2012, and if the residents are spending portions of a program (or years) at one hospital and the remainder of the program at another hospital(s), the adjustment to each qualifying hospital's cap for new residency training program (s) is equal to the sum of the products of three factors (limited to the number of accredited slots for each program):

(A) The highest total number of FTE residents trained in any program year during the fifth year of the first new program's existence at all of the hospitals to which the residents in the program rotate;

(B) The number of years in which residents are expected to complete the program, based on the minimum accredited length for each type of program.

(C) The ratio of the number of FTE residents in the new program that trained at the hospital over the entire 5-year period to the total number of FTE residents that trained at all hospitals over the entire 5-year period.

(ii) If a hospital begins training residents in a new medical residency training program(s) for the first time on or after January 1, 1995, but before October 1, 2012, prior to the implementation of the hospital's adjustment to its FTE cap beginning with the fourth year of the hospital's first new residency program(s), the hospital's cap may be temporarily adjusted during each of the first 3 years of the hospital's first new residency program using the actual number of residents participating in the new program. The adjustment may not exceed the number of accredited slots available to the hospital for each program year. If a hospital begins training residents in a new medical residency training program(s) for the first time on or after October 1, 2012, prior to the implementation of the hospital's adjustment to its FTE cap beginning with the sixth year of the hospital's first new residency program(s), the hospital's cap may be adjusted temporarily during each of the first 5 years of the hospital's first new residency program using the actual number of FTE residents participating in the new program. The adjustment may not exceed the number of accredited slots available to the hospital for each program year.

(iii) If a hospital begins training residents in a new medical residency training program for the first time on or after January 1, 1995, but before October 1, 2012, the cap will not be adjusted for new programs established more than 3 years after residents begin training in the first new program, or if a hospital begins training residents in a new medical residency training program for the first time on or after October 1, 2012, the cap will not be adjusted for new programs established more than 5 years after residents begin training in the first new program.

(iv) Effective for Medicare GME affiliation agreements entered into on or after October 1, 2005, an urban hospital that qualifies for an adjustment to its FTE cap under paragraph (e)(1) of this section is permitted to be part of a Medicare GME affiliated group for purposes of establishing an aggregate FTE cap only if the adjustment that results from the affiliation is an increase to the urban hospital's FTE cap.

(v) A rural hospital that qualifies for an adjustment to its FTE cap under paragraph (e)(1) of this section is permitted to be part of a Medicare GME affiliated group for purposes of establishing an aggregate FTE cap.

(2) If a hospital had allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, the hospital's unweighted FTE cap may be adjusted for a new medical residency training program(s) established on or after January 1, 1995, and on or before August 5, 1997. The adjustment to the hospital's FTE resident cap for new residency training programs is based on the sum of the product of the highest number of FTE residents in any program year during the third year of the newly established program and the number of years in which residents are expected to complete each program based on the minimum accredited length for the type of program.

(i) If the residents are spending portions of a program year (or years) at one hospital and the remainder of the program at another hospital(s), the adjustment to each respective hospital's cap for each program is equal to the product of the highest number of FTE residents in any program year during the third year of each program's existence and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program and the number of years the residents are training at each respective hospital.

(ii) Prior to the implementation of the hospital's adjustment to its FTE cap beginning with the fourth year of the hospital's residency program, the hospital's cap may be temporarily adjusted during each of the first 3 years of the hospital's new residency program, using the actual number of FTE residents in the new programs. The adjustment may not exceed the number of accredited slots available to the hospital for each program year.

(3) If a rural hospital participates in new medical residency training programs, regardless of whether the rural hospital had allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, the hospital's unweighted FTE cap may be adjusted in the same manner described in paragraph (e)(2) of this section to reflect the increase for residents training in a new medical residency training program(s) established after August 5, 1997 and before October 1, 2012. If a rural hospital participates in new medical residency training programs on or after October 1, 2012, the hospital's unweighted FTE cap is adjusted in accordance with paragraph (e)(1) of this section, except that the adjustment is based on the sum of the products of the highest number of FTE residents in any program year during the fifth year of each new program's existence and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program.

(4) A hospital seeking an adjustment to its FTE cap must provide documentation to its fiscal intermediary justifying the adjustment.

(5) The cap will not be adjusted for expansion of existing or previously existing programs.

(f) * * *

(7) * * *

(i) * * *

(B) Specify the effective period of the emergency Medicare GME affiliation agreement (which must, in any event, terminate at the conclusion of four academic years following the academic year in which the section 1135 emergency period began).

* * * * *

(n) * * *

(2) * * *

(ii) If a hospital receives an increase in the otherwise applicable FTE resident cap under paragraph (n)(1) of this section, and does not use all of that increase in its final (12-month or partial) cost report of the 5-year period beginning July 1, 2011 and ending June 30, 2016, the Medicare contractor will remove the applicable unused slots, and the hospital's increase in the otherwise applicable FTE resident cap received under paragraph (n)(1) of this section will be reduced for portions of cost reporting periods on or after July 1, 2016. The number of applicable unused slots is equal to the difference between the increase in the otherwise applicable FTE resident cap and the applicable slots used. In determining the applicable slots used, the following amounts are added, as relevant:

(A) If a hospital uses the increase in the otherwise applicable FTE resident cap under paragraph (n)(1) of this section to expand an existing program(s), the used slots are equal to the lesser of the number of slots used for an expansion(s) in the fourth 12-month cost report or the final cost report.

(B) If a hospital uses the increase in the otherwise applicable FTE resident cap under paragraph (n)(1) of this section to start a new program(s), the used slots are equal to the number of slots used for a new program(s) in the final cost report.

(C) The portion, if any, of the increase in the otherwise applicable FTE resident cap under paragraph (n)(1) of this section used for cap relief, subject to the requirements in paragraph (n)(2)(i) of this section.

(iii) CMS may determine whether a hospital has met the requirements under paragraphs (n)(2)(i) and (n)(2)(ii) of this section during the 5-year period of July 1, 2011, through June 30, 2016, in such manner and at such time as CMS determines appropriate, including at the end of such 5-year period.

(iv) In a case where the Medicare contractor determines that a hospital did not meet the requirements under paragraphs (n)(2)(i), (n)(2)(ii), and (n)(2)(iii) of this section in a cost reporting period within the 5-year time period, the Medicare contractor will reduce the otherwise applicable FTE resident cap of the hospital by the amount by which such limit was increased under paragraph (n)(1) of this section from the earliest cost reporting period that is reopenable in which it would be determined that the hospital did not meet the requirements.

* * * * *

■ 17. Section 413.100 is amended by adding a new paragraph (c)(2)(vii)(D) to read as follows:

§ 413.100 Special treatment of certain accrued costs.

* * * * *

(c) * * *

(2) * * *

(vii) * * *

(D) Exception: Qualified defined benefit pension plans, which are funded deferred compensation arrangements, shall be reported on a cash accounting basis as follows:

(1) The allowable pension cost shall be equal to the amount of actual pension contributions funded during the hospital's current Medicare cost reporting period, plus any contributions funded in a prior period and carried forward, subject to the limit under paragraph (c)(2)(vii)(D)*(2)* of this section.

(2) Except as provided in paragraph (c)(2)(vii)(D)*(3)* of this section, the allowable pension cost shall not exceed 150 percent of the average contribution(s) funded during the three consecutive Medicare cost reporting periods that produce the highest average contribution(s), out of the five most recent Medicare cost reporting periods (ending with the current cost reporting period). Contributions in excess of the limit may be carried forward to future period(s). In the case of a newly adopted pension plan, the 5-year look-back period and/or the 3-year averaging period will be limited to the number of cost reporting periods the provider sponsored a qualified defined benefit pension plan.

(3) A waiver of the limit imposed under paragraph (c)(2)(vii)(D)*(2)* of this section may be granted for a specific Medicare cost reporting period for all or a portion of the contributions in excess of the limit imposed under paragraph (c)(2)(vii)(D)*(2)* of this section if it is determined that such excess costs are reasonable and necessary for that period.

PART 424—CONDITIONS FOR MEDICARE PAYMENT

■ 18. The authority citation for Part 424 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395(hh)).

■ 19. Section 424.30 is revised to read as follows:

§ 424.30 Scope.

This subpart sets forth the requirements, procedures, and time limits for claiming Medicare payments. Claims must be filed in all cases except when services are furnished on a prepaid capitation basis by an MA organization, or through cost settlement with either a health maintenance organization (HMO), a competitive medical plan (CMP), or a health care prepayment plan (HCPP), or as part of a demonstration. Therefore, claims must be filed by hospitals seeking IME payment under § 412.105(g) of this chapter, and/or direct GME payment under § 413.76(c) of this chapter, and/or nursing or allied health education payment under § 413.87 of this chapter associated with inpatient services furnished on a prepaid capitation basis by an MA organization. Hospitals that must report patient data for purposes of the DSH payment adjustment under § 412.106 of this chapter for inpatient services furnished on a prepaid capitation basis by an MA organization, or through cost settlement with an HMO/CMP, or as part of a demonstration, are required to file claims by submitting no pay bills for such inpatients. Special procedures for claiming payment after the beneficiary has died and for certain bills paid by organizations are set forth in subpart E of this part.

PART 476—UTILIZATION AND QUALITY CONTROL REVIEW

■ 20. The authority citation for Part 476 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395(hh)).

■ 21. Section 476.1 is amended by adding a definition of ''Provider'' in alphabetical order, to read as follows:

§ 476.1 Definitions.

* * * * *

Provider means a health care facility, institution, or organization, including but not limited to a hospital, involved in the delivery of health care services for which payment may be made in whole or in part under Title XVIII of the Act.

* * * * *

■ 22. Section 476.78 is amended by revising the section heading and the introductory text of paragraph (b)(2) to read as follows:

§ 476.78 Responsibilities of providers and practitioners.

* * * * *

(b) * * *

(2) Providers and practitioners must provide patient care data and other pertinent data to the QIO at the time the QIO is collecting review information

that is required for the QIO to make its determinations. When the QIO does postadmission, preprocedure review, the provider must provide the necessary information before the procedure is performed, unless it must be performed on an emergency basis. Providers and practitioners must—

* * * * *

■ 23. Section 476.90 is revised to read as follows:

§ 476.90 Lack of cooperation by a provider or practitioner.

(a) If a provider or practitioner refuses to allow a QIO to enter and perform the duties and functions required under its contract with CMS, the QIO may—

(1) Determine that the provider or practitioner has failed to comply with the requirements of 42 CFR 1004.10(c) and report the matter to the HHS Inspector General; or

(2) Issue initial denial determinations for those claims it is unable to review, make the determination that financial liability will be assigned to the provider or practitioner, and may report the matter to the HHS Inspector General.

(b) If a QIO gives a provider or practitioner sufficient notice and a reasonable amount of time to respond to a request for information about a claim, and if the provider or practitioner does not respond in a timely manner, the QIO will deny the claim. A provider or practitioner may request that the QIO reconsider its decision to deny the claim. No further appeal rights are available.

(Catalog of Federal Domestic Assistance Program No. 93.773, Medicare—Hospital Insurance; Program No. 93.774, Medicare—Supplementary Medical Insurance Program; and Program No. 93.778, Medical Assistance)

Dated: July 27, 2012.

Kathleen Sebelius,

Secretary.

Note: The following Addendum and Appendixes will not appear in the Code of Federal Regulations.

Addendum—Schedule of Standardized Amounts, Update Factors, and Rate-of-Increase Percentages Effective With Cost Reporting Periods Beginning On or After October 1, 2012 and Payment Rates for LTCHs Effective for Discharges Occurring On or After October 1, 2012

I. Summary and Background

In this Addendum, we are setting forth a description of the methods and data we used to determine the prospective payment rates for Medicare hospital inpatient operating costs and Medicare hospital inpatient capital-related costs for FY 2013 for acute care hospitals. We also are setting forth the rate-of-increase percentages for updating the target amounts for certain hospitals excluded from the IPPS for FY 2013. We note that, because certain hospitals excluded from the IPPS are paid on a reasonable cost basis subject to a rate-of-increase ceiling (and not by the IPPS), these hospitals are not affected by the figures for the standardized amounts, offsets, and budget neutrality factors. Therefore, in this final rule, we are finalizing the rate-of-increase percentages for updating the target amounts for certain hospitals excluded from the IPPS that are effective for cost reporting periods beginning on or after October 1, 2012.

In addition, we are setting forth a description of the methods and data we used to determine the standard Federal rate that would be applicable to Medicare LTCHs for FY 2013.

In general, except for SCHs and hospitals located in Puerto Rico, for FY 2013, each hospital's payment per discharge under the IPPS is based on 100 percent of the Federal national rate, also known as the national adjusted standardized amount. This amount reflects the national average hospital cost per case from a base year, updated for inflation.

Currently, SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal national rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on the FY 2006 costs per discharge.

We note that, as discussed in section IV.G. of the preamble of this final rule, section 3124 of the Affordable Care Act extended the MDH program from the end of FY 2011 (that is, for discharges occurring before October 1, 2011) to the end of FY 2012 (that is, for discharges occurring before October 1, 2012). (Under prior law, the MDH program was to be in effect through the end of FY 2011 only.) Therefore, due to the expiration of the MDH program beginning with FY 2013, we are not including hospitals that are currently MDHs (until October 1, 2012) in our update of the hospital-specific rates for FY 2013.

For hospitals located in Puerto Rico, the payment per discharge is based on the sum of 25 percent of an updated Puerto Rico-specific rate based on average costs per case of Puerto Rico hospitals for the base year and 75 percent of the Federal national rate. (We refer readers to section II.D.3. of this Addendum for a complete description.)

As discussed below in section II. of this Addendum, we are making changes in the determination of the prospective payment rates for Medicare inpatient operating costs for acute care hospitals for FY 2013. In section III. of this Addendum, we discuss our policy changes for determining the prospective payment rates for Medicare inpatient capital-related costs for FY 2013. In section IV. of this Addendum, we are setting forth our changes for determining the rate-of-increase limits for certain hospitals excluded from the IPPS for FY 2013. In section V. of this Addendum, we are making changes in the determination of the standard Federal rate for LTCHs paid under the LTCH PPS for FY 2013. The tables to which we refer in the preamble of this final rule are listed in section VI. of this Addendum and are available via the Internet.

II. Changes to Prospective Payment Rates for Hospital Inpatient Operating Costs for Acute Care Hospitals for FY 2013

The basic methodology for determining prospective payment rates for hospital inpatient operating costs for acute care hospitals for FY 2005 and subsequent fiscal years is set forth under § 412.64. The basic methodology for determining the prospective payment rates for hospital inpatient operating costs for hospitals located in Puerto Rico for FY 2005 and subsequent fiscal years is set forth under §§ 412.211 and 412.212. Below we discuss the factors used for determining the prospective payment rates for FY 2013.

In summary, the standardized amounts set forth in Tables 1A, 1B, and 1C that are listed and published in section VI. of this Addendum (and available via the Internet) reflect—

- Equalization of the standardized amounts for urban and other areas at the level computed for large urban hospitals during FY 2004 and onward, as provided for under section 1886(d)(3)(A)(iv)(II) of the Act.
- The labor-related share that is applied to the standardized amounts and Puerto Rico-specific standardized amounts to give the hospital the highest payment, as provided for under sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act.
- An update of 1.8 percent for all areas (that is, the FY 2013 estimate of

the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for MFP and less 0.1 percentage point), as required by section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. For hospitals that fail to submit data, in a form and manner, and at the time, specified by the Secretary relating to the quality of inpatient care furnished by the hospital, pursuant to section 1886(b)(3)(B)(viii) of the Act, the update is –0.2 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent, less 2.0 percentage points for failure to submit data under the Hospital IQR Program, less an adjustment of 0.7 percentage point for MFP, and less 0.1 percentage point).

- An update of 1.8 percent to the Puerto Rico-specific standardized amount (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for MFP and less 0.1 percentage point), in accordance with section 1886(d)(9)(C)(i) of the Act, as amended by section 401(c) of Public Law 108–173, which sets the update to the Puerto Rico-specific standardized amount equal to the applicable percentage increase set forth under section 1886(b)(3)(B)(i) of the Act.
- An adjustment to the standardized amount to ensure budget neutrality for DRG recalibration and reclassification, as provided for under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to ensure the wage index changes are budget neutral, as provided for under section 1886(d)(3)(E)(i) of the Act. We note that section 1886(d)(3)(E)(i) of the Act requires that when we compute such budget neutrality, we assume that the provisions of section 1886(d)(3)(E)(ii) of the Act (requiring a 62 percent labor-related share in certain circumstances) had not been enacted.
- An adjustment to ensure the effects of geographic reclassification are budget neutral, as provided for under section 1886(d)(8)(D) of the Act, by removing the FY 2012 budget neutrality factor and applying a revised factor.
- An adjustment to ensure the effects of the rural community hospital demonstration program required under section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, which extended the demonstration program for an additional 5 years, are budget neutral as required under section 410A(c)(2) of Public Law 108–173.
- An adjustment to remove the FY 2012 outlier offset and apply an offset for FY 2013, as provided for under section 1886(d)(3)(B) of the Act.
- As discussed below and in section II.D. of the preamble of this final rule, an adjustment to meet the requirements of sections 7(b)(1)(A) and 7(b)(1)(B) of Public Law 110–90 to adjust the standardized amounts to offset the estimated amount of the increase in aggregate payments (including interest) due to the effect of documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2008 and FY 2009. As discussed below, for FY 2013, we are making an adjustment to the standardized amounts to complete the necessary adjustments required by the provisions of sections 7(b)(1)(A) and 7(b)(1)(B) of Public Law 110–90. (We note as discussed in greater detail in section II.D. of the preamble of this final rule, at this time, we are not finalizing our proposed adjustment to the standardized amount for FY 2013 to offset the estimated amount of the increase in aggregate payments due to the effect of documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2010.)

Beginning in FY 2008, we applied the budget neutrality adjustment for the rural floor to the hospital wage indices rather than the standardized amount. As we did for FY 2012, for FY 2013, we are continuing to apply the rural floor budget neutrality adjustment to hospital wage indices rather than the standardized amount. Consistent with section 3141 of the Affordable Care Act, instead of applying a State level rural floor budget neutrality adjustment to the wage index, we are applying a uniform, national budget neutrality adjustment to the FY 2013 wage index for the rural floor. We note that, as finalized in the FY 2012 IPPS/LTCH PPS final rule, we extended the imputed floor through FY 2013 (76 FR 51593). Therefore, for this final rule, we are continuing to include the imputed floor in calculating the uniform, national rural floor budget neutrality adjustment to the wage indices. Thus, the imputed floor is reflected in the FY 2013 wage index. Additionally, in the FY 2013 IPPS/LTCH PPS proposed rule, we proposed an alternative temporary methodology for computing the imputed floor index in section II.G.2. of the preamble of that proposed rule. We are finalizing that alternative methodology and have included this alternative methodology in our calculation of rural floor budget neutrality in this final rule.

We note that, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51788 through 51790), we finalized an adjustment of 1.1 percent to the standardized amount (that is, a factor of 1.011) in light of the *Cape Cod* decision. The adjustment is a one-time permanent adjustment that is left permanently on the standardized amount.

A. Calculation of the Adjusted Standardized Amount

1. Standardization of Base-Year Costs or Target Amounts

In general, the national standardized amount is based on per discharge averages of adjusted hospital costs from a base period (section 1886(d)(2)(A) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. For Puerto Rico hospitals, the Puerto Rico-specific standardized amount is based on per discharge averages of adjusted target amounts from a base period (section 1886(d)(9)(B)(i) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d)(9) of the Act. The September 1, 1983 interim final rule (48 FR 39763) contained a detailed explanation of how base-year cost data (from cost reporting periods ending during FY 1981) were established for urban and rural hospitals in the initial development of standardized amounts for the IPPS. The September 1, 1987 final rule (52 FR 33043 and 33066) contains a detailed explanation of how the target amounts were determined and how they are used in computing the Puerto Rico rates.

Sections 1886(d)(2)(B) and 1886(d)(2)(C) of the Act require us to update base-year per discharge costs for FY 1984 and then standardize the cost data in order to remove the effects of certain sources of cost variations among hospitals. These effects include case-mix, differences in area wage levels, cost-of-living adjustments for Alaska and Hawaii, IME costs, and costs to hospitals serving a disproportionate share of low-income patients.

In accordance with section 1886(d)(3)(E) of the Act, the Secretary estimates, from time-to-time, the proportion of hospitals' costs that are attributable to wages and wage-related costs. In general, the standardized amount is divided into labor-related and nonlabor-related amounts; only the proportion considered to be the labor-related amount is adjusted by the wage index. Section 1886(d)(3)(E) of the Act requires that 62 percent of the standardized amount be adjusted by the wage index, unless doing so would result in lower payments to a hospital than would otherwise be made. (Section 1886(d)(9)(C)(iv)(II) of the Act extends

this provision to the labor-related share for hospitals located in Puerto Rico.)

For FY 2013, we are continuing to use a labor-related share of 68.8 percent for discharges occurring on or after October 1, 2012, for the national standardized amounts and 62.1 percent for the Puerto Rico-specific standardized amount. Consistent with section 1886(d)(3)(E) of the Act, we are applying the wage index to a labor-related share of 62 percent for all IPPS hospitals whose wage index values are less than or equal to 1.0000. For all IPPS hospitals whose wage indices are greater than 1.0000, we are applying the wage index to a labor-related share of 68.8 percent of the national standardized amount. For FY 2013, all Puerto Rico hospitals have a wage index less than 1.0. Therefore, the national labor-related share is 62 percent because the wage index for all Puerto Rico hospitals is less than 1.0.

For hospitals located in Puerto Rico, we are applying a labor-related share of 62.1 percent if its Puerto Rico-specific wage index is greater than 1.0000. For hospitals located in Puerto Rico whose Puerto-Rico specific wage index values are less than or equal to 1.0000, we are applying a labor share of 62 percent.

The standardized amounts for operating costs appear in Tables 1A, 1B, and 1C that are listed and published in section VI. of the Addendum to this final rule and are available via the Internet.

2. Computing the Average Standardized Amount

Section 1886(d)(3)(A)(iv)(II) of the Act requires that, beginning with FY 2004 and thereafter, an equal standardized amount be computed for all hospitals at the level computed for large urban hospitals during FY 2003, updated by the applicable percentage update. Section 1886(d)(9)(A)(ii)(II) of the Act equalizes the Puerto Rico-specific urban and rural area rates. Accordingly, we are calculating the FY 2013 national standardized amount and Puerto Rico-specific rate irrespective of whether a hospital is located in an urban or rural location.

3. Updating the Average Standardized Amount

Section 1886(b)(3)(B) of the Act specifies the applicable percentage increase used to update the standardized amount for payment for inpatient hospital operating costs. As discussed in section IV.H. of the preamble of this final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, we are reducing the FY 2013 applicable percentage increase (which is based on the second quarter 2012 forecast of the FY 2006-based IPPS market basket) by the MFP adjustment (the 10-year moving average of MFP for the period ending FY 2013) of 0.7 percent, which is calculated based on IHS Global Insight, Inc.'s (IGI's) second quarter 2012 forecast. In addition, in accordance with section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are further updating the standardized amount for FY 2013 by the estimated market basket percentage increase less 0.1 percentage point for hospitals in all areas. Sections 1886(b)(3)(B)(xi) and (xii) of Act, as added and amended by sections 3401(a) and 10319(a) the Affordable Care Act, further state that these adjustments may result in the applicable percentage increase being less than zero. The percentage increase in the market basket reflects the average change in the price of goods and services comprising routine, ancillary, and special care unit hospital inpatient services. Based on IGI's 2012 second quarter forecast of the hospital market basket increase (as discussed in Appendix B of this final rule), the most recent forecast of the hospital market basket increase for FY 2013 is 2.6 percent. Thus, for FY 2013, the update to the average standardized amount is 1.8 percent for hospitals in all areas (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for MFP and less 0.1 percentage point). For hospitals that do not submit quality data pursuant to section 1886(b)(3)(B)(viii) of the Act, the estimated update to the operating standardized amount is −0.2 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent, less 2.0 percentage points for failure to submit data under the Hospital IQR Program, less an adjustment of 0.7 percentage point for MFP, and less 0.1 percentage point). The standardized amounts in Tables 1A through 1C that are published in section VI. of this Addendum and available via the Internet reflect these differential amounts.

Section 401(c) of Public Law 108–173 amended section 1886(d)(9)(C)(i) of the Act and states that, for discharges occurring in a fiscal year (beginning with FY 2004), the Secretary shall compute an average standardized amount for hospitals located in any area of Puerto Rico that is equal to the average standardized amount computed under subclause (I) for FY 2003 for hospitals in a large urban area (or, beginning with FY 2005, for all hospitals in the previous fiscal year) increased by the applicable percentage increase under subsection (b)(3)(B) for the fiscal year involved. Therefore, the update to the Puerto Rico-specific operating standardized amount is subject to the applicable percentage increase set forth under section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act (that is, the same update factor as for all other hospitals subject to the IPPS). Accordingly, we are finalizing an applicable percentage increase to the Puerto Rico-specific standardized amount of 1.8 percent.

Although the update factors for FY 2013 are set by law, we are required by section 1886(e)(4) of the Act to recommend, taking into account MedPAC's recommendations, appropriate update factors for FY 2013 for both IPPS hospitals and hospitals and hospital units excluded from the IPPS. Section 1886(e)(5)(A) of the Act requires that we publish our proposed recommendations in the **Federal Register** for public comment. Our final recommendation on the update factors is set forth in Appendix B of this final rule.

4. Other Adjustments to the Average Standardized Amount

As in the past, we are adjusting the FY 2013 standardized amount to remove the effects of the FY 2012 geographic reclassifications and outlier payments before applying the FY 2013 updates. We then apply budget neutrality offsets for outliers and geographic reclassifications to the standardized amount based on FY 2013 payment policies.

We do not remove the prior year's budget neutrality adjustments for reclassification and recalibration of the DRG relative weights and for updated wage data because, in accordance with sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E) of the Act, estimated aggregate payments after updates in the DRG relative weights and wage index should equal estimated aggregate payments prior to the changes. If we removed the prior year's adjustment, we would not satisfy these conditions.

Budget neutrality is determined by comparing aggregate IPPS payments before and after making changes that are required to be budget neutral (for example, changes to MS–DRG classifications, recalibration of the MS–DRG relative weights, updates to the wage index, and different geographic reclassifications). We include outlier payments in the simulations because

they may be affected by changes in these parameters.

In order to appropriately estimate aggregate payments in our modeling, we make several inclusions and exclusions so that the appropriate universe of claims and charges are included. We discuss IME Medicare Advantage payment amounts, fee-for-service only claims, and charges for anti-hemophilic blood factor and organ acquisition below.

First, consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50433), because IME Medicare Advantage payments are made to IPPS hospitals under section 1886(d) of the Act, we believe these payments must be part of these budget neutrality calculations. However, we note that it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation or the outlier offset to the standardized amount because the statute requires that outlier payments be not less than 5 percent nor more than 6 percent of total ''operating DRG payments,'' which does not include IME and DSH payments. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.

Second, consistent with the methodology in the FY 2012 IPPS/LTCH PPS final rule, in order to ensure that we capture only fee-for-service claims, we are only including claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is a fee-for-service claim).

Third, consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50423), we examined the MedPAR file and removed pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field for the budget neutrality adjustments. We also removed organ acquisition charges from the covered charge field for the budget neutrality adjustments because organ acquisition is a pass-through payment not paid under the IPPS.

Comment: One commenter noted that it is still likely that CMS is including charges for anti-hemophilic blood factor (which are paid separately under the IPPS) in the MedPAR claims used to determine the budget neutrality adjustments. The commenter explained that the majority of patients receiving blood clotting drugs have a pharmacy indicator of ''5'', which denotes ''general drugs and/or IV therapy and blood clotting drugs.'' The commenter searched the MedPAR file and found 67,548 claims reporting patients receiving blood clotting drugs and 843 of these claims had a pharmacy indicator of ''3''. From the subset of 843 claims, 5 had pharmacy charges in excess of $100,000 and 724 claims had pharmacy charges greater than $100,000 with a pharmacy indicator of ''5''. The commenter noted that the bulk of these 843 claims contain a pharmacy indicator of ''5''; however, the MedPAR file as currently constructed does not allow for the separation of anti-hemophilic blood factor charges from other pharmacy charges. The commenter concluded that the inclusion of all pharmacy charges with a pharmacy indicator of ''5'' is inappropriate.

Response: We appreciate the commenter's concern regarding including charges that may not be appropriate to include within our modeling. As acknowledged by the commenter, the MedPAR file as currently constructed does not allow for the separation of anti-hemophilic blood factor charges from other pharmacy charges. We will explore the possibility of uniquely identifying anti-hemophilic blood factor pharmacy charges within the MedPAR file for future rulemaking.

Section 3021 of the Affordable Care Act, codified under section 1115A of the Act, authorizes CMS to test innovative payment and service delivery models with the goal of reducing Medicare program expenditures while preserving or enhancing the quality of care furnished to individuals. Because initiatives established under this authority could result in IPPS hospitals receiving a payment that is different from what they otherwise would receive under the IPPS, we believe it is important to identify how these initiatives are addressed in the context of our budget neutrality calculations.

The Bundled Payments for Care Improvement (BPCI) initiative, developed by CMS' Center for Medicare and Medicaid Innovation under the authority of section 3021 of the Affordable Care Act (codified under section 1115A of the Act), will test four payment models that link payments for multiple services during an episode of care. On August 23, 2011, CMS invited providers to apply to help develop and test four models of bundling payments under the BPCI. We refer readers to section IV.H.4. of the preamble of this final rule for a discussion on the BPCI initiative. We note that under Models 1, 2, and 4, participating IPPS hospitals could receive a payment for all or selected IPPS claims under the BPCI that differs from payments they would otherwise receive under the IPPS. We also note that Model 3 addresses payments for related readmissions and postacute care services. Therefore, we believe it is not necessary to address the treatment of any data for participating hospitals in Model 3.

In the proposed rule, for purposes of computing the budget neutrality calculations to determine the average standardized amount, we proposed to include all applicable data from subsection (d) hospitals participating in BPCI Models 1, 2, and 4 in our IPPS payment modeling and ratesetting calculations (which includes recalibration of the MS–DRG relative weights, ratesetting, calculation of the budget neutrality factors, and the impact analysis). In essence, we would continue to treat these hospitals the same as in prior fiscal years for purposes of the FY 2013 (and subsequent years) IPPS payment modeling and ratesetting process without regard to a hospital's participation within these three bundled payment models (that is, we would treat these hospitals as if they are not participating in Model 1, Model 2, or Model 4 under the BPCI initiative). We stated that we believe it is appropriate to include all applicable data from these subsection (d) hospitals in our IPPS payment modeling and ratesetting calculations because these hospitals are still receiving IPPS payments under section 1886(d) of the Act (in addition to the reconciliation payment the hospital may receive under Model 2 of the BPCI initiative). Moreover, the Secretary has the authority to make appropriate adjustments for payment amounts under section 1886(d)(5)(I)(i) of the Act to include all applicable data from these ''subsection (d)'' hospitals in our IPPS ratesetting calculations. We further stated that we believe it is appropriate to use the Secretary's authority under section 1886(d)(5)(I)(i) of the Act to include all IPPS short-term acute care hospitals and their data within the IPPS ratesetting calculations because excluding these hospitals would diminish the number of providers used to determine the IPPS rates, which could cause fluctuations to the IPPS rates and could produce instability in the IPPS rates. We did not receive any public comments on this proposal and, therefore, we are finalizing our proposal as presented in the FY 2013 IPPS proposed rule (77 FR 28138 through 28139) and summarized above without modification.

Specifically, we are adopting as final our methodology to include all applicable data from subsection (d) hospitals participating in BPCI Models 1, 2, and 4 in our IPPS payment modeling and ratesetting calculations (which includes recalibration of the MS–DRG relative weights, ratesetting, calculation of the budget neutrality factors, and the impact analysis).

The Affordable Care Act established the Hospital Readmissions Reduction Program and the Hospital Value-Based Purchasing (VBP) Program which adjust payments to certain IPPS hospitals beginning with discharges on or after October 1, 2012. Because the adjustments made under these programs affect the estimation of aggregate IPPS payments, in the proposed rule we stated that we believe it is appropriate to include adjustments for these programs within our budget neutrality calculations. We discuss the treatment of these two programs in the context of budget neutrality adjustments below.

Section 3025 of the Affordable Care Act, as amended by section 10309 of the Affordable Care Act, added a new subsection (q) to section 1886 of the Act. Section 1886(q) of the Act establishes the ''Hospital Readmissions Reduction Program'' effective for discharges from an ''applicable hospital'' beginning on or after October 1, 2012, under which payments to those hospitals under section 1886(d) of the Act will be reduced to account for certain excess readmissions. Under the Hospital Readmissions Reduction Program under section 1886(q) of the Act, payments for discharges from an ''applicable hospital'' will be in an amount equal to the product of the ''base operating DRG payment amount'' and an ''adjustment factor'' that accounts for excess readmissions for the hospital for the fiscal year, for discharges beginning on October 1, 2012. (The statute also specifies that any applicable add-on payments for IME, DSH, outliers and low-volume hospitals provided for under sections 1886(d)(5)(A), (d)(5)(B), (d)(5)(F), and (d)(12) of the Act, respectively, are not affected by the adjustment for excess readmissions under the Hospital Readmissions Reduction Program.) In other words, payment under section 1886(q) is the base operating DRG payment amount multiplied by the adjustment factor, calculated separately from any outliers, IME, DSH, or low-volume payment adjustment the hospital may otherwise receive. We refer readers to section IV.A. of the preamble of this final rule for full details of our implementation of the Hospital Readmissions Reduction Program for FY 2013, including definitions of the ''base operating DRG payment amount.'' Under current law, the Hospital Readmissions Reduction Program under section 1886(q) of the Act is not budget neutral.

Section 1886(o) of the Act requires the Secretary to establish a hospital value-based purchasing program under which, beginning in FY 2013, value-based incentive payments will be made in a fiscal year to eligible subsection (d) hospitals that meet performance standards established for a performance period for that fiscal year. As specified under section 1886(o)(7)(B)(i) of the Act, the cost of these value-based incentive payments are funded by a reduction applied to each eligible hospital's base-operating DRG payment amount, for each discharge occurring in the fiscal year, beginning with FY 2013. For FY 2013, the reduction amount is equal to 1.00 percent. As required by section 1886(o)(7)(A) of the Act, the total amount of allocated funds available for value-based incentive payments with respect to a fiscal year is equal to the total amount of estimated base-operating DRG payment reductions (the applicable percent reduction for FY 2013 is 1.0), as estimated by the Secretary. We refer readers to section VIII.C. of the preamble of this final rule for details regarding our implementation of the Hospital VBP Program, including the definition of the ''base operating DRG payment amount.''

Unlike the Hospital Readmissions Reduction Program (where an adjustment factor is applied to reduce the base-operating DRG payment amount for excess readmissions), the Hospital VBP Program is estimated to have no effect on overall payments. As mentioned above, for FY 2013, the total amount of the funding pool for value-based incentive payments is estimated to equal the total amount of the eligible hospitals' base-operating DRG payment amount reductions. In other words, the funding pool that CMS sets aside for the Hospital VBP Program is then equally redistributed by applying the hospital VBP adjustment. However, both the hospital readmissions payment adjustment (reduction) and the hospital VBP adjustment (redistribution) are applied on a claim by claim basis by adjusting, as applicable, the base-operating DRG payment amount for individual subsection (d) hospitals, which affects the overall sum of aggregate payments on each side of the comparison within the budget neutrality calculations. For example, when we calculate the budget neutrality factor for MS–DRG reclassification and recalibration of the relative weights, we compare aggregate payments estimated using the prior year's GROUPER and relative weights to estimated payments using the new GROUPER and relative weights. (We refer readers to section II.4.a. of this Addendum for full details.) Other factors, such as the DSH and IME payment adjustments, are the same on both sides of the comparison because we are only seeking to ensure that aggregate payments do not increase or decrease as a result of the changes of MS–DRG reclassification and recalibration. In order to properly sum aggregate payments on each side of the comparison, we proposed to apply the hospital readmissions payment adjustment and the hospital VBP adjustment on each side of the comparison. We did not receive any public comments on this proposal. Therefore, to assure that aggregate payments are estimated correctly in light of the effects of the Hospital Readmissions Reduction Program and the Hospital VBP Program, we are finalizing our proposal as presented in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28138 through 28139) without modification, and are applying the readmissions payment adjustment and the Hospital VBP payment adjustment on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

For the proposed rule, for the purpose of modeling the aggregate payments for excess readmissions and the readmissions adjustment factors, we used excess readmission ratios for the applicable hospitals from the 3-year period of July 1, 2007, to June 30, 2010 (the 3-year period preceding the FY 2013 ''applicable period'' of July 1, 2008, to June 30, 2011, that was finalized in last year's rulemaking (76 FR 51671 through 51672), because the underlying data from this period had already been made available to the public on the Hospital Compare Web site (as of July 2011). At that time, the data from the 3-year applicable period of July 1, 2008, to June 30, 2011, for FY 2013 had not been through the review and correction process required by section 1886(q)(6) of the Act. As we indicated in the proposed rule, for this final rule, we are using excess readmission ratios based on admissions for the finalized applicable period of July 1, 2008, to June 30, 2011, to calculate the aggregate payments for excess readmissions and ultimately to calculate the readmissions payment adjustment factors for FY 2013, because applicable hospitals have had the opportunity to review and correct these

data before the data were made public under our proposal set forth in the proposed rule regarding the reporting of hospital-specific readmission rates, consistent with section 1886(q)(6) of the Act (as discussed in section IV.A.3.d. of the preamble of this final rule).

a. Recalibration of MS–DRG Relative Weights and Updated Wage Index—Budget Neutrality Adjustment

Section 1886(d)(4)(C)(iii) of the Act specifies that, beginning in FY 1991, the annual DRG reclassification and recalibration of the relative weights must be made in a manner that ensures that aggregate payments to hospitals are not affected. As discussed in section II.H. of the preamble of this final rule, we normalized the recalibrated MS–DRG relative weights by an adjustment factor so that the average case relative weight after recalibration is equal to the average case relative weight prior to recalibration. However, equating the average case relative weight after recalibration to the average case relative weight before recalibration does not necessarily achieve budget neutrality with respect to aggregate payments to hospitals because payments to hospitals are affected by factors other than average case relative weight. Therefore, as we have done in past years, we are making a budget neutrality adjustment to ensure that the requirement of section 1886(d)(4)(C)(iii) of the Act is met.

Section 1886(d)(3)(E)(i) of the Act requires us to update the hospital wage index on an annual basis beginning October 1, 1993. This provision also requires us to make any updates or adjustments to the wage index in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. Section 1886(d)(3)(E)(i) of the Act requires that we implement the wage index adjustment in a budget neutral manner. However, section 1886(d)(3)(E)(ii) of the Act sets the labor-related share at 62 percent for hospitals with a wage index less than or equal to 1.0, and section 1886(d)(3)(E)(i) of the Act provides that the Secretary shall calculate the budget neutrality adjustment for the adjustments or updates made under that provision as if section 1886(d)(3)(E)(ii) of the Act had not been enacted. In other words, this section of the statute requires that we implement the updates to the wage index in a budget neutral manner, but that our budget neutrality adjustment should not take into account the requirement that we set the labor-related share for hospitals with wage indices less than or equal to 1.0 at the more advantageous level of 62 percent. Therefore, for purposes of this budget neutrality adjustment, section 1886(d)(3)(E)(i) of the Act prohibits us from taking into account the fact that hospitals with a wage index less than or equal to 1.0 are paid using a labor-related share of 62 percent. Consistent with current policy, for FY 2013, we are adjusting 100 percent of the wage index factor for occupational mix. We describe the occupational mix adjustment in section III.F. of the preamble of this final rule.

For FY 2013, to comply with the requirement that MS–DRG reclassification and recalibration of the relative weights be budget neutral for the Puerto Rico standardized amount and the hospital-specific rates, we used FY 2011 discharge data to simulate payments and compared aggregate payments using the FY 2012 labor-related share percentages, the FY 2012 relative weights, and the FY 2012 pre-reclassified wage data and applied the FY 2013 hospital readmissions payment adjustments and estimated FY 2013 hospital VBP payment adjustments to aggregate payments using the FY 2012 labor-related share percentages, the FY 2013 relative weights, and the FY 2012 pre-reclassified wage data and applied the same hospital readmissions payment adjustments and estimated hospital VBP adjustments. Based on this comparison, we computed a budget neutrality adjustment factor equal to 0.998431. As discussed in section IV. of this Addendum, we also are applying the MS–DRG reclassification and recalibration budget neutrality factor of 0.998431 to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2012.

In order to meet the statutory requirements that we do not take into account the labor-related share of 62 percent when computing wage index budget neutrality, it was necessary to use a three-step process to comply with the requirements that MS–DRG reclassification and recalibration of the relative weights and the updated wage index and labor-related share have no effect on aggregate payments for IPPS hospitals. We first determined an MS–DRG reclassification and recalibration budget neutrality factor of 0.998431 (by using the same methodology described above to determine the MS–DRG reclassification and recalibration budget neutrality factor for the Puerto Rico standardized amount and hospital-specific rates). Secondly, to compute a budget neutrality factor for wage index and labor-related share changes, we used FY 2011 discharge data to simulate payments and compared aggregate payments using FY 2013 relative weights and FY 2012 pre-reclassified wage indices, applied the FY 2012 labor-related share of 68.8 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0) and applied the FY 2013 hospital readmissions payment adjustment and the FY 2013 estimated hospital VBP payment adjustment when estimating aggregate payments using the FY 2013 relative weights and the FY 2013 pre-reclassified wage indices, applied the labor-related share for FY 2013 of 68.8 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0), and applied the same FY 2013 hospital readmissions payment adjustments and estimated FY 2013 hospital VBP payment adjustments. In addition, we applied the MS–DRG reclassification and recalibration budget neutrality factor (derived in the first step) to the rates that were used to simulate payments for this comparison of aggregate payments from FY 2012 to FY 2013. By applying this methodology, we determined a budget neutrality factor of 1.000331 for changes to the wage index. Finally, we multiplied the MS–DRG reclassification and recalibration budget neutrality factor of 0.998431(derived in the first step) by the budget neutrality factor of 1.000331 for changes to the wage index (derived in the second step) to determine the MS–DRG reclassification and recalibration and updated wage index budget neutrality factor of 0.998761.

b. Reclassified Hospitals—Budget Neutrality Adjustment

Section 1886(d)(8)(B) of the Act provides that, effective with discharges occurring on or after October 1, 1988, certain rural hospitals are deemed urban. In addition, section 1886(d)(10) of the Act provides for the reclassification of hospitals based on determinations by the MGCRB. Under section 1886(d)(10) of the Act, a hospital may be reclassified for purposes of the wage index.

Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. We note that the wage index adjustments provided for under section 1886(d)(13) of the Act are not budget neutral. Section 1886(d)(13)(H) of the Act provides that any increase in a wage index under section 1886(d)(13) shall

not be taken into account ''in applying any budget neutrality adjustment with respect to such index'' under section 1886(d)(8)(D) of the Act. To calculate the budget neutrality factor for FY 2013, we used FY 2011 discharge data to simulate payments and compared total IPPS payments with FY 2013 relative weights, FY 2013 labor-related share percentages, and FY 2013 wage data prior to any reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act and applied the FY 2013 hospital readmissions payment adjustments and the estimated FY 2013 hospital VBP payment adjustments to total IPPS payments with FY 2013 relative weights, FY 2013 labor-related share percentages, and FY 2013 wage data after such reclassifications and applied the same hospital readmissions payment adjustments and the estimated hospital VBP payment adjustments. Based on these simulations, we calculated an adjustment factor of 0.991276 to ensure that the effects of these provisions are budget neutral, consistent with the statute.

The FY 2013 budget neutrality adjustment factor is applied to the standardized amount after removing the effects of the FY 2012 budget neutrality adjustment factor. We note that, the FY 2013 budget neutrality adjustment reflects FY 2013 wage index reclassifications approved by the MGCRB or the Administrator.

c. Rural Floor and Imputed Floor Budget Neutrality Adjustment

As noted above, as discussed in section III.G. 2.b. of the preamble of this final rule, in the FY 2012 IPPS/LTCH PPS final rule, we extended the imputed floor through FY 2013. We make an adjustment to the wage index to ensure that aggregate payments to hospitals after implementation of the rural floor under section 4410 of the BBA (Pub. L. 105–33) and the imputed floor under § 412.64(h)(4) of the regulations are not affected. In addition, we note in section III.G.2.b. of the preamble of this final rule, we are finalizing our proposal to use an alternative temporary methodology for computing the imputed floor index. In the proposed rule, we did not apply this alternative in our calculation of the proposed uniform, national rural floor budget neutrality adjustment to the wage indices because the projected impact of that proposal was estimated at less than $5 million and, therefore, would have a negligible impact on the adjustment. For this final rule, consistent with our methodology for treating the imputed floor, we have included this alternative methodology for computing the imputed floor index in the calculation of the uniform, national rural floor budget neutrality adjustment in this final rule. Consistent with section 3141 of the Affordable Care Act and as discussed in section III.G. of the preamble of this final rule, the budget neutrality adjustment for the rural and imputed floors is a national adjustment to the wage index.

Since FY 2012, there has been one hospital in rural Puerto Rico. Therefore, similar to our calculation in the FY 2012 IPPS/LTCH final rule (76 FR 51593), for FY 2013, we are calculating a national rural Puerto Rico wage index (used to adjust the labor-related share of the national standardized amount for hospitals located in Puerto Rico which receive 75 percent of the national standardized amount) and a rural Puerto Rico-specific wage index (which is used to adjust the labor-related share of the Puerto Rico-specific standardized amount for hospitals located in Puerto Rico that receive 25 percent of the Puerto Rico-specific standardized amount). Because this rural Puerto Rico hospital still has no established wage data, our calculation is based on the policy adopted in the FY 2008 IPPS final rule with comment period (72 FR 47323). A complete discussion regarding the computation of the rural Puerto Rico wage index can be found in the FY 2012 IPPS/LTCH PPS final rule.

To calculate the national rural floor and imputed floor budget neutrality adjustment factor and Puerto Rico-specific rural floor budget neutrality adjustment factor, we used FY 2011 discharge data and FY 2013 post-reclassified national and Puerto Rico-specific wage indices to simulate IPPS payments. First, we compared the national and Puerto Rico-specific simulated payments without the national rural floor and imputed floor and Puerto Rico-specific rural floor applied to the national and Puerto Rico-specific simulated payments with the national rural floor and imputed floor and Puerto Rico-specific rural floor applied to determine the national rural budget neutrality adjustment factor of 0.991340 and the Puerto Rico-specific budget neutrality adjustment factor of 0.987620. The national adjustment is applied to the national wage indices to produce a national rural floor budget neutral wage index and the Puerto Rico-specific adjustment is applied to the Puerto Rico-specific wage indices to produce a Puerto Rico-specific rural floor budget neutral wage index.

d. Case-Mix Budget Neutrality Adjustment

Below we summarize the adjustments to the FY 2013 payment rates to account for the effect of changes in documentation and coding that do not reflect real changes in case-mix. We refer readers to section II.D. of the preamble of this final rule for a complete discussion regarding our proposals and final policies (including our historical adjustments to the payment rates) to eliminate the estimated effect of changes in documentation and coding that do not reflect real changes in case-mix.

(1) Prospective Adjustments for Documentation and Coding in FY 2008 and FY 2009 Authorized by Section 7(b)(1)(A) of Public Law 110–90 and Section 1886(d)(3)(A)(vi) of the Act

Section 7(b)(1)(A) of Public Law 110–90 requires that, if the Secretary determines that implementation of the MS–DRG system resulted in changes in documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2008 or FY 2009 that are different than the prospective documentation and coding adjustments applied under section 7(a) of Public Law 110–90, the Secretary shall make an appropriate adjustment under section 1886(d)(3)(A)(vi) of the Act. Section 1886(d)(3)(A)(vi) of the Act authorizes adjustments to the average standardized amounts for subsequent fiscal years in order to eliminate the effect of such coding or classification changes.

For FY 2013, as proposed, we are finalizing a −1.9 percent adjustment to the standardized amount to complete the adjustment required under section 7(b)(1)(A) of Public Law 110–90. We refer readers to section II.D. of the preamble of this final rule for a complete discussion on our historical adjustments and the FY 2013 adjustment to the standardized amount pursuant to section 7(b)(1)(A) of Public Law 110–90.

(2) Prospective Adjustments for Documentation and Coding in FY 2010 Authorized by Section 1886(d)(3)(A)(vi) of the Act

Section 1886(d)(3)(A)(vi) of the Act authorizes adjustments to the average standardized amounts if the Secretary determines such adjustments to be necessary for any subsequent fiscal years in order to eliminate the effect of coding or classification changes that do not reflect real changes in case mix. After reviewing public comments and recommendations received from MedPAC, we analyzed claims data in FY 2010 to determine whether any additional adjustment would be required to ensure that the introduction of MS–DRGs was implemented in a

budget neutral manner. As discussed in section II.D. of the preamble of this final rule, our analysis showed a documentation and coding effect in FY 2010 of 0.8 percent, and we proposed to make an additional −0.8 percent adjustment to account for the effects of documentation and coding that did not reflect an increase in case-mix severity in FY 2010.

As discussed earlier in this preamble, we are not finalizing an additional −0.8 percent adjustment to the FY 2013 standardized amount to account for documentation and coding that did not reflect an actual increase in case-mix in FY 2010. (However, as discussed above, we still are making an adjustment of −1.9 percent to the standardized amount, accounting for all documentation and coding effects observed between FY 2008 though FY 2009.)

(3) Recoupment or Repayment Adjustment for Documentation and Coding in FY 2008 and FY 2009 Authorized by Section 7(b)(1)(B) of Public Law 110–90

Section 7(b)(1)(B) of Public Law 110–90 requires the Secretary to make an adjustment to the standardized amounts under section 1886(d) of the Act to offset the estimated increase or decrease in aggregate payments for FY 2008 and FY 2009 (including interest) resulting from the difference between the estimated actual documentation and coding effect and the documentation and coding adjustments applied under section 7(a) of Public Law 110–90. This determination must be based on a retrospective evaluation of claims data. As discussed in section II.D.5. of the preamble of this final rule, we determined that an aggregate adjustment of −5.8 percent in FYs 2011 and 2012 would be necessary in order to meet these statutory requirements.

In the FY 2011 IPPS/LTCH PPS final rule, for FY 2011, we made an adjustment to the standardized amount of −2.9 percent, representing approximately half of the required adjustment. For FY 2012, in accordance with the timeframes set forth by section 7(b)(1)(B) of Public Law 110–90, and consistent with the discussion in the FY 2011 IPPS/LTCH PPS final rule, we completed the recoupment adjustment by implementing the remaining −2.9 percent adjustment, in addition to removing the effect of the −2.9 percent adjustment to the standardized amount finalized for FY 2011 (76 FR 51489 and 51498). Therefore, the required recoupment for overpayments due to documentation and coding effects on discharges occurring in FYs 2008 and 2009 has been completed within the required statutory timeframes. However, to avoid continuing the −2.9 percent adjustment finalized in FY 2012, for FY 2013, we are finalizing the +2.9 percent adjustment to the standardized amount as we proposed. This adjustment removes the one-time −2.9 percent adjustment implemented in FY 2012.

(4) Documentation and Coding Adjustment to the Puerto Rico-Specific Standardized Amount

As discussed in section II.D.9. of the preamble of this final rule, in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50071 through 50073), using the same methodology we applied to estimate documentation and coding changes under IPPS for non-Puerto Rico hospitals, our best estimate, based on the then most recently available data (FY 2009 claims paid through March 2010), was that for documentation and coding changes that occurred over FY 2008 and FY 2009, a cumulative adjustment of −2.6 percent was required to eliminate the full effect of the documentation and coding changes on future payments based on the Puerto Rico-specific standardized amount. In FY 2011, as finalized in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50071 through 50073), we applied an adjustment of −2.6 percent to the Puerto Rico-specific standardized amount. Therefore, because the Puerto Rico-specific standardized amount received a full prospective adjustment of −2.6 percent in FY 2011, in section II.D.9. of the preamble of this final rule, as we proposed, we are not making any further adjustment for FY 2013. For a complete discussion on our policy, we refer readers to section II.D.9. of the preamble of this final rule.

We note that, based upon our analysis of FY 2010 claims data; we found no significant additional effect of documentation and coding that would warrant any additional adjustment to the Puerto Rico-specific standardized amount.

e. Rural Community Hospital Demonstration Program Adjustment

As discussed in section IV.K. of the preamble to this final rule, section 410A of Public Law 108–173 originally required the Secretary to establish a demonstration program that modifies reimbursement for inpatient services for up to 15 small rural hospitals. Section 410A(c)(2) of Public Law 108–173 requires that ''[i]n conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented.''

Sections 3123 and 10313 of the Affordable Care Act extended the demonstration program for an additional 5-year period, and allowed up to 30 hospitals to participate in 20 States with low population densities determined by the Secretary. (In determining which States to include in the expansion, the Secretary is required to use the same criteria and data that the Secretary used to determine the States for purposes of the initial 5-year period.) In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51700 through 51705), in order to achieve budget neutrality, we adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration program as described in section IV.K. of that final rule. In other words, we applied budget neutrality across the payment system as a whole rather than merely across the participants of this demonstration program, consistent with past practice. We stated that we believe that the language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that ''aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration * * * was not implemented,'' but does not identify the range across which aggregate payments must be held equal.

For FY 2013, for the 23 hospitals participating in the demonstration program, we are adjusting the national IPPS payment rates according to the methodology set forth elsewhere in this final rule. For this final rule, the estimated amount for the adjustment to the national IPPS payment rates for FY 2013 is $34, 288,129. (For the proposed rule, the estimated amount for the adjustment to the national IPPS payment rates for FY 2013 was $35,077,708.) Accordingly, to account for the estimated costs of the demonstration program for the specific time periods as explained in detail in section IV.K. of the preamble of this final rule, for FY 2013, we computed a factor of 0.999677 for the rural community hospital demonstration program budget neutrality adjustment that will be applied to the IPPS standard Federal payment rate.

In the proposed rule, we stated that if updated data became available prior to the publication of the FY 2013 IPPS/LTCH PPS final rule, we would use that data, to the extent appropriate, to estimate the costs of the demonstration

program in FY 2013. Therefore, this estimated budget neutrality offset amount in this final rule reflects updated data.

In addition, we proposed in the proposed rule that if settled cost reports for all of the demonstration hospitals that participated in the applicable fiscal year (2007, 2008, 2009, or 2010) were made available prior to this FY 2013 IPPS/LTCH PPS final rule, we would incorporate into the FY 2013 budget neutrality offset amount the difference between the final cost of the demonstration in any of these years (as described previously) and the budget neutrality offset amount applicable to such year as finalized in the respective year's IPPS final rule. Because settled cost reports are not available for these years, we are not incorporating into the FY 2013 budget neutrality offset amount the difference between the final cost of the demonstration in any of these years and the budget neutrality offset amount applicable to such year as finalized in the respective year's IPPS final rule. We expect that the settled cost reports will be available prior to the FY 2014 IPPS/LTCH PPS proposed rule, and that we will be able to propose to make this adjustment at the appropriate time.

f. Outlier Payments

Section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of the prospective payment rate for the DRG, any IME and DSH payments, any new technology add-on payments, and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). We refer to the sum of the prospective payment rate for the DRG, any IME and DSH payments, any new technology add-on payments, and the outlier threshold as the outlier ''fixed-loss cost threshold.'' To determine whether the costs of a case exceed the fixed-loss cost threshold, a hospital's CCR is applied to the total covered charges for the case to convert the charges to estimated costs. Payments for eligible cases are then made based on a marginal cost factor, which is a percentage of the estimated costs above the fixed-loss cost threshold. The marginal cost factor for FY 2013 is 80 percent, the same marginal cost factor we have used since FY 1995 (59 FR 45367).

In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments (which does not include IME and DSH payments) plus outlier payments. When setting the outlier threshold, we compute the 5.1 percent target by dividing the total operating outlier payments by the total operating DRG payments plus outlier payments. We do not include any other payments such as IME and DSH within the outlier target amount. Therefore, it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. Similarly, section 1886(d)(9)(B)(iv) of the Act requires the Secretary to reduce the average standardized amount applicable to hospitals located in Puerto Rico to account for the estimated proportion of total DRG payments made to outlier cases. More information on outlier payments may be found on the CMS Web site at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html?redirect=AcuteInpatientPPS/04_outlier.asp#TopOfPage*.

(1) FY 2013 Outlier Fixed-Loss Cost Threshold

For FY 2013, we proposed to continue to use the same methodology that we first used for FY 2009 (73 FR 48763 through 48766) to calculate the outlier threshold. Similar to the methodology used in the FY 2009 IPPS final rule, for FY 2013, we proposed to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained below). As we have done in the past, to calculate the proposed FY 2013 outlier threshold, we simulated payments by applying proposed FY 2013 payment rates and policies using cases from the FY 2011 MedPAR file. Therefore, in order to determine the proposed FY 2013 outlier threshold, we inflated the charges on the MedPAR claims by 2 years, from FY 2011 to FY 2013.

We also proposed to continue to use a refined methodology that takes into account the lower inflation in hospital charges that are occurring as a result of the outlier final rule (68 FR 34494), which changed our methodology for determining outlier payments by implementing the use of more current CCRs. Our refined methodology uses more recent data that reflect the rate-of-change in hospital charges under the new outlier policy.

Using the most recent data available, we calculated the 1-year average annualized rate-of-change in charges per case from the last quarter of FY 2010 in combination with the first quarter of FY 2011 (July 1, 2010, through December 31, 2010) to the last quarter of FY 2011 in combination with the first quarter of FY 2012 (July 1, 2011, through December 31, 2011). This rate-of-change was 6.8 percent (1.068003) or 14.06 percent (1.140630) over 2 years. As we have done in the past, we established the proposed FY 2013 outlier threshold using hospital CCRs from the December 2011 update to the Provider-Specific File (PSF)—the most recent available data at the time of the proposed rule.

As discussed in the FY 2007 IPPS final rule (71 FR 48150), we worked with the Office of Actuary to derive the methodology described below to develop the CCR adjustment factor. For FY 2013, we proposed to continue to use the same methodology to calculate the CCR adjustment by using the FY 2011 operating cost per discharge increase in combination with the actual FY 2011 operating market basket percentage increase determined by IHS Global Insight, Inc. (IGI), as well as the charge inflation factor described above to estimate the adjustment to the CCRs. (We note that, the FY 2011 actual (otherwise referred to as ''final'') operating market basket percentage increase reflects historical data, whereas the published FY 2011 operating market basket update factor was based on IGI's 2010 second quarter forecast with historical data through the first quarter of 2010. We also note that, while the FY 2011 published operating market basket update was based on the FY 2002-based IPPS market basket, the actual or ''final'' market basket percentage increase is based on the FY 2006-based IPPS market basket. Similarly, the FY 2011 published capital market basket update factor was based on the FY 2002-based capital market basket and the actual or ''final'' capital market basket percentage increase is based on the FY 2006-based capital market basket.) By using the operating market basket percentage increase and the increase in the average cost per discharge from hospital cost reports, we are using two different measures of cost inflation.

Under our proposal to continue to use the same methodology to calculate the CCR adjustment for FY 2013, we determined the proposed adjustment by taking the percentage increase in the operating costs per discharge from FY 2009 to FY 2010 (1.0160) from the cost report and dividing it by the final operating market basket percentage increase from FY 2010 (1.0210). This

operation removes the measure of pure price increase (the market basket) from the percentage increase in operating cost per discharge, leaving the nonprice factors in the cost increase (for example, quantity and changes in the mix of goods and services). We repeated this calculation for 2 prior years to determine the 3-year average of the rate of adjusted change in costs between the operating market basket percentage increase and the increase in cost per case from the cost report (the FY 2007 to FY 2008 percentage increase of operating costs per discharge of 1.0505 divided by the FY 2008 final operating market basket percentage increase of 1.0400, and the FY 2008 to FY 2009 percentage increase of operating costs per discharge of 1.0295 divided by the FY 2009 final operating market basket percentage increase of 1.0260). For FY 2013, we averaged the differentials calculated for FY 2008, FY 2009, and FY 2010, which resulted in a mean ratio of 1.0029. We multiplied the 3-year average of 1.0029 by the FY 2011 final operating market basket percentage increase of 1.0270, which resulted in an operating cost inflation factor of 2.99 percent or 1.029948. We then divided the operating cost inflation factor by the 1-year average change in charges (1.068003) and we proposed to apply an adjustment factor of 0.964368 to the operating CCRs from the PSF (calculation performed on unrounded numbers).

As stated in the FY 2009 IPPS final rule (73 FR 48763), we continue to believe it is appropriate to apply only a 1-year adjustment factor to the CCRs. On average, it takes approximately 9 months for a fiscal intermediary or MAC to tentatively settle a cost report from the fiscal year end of a hospital's cost reporting period. The average ''age'' of hospitals' CCRs from the time the fiscal intermediary or the MAC inserts the CCR in the PSF until the beginning of FY 2009 is approximately 1 year. Therefore, as stated above, we believe a 1-year adjustment factor to the CCRs is appropriate.

We used the same methodology for the capital CCRs and determined the proposed adjustment by taking the percentage increase in the capital costs per discharge from FY 2009 to FY 2010 (1.0102) from the cost report and dividing it by the final capital market basket percentage increase from FY 2010 (1.010). We repeated this calculation for 2 prior years to determine the 3-year average of the rate of adjusted change in costs between the capital market basket percentage increase and the increase in cost per case from the cost report (the FY 2007 to FY 2008 percentage increase of capital costs per discharge of 1.0809 divided by the FY 2008 final capital market basket percentage increase of 1.0150, and the FY 2008 to FY 2009 percentage increase of capital costs per discharge of 1.0499 divided by the FY 2009 final capital market basket percentage increase of 1.0150). For FY 2013, we averaged the differentials calculated for FY 2008, FY 2009, and FY 2010, which resulted in a mean ratio of 1.0332. We multiplied the 3-year average of 1.0332 by the FY 2011 final capital market basket percentage increase of 1.0120, which resulted in a capital cost inflation factor of 4.56 percent or 1.045567. We then divided the capital cost inflation factor by the 1-year average change in charges (1.068003) and we proposed to apply an adjustment factor of 0.978993 to the capital CCRs from the PSF (calculation performed on unrounded numbers). We proposed to use the same charge inflation factor for the capital CCRs that was used for the operating CCRs. The charge inflation factor is based on the overall billed charges. Therefore, we believe it is appropriate to apply the charge factor to both the operating and capital CCRs.

As stated above, for FY 2013, we applied the proposed FY 2013 rates and policies using cases from the FY 2011 MedPAR files in calculating the proposed outlier threshold.

As discussed in section III.B.3. of the preamble to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 and 50161) and in section III.G.3. of the preamble of this final rule, in accordance with section 10324(a) of the Affordable Care Act, beginning in FY 2011, we created a wage index floor of 1.00 for all hospitals located in States determined to be frontier States. We noted that the frontier State floor adjustments will be calculated and applied after rural and imputed floor budget neutrality adjustments are calculated for all labor market areas, in order to ensure that no hospital in a frontier State will receive a wage index lesser than 1.00 due to the rural and imputed floor adjustment. In accordance with section 10324(a) of the Affordable Care Act, the frontier State adjustment will not be subject to budget neutrality, and will only be extended to hospitals geographically located within a frontier State. However, for purposes of estimating the proposed outlier threshold for FY 2013, it was necessary to apply this provision by adjusting the wage index of those eligible hospitals in a frontier State when calculating the outlier threshold that results in outlier payments being 5.1 percent of total payments for FY 2013. If we did not take into account this provision, our estimate of total FY 2013 payments would be too low, and, as a result, our proposed outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments.

In the proposed rule, we stated that our estimate of the cumulative effect of changes in documentation and coding due to the adoption of the MS–DRGs of 5.4 percent from FY 2008 and FY 2009 and 0.8 percent from FY 2010 is already included within the claims data (FY 2011 MedPAR files) used to calculate the proposed FY 2013 outlier threshold. We also stated in the proposed rule that we estimated that there would be no continued changes in documentation and coding in FYs 2011 and 2012. Therefore, the cumulative effect of documentation and coding that has occurred is already reflected within the FY 2011 MedPAR claims data, and we did not believe there was any need to inflate FY 2011 claims data for any additional case-mix growth projected to have occurred since FY 2010.

As we did in establishing the FY 2009 outlier threshold (73 FR 57891), in our projection of FY 2013 outlier payments, we did not propose to make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement. We indicated that we continue to believe that, due to the policy implemented in the June 9, 2003 outlier final rule (68 FR 34494), CCRs will no longer fluctuate significantly and, therefore, few hospitals will actually have these ratios reconciled upon cost report settlement. In addition, it is difficult to predict the specific hospitals that will have CCRs and outlier payments reconciled in any given year. We also noted that reconciliation occurs because hospitals' actual CCRs for the cost reporting period are different than the interim CCRs used to calculate outlier payments when a bill is processed. Our simulations assume that CCRs accurately measure hospital costs based on information available to us at the time we set the outlier threshold. For these reasons, we proposed not to make any assumptions about the effects of reconciliation on the outlier threshold calculation.

As described in sections IV.A. and VIII.B., respectively, of the preamble of this final rule, sections 1886(q) and 1886(o) of the Act establish the Hospital Readmissions Reduction Program and the Hospital VBP Program, respectively. As we discussed in the proposed rule, we do not believe it is appropriate to include the hospital VBP payment adjustments and the hospital

readmissions payment adjustments in the outlier threshold calculation or the outlier offset to the standardized amount. Specifically, consistent with our proposed definition of the base operating DRG payment amount for the Hospital Readmissions Reduction Program under proposed § 412.152 and the Hospital VBP Program under proposed § 412.160, we indicated that outlier payments under section 1886(d)(5)(A) of the Act are not affected by these payment adjustments. Therefore, outlier payments would continue to be calculated based on the unadjusted base DRG payment amount (as opposed to using the base-operating DRG payment amount adjusted by the hospital readmissions payment adjustment and the hospital VBP adjustment). Consequently, we proposed to exclude the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.

Using this methodology, we proposed an outlier fixed-loss cost threshold for FY 2013 equal to the prospective payment rate for the DRG, plus any IME and DSH payments, and any add-on payments for new technology, plus $27,425.

We note that on June 11, 2012, we published a correction notice to the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 34326 through 34331). In that correction notice, we stated that we inadvertently applied the incorrect adjustment factors to the operating and capital cost-to-charge ratios (CCRs) from the PSF when performing the calculation of the proposed FY 2013 outlier fixed-loss cost threshold for the proposed rule. The correction of this error resulted in a decrease in the proposed outlier fixed-loss cost threshold of approximately $1,000, which resulted in a corrected proposed FY 2013 outlier fixed-loss cost threshold of $26,337.

We also noted in that correction notice that the corrected proposed FY 2013 outlier fixed-loss cost threshold represented a $3,952 (or 17.7 percent) increase from the final FY 2012 outlier fixed-loss cost threshold of $22,385. Since FY 2009, the outlier fixed-loss cost threshold has been between $20,185 and $23,140. Therefore, we were concerned about this large increase in the outlier fixed-loss cost threshold from FY 2012.

In the proposed rule, we further noted that the proposed 2-year charge inflation factor of 14.06 percent applied to the FY 2011 MedPAR claims used to compute the FY 2013 outlier fixed-loss cost threshold is higher than the 2-year charge inflation factor of 7.94 percent applied to the FY 2010 MedPAR claims used to compute the FY 2012 final outlier fixed-loss cost threshold. We stated that we believe that a large increase in the charge inflation factor for FY 2013 (from FY 2012) increased projected total outlier payments. With an increase in projected outlier payments, in order for CMS to meet the 5.1 percent target, it would be necessary to reduce the amount of outlier payments by raising the outlier fixed-loss cost threshold. Therefore, in addition to being concerned about the large increase in the fixed-loss threshold proposed for FY 2013 compared to FY 2012, we were concerned about this large charge inflation increase and how it potentially affected the proposed FY 2013 outlier fixed-loss cost threshold. As described above, to determine the 1-year average annualized rate-of-change in charges per case, we currently use a methodology that compares the average charge per case from the most recent 6-month period of MedPAR data that are available to the same 6-month period of MedPAR data from the prior year. We adopted this methodology in the FY 2005 IPPS final rule (69 FR 49277) as a result of the special circumstances surrounding the revisions to the outlier payment methodology at that time. In that rule, we stated that we would continue to consider other methodologies for determining charge inflation when calculating the outlier threshold in the future. We welcomed public comment on possible modifications to our current methodologies, including the possibility of looking at a larger time period beyond 6 months to determine the average charge per case to measure the charge inflation factor.

In addition, as pointed out by commenters who responded to the policies presented in last year's final rule (76 FR 51793 through 51795), in this year's proposed rule we noted that CMS has not met the 5.1 percent target for some time and the commenters have recommended enhancements to the methodology to improve the calculation of the outlier fixed-loss cost threshold. Commenters have focused on CMS' underestimation of actual outlier payments. Since FY 2009, we have used the same methodology to calculate the outlier fixed-loss cost threshold. While we have been reluctant to make changes to our methodology, as discussed below, our proposed estimate for FY 2011 was that outlier payments would be approximately 4.7 percent of actual total MS–DRG payments and for FY 2012 outlier payments would be approximately 6.0 percent of actual total MS–DRG payments (we have revised both of these estimates for the final rule using the latest data available as discussed below). In the proposed rule, we stated that while these estimates differ—with one being under the target and one above the target—they draw attention to the potential for improving our estimation methodology so that we meet the 5.1 percent target. We welcomed public comment on ways to enhance the accuracy of our methodology to calculate the FY 2013 outlier fixed-loss cost threshold, especially additional analyses that could inform potential technical improvements.

Comment: Commenters analyzed the CCRs used in the proposed rule to calculate the outlier fixed-loss cost threshold and found that CMS used outdated CCRs for the proposed rule. The commenters attempted to match the CCRs from the proposed rule impact file to the CCRs in the March 2012 PSF update with an effective date prior to January 15, 2012, and found that the CCRs in the impact file matched the CCRs in the March 2012 PSF update for only 200 providers. The commenter used CMS' methodology to calculate the outlier fixed-loss cost threshold and determined that the proposed outlier fixed-loss cost threshold should have been $23,780 for FY 2013.

Response: We appreciate the commenters pointing out this error. After further research, we discovered that we inadvertently removed all CCRs from the December 2011 PSF update that had an effective date after December 2010. Therefore, we used ''outdated'' CCRs to calculate the proposed outlier fixed-loss cost threshold. After this error was brought to our attention, we calculated the proposed outlier fixed-loss cost threshold with the ''best available'' CCRs. Specifically, we used operating and capital CCRs from the latest effective date in the December 2011 update of the PSF and determined that the proposed outlier fixed-loss cost threshold for FY 2013 should have been $23,630.

Comment: Many commenters expressed concern that CMS is still not reaching the 5.1 percent target for outlier payments and believed there is still room for improvement. The commenters made various suggestions to improve the current methodology used to calculate the outlier threshold.

Several commenters suggested three alternative methodologies (discussed below) to adjust the CCRs, while other commenters only recommended the first and third options listed below. The

commenters that suggested the three methodologies stated that they believed that a 1-year CCR adjustment is not appropriate since hospitals have different fiscal year ends and, therefore, different adjustments should be applied to the CCRs.

The first methodology the commenters recommended was for CMS to project CCRs over periods of time based on variations in hospital cost reporting fiscal year ends rather than 1 year in order to better reflect the CCRs as they are expected to exist during FY 2013 (we received similar comments in response to the policies presented in last year's rule recommending the adoption of this methodology to adjust the CCRs (75 FR 51793)). Using this methodology to adjust the CCRs, the commenters determined an outlier fixed-loss cost threshold for FY 2013 of $23,190.

The second methodology suggested by commenters was similar to the first methodology but projected CCRs by quarter rather than using hospital cost reporting fiscal year ends. For example, commenters suggested that CCRs in the PSF from June 2011 through September 2011 be projected 2 years from June 2013 through September 2013. Using this methodology to adjust the CCRs, the commenters determined an outlier fixed-loss cost threshold for FY 2013 of $23,195.

The third methodology recommended by commenters used historical CCR data from the PSF to compute a rate-of-change in CCRs. Under this approach, the average case-weighted operating and capital CCR from October 2010 was compared to the average case-weighted operating and capital CCR from October 2011, and determined a −2.73 percent reduction for the operating CCRs and a −2.25 percent reduction for the capital CCRs. Although this adjustment would still be based on 1 year's data, the commenters believed that the use of historical data to adjust the CCRs is consistent with CMS' estimation of charge inflation.

Similar to comments received in response to the policies presented last year (76 FR 51793 through 51794), one commenter suggested that, if CMS did not incorporate the changes described above to its methodology for estimating outlier payments, it would recommend incorporating an ''estimate adjustment factor'' into the outlier projections. This commenter explained that outlier payments have been underpaid in every year since FY 2003. Based on estimated actual payments determined by the commenter's data analysis, the commenter asserted that the underpayment has exceeded 0.5 percent in all years since FY 2003. The commenter recommended that CMS determine an outlier fixed-loss cost threshold that would maintain the 5.1 percent target by applying an ''estimate adjustment factor'' when determining the outlier fixed-loss cost threshold. The commenter provided an example by taking the average variance of 0.68 percentage point in the actual payment from FY 2009 and FY 2011. Based on this factor, CMS would model the threshold to a level of 5.78 percent (5.1 percent plus 0.68 percent). If CMS were to estimate that it made outlier payments in excess of the 5.1 percent target, then the ''estimate adjustment factor'' would be negative. The commenter stated that this would fulfill the statutory requirement under section 1886(d)(5)(A) of the Act that requires CMS to establish thresholds such that outlier payments will be projected to achieve at least 5.1 percent of DRG payments and would more closely achieve a result that is fully consistent with the statute.

Some commenters noted that some hospitals are at a financial disadvantage compared to others and outliers should not be among the reasons of this disadvantage. The commenters recommended that CMS lower the threshold, thereby increasing the chance that CMS will pay within the congressionally mandated target range of 5 to 6 percent. Another commenter, from a society representing transplant surgeons, applauded CMS' recognition and concern for the large increase in the outlier threshold. The commenter was concerned that the large increase in the outlier fixed-loss cost threshold may affect the reimbursement for transplant cases because these cases are typically high in costs and, therefore, reach outlier payment status. The commenter requested that CMS study the rapid rise in the outlier fixed-loss cost threshold while assuring stability in the outlier fixed-loss cost threshold and authorizing appropriate additional payment to transplant centers facing extraordinarily resource-intensive cases. Other commenters recommended that CMS maintain the outlier fixed-loss cost threshold from FY 2012 for FY 2013 until CMS develops a more reliable methodology for determining the outlier fixed-loss cost threshold.

Response: We appreciate the commenters providing multiple alternative methodologies to adjust the CCRs used in our outlier fixed-loss cost threshold. Due to the many options the commenters presented, we believe the most prudent approach is to study the merits of each methodology and, if appropriate, make a proposal in next year's proposed rule if we believe making a change to our current methodology would improve our methodology for projecting the outlier fixed-loss cost threshold. As we have stated in prior years, using our current methodology, it is possible that some of the CCRs in the March 2012 PSF will be used in FY 2013 for actual outlier payments, while other CCRs may be 1 year old. Therefore, we apply a 1-year adjustment to the CCRs. The adjusted CCR is applied throughout the fiscal year within the outlier model. For this final rule, we are continuing to use the methodology we have used since FY 2009 to adjust the CCRs used to determine the outlier fixed-loss cost threshold. However, as stated above, we intend to study the merits of the commenters' suggestions for future rulemaking.

With regard to the comment that CMS implement an ''estimate adjustment factor'', as we stated last year, further analysis by CMS is necessary to determine if the commenter's approach to applying such a factor is appropriate. We will consider the commenter's suggestion to apply an ''estimate adjustment factor'' (in conjunction with analyzing the alternative methodologies to adjust the CCRs discussed above), for future rulemaking if, based on our analysis, we determine that application of an ''estimate adjustment factor'' is appropriate and consistent with the statute.

Also, as noted above, section 1886(d)(5)(A)(iv) of the Act requires outlier payments to be not less than 5 percent nor more than 6 percent of total estimated or projected payments. Therefore, we cannot adopt the commenter's suggestion to maintain the FY 2012 outlier fixed-loss cost threshold for FY 2013 because setting a threshold that is based on the current fiscal year for the coming fiscal year is inconsistent with the statute.

Comment: Commenters noted that from FYs 2007 through 2011, in each rulemaking cycle the final threshold is always significantly lower than the proposed threshold. The commenters believed this decline is most likely the result of using more recently updated CCRs in the calculations for the final rule. The commenter emphasized the need for CMS to use the most recent data available when it calculates the outlier fixed-loss cost threshold.

One commenter recommended that CMS use the June 2012 PSF update instead of the March 2012 update to the PSF to calculate the outlier fixed-loss cost threshold for the final rule. The commenter explained that there was a delay in hospitals filing the form CMS

2552–10 cost reports and the March 2012 update to the PSF does not contain CCRs from these cost reports. The commenter stated that the June 2012 PSF is probably the first update that would contain updated CCRs from the CMS 2552–10 cost reports.

Response: CMS' historical policy is to use the best available data when setting the payment rates and factors in both the proposed and final rules. Sometimes there are variables that change between the proposed and final rule due to the availability of more recent data, such as the charge inflation factor and the CCR adjustment factors that can cause fluctuations in the threshold amount. Other factors such as changes to the wage indexes and market basket increase can also cause the outlier fixed-loss cost threshold to fluctuate between the proposed and final rule each year. CMS uses the latest data that is available at the time of the proposed and final rule, such as the most recent update of MedPAR claims data and CCRs from the most recent update of the PSF.

With regard to the commenters recommendation to use the June 2012 PSF update, this file was not available in time for the FY 2013 final rule and, therefore, we used the latest data available, which was the March 2012 PSF update.

Comment: One commenter was concerned that CMS did not include outlier reconciliations in developing the outlier fixed-loss cost threshold, and its failure to provide objective data concerning the number of hospitals that have been subjected to reconciliation and the amount recovered during this process. The commenter searched Worksheet E, Part A, line 24.99 and line 52 and provided a summary table of operating outlier dollars (total of $82,080,928) recovered through the reconciliation process. The commenter concluded that absent the disclosure of data showing that these recoveries were immaterial, the commenter requested that CMS consider these recoveries in its determination of the outlier fixed-loss cost threshold.

Response: We received a similar comment in response to the policies presented in last year's rule, and we appreciate the commenter, again, informing us of its concern regarding our policy of not including outlier reconciliation within the development of the outlier fixed-loss cost threshold. However, as stated above, we continue to believe that, due to the policy implemented in the June 9, 2003 outlier final rule (68 FR 34494), CCRs will no longer fluctuate significantly and, therefore, few hospitals will actually have these ratios reconciled upon cost report settlement. In addition, it is difficult to predict the specific hospitals that will have CCRs and outlier payments reconciled in any given year. We also noted that reconciliation occurs because hospitals' actual CCRs for the cost reporting period are different than the interim CCRs used to calculate outlier payments when a bill is processed. Our simulations assume that CCRs accurately measure hospital costs based on information available to us at the time we set the outlier threshold. For these reasons, we proposed and are again finalizing our policy not to make any assumptions about the effects of reconciliation on the outlier threshold calculation.

Also, outlier reconciliation is a function of the cost report and Medicare contractors record the outlier reconciliation amount on each provider's cost report (and are not required to report these data to CMS outside of the cost report settlement process). Therefore, the outlier reconciliation data that the commenter is requesting is publicly available through the cost report. Since the effective date of Change Request 7192 on April 1, 2011, we have approved the reconciliation of outlier payments for some providers. Other providers that were flagged for outlier reconciliation are still under review for approval. In addition, some providers flagged for outlier reconciliation may experience a delay in reconciling their outlier payments due to circumstances that prevent the Medicare contractor from finalizing the hospital's cost report (such as other payments that may need to be reconciled aside from outlier payments).

We note that we did not receive any public comments on possible modifications to our current charge inflation methodology or the possibility of looking at a larger time period beyond 6 months to determine the average charge per case to measure the charge inflation factor.

Because we are not making any changes to our methodology for this final rule, for FY 2013, we are using the same methodology we proposed to calculate the outlier threshold for FY 2013 (using the most recent data available at the time of this final rule).

Using the most recent data available, we calculated the 1-year average annualized rate-of-change in charges per case from the first quarter of FY 2011 in combination with the second quarter of FY 2011 (October 1, 2010, through March 31, 2011) to the first quarter of FY 2012 in combination with the second quarter of FY 2012 (October 1, 2011 through March 31, 2011). This rate-of-change was 4.24 percent (1.042411) or 8.94 percent (1.0866203) over 2 years. As we have done in the past, we established the final FY 2013 outlier threshold using hospital CCRs from the March 2012 update to the PSF—the most recent available data at the time of this final rule.

For FY 2013, we calculated the CCR adjustment by using the FY 2011 operating cost per discharge increase in combination with the actual FY 2011 operating market basket percentage increase determined by IHS Global Insight, Inc. (IGI), as well as the charge inflation factor described above to estimate the adjustment to the CCRs. (As noted above, the FY 2011 actual (otherwise referred to as ''final'') operating market basket percentage increase reflects historical data, whereas the published FY 2011 operating market basket update factor was based on IGI's 2010 second quarter forecast with historical data through the first quarter of 2010. As also noted above, while the FY 2011 published operating market basket update was based on the FY 2002-based IPPS market basket, the actual or ''final'' market basket percentage increase is based on the FY 2006-based IPPS market basket. Similarly, the FY 2011 published capital market basket update factor was based on the FY 2002-based capital market basket and the actual or ''final'' capital market basket percentage increase is based on the FY 2006-based capital market basket.) By using the operating market basket percentage increase and the increase in the average cost per discharge from hospital cost reports, we are using two different measures of cost inflation. For FY 2013, we determined the adjustment by taking the percentage increase in the operating costs per discharge from FY 2009 to FY 2010 (1.0290) from the cost report and divided it by the final operating market basket percentage increase from FY 2010 (1.0160). This operation removes the measure of pure price increase (the market basket) from the percentage increase in operating cost per discharge, leaving the nonprice factors in the cost increase (for example, quantity and changes in the mix of goods and services). We repeated this calculation for 2 prior years to determine the 3-year average of the rate-of-adjusted change in costs between the operating market basket percentage increase and the increase in cost per case from the cost report (the FY 2007 to FY 2008 percentage increase of operating costs per discharge of 1.0505 divided by the FY 2008 final operating market basket percentage increase of 1.0400, and the

FY 2008 to FY 2009 percentage increase of operating costs per discharge of 1.0295 divided by FY 2009 final operating market basket percentage increase of 1.0260). For FY 2013, we averaged the differentials calculated for FY 2008, FY 2009, and FY 2010, which resulted in a mean ratio of 1.0029. We multiplied the 3-year average of 1.0029 by the FY 2011 final operating market basket percentage increase of 1.0270, which resulted in an operating cost inflation factor of 2.99 percent or 1.029948. We then divided the operating cost inflation factor by the 1-year average change in charges (1.042411) and applied an adjustment factor of 0.988044 to the operating CCRs from the PSF (calculation performed on unrounded numbers).

We used the same methodology for the capital CCRs and determined the adjustment by taking the percentage increase in the capital costs per discharge from FY 2009 to FY 2010 (1.0102) from the cost report and dividing it by the final capital market basket percentage increase from FY 2010 (1.010). We repeated this calculation for 2 prior years to determine the 3-year average of the rate-of-adjusted change in costs between the capital market basket percentage increase and the increase in cost per case from the cost report (the FY 2007 to FY 2008 percentage increase of capital costs per discharge of 1.0809 divided by the FY 2008 final capital market basket percentage increase of 1.0150, and the FY 2008 to FY 2009 percentage increase of capital costs per discharge of 1.0499 divided by the FY 2009 final capital market basket percentage increase of 1.0150). For FY 2013, we averaged the differentials calculated for FY 2008, FY 2009, and FY 2010, which resulted in a mean ratio of 1.0332. We multiplied the 3-year average of 1.0332 by the FY 2010 final capital market basket percentage increase of 1.0120, which resulted in a capital cost inflation factor of 4.56 percent or 1.045567. We then divided the capital cost inflation factor by the 1-year average change in charges (1.042411) and applied an adjustment factor of 1.003028 to the capital CCRs from the PSF (calculation performed on unrounded numbers). We are using the same charge inflation factor for the capital CCRs that was used for the operating CCRs. The charge inflation factor is based on the overall billed charges.

As stated above, for FY 2013, we applied the final FY 2013 payment rates and policies using cases from the FY 2011 MedPAR file in calculating the final outlier fixed-loss cost threshold for FY 2013.

As discussed in section III.B.3. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 and 50161) and in section III.F. of the preamble of this final rule, in accordance with section 10324(a) of the Affordable Care Act, beginning in FY 2011, we created a wage index floor of 1.00 for all hospitals located in States determined to be frontier States. We noted that the frontier State floor adjustments will be calculated and applied after rural and imputed floor budget neutrality adjustments are calculated for all labor market areas, in order to ensure that no hospital in a frontier State will receive a wage index lesser than 1.00 due to the rural and imputed floor adjustment. In accordance with section 10324(a) of the Affordable Care Act, the frontier State adjustment will not be subject to budget neutrality, and will only be extended to hospitals geographically located within a frontier State. However, for purposes of estimating the final outlier fixed-loss cost threshold for FY 2013, it was necessary to apply this provision by adjusting the wage index of those eligible hospitals in a frontier State when calculating the outlier fixed-loss cost threshold that results in outlier payments being 5.1 percent of total payments for FY 2013. If we did not take into account this provision, our estimate of total FY 2013 payments would be too low, and, as a result, our proposed outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments.

Also, for this final rule, the cumulative effect of documentation and coding that we estimate has occurred is already reflected within the FY 2011 MedPAR claims data, and we did not believe there was any need to inflate FY 2011 claims data for any additional case-mix growth projected to have occurred since FY 2010.

As discussed above, in our projection of FY 2013 outlier payments, we did not make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement. Also, we are finalizing our proposal to exclude the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.

Using this methodology, we calculated a final outlier fixed-loss cost threshold for FY 2013 equal to the prospective payment rate for the MS–DRG, plus any IME and DSH payments, and any add-on payments for new technology, plus $21,821. We note, that the final outlier fixed-loss cost threshold is $1,089 less than the revised corrected proposed threshold amount ($23,630) mentioned above (which used the correct CCRs from December 2010 PSF update and properly adjusted the CCRs). We believe this decrease is attributable to the reduction in the charge inflation factor from 14.06 percent in the proposed rule to 8.94 percent in this final rule (a reduction of 5.12 percentage points). A lower charge inflation factor decreases the projected total outlier payments. With a decrease in projected outlier payments, in order for CMS to meet the 5.1 percent target, it would be necessary to increase the amount of outlier payments by reducing the outlier fixed-loss cost threshold.

In addition, at this time, we are not finalizing our proposal to make an adjustment to the standardized amounts to offset the estimated amount of the increase in aggregate payments due to the effect of documentation and coding that did not reflect real changes in case-mix for discharges occurring during FY 2010. Therefore, an increase to the standardized amount relative to the proposed rule also decreases the projected total outlier payments, which requires a reduction in the outlier fixed-loss cost threshold in order to increase the amount of outlier payments. Also, the final outlier fixed-loss cost threshold of $21,821 is $1,369 less than the outlier fixed-loss cost threshold of $23,190 requested by the commenters above. Because we are using the most recent available CCR data to calculate the final outlier fixed-loss cost threshold and the final outlier fixed-loss cost threshold is much lower than the threshold amount requested by the commenters, as discussed above, we believe it is prudent to closely analyze the commenters' suggestions on modifying the methodology to calculate the outlier fixed-loss cost threshold and how to improve our estimation of the outlier payout from prior years after this final rule so that, if warranted, we can make any proposals related to these issues in a future rulemaking.

(2) Other Changes Concerning Outliers

As stated in the FY 1994 IPPS final rule (58 FR 46348), we establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. When we modeled the combined operating and capital outlier payments, we found that using a common threshold resulted in a lower percentage of outlier payments for capital-related costs than for operating costs. We project that the thresholds for FY 2013 will result in outlier payments that will

equal 5.1 percent of operating DRG payments and 6.38 percent of capital payments based on the Federal rate.

In accordance with section 1886(d)(3)(B) of the Act, we are reducing the FY 2013 standardized amount by the same percentage to account for the projected proportion of payments paid as outliers.

The outlier adjustment factors that are applied to the standardized amount based on the FY 2013 outlier threshold are as follows:

	Operating standardized amounts	Capital federal rate
National	0.948999	0.936209
Puerto Rico	0.944760	0.925579

We are applying the outlier adjustment factors to the FY 2013 rates after removing the effects of the FY 2012 outlier adjustment factors on the standardized amount.

To determine whether a case qualifies for outlier payments, we apply hospital-specific CCRs to the total covered charges for the case. Estimated operating and capital costs for the case are calculated separately by applying separate operating and capital CCRs. These costs are then combined and compared with the outlier fixed-loss cost threshold.

Under our current policy at § 412.84, we calculate operating and capital CCR ceilings and assign a statewide average CCR for hospitals whose CCRs exceed 3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals. Based on this calculation, for hospitals for which the fiscal intermediary or MAC computes operating CCRs greater than 1.146 or capital CCRs greater than 0.166, or hospitals for which the fiscal intermediary or MAC is unable to calculate a CCR (as described under § 412.84(i)(3) of our regulations), statewide average CCRs are used to determine whether a hospital qualifies for outlier payments. Table 8A listed in section VI. of this Addendum (and available only via the Internet) contains the statewide average operating CCRs for urban hospitals and for rural hospitals for which the fiscal intermediary or MAC is unable to compute a hospital-specific CCR within the above range. Effective for discharges occurring on or after October 1, 2012, these statewide average ratios will replace the ratios posted on the Internet at *http://www.cms.gov/AcuteInpatientPPS/FR2012/list.asp#TopOfPage.* Table 8B listed in section VI. of this Addendum (and available via the Internet) contains the comparable statewide average capital CCRs. Again, the CCRs in Tables 8A and 8B will be used during FY 2013 when hospital-specific CCRs based on the latest settled cost report are either not available or are outside the range noted above. Table 8C listed in section VI. of this Addendum (and available via the Internet) contains the statewide average total CCRs used under the LTCH PPS as discussed in section V. of this Addendum.

We finally note that we published a manual update (Change Request 3966) to our outlier policy on October 12, 2005, which updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update covered an array of topics, including CCRs, reconciliation, and the time value of money. We encourage hospitals that are assigned the statewide average operating and/or capital CCRs to work with their fiscal intermediary or MAC on a possible alternative operating and/or capital CCR as explained in Change Request 3966. Use of an alternative CCR developed by the hospital in conjunction with the fiscal intermediary or MAC can avoid possible overpayments or underpayments at cost report settlement, thus ensuring better accuracy when making outlier payments and negating the need for outlier reconciliation. We also note that a hospital may request an alternative operating or capital CCR ratio at any time as long as the guidelines of Change Request 3966 are followed. Additionally, as mentioned above, we published an additional manual update (Change Request 7192) to our outlier policy on December 3, 2010, which also updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update outlines the outlier reconciliation process for hospitals and Medicare contractors. To download and view the manual instructions on outlier reconciliation, we refer readers to the CMS Web site: *http://www.cms.hhs.gov/manuals/downloads/clm104c03.pdf.*

(3) FY 2011 and FY 2012 Outlier Payments

In the FY 2012 IPPS final rule (76 FR 51795 through 51796), we stated that, based on available data, we estimated that actual FY 2011 outlier payments would be approximately 4.7 percent of actual total MS–DRG payments. This estimate was computed based on simulations using the FY 2010 MedPAR file (discharge data for FY 2010 claims). That is, the estimate of actual outlier payments did not reflect actual FY 2011 claims, but instead reflected the application of FY 2011 payment rates and policies to available FY 2010 claims.

Our current estimate, using available FY 2011 claims data, is that actual outlier payments for FY 2011 were approximately 4.8 percent of actual total MS–DRG payments. Thus, the data indicate that, for FY 2011, the percentage of actual outlier payments relative to actual total payments is lower than we projected for FY 2011. Consistent with the policy and statutory interpretation we have maintained since the inception of the IPPS, we do not plan to make retroactive adjustments to outlier payments to ensure that total outlier payments for FY 2011 are equal to 5.1 percent of total MS–DRG payments.

In the proposed rule, we estimated that actual outlier payments for FY 2012 will be approximately 6.0 percent of actual total MS–DRG payments, approximately 0.9 percentage point higher than the 5.1 percent we projected when setting the outlier policies for FY 2012. This estimate of 6.0 percent was based on simulations using the FY 2011 MedPAR file (discharge data for FY 2011 claims). We note that, similar to our error in estimating the proposed outlier fixed-loss cost threshold, this estimate was incorrect because we inadvertently used CCRs with an effective date prior to December 2010. For this final rule, using the latest CCRs from the March 2012 update of the PSF, we estimate that actual outlier payments for FY 2012 will be approximately 5.0 percent of actual total MS–DRG payments, approximately 0.1 percentage point lower than the 5.1 percent we projected when setting the outlier policies for FY 2012. This estimate of 5.0 percent is based on simulations using the FY 2011 MedPAR file (discharge data for FY 2011 claims).

Comment: Commenters disagreed with CMS' use of modeled data versus actual payment data to compute the outlier payment percentage for FY 2011. The commenters stated that they performed their own analyses using actual payment information in the MedPAR file, which resulted in outlier payments being 4.42 percent of actual MS–DRG payments for FY 2011. The commenters recommended that CMS determine the FY 2011 outlier payment percentage using actual payments rather than modeled payments.

The commenters disagreed with CMS' reasons presented in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50431) for using modeled data instead of actual data. In that final rule, CMS supported its decision to use modeled data in part because ''while accurate at the time the MedPAR file is constructed, claims can be cancelled, edited and resubmitted to NCH after the MedPAR file is built, and,

therefore, the payment field shown on MedPAR is subject to change and does not necessarily represent the final payment on that claim.'' The commenters stated that while this is true, the argument applies equally to modeling payments from the MedPAR data. The commenters explained that if a claim is cancelled after the MedPAR file is built, the modeled payment for that claim will be included in overall estimates.

The commenters further noted that, in the FY 2011 IPPS/LTCH PPS final rule, CMS expressed concern that SCHs and MDHs complicate the use of the payment field shown on the MedPAR file (75 FR 50431). The commenter disagreed with CMS and stated that CMS' argument is valid for determining the DRG-based operating payments needed to calculate outlier payment levels; however, the SCH/MDH argument does not apply to outlier payments. The commenters claimed that ''the PRICER program determines outlier payments for all hospitals, including SCH/MDHs, based on the Federal rate only.'' The commenters added that ''the outlier payments are recorded in the ''OUTLIER AMOUNT'' field (and not included in the DRG PRICE).'' Therefore, the commenters asserted that ''obtaining the outlier payments directly from the MedPAR file does not introduce complications related to the SCH/MDH status.'' Moreover, the commenters stated, ''that SCH/MDH hospitals represent a small percent of hospitals overall.''

The commenters also believed that CMS' estimate is not as accurate as it could be. The commenter noted that CMS' statement in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51796) indicates that CMS estimated outlier payments for FY 2010 using a single CCR. The commenter stated that they were perplexed that CMS would not use the actual CCRs utilized in the actual payment process given that they are readily available in the PSF.

Using actual payment data, the commenter computed an outlier payout of 4.74 percent and 4.13 percent for FY 2009 and FY 2010 respectively, versus the 5.3 percent and 4.7 percent that CMS published in the FY 2011 and FY 2012 final rules. The commenter concluded that using modeled data has consistently overestimated outlier payments. The commenter recommended that CMS publish in the final rule the outlier percentage for FYs 2009 through 2011 based on actual payments.

Response: We responded to similar comments in response to policies presented in last year's final rule and refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51796).

Comment: One commenter was not aware that in determining the FY 2011 outlier payout, CMS first identifies SCHs then sums up the total Federal payments and hospital-specific rate (HSP) payments and then excludes from the outlier calculation those SCHs whose HSP payments were greater than their Federal payments. Using actual payments, the commenter performed a similar edit for SCHs and an edit for MDHs (by excluding 75 percent of their standard Federal rate based on MS–DRG and outlier payments). Using the payment amounts on the claims, the commenter determined an outlier payout of 4.39 percent for FY 2011. The commenter also modeled the FY 2011 outlier payout by incorporating the same edit described above for SCHs and MDHs, and used CCRs that were in effect during FY 2011 from the March 2012 PSF update, and DSH and IME factors from the FY 2011 final rule impact file. The commenter used FY 2011 payment rates and determined a modeled outlier payout of 4.42 percent for FY 2011. The commenter noted that the modeled outlier percentage of 4.42 was very close to the actual outlier payment percentage of 4.39. The commenter added that using this model, an outlier fixed-loss cost threshold of $20,055 would have resulted in an outlier payout of 5.1 percent for FY 2011 versus CMS' final FY 2011 outlier fixed-loss cost threshold of $23,075 (which represents a 15 percent error in setting the threshold).

The commenter also used cost report data from the March 2012 HCRIS update to analyze the historical actual outlier payout from 2003 through 2010. To determine the outlier payout for each year, the commenter summed up total MS–DRG payments and outlier payments for each fiscal year based on cost report begin dates within the fiscal year. The commenters stated that CMS did not meet the 5.1 percent target in any of these fiscal years.

The commenter also stated that it is important for CMS to assess how closely the prior year's threshold achieved its target. The commenter explained that if outlier payments from the prior year closely approximate the target, unless there are policy changes imposed by Congress or the agency or indications that demographic or public health factors had an impact on inpatient service intensity, then there is little need for dramatic change to the threshold from the prior year for the upcoming fiscal year.

The commenter modeled the FY 2012 outlier payout by using FY 2011 MedPAR data and inflating the charges by 6.8 percent. The commenter used the FY 2012 IPPS/LTCH PPS final rule impact file for payment variables and FY 2012 payment rules and determined an outlier payment of 5.8 percent. In the proposed rule, CMS calculated a 6.0 percent outlier payout for FY 2012. The commenter believed that the reason for this high outlier payout is due to the use of out of date CCRs. The commenter explained that they used CCRs from the March 2012 PSF update for the first three quarters of FY 2012 and projected forward CCRs by 1 year for the last quarter of FY 2012. The commenter noted that the estimate of 5.8 percent may still be too high because it is expected that many hospitals will have their CCRs updated in the last quarter of FY 2012 due to the delay in filing form CMS 2552–10 cost reports (and CCRs tend to trend lower over time which would lower the threshold). The commenter noted that this delay probably impacts the estimated FY 2012 outlier payout because hospitals did not have their CCR updated in the PSF, which caused relatively ''older'' CCRs to be used for payment of outliers longer than normal. (These older CCRs typically are higher than more recent updated CCRs, which would result in higher outlier payments during FY 2012.)

Response: We appreciate the commenter's analysis above. We believe it is necessary to annually recompute the outlier fixed-loss cost threshold because section 1886(d)(5)(A)(iv) of the Act requires outlier payments to be not less than 5 percent nor more than 6 percent of total estimated or projected payments. Additionally, aside from the statute, there are many variables such as the market basket increase, wage index, charge inflation factor and other adjustments to the standardized amount that could affect the outlier fixed-loss cost threshold from one year to the next, which warrants an annual recalculation of the outlier fixed-loss cost threshold factoring in these changes so that we can meet our target of a 5.1 percent outlier payout. However, we recognize the commenter's concerns with our methodology for calculating the outlier fixed-loss cost threshold and our calculation of the outlier payout from prior years. Therefore, as stated above, we plan to closely analyze the commenters' suggestions for modifying the methodology to calculate the outlier fixed-loss cost threshold amount and to improve our estimation of the outlier payout from prior years after this final rule so that, if warranted, we can make

any proposals on these issues in a future rulemaking.

5. FY 2013 Standardized Amount

The adjusted standardized amount is divided into labor-related and nonlabor-related portions. Tables 1A and 1B listed and published in section VI. of this Addendum (and available via the Internet) contain the national standardized amounts that we are applying to all hospitals, except hospitals located in Puerto Rico, for FY 2013. The Puerto Rico-specific amounts are shown in Table 1C listed and published in section VI. of this Addendum (and available via the Internet). The amounts shown in Tables 1A and 1B differ only in that the labor-related share applied to the standardized amounts in Table 1A is the labor-related share of 68.8 percent, and Table 1B is 62 percent. In accordance with sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act, we are applying a labor-related share of 62 percent, unless application of that percentage would result in lower payments to a hospital than would otherwise be made. In effect, the statutory provision means that we will apply a labor-related share of 62 percent for all hospitals (other than those in Puerto Rico) whose wage indices are less than or equal to 1.0000.

In addition, Tables 1A and 1B include the standardized amounts reflecting the applicable percentage increase of 1.8 percent for FY 2013, and an update of −0.2 percent for hospitals that fail to submit quality data consistent with section 1886(b)(3)(B)(viii) of the Act.

Under section 1886(d)(9)(A)(ii) of the Act, the Federal portion of the Puerto Rico payment rate is based on the discharge-weighted average of the national large urban standardized amount (this amount is set forth in Table 1A). The labor-related and nonlabor-related portions of the national average standardized amounts for Puerto Rico hospitals for FY 2013 are set forth in Table 1C listed and published in section VI. of this Addendum (and available via the Internet). This table also includes the Puerto Rico standardized amounts. The labor-related share applied to the Puerto Rico-specific standardized amount is the labor-related share of 62.1 percent, or 62 percent, depending on which provides higher payments to the hospital. (Section 1886(d)(9)(C)(iv) of the Act, as amended by section 403(b) of Public Law 108–173, provides that the labor-related share for hospitals located in Puerto Rico be 62 percent, unless the application of that percentage would result in lower payments to the hospital.)

The following table illustrates the changes from the FY 2012 national standardized amount. The second column shows the changes from the FY 2012 standardized amounts for hospitals that satisfy the quality data submission requirement and, therefore, receive the full update of 1.8 percent. The third column shows the changes for hospitals receiving the reduced update of −0.2 percent. The first row of the table shows the updated (through FY 2012) average standardized amount after restoring the FY 2012 offsets for outlier payments, demonstration budget neutrality, the geographic reclassification budget neutrality, and the retrospective documentation and coding adjustment under section 7(b)(1)(B) of Public Law 110–90. The MS–DRG reclassification and recalibration wage index budget neutrality factors are cumulative. Therefore, those FY 2012 factors are not removed from this table.

COMPARISON OF FY 2012 STANDARDIZED AMOUNTS TO THE FY 2013 STANDARDIZED AMOUNT WITH FULL AND REDUCED UPDATE

	Full update (1.8 percent); wage index is greater than 1.0000	Full update (1.8 percent); wage index is less than or equal to 1.0000	Reduced update (−0.2 percent); wage index is greater than 1.0000	Reduced Update (−0.2 percent); Wage index is less than or equal to 1.0000
FY 2012 Base Rate, after removing geographic reclassification budget neutrality, rural community hospital demonstration program budget neutrality, cumulative FY 2008 and FY 2009 documentation and coding adjustment, FY 2012 documentation and coding recoupment, and outlier offset (based on the labor-related share percentage for FY 2012).	Labor: $4,060.65 ..... Nonlabor: $1,841.46 ..	Labor: $3,659.31 ..... Nonlabor: $2,242.80 ..	Labor: $4,060.65 ..... Nonlabor: $1,841.46 ..	Labor: $3,659.31. Nonlabor: $2,242.80.
FY 2013 Update Factor	1.018	1.018	0.998	0.998.
FY 2013 MS-DRG Recalibration and Wage Index Budget Neutrality Factor.	0.998761	0.998761	0.998761	0.998761.
FY 2013 Reclassification Budget Neutrality Factor.	0.991276	0.991276	0.991276	0.991276.
FY 2013 Rural Community Demonstration Program Budget Neutrality Factor.	0.999677	0.999677	0.999677	0.999677.
FY 2013 Operating Outlier Factor	0.948999	0.948999	0.948999	0.948999.
Documentation and coding adjustments required under sections 7(b)(1)(A) and 7(b)(1)(B) of Pub. L. 110–90.	0.9478	0.9478	0.9478	0.9478.
National Standardized Amount for FY 2013 ..	Labor: $3,679.95 ..... Nonlabor: $1,668.81 ..	Labor: $3,316.23 ..... Nonlabor: $2,032.53 ..	Labor: $3,607.65 ..... Nonlabor: $1,636.02 ..	Labor: $3,251.08. Nonlabor: $1,992.59.

The following table illustrates the changes from the FY 2012 Puerto Rico-specific payment rate for hospitals located in Puerto Rico. The second column shows the changes from the FY 2012 Puerto Rico specific payment rate for hospitals with a Puerto Rico-specific wage index greater than 1.0000. The third column shows the changes from the FY 2012 Puerto Rico specific payment rate for hospitals with a Puerto Rico-specific wage index less than 1.0000. The first row of the table shows the updated (through FY 2012) Puerto Rico-specific payment rate after restoring the FY 2012 offsets for Puerto Rico-specific outlier payments, rural community hospital demonstration

program budget neutrality, and the geographic reclassification budget neutrality. The MS–DRG recalibration budget neutrality factor is cumulative and is not removed from this table.

COMPARISON OF FY 2012 PUERTO RICO-SPECIFIC PAYMENT RATE TO THE FY 2013 PUERTO RICO-SPECIFIC PAYMENT RATE

	Update (1.8 percent); wage index is greater than 1.0000	Update (1.8 percent); wage index is less than or equal to 1.0000
FY 2012 Puerto Rico Base Rate, after removing geographic reclassification budget neutrality, the rural community hospital demonstration program budget neutrality, Puerto Rico outlier offset (based on the Puerto Rico specific labor-related share percentage for FY 2012).	Labor: $1,643.77 Nonlabor: $1,003.21	Labor: $1,641.13 Nonlabor: $1,005.85.
FY 2013 Update Factor	1.018	1.018.
FY 2013 MS–DRG Recalibration Budget Neutrality Factor	0.998431	0.998431.
FY 2013 Reclassification Budget Neutrality Factor	0.991276	0.991276.
FY 2013 Rural Community Hospital Demonstration Program Budget Neutrality Factor.	0.999677	0.999677.
FY 2013 Puerto Rico Operating Outlier Factor	0.944760	0.944760.
Puerto Rico-Specific Payment Rate for FY 2013	Labor: $1,564.17 Nonlabor: $954.62	Labor: $1,561.65 Nonlabor: $957.14.

B. Adjustments for Area Wage Levels and Cost-of-Living

Tables 1A through 1C, as published in section VI. of this Addendum (and available via the Internet), contain the labor-related and nonlabor-related shares that we used to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico for FY 2013. This section addresses two types of adjustments to the standardized amounts that are made in determining the prospective payment rates as described in this Addendum.

1. Adjustment for Area Wage Levels

Sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act require that we make an adjustment to the labor-related portion of the national and Puerto Rico prospective payment rates, respectively, to account for area differences in hospital wage levels. This adjustment is made by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. In section III. of the preamble of this final rule, we discuss the data and methodology for the FY 2013 wage index.

2. Adjustment for Cost-of-Living in Alaska and Hawaii

Section 1886(d)(5)(H) of the Act provides discretionary authority to the Secretary to make ''such adjustments * * * as the Secretary deems appropriate'' to take into account the unique circumstances of hospitals located in Alaska and Hawaii. Higher labor-related costs for these two States are taken into account in the adjustment for area wages described above. To account for higher nonlabor-related costs for these two States, we multiply the nonlabor-related portion of the standardized amount for hospitals in Alaska and Hawaii by an adjustment factor. For FY 2011 and in prior fiscal years, we used the most recent cost-of-living adjustment (COLA) factors obtained from the U.S. Office of Personnel Management (OPM) Web site at *http://www.opm.gov/oca/cola/rates.asp* to update this nonlabor portion.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28145 and 28146), we explained that sections 1911 through 1919 of the Nonforeign Area Retirement Equity Assurance Act, as contained in subtitle B of title XIX of the National Defense Authorization Act (NDAA) for Fiscal Year 2010 (Pub. L. 111–84, October 28, 2009), transitions the Alaska and Hawaii COLAs to locality pay. We further explained in the proposed rule that, beginning in FY 2012, as OPM transitioned away from COLAs, we continued to use the same ''frozen'' COLA factors (published by OPM) that we used to adjust payments in FY 2011 (which were based on OPM's 2009 COLA factors) to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii. We refer readers to the FY 2013 IPPS/LTCH PPS proposed rule for a more detailed discussion of our rationale for continuing to use the frozen COLAs.

In the FY 2013 IPPS/LTCH PPS proposed rule, for FY 2013, we proposed to continue to use the same COLA factors that are used to adjust payments in FY 2012 (as originally used to adjust payments in FY 2011, which are based on OPM's 2009 COLA factors), and we also proposed a methodology to update the COLA factors published by OPM beginning in FY 2014. Specifically, we proposed to update the COLA factors published by OPM that we used to adjust payments in FY 2011 (which are based on OPM's 2009 COLA factors) by using the comparison of the growth in the overall CPI relative to the growth in the CPI in Anchorage and Honolulu to update the COLA adjustment factors for all areas in Alaska and Hawaii, respectively. We noted that OPM's COLA factors were calculated with a statutorily mandated cap of 25 percent, and we have exercised our discretionary authority to adjust Alaska and Hawaii payments by incorporating this cap. We again refer readers to the FY 2013 IPPS/LTCH PPS proposed rule for a more detailed discussion of our methodology. Lastly, as we stated in the proposed rule, we are updating the COLA factors based on our methodology every 4 years, at the same time as the update to the labor-related share of the IPPS market basket. The labor-related share of the IPPS market basket is currently not scheduled to be updated until FY 2014.

We did not receive any public comments on this proposal. Therefore, we are finalizing our proposals without modification. Specifically, we are adopting as final our proposed methodology to update the COLA factors annually beginning in FY 2014. We also are finalizing our proposal for FY 2013 to continue to use the same COLA factors used to adjust payments

in FY 2012. Therefore, the COLA factors which will be used to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii for FY 2013 remain unchanged from FY 2012. The table below shows the COLA factors that we are establishing for FY 2013:

FY 2013 COST-OF-LIVING ADJUSTMENT FACTORS: ALASKA AND HAWAII HOSPITALS

Area	Cost of living adjustment factor
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.23
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.23
City of Juneau and 80-kilometer (50-mile) radius by road	1.23
Rest of Alaska	1.25
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.18
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

C. Calculation of the Prospective Payment Rates

General Formula for Calculation of the Prospective Payment Rates for FY 2013

In general, the operating prospective payment rate for all hospitals paid under the IPPS located outside of Puerto Rico, except SCHs, for FY 2013 equals the Federal rate. (As noted above, due to the expiration of the MDH program, beginning with FY 2013, we are not including MDHs in our discussion of the update of the hospital-specific rates for FY 2013.)

Currently, SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal national rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on the FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

The prospective payment rate for SCHs for FY 2013 equals the higher of the applicable Federal rate, or the hospital-specific rate as described below. The prospective payment rate for hospitals located in Puerto Rico for FY 2013 equals 25 percent of the Puerto Rico-specific payment rate plus 75 percent of the applicable national rate.

1. Federal Rate

The Federal rate is determined as follows:

Step 1—Select the applicable average standardized amount depending on whether the hospital submitted qualifying quality data (full update for hospitals submitting quality data; update including a −2.0 percent adjustment for hospitals that did not submit these data).

Step 2—Multiply the labor-related portion of the standardized amount by the applicable wage index for the geographic area in which the hospital is located or the area to which the hospital is reclassified.

Step 3—For hospitals in Alaska and Hawaii, multiply the nonlabor-related portion of the standardized amount by the applicable cost-of-living adjustment factor.

Step 4—Add the amount from Step 2 and the nonlabor-related portion of the standardized amount (adjusted, if applicable, under Step 3).

Step 5—Multiply the final amount from Step 4 by the relative weight corresponding to the applicable MS–DRG (Table 5 listed in section VI. of this Addendum and available via the Internet).

The Federal rate as determined in Step 5 may then be further adjusted if the hospital qualifies for either the IME or DSH adjustment. In addition, for hospitals that qualify for a low-volume payment adjustment under section 1886(d)(12) of the Act and 42 CFR 412.101(b), the payment in Step 5 would be increased by the formula described in section IV.D. of the preamble of this final rule. Finally, the base-operating DRG payment amount may be further adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment as described under sections 1886 (q) and 1886(o) of the Act, respectively.

2. Hospital-Specific Rate (Applicable Only to SCHs)

a. Calculation of Hospital-Specific Rate

Section 1886(b)(3)(C) of the Act provides that currently SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on the FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment. For a more detailed discussion of the calculation of the hospital-specific rates, we refer readers to the FY 1984 IPPS interim final rule (48 FR 39772); the April 20, 1990 final rule with comment period (55 FR 15150); the FY 1991 IPPS final rule (55 FR 35994); and the FY 2001 IPPS final rule (65 FR 47082).

We note that, in the FY 2012 IPPS/LTCH final rule (76 FR 51799), we finalized an adjustment of 0.9 percent to the hospital-specific rate (that is, a factor of 1.009) in light of the *Cape Cod* decision. The adjustment is a one-time permanent adjustment to the hospital-specific rates.

b. Updating the FY 1982, FY 1987, FY 1996 and FY 2006 Hospital-Specific Rate for FY 2013

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase applicable to the hospital-specific rates for SCHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Because the Act sets the update factor for SCHs equal to the update factor for all other IPPS hospitals, the update to the hospital-specific rates for SCHs is subject to the amendments to section 1886(b)(3)(B) of the Act made by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, the applicable percentage increase to the hospital-specific rates applicable to SCHs is 1.8 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for MFP and less 0.1 percentage point) for hospitals that submit quality data or −0.2 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent, less 2.0 percentage points for failure to submit data under the Hospital IQR Program, less an adjustment of 0.7 percentage point for MFP, and less 0.1 percentage point) for hospitals that fail to submit quality data. For a complete discussion of the applicable percentage increase applicable to the hospital-specific rates for SCHs, we refer readers to section IV.B. of the preamble of this final rule.

In addition, because SCHs use the same MS–DRGs as other hospitals when they are paid based in whole or in part on the hospital-specific rate, the hospital-specific rate is adjusted by a budget neutrality factor to ensure that changes to the MS–DRG classifications and the recalibration of the MS–DRG relative weights are made in a manner

so that aggregate IPPS payments are unaffected. Therefore, a SCH's hospital-specific rate is adjusted by the MS–DRG reclassification and recalibration budget neutrality factor of 0.998431, as discussed in section III. of this Addendum. The resulting rate is used in determining the payment rate an SCH will receive for its discharges beginning on or after October 1, 2012.

c. Documentation and Coding Adjustment to the FY 2013 Hospital-Specific Rate for SCHs

As discussed in section II.D. of the preamble of this final rule, because hospitals paid based in whole or in part on the hospital-specific rate (that is, SCHs and, until October 1, 2012, MDHs) use the same MS–DRG system as other hospitals, we believe they have the potential to realize increased payments from documentation and coding changes that do not reflect real increases in patients' severity of illness. Under section 1886(d)(3)(A)(vi) of the Act, Congress stipulated that hospitals paid based on the standardized amount should not receive additional payments based on the effect of documentation and coding changes that do not reflect real changes in case-mix. Similarly, we believe that hospitals paid based on the hospital-specific rate should not have the potential to realize increased payments due to documentation and coding changes that do not reflect real increases in patients' severity of illness. Therefore, as discussed in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50426) and in section II.D. of the preamble of this final rule, we believe they should be equally subject to a prospective budget neutrality adjustment that we are applying for adoption of the MS–DRGs to all other hospitals. While we continue to believe that section 1886(d)(3)(A)(vi) of the Act does not provide explicit authority for application of the documentation and coding adjustment to the hospital-specific rates, we believe that we have the authority to apply the documentation and coding adjustment to the hospital-specific rates to ensure rates are not increased in a manner that does not reflect real changes in case-mix, and using our special exceptions and adjustment authority under section 1886(d)(5)(I)(i) of the Act.

As we discuss in section II.D. of the preamble of this final rule, we have determined that a cumulative adjustment of −5.4 percent is required to eliminate the full effect of changes in documentation and coding that occurred in FY 2008 and FY 2009 on future payments to SCHs. Currently, we have made cumulative adjustments to the hospital-specific rates to account for 4.9 percent of the 5.4 percent effect of changes in documentation and coding that occurred in FY 2008 and FY 2009. (For FY 2011, we established a prospective adjustment of −2.9 percent to the hospital-specific rates, and, for FY 2012, we established a prospective adjustment to the hospital-specific rates of −2.0 percent.) In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51499), we indicated that, because the −2.0 percent adjustment we made in FY 2012 did not reflect the entire remaining required adjustment amount of −2.5 percent, an additional −0.5 percent adjustment to the hospital-specific rates would be required in a future rulemaking.

In this final rule, as we proposed, we are finalizing a −0.5 percent prospective adjustment to the hospital-specific rate to account for the remainder of the 5.4 percent effect of documentation and coding that occurred in FY 2008 and FY 2009. We continue to believe that hospitals paid based on their hospital-specific rate (that is, SCHs and, until October 1, 2012, MDHs) had the same opportunity to benefit from improvements in documentation and coding that did not reflect an increase in patient severity, and we continue to believe that any resulting adjustments should be applied similarly to all subsection (d) hospitals, when possible.

As discussed in section II.D. of the preamble of this final rule, consistent with our policy for IPPS hospitals based upon a review of FY 2010 claims data using the same methodology, we proposed to make an additional −0.8 percent adjustment to the hospital-specific rates to account for documentation and coding that did not reflect an actual increase in case-mix in FY 2010. In the proposed rule, we stated that we believe that a full prospective adjustment is the most appropriate means to take into account the effect of documentation and coding changes on payments, while maintaining equity as much as possible between different IPPS hospitals paid using the MS–DRG system. Therefore, as discussed in more detail in the preamble of this final rule, we proposed a combined adjustment of −1.3 percent (−0.5 percent + −0.8 percent) to the hospital-specific rates, accounting for all documentation and coding effects observed between FY 2008 though FY 2010.

As discussed in section II.D. of the preamble of this final rule, we are not finalizing an additional −0.8 percent adjustment to the FY 2013 hospital-specific rates to account for documentation and coding that did not reflect an actual increase in case-mix in FY 2010. However, as stated above, we are making an adjustment of −0.5 percent to the hospital-specific rates, accounting for all documentation and coding effects observed during FY 2008 and FY 2009.

3. General Formula for Calculation of Prospective Payment Rates for Hospitals Located in Puerto Rico Beginning on or after October 1, 2012, and before October 1, 2013

Section 1886(d)(9)(E)(iv) of the Act provides that, effective for discharges occurring on or after October 1, 2004, hospitals located in Puerto Rico are paid based on a blend of 75 percent of the national prospective payment rate and 25 percent of the Puerto Rico-specific rate.

a. Puerto Rico-Specific Rate

The Puerto Rico-specific prospective payment rate is determined as follows:

Step 1—Select the applicable average standardized amount considering the applicable wage index (obtained from Table 1C published in section VI. of this Addendum and available via the Internet).

Step 2—Multiply the labor-related portion of the standardized amount by the applicable Puerto Rico-specific wage index.

Step 3—Add the amount from Step 2 and the nonlabor-related portion of the standardized amount.

Step 4—Multiply the amount from Step 3 by the applicable MS–DRG relative weight (obtained from Table 5 listed in section VI. of this Addendum and available via the Internet).

Step 5—Multiply the result in Step 4 by 25 percent.

b. National Prospective Payment Rate

The national prospective payment rate is determined as follows:

Step 1—Select the applicable average standardized amount.

Step 2—Multiply the labor-related portion of the standardized amount by the applicable wage index for the geographic area in which the hospital is located or the area to which the hospital is reclassified.

Step 3—Add the amount from Step 2 and the nonlabor-related portion of the national average standardized amount.

Step 4—Multiply the amount from Step 3 by the applicable MS–DRG relative weight (obtained from Table 5 listed in section VI. of this Addendum and available via the Internet).

Step 5—Multiply the result in Step 4 by 75 percent.

The sum of the Puerto Rico-specific rate and the national prospective payment rate computed above equals

the prospective payment for a given discharge for a hospital located in Puerto Rico. This rate is then further adjusted if the hospital qualifies for either the IME or DSH adjustment.

III. Changes to Payment Rates for Acute Care Hospital Inpatient Capital-Related Costs for FY 2013

The PPS for acute care hospital inpatient capital-related costs was implemented for cost reporting periods beginning on or after October 1, 1991. Effective with that cost reporting period, hospitals were paid during a 10-year transition period (which extended through FY 2001) to change the payment methodology for Medicare acute care hospital inpatient capital-related costs from a reasonable cost-based methodology to a prospective methodology (based fully on the Federal rate).

The basic methodology for determining Federal capital prospective rates is set forth in the regulations at 42 CFR 412.308 through 412.352. Below we discuss the factors that we used to determine the capital Federal rate for FY 2013, which is effective for discharges occurring on or after October 1, 2012.

The 10-year transition period ended with hospital cost reporting periods beginning on or after October 1, 2001 (FY 2002). Therefore, for cost reporting periods beginning in FY 2002, all hospitals (except ''new'' hospitals under § 412.304(c)(2)) are paid based on the capital Federal rate. For FY 1992, we computed the standard Federal payment rate for capital-related costs under the IPPS by updating the FY 1989 Medicare inpatient capital cost per case by an actuarial estimate of the increase in Medicare inpatient capital costs per case. Each year after FY 1992, we update the capital standard Federal rate, as provided at § 412.308(c)(1), to account for capital input price increases and other factors. The regulations at § 412.308(c)(2) also provide that the capital Federal rate be adjusted annually by a factor equal to the estimated proportion of outlier payments under the capital Federal rate to total capital payments under the capital Federal rate. In addition, § 412.308(c)(3) requires that the capital Federal rate be reduced by an adjustment factor equal to the estimated proportion of payments for exceptions under § 412.348. (We note that, as discussed below in section III.A.4. of this Addendum, there is no longer a need for an exceptions payment adjustment factor.) Section 412.308(c)(4)(ii) requires that the capital standard Federal rate be adjusted so that the effects of the annual DRG reclassification and the recalibration of DRG weights and changes in the geographic adjustment factor (GAF) are budget neutral.

Section 412.374 provides for blended payments to hospitals located in Puerto Rico under the IPPS for acute care hospital inpatient capital-related costs. Accordingly, under the capital PPS, we compute a separate payment rate specific to hospitals located in Puerto Rico using the same methodology used to compute the national Federal rate for capital-related costs. In accordance with section 1886(d)(9)(A) of the Act, under the IPPS for acute care hospital operating costs, hospitals located in Puerto Rico are paid for operating costs under a special payment formula. Effective October 1, 2004, in accordance with section 504 of Public Law 108–173, the methodology for operating payments made to hospitals located in Puerto Rico under the IPPS was revised to make payments based on a blend of 25 percent of the applicable standardized amount specific to Puerto Rico hospitals and 75 percent of the applicable national average standardized amount. In conjunction with this change to the operating blend percentage, effective with discharges occurring on or after October 1, 2004, we also revised the methodology for computing capital payments made to hospitals located in Puerto Rico to be based on a blend of 25 percent of the Puerto Rico capital rate and 75 percent of the national capital Federal rate (69 FR 49185).

A. Determination of Federal Hospital Inpatient Capital-Related Prospective Payment Rate Update

In the discussion that follows, we explain the factors that we used to determine the capital Federal rate for FY 2013. In particular, we explain why the FY 2013 capital Federal rate increases approximately 1.0 percent, compared to the FY 2012 capital Federal rate. As discussed in the impact analysis in Appendix A to this final rule, we estimate that capital payments per discharge will increase 1.8 percent during that same period. Because capital payments constitute about 10 percent of hospital payments, a percent change in the capital Federal rate yields only about a 0.1 percent change in actual payments to hospitals.

1. Projected Capital Standard Federal Rate Update

a. Description of the Update Framework

Under § 412.308(c)(1), the capital standard Federal rate is updated on the basis of an analytical framework that takes into account changes in a capital input price index (CIPI) and several other policy adjustment factors. Specifically, we adjust the projected CIPI rate-of-increase as appropriate each year for case-mix index-related changes, for intensity, and for errors in previous CIPI forecasts. The update factor for FY 2013 under that framework is 1.2 percent based on the best data available at this time. The update factor under that framework is based on a projected 1.2 percent increase in the CIPI, a 0.0 percent adjustment for intensity, a 0.0 percent adjustment for case-mix, a 0.0 percent adjustment for the FY 2011 DRG reclassification and recalibration, and a forecast error correction of 0.0 percent. As discussed below in section III.C. of this Addendum, we continue to believe that the CIPI is the most appropriate input price index for capital costs to measure capital price changes in a given year. We also explain the basis for the FY 2013 CIPI projection in that same section of this Addendum. (We note that, as discussed in section V.C. of the preamble of this final rule, at this time, we are not finalizing our proposal to apply a −0.8 percent adjustment to the capital Federal rate in FY 2013 to account for the effect of changes in documentation and coding under the MS–DRGs that do not correspond to changes in real increases in patients' severity of illness.) Below we describe the policy adjustments that we are applying in the update framework for FY 2013.

The case-mix index is the measure of the average DRG weight for cases paid under the IPPS. Because the DRG weight determines the prospective payment for each case, any percentage increase in the case-mix index corresponds to an equal percentage increase in hospital payments.

The case-mix index can change for any of several reasons:

- The average resource use of Medicare patients changes (''real'' case-mix change);
- Changes in hospital documentation and coding of patient records result in higher weighted DRG assignments (''coding effects''); and
- The annual DRG reclassification and recalibration changes may not be budget neutral (''reclassification effect'').

We define real case-mix change as actual changes in the mix (and resource requirements) of Medicare patients as opposed to changes in documentation and coding behavior that result in assignment of cases to higher-weighted DRGs, but do not reflect higher resource requirements. The capital update framework includes the same case-mix index adjustment used in the former operating IPPS update framework (as

discussed in the May 18, 2004 IPPS proposed rule for FY 2005 (69 FR 28816)). (We no longer use an update framework to make a recommendation for updating the operating IPPS standardized amounts as discussed in section II. of Appendix B to the FY 2006 IPPS final rule (70 FR 47707).)

For FY 2013, we are projecting a 0.5 percent total increase in the case-mix index. We estimated that the real case-mix increase will also equal 0.5 percent for FY 2013. The net adjustment for change in case-mix is the difference between the projected real increase in case-mix and the projected total increase in case-mix. Therefore, the net adjustment for case-mix change in FY 2013 is 0.0 percentage point.

The capital update framework also contains an adjustment for the effects of DRG reclassification and recalibration. This adjustment is intended to remove the effect on total payments of prior year's changes to the DRG classifications and relative weights, in order to retain budget neutrality for all case-mix index-related changes other than those due to patient severity of illness. Due to the lag time in the availability of data, there is a 2-year lag in data used to determine the adjustment for the effects of DRG reclassification and recalibration. For example, we have data available to evaluate the effects of the FY 2011 DRG reclassification and recalibration as part of our update for FY 2013. We estimate that FY 2011 DRG reclassification and recalibration resulted in no change in the case-mix when compared with the case-mix index that would have resulted if we had not made the reclassification and recalibration changes to the DRGs. Therefore, we are making a 0.0 percent adjustment for reclassification and recalibration in the update framework for FY 2013.

The capital update framework also contains an adjustment for forecast error. The input price index forecast is based on historical trends and relationships ascertainable at the time the update factor is established for the upcoming year. In any given year, there may be unanticipated price fluctuations that may result in differences between the actual increase in prices and the forecast used in calculating the update factors. In setting a prospective payment rate under the framework, we make an adjustment for forecast error only if our estimate of the change in the capital input price index for any year is off by 0.25 percentage point or more. There is a 2-year lag between the forecast and the availability of data to develop a measurement of the forecast error. A forecast error of 0.0 percentage point was calculated for the FY 2013 update. That is, current historical data indicate that the forecasted FY 2011 CIPI (1.2 percent) used in calculating the FY 2011 update factor is the same as the actual realized price increases (1.2 percent). Because we estimate forecast error for the FY 2011 CIPI, we are making a 0.0 percent adjustment for forecast error in the update for FY 2013.

Under the capital IPPS update framework, we also make an adjustment for changes in intensity. Historically, we calculated this adjustment using the same methodology and data that were used in the past under the framework for operating IPPS. The intensity factor for the operating update framework reflected how hospital services are utilized to produce the final product, that is, the discharge. This component accounts for changes in the use of quality-enhancing services, for changes within DRG severity, and for expected modification of practice patterns to remove noncost-effective services. Our intensity measure is based on a 5-year average.

We calculate case-mix constant intensity as the change in total cost per discharge, adjusted for price level changes (the CIPI for hospital and related services) and changes in real case-mix. Without reliable estimates of the proportions of the overall annual intensity increases that are due, respectively, to ineffective practice patterns and the combination of quality-enhancing new technologies and complexity within the DRG system, we assume that one-half of the annual increase is due to each of these factors. The capital update framework thus provides an add-on to the input price index rate of increase of one-half of the estimated annual increase in intensity, to allow for increases within DRG severity and the adoption of quality-enhancing technology.

In this final rule, we are continuing to use a Medicare-specific intensity measure that is based on a 5-year adjusted average of cost per discharge for FY 2013 (we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50436) for a full description of our Medicare-specific intensity measure). Specifically, for FY 2013, we are using an intensity measure that is based on an average of cost per discharge data from the 5-year period beginning with FY 2005 and extending through FY 2010. Based on these data, we estimated that case-mix constant intensity declined during FYs 2005 through 2010. In the past, when we found intensity to be declining, we believed a zero (rather than a negative) intensity adjustment was appropriate. Consistent with this approach, because we estimate that intensity declined during that 5-year period, we believe it is appropriate to continue to apply a zero intensity adjustment for FY 2013. Therefore, we are making a 0.0 percent adjustment for intensity in the update for FY 2013.

Above, we described the basis of the components used to develop the 1.2 percent capital update factor under the capital update framework for FY 2013 as shown in the table below.

CMS FY 2013 UPDATE FACTOR TO THE CAPITAL FEDERAL RATE

Capital Input Price Index	1.2
Intensity	0.0
Case-Mix Adjustment Factors:	
Real Across DRG Change	−0.5
Projected Case-Mix Change	0.5
Subtotal	1.2
Effect of FY 2011 Reclassification and Recalibration	0.0
Forecast Error Correction	0.0
Total Update	1.2

b. Comparison of CMS and MedPAC Update Recommendation

In its March 2012 Report to Congress, MedPAC did not make a specific update recommendation for capital IPPS payments for FY 2013. (We refer readers to MedPAC's Report to the Congress: Medicare Payment Policy, March 2012, Chapter 3.)

2. Outlier Payment Adjustment Factor

Section 412.312(c) establishes a unified outlier payment methodology for inpatient operating and inpatient capital-related costs. A single set of thresholds is used to identify outlier cases for both inpatient operating and inpatient capital-related payments. Section 412.308(c)(2) provides that the standard Federal rate for inpatient capital-related costs be reduced by an adjustment factor equal to the estimated proportion of capital-related outlier payments to total inpatient capital-related PPS payments. The outlier thresholds are set so that operating outlier payments are projected to be 5.1 percent of total operating IPPS DRG payments.

For FY 2012, we estimated that outlier payments for capital would equal 6.18 percent of inpatient capital-related payments based on the capital Federal rate in FY 2012. Based on the thresholds as set forth in section II.A. of this Addendum, we estimate that outlier payments for capital-related costs will equal 6.38 percent for inpatient capital-related payments based on the capital Federal rate in FY 2013. Therefore, we are applying an outlier adjustment

factor of 0.9362 in determining the capital Federal rate for FY 2013. Thus, we estimate that the percentage of capital outlier payments to total capital Federal rate payments for FY 2013 will be somewhat higher than the percentage for FY 2012. This increase in estimated capital outlier payments is primarily due to the decrease in the outlier threshold used to identify outlier cases for both inpatient operating and inpatient capital-related payments, which is discussed in section II.A. of this Addendum. That is, because the outlier threshold used to identify outlier cases is lower, cases will receive higher outlier payments and more cases will qualify for outlier payments.

The outlier reduction factors are not built permanently into the capital rates; that is, they are not applied cumulatively in determining the capital Federal rate. The FY 2013 outlier adjustment of 0.9362 is a −0.21 percent change from the FY 2012 outlier adjustment of 0.9382. Therefore, the net change in the outlier adjustment to the capital Federal rate for FY 2013 is 0.9976 (0.9362/0.9382). Thus, the outlier adjustment will decrease the FY 2013 capital Federal rate by 0.21 percent compared to the FY 2012 outlier adjustment.

3. Budget Neutrality Adjustment Factor for Changes in DRG Classifications and Weights and the GAF

Section 412.308(c)(4)(ii) requires that the capital Federal rate be adjusted so that aggregate payments for the fiscal year based on the capital Federal rate after any changes resulting from the annual DRG reclassification and recalibration and changes in the GAF are projected to equal aggregate payments that would have been made on the basis of the capital Federal rate without such changes. Because we implemented a separate GAF for Puerto Rico, we apply separate budget neutrality adjustments for the national GAF and the Puerto Rico GAF. We apply the same budget neutrality factor for DRG reclassifications and recalibration nationally and for Puerto Rico. Separate adjustments were unnecessary for FY 1998 and earlier because the GAF for Puerto Rico was implemented in FY 1998.

To determine the factors for FY 2013, we compared (separately for the national capital rate and the Puerto Rico capital rate) estimated aggregate capital Federal rate payments based on the FY 2012 MS–DRG classifications and relative weights and the FY 2012 GAF to estimated aggregate capital Federal rate payments based on the FY 2012 MS–DRG classifications and relative weights and the FY 2013 GAFs. To achieve budget neutrality for the changes in the national GAFs, based on calculations using updated data, we are applying an incremental budget neutrality adjustment factor of 1.0003 for FY 2013 to the previous cumulative FY 2012 adjustment factor of 0.9908, yielding an adjustment factor of 0.9911, through FY 2013. For the Puerto Rico GAFs, we are applying an incremental budget neutrality adjustment factor of 1.0056 for FY 2013 to the previous cumulative FY 2012 adjustment factor of 1.0043, yielding a cumulative adjustment factor of 1.0100 through FY 2013.

We then compared estimated aggregate capital Federal rate payments based on the FY 2012 MS–DRG relative weights and the FY 2013 GAFs to estimate aggregate capital Federal rate payments based on the cumulative effects of the FY 2013 MS–DRG classifications and relative weights and the FY 2013 GAFs. The incremental adjustment factor for DRG classifications and changes in relative weights is 0.9996 both nationally and for Puerto Rico. The cumulative adjustment factors for MS–DRG classifications and changes in relative weights and for changes in the GAFs through FY 2013 are 0.9904 nationally and 1.0095 for Puerto Rico. We note that all the values are calculated with unrounded numbers.

The methodology used to determine the recalibration and geographic adjustment factor (GAF/DRG) budget neutrality adjustment is similar to the methodology used in establishing budget neutrality adjustments under the IPPS for operating costs. One difference is that, under the operating IPPS, the budget neutrality adjustments for the effect of geographic reclassifications are determined separately from the effects of other changes in the hospital wage index and the MS–DRG relative weights. Under the capital IPPS, there is a single GAF/DRG budget neutrality adjustment factor (the national capital rate and the Puerto Rico capital rate are determined separately) for changes in the GAF (including geographic reclassification) and the MS–DRG relative weights. In addition, there is no adjustment for the effects that geographic reclassification has on the other payment parameters, such as the payments for DSH or IME.

For FY 2012, we established a GAF/DRG budget neutrality adjustment factor of 1.0004 (76 FR 51803). For FY 2013, we are establishing a GAF/DRG budget neutrality adjustment factor of 0.9998. The GAF/DRG budget neutrality adjustment factors are built permanently into the capital rates; that is, they are applied cumulatively in determining the capital Federal rate. This follows the requirement that estimated aggregate payments each year be no more or less than they would have been in the absence of the annual DRG reclassification and recalibration and changes in the GAFs. The incremental change in the adjustment factor from FY 2012 to FY 2013 is 0.9998. The cumulative change in the capital Federal rate due to this adjustment is 0.9904 (the product of the incremental factors for FYs 1995 through 2012 and the incremental factor of 0.9998 for FY 2013). (For a historical listing of the DRG and GAF budget neutrality adjustment factors, we refer readers to section III. of the Addendum to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51803).)

The factor accounts for the MS–DRG reclassifications and recalibration and for changes in the GAFs. It also incorporates the effects on the GAFs of FY 2013 geographic reclassification decisions made by the MGCRB compared to FY 2012 decisions. However, it does not account for changes in payments due to changes in the DSH and IME adjustment factors.

4. Exceptions Payment Adjustment Factor

Section 412.308(c)(3) of our regulations requires that the capital standard Federal rate be reduced by an adjustment factor equal to the estimated proportion of additional payments for both regular exceptions and special exceptions under § 412.348 relative to total capital PPS payments.

Since FY 2002, an adjustment for regular exception payments was no longer necessary in determining the capital Federal rate because, in accordance with § 412.348(b), regular exception payments were only made for cost reporting periods beginning on or after October 1, 1991, and before October 1, 2001. Accordingly, in FY 2002 and subsequent fiscal years, no payments are made under the regular exceptions provision (66 FR 39949). Furthermore, as discussed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51804), there are no longer any remaining hospitals eligible to receive a special exceptions payment under § 412.348(g) because they have reached the limitation on the period for exception payments under § 412.348(g)(7). Therefore, beginning with FY 2012, there is no longer a need for an exceptions payment adjustment factor.

5. Capital Federal Rate for FY 2013

For FY 2012, we established a capital Federal rate of $421.42 (76 FR 51804). We are establishing an update of 1.2 percent in determining the FY 2013 capital Federal rate for all hospitals. (As discussed in greater detail in section V.E. of the preamble of this final rule, at this time we are not adopting our proposal to make an additional −0.8 percent adjustment to the national capital Federal rate in FY 2013 to account for the effect of changes in case-mix resulting from documentation and coding changes that do not reflect real changes in the case-mix in light of the adoption of MS–DRGs. However, the cumulative documentation and coding adjustment factor of 0.9479 applied in determining the FY 2012 capital Federal rate remains applied to that rate. As a result of the 1.2 percent update and other budget neutrality factors discussed above, we are establishing a national capital Federal rate of $425.49 for FY 2013. The national capital Federal rate for FY 2013 was calculated as follows:

- The FY 2013 update factor is 1.0120, that is, the update is 1.2 percent.
- The FY 2013 budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the MS–DRG classifications and relative weights and changes in the GAFs is 0.9998.
- The FY 2013 outlier adjustment factor is 0.9362.

Because the capital Federal rate has already been adjusted for differences in case-mix, wages, cost-of-living, indirect medical education costs, and payments to hospitals serving a disproportionate share of low-income patients, we are not making additional adjustments in the capital Federal rate for these factors, other than the budget neutrality factor for changes in the MS–DRG classifications and relative weights and for changes in the GAFs. (As discussed in section III.A.4. of this Addendum, there is no longer a need for an exceptions payment adjustment factor in determining the capital Federal rate.)

We are providing the following chart that shows how each of the factors and adjustments for FY 2013 affects the computation of the FY 2013 national capital Federal rate in comparison to the FY 2012 national capital Federal rate. The FY 2013 update factor has the effect of increasing the capital Federal rate by 1.2 percent compared to the FY 2012 capital Federal rate. The GAF/DRG budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.02 percent. The FY 2013 outlier adjustment factor has the effect of decreasing the capital Federal rate by 0.21 percent compared to the FY 2012 capital Federal rate. The combined effect of all the changes will increase the national capital Federal rate by 0.97 percent compared to the FY 2012 national capital Federal rate.

COMPARISON OF FACTORS AND ADJUSTMENTS: FY 2012 CAPITAL FEDERAL RATE AND FY 2013 CAPITAL FEDERAL RATE

	FY 2012	FY 2013	Change	Percent change
Update Factor [1]	1.0150	1.0120	1.0120	1.20
GAF/DRG Adjustment Factor [1]	1.0040	0.9998	0.9998	−0.02
Outlier Adjustment Factor [2]	0.9382	0.9362	1.0019	−0.21
Capital Federal Rate	$421.42	$425.49	1.0097	0.97

[1] The update factor and the GAF/DRG budget neutrality adjustment factors are built permanently into the capital Federal rates. Thus, for example, the incremental change from FY 2012 to FY 2013 resulting from the application of the 0.9998 GAF/DRG budget neutrality adjustment factor for FY 2013 is a net change of 0.9998 (or −0.02 percent).

[2] The outlier reduction factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the FY 2013 outlier adjustment factor is 0.9362/0.9382, or 0.9979 (or −0.21 percent).

In this final rule, we also are providing the following chart that shows how the final FY 2013 capital Federal rate differs from the proposed FY 2013 capital Federal rate as presented in the FY 2013 IPPS/LTCH PPS proposed rule.

COMPARISON OF FACTORS AND ADJUSTMENTS: PROPOSED FY 2013 CAPITAL FEDERAL RATE AND FINAL FY 2013 CAPITAL FEDERAL RATE

	Proposed * FY 2013	Final FY 2013	Change	Percent change
Update Factor	1.0130	1.0120	0.9990	−0.10
GAF/DRG Adjustment Factor	1.0002	0.9998	0.9997	−0.03
Outlier Adjustment Factor	0.9357	0.9362	1.0005	0.05
MS–DRG Documentation and Coding Adjustment Factor	0.9404	0.9479	1.0080	0.80
Capital Federal Rate	$422.47	$425.49	1.0071	0.71

* The proposed FY 2013 capital Federal rate reflects the correction to the outlier adjustment factor presented in the FY 2013 IPPS/LTCH PPS correction notice (77 FR 34328).

6. Special Capital Rate for Puerto Rico Hospitals

Section 412.374 provides for the use of a blended payment system for payments made to hospitals located in Puerto Rico under the PPS for acute care hospital inpatient capital-related costs. Accordingly, under the capital PPS, we compute a separate payment rate specific to hospitals located in Puerto Rico using the same methodology used to compute the national Federal rate for capital-related costs. Under the broad authority of section 1886(g) of the Act, beginning with discharges occurring on or after October 1, 2004, capital payments made to hospitals located in Puerto Rico are based on a blend of 25 percent of the Puerto Rico capital rate and 75 percent of the capital Federal rate. The Puerto Rico capital rate is derived from the costs of Puerto Rico hospitals only, while the capital Federal rate is derived from the costs of all acute care hospitals participating in the IPPS (including Puerto Rico).

To adjust hospitals' capital payments for geographic variations in capital costs, we apply a GAF to both portions of the blended capital rate. The GAF is calculated using the operating IPPS wage index, and varies depending on the labor market area or rural area in which the hospital is located. We use the Puerto Rico wage index to determine the GAF for the Puerto Rico part of the capital-blended rate and the national wage index to determine the GAF for the national part of the blended capital rate.

Because we implemented a separate GAF for Puerto Rico in FY 1998, we also apply separate budget neutrality adjustment factors for the national GAF and for the Puerto Rico GAF. However, we apply the same budget neutrality adjustment factor for MS–DRG reclassifications and recalibration nationally and for Puerto Rico. The budget neutrality adjustment factors for the national GAF and for the Puerto Rico GAF, and the budget neutrality factor for MS–DRG reclassifications and recalibration (which is the same nationally and for Puerto Rico) is discussed above in section III.A.3. of this Addendum.

In computing the payment for a particular Puerto Rico hospital, the Puerto Rico portion of the capital rate (25 percent) is multiplied by the Puerto Rico-specific GAF for the labor market area in which the hospital is located, and the national portion of the capital rate (75 percent) is multiplied by the national GAF for the labor market area in which the hospital is located (which is computed from national data for all hospitals in the United States and Puerto Rico).

For FY 2012, the special capital rate for hospitals located in Puerto Rico was $203.86 (76 FR 51805). With the changes we are making to the other factors used to determine the capital Federal rate, the FY 2013 special capital rate for hospitals in Puerto Rico is $207.25.

B. Calculation of the Inpatient Capital-Related Prospective Payments for FY 2013

For purposes of calculating payments for each discharge during FY 2013, the capital Federal rate is adjusted as follows: (Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME Adjustment Factor, if applicable). The result is the adjusted capital Federal rate.

Hospitals also may receive outlier payments for those cases that qualify under the thresholds established for each fiscal year. Section 412.312(c) provides for a single set of thresholds to identify outlier cases for both inpatient operating and inpatient capital-related payments. The outlier thresholds for FY 2013 are in section II.A. of this Addendum. For FY 2013, a case would qualify as a cost outlier if the cost for the case plus the (operating) IME and DSH payments is greater than the prospective payment rate for the MS–DRG plus the fixed-loss amount of $21,821.

Currently, as provided under § 412.304(c)(2), we pay a new hospital 85 percent of its reasonable costs during the first 2 years of operation unless it elects to receive payment based on 100 percent of the capital Federal rate. Effective with the third year of operation, we pay the hospital based on 100 percent of the capital Federal rate (that is, the same methodology used to pay all other hospitals subject to the capital PPS).

C. Capital Input Price Index

1. Background

Like the operating input price index, the capital input price index (CIPI) is a fixed-weight price index that measures the price changes associated with capital costs during a given year. The CIPI differs from the operating input price index in one important aspect—the CIPI reflects the vintage nature of capital, which is the acquisition and use of capital over time. Capital expenses in any given year are determined by the stock of capital in that year (that is, capital that remains on hand from all current and prior capital acquisitions). An index measuring capital price changes needs to reflect this vintage nature of capital. Therefore, the CIPI was developed to capture the vintage nature of capital by using a weighted-average of past capital purchase prices up to and including the current year.

We periodically update the base year for the operating and capital input price indexes to reflect the changing composition of inputs for operating and capital expenses. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 44021), we rebased and revised the CIPI to a FY 2006 base year to reflect the more current structure of capital costs in hospitals. A complete discussion of this rebasing is provided in section IV. of the preamble of that final rule.

2. Forecast of the CIPI for FY 2013

Based on the latest forecast by IHS Global Insight, Inc. (second quarter of 2012), we are forecasting the FY 2006-based CIPI to increase 1.2 percent in FY 2013. This reflects a projected 1.8 percent increase in vintage-weighted depreciation prices (building and fixed equipment, and movable equipment), and a projected 1.9 percent increase in other capital expense prices in FY 2013, partially offset by a projected 2.3 percent decline in vintage-weighted interest expenses in FY 2013. The weighted average of these three factors produces the 1.2 percent increase for the FY 2006-based CIPI as a whole in FY 2013.

IV. Changes to Payment Rates for Excluded Hospitals: Rate-of-Increase Percentages

Historically, hospitals and hospital units excluded from the prospective payment system received payment for inpatient hospital services they furnished on the basis of reasonable costs, subject to a rate-of-increase ceiling. An annual per discharge limit (the target amount as defined in § 413.40(a)) was set for each hospital or hospital unit based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. The updated target amount for that period was multiplied by the Medicare discharges during that period and applied as an aggregate upper limit (the ceiling as defined in § 413.40(a)) on total inpatient operating costs for a hospital's cost reporting period. Prior to October 1, 1997, these payment provisions applied consistently to all categories of excluded providers (rehabilitation hospitals and units (now referred to as IRFs), psychiatric hospitals and units (now referred to as IPFs), LTCHs, children's hospitals, and cancer hospitals).

Payments for services furnished in children's hospitals and cancer hospitals that are excluded from the IPPS continue to be subject to the rate-of-increase ceiling based on the hospital's own historical cost experience. (We note that, in accordance with § 403.752(a), RNHCIs are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27998), we proposed that the FY 2013 rate-of-increase percentage for updating the target amounts for cancer and children's hospitals and RNHCIs would be the estimated percentage increase in the FY 2013 IPPS operating market basket, in accordance with applicable regulations at § 413.40. In the proposed rule, we estimated the percentage increase in the FY 2013 IPPS operating market basket to be 3.0 percent (that is, the estimate of the market basket rate-of-increase). Based on IHS Global Insight, Inc.'s 2012

first quarter forecast, with historical data through the 2011 fourth quarter, we estimated the IPPS operating market basket update would be 3.0 percent for FY 2013. However, we proposed that if more recent data become available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2013. Therefore, based on IHS Global Insight, Inc.'s 2012 second quarter forecast, with historical data through the 2012 first quarter, we estimate that the final FY 2013 update to the IPPS operating market basket is 2.6 percent. For cancer and children's hospitals and RNHCIs, the final FY 2013 rate-of-increase percentage that will be applied to the FY 2012 target amounts in order to determine the final FY 2013 target amount is 2.6 percent.

IRFs, IPFs, and LTCHs were previously paid under the reasonable cost methodology. However, the statute was amended to provide for the implementation of prospective payment systems for IRFs, IPFs, and LTCHs. In general, the prospective payment systems for IRFs, IPFs, and LTCHs provide transitioning periods of varying lengths of time during which a portion of the prospective payment was based on cost-based reimbursement rules under 42 CFR Part 413 (certain providers do not receive a transition period or may elect to bypass the transition as applicable under 42 CFR Part 412, Subparts N, O, and P). We note that all of the various transitioning periods provided for under the IRF PPS, the IPF PPS, and the LTCH PPS have ended.

The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section VII. of the preamble and section V. of the Addendum to this final rule for the update changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2013. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

V. Changes to the Payment Rates for the LTCH PPS for FY 2013

A. LTCH PPS Standard Federal Rate for FY 2013

1. Background

In section VII. of the preamble of this final rule, we discuss our changes to the payment rates, factors, and specific policies under the LTCH PPS for FY 2013.

Under § 412.523(c)(3)(ii) of the regulations, for LTCH PPS rate years beginning RY 2004 through RY 2006, we updated the standard Federal rate annually by a factor to adjust for the most recent estimate of the increases in prices of an appropriate market basket of goods and services for LTCHs. We established this policy of annually updating the standard Federal rate because, at that time, we believed that was the most appropriate method for updating the LTCH PPS standard Federal rate for years after the initial implementation of the LTCH PPS in FY 2003. Thus, under § 412.523(c)(3)(ii), for RYs 2004 through 2006, the annual update to the LTCH PPS standard Federal rate was equal to the previous rate year's Federal rate updated by the most recent estimate of increases in the appropriate market basket of goods and services included in covered inpatient LTCH services.

In determining the annual update to the standard Federal rate for RY 2007, based on our ongoing monitoring activity, we believed that, rather than solely using the most recent estimate of the LTCH PPS market basket update as the basis of the annual update factor, it was appropriate to adjust the standard Federal rate to account for the effect of documentation and coding in a prior period that was unrelated to patients' severity of illness (71 FR 27818). Accordingly, we established under § 412.523(c)(3)(iii) that the annual update to the standard Federal rate for RY 2007 was zero percent based on the most recent estimate of the LTCH PPS market basket at that time, offset by an adjustment to account for changes in case-mix in prior periods due to the effect of documentation and coding that were unrelated to patients' severity of illness. For RY 2008 through FY 2011, we also made an adjustment for the effect of documentation and coding that was unrelated to patients' severity of illness in establishing the annual update to the standard Federal rate as set forth in the regulations at §§ 412.523(c)(3)(iv) through (c)(3)(vii). For FY 2012, we updated the standard Federal rate by the most recent estimate of the LTCH PPS market basket at that time, including additional statutory adjustments required by section 1886(m)(3)(A) of the Act.

Section 1886(m)(3)(A) of the Act, as added by section 3401(c) of the Affordable Care Act, specifies that, for rate year 2010 and each subsequent rate year, any annual update to the standard Federal rate shall be reduced:

- For rate year 2010 through 2019, by the other adjustment specified in section 1886(m)(3)(A)(ii) and (m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (which we refer to as ''the multifactor productivity (MFP) adjustment'') as discussed in section VII.D.2.d. of the preamble of this final rule.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year. (As noted in section VII.D.2.d. of the preamble of this final rule, the annual update to the LTCH PPS occurs on October 1 and we have adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010. Therefore, for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use the term ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.)

For FY 2012, consistent with our historical practice, we established an update to the LTCH PPS standard Federal rate based on the full estimated LTCH PPS market basket increase of 2.9 percent and the 1.1 percentage point reductions required by sections 1886(m)(3)(A)(i) and (m)(4)(C) of the Act. Accordingly, at § 412.523(c)(3)(viii) of the regulations, we established an annual update of 1.8 percent to the standard Federal rate for FY 2012 (76 FR 51769 through 51771 and 51807).

In this final rule, for FY 2013, as discussed in greater detail in section VII.D.2. of the preamble of this final rule, we are establishing an annual update to the LTCH PPS standard Federal rate based on the full estimated increase in the LTCH PPS market basket, less the MFP adjustment consistent with section 1886(m)(3)(A)(i) of the Act and less the 0.1 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(C) of the Act. Specifically, in this final rule, based on the best available data, we are establishing an annual update to the standard Federal rate of 1.8 percent, which is based on the full estimated increase in the LTCH PPS market basket of 2.6 percent, less the MFP adjustment of 0.7 percentage point consistent with section 1886(m)(3)(A)(i) of the Act and less the 0.1 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(C) of the Act.

2. Development of the FY 2013 LTCH PPS Standard Federal Rate

We continue to believe that the annual update to the LTCH PPS standard Federal rate should be based on the most recent estimate of the increase in the LTCH PPS market

basket, including any statutory adjustments. Consistent with our historical practice, we applied the annual update to the LTCH PPS standard Federal rate from the previous year. In determining the standard Federal rate for FY 2013, we also made certain regulatory adjustments. Specifically, we made a one-time prospective adjustment to the standard Federal rate under § 412.523(d)(3), as discussed in greater detail in section VII.E.4. of the preamble of this final rule (which will not be applicable to payments for discharges occurring prior to December 29, 2012, consistent with the statute. In addition, in determining the FY 2013 standard Federal rate, we applied a budget neutrality adjustment factor for the changes related to the area wage adjustment (that is, changes to the wage data and labor-related share) in accordance with § 412.523(d)(4).

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51769 through 51771 and 51807), we established an annual update to the LTCH PPS standard Federal rate of 1.8 percent for FY 2012 based on the full estimated LTCH PPS market basket increase of 2.9 percent, less the MFP adjustment of 1.0 percentage point consistent with section 1886(m)(3)(A)(i) of the Act and less the 0.1 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(C) of the Act. Accordingly, at § 412.523(c)(3)(viii), we established an annual update to the standard Federal rate for FY 2012 of 1.8 percent. That is, we applied an update factor of 1.018 to the FY 2011 Federal rate of $39,599.95 to determine the FY 2012 standard Federal rate. Furthermore, for FY 2012, we applied an area wage level budget neutrality factor of 0.99775 to the standard Federal rate to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index values and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Consequently, we established a standard Federal rate for FY 2012 of $40,222.05 (calculated as $39,599.95 × 1.018 × 0.99775), which is applicable to LTCH PPS discharges occurring on or after October 1, 2011, through September 30, 2012.

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28153), we proposed to establish an annual update to the LTCH PPS standard Federal rate of 2.1 percent for FY 2013, based on the full estimated increase in the proposed LTCH PPS market basket of 3.0 percent less the proposed MFP adjustment of 0.8 percentage point, consistent with section 1886(m)(3)(A)(i) of the Act, and less the 0.1 percentage point required by sections 1886(m)(3)(A)(ii) and(m)(4)(C) of the Act. Therefore, under proposed § 412.523(c)(3)(ix)(A), we proposed to apply a factor of 1.021 to the FY 2012 standard Federal rate of $40,222.05 (as established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51807)) to determine the proposed FY 2013 standard Federal rate. In that same proposed rule, we also proposed that the standard Federal rate for FY 2013 would be further adjusted by the proposed one-time prospective adjustment factor for FY 2013 of 0.98734 under proposed § 412.523(d)(3)(ii)(which would not be applicable to payments for discharges occurring prior to December 29, 2012, consistent with the statute). In addition, for FY 2013, we proposed to apply an area wage level budget neutrality factor of 0.99903 to the standard Federal rate to ensure that any changes to the area wage level adjustment (that is, the proposed annual update of the wage index values and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Consequently, that same proposed rule, we proposed to establish a standard Federal rate for FY 2013 of $40,507.48 (calculated as $40,222.05 × 1.021 × 0.98734 × 0.99903). Furthermore, consistent with the statute, the proposed one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 would not apply to payments for discharges occurring before December 29, 2012. Therefore, we proposed that payment for discharges occurring on or after October 1, 2012 and on or before December 28, 2012, would not reflect that proposed adjustment and instead would be paid based on a standard Federal rate of $41,026.88 (calculated as $40,507.48 divided by 0.98734).

Comment: One commenter stated that the proposed update to the standard Federal rate for FY 2013 did not take into account the expected ''across the board 2-percent payment cut or sequester'' that will be effective in January 2013 under current law. In light of the impending sequester, the commenter recommended that CMS vacate the implementation of the proposed MFP adjustment and the 0.1 percentage point reduction required by sections 1886(m)(3)(A)(ii) and(m)(4)(C) of the Act, as well as the proposed one-time prospective adjustment of approximately −1.3 percent. Another commenter requested that CMS provide guidance on how CMS will implement the 2-percent sequestration reduction to Medicare payment to LTCHs that will take effective in January 2013, as required under current law.

Response: Section 1886(m)(3)(A) of the Act specifies that, for rate year 2010 and each subsequent rate year through 2019, any annual update to the standard Federal rate shall be reduced:

- For rate year 2010 through 2019, by the ''other adjustment'' specified in sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment (which we refer to as ''the multifactor productivity (MFP) adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act.

Specifically, for FY 2013, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the standard Federal rate be reduced by the productivity adjustment (''the MFP adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act, and sections 1886(m)(3)(A)(ii) and 1886(m)(4)(C) of the Act require that any annual update to the standard Federal rate be reduced by 0.1 percentage point. Therefore, we are not adopting the commenter's suggestion to not apply these statutorily required adjustments in determining the FY 2013 standard Federal rate. In section VII.E.4. of the preamble of this final rule, we discuss and provide responses to the public comments we received on our proposal to apply a one-time prospective adjustment of approximately −1.3 percent in determining the FY 2013 standard Federal rate. For the reasons discussed in that section, we continue to believe it is appropriate to apply a one-time prospective adjustment to the standard Federal rate for FY 2013, and therefore are not adopting the commenter's suggestion to vacate the application of that adjustment.

We are not addressing the implementation of the spending reductions (sequestration order) required by Public Law 112–25 (the Budget Control Act of 2011) in this final rule as those provisions would impact Medicare payments across settings, and not just affect LTCH PPS payments.

In this final rule, for FY 2013, as noted above and as discussed in greater detail in section VII.D.2. of the preamble of this final rule, consistent with our historical practice, we are establishing an annual update to the LTCH PPS standard Federal rate of 1.8 percent, based on the full estimated increase in the LTCH PPS market basket of 2.6 percent less the MFP adjustment of 0.7 percentage point consistent with section 1886(m)(3)(A)(i) and less the 0.1 percentage point required by sections 1886(m)(3)(A)(ii) and(m)(4)(C) of the

Act. Furthermore, as discussed in section VII.E.4. of the preamble of this final rule, in determining the standard Federal rate for FY 2013, we are making a one-time prospective adjustment to the standard Federal rate under § 412.523(d)(3) of approximately −1.3 percent (which will not be applicable to payments for discharges occurring prior to December 29, 2012, consistent with the statute).

In this final rule, under § 412.523(c)(3)(ix)(A), we applied a factor of 1.018 to the FY 2012 standard Federal rate of $40,222.05 (as established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51807)) to determine the FY 2013 standard Federal rate. In addition, as discussed in section VII.E.4. of the preamble of this final rule, the standard Federal rate is further adjusted by the one-time prospective adjustment factor of 0.98734 for FY 2013 under § 412.523(d)(3)(ii). However, consistent with the statute, we specify at § 412.523(c)(3)(ix)(B) that, for payments for discharges occurring on or after October 1, 2012, and before December 29, 2012, payments are based on the standard Federal rate in paragraph (c)(3)(ix)(A) of this section without regard to the one-time prospective adjustment provided for under § 412.523(d)(3)(ii). In addition, as discussed in greater detail in section V.B.5. of this Addendum, for FY 2013, we applied an area wage level budget neutrality factor of 0.999265 to the standard Federal rate to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index values and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Consequently, in this final rule, under § 412.523(c)(3)(ix)(A), we established a standard Federal rate for FY 2013 of $40,397.96 (calculated as $40,222.05 × 1.018 × 0.98734 × 0.999265). Furthermore, consistent with section 114(c)(4) of the MMSEA, as amended by sections 3106(a) and 10312 of the Affordable Care Act, the one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 will not be applied to payments for discharges occurring before December 29, 2012. Therefore, payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will not reflect this adjustment and instead will be paid based on a standard Federal rate of $40,915.95 (calculated as $40,397.96 divided by 0.98734).

B. Adjustment for Area Wage Levels Under the LTCH PPS for FY 2013

1. Background

Under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal rate to account for differences in LTCH area wage levels at § 412.525(c). The labor-related share of the LTCH PPS standard Federal rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The applicable LTCH PPS wage index is computed using wage data from inpatient acute care hospitals without regard to reclassification under section 1886(d)(8) or section 1886(d)(10) of the Act.

When we implemented the LTCH PPS, we established a 5-year transition to the full area wage index level adjustment. The area wage level adjustment was completely phased-in for cost reporting periods beginning in FY 2007. Therefore, for cost reporting periods beginning on or after October 1, 2006, the applicable LTCH wage index values are the full LTCH PPS wage index values calculated based on acute care hospital inpatient wage index data without taking into account geographic reclassification under section 1886(d)(8) and section 1886(d)(10) of the Act. For additional information on the phase-in of the area wage level adjustment under the LTCH PPS, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56015 through 56019) and the RY 2008 LTCH PPS final rule (72 FR 26891).

2. Geographic Classifications/Labor Market Area Definitions

As discussed in the August 30, 2002 LTCH PPS final rule, which implemented the LTCH PPS (67 FR 56015 through 56019), in establishing an adjustment for area wage levels, the labor-related portion of a LTCH's Federal prospective payment is adjusted by using an appropriate wage index based on the labor market area in which the LTCH is located. Specifically, the application of the LTCH PPS area wage level adjustment at existing § 412.525(c) is made on the basis of the location of the LTCH in either an urban area or a rural area as defined in § 412.503. Currently under the LTCH PPS at § 412.503, an ''urban area'' is defined as a Metropolitan Statistical Area (which would include a metropolitan division, where applicable) as defined by the Executive OMB and a ''rural area'' is defined as any area outside of an urban area.

In the RY 2006 LTCH PPS final rule (70 FR 24184 through 24185), in regulations at § 412.525(c), we revised the labor market area definitions used under the LTCH PPS effective for discharges occurring on or after July 1, 2005, based on the Executive OMB's CBSA designations, which are based on 2000 Census data. We made this revision because we believe that the CBSA-based labor market area definitions will ensure that the LTCH PPS wage index adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We note that these are the same CBSA-based designations implemented for acute care hospitals under the IPPS at § 412.64(b) (69 FR 49026 through 49034). (For further discussion of the CBSA-based labor market area (geographic classification) definitions currently used under the LTCH PPS, we refer readers to the RY 2006 LTCH PPS final rule (70 FR 24182 through 24191).) We have updated the LTCH PPS CBSA-based labor market area definitions annually since they were adopted for RY 2006 (73 FR 26812 through 26814, 74 FR 44023 through 44204, and 75 FR 50444 through 50445).

In OMB Bulletin No. 10–2, issued on December 1, 2009, OMB announced that the CBSA changes in that bulletin would be the final update prior to the 2010 Census of Population and Housing. (The OMB bulletin is available on the OMB Web site at *http://www.whitehouse.gov/OMB*. Go to ''Agency Information'' and click on ''Bulletins''.) We adopted those changes under the LTCH PPS in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50444 through 50445), effective beginning October 1, 2010, and adopted their continued use for FY 2012 (76 FR 51808).

In 2013, OMB plans to announce new area delineations based on its 2010 standards (75 FR 37246) and the 2010 Census data. We did not receive any public comments on our proposal. Therefore, in this final rule, consistent with our proposal, for the FY 2013 area wage adjustment, we will continue to use the same labor market areas that we adopted for FY 2012.

3. LTCH PPS Labor-Related Share

Under the adjustment for differences in area wage levels at § 412.525(c), the labor-related share of a LTCH's PPS Federal prospective payment is adjusted by the applicable wage index for the labor market area in which the LTCH is located. The LTCH PPS labor-related share currently represents the sum of

the labor-related portion of operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Business Support Services, and All-Other: Labor-Related Services) and a labor-related portion of capital costs using the applicable LTCH PPS market basket.

For FY 2012, we revised and rebased the market basket used under the LTCH PPS by adopting the newly created FY 2008-based RPL market basket. Accordingly, the current LTCH PPS labor-related share is based on the relative importance of the labor-related share of operating costs and capital costs of the RPL market basket based on FY 2008 data, as those were the best available data at that time that reflected the cost structure of LTCHs. For FY 2012, we established a labor-related share of 70.199 percent based on the best available data at that time from the FY 2008-based RPL market basket for FY 2012 (76 FR 51766 through 51769 and 51808). (Additional background information on the historical development of the labor-related share under the LTCH PPS and the development of the RPL market basket can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817 and 27829 through 27830).)

As discussed in section VII.C. of the preamble of this final rule, we are revising and rebasing the market basket used under the LTCH PPS by adopting the newly created FY 2009-based LTCH-specific market basket. As we proposed, in this final rule, we determined the labor-related share for FY 2013 as the sum of the FY 2013 relative importance of each labor-related cost category of the FY 2009-based LTCH-specific market basket. Consistent with the current labor-related share determined from the relative importance of each labor-related cost category of the FY 2008-based RPL market basket, we determined the LTCH PPS labor-related share for FY 2013 based on the relative importance of the labor-related share of operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Business Support Services, and All Other: Labor-Related Services) and the labor-related share of capital costs of the LTCH-specific market basket based on FY 2009 data, as we believe these are currently the best data available to reflect the cost structure of LTCHs.

In this final rule, consistent with our proposal to use the most recent available data to determine the labor-related share for FY 2013, we are establishing a labor-related share under the LTCH PPS for FY 2013 based on IGI's second quarter 2012 forecast of the FY 2009-based LTCH-specific market basket for FY 2013, as these are the most recent available data at this time that reflect the cost structure of LTCHs. As discussed in greater detail in section VII.D.3.f. of this preamble, the sum of the relative importance for FY 2013 for operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Business Support Services, and All-Other: Labor-Related Services) is 58.843 percent and the labor-related share of capital costs is 4.253 percent. Therefore, in this final rule, under the authority set forth in section 123 of the BBRA as amended by section 307(b) of the BIPA, we are establishing a labor-related share of 63.096 percent (58.843 percent plus 4.253 percent) under the LTCH PPS for FY 2013, which will be effective for discharges occurring on or after October 1, 2012, and through September 30, 2013. (For additional details on the development of the LTCH PPS labor-related share for FY 2013, we refer readers to section VII.D.3.f. of the preamble of this final rule.)

4. LTCH PPS Wage Index for FY 2013

Historically, under the LTCH PPS, we have established LTCH PPS wage index values calculated from acute care IPPS hospital wage data without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act (67 FR 56019). The area wage level adjustment established under the LTCH PPS is based on a LTCH's actual location without regard to the urban or rural designation of any related or affiliated provider.

In the FY 2012 LTCH PPS final rule (76 FR 51808 through 51809), we calculated the FY 2012 LTCH PPS wage index values using the same data used for the FY 2012 acute care hospital IPPS (that is, data from cost reporting periods beginning during FY 2008), without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act, as these were the most recent complete data available at that time. In that same final rule, we indicated that we computed the FY 2012 LTCH PPS wage index values consistent with the urban and rural geographic classifications (labor market areas) and consistent with the pre-reclassified IPPS wage index policy (that is, our historical policy of not taking into account IPPS geographic reclassifications in determining payments under the LTCH PPS). As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus (or campuses) are located (as discussed in section III.D. of the preamble of this final rule). We also continued to use our existing policy for determining wage index values in areas where there are no IPPS wage data.

Consistent with our historical methodology, to determine the applicable wage index values under the LTCH PPS for FY 2013, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of BIPA, to determine appropriate adjustments under the LTCH PPS, as we proposed, we used wage data collected from cost reports submitted by IPPS hospitals for cost reporting periods beginning during FY 2009, without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act. We used FY 2009 data because these data are the most recent complete data available. These are the same data used to compute the FY 2013 acute care hospital inpatient wage index, as discussed in section III. of the preamble of this final rule. (For our rationale for using IPPS hospital wage data as a proxy for determining the wage index values used under the LTCH PPS, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 44024 through 44025).)

As we proposed, the FY 2013 LTCH PPS wage index values we are presenting in this final rule are computed consistent with the urban and rural geographic classifications (labor market areas) discussed above in section V.B.2. of the Addendum to this final rule and consistent with the pre-reclassified IPPS wage index policy (that is, our historical policy of not taking into account IPPS geographic reclassifications under sections 1886(d)(8) and 1886(d)(10) of the Act in determining payments under the LTCH PPS). As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus or campuses are located (as discussed in section III.G. of the preamble of this final rule). Furthermore, in determining the FY 2013 LTCH PPS wage index values in this final rule, as we proposed, we continued to use our existing policy for determining wage index values in areas where there are no IPPS wage data.

As discussed in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28154), we established a methodology for determining LTCH PPS wage index values for areas that have no IPPS wage data in the RY 2009 LTCH PPS final rule, and as we proposed, we are

continuing to use this methodology for FY 2013. (We refer readers to the RY 2009 LTCH PPS final rule (73 FR 26817 through 26818) for an explanation of and rationale for our policy for determining LTCH PPS wage index values for areas that have no IPPS wage data.)

There are currently no LTCHs located in labor areas without IPPS hospital wage data (or IPPS hospitals) for FY 2013. However, we calculate LTCH PPS wage index values for these areas using our established methodology in the event that, in the future, a LTCH should open in one of those areas. Under our existing methodology, the LTCH PPS wage index value for urban CBSAs with no IPPS wage data is determined by using an average of all of the urban areas within the State, and the LTCH PPS wage index value for rural areas with no IPPS wage data is determined by using the unweighted average of the wage indices from all of the CBSAs that are contiguous to the rural counties of the State.

Based on the FY 2009 IPPS wage data that we used to determine the FY 2013 LTCH PPS wage index values in this final rule, there are no IPPS wage data for the urban area Hinesville-Fort Stewart, GA (CBSA 25980). Consistent with the methodology discussed above, we calculated the FY 2013 wage index value for CBSA 25980 as the average of the wage index values for all of the other urban areas within the State of Georgia (that is, CBSAs 10500, 12020, 12060, 12260, 15260, 16860, 17980, 19140, 23580, 31420, 40660, 42340, 46660, and 47580), as shown in Table 12A, which is listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site). We note that, as IPPS wage data are dynamic, it is possible that urban areas without IPPS wage data will vary in the future.

Based on FY 2009 IPPS wage data that we used to determine the FY 2013 LTCH PPS wage index values in this final rule, there are no rural areas without IPPS hospital wage data. Therefore, it is not necessary to use our established methodology to calculate a LTCH PPS wage index value for rural areas with no IPPS wage data for FY 2013. We note that, as IPPS wage data are dynamic, it is possible that rural areas without IPPS wage data will vary in the future.

The FY 2013 LTCH wage index values that will be applicable for LTCH discharges occurring on or after October 1, 2012, through September 30, 2013, are presented in Table 12A (for urban areas) and Table 12B (for rural areas), which are listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site.

5. Budget Neutrality Adjustment for Changes to the Area Wage Level Adjustment

Historically, the LTCH PPS wage index and labor-related share are updated annually based on the latest available data. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771 through 51773 and 51809), under § 412.525(c)(2), we established that any changes to the wage index values or labor-related share will be made in a budget neutral manner such that estimated aggregate LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage level adjustment budget neutrality factor that will be applied to the standard Federal rate to ensure that any changes to the area wage level adjustment are budget neutral such that any changes to the wage index values or labor-related share will not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Accordingly, under § 412.523(d)(4), we established that we will apply an area wage level adjustment budget neutrality factor in determining the standard Federal rate, and we also established a methodology for calculating an area wage level adjustment budget neutrality factor.

For FY 2013, in accordance with § 412.523(d)(4), we applied an area wage level adjustment budget neutrality factor to adjust the standard Federal rate to account for the estimated effect of any adjustments or updates to the area wage level adjustment under § 412.525(c)(1) on estimated aggregate LTCH PPS payments using the methodology we established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51773). Specifically, as we proposed, we determined an area wage level adjustment budget neutrality factor that will be applied to the standard Federal rate under at § 412.523(d)(4) for FY 2013 using the following methodology:

Step 1—We simulated estimated aggregate LTCH PPS payments using the FY 2012 wage index values (as established in Tables 12A and 12B listed in the Addendum to the FY 2012 IPPS/LTCH PPS final rule and available via the Internet on the CMS Web site) and the FY 2012 labor-related share of 70.199 percent (as established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51767 and 51808).

Step 2—We simulated estimated aggregate LTCH PPS payments using the FY 2013 wage index values (as shown in Tables 12A and 12B listed in the Addendum to this final rule and available via the Internet on the CMS Web site) and the FY 2013 labor related share of 63.096 percent (based on the latest available data as discussed in section VII.C.3.f. of this preamble).

Step 3—We calculated the ratio of these estimated total LTCH PPS payments by dividing the estimated total LTCH PPS payments using the FY 2012 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS payments using the FY 2013 area wage level adjustments (calculated in Step 2) to determine the area wage level adjustment budget neutrality factor for FY 2013.

Step 4—We then applied the FY 2013 area wage level adjustment budget neutrality factor from Step 3 to determine the FY 2013 LTCH PPS standard Federal rate after the application of the FY 2013 annual update (discussed in section V.A.2. of the Addendum to this final rule). For this final rule, using the steps in the methodology described above, we determined a FY 2013 area wage level adjustment budget neutrality factor of 0.999265. Accordingly, in section V.A.2. of the Addendum to this final rule, to determine the FY 2013 LTCH PPS standard Federal rate, we applied an area wage level adjustment budget neutrality factor of 0.099265, in accordance with § 412.523(d)(4). The FY 2013 LTCH PPS standard Federal rate shown in Table 1E of the Addendum to this final rule reflects this adjustment factor.

C. LTCH PPS Cost-of-Living Adjustment for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), a cost-of-living adjustment (COLA) is provided for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States. Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels described above.

Historically, we used the most recent updated COLA factors obtained from the U.S. Office of Personnel Management (OPM) Web site at *http://www.opm.gov/oca/cola/rates.asp* to adjust the LTCH PPS payments for LTCHs in Alaska and Hawaii. Recent statutory changes

transition the Alaska and Hawaii COLAs to locality pay (phased in over a 3-year period beginning in January 2010, with COLA rates being frozen as of October 28, 2009, and then proportionately reduced to reflect the phase-in of locality pay). As stated previously, we do not believe it is appropriate to use either the 2010 or 2011 reduced COLA factors to adjust the nonlabor-related portion of the standard Federal rate for LTCHs in Alaska and Hawaii for Medicare payment purposes. Therefore, for FY 2012, we continued to use the same COLA factors (published by OPM) that we used to adjust payments in FY 2011 (which were based on OPM's 2009 COLA factors) to adjust the nonlabor-related portion of the standard Federal rate for LTCHs located in Alaska and Hawaii.

As we discuss in section VII.D.4. of the preamble of this final rule, we believe it was appropriate to use ''frozen'' COLA factors to adjust payments in FY 2012, while we explored alternatives for updating the COLA factors in the future. In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28019 through 28020 and 28155), we proposed to continue to use the same ''frozen'' COLA factors used in FY 2012 to adjust the nonlabor-related portion of the standard Federal rate for LTCHs in Alaska and Hawaii in FY 2013 under § 412.525(b). In that same proposed rule, we also proposed a methodology to update the COLA factors for Alaska and Hawaii, beginning in FY 2014, based on a comparison of the growth in the CPIs for Anchorage, Alaska and Honolulu, Hawaii relative to the growth in the CPI for the average U.S. city as published by the Bureau of Labor Statistics (BLS). As discussed in section VII.D.4. of the preamble of this final rule, we did not receive any public comments on these proposals and we are adopting them as final, without modification, in this final rule. As explained previously, we believe using these COLA factors will appropriately adjust the nonlabor-related portion of the standard Federal rate for LTCHs in Alaska and Hawaii. (For additional details on the methodology we are adopting in this final rule to update the COLA factors for Alaska and Hawaii beginning in FY 2014, we refer readers to section VII.D.4. of the preamble of this final rule.)

In this final rule, for FY 2013, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of BIPA, to determine appropriate adjustments under the LTCH PPS, consistent with our current policy, we are applying a COLA to the LTCH PPS payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the factors listed in the chart below. These factors are the same COLA factors used to adjust payments in FY 2012 (which are based on OPM's 2009 COLA factors). As stated above, we believe using these COLA factors will appropriately adjust the nonlabor-related portion of the standard Federal rate for LTCHs in Alaska and Hawaii under § 412.525(b).

COST-OF-LIVING ADJUSTMENT FACTORS FOR ALASKA AND HAWAII HOSPITALS FOR THE LTCH PPS FOR FY 2013

Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.23
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.23
City of Juneau and 80-kilometer (50-mile) radius by road	1.23
All other areas of Alaska	1.25
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.18
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

D. Adjustment for LTCH PPS High-Cost Outlier (HCO) Cases

1. Background

Under the broad authority conferred upon the Secretary by section 123 of the BBRA as amended by section 307(b) of BIPA, in the regulations at § 412.525(a), we established an adjustment for additional payments for outlier cases that have extraordinarily high costs relative to the costs of most discharges. We refer to these cases as high cost outliers (HCOs). Providing additional payments for outliers strongly improves the accuracy of the LTCH PPS in determining resource costs at the patient and hospital level. These additional payments reduce the financial losses that would otherwise be incurred when treating patients who require more costly care and, therefore, reduce the incentives to underserve these patients. We set the outlier threshold before the beginning of the applicable rate year so that total estimated outlier payments are projected to equal 8 percent of total estimated payments under the LTCH PPS.

Under § 412.525(a) in the regulations (in conjunction with § 412.503), we make outlier payments for any discharges if the estimated cost of a case exceeds the adjusted LTCH PPS payment for the MS–LTC–DRG plus a fixed-loss amount. Specifically, in accordance with § 412.525(a)(3) (in conjunction with § 412.503), we make an additional payment for an HCO case that is equal to 80 percent of the difference between the estimated cost of the patient case and the outlier threshold, which is the sum of the adjusted Federal prospective payment for the MS–LTC–DRG and the fixed-loss amount. The fixed-loss amount is the amount used to limit the loss that a hospital will incur under the outlier policy for a case with unusually high costs. This results in Medicare and the LTCH sharing financial risk in the treatment of extraordinarily costly cases. Under the LTCH PPS HCO policy, the LTCH's loss is limited to the fixed-loss amount and a fixed percentage of costs above the outlier threshold (adjusted MS–LTC–DRG payment plus the fixed-loss amount). The fixed percentage of costs is called the marginal cost factor. We calculate the estimated cost of a case by multiplying the Medicare allowable covered charge by the hospital's overall hospital cost-to-charge ratio (CCR).

Under the LTCH PPS HCO policy at § 412.525(a), we determine a fixed-loss amount, that is, the maximum loss that a LTCH can incur under the LTCH PPS for a case with unusually high costs before the LTCH will receive any additional payments. We calculate the fixed-loss amount by estimating aggregate payments with and without an outlier policy. The fixed-loss amount results in estimated total outlier payments being projected to be equal to 8 percent of projected total LTCH PPS payments. Currently, MedPAR claims data and CCRs based on data from the most recent Provider-Specific File (PSF) (or from the applicable statewide average CCR if a LTCH's CCR data are faulty or unavailable) are used to establish a fixed-loss threshold amount under the LTCH PPS.

2. Determining LTCH CCRs Under the LTCH PPS

a. Background

The following is a discussion of CCRs that are used in determining payments for HCO and SSO cases under the LTCH PPS, at § 412.525(a) and § 412.529, respectively. Although this section is specific to HCO cases, because CCRs and the policies and methodologies pertaining to them are used in determining payments for both HCO and SSO cases (to determine the estimated cost of the case at § 412.529(d)(2)), we are discussing the determination of CCRs under the LTCH

PPS for both of these types of cases simultaneously.

In determining both HCO payments (at § 412.525(a)) and SSO payments (at § 412.529), we calculate the estimated cost of the case by multiplying the LTCH's overall CCR by the Medicare allowable charges for the case. In general, we use the LTCH's overall CCR, which is computed based on either the most recently settled cost report or the most recent tentatively settled cost report, whichever is from the latest cost reporting period, in accordance with § 412.525(a)(4)(iv)(B) and § 412.529(f)(4)(ii) for HCOs and SSOs, respectively. (We note that, in some instances, we use an alternative CCR, such as the statewide average CCR in accordance with the regulations at § 412.525(a)(4)(iv)(C) and § 412.529(f)(4)(iii), or a CCR that is specified by CMS or that is requested by the hospital under the provisions of the regulations at § 412.525(a)(4)(iv)(A) and § 412.529(f)(4)(i).) Under the LTCH PPS, a single prospective payment per discharge is made for both inpatient operating and capital-related costs. Therefore, we compute a single ''overall'' or ''total'' LTCH-specific CCR based on the sum of LTCH operating and capital costs (as described in Section 150.24, Chapter 3, of the Medicare Claims Processing Manual (Pub. 100–4)) as compared to total charges. Specifically, a LTCH's CCR is calculated by dividing a LTCH's total Medicare costs (that is, the sum of its operating and capital inpatient routine and ancillary costs) by its total Medicare charges (that is, the sum of its operating and capital inpatient routine and ancillary charges).

b. LTCH Total CCR Ceiling

Generally, a LTCH is assigned the applicable statewide average CCR if, among other things, a LTCH's CCR is found to be in excess of the applicable maximum CCR threshold (that is, the LTCH CCR ceiling). This is because CCRs above this threshold are most likely due to faulty data reporting or entry, and, therefore, CCRs based on erroneous data should not be used to identify and make payments for outlier cases. Thus, under our established policy, generally, if a LTCH's calculated CCR is above the applicable ceiling, the applicable LTCH PPS statewide average CCR is assigned to the LTCH instead of the CCR computed from its most recent (settled or tentatively settled) cost report data.

In accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCOs and § 412.529(f)(4)(iii)(B) for SSOs, in the proposed rule, using our established methodology for determining the LTCH total CCR ceiling (described above), based on IPPS total CCR data from the December 2011 update of the PSF, we proposed to establish a total CCR ceiling of 1.210 under the LTCH PPS that would be effective for discharges occurring on or after October 1, 2012, through September 30, 2013. Consistent with our historical policy of using the best available data, we also proposed that if more recent data became available, we would use such data to establish a total CCR ceiling for FY 2013 in the final rule. We did not receive any public comments on our proposals related to determining the LTCH total CCR ceiling for FY 2013, and are adopting them as final, without modification, in this final rule.

In accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCOs and § 412.529(f)(4)(iii)(B) for SSOs, in this final rule, as we proposed, using our established methodology for determining the LTCH total CCR ceiling (described above), based on IPPS total CCR data from the latest available data (that is, the March 2012 update of the PSF), we are establishing a total CCR ceiling of 1.212 under the LTCH PPS that will be effective for discharges occurring on or after October 1, 2012, through September 30, 2013.

c. LTCH Statewide Average CCRs

Our general methodology established for determining the statewide average CCRs used under the LTCH PPS is similar to our established methodology for determining the LTCH total CCR ceiling (described above) because it is based on ''total'' IPPS CCR data. Under the LTCH PPS HCO policy at § 412.525(a)(4)(iv)(C) and the SSO policy at § 412.529(f)(4)(iii), the fiscal intermediary or MAC may use a statewide average CCR, which is established annually by CMS, if it is unable to determine an accurate CCR for a LTCH in one of the following circumstances: (1) New LTCHs that have not yet submitted their first Medicare cost report (for this purpose, consistent with current policy, a new LTCH is defined as an entity that has not accepted assignment of an existing hospital's provider agreement in accordance with § 489.18); (2) LTCHs whose CCR is in excess of the LTCH CCR ceiling; and (3) other LTCHs for whom data with which to calculate a CCR are not available (for example, missing or faulty data). (Other sources of data that the fiscal intermediary or MAC may consider in determining a LTCH's CCR include data from a different cost reporting period for the LTCH, data from the cost reporting period preceding the period in which the hospital began to be paid as a LTCH (that is, the period of at least 6 months that it was paid as a short-term, acute care hospital), or data from other comparable LTCHs, such as LTCHs in the same chain or in the same region.)

In the proposed rule, using our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS total CCR data from the December 2011 update of the PSF, we proposed LTCH PPS statewide average total CCRs for urban and rural hospitals that would be effective for discharges occurring on or after October 1, 2012, through September 30, 2013, in Table 8C listed in section VI. of the Addendum to that proposed rule and available via the Internet. We did not receive any public comments on our proposals related to determining the LTCH PPS statewide average CCRs for FY 2013, and are adopting them as final, without modification, in this final rule.

Consistent with our historical practice of using the best available data, in this final rule, using our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS ''total CCR'' data from the March 2012 update of the PSF, we are establishing LTCH PPS statewide average total CCRs for urban and rural hospitals that will be effective for discharges occurring on or after October 1, 2012, through September 20, 2013, in Table 8C listed in section VI. of the Addendum to this final rule (and available via the Internet).

All areas in the District of Columbia, New Jersey, and Rhode Island are classified as urban. Therefore, there are no rural statewide average total CCRs listed for those jurisdictions in Table 8C. This policy is consistent with the policy that we established when we revised our methodology for determining the applicable LTCH statewide average CCRs in the FY 2007 IPPS final rule (71 FR 48119 through 48121) and is the same as the policy applied under the IPPS.

In addition, as we proposed, consistent with our existing methodology, in determining the urban and rural statewide average total CCRs for Maryland LTCHs paid under the LTCH PPS, in this final rule, we continue to use, as a proxy, the national average total CCR for urban IPPS hospitals and the national average total CCR for rural IPPS hospitals, respectively. We use this proxy because we believe that the CCR data on the PSF for Maryland hospitals may not be entirely accurate (as discussed in greater

detail in the FY 2007 IPPS final rule (71 FR 48120)).

d. Reconciliation of LTCH HCO and SSO Payments

We note that under the LTCH PPS HCO policy at § 412.525(a)(4)(iv)(D) and the LTCH PPS SSO policy at § 412.529(f)(4)(iv), the payments for HCO and SSO cases, respectively, are subject to reconciliation. Specifically, any reconciliation of outlier payments is based on the CCR that is calculated based on a ratio of cost-to-charge data computed from the relevant cost report determined at the time the cost report coinciding with the discharge is settled. For additional information, we refer readers to sections 150.26 through 150.28 of the Medicare Claims Processing Manual (Pub. 100–4) as added by Change Request 7192 (Transmittal 2111; December 3, 2010) and the RY 2009 LTCH PPS final rule (73 FR 26820 through 26821).

3. Establishment of the LTCH PPS Fixed-Loss Amount for FY 2013

When we implemented the LTCH PPS, as discussed in the August 30, 2002 LTCH PPS final rule (67 FR 56022 through 56026), under the broad authority of section 123 of the BBRA as amended by section 307(b) of BIPA, we established a fixed-loss amount so that total estimated outlier payments are projected to equal 8 percent of total estimated payments under the LTCH PPS. To determine the fixed-loss amount, we estimate outlier payments and total LTCH PPS payments for each case using claims data from the MedPAR files. Specifically, to determine the outlier payment for each case, we estimate the cost of the case by multiplying the Medicare covered charges from the claim by the LTCH's CCR. Under § 412.525(a)(3) (in conjunction with § 412.503), if the estimated cost of the case exceeds the outlier threshold, we make an outlier payment equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (that is, the sum of the adjusted Federal prospective payment for the MS–LTC–DRG and the fixed-loss amount).

In the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 28175), we presented our proposals regarding the methodology and data we would use to calculate the fixed-loss amount for FY 2013. In general, we proposed to continue to use our existing methodology to calculate a fixed-loss amount for FY 2013 using the best available data that would maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments (based on the rates and policies presented in that proposed rule). (For additional detail on the rationale for setting the HCO payment ''target'' at 8 percent of total estimated LTCH PPS payments, we refer readers to the to the FY 2003 LTCH PPS final rule (67 FR 56022 through 56024).) Using our existing methodology, we proposed a fixed-loss amount of $15,728 for FY 2013. (We refer readers to the FY 2013 IPPS/LTCH PPS proposed rule for additional details on our proposals related to the development of the fixed-loss amount for FY 2013 (77 FR 28157).)

Comment: A few commenters expressed support for the proposed fixed-loss amount for FY 2013, stating that the lower fixed-loss amount calculated using our proposed methodology would maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments, consistent with current policy.

Response: We appreciate the commenters' support for our proposed methodology.

In this final rule, we are adopting our proposal as final without modification. However, consistent with our historical practice of using the best available data, and our proposal to use more recent data if they become available, we used the most recent available LTCH claims data and CCR data at this time to calculate the fixed-loss amount for FY 2013 for this final rule.

In this final rule, we continued to use our existing methodology to calculate the fixed-loss amount for FY 2013 (based on the data and the rates and policies presented in this final rule) in order to maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments. Consistent with our historical practice of using the best data available, in determining the fixed-loss amount for FY 2013, we used the most recent available LTCH claims data and CCR data at this time. Specifically, for this final rule, we used LTCH claims data from the March 2012 update of the FY 2011 MedPAR file and CCRs from the March 2012 update of the PSF to determine a fixed-loss amount that would result in estimated outlier payments projected to be equal to 8 percent of total estimated payments in FY 2013 because these data are the most recent complete LTCH data available at this time.

Under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of BIPA, we established a fixed-loss amount of $17,931 for FY 2012. For this final rule, we are establishing a fixed-loss amount of $15,408 for FY 2013. Thus, we will make an additional payment for an HCO case that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted Federal LTCH payment for the MS–LTC–DRG and the fixed-loss amount of $15,408). We also note that the fixed-loss amount of $15,408 for FY 2013 is lower than the FY 2012 fixed-loss amount of $17,931 and slightly lower than the proposed FY 2013 fixed-loss amount of $15,728. Based on our payment simulations using the most recent available data at this time, the decrease in the fixed-loss amount for FY 2013 is necessary to maintain the existing requirement that estimated outlier payments would equal 8 percent of estimated total LTCH PPS payments. (For further information on the existing 8 percent HCO ''target'' requirement, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56022 through 56024). Maintaining the fixed-loss amount at the current level would result in HCO payments that are less than the current regulatory 8-percent requirement because a higher fixed-loss amount would result in fewer cases qualifying as outlier cases. In addition, maintaining the higher fixed-loss amount would result in a decrease in the amount of the additional payment for an HCO case because the maximum loss that a LTCH must incur before receiving an HCO payment (that is, the fixed-loss amount) would be larger. For these reasons, we believe that lowering the fixed-loss amount is appropriate and necessary to maintain that estimated outlier payments would equal 8 percent of estimated total LTCH PPS payments as required under § 412.525(a).

4. Application of Outlier Policy to SSO Cases

As we discussed in the August 30, 2002 final rule (67 FR 56026), under some rare circumstances, a LTCH discharge could qualify as an SSO case (as defined in the regulations at § 412.529 in conjunction with § 412.503) and also as an HCO case. In this scenario, a patient could be hospitalized for less than five-sixths of the geometric average length of stay for the specific MS–LTC–DRG, and yet incur extraordinarily high treatment costs. If the estimated costs exceeded the HCO threshold (that is, the SSO payment plus the fixed-loss amount), the discharge is eligible for payment as an HCO. Thus, for an SSO case in FY 2013, the HCO payment would be 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the fixed-loss amount of $15,408

and the amount paid under the SSO policy as specified in § 412.529).

E. Computing the Adjusted LTCH PPS Federal Prospective Payments for FY 2013

Section 412.525 sets forth the adjustments to the LTCH PPS standard Federal rate. Under § 412.525(c), the standard Federal rate is adjusted to account for differences in area wages by multiplying the labor-related share of the standard Federal rate by the applicable LTCH PPS wage index (FY 2013 values shown in Tables 12A and 12B listed in section VI. of the Addendum of this final rule and available via the Internet). The standard Federal rate is also adjusted to account for the higher costs of hospitals in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal rate by the applicable cost-of-living factor (FY 2013 factors shown in the chart in section V.C. of the Addendum of this final rule) in accordance with § 412.525(b). In this final rule, we are establishing a standard Federal rate for FY 2013 of $40,397.96 (however, payment for discharges occurring on or after October 1, 2012, and before December 29, 2012 will not reflect that adjustment consistent with the statute, and instead will be paid based on a standard Federal rate of $40,915.95), as discussed above in section V.A.2. of the Addendum of this final rule. We illustrate the methodology to adjust the LTCH PPS Federal standard rate for FY 2013 in the following example:

Example:

During FY 2013, a Medicare patient is in a LTCH located in Chicago, Illinois (CBSA 16974) and discharged on January 1, 2013. The FY 2013 LTCH PPS wage index value for CBSA 16974 is 1.0600 (obtained from Table 12A listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site). The Medicare patient is classified into MS–LTC–DRG 28 (Spinal Procedures with MCC), which has a relative weight for FY 2013 of 1.1124 (obtained from Table 11 listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site).

To calculate the LTCH's total adjusted Federal prospective payment for this Medicare patient in FY 2013, we computed the wage-adjusted Federal prospective payment amount by multiplying the unadjusted FY 2013 standard Federal rate ($40,397.96) by the labor-related share (63.096 percent) and the wage index value (1.0600). This wage-adjusted amount is then added to the nonlabor-related portion of the unadjusted standard Federal rate (36.904 percent; adjusted for cost of living, if applicable) to determine the adjusted Federal rate, which is then multiplied by the MS–LTC–DRG relative weight (1.1124) to calculate the total adjusted Federal LTCH PPS prospective payment for FY 2013 ($46,693.95). The table below illustrates the components of the calculations in this example.

Unadjusted Standard Federal Prospective Payment Rate	$40,397.96
Labor-Related Share	× 0.63096
Labor-Related Portion of the Federal Rate	= $25,489.49
Wage Index (CBSA 16974)	× 1.0600
Wage-Adjusted Labor Share of Federal Rate	= $27,018.6
Nonlabor-Related Portion of the Federal Rate ($40,397.96 × 0.36904)	+ $14,908.46
Adjusted Federal Rate Amount	= $41,927.32
MS–LTC–DRG 28 Relative Weight	× 1.1124
Total Adjusted Federal Prospective Payment	= $46,639.95

VI. Tables Referenced in this Final Rule and Available Only Through the Internet on the CMS Web Site

This section lists the tables referred to throughout the preamble of this final rule and in this Addendum. In the past, a majority of these tables were published in the **Federal Register** as part of the annual proposed and final rules. However, similar to FY 2012, for the FY 2013 rulemaking cycle, the IPPS and LTCH tables will not be published as part of the annual IPPS/LTCH PPS proposed and final rulemakings and will be available only through the Internet. Specifically, IPPS Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4E, 4F, 4J, 5, 6A, 6B, 6C, 6D, 6E, 6F, 6G, 6I, 6I.1, 6.I.2, 6J, 6J.1, 6K, 7A, 7B, 8A, 8B, 9A, 9C, 10 and new Tables 15 and 16 and LTCH PPS Tables 8C, 11, 12A, 12B, 13A, and 13B will be available only through the Internet. IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS table 1E, displayed at the end of this section, will continue to be published in the **Federal Register** as part of the annual proposed and final rules. As discussed in section II.G.9. of the preamble of this final rule, for FY 2013, there will be one change to the ICD–9–CM coding system, effective October 1, 2012. We are creating new procedure code 00.95 (Injection or infusion of glucarpidase). The new procedure code is listed in Table 6B (New Procedure Codes) for this final rule, which is available via the Internet. There are no new, revised, or deleted diagnosis codes and no revised or deleted procedure codes effective October 1, 2012, that are usually announced in Tables 6A (New Diagnosis Codes), 6C (Invalid Diagnosis Codes), 6D (Invalid Procedure Codes), 6E (Revised Diagnosis Code Titles), and 6F (Revised Procedure Codes). Therefore, IPPS Tables 6A, 6C, 6D, 6E and 6F are not being published as part of this FY 2013 rulemaking cycle. As discussed in section IV.E. of the preamble of this final rule, effective FY 2013 and forward, the low-volume hospital definition and payment adjustment methodology under section 1886(d)(12) of the Act returns to the pre-Affordable Care Act definition and payment adjustment methodology (we refer readers to section IV.E. for complete details on the low-volume hospital payment adjustment). Therefore, we are no longer including a table (previously Table 14) in this final rule that lists the low-volume payment adjustments.

Readers who experience any problems accessing any of the tables that are posted on the CMS Web sites identified below should contact Michael Treitel at (410) 786–4552.

The following IPPS tables for this FY 2013 final rule are available only through the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled, ''FY 2013 IPPS Final Rule Home Page'' or ''Acute Inpatient—Files for Download''.

Puerto Rico	207.25

TABLE 1E—LTCH STANDARD FEDERAL PROSPECTIVE PAYMENT RATE—FY 2013

	Rate
Standard Federal Rate*	$40,397.96

*Consistent with section 114(c)(4) of the MMSEA as amended by sections 3106(a) and 10312 of the Affordable Care Act, the one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 is not applied to payments for discharges occurring before December 29, 2012. Therefore, payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, does not reflect that adjustment and instead such discharges are paid based on a standard Federal rate of $40,915.95 (calculated as $40,397.96 divided by 0.98734).

Appendix A: Economic Analyses

I. Regulatory Impact Analysis

A. Introduction

We have examined the impacts of this final rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (February 2, 2011) the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995, Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999), and the Congressional Review Act (5 U.S.C. 804(2)).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. A regulatory impact analysis (RIA) must be prepared for major rules with economically significant effects ($100 million or more in any 1 year).

We have determined that this final rule is a major rule as defined in 5 U.S.C. 804(2). We estimate that the changes for FY 2013 acute care hospital operating and capital payments will redistribute amounts in excess of $100 million to acute care hospitals. The applicable percentage increase to the IPPS rates required by the statute, in conjunction with other payment changes in this final rule, will result in an estimated $2.45 billion increase in FY 2013 operating payments (or 2.3 percent change) and an estimated $154 million increase in FY 2013 capital payments (or 1.8 percent change). These changes are relative to payments made in FY 2012. The impact analysis of the capital payments can be found in section I.I. of this Appendix. In addition, as described in section I.J. of this Appendix, LTCHs are expected to experience an increase in payments by $92 million in FY 2013 relative to FY 2012.

Our operating impact estimate includes the 1.0 percent documentation and coding adjustment applied to the IPPS standardized amounts (which accounts for the −1.9 percent documentation and coding adjustment and +2.9 percent adjustment to restore the one-time recoupment adjustment made to the national standardized amount for FY 2012). In addition, our operating impact estimate includes the 1.8 percent hospital update to the standardized amount (which includes the 2.6 percent market basket update less 0.7 percentage point for the multifactor productivity adjustment and less 0.1 percentage point required under the Affordable Care Act). The estimates of IPPS operating payments to acute care hospitals do not reflect any changes in hospital admissions or real case-mix intensity, which will also affect overall payment changes.

The analysis in this Appendix, in conjunction with the remainder of this document, demonstrates that this final rule is consistent with the regulatory philosophy and principles identified in Executive Orders 12866 and 13563, the RFA, and section 1102(b) of the Act. This final rule will affect payments to a substantial number of small rural hospitals, as well as other classes of hospitals, and the effects on some hospitals may be significant.

B. Need

This final rule is necessary in order to make payment and policy changes under the Medicare IPPS for Medicare acute care hospital inpatient services for operating and capital-related costs as well as for certain hospitals and hospital units excluded from the IPPS. This final rule also is necessary to make payment and policy changes for Medicare hospitals under the LTCH PPS payment system.

C. Objectives of the IPPS

The primary objective of the IPPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe the changes in this final rule will further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and equitable while avoiding or minimizing unintended adverse consequences.

D. Limitations of Our Analysis

The following quantitative analysis presents the projected effects of our policy changes, as well as statutory changes effective for FY 2013, on various hospital groups. We estimate the effects of individual policy changes by estimating payments per case while holding all other payment policies constant. We use the best data available, but, generally, we do not attempt to make adjustments for future changes in such variables as admissions, lengths of stay, or case-mix.

E. Hospitals Included in and Excluded From the IPPS

The prospective payment systems for hospital inpatient operating and capital-related costs of acute care hospitals encompass most general short-term, acute care hospitals that participate in the Medicare program. There were 32 Indian Health Service hospitals in our database, which we excluded from the analysis due to the special characteristics of the prospective payment methodology for these hospitals. Among other short-term, acute care hospitals, only the 45 such hospitals in Maryland remain excluded from the IPPS pursuant to the waiver under section 1814(b)(3) of the Act.

As of July 2012, there are 3,423 IPPS acute care hospitals included in our analysis. This represents about 67 percent of all Medicare-participating hospitals. The majority of this impact analysis focuses on this set of hospitals. There also are approximately 1,328 CAHs. These small, limited service hospitals are paid on the basis of reasonable costs rather than under the IPPS. There are also 1,268 IPPS-excluded hospitals and 2,063 IPPS-excluded hospital units. These IPPS-excluded hospitals and units include IPFs, IRFs, LTCHs, RNHCIs, children's hospitals, and cancer hospitals, which are paid under separate payment systems. Changes in the prospective payment systems for IPFs and IRFs are made through separate rulemaking. Payment impacts for these IPPS-excluded hospitals and units are not included in this final rule. The impact of the update and policy changes to the LTCH PPS for FY 2013 is discussed in section I.J. of this Appendix.

F. Effects on Hospitals and Hospital Units Excluded From the IPPS

As of July 2012, there were 3,331 hospitals and hospital units excluded from the IPPS. Of these, 94 children's hospitals, 11 cancer hospitals, and 18 RNHCIs are being paid on a reasonable cost basis subject to the rate-of-increase ceiling under § 413.40. The remaining providers, 231 rehabilitation hospitals and 908 rehabilitation units, and 442 LTCHs, are paid the Federal prospective per discharge rate under the IRF PPS and the LTCH PPS, respectively, and 472 psychiatric hospitals and 1,155 psychiatric units are paid the Federal per diem amount under the IPF PPS. As stated above, IRFs and IPFs are not affected by the rate updates discussed in this final rule. The impacts of the changes on LTCHs are discussed in section I.J. of this Appendix.

In the past, certain hospitals and units excluded from the IPPS have been paid based on their reasonable costs subject to limits as established by the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA). Cancer

and children's hospitals continue to be paid on a reasonable cost basis subject to TEFRA limits for FY 2013. For these hospitals (cancer and children's hospitals), consistent with the authority provided in section 1886(b)(3)(B)(ii) of the Act, the update is the estimated FY 2013 percentage increase in the IPPS operating market basket. In compliance with section 404 of the MMA, in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43930), we replaced the FY 2002-based IPPS operating and capital market baskets with the revised and rebased FY 2006-based IPPS operating and capital market baskets. Therefore, consistent with current law, based on IHS Global Insight, Inc.'s 2012 second quarter forecast, with historical data through the 2012 first quarter, we are estimating that the FY 2013 update based on the IPPS operating market basket is 2.6 percent (that is, the current estimate of the market basket rate-of-increase). However, the Affordable Care Act requires an adjustment for multifactor productivity (currently 0.7 percentage point) and a 0.1 percentage point reduction to the market basket update resulting in a 1.8 percent applicable percentage increase for IPPS hospitals subject to a reduction of 2.0 percentage points if the hospital fails to submit quality data under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act. RNCHIs, children's hospitals and cancer hospitals are not subject to the reductions in the applicable percentage increase required under the Affordable Care Act. In accordance with § 403.752(a) of the regulations, RNHCIs are paid under § 413.40. Therefore, for RNHCIs, the update is the same as for children's and cancer hospitals, which is the percentage increase in the FY 2013 IPPS operating market basket, estimated at 2.6 percent, without the reductions required under the Affordable Care Act.

The impact of the update in the rate-of-increase limit on those excluded hospitals depends on the cumulative cost increases experienced by each excluded hospital since its applicable base period. For excluded hospitals that have maintained their cost increases at a level below the rate-of-increase limits since their base period, the major effect is on the level of incentive payments these excluded hospitals receive. Conversely, for excluded hospitals with cost increases above the cumulative update in their rate-of-increase limits, the major effect is the amount of excess costs that will not be paid.

We note that, under § 413.40(d)(3), an excluded hospital that continues to be paid under the TEFRA system and whose costs exceed 110 percent of its rate-of-increase limit receives its rate-of-increase limit plus the lesser of 50 percent of its reasonable costs in excess of 110 percent of the limit, or 10 percent of its limit. In addition, under the various provisions set forth in § 413.40, cancer and children's hospitals can obtain payment adjustments for justifiable increases in operating costs that exceed the limit.

G. Quantitative Effects of the Policy Changes Under the IPPS for Operating Costs

1. Basis and Methodology of Estimates

In this final rule, we are announcing policy changes and payment rate updates for the IPPS for FY 2013 for operating costs of acute care hospitals. The FY 2013 updates to the capital payments to acute care hospitals are discussed in section I.I. of this Appendix.

Based on the overall percentage change in payments per case estimated using our payment simulation model, we estimate that total FY 2013 operating payments will increase by 2.3 percent compared to FY 2012. In addition to the applicable percentage increase, this amount reflects the FY 2013 adjustments for documentation and coding described in section II.D. of the preamble of this final rule: 1.0 percent for the IPPS national standardized amounts and −0.5 percent for the IPPS hospital-specific rates. The impacts do not reflect changes in the number of hospital admissions or real case-mix intensity, which will also affect overall payment changes.

We have prepared separate impact analyses of the changes to each system. This section deals with the changes to the operating inpatient prospective payment system for acute care hospitals. Our payment simulation model relies on the most recent available data to enable us to estimate the impacts on payments per case of certain changes in this final rule. However, there are other changes for which we do not have data available that will allow us to estimate the payment impacts using this model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data.

The data used in developing the quantitative analyses of changes in payments per case presented below are taken from the FY 2011 MedPAR file and the most current Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the operating PPS do not incorporate cost data, data from the most recently available hospital cost reports were used to categorize hospitals. Our analysis has several qualifications. First, in this analysis, we do not make adjustments for future changes in such variables as admissions, lengths of stay, or underlying growth in real case-mix. Second, due to the interdependent nature of the IPPS payment components, it is very difficult to precisely quantify the impact associated with each change. Third, we use various data sources to categorize hospitals in the tables. In some cases, particularly the number of beds, there is a fair degree of variation in the data from the different sources. We have attempted to construct these variables with the best available source overall. However, for individual hospitals, some miscategorizations are possible.

Using cases from the FY 2011 MedPAR file, we simulated payments under the operating IPPS given various combinations of payment parameters. As described above, Indian Health Service hospitals and hospitals in Maryland were excluded from the simulations. The impact of payments under the capital IPPS, or the impact of payments for costs other than inpatient operating costs, are not analyzed in this section. Estimated payment impacts of the capital IPPS for FY 2013 are discussed in section I.I. of this Appendix.

We discuss the following changes below:

- The effects of the application of the documentation and coding adjustment and applicable percentage increase (including the market basket update, the multifactor productivity adjustment and the applicable percentage reduction in accordance with the Affordable Care Act) to the standardized amount and hospital-specific rates.
- The effects of the annual reclassification of diagnoses and procedures, full implementation of the MS–DRG system and 100 percent cost-based MS–DRG relative weights.
- The effects of the changes in hospitals' wage index values reflecting updated wage data from hospitals' cost reporting periods beginning during FY 2009, compared to the FY 2008 wage data.
- The effects of the recalibration of the MS–DRG relative weights as required by section 1886(d)(4)(C) of the Act, including the wage and recalibration budget neutrality factors.
- The effects of the geographic reclassifications by the MGCRB that will be effective in FY 2013.
- The effects of the rural floor and imputed floor with the application of the national budget neutrality factor applied to the wage index, as required by the Affordable Care Act.
- The effects of the frontier State wage index provision that requires that hospitals located in States that qualify as frontier States cannot have a wage index less than 1.0. This provision is not budget neutral.
- The effects of the implementation of section 505 of Public Law 108–173, which provides for an increase in a hospital's wage index if the hospital qualifies by meeting a threshold percentage of residents of the county where the hospital is located who commute to work at hospitals in counties with higher wage indexes.
- The effects of the policies for implementation of the Hospital Readmissions Reduction Program under section 3025 of the Affordable Care Act, that adjusts hospital's base operating DRG amount by an adjustment factor to account for a hospital's excess readmissions.
- The effects of the expiration of the special payment status for MDHs under section 3124 of the Affordable Care Act under which MDHs that currently receive the higher of payments made under the Federal standardized amount or the payments made under the Federal standardized amount plus 75 percent of the difference between the Federal standardized amount and the hospital-specific rate will be paid based on the Federal standardized amount starting in FY 2013.
- The total estimated change in payments based on the FY 2013 policies relative to payments based on FY 2012 policies that include the applicable percentage increase of 1.8 percent (or 2.6 percent market basket update with a reduction of 0.7 percentage point for the multifactor productivity adjustment, and a 0.1 percentage point reduction, as required under the Affordable Care Act).

To illustrate the impact of the FY 2013 changes, our analysis begins with a FY 2012 baseline simulation model using: The FY 2013 applicable percentage increase of 1.8 percent and the documentation and coding

adjustment of 1.0 percent to the Federal standardized amount and the −0.5 percent documentation and coding adjustment to the hospital-specific rate; the FY 2012 MS-DRG GROUPER (Version 29.0); the most current CBSA designations for hospitals based on OMB's MSA definitions; the FY 2012 wage index; and no MGCRB reclassifications. Outlier payments are set at 5.1 percent of total operating MS–DRG and outlier payments for modeling purposes.

Section 1886(b)(3)(B)(viii) of the Act, as added by section 5001(a) of Public Law 109–171, as amended by section 4102(b)(1)(A) of the ARRA (Pub. L. 111–5) and by section 3401(a)(2) of the Affordable Care Act (Pub. L. 111–148), provides that, for FY 2007 and each subsequent year, the update factor will include a reduction of 2.0 percentage points for any subsection (d) hospital that does not submit data on measures in a form and manner and at a time specified by the Secretary. (Beginning in FY 2015, the reduction is one-quarter of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act.) At the time that this impact was prepared, 52 hospitals did not receive the full market basket rate-of-increase for FY 2012 because they failed the quality data submission process or did not choose to participate. For purposes of the simulations shown below, we modeled the payment changes for FY 2013 using a reduced update for these 52 hospitals. However, we do not have enough information at this time to determine which hospitals will not receive the full update factor for FY 2013.

Each policy change, statutory or otherwise, is then added incrementally to this baseline, finally arriving at an FY 2013 model incorporating all of the changes. This simulation allows us to isolate the effects of each change.

Our final comparison illustrates the percent change in payments per case from FY 2012 to FY 2013. Three factors not discussed separately have significant impacts here. The first factor is the update to the standardized amount. In accordance with section 1886(b)(3)(B)(i) of the Act, we are updating the standardized amounts for FY 2013 using an applicable percentage increase of 1.8 percent. This includes our forecasted IPPS operating hospital market basket increase of 2.6 percent with a reduction of 0.7 percentage point for the multifactor productivity adjustment and a 0.1 percentage point reduction as required under the Affordable Care Act. (Hospitals that fail to comply with the quality data submission requirements will receive an update of −0.2 percent (this update includes the 2.0 percentage point reduction for failure to submit these data)). Under section 1886(b)(3)(B)(iv) of the Act, the updates to the hospital-specific amounts for SCHs are also equal to the applicable percentage increase, or 1.8 percent. In addition, we are updating the Puerto Rico-specific amount by an applicable percentage increase of 1.8 percent.

A second significant factor that affects the changes in hospitals' payments per case from FY 2012 to FY 2013 is the change in hospitals' geographic reclassification status from one year to the next. That is, payments may be reduced for hospitals reclassified in FY 2012 that are no longer reclassified in FY 2013. Conversely, payments may increase for hospitals not reclassified in FY 2012 that are reclassified in FY 2013.

A third significant factor is that we currently estimate that actual outlier payments during FY 2012 will be 5.0 percent of total MS-DRG payments. Our updated FY 2012 outlier estimate accounts for changes to the FY 2012 IPPS payments required under the Affordable Care Act. When the FY 2012 final rule was published, we projected FY 2012 outlier payments would be 5.1 percent of total MS-DRG plus outlier payments; the average standardized amounts were offset correspondingly. The effects of the lower than expected outlier payments during FY 2012 (as discussed in the Addendum to this final rule) are reflected in the analyses below comparing our current estimates of FY 2012 payments per case to estimated FY 2013 payments per case (with outlier payments projected to equal 5.1 percent of total MS-DRG payments).

Comment: Some commenters stated that CMS' FY 2013 IPPS/LTCH PPS proposed rule showed an increase in operating payments of 0.9 percent or $904 million by 2013, but that the estimated 0.9 percent increase failed to account for a decrease in IME payments which will be the consequence of changes CMS makes in calculating the number of beds to be included in its bed-to-resident ratio, as well as the expiration of temporary increases arising from the Affordable Care Act.

Response: Section H of the Addendum provides the impacts of other policy changes that we are not able to model in the IPPS payment simulation model in the IPPS Operating Impact statement. Finally, all estimates due to policy changes in the FY 2013 IPPS/LTCH PPS final rule are included in the Accounting Statement.

2. Analysis of Table I

Table I displays the results of our analysis of the changes for FY 2013. The table categorizes hospitals by various geographic and special payment consideration groups to illustrate the varying impacts on different types of hospitals. The top row of the table shows the overall impact on the 3,423 acute care hospitals included in the analysis.

The next four rows of Table I contain hospitals categorized according to their geographic location: All urban, which is further divided into large urban and other urban; and rural. There are 2,497 hospitals located in urban areas included in our analysis. Among these, there are 1,373 hospitals located in large urban areas (populations over 1 million), and 1,124 hospitals in other urban areas (populations of 1 million or fewer). In addition, there are 926 hospitals in rural areas. The next two groupings are by bed-size categories, shown separately for urban and rural hospitals. The final groupings by geographic location are by census divisions, also shown separately for urban and rural hospitals.

The second part of Table I shows hospital groups based on hospitals' FY 2012 payment classifications, including any reclassifications under section 1886(d)(10) of the Act. For example, the rows labeled urban, large urban, other urban, and rural show that the numbers of hospitals paid based on these categorizations after consideration of geographic reclassifications (including reclassifications under sections 1886(d)(8)(B) and 1886(d)(8)(E) of the Act that have implications for capital payments) are 2,512; 1,383; 1,129; and 911, respectively.

The next three groupings examine the impacts of the changes on hospitals grouped by whether or not they have GME residency programs (teaching hospitals that receive an IME adjustment) or receive DSH payments, or some combination of these two adjustments. There are 2,392 nonteaching hospitals in our analysis, 789 teaching hospitals with fewer than 100 residents, and 242 teaching hospitals with 100 or more residents.

In the DSH categories, hospitals are grouped according to their DSH payment status, and whether they are considered urban or rural for DSH purposes. The next category groups together hospitals considered urban or rural, in terms of whether they receive the IME adjustment, the DSH adjustment, both, or neither.

The next five rows examine the impacts of the changes on rural hospitals by special payment groups (SCHs, RRCs, and MDHs). There were 203 RRCs, 326 SCHs, 195 former MDHs, and 118 hospitals that are both SCHs and RRCs, and 18 hospitals that were former MDHs and RRCs.

The next series of groupings are based on the type of ownership and the hospital's Medicare utilization expressed as a percent of total patient days. These data were taken from the FY 2009 or FY 2008 Medicare cost reports.

The next two groupings concern the geographic reclassification status of hospitals. The first grouping displays all urban hospitals that were reclassified by the MGCRB for FY 2013. The second grouping shows the MGCRB rural reclassifications. The final category shows the impact of the policy changes on the 19 cardiac hospitals.

[1] Because data necessary to classify some hospitals by category were missing, the total number of hospitals in each category may not equal the national total. Discharge data are from FY 2011, and hospital cost report data are from reporting periods beginning in FY 2009 and FY 2008.

[2] This column displays the payment impact of the hospital rate update and documentation and coding adjustment including the 1.8 percent adjustment to the national standardized amount (the 2.6 percent market basket update reduced by the 0.7 percentage point for the multifactor productivity adjustment and the 0.1 percentage point reduction under the Affordable Care Act) and the 1.0 percent documentation and coding adjustment to the national standardized amount (-1.9 documentation and coding adjustment and 2.9 percent return to the rate to account for the one-time documentation and coding recoupment from FY 2012). In addition, it displays the payment impact of the hospital rate update of 1.8 percent and the documentation and coding adjustment of -0.5 percent to the hospital-specific rate.

[3] This column displays the payment impact of the changes to the Version 30.0 GROUPER and the recalibration of the MS-DRG weights based on FY 2011 MedPAR data in accordance with section 1886(d)(4)(C)(iii) of the Act. This column displays the application of the recalibration budget neutrality factor of 0.998431 in accordance with section 1886(d)(4)(C)(iii) of the Act.

[4] This column displays the payment impact of the update to wage index data using FY 2009 cost report data. This column displays the payment impact of the application of the wage budget neutrality factor, which is calculated separately from the recalibration budget neutrality factor, and is calculated in accordance with section 1886(d)(3)(E)(i) of the Act. The wage budget neutrality factor is 1.000331.

[5] This column displays the combined payment impact of the changes in Columns 3 through 4 and the cumulative budget neutrality factor for MS-DRG and wage changes in accordance with section 1886(d)(4)(C)(iii) of the Act and section 1886(d)(3)(E) of the Act. The cumulative wage and recalibration budget neutrality factor of 0.998761 is the product of the wage budget neutrality factor and the recalibration budget neutrality factor.

[6] Shown here are the effects of geographic reclassifications by the Medicare Geographic Classification Review Board (MGCRB). The effects demonstrate the FY 2013 payment impact of going from no reclassifications to the reclassifications scheduled to be in effect for FY 2013. Reclassification for prior years has no bearing on the payment impacts shown here. This column reflects the geographic budget neutrality factor of 0.991276.

[7] This column displays the effects of the rural floor and imputed floor, including the Affordable Care Act requirement that the floor budget neutrality is at a 100 percent national level adjustment. This column does not reflect the alternative temporary methodology beginning in FY 2013; we note that the impact of that methodology is discussed separately and will have a negligible impact on budget neutrality. The rural floor and imputed floor budget neutrality factor is 0.991340.

[8] This column shows the impact of the policy required under section 10324 of the Affordable Care Act that hospitals located in frontier States have a wage index no less than 1.0.

[9] This column displays the impact of section 505 of Pub. L. 108-173, which provides for an increase in a hospital's wage index if the hospital qualifies by meeting a threshold percentage of residents of the county where the hospital is located who commute to work at hospitals in counties with higher wage indexes.

[10] This column displays the impact of the expiration of MDH status, under section 3124 of the Affordable Care Act, a non-budget neutral payment provision.

[11] This column displays the impact of the implementation of the Hospital Readmissions Reduction Program, section 3025 of the Affordable Care Act, a non-budget neutral provision that adjusts a hospital's payment for excess readmissions.

[12] This column shows the changes in payments from FY 2012 to FY 2013. It reflects the impact of the FY 2013 hospital update, the adjustments due to the documentation and coding. It also reflects changes in hospitals' reclassification status in FY 2013 compared to FY 2012. It incorporates all of the changes displayed in Columns 2, 5, 6, 7, 8, 9, 10 and 11 (the changes displayed in Columns 3 and 4 are included in Column 5). The sum of these impacts may be different from the percentage changes shown here due to rounding and interactive effects.

BILLING CODE 4120–01–C

a. Effects of the Hospital Update and Documentation and Coding Adjustment (Column 2)

As discussed in section II.D. of the preamble of this final rule, this column includes the hospital update, including the 2.6 percent market basket update, the reduction of 0.7 percentage point for the multifactor productivity adjustment, and the 0.1 percentage point reduction in accordance with the Affordable Care Act. In addition, this column includes the FY 2013 documentation and coding adjustment of 1.0 percent on the national standardized amount, which includes the −1.9 percent prospective adjustment for documentation and coding and a 2.9 percent adjustment to restore the one-time recoupment adjustment made to the national standardized amount for FY 2012. As a result, we are making a 2.8 percent update to the national standardized amount.

This column also includes the 1.3 percent update to the hospital-specific rates, which includes the 1.8 percent for the hospital update and −0.5 percent documentation and coding adjustment.

Overall, hospitals will experience a 2.7 percent increase in payments primarily due to the effects of the hospital update and documentation and coding adjustment on the national standardized amount. Hospitals that are paid under the hospital-specific rate, namely SCHs, will see a 1.3 percent increase in payments; therefore, hospital categories with SCHs paid under the hospital-specific rate will see increases in payments less than 2.8 percent.

b. Effects of the Changes to the MS–DRG Reclassifications and Relative Cost-Based Weights with Recalibration Budget Neutrality (Column 3)

Column 3 shows the effects of the changes to the MS–DRGs and relative weights with the application of the recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. Consistent with section 1886(d)(4)(C)(iii) of the Act, we are calculating a recalibration budget neutrality factor to account for the changes in MS–DRGs and relative weights to ensure that the overall payment impact is budget neutral.

As discussed in section II.E. of the preamble of this final rule, the FY 2013 MS–DRG relative weights will be 100 percent cost-based and 100 percent MS–DRGs. For FY 2013, the MS–DRGs are calculated using the FY 2011 MedPAR data grouped to the Version 30.0 (FY 2013) MS–DRGs. The methods of calculating the relative weights and the reclassification changes to the GROUPER are described in more detail in section II.H. of the preamble of this final rule.

The ''All Hospitals'' line in Column 3 indicates that changes due to the MS–DRGs and relative weights will result in a 0.0 percent change in payments with the application of the recalibration budget neutrality factor of 0.998431 on to the standardized amount. Due to the changes to the MS–DRG GROUPER in this final rule, there were some shifts in payments due to changes in the relative weights with rural hospitals experiencing a 0.1 percent decrease in payments.

c. Effects of the Wage Index Changes (Column 4)

Column 4 shows the impact of updated wage data with the application of the wage budget neutrality factor. Section 1886(d)(3)(E) of the Act requires that, beginning October 1, 1993, we annually update the wage data used to calculate the wage index. In accordance with this requirement, the wage index for acute care hospitals for FY 2013 is based on data submitted for hospital cost reporting periods beginning on or after October 1, 2008 and before October 1, 2009. The estimated impact of the updated wage data and labor share on hospital payments is isolated in Column 4 by holding the other payment parameters constant in this simulation. That is, Column 4 shows the percentage change in payments when going from a model using the FY 2012 wage index, based on FY 2008 wage data, the current labor-related share and having a 100-percent occupational mix adjustment applied, to a model using the FY 2013 pre-reclassification wage index with the labor-related share, also having a 100-percent occupational mix adjustment applied, based on FY 2009 wage data (while holding other payment parameters such as use of the Version 30.0 MS–DRG GROUPER constant). The occupational mix adjustment is based on the 2010 occupational mix survey.

In addition, the column shows the impact of the application of wage budget neutrality to the national standardized amount. In FY 2010, we began calculating separate wage budget neutrality and recalibration budget neutrality factors, in accordance with section 1886(d)(3)(E) of the Act, which specifies that budget neutrality to account for wage changes or updates made under that subparagraph must be made without regard to the 62 percent labor-related share guaranteed under section 1886(d)(3)(E)(ii) of the Act. Therefore, for FY 2013, we are calculating the wage budget neutrality factor to ensure that payments under updated wage data and the labor-related share are budget neutral without regard to the lower labor-related share of 62 percent applied to hospitals with a wage index less than or equal to 1. In other words, the wage budget neutrality is calculated under the assumption that all hospitals receive the higher labor-related share of the standardized amount. The wage budget neutrality factor is 1.000331, and the overall payment change is 0 percent.

Column 4 shows the impacts of updating the wage data using FY 2009 cost reports. Overall, the new wage data will lead to a 0.0 percent change for all hospitals before being combined with the wage budget neutrality adjustment shown in Column 4. Among the regions, the largest increase is in the urban New England region, which experiences a 0.9 percent increase. The largest decline from updating the wage data is seen in the rural East South Central region (−0.5 percent decrease).

In looking at the wage data itself, the national average hourly wage increased 3.3 percent compared to FY 2012. Therefore, the only manner in which to maintain or exceed the previous year's wage index was to match or exceed the national 3.3 percent increase in average hourly wage. Of the 3,409 hospitals with wage data for both FYs 2012 and 2013, 1,529, or 44.9 percent, experienced an average hourly wage increase of 3.3 percent or more.

The following chart compares the shifts in wage index values for hospitals due to changes in the average hourly wage data for FY 2013 relative to FY 2012. Among urban hospitals, none will experience an increase of more than 5 percent and less than 10 percent and none will experience an increase of more than 10 percent. Among rural hospitals, none will experience an increase of more than 5 percent and less than 10 percent, and none will experience an increase of more than 10 percent. However, 926 rural hospitals will experience increases or decreases of less than 5 percent, while 2,483 urban hospitals will experience increases or decreases of less than 5 percent. No urban hospitals will experience decreases in their wage index values of more than 5 percent and less than 10 percent. No urban hospitals will experience decreases in their wage index values of more than 10 percent. No rural hospitals will experience a decrease of more than 10 percent. No rural hospitals will experience decreases in their wage index values of greater than 5 percent but less than 10 percent. These figures reflect changes in the ''pre-reclassified, occupational mix-adjusted wage index,'' that is, the wage index before the application of geographic reclassification, the rural floor, the out-migration adjustment, and other wage index exceptions and adjustments. (We refer readers to sections III.G.2. through III.I. of the preamble of this final rule for a complete discussion of the exceptions and adjustments to the wage index.) We note that the ''post-reclassified wage index'' or ''payment wage index,'' the final wage index that includes all such exceptions and adjustments (as reflected in Tables 2, 4A, 4B, 4C, and 4F of the Addendum to this final rule, which are available via the Internet on the CMS Web site) is used to adjust the labor-related share of a hospital's standardized amount, either 68.8 percent or 62 percent, depending upon whether a hospital's wage index is greater than 1.0 or less than or equal to 1.0. Therefore, the pre-reclassified wage index figures in the chart below may illustrate a somewhat larger or smaller change than will occur in a hospital's payment wage index and total payment.

The following chart shows the projected impact of changes in the average hourly wage data for urban and rural hospitals.

Percentage change in area wage index values	Number of hospitals	
	Urban	Rural
Increase more than 10 percent	0	0
Increase more than 5 percent and less than 10 percent	0	0
Increase or decrease less than 5 percent	2,483	926
Decrease more than 5 percent and less than 10 percent	0	0
Decrease more than 10 percent	0	0

d. Combined Effects of the MS–DRG and Wage Index Changes (Column 5)

Section 1886(d)(4)(C)(iii) of the Act requires that changes to MS–DRG reclassifications and the relative weights cannot increase or decrease aggregate payments. In addition, section 1886(d)(3)(E) of the Act specifies that any updates or adjustments to the wage index are to be budget neutral. We computed a wage budget neutrality factor of 1.000331, and a recalibration budget neutrality factor of 0.998431 (which is applied to the Puerto Rico-specific standardized amount and the hospital-specific rates). The product of the two budget neutrality factors is the cumulative wage and recalibration budget neutrality factor. The cumulative wage and recalibration budget neutrality adjustment is 0.998761, or approximately −0.1 percent, which is applied to the national standardized amounts. Because the wage budget neutrality and the recalibration budget neutrality are calculated under different methodologies according to the statute, when the two budget neutralities are combined and applied to the standardized amount, the overall payment impact is not necessarily budget neutral. However, in this final rule, we are estimating that the changes in the MS–DRG relative weights and updated wage data with wage and budget neutrality applied will result in a 0.0 change in payments.

We estimate that the combined impact of the changes to the relative weights and MS–DRGs and the updated wage data with budget neutrality applied will result in 0.1 percent increase in payments for urban hospitals and 0.3 percent decrease in payments for rural hospitals. Urban New England hospitals will experience a 0.9 percent increase in payments due to increases in their wages compared to the national average, while the urban East South Central area will experience a 0.8 decrease in payments and rural South Atlantic will experience a 0.6 decrease in payments because of below average increases in wages.

e. Effects of MGCRB Reclassifications (Column 6)

Our impact analysis to this point has assumed acute care hospitals are paid on the basis of their actual geographic location (with the exception of ongoing policies that provide that certain hospitals receive payments on other bases than where they are geographically located). The changes in Column 6 reflect the per case payment impact of moving from this baseline to a simulation incorporating the MGCRB decisions for FY 2013 which affect hospitals' wage index area assignments.

By spring of each year, the MGCRB makes reclassification determinations that will be effective for the next fiscal year, which begins on October 1. The MGCRB may approve a hospital's reclassification request for the purpose of using another area's wage index value. Hospitals may appeal denials of MGCRB decisions to the CMS Administrator. Further, hospitals have 45 days from publication of the IPPS rule in the **Federal Register** to decide whether to withdraw or terminate an approved geographic reclassification for the following year.

The overall effect of geographic reclassification is required by section 1886(d)(8)(D) of the Act to be budget neutral. Therefore, we are applying an adjustment of 0.991276 to ensure that the effects of the reclassifications under section 1886(d)(10) of the Act are budget neutral (section II.A. of the Addendum to this final rule). Geographic reclassification generally benefits hospitals in rural areas. We estimate that the geographic reclassification will increase payments to rural hospitals by an average of 2.1 percent. By region, all the rural hospital categories, with the exception of one rural Puerto Rico hospital, will experience increases in payments due to MGCRB reclassification. Rural hospitals in the East South Central region will experience a 2.9 percent increase in payments and rural hospitals in the Mountain region will experience a 0.4 percent increase in payments. Urban hospitals in New England and the Middle Atlantic will experience an increase in payments of 0.7 percent and 0.1 percent, respectively, largely due to reclassifications of hospitals in Connecticut and New Jersey.

Table 9A listed in section VI. of the Addendum to this final rule and available via the Internet reflects the reclassifications for FY 2013.

f. Effects of the Rural and Imputed Floor, Including Application of National Budget Neutrality (Column 7)

As discussed in section III.B. of the preamble of the FY 2009 IPPS final rule, the FY 2010 IPPS/RY 2010 LTCH PPS final rule, the FY 2011 IPPS/LTCH PPS final rule and this final rule, section 4410 of Public Law 105–33 established the rural floor by requiring that the wage index for a hospital in any urban area cannot be less than the wage index received by rural hospitals in the same State. We apply a uniform budget neutrality adjustment to the wage index. In addition, the imputed floor, which is budget neutral, was extended in FY 2012 for 2 additional years. In the past only urban hospitals in New Jersey had been receiving the imputed floor. As discussed earlier in this final rule, we are finalizing the proposal in the FY 2013 IPPS/LTCH PPS proposed rule to establish an alternative temporary methodology for the imputed floor, which will result in an imputed floor for Rhode Island for FY 2013.

The imputed floor for Rhode Island is also accounted for in the calculation of the rural floor and imputed rural floor budget neutrality factor. The Affordable Care Act requires that we apply one rural floor budget neutrality factor to the wage index nationally, and the imputed floor is part of the rural floor budget neutrality factor applied to the wage index nationally. The FY 2013 rural floor budget neutrality factor applied to the wage index is 0.991340, which will reduce wage indexes by −0.87 percent.

Column 7 shows the projected impact of the rural floor and imputed floor with the national rural floor budget neutrality factor applied to the wage index. The column compares the post-reclassification FY 2013 wage index of providers before the rural floor and imputed floor adjustment and the post-reclassification FY 2013 wage index of providers with the rural floor and imputed floor adjustment. Only urban hospitals can benefit from the rural floor provision. Because the provision is budget neutral, all other hospitals (that is, all rural hospitals and those urban hospitals to which the adjustment is not made) experience a decrease in payments due to the budget neutrality adjustment applied nationally to their wage index.

We project that, in aggregate, rural hospitals will experience a 0.3 percent decrease in payments as a result of the application of rural floor budget neutrality because the rural hospitals do not benefit from the rural floor, but have their wage indexes downwardly adjusted to ensure that the application of the rural floor is budget neutral overall. We project hospitals located in other urban areas (populations of 1 million or fewer) will experience a 0.2 percent increase in payments because those providers benefit from the rural floor. Urban hospitals in the New England region can expect a 3.6 percent increase in payments primarily due to the application of the rural floor in Massachusetts and the application of national rural floor budget neutrality as required by the Affordable Care Act. All 60 urban providers in Massachusetts are expected to receive the rural floor wage index value, including rural floor budget neutrality, of 1.3047. During most past years, there have been no IPPS hospitals located in rural areas in Massachusetts. There was one urban IPPS hospital that was reclassified to rural Massachusetts (under section 1886(d)(8)(E) of the Act) which established the Massachusetts rural floor, but the wage index resulting from that hospital's data was not high enough for any urban hospital to benefit from the rural floor policy. However, beginning with the FY 2012 wage index, the rural floor for the State

is established by the conversion of a CAH to an IPPS hospital that is geographically located in rural Massachusetts. We estimate that Massachusetts hospitals will receive approximately a 5.7 percent increase in IPPS payments due to the application of rural floor.

Urban Mountain hospitals are estimated to receive a 0.6 percent increase in payments due to an increase in the rural floor for Arizona hospitals, as compared to our estimates published in the FY 2013 IPPS/LTCH PPS proposed rule. The Arizona rural floor wage index increased significantly from 0.9243 to 1.0661, attributable to one urban hospital that reclassified to rural Arizona under § 412.103 of the Medicare regulations. As a result, 46 out of the 53 urban hospitals in Arizona will benefit from the rural floor of 1.0661. Urban Arizona hospitals will experience a 2.2 percent increase in payments (approximately $33 million) due to the increase in the rural floor.

Urban Puerto Rico hospitals are expected to experience a 0.1 percent increase in payments as a result of the application of a Puerto Rico rural floor. Urban Puerto Rico hospitals will receive a rural floor as a result of a one IPPS hospital located in rural Puerto Rico setting a rural floor. We are applying a rural floor budget neutrality factor to the Puerto Rico-specific wage index of 0.987620 or −1.2 percent. The Puerto Rico-specific wage index adjusts the Puerto Rico-specific standardized amount, which represents 25 percent of payments to Puerto Rico hospitals.

There are 29 hospitals in New Jersey that benefit from the extension of the imputed floor and will receive the imputed floor wage index value, including rural floor budget neutrality of 1.0994, which we estimate will increase their payments by approximately $29 million. Urban Middle Atlantic hospitals will experience a 0.3 percent decrease in payments, which reflects the increase in payments for New Jersey hospitals receiving the imputed floor and a decrease for all other urban hospitals in the in the Middle Atlantic region. Four Rhode Island hospitals benefit from the newly established imputed rural floor and will receive an additional $2.5 million.

In response to a public comment addressed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51593), we are providing the payment impact of the rural floor and imputed floor with budget neutrality at the State level. Column 1 of the table below displays the number of IPPS hospitals located in each State. Column 2 displays the number of hospitals in each State that will receive the rural floor or imputed floor wage index for FY 2013. Column 3 displays the percentage of total payments each State will receive or contribute to fund the rural floor and imputed floor with national budget neutrality. The column compares the post-reclassification FY 2013 wage index of providers before the rural floor and imputed floor adjustment and the post-reclassification FY 2013 wage index of providers with the rural floor and imputed floor adjustment. Column 4 displays the estimated payment amount that each State will gain or lose due to the application of the rural floor and imputed floor with national budget neutrality.

FY 2013 IPPS Estimated Payments Due to Rural Floor and Imputed Floor With National Budget Neutrality

State	Number of hospitals (1)	Number of hospitals receiving rural floor or imputed floor (2)	Percent change in payments due to application of rural floor and imputed floor with budget neutrality (3)	Difference (in millions) (4)
Alabama	96	3	−0.4	−$8.2
Alaska	6	4	1.5	2.3
Arizona	58	45	1.7	31.4
Arkansas	45	0	−0.5	−5.2

Washington, D.C	7	0	−0.5	−2.5
West Virginia	33	2	−0.3	−2.9
Wisconsin	65	8	−0.3	−5.0
Wyoming	11	0	−0.1	−0.2

g. Effects of the Application of the Frontier State Wage Index (Column 8)

Section 10324(a) of Affordable Care Act requires that we establish a minimum post-reclassified wage-index of 1.00 for all hospitals located in ''frontier States.'' The term ''frontier States'' is defined in the statute as States in which at least 50 percent of counties have a population density less than 6 persons per square mile. Based on these criteria, four States (Montana, North Dakota, South Dakota, and Wyoming) are considered frontier States and 45 hospitals located in those States will receive a frontier wage index of 1.0. Although Nevada is also, by definition, a frontier State and was assigned a frontier floor value of 1.0000 for FY 2012, its FY 2013 rural floor value of 1.0256 is greater and, therefore, is the State's minimum wage index for FY 2013. As a result, hospitals located in Nevada will not experience a change in payment as a result of this provision. Overall, this provision is not budget neutral and is estimated to increase IPPS operating payments by approximately $69 million.

Urban hospitals located in the West North Central region and urban hospitals located in the Mountain region will receive an increase in payments by 0.8 percent and 0.2 percent, respectively because many of the hospitals located in this region are frontier hospitals. Similarly, rural hospitals located in the Mountain region and rural hospitals in the West North Central region will experience an increase in payments by 0.8 percent and 0.2 percent, respectively.

h. Effects of the Wage Index Adjustment for Out-Migration (Column 9)

Section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. Hospitals located in counties that qualify for the payment adjustment are to receive an increase in the wage index that is equal to a weighted average of the difference between the wage index of the resident county, post-reclassification and the higher wage index work area(s), weighted by the overall percentage of workers who are employed in an area with a higher wage index. Overall, rural hospitals will experience a 0.1 percent increase in payments as a result of the out-migration wage adjustment. Rural DSH providers with less than 100 beds will experience a 0.4 percent increase in payments. Urban New England hospitals will experience a 0.3 percent increase in payments due to increases in their out-migration wage adjustment attributable to the hospitals located in counties neighboring Massachusetts that has a higher wage index due to the Massachusetts rural floor. There are 287 providers that will receive the out-migration wage adjustment in FY 2013. This out-migration wage adjustment is not budget neutral, and we estimate the impact of these providers receiving the out-migration increase to be approximately $53 million.

i. Effects of the Expiration of MDH Special Payment Status (Column 10)

Column 10 shows our estimate of the changes in payments due to the expiration of MDH status, a nonbudget neutral payment provision, under section 3124 of the Affordable Care Act. Hospitals that qualified to be MDHs receive the higher of payments made under the Federal standardized amount or the payments made under the Federal standardized amount plus 75 percent of the difference between the Federal standardized amount and the hospital-specific rate (a hospital-specific cost-based rate). Because this provision was not budget neutral, the expiration of this payment provision results in a 0.2 percent decrease in payments overall. There are currently 213 MDHs, of which 98 were estimated to be paid under the blended payment of the federal standardized amount and hospital-specific rate. Because those 98 MDHs will no longer receive the blended payment and will be paid only under the Federal standardized amount in FY 2013, it is estimated that those hospitals will experience an overall decrease in payments of approximately $183 million.

MDHs were generally rural hospitals, so the expiration of the MDH program will result in an overall decrease in payments to rural hospitals of 1.4 percent. Rural New England hospitals can expect a decrease in payments of 3.4 percent because 8 out of the 23 rural New England hospitals are MDHs that will lose this special payment status under the expiration of the program at the end of FY 2012. MDHs can expect a decrease in payments of 7.8 percent.

j. Effects of the Hospital Readmissions Reduction Program (Column 11)

Column 11 shows our estimates of effects of the policies for implementation of the Hospital Readmissions Reduction Program, which was established under section 3025 of the Affordable Care Act. The Hospital Readmissions Reduction Program requires a reduction to a hospital's base operating DRG payments to account for excess readmissions, which is based on a hospital's risk-adjusted readmission rate during a 3-year period for three applicable conditions: Acute Myocardial Infarction, Heart Failure, and Pneumonia. This provision is not budget neutral. A hospital's readmission adjustment is the higher of a ratio of the hospital's aggregate payments for excess readmissions to their aggregate payments for all discharges, or a floor, which has been defined in statute as 0.99 (or a 1-percent reduction) for FY 2013. A hospital's base operating DRG payment (that is, wage-adjusted DRG payment amount, as discussed in section IV.A. of the preamble of this final rule) is the portion of the IPPS payment subject to the readmissions payment adjustment (DSH, IME, outliers and low-volume add-on payments are not subject to the readmissions adjustment). In this final rule, we estimate that 2,206 hospitals will have their base operating DRG payments reduced by the readmissions adjustment, resulting in a 0.3 percent decrease in payments to hospitals overall.

Urban hospitals in the Middle Atlantic, rural hospitals in the East South Central region, West South Central region, rural DSH hospitals and hospitals with Medicare utilization of over 65 percent will experience the highest decreases of 0.4 percent among the different hospital categories. Urban hospitals in the West South Central region, Mountain region and Pacific region will experience the smallest decreases of 0.1 percent in payments. Puerto Rico hospitals show a 0 percent change in payments because they are exempt from the provision.

k. Effects of All FY 2013 Changes (Column 12)

Column 12 shows our estimate of the changes in payments per discharge from FY 2012 and FY 2013, resulting from all changes reflected in this final rule for FY 2013. It includes combined effects of the previous columns in the table.

The average increase in payments under the IPPS for all hospitals is approximately 2.3 percent for FY 2013 relative to FY 2012. As discussed in section II.D. of the preamble of this final rule, this column includes the FY 2013 documentation and coding adjustment of 1.0 percent on the national standardized amount (the −1.9 percent documentation and coding adjustment and the 2.9 percent adjustment to restore the one-time recoupment adjustment made to national standardized amount) and the −0.5 percent documentation and coding adjustment on the hospital-specific rates. In addition, this column includes the annual hospital update of 1.8 percent to the national standardized amount. This annual hospital update includes the 2.6 percent market basket update, the reduction of 0.7 percentage point for the multifactor productivity adjustment, and the 0.1 percentage point reduction under section 3401 of the Affordable Care Act. As described in Column 2, the annual hospital update, combined with the documentation and coding adjustment, results in a 2.7 percent increase in payments in FY 2013 relative to FY 2012. In addition, Column 8 describes an estimated 0.1 percent increase in payments due to the frontier State wage index. Column 10 describes the estimated 0.2 percent decrease in payments due to the expiration of the MDH status under section 3124 of the Affordable Care Act. Column 11 shows the estimated 0.3 percent decrease in payments due to the establishment of the Hospital Readmissions Reduction Program, which reduces a hospital's base operating DRG payments by a readmission adjustment factor based on a hospital's performance on readmissions for specified conditions. In addition, although not shown in the impacts table, payments are estimated to decrease by 0.1 due to the expiration of section 508 reclassifications that had been extended for 6 months of FY 2012 under section 302 of the Temporary Payroll Tax Cut Continuation Act of 2011 (Pub. L. 112–78), as amended by section 3001 of the Middle Class Tax Relief and Job Creation Act of 2012 (Pub. L. 112–96). Section 508 was not a budget-neutral provision. The impact of moving from our estimate of FY 2012 outlier payments, 5.0 percent, to the estimate of FY 2013 outlier payments, 5.1 percent, results in an increase of 0.1 percent in FY 2013 payments relative to FY 2012. There might also be interactive effects among the various factors comprising the payment system that we are not able to isolate. For these reasons, the values in Column 12 may not equal the sum of the percentage changes described above.

The overall change in payments per discharge for hospitals paid under the IPPS in FY 2013 is estimated to increase by 2.3 percent. The payment increase among the hospital categories is largely attributed to the updates to the rate including the hospital update. Hospitals in urban areas will experience an estimated 2.5 percent increase in payments per discharge in FY 2013 compared to FY 2012. Hospital payments per discharge in rural areas are estimated to increase by 0.3 percent in FY 2013 as compared to FY 2012 due to the expiration of MDH status.

Among urban census divisions, the Urban New England hospitals will experience an estimated 1.5 percent increase in payments, less than the national average, because many of the urban providers in this region had benefited from section 508 reclassifications in FY 2012 that will expire for FY 2013. Urban hospitals in the Pacific will see the largest payment increases (4.0 percent) because the hospitals are benefitting from the rural floors in their States.

Among the rural regions, the hospitals in the New England Region will experience the estimated decreases in payments of 0.8 percent, due to the expiration of MDH status. Rural hospitals in the Mountain Region are estimated to experience a 1.1 percent increase because the rural providers in this region benefit from MGCRB reclassification and the application of the Frontier wage index, which offsets decreases due to the rural floor and the expiration of MDH status.

Among special categories of hospitals, former MDHs will receive an estimated payment decrease of 6.4 percent due to the expiration of the MDH status. SCHs are paid the higher of their Federal rate and the hospital-specific rate. Overall, SCHs are estimated to experience a payment increase of 0.1 percent due to the application of the rural floor budget neutrality and the implementation of the Hospital Readmissions Reduction Program.

Rural hospitals reclassified for FY 2013 will receive an estimated 1.1 percent payment increase. Rural hospitals that are not reclassifying are estimated to receive a payment decrease of 1.1 percent due to lower wage data, the application of rural floor budget neutrality and expiration of MDH status. Urban reclassified hospitals will experience an estimated payment increase at 2.6 percent due to the benefits under MGCRB reclassification and the rural floor. Urban nonreclassified hospitals will experience an estimated payment increase of 2.5 percent.

Cardiac hospitals are expected to experience a payment increase 3.9 percent in FY 2013 relative to FY 2012 primarily due to benefits to the changes in the relative weights and the application of the Frontier wage index.

3. Impact Analysis of Table II

Table II presents the projected impact of the changes for FY 2013 for urban and rural hospitals and for the different categories of hospitals shown in Table I. It compares the estimated average payments per discharge for FY 2012 with the average payments per discharge for FY 2013, as calculated under our models. Thus, this table presents, in terms of the average dollar amounts paid per discharge, the combined effects of the changes presented in Table I. The estimated percentage changes shown in the last column of Table II equal the estimated percentage changes in average payments per discharge from Column 12 of Table I.

TABLE II—IMPACT ANALYSIS OF CHANGES FOR FY 2013 ACUTE CARE HOSPITAL OPERATING PROSPECTIVE PAYMENT SYSTEM

[Payments per discharge]

	Number of hospitals	Average FY 2012 payment per discharge	Average FY 2013 payment per discharge	All FY 2013 changes
	(1)	(2)	(3)	(4)
All hospitals	3,423	10,477	10,716	2.3
By Geographic Location:				
Urban hospitals	2,497	10,881	11,153	2.5
Large urban areas (populations over 1 million)	1,373	11,503	11,803	2.6
Other urban areas (populations of 1 million or fewer)	1,124	10,117	10,355	2.4
Rural hospitals	926	7,845	7,868	0.3
Bed Size (Urban):				
0–99 beds	633	8,343	8,550	2.5
100–199 beds	780	9,192	9,423	2.5
200–299 beds	448	9,955	10,212	2.6
300–499 beds	430	11,133	11,428	2.6
500 or more beds	206	13,424	13,733	2.3
Bed Size (Rural):				
0–49 beds	321	6,307	6,241	−1.1
50–99 beds	347	7,335	7,214	−1.7
100–149 beds	153	7,605	7,681	1
150–199 beds	58	8,544	8,673	1.5
200 or more beds	47	9,656	9,847	2
Urban by Region:

Specialty Hospitals:				
Cardiac Hospitals	19	10,925	11,350	3.9

H. Effects of Other Policy Changes

In addition to those policy changes discussed above that we are able to model using our IPPS payment simulation model, we are making various other changes in this final rule. Generally, we have limited or no specific data available with which to estimate the impacts of these changes. Our estimates of the likely impacts associated with these other changes are discussed below.

1. Effects of Policy on HACs, Including Infections

In section II.F. of the preamble of this final rule, we discuss our implementation of section 1886(d)(4)(D) of the Act, which requires the Secretary to identify conditions that are: (1) High cost, high volume, or both; (2) result in the assignment of a case to an MS–DRG that has a higher payment when present as a secondary diagnosis; and (3) could reasonably have been prevented through application of evidence-based guidelines. For discharges occurring on or after October 1, 2008, hospitals will not receive additional payment for cases in which one of the selected conditions was not present on admission, unless, based on data and clinical judgment, it cannot be determined at the time of admission whether a condition is present. That is, the case will be paid as though the secondary diagnosis were not present. However, the statute also requires the Secretary to continue counting the condition as a secondary diagnosis that results in a higher IPPS payment when doing the budget neutrality calculations for MS–DRG reclassifications and recalibration. Therefore, we will perform our budget neutrality calculations as though the payment provision did not apply, but Medicare will make a lower payment to the hospital for the specific case that includes the secondary diagnosis. Thus, the provision results in cost savings to the Medicare program.

We note that the provision will only apply when one or more of the selected conditions are the only secondary diagnosis or diagnoses present on the claim that will lead to higher payment. Medicare beneficiaries will generally have multiple secondary diagnoses during a hospital stay, such that beneficiaries having one MCC or CC will frequently have additional conditions that also will generate higher payment. Only a small percentage of the cases will have only one secondary diagnosis that would lead to a higher payment. Therefore, if at least one nonselected secondary diagnosis that leads to higher payment is on the claim, the case will continue to be assigned to the higher paying MS–DRG and there will be no Medicare savings from that case. In addition, as discussed in section II.F.3. of the preamble of this final rule, it is possible to have two severity levels where the HAC does not affect the MS–DRG assignment or for an MS–DRG not to have severity levels. In either of these circumstances, the case will continue to be assigned to the higher paying MS–DRG and there will be no Medicare savings from that case.

In section II.F. of the preamble of this final rule, we are adding two HACs for FY 2013: Surgical Site Infection (SSI) Following Cardiac Implantable Electronic Device (CIED) Procedures and Iatrogenic Pneumothorax with Venous Catheterization. Similar to the current HACs, only a very small number of discharges would have only one secondary diagnosis that would lead to a higher payment. Therefore, there will likely be very few discharges where the MS–DRG is reassigned for these proposed conditions and this would result in a minimal payment impact.

The HAC payment provision went into effect on October 1, 2008. Our savings estimates for the next 5 fiscal years are shown below:

Year	Savings (in millions)
FY 2013	$24
FY 2014	26
FY 2015	28
FY 2016	30
FY 2017	33

2. Effects of Policy Relating to New Medical Service and Technology Add-On Payments

In section II.I. of the preamble to this final rule, we discuss four applications for add-on

payments for new medical services and technologies for FY 2013, as well as the status of the new technology that was approved to receive new technology add-on payments in FY 2012. As explained in that section, add-on payments for new technology under section 1886(d)(5)(K) of the Act are not required to be budget neutral. As discussed in section II.I.4. of the preamble of this final rule, we are approving three of the four applications for new technology add-on payments for FY 2013. In this final rule, we also are continuing to make new technology add-on payments in FY 2013 for the AutoLITT™ (because the technology is still within the 3-year anniversary of the product's entry onto the market). We note that new technology add-on payments per case are limited to the lesser of (1) 50 percent of the costs of the new technology or (2) 50 percent of the amount by which the costs of the case exceed the standard MS–DRG payment for the case. Because it is difficult to predict the actual new technology add-on payment for each case, our estimates below are based on the increase in add-on payments for FY 2013 as if every claim that would qualify for a new technology add-on payment would receive the maximum add-on payment. For the AutoLITT™, for FY 2011, the applicant estimated that approximately 170 Medicare beneficiaries would be eligible for the AutoLITT™. Therefore, based on the applicant's estimate from FY 2011, we currently estimate that new technology add-on payments for the AutoLITT™ will increase overall FY 2013 payments by $900,000. For Voraxaze®, for FY 2013, the applicant estimates that approximately 140 Medicare beneficiaries will be eligible for the technology. Therefore, we currently estimate that new technology add-on payments for Voraxaze® will increase overall FY 2013 payments by $6,300,000. For Dificid™, for FY 2013, the applicant estimates that approximately 40,138 Medicare beneficiaries will be eligible for the technology. Therefore, we currently estimate that new technology add-on payments for Dificid™ will increase overall FY 2013 payments by $34,839,784. For the Zenith® F. Graft, for FY 2013, the applicant estimates that approximately 500 Medicare beneficiaries will be eligible for the technology. Therefore, we currently estimate that new technology add-on payments for the Zenith® F. Graft will increase overall FY 2013 payments by $4,085,750. The total increase in overall FY 2013 payments due to new technology add-on payment is estimated to be $46,125,534.

3. Effects of Policy Changes Relating to SCHs

In section IV.B.2. of the preamble of this final rule, we discuss our clarification of the regulations related to the termination of a hospital's status as an SCH. We are adding a provision to the regulations to clarify that if CMS determines that the hospital was incorrectly designated as an SCH, SCH status may be cancelled retroactively, consistent with the provisions at 42 CFR 405.1885. We also are specifying that if a hospital that was incorrectly designated as an SCH notifies CMS of that error, the SCH classification status may be terminated effective 30 days from CMS' date of determination. We believe it is difficult to quantify the payment impact of these clarifications because we cannot estimate the number of SCHs that will be affected by these policies. However, we believe any impact will be insignificant because the policies only affect hospitals that were incorrectly classified as SCHs. In the proposed rule, we solicited public comments on these issues. Any public comments that we received are addressed in section IV.B.2. of the preamble of this final rule.

In section IV.B.3. of the preamble of this final rule, we discuss our addition of a provision to the regulations to allow hospitals that are currently classified as MDHs to apply for classification as SCHs upon the expiration of the MDH program on September 30, 2012. We are providing that, for any MDH that applies for SCH classification at least 30 days prior to the expiration of the MDH program and requests that SCH classification status be effective with the expiration of the MDH program, and the hospital is approved for SCH status, the effective for SCH status will be the day following the expiration of the MDH program. We believe it is difficult to quantify the payment impact of this policy because we cannot estimate the number of MDHs that will be applying for SCH status.

4. Effects of the Payment Adjustment for Low-Volume Hospitals for FY 2013

In section IV.D. of the preamble to this final rule, we discuss the provisions of the Affordable Care Act that expanded the definition of low-volume hospital and modified the methodology for determining the payment adjustment for hospitals meeting that definition for FYs 2011 and 2012. In accordance with section 1886(d)(12) of the Act, beginning with FY 2013, the low-volume hospital definition and payment adjustment methodology will revert back to the statutory requirements that were in effect prior to the amendments made by the Affordable Care Act. Therefore, effective for FY 2013 and subsequent years, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year.

Based on FY 2011 claims data (March 2012 update of the MedPAR file), we estimate that approximately 600 hospitals in our database qualified as a low-volume hospital for FY 2012, but will no longer meet the mileage and discharges criteria to qualify as a low-volume hospital under section 1886(d)(12) of the Act for FY 2013. Because we estimate that these hospitals will no longer qualify for the low-volume hospital adjustment in FY 2013 (due to the statutory change in the qualifying criteria), we project that these hospitals will experience a decrease in payments of approximately $318 million in FY 2013 as compared to the payments that they would have otherwise received in FY 2013 in absence of the statutory change in the low-volume hospital qualifying criteria.

5. Effects of Policy Changes Relating to Payment Adjustments for Medicare Disproportionate Share Hospitals (DSHs) and Indirect Medical Education (IME)

In section IV.F. of the preamble of this final rule, we discuss our finalization of a proposal to include ancillary labor and delivery beds in the available bed count used to determine the DSH payment adjustment and the IME payment adjustment. The impact of the changes to the DSH payment adjustment should be negligible, as the DSH payment adjustment is determined mainly by the demographic composition of an individual hospital's patient population, and not its overall bed count. However, we note that some hospitals' bed counts do not meet the minimum threshold required to qualify for the DSH payment adjustment. For these hospitals that do not meet the minimum bed count required to qualify for the DSH payment adjustment, an increase in the number of available beds could now allow them to qualify for the DSH payment adjustment. For purposes of the IME payment adjustment, an increase in a hospital's number of available beds would result in a decrease in the resident-to-bed ratio. The inclusion of bed days associated with labor and delivery patients in the available bed count for IME will increase the available beds, decrease the resident-to-bed ratio, and, consequently, decrease IME payments to teaching hospitals, depending on the number of these hospitals' labor and delivery beds. Based on labor and delivery patient days currently reported in the Medicare hospital cost report database, we estimate that the inclusion of labor and delivery beds in the available bed day count will decrease IME payments by $40 million in FY 2013.

Comment: One commenter was unable to replicate our proposed estimate of $170 in savings due to the inclusion of labor and delivery days in the available bed day count for IME. The commenter sought additional information on how the estimate was made.

Response: We thank the commenter for the comment. In the proposed rule, we determined our estimate based on Medicare hospital cost report data from 2010, which is the most recently available data for when hospitals began reporting their labor and delivery patient days. We used these data to estimate the number of available bed days with the inclusion of the labor and delivery patient days for teaching hospitals. We then calculated the change in IME payments with the revised bed count. Because only a subset of providers had submitted their 2010 Medicare hospital cost report data at the time of our estimate, we had to extrapolate our estimate to apply to all teaching hospitals. In the proposed rule, we inadvertently added our estimate of labor and delivery bed days to hospitals' total bed day count, not their bed day count used to determine IME payments, resulting in a greater estimate of savings. We have corrected our estimate of savings to $40 million, as stated above in this final rule.

6. Effects of the Policy Changes Relating to GME and IME

a. Effects of Clarification and Policy Regarding Timely Filing Requirements Under Fee-for-Service Medicare

In section IV.E.2. of the preamble of this final rule, we discuss a clarification related to the time limits for filing claims for IME, direct GME, and nursing and allied health education payments for services furnished to MA enrollees. This clarification is intended to make clear to hospitals that they must follow the regulations governing the time limits for filing claims at § 424.44 in order to receive IME, and/or direct GME, and/or nursing or allied health education program payments associated with Medicare Advantage enrollees. Because we are not making any policy changes (but rather clarifying the existing timely filing requirements), there is no financial impact for this clarification.

In section IV.E.2. of the preamble of this final rule, we also are adopting a policy under which hospitals that are required to submit no pay bills for services furnished on a prepaid capitation basis by an MA organization, or through cost settlement with either a health maintenance organization, a competitive medical plan, a health care prepayment plan, or a demonstration, for the purpose of calculating the DPP that is used in determining the DSH payment adjustment must do so within the time limits for filing claims at § 424.44. We do not anticipate that this policy will have any impact, as providers are already submitting no pay bills for purposes of the DPP.

b. Effects of Policy Changes Relating to New Teaching Hospitals: New Program Growth From 3 Years to 5 Years

In section IV.I.2. of the preamble of this final rule, we discuss our finalization of a proposal to extend the period a new teaching hospital has to establish its caps for direct GME and IME payment purposes from 3 years to 5 years. We are revising the regulations to state that if a new teaching hospital participates in training residents in a new program for the first time on or after October 1, 2012, that new teaching hospital's caps will be based on the products of the highest number of FTE residents training in any program year during the fifth year of each new program's existence for all new residency training programs and the number of years in which residents are expected to complete the program based on the minimum accredited length for each type of program. The cap will be applied beginning with the sixth academic year of the first new program. We note that, in the preamble, we have also provided a formula for calculating the FTE resident cap when residents in the new program rotate to more than one hospital during the 5 years. We believe the expansion of the cap-building period from 3 years to 5 years would make our policies for the establishment of a hospital's cap more compatible with current accreditation requirements that hospitals must meet to establish new residency training programs. We estimate that these policies will cost approximately $175 million over the next 10 years. However, because these changes to the cap growth period from 3 years to 5 years will only affect new programs beginning on or after October 1, 2012, we estimate that no cost will be incurred until FY 2016. This estimate assumes that there could be 20 new teaching hospitals each year.

c. Effects of Changes Relating to 5-Year Period Following Implementation of Reductions and Increases to Hospitals' FTE Resident Caps for GME Payment Purposes Under Section 5503 of the Affordable Care Act

In section IV.I.3. of the preamble of this final rule, we discuss our final policies related to the 5-year period following implementation of reductions and increases to hospitals' FTE resident caps for GME payment purposes under section 5503 of the Affordable Care Act. Section 5503 of the Affordable Care Act amended the Medicare statute by adding a new section 1886(h)(8) of the Act, which provides for reductions in the statutory FTE resident caps for direct GME and IME under Medicare for certain hospitals, and authorizes a ''redistribution'' to certain hospitals of the estimated number of FTE resident slots resulting from the reductions. The amendments made by section 5503 also specify that a hospital that receives an increase in its cap shall ensure, during the 5-year period beginning on the date of such increase (July 1, 2011), that certain requirements, referred to as the primary care average and 75-percent threshold, are met in order to retain those slots. Otherwise, the Medicare statute authorizes the Secretary to reduce the FTE caps of the hospital if the hospital fails to meet either of those requirements.

Because the statutorily directed criteria for consideration in awarding slots under section 5503 included the requirement that hospitals applying for slots demonstrate the likelihood of filling the slots within the first three cost reporting periods beginning on or after July 1, 2011, and we relied on that information in awarding slots, we proposed that a hospital that received section 5503 slots must fill at least half of its section 5503 slots, IME and direct GME respectively, in at least one of the following timeframes: The first 12-month cost reporting period of the 5-year period, and/or in its second 12-month cost reporting period and/or in its third 12-month cost reporting period of the 5-year period, or lose its section 5503 slots. We also proposed that the hospital must fill all of the slots it received by its final cost reporting period beginning during the timeframe of July 1, 2011, through June 30, 2016, or lose all of its section 5503 slots after June 30, 2016. However, based on public comments received, we are instead finalizing a policy under which, regardless of whether slots are used for new programs or expansions of existing programs, the Medicare contractors will remove the applicable unused section 5503 slots for portions of cost reporting periods on or after July 1, 2016. The slots that are removed will be distributed to other hospitals. We also are finalizing an additional policy regarding slots used specifically for program expansions under which in determining the applicable unused slots for purposes of reductions for cost reporting periods on or after July 1, 2016, the slots used are equal to the lesser of the number of slots used in the fourth 12-month cost report or the final cost report.

We believe the impact of these policies regarding the timing of the use of these section 5503 slots is budget neutral. We believe that hospitals will take the steps necessary to comply with the section 5503 requirements to ensure, to the best of their ability, that they will not lose their section 5503 slots. We also believe that section 5503 slots are valuable enough to hospitals that it is worthwhile for hospitals to fill as many of their section 5503 slots as possible in accordance with the policy in this final rule, because not doing so would mean the loss of unused section 5503 slots after Year 5 ends. Furthermore, section 1886(h)(8)(B)(iii) of the Act instructs the Secretary to redistribute positions that are removed from hospitals that fail to meet the requirements at section 1886(h)(8)(B)(ii) of the Act; therefore, the section 5503 slots would ultimately be filled and paid for by Medicare regardless. Thus, there will be neither an additional cost due to these policies nor savings related to these policies.

d. Preservation of Resident Cap Positions From Closed Hospitals (Section 5506 of the Affordable Care Act)

In section IV.I.4. of the preamble of this final rule, we discuss our clarifications of existing policy related to section 5506 of the Affordable Care Act. Section 5506 amended the Medicare statute to add a provision that instructs the Secretary to establish a process by regulation under which, in the event a teaching hospital closes, the Secretary will permanently increase the FTE resident caps for hospitals that meet certain criteria up to the number of the closed hospital's FTE resident caps. The Secretary is directed to ensure that the total number of FTE resident cap slots distributed is not to exceed the amount of slots in the closed hospital's direct GME and IME FTE resident caps, respectively. The regulations and application process regarding section 5506 were implemented in the November 24, 2010 final rule with comment period (75 FR 72212). The provisions included in the preamble of this final rule are generally administrative in nature, related to the rules regarding the application of section 5506, minor changes or clarifications to the ranking criteria on the applications, changes or clarifications regarding the effective dates of slots awarded under section 5506, and reiteration that the regulations at § 413.79(h) regarding temporary FTE resident caps for displaced residents, and the attending exemption from the 3-year rolling average and resident-to-bed ratio cap are being preserved. Therefore, there is no financial impact for these section 5506 provisions.

7. Effects of Changes Relating to the Reporting Requirements for Pension Costs for Medicare Cost-Finding Purposes

In section IV.J. of the preamble of this final rule, we discuss finalizing our proposal to amend two existing regulations to conform these regulations to the final policy we adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51693 through 51597) with regard to pension costs for Medicare cost-finding

purposes. Because we are making only conforming changes to the regulations and not further modifying the policy we finalized, there is no impact on hospitals for these changes for FY 2013.

8. Effects of Implementation of Rural Community Hospital Demonstration Program

In section IV.K. of the preamble of this final rule, we discuss our implementation of section 410A of Public Law 108–173, as amended, which requires the Secretary to conduct a demonstration that would modify reimbursement for inpatient services for up to 30 rural community hospitals. Section 410A(c)(2) requires that ''[i]n conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented.'' As discussed in section IV.K. of the preamble of this final rule, in the IPPS final rules for each of the previous 8 fiscal years, we have estimated the additional payments made by the program for each of the participating hospitals as a result of the demonstration. In order to achieve budget neutrality, we are adjusting the national IPPS rates by an amount sufficient to account for the added costs of this demonstration. In other words, we are applying budget neutrality across the payment system as a whole rather than merely across the participants of this demonstration. We believe that the language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that ''aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration * * * was not implemented'' but does not identify the range across which aggregate payments must be held equal.

We are adjusting the national IPPS rates according to the methodology set forth elsewhere in this final rule. The adjustment to the national IPPS rates to account for estimated demonstration cost for FY 2013 for the 7 ''pre-expansion'' participating hospitals that are currently participating in the demonstration and the 16 additional hospitals participating as a result of the expansion of the demonstration under the Affordable Care Act is $34,288,129. We note that we proposed that if settled cost reports for all of the demonstration hospitals that participated in the applicable fiscal year (2007, 2008, 2009, or 2010) were made available prior to this FY 2013 IPPS/LTCH PPS final rule, we would incorporate into the FY 2013 budget neutrality offset amount the difference between the final cost of the demonstration in any of these years and the budget neutrality offset amount applicable to such year as finalized in the respective year's IPPS final rule. The estimated amount of $34,288,129 does not account for any differences between the cost of the demonstration program for hospitals participating in the demonstration for FYs 2007 through 2010 and the amounts that were offset by the budget neutrality adjustment for these years because the specific numeric value associated with this component of the adjustment to the national IPPS rates cannot be known at this time. This is because the large majority of settled cost reports beginning in FYs 2007 through 2010 for the hospitals participating in the demonstration during those years also are not available at this time.

9. Effects of Change in Effective Date for Policies Relating to Hospital Services Furnished Under Arrangements

In section IV.L. of the preamble of this final rule, we discuss that, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51711 through 51714), we limited the circumstances under which a hospital may furnish services to Medicare beneficiaries ''under arrangements.'' Under the revised policy, ''routine services'' (that is, bed, board, and nursing and other related services) must be provided in the hospital in which the patient is a registered inpatient in order for the services to be considered as being provided by the hospital. Routine services furnished to Medicare beneficiaries as inpatients of the hospital are considered services furnished by the hospital. Only diagnostic and therapeutic services (that is, ancillary services) may be provided under arrangements outside the hospital. We have become aware that a number of affected hospitals need additional time to restructure existing arrangements and establish necessary operational protocols to comply with this requirement. Therefore, as we proposed, we are postponing the effective date of the revised policy change from services provided on or after October 1, 2011, to cost reporting periods beginning in FY 2014. We have determined that the impact of this effective date change is negligible.

I. Effects of Changes in the Capital IPPS

1. General Considerations

For the impact analysis presented below, we used data from the March 2012 update of the FY 2011 MedPAR file and the March 2012 update of the Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the capital prospective payment system do not incorporate cost data, we used the March 2012 update of the most recently available hospital cost report data (FYs 2009 and 2010) to categorize hospitals. Our analysis has several qualifications. We use the best data available and make assumptions about case-mix and beneficiary enrollment as described below. (As discussed in greater detail in section V.E. of the preamble of this final rule, at this time, we are not adopting our proposal to make an additional −0.8 percent adjustment to the national capital Federal rate in FY 2013 to account for the effect of changes in case-mix resulting from documentation and coding changes that do not reflect real changes in the case-mix in light of the adoption of MS–DRGs. However, the cumulative documentation and coding adjustment factor of 0.9479 applied in determining the FY 2012 capital Federal rate remains applied to that rate. We also note, as we proposed, we are not making any further adjustments to the Puerto Rico-specific capital rate in FY 2013 to account for changes in documentation and coding.)

Due to the interdependent nature of the IPPS, it is very difficult to precisely quantify the impact associated with each change. In addition, we draw upon various sources for the data used to categorize hospitals in the tables. In some cases (for instance, the number of beds), there is a fair degree of variation in the data from different sources. We have attempted to construct these variables with the best available sources overall. However, it is possible that some individual hospitals are placed in the wrong category.

Using cases from the March 2012 update of the FY 2011 MedPAR file, we simulated payments under the capital IPPS for FY 2012 and FY 2013 for a comparison of total payments per case. Any short-term, acute care hospitals not paid under the general IPPS (Indian Health Service hospitals and hospitals in Maryland) are excluded from the simulations.

The methodology for determining a capital IPPS payment is set forth at § 412.312. The basic methodology for calculating capital IPPS payments in FY 2013 is as follows:

(Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME adjustment factor, if applicable).

In addition to the other adjustments, hospitals may also receive outlier payments for those cases that qualify under the threshold established for each fiscal year. We modeled payments for each hospital by multiplying the capital Federal rate by the GAF and the hospital's case-mix. We then added estimated payments for indirect medical education, disproportionate share, and outliers, if applicable. For purposes of this impact analysis, the model includes the following assumptions:

- We estimate that the Medicare case-mix index will increase by 0.5 percent in both FYs 2012 and 2013.
- We estimate that the Medicare discharges will be approximately 12.5 million in FY 2012 and 12.9 million in FY 2013.
- The capital Federal rate was updated beginning in FY 1996 by an analytical framework that considers changes in the prices associated with capital-related costs and adjustments to account for forecast error, changes in the case-mix index, allowable changes in intensity, and other factors. As discussed in section III.A.1.a. of the Addendum to this final rule, the update is 1.2 percent for FY 2013.
- In addition to the FY 2013 update factor, the FY 2013 capital Federal rate was calculated based on a GAF/DRG budget neutrality adjustment factor of 0.9998, and an outlier adjustment factor of 0.9362.

2. Results

We used the actuarial model described above to estimate the potential impact of our changes for FY 2013 on total capital payments per case, using a universe of 3,423 hospitals. As described above, the individual hospital payment parameters are taken from the best available data, including the March 2012 update of the FY 2011 MedPAR file, the March 2012 update to the PSF, and the most recent cost report data from the March 2012

update of HCRIS. In Table III, we present a comparison of estimated total payments per case for FY 2012 and estimated total payments per case for FY 2013 based on the FY 2013 payment policies. Column 2 shows estimates of payments per case under our model for FY 2012. Column 3 shows estimates of payments per case under our model for FY 2013. Column 4 shows the total percentage change in payments from FY 2012 to FY 2013. The change represented in Column 4 includes the 1.2 percent update to the capital Federal rate and other changes in the adjustments to the capital Federal rate. The comparisons are provided by: (1) Geographic location; (2) region; and (3) payment classification.

The simulation results show that, on average, capital payments per case in FY 2013 are expected to increase as compared to capital payments per case in FY 2012. However, the capital Federal rate for FY 2013 will increase approximately 1.0 percent as compared to the FY 2012 capital Federal rate. The changes to the GAFs are expected to result, on average, in a slight decrease in capital payments for most regions with certain exceptions. The regional variations in the estimated change in capital payments are consistent with the changes in payments due to changes in the wage index (and policies affecting the wage index) shown in Table I in section I. of this Appendix.

We also are estimating a slight increase in outlier payments in FY 2013 as compared to FY 2012. This is primarily because of the decrease to the outlier fixed-loss amount (discussed in section II.A.4.f. of the Addendum to this final rule). In addition, this estimated increase in outlier payments is based on the FY 2011 claims from the March 2012 update of the MedPAR file, and we are currently estimating that FY 2013 capital outlier payments will be slightly more than the projected 6.18 percent used to determine the outlier offset that we applied in determining the FY 2012 capital Federal rate.

The net impact of these changes, as discussed above, is an estimated 1.8 percent change in capital payments per discharge from FY 2012 to FY 2013 for all hospitals (as shown below in Table III).

The geographic comparison shows that, on average, all hospitals are expected to experience an increase in capital IPPS payments per case in FY 2013 as compared to FY 2012. These increases are primarily due to the estimated increase in capital outlier payments. Capital IPPS payments per case for large urban hospitals are estimated to increase 2.0 percent, while other urban hospitals are expected to experience a 1.7 percent increase. Rural hospitals, on average, are expected to experience a 1.5 percent increase in capital payments per discharge from FY 2012 to FY 2013.

The comparisons by region show that the estimated increases in capital payments per discharge from FY 2012 to FY 2013 in urban areas ranges from a 0.8 percent increase for the New England urban region to a 3.2 percent increase for the Pacific urban region. For urban regions, the changes to the GAFs are expected to have a slightly negative effect on capital IPPS payments per discharge. However, for the Pacific urban region, as well as the Mountain urban region and the Puerto Rico urban region, a large part of the expected increase in capital IPPS payments per discharge is due to the GAFs. This is primarily due to changes in the wage index for hospitals located in that area as discussed in section I. of this Appendix.

Whereas the Pacific urban region is estimated to experience the largest increase in capital IPPS payment per discharge, the estimated increase for the Pacific rural region is the lowest at 0.4 percent. The largest percentage increase in capital payments per discharge from FY 2012 to FY 2013 for rural regions is estimated for the Mountain rural region to be 2.9 percent. The Puerto Rico rural region is estimated to experience a 2.5 percent increase in capital payments per discharge in FY 2013 compared to FY 2012.

Hospitals of all type of ownership (that is, voluntary hospitals, government hospitals, and proprietary hospitals) are estimated to experience an increase in capital payments per case from FY 2012 to FY 2013. The increase in capital payments for both voluntary and proprietary hospitals is estimated at 1.8 percent, and government hospitals are estimated to experience a 2.0 percent increase in capital payments per case from FY 2012 to FY 2013.

Section 1886(d)(10) of the Act established the MGCRB. Hospitals may apply for reclassification for purposes of the wage index for FY 2013. Reclassification for wage index purposes also affects the GAFs because that factor is constructed from the hospital wage index. To present the effects of the hospitals being reclassified for FY 2013, we show the average capital payments per case for reclassified hospitals for FY 2013. As with all other categories, reclassified hospitals are expected to experience an increase in capital payments. The estimated percentage increase for urban reclassified hospitals is 2.0 percent, and 1.9 percent for urban nonreclassified hospitals. Rural reclassified hospitals are estimated to experience a 1.6 percent increase in capital payments per discharge from FY 2012 to FY 2013, while rural nonreclassified hospitals are estimated to experience a 1.3 percent increase in capital payments per case. Other reclassified hospitals (that is, hospitals reclassified under section 1886(d)(8)(B) of the Act) are expected to experience a 1.0 percent increase in capital payments from FY 2012 to FY 2013.

TABLE III—COMPARISON OF TOTAL PAYMENTS PER CASE

[FY 2012 payments compared to FY 2013 payments]

	Number of hospitals	Average FY 2012 payments/ case	Average FY 2013 payments/ case	Percentage change
By Geographic Location:				
All hospitals	3,423	794	809	1.8
Large urban areas (populations over 1 million)	1,373	876	894	2.0
Other urban areas (populations of 1 million of fewer)	1,124	777	790	1.7
Rural areas	926	550	558	1.5
Urban hospitals	2,497	832	847	1.9
0–99 beds	633	678	692	1.9

J. Effects of Payment Rate Changes and Policy Changes Under the LTCH PPS

1. Introduction and General Considerations

In section VII. of the preamble and section V. of the Addendum to this final rule, we set forth the annual update to the payment rates for the LTCH PPS for FY 2013. In the preamble, we specify the statutory authority for the provisions that are presented, identify those policies, and present rationales for our decisions as well as alternatives that were considered. In this section of Appendix A to this final rule, we discuss the impact of the changes to the payment rate, factors, and other payment rate policies related to the LTCH PPS that are presented in the preamble of this final rule in terms of their estimated fiscal impact on the Medicare budget and on LTCHs.

Currently, there are 428 LTCHs included in this impacts analysis which includes data for 82 nonprofit (voluntary ownership control) LTCHs and 323 proprietary LTCHs. Of the remaining 23 LTCHs, 14 LTCHs are government-owned and operated and the ownership type of the other 9 LTCHs is unknown. In the impact analysis, we used the payment rate, factors, and policies presented in this final rule, including the 1.8 percent annual update, which is based on the full increase of the LTCH PPS market basket and the reductions required by sections 1886(m)(3) and (m)(4) of the Act, a one-time prospective adjustment factor of 0.98734 (approximately −1.3 percent), which will not apply to payments for discharges occurring on or before December 28, 2012 (consistent with the statute), the update to the MS–LTC–DRG classifications and relative weights, the update to the wage index values and labor-related share, the expiration of the statutory delay in the application of very short-stay outlier policy under § 412.529(c)(3), effective for discharges occurring on or after December 29, 2012 (that is, the option for certain short-stay outlier cases to be paid under the ''blended payment'' will be replaced with the ''IPPS comparable per diem amount'' as discussed in section VII.E.3. of the preamble of this final rule), and the best available claims and CCR data to estimate the change in payments for FY 2013.

The standard Federal rate for FY 2012 was $40,222.05. For FY 2013, we are establishing a standard Federal rate of $40,397.96 that reflects the 1.8 percent annual update to the standard Federal rate, and the area wage budget neutrality factor of 0.999265, which ensures that the changes in the wage indexes and labor-related share do not influence aggregate payments. Furthermore, consistent with section 114(c)(4) of the MMSEA, as amended by sections 3106(a) and 10312 of the Affordable Care Act, the one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 (approximately −1.3 percent) will not apply to payments for discharges occurring before December 29, 2012. Therefore, payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will not reflect that adjustment and, instead, will be paid based on a standard Federal rate of $40,915.95.

Based on the best available data for the 428 LTCHs in our database, we estimate that the annual update to the standard Federal rate for FY 2013 (discussed in section V.A.2. of the Addendum to this final rule) and the changes to the area wage adjustment for FY 2013 (discussed in section V.B. of the Addendum to this final rule), in addition to an estimated increase in HCO payments and an estimated decrease in SSO payments, will result in an increase in estimated payments from FY 2012 of approximately $92 million. Based on the 428 LTCHs in our database, we estimate that the FY 2013 LTCH PPS payments will be approximately $5.52 billion, as compared to estimated FY 2012 LTCH PPS payments of approximately $5.43 billion. Because the combined distributional effects and estimated changes to the Medicare program payments are over approximately $100 million, this final rule is considered a major economic rule, as defined in this section. We note that the approximately $92 million for the projected increase in estimated aggregate LTCH PPS payments from FY 2012 to FY 2013 does not reflect changes in LTCH admissions or case-mix intensity in estimated LTCH PPS payments, which also will affect overall payment changes. It also does not include the estimated effect of the 1-year extension of the moratorium on the application of the ''25-percent threshold'' payment adjustment policy on LTCH PPS payments, which is discussed below in section I.J.b.3. of this Appendix.

The projected 1.7 percent increase in estimated payments per discharge from FY 2012 to FY 2013 is attributable to several factors, including the 1.8 percent annual update to the standard Federal rate, the one-time prospective adjustment factor for FY 2013 of 0.98734 (approximately −1.3 percent) to the standard Federal rate, which is not applicable to payments for discharges occurring on or before December 28, 2012, consistent with the statute, and projected increases in estimated HCO payments and decreases in SSO payments due to a change in the SSO payment methodology effective for discharges occurring on or after December 29, 2012 (as described in section VII.E.3. of the preamble of this final rule). As Table IV shows, the change attributable solely to the annual update to the standard Federal rate (1.8 percent), including the one-time prospective adjustment factor for FY 2013 (approximately −1.3 percent), which is not applicable to payments for discharges occurring before December 29, 2012, is projected to result in an increase of 0.7 percent in payments per discharge from FY 2012 to FY 2013, on average, for all LTCHs. This estimated increase of 0.7 percent reflects the 1.8 percent annual update for payments in FY 2013, and the −1.3 percent one-time prospective adjustment factor for FY 2013, which will not apply in determining payments for discharges occurring on or before December 28, 2012, and also includes estimated payments for SSO cases that are paid using special methodologies that are not affected by the annual update to the standard Federal rate. Therefore, the projected increase in payments based on the standard Federal rate is less than the 1.8 percent annual update for FY 2013. Because we are applying an area wage level budget neutrality factor to the standard Federal rate, the annual update to the wage data and labor-related share does not impact the increase in payments.

As discussed in section V.B. of the Addendum to this final rule, we are updating the wage index values for FY 2013 based on the most recent available data. In addition, we are decreasing the labor-related share from 70.199 percent to 63.096 percent under the LTCH PPS for FY 2013, based on the most recent available data on the relative importance of the labor-related share of operating and capital costs based on the FY 2009-based LTCH-specific market basket. We also are applying an area wage level budget neutrality factor of 0.999265, which reduces the standard Federal rate by less than 0.1 percent. Therefore, the changes to the wage data and labor-related share do not result in a change in estimated aggregate LTCH PPS payments.

We project that LTCHs will experience a decrease in aggregate payments of 0.5 percent in FY 2013 as a result of the expiration of the statutory delay in the application of the very short-stay outlier policy under § 412.529(c)(3), effective for discharges occurring on or after December 29, 2012. Generally, very short-stay outliers are cases that have a length of stay that is less than or equal to one standard deviation from the geometric mean average length of stay of the same DRG under the IPPS. Under the moratorium, very short-stay outliers are paid the lowest of: (1) The LTC–DRG payment; (2) 100 percent of cost; (3) 120 percent of the LTCH per diem payment; or (4) a blend of 120 percent of the LTCH per diem amount and the ''IPPS comparable per diem amount'' (the ''blended payment''). With the expiration of the moratorium, in the case of very short-stay outliers, effective for discharges on or after December 29, 2012, the ''blended payment'' will be replaced with only the ''IPPS comparable per diem amount,'' which results in a decrease in payments for many of these cases.

Table IV below shows the impact of the payment rate and the policy changes on LTCH PPS payments for FY 2013 presented in this final rule by comparing estimated FY 2012 payments to estimated FY 2013 payments. The projected increase in payments per discharge from FY 2012 to FY 2013 is 1.7 percent (shown in Column 9). This projected increase in payments is attributable to the impacts of the change to the standard Federal rate (0.7 percent in Column 6), the end of the moratorium on delaying the implementation of the very short-stay outlier policy (−0.5 percent in Column 8), as well as the effect of the estimated increase in payments for HCO cases and SSO cases (1.1 percent and 0.2 percent, respectively). That is, estimated total HCO payments are projected to increase from FY 2012 to FY 2013 in order to ensure that the estimated HCO payments would be 8 percent of the total estimated LTCH PPS payments in FY 2013. An analysis of the most recent available LTCH PPS claims data (that is, FY 2011 claims data from the March 2012 update of the MedPAR file) indicates

that the FY 2012 HCO threshold of $17,931 (as established in the FY 2012 IPPS/LTCH PPS final rule) may-result in HCO payments in FY 2012 that fall below the estimated 8 percent. Specifically, we currently estimate that HCO payments will be approximately 6.9 percent of the estimated total LTCH PPS payments in FY 2012. We estimate that the impact of the increase in HCO payments will result in approximately a 1.1 percent increase in estimated payments from FY 2012 to FY 2013, on average, for all LTCHs. Furthermore, in calculating the estimated increase in payments from FY 2012 to FY 2013 for HCOs, we increased estimated costs by the applicable market basket percentage increase as projected by our actuaries. This increase in estimated costs also results in a projected increase in SSO payments of 0.2 percent relative to last year. However, the expiration of the statutory moratorium on the application of the very short-stay outlier policy, effective December 29, 2012, which replaces the ''blended payment'' option with the ''IPPS comparable per diem amount'' option for certain SSO cases (as described in section VII.E.3. of the preamble of this final rule) is expected to result in a −0.5 percent change in aggregate payments. The net result of these projected changes in SSO payments in FY 2013 is an estimated change in aggregate payments of −0.3 percent. We note that estimated payments for all SSO cases comprise approximately 12 percent of the estimated total LTCH PPS payments, and estimated payments for HCO cases comprise approximately 8 percent of the estimated total FY 2013 LTCH PPS payments. Payments for HCO cases are based on 80 percent of the estimated cost of the case above the HCO threshold, while the majority of the payments for SSO cases (approximately 59 percent) are based on the estimated cost of the case.

As we discuss in detail throughout this final rule, based on the most recent available data, we believe that the provisions of this final rule relating to the LTCH PPS will result in an increase in estimated aggregate LTCH PPS payments and that the resulting LTCH PPS payment amounts will result in appropriate Medicare payments.

2. Impact on Rural Hospitals

For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. As shown in Table IV, we are projecting a 3.3 percent increase in estimated payments per discharge for FY 2013 as compared to FY 2012 for rural LTCHs that will result from the changes presented in this final rule, as well as the effect of estimated changes to HCO and SSO payments. This estimated impact is based on the data for the 27 rural LTCHs in our database (out of 428 LTCHs) for which complete data were available.

The estimated increase in LTCH PPS payments from FY 2012 to FY 2013 for rural LTCHs is primarily due to the higher than average impacts from the changes to the area wage level adjustment, specifically, the decrease in the labor-related share from 70.199 to 63.096. Although we applied an area wage level budget neutrality factor for changes to the wage indexes and labor-related share to ensure that there is no change in aggregate LTCH PPS payments due to those changes, we estimate rural hospitals will experience a 1.1 percent increase in payments due to the changes to the area wage level adjustment, as shown in Column 7 below. Rural hospitals generally have a wage index of less than 1; therefore, a decrease to the labor-related share results in their wage index reducing a smaller portion of the standard Federal rate, resulting in an estimated increase in payments in FY 2013 as compared to FY 2012.

3. Anticipated Effects of LTCH PPS Payment Rate Changes and Policy Changes

a. Budgetary Impact

Section 123(a)(1) of the BBRA requires that the PPS developed for LTCHs ''maintain budget neutrality.'' We believe that the statute's mandate for budget neutrality applies only to the first year of the implementation of the LTCH PPS (that is, FY 2003). Therefore, in calculating the FY 2003 standard Federal rate under § 412.523(d)(2), we set total estimated payments for FY 2003 under the LTCH PPS so that estimated aggregate payments under the LTCH PPS were estimated to equal the amount that would have been paid if the LTCH PPS had not been implemented.

As discussed above in section I.J.1. of this Appendix, we project an increase in aggregate LTCH PPS payments in FY 2013 relative to FY 2012 of approximately $92 million based on the 428 LTCHs in our database.

b. Expiration of Statutory Delay on Full Implementation of the ''25 Percent Threshold'' Payment Adjustment and 1-Year Extension

As discussed in section VII.E.2. of the preamble of this final rule, the statutory delay in the full application of the ''25 percent threshold'' payment adjustment for LTCHs under § 412.534 and § 412.536 will expire for cost reporting periods beginning on or after July 1, 2012, or October 1, 2012, as applicable. We are establishing a 1-year extension of the moratorium on the application of the ''25 percent threshold'' payment adjustment policy as provided by section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(a) and 10312(a) of the Affordable Care Act, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013 (and for discharges occurring on or after October 1, 2012, through the end of the cost reporting period of LTCHs with cost reporting periods beginning on or after July 1, 2012, and before September 30, 2012, as explained in section VII.E.2. of the preamble of this final rule). We estimate that this policy will result in a payment impact of approximately $170 million to LTCHs.

c. Impact on Providers

The basic methodology for determining a per discharge LTCH PPS payment is set forth under § 412.515 through § 412.536. In addition to the basic MS–LTC–DRG payment (the standard Federal rate multiplied by the MS–LTC–DRG relative weight), we make adjustments for differences in area wage levels, the COLA for Alaska and Hawaii, and SSOs. Furthermore, LTCHs may also receive HCO payments for those cases that qualify based on the threshold established each year.

To understand the impact of the changes to the LTCH PPS payments presented in this final rule on different categories of LTCHs for FY 2013, it is necessary to estimate payments per discharge for FY 2012 using the rates, factors (including the FY 2012 GROUPER (Version 29.0), and relative weights and the policies established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51733 through 51781 and 51838 through 51844). It is also necessary to estimate the payments per discharge that will be made under the LTCH PPS rates, factors, policies, and GROUPER (Version 30.0) for FY 2013 (as discussed in section VII. of the preamble and section V. of the Addendum to this final rule). These estimates of FY 2012 and FY 2013 LTCH PPS payments are based on the best available LTCH claims data and other factors, such as the application of inflation factors to estimate costs for SSO and HCO cases in each year. We also evaluated the change in estimated FY 2012 payments to estimated FY 2013 payments (on a per discharge basis) for each category of LTCHs. We are establishing a standard Federal rate for FY 2013 of $40,397.96 that includes the 1.8 percent annual update, the area wage budget neutrality factor, and the one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 (approximately −1.3 percent) that will not apply to payments for discharges occurring on or before December 29, 2012, consistent with statute. Payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will not reflect that one-time prospective adjustment and instead will be paid based on a standard Federal rate of $40,915.95.

Therefore, we modeled payments so that claims with discharge dates prior to January will be paid on the basis of a rate that does not reflect the one-time prospective adjustment, and claims with discharges in January or after will reflect the standard Federal rate for FY 2013 that reflects the one-time prospective adjustment. Furthermore, because the statutory moratorium on the application of the very short-stay outlier policy will expire effective for discharges occurring on or after December 29, 2012, we modeled payments so that claims that will qualify for a payment under the very short-stay outlier policy with discharge dates in October, November, and December are paid based on the ''blended payment'' option, if applicable, and claims that will qualify for a payment under the very short-stay outlier policy with discharges in January through September are paid based on the ''IPPS comparable per diem amount,'' if applicable (as described in section VII.E.3. of the preamble of this final rule).

Hospital groups were based on characteristics provided in the OSCAR data, FY 2008 through FY 2009 cost report data in HCRIS, and PSF data. Hospitals with incomplete characteristics were grouped into the ''unknown'' category. Hospital groups included the following:

- Location: Large urban/other urban/rural.
- Participation date.
- Ownership control.

- Census region.
- Bed size.

To estimate the impacts of the payment rates and policy changes among the various categories of existing providers, we used LTCH cases from the FY 2011 MedPAR file to estimate payments for FY 2012 and to estimate payments for FY 2013 for 428 LTCHs. We believe that the discharges based on the FY 2011 MedPAR data for the 428 LTCHs in our database, which includes 323 proprietary LTCHs, provide sufficient representation in the MS–LTC–DRGs containing discharges for patients who received LTCH care for the most commonly treated LTCH patients' diagnoses.

d. Calculation of Prospective Payments

For purposes of this impact analysis, to estimate per discharge payments under the LTCH PPS, we simulated payments on a case-by-case basis using LTCH claims from the FY 2011 MedPAR files. For modeling estimated LTCH PPS payments for FY 2012, we used the FY 2012 standard Federal rate (that is, $40,222.05 effective for LTCH discharges occurring on or after October 1, 2011, through September 30, 2012).

For modeling estimated LTCH PPS payments for FY 2013, we used the FY 2013 standard Federal rate of $40,397.96, which includes the one-time prospective adjustment of 0.98734 for FY 2013 for payments for discharges occurring on or after December 29, 2012, and through September 30, 2013. As noted above, consistent with section 114(c)(4) of the MMSEA, as amended by sections 3106(a) and 10312 of the Affordable Care Act, the one-time prospective adjustment to the standard Federal rate for FY 2013 of 0.98734 (approximately −1.3 percent) will not apply to payments for discharges occurring before December 29, 2012. Therefore, payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will not reflect that adjustment and instead will be paid based on a standard Federal rate of $40,915.95; therefore, for the purpose of payment modeling, claims with discharges occurring during October through December were modeled using this payment rate.

The FY 2013 standard Federal rate of $40,397.96 includes the application of an area wage level budget neutrality factor of 0.999265 (as discussed in section V.B.5. of the Addendum to this final rule). As noted above, consistent with section 114(c)(4) of the MMSEA, as amended by sections 3106(a) and 10312 of the Affordable Care Act, this payment rate will not apply to payments for discharges occurring before December 29, 2012. Therefore, payment for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will be paid based on a standard Federal rate of $40,915.95, which also includes the area wage level budget neutrality factor of 0.999265.

Furthermore, in modeling estimated LTCH PPS payments for both FY 2012 and FY 2013 in this impact analysis, we applied the FY 2012 and the FY 2013 adjustments for area wage levels and the COLA for Alaska and Hawaii. Specifically, we adjusted for differences in area wage levels in determining estimated FY 2012 payments using the current LTCH PPS labor-related share of 70.199 percent (76 FR 51766) and the wage index values established in the Tables 12A and 12B listed in the Addendum to the FY 2012 IPPS/LTCH PPS final rule (and available via the Internet (76 FR 51813)). We also applied the FY 2012 COLA factors shown in the table in section V.C. of the Addendum to that final rule (76 FR 51810) to the FY 2012 nonlabor-related share (29.801 percent) for LTCHs located in Alaska and Hawaii. Similarly, we adjusted for differences in area wage levels in determining the estimated FY 2013 payments using the FY 2013 LTCH PPS labor-related share of 63.096 percent and the FY 2013 wage index values presented in Tables 12A and 12B listed in section VI. of the Addendum to this final rule (and available via the Internet). We also applied the FY 2013 COLA factors shown in the table in section V.C. of the Addendum to this final rule to the FY 2013 nonlabor-related share (36.904 percent) for LTCHs located in Alaska and Hawaii.

As discussed above, our impact analysis reflects an estimated change in payments for SSO cases, as well as an estimated increase in payments for HCO cases (as described in section V.D. of the Addendum to this final rule). In modeling payments for SSO and HCO cases in FY 2013, we applied an inflation factor of 1.050 (determined by OACT) to estimate the costs of each case using the charges reported on the claims in the FY 2011 MedPAR files and the best available CCRs from the March 2012 update of the PSF. Furthermore, in modeling estimated LTCH PPS payments for FY 2013 in this impact analysis, we used the FY 2013 fixed-loss amount of $15,408 (as discussed in section V.D. of the Addendum to this final rule). Finally, in modeling payments for SSO cases, we included the expiration of the statutory moratorium on application of the very short-stay outlier, effective for discharges occurring on or after December 29, 2012, under which the ''blended payment'' option of the SSO payment formula will be replaced with the ''IPPS comparable per diem amount'' for very short-stay outlier cases as discussed in section VII.E.3. of the preamble of this final rule.

These impacts reflect the estimated ''losses'' or ''gains'' among the various classifications of LTCHs from FY 2012 to FY 2013 based on the payment rates and policy changes presented in this final rule. Table IV illustrates the estimated aggregate impact of the LTCH PPS among various classifications of LTCHs.

- The first column, LTCH Classification, identifies the type of LTCH.
- The second column lists the number of LTCHs of each classification type.
- The third column identifies the number of LTCH cases.
- The fourth column shows the estimated payment per discharge for FY 2012 (as described above).
- The fifth column shows the estimated payment per discharge for FY 2013 (as described above).
- The sixth column shows the percentage change in estimated payments per discharge from FY 2012 to FY 2013 due to the annual update to the standard Federal rate (as discussed in section V.A.2. of the Addendum to this final rule) and the one-time prospective adjustment factor for FY 2013 (which is not applicable to payments for discharges occurring before December 29, 2012, consistent with the statute).
- The seventh column shows the percentage change in estimated payments per discharge from FY 2012 to FY 2013 for changes to the area wage level adjustment (that is, the wage indexes and labor-related share), including the application of an area wage level budget neutrality factor (as discussed in section V.B.5. of the Addendum to this final rule).
- The eighth column shows the percentage change in estimated payments per discharge from FY 2012 to FY 2013 due to the expiration of the delay in the application of the ''very short-stay'' SSO policy that allowed for certain SSO cases to be paid under a ''blended payment amount'' based on the LTCH per diem rate and IPPS comparable per diem rate during the moratorium.
- The ninth column shows the percentage change in estimated payments per discharge from FY 2012 (Column 4) to FY 2013 (Column 5) for all changes (and includes the effect of estimated changes to HCO and SSO payments).

TABLE IV—IMPACT OF PAYMENT RATE AND POLICY CHANGES TO LTCH PPS PAYMENTS FOR FY 2013

[Estimated FY 2012 payments compared to estimated FY 2013 payments*]

LTCH classification	Number of LTCHs	Number of LTCH PPS cases	Average FY 2012 LTCH PPS payment per case	Average FY 2013 LTCH PPS payment per case [1]	Percent change in estimated payments per discharge from FY 2012 to FY 2013 for the annual update to the Federal rate [2]	Percent change in estimated payments per discharge from FY 2012 to FY 2013 for changes to the area wage level adjustment with budget neutrality [3]	Percent change in estimated payments per discharges due to expiration of statutory moratorium on application of the 'very' short-stay SSO Payment methodology [4]	Percent change in payments per discharge from FY 2012 to FY 2013 for all changes [5]

[1] Estimated FY 2013 LTCH PPS payments based on the payment rate and policy changes presented in the preamble and the Addendum to this final rule.

[2] Percent change in estimated payments per discharge from FY 2012 to FY 2013 for the annual update to the standard Federal rate and the one-time prospective adjustment factor for FY 2013 (which will not apply to payments for discharges occurring before December 29, 2012, consistent with the statute), as discussed in section V.A.2. of the Addendum to this final rule.

[3] Percent change in estimated payments per discharge from FY 2012 to FY 2013 for changes to the area wage level adjustment under § 412.525(c) (as discussed in section V.B. of the Addendum to this final rule).

[4] Percent change in estimated payments per discharges due to the expiration of the statutory moratorium on application of the ''very short-stay'' SSO payment option, effective for discharges occurring on or after December 29, 2012, under which the ''blended payment'' option of the SSO payment formula will be replaced with the ''IPPS comparable per diem amount'' for very short-stay outlier cases as discussed in section VII.E.3. of the preamble of this final rule.

[5] Percent change in estimated payments per discharge from FY 2012 LTCH PPS (shown in Column 4) to FY 2013 LTCH PPS (shown in Column 5), including all of the changes presented in the preamble and the Addendum to this final rule. Note, this column, which shows the percent change in estimated payments per discharge for all changes, does not equal the sum of the percent changes in estimated payments per discharge for the annual update to the standard Federal rate (column 6) and the changes to the area wage level adjustment with budget neutrality (Column 7) due to the effect of estimated changes in both estimated payments to SSO cases that are paid based on estimated costs and aggregate HCO payments (as discussed in this impact analysis), as well as other interactive effects that cannot be isolated.

e. Results

Based on the most recent available data for 428 LTCHs, we have prepared the following summary of the impact (as shown above in Table IV) of the LTCH PPS payment rate and policy changes presented in this final rule. The impact analysis in Table IV shows that estimated payments per discharge are expected to increase approximately 1.7 percent, on average, for all LTCHs from FY 2012 to FY 2013 as a result of the payment rate and policy changes presented in this final rule, including the expiration of the statutory moratorium on application of the ''very short-stay'' SSO policy which utilizes the ''IPPS comparable per diem amount'' payment option, effective for discharges occurring on or after December 29, 2012 (discussed in section VII.E.3. of the preamble of this final rule) and an estimated increase in HCO payments. This estimated 1.7 percent increase in LTCH PPS payments per discharge from the FY 2012 to FY 2013 for all LTCHs (as shown in Table IV) was determined by comparing estimated FY 2013 LTCH PPS payments (using the payment rate and policies discussed in this final rule) to estimated FY 2012 LTCH PPS payments (as described above in section I.J.1. of this Appendix).

We are establishing a standard Federal rate of $40,397.96 for FY 2013. Specifically, we are updating the standard Federal rate for FY 2013 by 1.8 percent, which is based on the latest estimate of the LTCH PPS market basket increase (2.6 percent), the reduction of 0.7 percentage point for the MFP adjustment, and the 0.1 percentage point reduction consistent with sections 1886(m)(3) and (m)(4) of the Act. In addition, we are applying a one-time prospective adjustment factor for FY 2013 of 0.98734 (approximately −1.3 percent) to the standard Federal rate. However, this reduction will not apply to payments for discharges occurring before December 29, 2012, consistent with section 114(c)(4) of the MMSEA, as amended by sections 3106(a) and 10312 of the Affordable Care Act. Therefore, payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, will not reflect that adjustment and instead will be paid based on a standard Federal rate of $40,915.95. We noted earlier in this section that, for most categories of LTCHs, as shown in Table IV (Column 6), the impact of the increase of 1.8 percent in the annual update to the standard Federal rate and the application of the one-time prospective adjustment for FY 2013 of approximately −1.3 percent, which will not apply to payments for discharges occurring before December 29, 2012, consistent with the statute, is projected to result in approximately a 0.7 percent increase in estimated payments per discharge for all LTCHs from FY 2012 to FY 2013. That is, for approximately the first 3 months of FY 2013, payments will not reflect the one-time prospective adjustment factor for FY 2013 such that payments will be based on the annual update to the standard Federal rate of 1.8 percent, and for the remaining 9 months of FY 2013, payments will be based on a standard Federal rate that reflects the FY 2013 annual update of 1.8 percent and the one-time prospective adjustment for FY 2013 of approximately −1.3 percent. In addition, our estimate of the changes in payments due to the update to the standard Federal rate also reflects estimated payments for SSO cases that are paid using special methodologies that are not affected by the update to the standard Federal rate. For these reasons, we estimate that payments will increase by 0.7 percent due to the annual update to the standard Federal rate and the application of the one-time prospective adjustment for FY 2013 (which is not applicable to payments for discharges occurring before December 29, 201, consistent with the statute).

(1) Location

Based on the most recent available data, the vast majority of LTCHs are located in urban areas. Only approximately 6 percent of the LTCHs are identified as being located in a rural area, and approximately 5 percent of all LTCH cases are treated in these rural hospitals. The impact analysis presented in Table IV shows that the average percent increase in estimated payments per discharge from FY 2012 to FY 2013 for all hospitals is 1.7 percent for all changes. For rural LTCHs, the percent change for all changes is estimated to be 3.3 percent, while for urban LTCHs, we estimate the increase will be 1.6 percent. Large urban LTCHs are projected to experience an increase of 1.5 percent in estimated payments per discharge from FY 2012 to FY 2013, while other urban LTCHs are projected to experience an increase of 1.8 percent in estimated payments per discharge from FY 2012 to FY 2013, as shown in Table IV.

(2) Participation Date

LTCHs are grouped by participation date into four categories: (1) Before October 1983; (2) between October 1983 and September 1993; (3) between October 1993 and September 2002; and (4) after October 2002. Based on the most recent available data, the category of LTCHs with the largest percentage of the LTCH cases (approximately 47 percent) are in hospitals that began participating in the Medicare program between October 1993 and September 2002, and are projected to experience nearly the average increase (1.7 percent) in estimated payments per discharge from FY 2012 to FY 2013, as shown in Table IV.

In the participation category where LTCHs began participating in the Medicare program before October 1983, LTCHs are projected to experience a higher than average percent increase (2.4 percent) in estimated payments per discharge from FY 2012 to FY 2013, as shown in Table IV. Approximately 4 percent of LTCHs began participating in the Medicare program before October 1983. Approximately 10 percent of LTCHs began participating in the Medicare program between October 1983 and September 1993. These LTCHs are projected to experience a 1.7 percent increase in estimated payments from FY 2012 to FY 2013. LTCHs that began participating in the Medicare program after October 2002 currently represent approximately 40 percent of all LTCHs, and are projected to experience an average increase (1.7 percent) in estimated payments from FY 2012 to FY 2013.

(3) Ownership Control

Other than LTCHs whose ownership control type is unknown, LTCHs are grouped into three categories based on ownership control type: Voluntary, proprietary, and government. Based on the most recent available data, approximately 19 percent of LTCHs are identified as voluntary (Table IV). We expect that LTCHs in the voluntary category will experience a higher than the average increase (2.3 percent) in estimated FY 2013 LTCH PPS payments per discharge as compared to estimated payments in FY 2012 primarily because we project the estimated increase in HCO payments to be higher than the average increase for these LTCHs. The majority (75 percent) of LTCHs is identified as proprietary and these LTCHs are projected to experience a nearly average increase (1.6 percent) in estimated payments per discharge from FY 2012 to FY 2013. Finally, government-owned and operated LTCHs are also expected to experience the average increase in payments of 1.7 percent in estimated payments per discharge from FY 2012 to FY 2013.

(4) Census Region

Estimated payments per discharge for FY 2013 are projected to increase for LTCHs located in all regions in comparison to FY 2012. Of the 9 census regions, we project that the increase in estimated payments per discharge will have the largest positive impact on LTCHs in the West South Central, East South Central, and New England regions (2.3 percent, 2.2 percent, and 2.1 percent respectively as shown in Table IV). The estimated percent increase in payments per discharge from FY 2012 to FY 2013 for those regions is largely attributable to the changes in the area wage level adjustment or updates to the MS–LTC–DRGs classifications and relative weights.

In contrast, LTCHs located in the Pacific region are projected to experience the smallest increase in estimated payments per discharge from FY 2012 to FY 2013. The average estimated increase in payments of 0.6 percent for LTCHs in the Pacific region is primarily due to estimated decreases in payments associated with the changes to the area wage level adjustment.

(5) Bed Size

LTCHs are grouped into six categories based on bed size: 0–24 beds; 25–49 beds; 50–74 beds; 75–124 beds; 125–199 beds; and greater than 200 beds.

We project that small LTCHs (0–24 beds) will experience a 2.2 percent increase in payments due to increases in the area wage level adjustment while large LTCHs (200+ beds) will experience a 1.8 percent increase in payments. LTCHs with between 75 and 124 beds are expected to experience a below average increase in payments per discharge from FY 2012 to FY 2013 (1.3 percent) primarily due to an estimated decrease in their payments from FY 2012 to FY 2013 due to the area wage level adjustment.

4. Effect on the Medicare Program

As noted previously, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments in FY 2013 relative to FY 2012 of

approximately $92 million (or approximately 1.7 percent) for the 428 LTCHs in our database. In addition, the effects of the extension of the moratorium on the application of the ''25 percent threshold'' payment adjustment policy, as provided by section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(a) and 10312(a) of the Affordable Care Act, for cost reporting periods beginning or after October 1, 2012, and before October 1, 2013 (and for discharges occurring on or after October 1, 2012, through the end of the cost reporting period of LTCHs with cost reporting periods beginning on or after July 1, 2012, and before September 30, 2012, as explained in section VII.E.2. of the preamble of this final rule), will result in a payment impact of approximately $170 million to LTCHs.

5. Effect on Medicare Beneficiaries

Under the LTCH PPS, hospitals receive payment based on the average resources consumed by patients for each diagnosis. We do not expect any changes in the quality of care or access to services for Medicare beneficiaries under the LTCH PPS, but we continue to expect that paying prospectively for LTCH services will enhance the efficiency of the Medicare program.

K. Effects of Requirements for Hospital Inpatient Quality Reporting (IQR) Program

In section VIII.A. of this final rule, we discuss our requirements for hospitals to report quality data under the Hospital IQR Program in order to receive the full annual percentage increase for FY 2015. We now estimate that approximately 95 hospitals may not receive the full annual percentage increase in any fiscal year. At the time that the analysis was prepared, 70 hospitals did not receive the full annual percentage increase in FY 2012.

For the FY 2015 payment determination, we will remove one chart-abstracted measure, and 16 claims based measures, beginning with January 1, 2012 discharges. We believe that these changes will not have a significant effect on our estimate. We believe that most of these hospitals will be either small rural or small urban hospitals. However, at this time, information is not available to determine the precise number of hospitals that will not meet the requirements to receive the full annual percentage increase for FY 2015.

In section VIII.A.6. of this final rule, we are finalizing for the FY 2015 payment determination, supplements to the chart validation process for the Hospital IQR Program. As a part of these supplements, we are finalizing, for FY 2015 payment determinations and subsequent years, to separate validation for chart-abstracted and HAI measures and to also validate two additional HAI measures, CAUTI and SSI. Starting with the FY 2015 payment determination, we are finalizing a modest increase to the current Hospital IQR Program validation sample of 18 cases per quarter (currently three each for SCIP, AMI, HF, PN, ED/IMM, and candidate CLABSI) to 27 cases per quarter (3 each for SCIP, AMI, HF, PN, ED/IMM, and up to 12 records combined for CLABSI, CAUTI, and SSI). However, in order not to increase the Hospital IQR validation program's overall burden to hospitals, while expanding some of the requirements, and targeting hospitals with higher levels of concern for data quality, we are reducing the total sample size of hospitals included in the annual validation random sample from 800 eligible hospitals to up to 600 eligible hospitals. This includes 400 hospitals in the base random sample and up to 200 hospitals in the target sample. The requirement of an additional 9 charts per hospital submitted for validation, combined with the decreased sample size, will result in approximately 1,800 additional charts per quarter being submitted to CMS by all selected hospitals. We provide payment to hospitals for the cost of sending charts to the CDAC contractor at the rate of 12 cents per page for copying and approximately $4.00 per chart for postage. Our experience shows that the average chart received by the CDAC contractor is approximately 275 pages. Thus, we estimate that we would expend approximately $66,600 per quarter to collect the additional charts we need to validate all measures.

The total requirement of 27 charts per hospital would result in approximately 16,200 charts per quarter being submitted to CMS. Using the assumptions discussed above, for the FY 2015 Hospital IQR Program, we estimate that we would have expenditures of approximately $599,400 per quarter related to the validation requirement. Given that we pay for the data collection effort, we believe that a requirement for 27 charts per hospital per quarter represents a minimal burden to participating hospitals selected for validation.

L. Effects of PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

In section VIII.B. of the preamble of this final rule, we discuss our proposed and final policies to implement the quality data reporting program for PPS-exempt hospitals (PCHs), which we refer to as the PCHQR Program. The PCHQR Program is established under section 1866(k) of the Act, as added by section 3005 of the Affordable Care Act. These quality reporting requirements will affect all PCHs participating in Medicare. In this final rule, PCHs will be required to register with the CDC, the CMS contractor, and QualityNet Web sites and take the proper training in order to be adequately prepared to use the respective systems to submit the data. The anticipated burden to these PCHs consists of the following: (1) The initial registration of the facility with CDC, the CMS contractor, and CMS; (2) training of the appropriate staff members on how to use the CDC agency-based data collection mechanism (CDC/NHSN), the CMS contractor-based collection mechanism for the cancer-specific quality measure data, and CMS (QualityNet) program; (3) the time required for collection and aggregation of data; (4) the time required for entry of the data into the CDC's NHSN data warehouse, CMS contractor's quality measure data warehouse, and QualityNet databases by the PCH's representative.

All PCHs that currently do not already report data to the NHSN will be required to register with the CDC, the CMS contractor, and the CMS/QualityNet and take the proper training in order to be adequately prepared to use the CDC's NHSN data warehouse, the CMS contractor's collection mechanism for data submission, and the CMS QualityNet Web site.

Those PCHs that already report the HAI measures to the NHSN will not be significantly affected because we intend to align our reporting infrastructure with that used by the NHSN. However, for PCHs that do not currently report the two HAI measures to the NHSN, at this time, we have no way to estimate how many PCHs will participate in the PCHQR program. Therefore, we are unable to estimate the burden for these PCHs.

Aside from the statutory requirements, it is important to note that one of our priorities is to help achieve better health and better health care for individuals through collection of valid, reliable, and relevant measures of quality health care data. Such data can be shared with appropriate health care related organizations and used to further the development of health care quality, which, in turn, helps to further our objectives and goals. Health care organizations can use their health care quality data for many purposes such as in their risk management programs, health care acquired infection prevention programs and research and development of medical programs, among others.

Even more importantly, we intend to share the information obtained from the PCHQR Program with the public as is required under the statute. These data will be displayed on the *Hospital Compare* Web site. The goals of making these data available to the public in a public user-friendly and relevant format, include, but are not limited to: (1) Keeping the public informed of the quality of care that is being provided in PCHs as a whole; (2) keeping the public informed of the quality of care being provided in specific PCHs; (3) allowing the public to compare and contrast the data about specific PCHs, thus enabling the public to make informed health care decisions regarding PCHs; and (4) providing information about current trends in health care. There are many other public uses for these quality data concerning PCHs. Further, keeping the public informed of quality of care provided in health care has always been of high priority to CMS.

We also seek to align the new PCHQR Program reporting requirements with current HHS high priority conditions and topics and to ultimately provide a comprehensive assessment of the quality of health care delivered in a variety of settings.

We did not receive any public comments on the anticipated effects of the PCHQR Program.

M. Effects of Hospital Value-Based Purchasing (VBP) Program Requirements

Section 1886(o)(1)(B) of the Act directs the Secretary to begin making value-based incentive payments under the Hospital VBP Program to hospitals for discharges occurring on or after October 1, 2012. These incentive payments will be funded for FY 2013 through a reduction to the FY 2013 base operating MS–DRG payment for each discharge of 1 percent, as required by section 1886(o)(7)(B) of the Act. The applicable percentage for FY

2014 is 1.25 percent, for FY 2015 is 1.5 percent, for FY 2016 is 1.75 percent, and for FY 2017 and subsequent years is 2 percent.

We previously published a detailed analysis of the FY 2013 Hospital VBP Program's impact, based on scoring for two quality domains, in the Hospital Inpatient VBP Program final rule (76 FR 26542 through 26545). As we indicated in the FY 2013 IPPS/LTCH PPS proposed rule, because we are not making any changes to the FY 2013 Hospital VBP Program, we do not believe we must provide an additional regulatory impact analysis for the FY 2013 Hospital VBP Program. In this final rule, we are setting forth the operational details of the payment adjustment. We believe that these operational details do not have a regulatory impact or financial impact beyond policies already finalized. They specify how CMS intends to ensure that the value-based incentive payments made to all hospitals in a fiscal year are equal, in total, to the reduced base operating DRG payment amounts.

In section VIII.C. of the preamble of this final rule, we discuss our proposal and final policy to add requirements for the Hospital VBP Program. In addition to certain operational and payment details for the FY 2013 Hospital VBP Program, we are making a number of additional changes related to the FY 2015 and the FY 2016 Hospital VBP Program, including measures, performance periods, performance standards, domain weighting, and other topics.

Specifically, with respect to the FY 2015 Hospital VBP Program, as we proposed, we are adding two additional measures in the Outcome domain, an AHRQ Patient Safety Indicators composite measure and CLABSI: Central Line-Associated Blood Stream Infection. We also are adding a measure of Medicare Spending per Beneficiary in the Efficiency domain.

With respect to the FY 2016 Hospital VBP Program, as we proposed, we are adopting four measures: Three 30-day mortality measures adopted for FY 2014 and proposed for FY 2015—MORT–30–AMI, MORT–30–HF, and MORT–30–PN—and the AHRQ PSI composite measure in the Outcome domain. All of these measures are required for the Hospital IQR Program; therefore, their inclusion in the Hospital VBP Program does not result in any additional burden because the Hospital VBP Program uses data that are required for the Hospital IQR Program.

For future program years, we intend to consider the impacts of Hospital VBP Program policies in the applicable IPPS/LTCH PPS rulemaking vehicle. Because we are not altering the underlying scoring methodology finalized for the FY 2013 Hospital VBP Program in this final rule, we do not believe it appropriate to revise the regulatory impact analysis published in the Hospital Inpatient VBP Program final rule referenced above. We intend to provide an updated analysis of the Hospital VBP Program's impacts for the FY 2014 program year in the FY 2014 IPPS/LTCH PPS rulemaking.

N. Effects of New Measures Added to the LTCH Quality Reporting (LTCHQR) Program

In section VIII.D. of the preamble of this final rule, we discuss the implementation of section 3004(a) of the Affordable Care Act, which added section 1886(m)(5) to the Act. Section 1886(m)(5) of the Act, further provides that in the case of an LTCH that does not submit data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a rate year, any annual update to the standard Federal rate for discharges for the hospital during the rate year, and after application of section 1886(m)(3) of the Act, shall be reduced by 2 percentage points. The initial requirements for this LTCH Quality Reporting (LTCHQR) Program were finalized in section VII.C. of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51756).

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51839 through 51840), we estimated that only a few LTCHs would not receive the full payment update in any fiscal year as a result of not submitting data under the LTCH quality reporting program. At this time, the LTCHQR Program has not been fully implemented, as data collection will not begin until October 1, 2012. However, we believe that statements we made in the FY 2012 IPPS/LTCH PPS final rule regarding the number and types of LTCHs that may not receive the full payment update as a result of failing to submit data to the Secretary under the LTCHQR Program remain valid. We believe that a majority of LTCHs will submit data because they will view the new quality reporting program as an important step in improving the quality of care patients receive in these facilities. We believe that most LTCHs will quickly and easily adapt to this new quality reporting program and find that the benefits of this program outweigh the burdens.

In section VIII.D.3.d. of the preamble of this final rule, for FY 2015, as we proposed, we have retained the three quality measures that were finalized for use in the LTCHQR Program in the FY 2012 IPPS/LTCH PPS final rule. These measures are: (1) Catheter-Associated Urinary Tract Infections (CAUTI); (2) Central Line Catheter-Associated Blood Stream Infection Event (CLABSI); and (3) Pressure Ulcers that are New or Have Worsened. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51780 through 51781), we estimated that the total yearly cost to all LTCH that are paid under the LTCH PPS to report these data (including: NHSN registration and training for the CAUTI and CLABSI quality measures; data submission for all three measures, and monitoring data submission) will be approximately $756,326. In section XI.B.9. of the preamble of this final rule, we have adopted this same burden estimate.

It is important to note that, as part of its endorsement maintenance process under NQF's Patient Safety Measures Project (*http://www.qualityforum.org/projects/patient_safety_measures.aspx*), the NQF reviewed the CAUTI and CLABSI measures that we adopted in the FY 2012 IPPS/LTCH final rule. As a result of this review, the NQF expanded the scope of endorsement of these measures to include additional care settings, including LTCHs. As proposed, in this final rule, we are specifying that the CAUTI and CLABSI measures will be adopted in their expanded form for the FY 2014 payment determination and all subsequent fiscal year payment determinations.

We do not believe that the total burden estimate, in the amount of $756,326, that was made in the FY 2012 IPPS/LTCH PPS final rule would be affected by the expansion of the CAUTI and CLABSI measures. We made this statement because these expanded measures are essentially the same measures we adopted in the FY 2012 IPPS/LTCH PPS final rule, except that the measure names have been changed and the scope of endorsement expanded so as to be applicable to the LTCH setting. The expanded CAUTI and CLABSI measures make no changes to the way that these data are to be collected and reported by LTCHs. Thus, use of the expanded CAUTI and CLABSI measures will place no additional financial burden on LTCHs. In addition, we believe that this financial burden should remain relatively stable over the first several years of this quality reporting program, subject to normal inflationary increases, such as increased labor wage rates.

In section VIII.D.3.d. of the preamble of this final rule, for the FY 2016 LTCHQR Program, as proposed, we are adding two additional quality measures to the LTCHQR Program. These quality measures are: (1) Percent of Nursing Home Residents Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short-Stay) (NQF #0680); and (2) Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431). Data for the staff immunization measure will be reported by LTCHs to NHSN. Data for the patient influenza vaccination measure will be collected using the LTCH CARE Data Set. While we are still in the process of identifying and developing the specific data items that will be necessary for these measures, we believe that the number of data items will be limited. Therefore, we anticipate little, if any, change in burden associated with these two measures.

As we noted previously, the LTCHQR Program has not been fully implemented, as data collection will not begin until October 1, 2012. At this time, we provide estimates of the costs associated with the collection and submission of data in section XI.B.9. of the preamble of this final rule.

In the FY 2013 IPPS/LTCH PPS proposed rule, we invited public comment on the impact that the proposed measures would have on LTCHs. The public comments that we received addressed the burden estimates associated with the proposed measures. We are addressing these public comments in section XI.B.9. of the preamble of this final rule, where we discuss in detail the information collection requirements and the burden associated with those requirements.

O. Effects of Quality Reporting Requirements for Ambulatory Surgical Centers (ASCs)

In section XIV.K. of the CY 2012 OPPS/ASC final rule with comment period (76 FR 74492 through 74517), we finalized quality reporting measures for the CYs 2014, 2015, and 2016 payment determinations and other requirements for the ASC Quality Reporting (ASCQR) Program. In section VIII.E. of the preamble of this final rule, we discuss proposed and final policies for ASCs to

report quality data under the ASCQR Program in order to be eligible to receive the full ASC annual payment update. We are unable at this time to estimate the number of ASCs that may not receive the full ASC annual payment update in CYs 2014, 2015, and 2016 because we do not have data that will allow us to make a reasonable estimate. ASCs have not yet submitted quality data to CMS; therefore, there are no data from previous program operations on which to base an estimate. Further, data from other quality programs do not allow us to make a reasonable estimate. Although we might be able to make a reasonable estimate based on data from other programs with respect to the structural and process of care measures, we are unable to estimate the number of ASCs that will not be eligible to receive the full ASC annual payment update with respect to the submission of QDCs for the claims-based measures. There are two other quality data reporting programs that utilize QDCs reported on claims similar to what we finalized in the ASCQR Program: the Physician Quality Reporting System (PQRS) and the E-Prescribing Incentive Program. However, these programs do not have comparable reporting incentives. The PQRS currently has no penalty for not meeting reporting requirements, and the E-Prescribing Incentive Program until CY 2012 was solely incentive-based, rather than penalty-based.

We did not receive any public comments regarding the effects of the proposed requirements for the ASCQR Program.

P. Effects of Requirements for the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program

In section VIII.F. of the preamble of this final rule, we discuss our proposed and final policies to implement the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program.

1. General Background and Intent for Implementation of the IPFQR Program

We intend to achieve several goals as we develop and implement the proposed IPFQR Program. One goal of the IPFQR Program is to implement the statutory requirements of section 1886(s)(4) of the Act as added by sections 3401(f)(4) and 10322(a) of the Affordable Care Act. However, in addition, it is important to note that one of our priorities is to help achieve better health and better health care for individuals through collection of valid, reliable, and relevant measures of quality health care data. Such data can be shared with appropriate health care related organizations and used to further the development of health care quality, which, in turn, helps to further CMS' objectives and goals. Health care organizations can use such health care quality data for many purposes such as in their risk management programs, health care acquired infection prevention programs and research and development of medical programs, among others.

More importantly, as required by the Act, we intend to share the information obtained from the IPFQR Program with the public. These data will be displayed on the CMS Web site. The goals of making these data available to the public in a properly risk-adjusted, public user-friendly and relevant format, include, but are not limited to: (1) Keeping the public informed of the quality of care that is being provided in IPFs as a whole; (2) keeping the public informed of the quality of care being provided in specific IPFs; (3) allowing the public to compare and contrast the data about specific IPFs, thus enabling the public to make informed health care decisions regarding IPFs; and (4) providing information about current trends in health care. There are certainly many other public uses for these quality data concerning IPFs. However, giving the public access to information about the quality of care in specific facilities and keeping the public informed of trends in health care has always been of high priority to CMS.

We also seek to align the new IPFQR Program reporting requirements with current HHS high priority conditions and topics and to ultimately provide a comprehensive assessment of the quality of health care delivered in a variety of settings.

2. Anticipated Effects

This final rule will affect all IPFs participating in Medicare. The facilities will have to register with QualityNet and take the proper training in order to be adequately prepared to use the QualityNet system to submit the data. The anticipated burden to these providers consists of the following: (1) The initial registration of the facility with QualityNet; (2) training of the appropriate staff members on how to use the QualityNet reporting program; (3) the time required for collection and aggregation of data; and (4) the time required for entry of the data into the QualityNet database by the IPF's representative.

We have estimated the burdens associated with IPFs reporting aggregated-level data on QualityNet. In our burden calculation, we have included the time used for chart abstraction and for training personnel on collection of chart-abstracted data, aggregation of the data, as well as training for submitting the aggregate-level data through QualityNet. We estimate that the annual hourly burden to each IPF for the collection, submission, and training of personnel for submitting all quality measures is approximately 821 hours in a year for each IPF. Thus, the average hourly burden to each IPF is approximately 68 hours per month. At this time, we have no way to estimate how many IPFs will participate in the program. Therefore, we cannot estimate the financial impact.

As we proposed in the FY 2013 IPPS/LTCH PPS proposed rule, we are adopting the quality measures, abstraction methods, population, sampling, and reporting approaches used by TJC. One reason we selected this approach was to minimize the burden on IPFs. There were 1,741 existing IPFs, of which 450 (approximately 26 percent) are currently reporting the proposed measures to TJC. For these IPFs, we estimate that the burden will be minimal.

We did not receive any public comments on the anticipated effects of the proposals for the IPFQR Program.

Q. Effects of Requirements for Provider and Practitioner Medical Record Deadlines and Claims Denials

In section X. of the preamble of this final rule, we discuss our proposed and finalized changes for practitioners to follow in responding to requests for medical records from Quality Improvement Organizations (QIOs). These changes require practitioners to adhere to the 21-day and 30-day timeframes in the regulations, which are currently only applicable to providers. In addition, the changes will give QIOs the authority to effectuate claim denials for practitioners who fail to submit the medical records within these timeframes. QIOs have authority to carry out claim denials for providers who fail to submit medical records, but similar provisions do not exist for practitioners. In fact, to this point, the QIOs' only option for practitioners who fail to submit medical records has been to refer the matter to the HHS Inspector General, and it seems appropriate to identify a step, short of recommending sanctions, for the QIOs to pursue.

On average, QIOs request approximately 2,000 medical records from practitioners each year. In general, requests for medical records from both practitioners and providers are ultimately fulfilled, but the average response time is considerably longer for practitioners than for providers. Because we are working to improve the QIOs' response time in completing various review activities, the application of the timeframes to practitioners is an important step in our efforts. In addition, given that the QIOs have the need for and the statutory authority to request medical records within a reasonable period of time, they have relied on the same 21-day and 30-day timeframes for practitioners. We believe that having the regulatory timeframe and authority to carry out claims denials for providers have generally resulted in providers complying with medical record requests within the required timeframes. In line with this, we believe that having this same regulatory authority for practitioners will result in practitioners complying with medical record requests within their required timeframes, which should, in turn, greatly reduce the potential for any claims denials. Moreover, because vendors are increasingly being used by providers and practitioners to respond to requests for medical records, the increasing effectiveness of this process could further diminish any impact of the regulatory changes. As we noted in the proposed rule, we believe the impact will be insignificant. However, at this time, we cannot determine the precise number of claim denials that could occur for practitioners as a result of these changes.

We did not receive any public comments on our proposed statement of impact.

R. Alternatives Considered

This final rule contains a range of policies. It also provides descriptions of the statutory provisions that are addressed, identifies the finalized policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

S. Overall Conclusion

1. Acute Care Hospitals

Table I of section I.G. of this Appendix demonstrates the estimated distributional impact of the IPPS budget neutrality requirements for the MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB. Table I also shows an overall increase of 2.3 percent in operating payments. We estimate that operating payments will increase by approximately $2.45 billion in FY 2013 relative to FY 2012. In addition, we estimate a savings of $24 million associated with the HACs policies in FY 2013, which is an additional $2 million in savings than in FY 2012. In FY 2012, pursuant to section 1109 of the Affordable Care Act, we distributed an additional $250 million to qualifying hospitals resulting in a decrease of $250 million in payments to hospitals in FY 2013 relative to FY 2012. Furthermore, we estimate that the expiration of the expansion of low-volume payments under sections 3125 and 10314 of the Affordable Care Act in FY 2013 will result in a decrease in payments of approximately $318 million compared to low-volume payments made in FY 2012. We estimate that new technology add-on payments will increase payments by approximately $46.1 million. Finally, we estimate that our finalized policies to count labor and delivery bed days in the available bed day count for IME and DSH payments will reduce IME payments by approximately $40 million for FY 2013. These estimates, combined with our FY 2013 operating estimate of $2.45 billion, will result in an increase of approximately $1.87 billion for FY 2013. We estimate that capital payments will experience a 1.8 percent increase in payments per case, as shown in Table III of section I.I. of this Appendix. We project that there will be a $154 million increase in capital payments in FY 2013 compared to FY 2012. The cumulative operating and capital payments should result in a net increase of approximately $2.04 billion to IPPS providers. The discussions presented in the previous pages, in combination with the rest of this final rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience an increase in estimated payments per discharge in FY 2013. In the impact analysis, we are using the rates, factors, and policies presented in this final rule, including updated wage index values and relative weights, and the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2013. Accordingly, based on the best available data for the 428 LTCHs in our database, we estimate that FY 2013 LTCH PPS payments will increase approximately $92 million relative to FY 2012. In addition, we estimate that extension of the moratorium on the application of the ''25 percent threshold'' payment adjustment policy, as provided by section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(a) and 10312(a) of the Affordable Care Act, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013, will result in a payment impact of approximately $170 million to LTCHs.

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf*), in Table V below, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the changes to the IPPS presented in this final rule. All expenditures are classified as transfers to Medicare providers.

TABLE V—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2012 TO FY 2013

Category	Transfers
Annualized Monetized Transfers.	$2.04 billion.
From Whom to Whom	Federal Government to IPPS Medicare Providers.
Total	$2.04 billion.

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis for the changes we are making under the LTCH PPS for this final rule projects an increase in estimated aggregate payments in FY 2013 relative to FY 2012 of approximately $92 million for the 428 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf*), in Table VI below, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to changes to the LTCH PPS. Table VI provides our best estimate of the estimated increase in Medicare payments under the LTCH PPS as a result of the provisions presented in this final rule based on the data for the 428 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

TABLE VI—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2012 LTCH PPS TO THE FY 2013 LTCH PPS

Category	Transfers
Annualized Monetized Transfers.	Positive transfer—Estimated increase in expenditures: $92 million.

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $34.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 33 of the Table of Small Business Size Standards for NAIC 622 found on the SBA Web site at: *http://www.sba.gov/contractingopportunities/sizestandardtopics/tableofsize/index.html*.).

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. We believe that the provisions of this final rule relating to acute care hospitals will have a significant impact on small entities as explained in this Appendix. Because we lack data on individual hospital receipts, we cannot determine the number of small proprietary LTCHs. Therefore, we are assuming that all LTCHs are considered small entities for the purpose of the analysis in section I.J. of this Appendix. Medicare fiscal intermediaries and MACs are not considered to be small entities. Because we acknowledge that many of the affected entities are small entities, the analysis discussed throughout the preamble of this final rule constitutes our regulatory flexibility analysis. In the FY 2013 IPPS/LTCH PPS proposed rule, we solicited public comments on our estimates and analysis of the impact of our proposals on those small entities. Any public comments that we received and our responses are presented throughout this final rule.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Social Security Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 603 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals. (We refer readers to Table I in section I.G. of this Appendix for the quantitative effects of the final policy changes under the IPPS for operating costs.)

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2012, that threshold level is approximately $136 million. This final rule will not mandate any requirements for State, local, or tribal governments, nor will it affect private sector costs.

VI. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget reviewed this final rule.

Appendix B: Recommendation of Update Factors for Operating Cost Rates of Payment for Inpatient Hospital Services

I. Background

Section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Under section 1886(e)(5) of the Act, we are required to publish update factors recommended by the Secretary in the proposed and final IPPS rules, respectively. Accordingly, this Appendix provides the recommendations for the update factors for the IPPS national standardized amount, the Puerto Rico-specific standardized amount, the hospital-specific rate for SCHs, and the rate-of-increase limits for certain hospitals excluded from the IPPS, as well as LTCHs. In prior years, we have made a recommendation in the IPPS proposed rule and final rule for the update factors for the payment rates for IRFs and IPFs. However, for FY 2013, we plan to include the Secretary's recommendation for the update factors for IRFs and IPFs in separate **Federal Register** documents at the time that we announce the annual updates for IRFs and IPFs. We also discuss our response to MedPAC's recommended update factors for inpatient hospital services.

II. Inpatient Hospital Update for FY 2013

A. FY 2013 Inpatient Hospital Update

Section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, sets the applicable percentage increase under the IPPS for FY 2013 as equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas (which is based on IHS Global Insight Inc.'s (IGI's) second quarter 2012 forecast of the FY 2006-based IPPS market basket), subject to a reduction of 2.0 percentage points if the hospital fails to submit quality data under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act, and then subject to an adjustment based on changes in economy-wide productivity and an additional reduction of 0.1 percentage point. Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that the application of the multifactor productivity adjustment and the additional FY 2012 adjustment of 0.1 percentage point may result in the applicable percentage increase being less than zero.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.H.1 of the preamble of the proposed rule, we proposed a multifactor productivity (MFP) adjustment (the 10-year moving average of MFP for the period ending FY 2012) of 0.8 percent (77 FR 27975 and 27976). Also, in the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27975 and 27976), based on IGI's first quarter 2012 forecast of the FY 2013 market basket increase, we proposed an applicable percentage increase to the FY 2012 operating standardized amount of 2.1 percent (that is, the proposed FY 2013 estimate of the market basket rate-of-increase of 3.0 percent less an adjustment of 0.8 percentage points for economy-wide productivity and less 0.1 percentage point) for hospitals in all areas, provided the hospital submits quality data in accordance with section 1886(b)(3)(B)(viii) of the Act and our rules. For hospitals that fail to submit quality data, we proposed an applicable percentage increase to the operating standardized amount of 0.1 percent (that is, the proposed FY 2013 estimate of the market basket rate-of-increase of 3.0 percent less 2.0 percentage points for failure to submit quality data, less an adjustment of 0.8 percentage points for economy-wide productivity, and less an additional adjustment of 0.1 percentage point).

For this final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.H.1. of the preamble of this final rule, we are making an MFP adjustment of 0.7 percent. Based on IGI's second quarter 2012 forecast of the FY 2013 market basket increase, we are providing for an applicable percentage increase to the FY 2012 operating standardized amount of 1.8 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for economy-wide productivity and less 0.1 percentage point) for hospitals in all areas, provided the hospital submits quality data in accordance with section 1886(b)(3)(B)(viii) of the Act and our rules. For hospitals that fail to submit quality data, we are providing for an applicable percentage increase to the operating standardized amount of −0.2 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less 2.0 percentage points for failure to submit quality data, less an adjustment of 0.7 percentage point for economy-wide productivity, and less an additional adjustment of 0.1 percentage point).

B. Update for SCHs for FY 2013

Section 1886(b)(3)(B)(iv) of the Act provides that the FY 2013 applicable percentage increase in the hospital-specific rate for SCHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Therefore, the update to the hospital specific rate for SCHs is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, we are providing for an applicable percentage increase to the hospital-specific rate applicable to SCHs of 1.8 percent for hospitals that submit quality data or −0.2 percent for hospitals that fail to submit quality data.

C. FY 2013 Puerto Rico Hospital Update

Section 401(c) of Public Law 108–173 amended section 1886(d)(9)(C)(i) of the Act and states that, for discharges occurring in a fiscal year (beginning with FY 2004), the Secretary shall compute an average standardized amount for hospitals located in any area of Puerto Rico that is equal to the average standardized amount computed under subclause (I) for FY 2003 for hospitals in a large urban area (or, beginning with FY 2005, for all hospitals in the previous fiscal year) increased by the applicable percentage increase under subsection (b)(3)(B) for the fiscal year involved. Therefore, the update to the Puerto Rico-specific operating standardized amount is subject to the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act as amended by sections 3401(a) and 10319(a) of the Affordable Care Act (that is, the same update factor as for all other hospitals subject to the IPPS). Accordingly, we are providing for an applicable percentage increase to the Puerto Rico-specific standardized amount of 1.8 percent.

D. Update for Hospitals Excluded From the IPPS

Section 1886(b)(3)(B)(ii) of the Act is used for purposes of determining the percentage increase in the rate-of-increase limits for children's and cancer hospitals. Section 1886(b)(3)(B)(ii) of the Act sets the percentage increase in the rate-of-increase limits equal to the market basket percentage increase. In accordance with § 403.752(a) of the regulations, RNHCIs are paid under § 413.40, which also uses section 1886(b)(3)(B)(ii) of the Act to update the percentage increase in the rate-of-increase limits.

Currently, children's hospitals, cancer hospitals, and RNHCIs are the remaining three types of hospitals still reimbursed under the reasonable cost methodology. We are providing that the FY 2013 rate-of-increase percentage applicable to the target amount for children's hospitals, cancer hospitals, and RNHCIs is the percentage increase in the IPPS operating market basket. For this final rule, the current estimate of the FY 2013 IPPS operating market basket percentage increase is 2.6 percent.

E. Update for LTCHs

Section 123 of Public Law 106–113, as amended by section 307(b) of Public Law 106–554 (and codified at section 1886(m)(1) of the Act), provides the statutory authority for updating payment rates under the LTCH PPS.

As discussed in section VII. of the preamble of this final rule, we are

establishing an update to the LTCH PPS standard Federal rate for FY 2013 based on the full LTCH PPS market basket increase estimate (for this final rule, estimated to be 2.6 percent), subject to an adjustment based on changes in economy-wide productivity and an additional reduction of 0.1 percentage point. The productivity adjustment described in section 1886(b)(3)(B)(xi)(ii) of the Act is currently estimated to be 0.7 percent for FY 2013. In addition, section 1886(m)(3)(A)(ii) of the Act requires that any annual update for FY 2013 be reduced by the ''other adjustment'' at section 1886(m)(4)(C) of the Act, which is 0.1 percentage point. Therefore, based on IGI's second quarter 2012 forecast of the FY 2013 market basket increase, we are providing for an annual update to the LTCH PPS standard Federal rate of 1.8 percent (that is, the current FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for economy-wide productivity and less 0.1 percentage point). Accordingly, we are applying an update factor of 1.018 in determining the LTCH PPS standard Federal rate for FY 2013. Furthermore, we are phasing in a one-time prospective adjustment to the standard Federal rate under § 412.523(d)(3) by applying a factor of 0.98734 (or approximately −1.3 percent) in FY 2013, which will not be applicable to payments for LTCH PPS discharges occurring on or before December 28, 2012 (consistent with current law).

III. Secretary's Recommendations

MedPAC is recommending an inpatient hospital update equal to one percent for FY 2013. MedPAC's rationale for this update recommendation is described in more detail below. As mentioned above, section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Consistent with current law, we are recommending an applicable percentage increase to the standardized amount of 1.8 percent (that is, the FY 2013 estimate of the market basket rate-of-increase of 2.6 percent less an adjustment of 0.7 percentage point for MFP and less 0.1 percentage point). We are recommending that the same applicable percentage increase apply to SCHs and the Puerto Rico-specific standardized amount.

In addition to making a recommendation for IPPS hospitals, in accordance with section 1886(e)(4)(A) of the Act, we are recommending update factors for certain other types of hospitals excluded from the IPPS. Consistent with our policies for these facilities, we are recommending an update for children's hospitals, cancer hospitals, and RNHCIs of 2.6 percent.

For FY 2013, consistent with policy set forth in section VII. of the preamble of this final rule, we are recommending an update of 1.8 percent to the LTCH PPS standard Federal rate.

IV. MedPAC Recommendation for Assessing Payment Adequacy and Updating Payments in Traditional Medicare

In its March 2012 Report to Congress, MedPAC assessed the adequacy of current payments and costs, and the relationship between payments and an appropriate cost base. MedPAC recommended an update to the hospital inpatient rates equal to one percent. MedPAC expects Medicare margins to remain low in 2012. At the same time, MedPAC's analysis finds that efficient hospitals have been able to maintain positive Medicare margins while maintaining a relatively high quality of care. MedPAC also recommended that Congress should require the Secretary to use the difference between the increase of the applicable percentage increase under the IPPS for FY 2013 and MedPAC's recommendation of a 1.0 percent update to gradually recover past overpayments due to documentation and coding changes.

Response: With regard to MedPAC's recommendation of an update to the hospital inpatient rates equal to one percent, for FY 2013, as discussed above, sections 3401(a) and 10319(a) of the Affordable Care Act amended section 1886(b)(3)(B) of the Act. Section 1886(b)(3)(B) of the Act, as amended by these sections, sets the requirements for the FY 2013 applicable percentage increase. Therefore, we have provided for an applicable percentage increase for FY 2013 of 1.8 percent, provided the hospital submits quality data, consistent with these statutory requirements.

With regard to MedPAC's recommendation that Congress should require the Secretary to use the difference between the increase of the applicable percentage increase under the IPPS for FY 2013 and MedPAC's recommendation of a 1.0 percent update to gradually recover past overpayments due to documentation and coding changes, we refer readers to section II.D. of the preamble of this final rule for a complete discussion of the FY 2013 documentation and coding adjustments. In section II.D. of the preamble of this final rule, we are making a prospective adjustment of 1.9 percent to the FY 2013 standardized amount to remove the remaining effect of documentation and coding that occurred in FY 2008 and FY 2009. We note that section 7(b)(1)(B) of Public Law 110–90 authorized recoupments of overpayments due to documentation and coding changes for FY 2008 and FY 2009, and under this authority, such recoupments had to be made no later than FY 2012. Accordingly, any recoupments of overpayments due to documentation and coding changes beyond the authority of section 7(b)(1)(B) of Public Law 110–90 would require changes to current law by Congress.

We also note that, because the operating and capital prospective payment systems remain separate, we are continuing to use separate updates for operating and capital payments. The update to the capital rate is discussed in section III. of the Addendum to this final rule.

Part III

Department of the Interior

Fish and Wildlife Service

50 CFR Part 20

Migratory Bird Hunting; Early Seasons and Bag and Possession Limits for Certain Migratory Game Birds in the Contiguous United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands; Final Rule

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 20

[Docket No. FWS–R9–MB–2012–0005; FF09M21200–123–FXMB1231099BPP0L2]

RIN 1018–AX97

Migratory Bird Hunting; Early Seasons and Bag and Possession Limits for Certain Migratory Game Birds in the Contiguous United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: This rule prescribes the hunting seasons, hours, areas, and daily bag and possession limits of mourning, white-winged, and white-tipped doves; band-tailed pigeons; rails; moorhens and gallinules; woodcock; common snipe; sandhill cranes; sea ducks; early (September) waterfowl seasons; migratory game birds in Alaska, Hawaii, Puerto Rico, and the Virgin Islands; youth waterfowl day; and some extended falconry seasons. Taking of migratory birds is prohibited unless specifically provided for by annual regulations. This rule permits taking of designated species during the 2012–13 season.

DATES: This rule is effective on September 1, 2012.

ADDRESSES: You may inspect comments received on the migratory bird hunting regulations during normal business hours at the Service's office in Room 4107, Arlington Square Building, 4501 N. Fairfax Drive, Arlington, VA. You may obtain copies of referenced reports from the street address above, or from the Division of Migratory Bird Management's Web site at *http://www.fws.gov/migratorybirds/,* or at *http://www.regulations.gov* at Docket No. FWS–R9–MB–2012–0005.

FOR FURTHER INFORMATION CONTACT: Ron W. Kokel, Division of Migratory Bird Management, U.S. Fish and Wildlife Service, (703) 358–1714.

SUPPLEMENTARY INFORMATION:

Regulations Schedule for 2011

On April 17, 2012, we published in the **Federal Register** (77 FR 23094) a proposal to amend 50 CFR part 20. The proposal provided a background and overview of the migratory bird hunting regulations process, and addressed the establishment of seasons, limits, and other regulations for hunting migratory game birds under §§ 20.101 through 20.107, 20.109, and 20.110 of subpart K. Major steps in the 2012–13 regulatory cycle relating to open public meetings and **Federal Register** notifications were also identified in the April 17 proposed rule.

On May 17, 2012, we published in the **Federal Register** (77 FR 29516) a second document providing supplemental proposals for early- and late-season migratory bird hunting regulations. The May 17 supplement also provided detailed information on the 2012–13 regulatory schedule and announced the Service Regulations Committee (SRC) and Flyway Council meetings.

On June 12, 2012, we published in the **Federal Register** (77 FR 34931) a third document revising our previously announced dates of the June 2012 SRC meetings.

On June 19 and 20, 2012, we held open meetings with the Flyway Council Consultants where the participants reviewed information on the current status of migratory shore and upland game birds and developed recommendations for the 2012–13 regulations for these species plus regulations for migratory game birds in Alaska, Puerto Rico, and the Virgin Islands; special September waterfowl seasons in designated States; special sea duck seasons in the Atlantic Flyway; and extended falconry seasons. In addition, we reviewed and discussed preliminary information on the status of waterfowl as it relates to the development and selection of the regulatory packages for the 2012–13 regular waterfowl seasons.

On July 20, 2012, we published in the **Federal Register** (77 FR 42920) a fourth document specifically dealing with the proposed frameworks for early-season regulations. In late August 2012, we published in the **Federal Register** a final rule which contained final frameworks for early migratory bird hunting seasons from which wildlife conservation agency officials from the States, Puerto Rico, and the Virgin Islands selected early-season hunting dates, hours, areas, and limits.

On July 25–26, 2012, we held open meetings with the Flyway Council Consultants at which the participants reviewed the status of waterfowl and developed recommendations for the 2012–13 regulations for these species. Proposed hunting regulations were discussed for late seasons. We published proposed frameworks for the 2012–13 late-season migratory bird hunting regulations in an August 17, 2012 **Federal Register** (77 FR 49868).

The final rule described here is the seventh in the series of proposed, supplemental, and final rulemaking documents for migratory game bird hunting regulations and deals specifically with amending subpart K of 50 CFR part 20. It sets hunting seasons, hours, areas, and limits for mourning, white-winged, and white-tipped doves; band-tailed pigeons; rails; moorhens and gallinules; woodcock; common snipe; sandhill cranes; sea ducks; early (September) waterfowl seasons; migratory game birds in Alaska, Hawaii, Puerto Rico, and the Virgin Islands; youth waterfowl hunting day; and some extended falconry seasons.

National Environmental Policy Act (NEPA) Consideration

NEPA considerations are covered by the programmatic document ''Final Supplemental Environmental Impact Statement: Issuance of Annual Regulations Permitting the Sport Hunting of Migratory Birds (FSES 88–14),'' filed with the Environmental Protection Agency on June 9, 1988. We published a notice of availability in the **Federal Register** on June 16, 1988 (53 FR 22582). We published our Record of Decision on August 18, 1988 (53 FR 31341). In addition, an August 1985 environmental assessment entitled ''Guidelines for Migratory Bird Hunting Regulations on Federal Indian Reservations and Ceded Lands'' is available from the address indicated under the caption **FOR FURTHER INFORMATION CONTACT**.

In a notice published in the September 8, 2005, **Federal Register** (70 FR 53376), we announced our intent to develop a new Supplemental Environmental Impact Statement (SEIS) for the migratory bird hunting program. Public scoping meetings were held in the spring of 2006, as detailed in a March 9, 2006, **Federal Register** (71 FR 12216). We released the draft SEIS on July 9, 2010 (75 FR 39577). The draft SEIS is available either by writing to the address indicated under **FOR FURTHER INFORMATION CONTACT** or by viewing our Web site at *http://www.fws.gov/migratorybirds*.

Endangered Species Act Consideration

Section 7 of the Endangered Species Act, as amended (16 U.S.C. 1531–1543; 87 Stat. 884), provides that, ''The Secretary shall review other programs administered by him and utilize such programs in furtherance of the purposes of this Act'' (and) shall ''insure that any action authorized, funded, or carried out * * * is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of [critical] habitat * * *.''

Consequently, we conducted formal consultations to ensure that actions resulting from these regulations would not likely jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of their critical habitat. Findings from these consultations are included in a biological opinion, which concluded that the regulations are not likely to jeopardize the continued existence of any endangered or threatened species. Additionally, these findings may have caused modification of some regulatory measures previously proposed, and the final frameworks reflect any such modifications. Our biological opinions resulting from this section 7 consultation are public documents available for public inspection at the address indicated under **ADDRESSES**.

Regulatory Planning and Review (Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget (OMB) will review all significant rules. OIRA has determined that this rule is significant because it will have an annual effect of $100 million or more on the economy.

Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this rule in a manner consistent with these requirements.

An economic analysis was prepared for the 2008–09 season. This analysis was based on data from the 2006 National Hunting and Fishing Survey, the most recent year for which data are available (see discussion in Regulatory Flexibility Act section below). This analysis estimated consumer surplus for three alternatives for duck hunting (estimates for other species are not quantified due to lack of data). The alternatives are (1) Issue restrictive regulations allowing fewer days than those issued during the 2007–08 season, (2) Issue moderate regulations allowing more days than those in alternative 1, and (3) Issue liberal regulations identical to the regulations in the 2007–08 season. For the 2008–09 season, we chose alternative 3, with an estimated consumer surplus across all flyways of $205–$270 million. We also chose alternative 3 for the 2009–10 and the 2010–11 seasons. At this time, we are proposing no changes to the season frameworks for the 2011–12 season, and as such, we will again consider these three alternatives. However, final frameworks for waterfowl will be dependent on population status information available later this year. For these reasons, we have not conducted a new economic analysis, but the 2008–09 analysis is part of the record for this rule and is available at *http://www.fws.gov/migratorybirds/NewReportsPublications/SpecialTopics/SpecialTopics.html#HuntingRegs* or at *http://www.regulations.gov* at Docket No. FWS–R9–MB–2012–0005.

Regulatory Flexibility Act

The annual migratory bird hunting regulations have a significant economic impact on substantial numbers of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). We analyzed the economic impacts of the annual hunting regulations on small business entities in detail as part of the 1981 cost-benefit analysis. This analysis was revised annually from 1990–95. In 1995, the Service issued a Small Entity Flexibility Analysis (Analysis), which was subsequently updated in 1996, 1998, 2004, and 2008. The primary source of information about hunter expenditures for migratory game bird hunting is the National Hunting and Fishing Survey, which is conducted at 5-year intervals. The 2008 Analysis was based on the 2006 National Hunting and Fishing Survey and the U.S. Department of Commerce's County Business Patterns, from which it was estimated that migratory bird hunters would spend approximately $1.2 billion at small businesses in 2008.

Copies of the Analysis are available upon request from the Division of Migratory Bird Management (see **ADDRESSES**) or from our Web site at *http://www.fws.gov/migratorybirds/NewReportsPublications/SpecialTopics/SpecialTopics.html#HuntingRegs* or at *http://www.regulations.gov* at Docket No. FWS–R9–MB–2012–0005.

Small Business Regulatory Enforcement Fairness Act

This rule is a major rule under 5 U.S.C. 804(2), the Small Business Regulatory Enforcement Fairness Act. For the reasons outlined above, this rule will have an annual effect on the economy of $100 million or more. However, because this rule establishes hunting seasons, under the exemption contained in 5 U.S.C. 808(1), we are not deferring the effective date.

Paperwork Reduction Act

We examined these regulations under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*). The various recordkeeping and reporting requirements imposed under regulations established in 50 CFR part 20, subpart K, are utilized in the formulation of migratory game bird hunting regulations. Specifically, OMB has approved the information collection requirements of our Migratory Bird Surveys and assigned control number 1018–0023 (expires 4/30/2014). This information is used to provide a sampling frame for voluntary national surveys to improve our harvest estimates for all migratory game birds in order to better manage these populations. OMB has also approved the information collection requirements of the Alaska Subsistence Household Survey, an associated voluntary annual household survey used to determine levels of subsistence take in Alaska, and assigned control number 1018–0124 (expires 4/30/2013).

A Federal agency may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

Unfunded Mandates Reform Act

We have determined and certify, in compliance with the requirements of the Unfunded Mandates Reform Act, 2 U.S.C. 1502 *et seq.,* that this rulemaking will not impose a cost of $100 million or more in any given year on local or State government or private entities. Therefore, this rule is not a ''significant regulatory action'' under the Unfunded Mandates Reform Act.

Civil Justice Reform—Executive Order 12988

The Department, in promulgating this rule, has determined that this rule will not unduly burden the judicial system and that it meets the requirements of sections 3(a) and 3(b)(2) of Executive Order 12988.

Takings Implication Assessment

In accordance with Executive Order 12630, this rule, authorized by the Migratory Bird Treaty Act, does not have significant takings implications and does not affect any constitutionally protected property rights. This rule will

not result in the physical occupancy of property, the physical invasion of property, or the regulatory taking of any property. In fact, this rule allows hunters to exercise otherwise unavailable privileges and, therefore, reduce restrictions on the use of private and public property.

Energy Effects—Executive Order 13211

Executive Order 13211 requires agencies to prepare Statements of Energy Effects when undertaking certain actions. While this rule is a significant regulatory action under Executive Order 12866, it is not expected to adversely affect energy supplies, distribution, or use. Therefore, this action is not a significant energy action and no Statement of Energy Effects is required.

Government-to-Government Relationship With Tribes

In accordance with the President's memorandum of April 29, 1994, ''Government-to-Government Relations with Native American Tribal Governments'' (59 FR 22951), Executive Order 13175, and 512 DM 2, we have evaluated possible effects on Federally-recognized Indian tribes and have determined that there are no effects on Indian trust resources. However, in the April 17 **Federal Register**, we solicited proposals for special migratory bird hunting regulations for certain Tribes on Federal Indian reservations, off-reservation trust lands, and ceded lands for the 2012–13 migratory bird hunting season. The resulting proposals were contained in a separate August 16, 2012, proposed rule (77 FR 49680). By virtue of these actions, we have consulted with Tribes affected by this rule.

Federalism Effects

Due to the migratory nature of certain species of birds, the Federal Government has been given responsibility over these species by the Migratory Bird Treaty Act. We annually prescribe frameworks from which the States make selections regarding the hunting of migratory birds, and we employ guidelines to establish special regulations on Federal Indian reservations and ceded lands. This process preserves the ability of the States and tribes to determine which seasons meet their individual needs. Any State or Indian tribe may be more restrictive than the Federal frameworks at any time. The frameworks are developed in a cooperative process with the States and the Flyway Councils. This process allows States to participate in the development of frameworks from which they will make selections, thereby having an influence on their own regulations. These rules do not have a substantial direct effect on fiscal capacity, change the roles or responsibilities of Federal or State governments, or intrude on State policy or administration. Therefore, in accordance with Executive Order 13132, these regulations do not have significant federalism effects and do not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement.

Regulations Promulgation

The rulemaking process for migratory game bird hunting must, by its nature, operate under severe time constraints. However, we intend that the public be given the greatest possible opportunity to comment. Thus, when the preliminary proposed rulemaking was published, we established what we believed were the longest periods possible for public comment. In doing this, we recognized that, when the comment period closed, time would be of the essence. That is, if there were a delay in the effective date of these regulations after this final rulemaking, States would have insufficient time to select season dates and limits; to communicate those selections to us; and to establish and publicize the necessary regulations and procedures to implement their decisions. We find that ''good cause'' exists, within the terms of 5 U.S.C. 553(d)(3) of the Administrative Procedure Act, and therefore, under authority of the Migratory Bird Treaty Act (July 3, 1918), as amended (16 U.S.C. 703–711), these regulations will take effect less than 30 days after publication. Accordingly, with each conservation agency having had an opportunity to participate in selecting the hunting seasons desired for its State or Territory on those species of migratory birds for which open seasons are now prescribed, and consideration having been given to all other relevant matters presented, certain sections of title 50, chapter I, subchapter B, part 20, subpart K, are hereby amended as set forth below.

List of Subjects in 50 CFR Part 20

Exports, Hunting, Imports, Reporting and recordkeeping requirements, Transportation, Wildlife.

Dated: August 16, 2012.

Rachel Jacobson,

Principal Assistant Deputy Secretary for Fish and Wildlife and Parks.

For the reasons set out in the preamble, title 50, chapter I, subchapter B, part 20, subpart K of the Code of Federal Regulations is amended as follows:

PART 20—[AMENDED]

■ 1. The authority citation for part 20 continues to read as follows:

Authority: Migratory Bird Treaty Act, 40 Stat. 755, 16 U.S.C. 703–712; Fish and Wildlife Act of 1956, 16 U.S.C. 742 a–j, Public Law 106–108, 113 Stat. 1491, Note Following 16 U.S.C. 703.

Note: The following annual hunting regulations provided for by §§ 20.101 through 20.106 and 20.109 of 50 CFR 20 will not appear in the Code of Federal Regulations because of their seasonal nature.

■ 2. Section 20.101 is revised to read as follows:

§ 20.101 Seasons, limits, and shooting hours for Puerto Rico and the Virgin Islands.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset.

CHECK COMMONWEALTH REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

(a) *Puerto Rico.*

	Season dates	Limits	
		Bag	Possession
Doves and Pigeons:			
Zenaida, white-winged,and mourning doves (1)	Sept. 1–Oct. 29	20	20
Scaly–naped pigeons	Sept. 1–Oct. 29	5	5
Ducks	Nov. 10–Dec. 17 &	6	12
	Jan. 12–Jan. 28	6	12
Common Moorhens	Nov. 10–Dec. 17 &	6	12
	Jan. 12–Jan. 28	6	12

	Season dates	Limits	
		Bag	Possession
Common Snipe	Nov. 10–Dec. 17 &	8	16
	Jan. 12–Jan. 28	8	16

(1) Not more than 10 Zenaida and 3 mourning doves in the aggregate.

Restrictions: In Puerto Rico, the season is closed on the ruddy duck, white-cheeked pintail, West Indian whistling duck, fulvous whistling duck, masked duck, purple gallinule, American coot, Caribbean coot, white-crowned pigeon, and plain pigeon.

Closed Areas: Closed areas are described in the July 20, 2012, **Federal Register** (77 FR 42920).

(b) *Virgin Islands.*

	Season dates	Limits	
		Bag	Possession
Zenaida doves	Sept. 1–Sept. 30	10	10
Ducks	CLOSED		

Restrictions: In the Virgin Islands, the seasons are closed for ground or quail doves, pigeons, ruddy duck, white-cheeked pintail, West Indian whistling duck, fulvous whistling duck, masked duck, and purple gallinule.

Closed Areas: Ruth Cay, just south of St. Croix, is closed to the hunting of migratory game birds. All Offshore Cays under jurisdiction of the Virgin Islands Government are closed to the hunting of migratory game birds.

■ 3. Section 20.102 is revised to read as follows:

§ 20.102 Seasons, limits, and shooting hours for Alaska.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920).

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

Area seasons	Dates
North Zone	Sept. 1–Dec. 16.
Gulf Coast Zone	Sept. 1–Dec. 16.
Southeast Zone	Sept. 16–Dec. 31.
Pribilof & Aleutian Islands Zone.	Oct. 8–Jan. 22.
Kodiak Zone	Oct. 8–Jan. 22.

DAILY BAG AND POSSESSION LIMITS

Area	Ducks (1)	Dark geese (2)(3)(4)	Light geese (2)	Brant (2)	Common snipe	Sandhill cranes (5)
North Zone	10–30	4–8	4–8	2–4	8–16	3–6
Gulf Coast Zone	8–24	4–8	4–8	2–4	8–16	2–4
Southeast Zone	7–21	4–8	4–8	2–4	8–16	2–4
Pribilof and Aleutian Islands Zone	7–21	4–8	4–8	2–4	8–16	2–4
Kodiak Zone	7–21	4–8	4–8	2–4	8–16	2–4

(1) The basic duck bag limits may include no more than 1 canvasback daily, 3 in possession, and may not include sea ducks. In addition to the basic duck limits, sea duck limits of 10 daily, 20 in possession, singly or in the aggregate, including no more than 6 each of either harlequin or long-tailed ducks, are allowed. Special sea duck limits will be available to nonresidents, but at lower daily limits than residents, and they may take no more than a possession limit of 20 per season, including no more than 4 each of harlequin and long-tailed ducks, black, surf, and white-winged scoters, and king and common eiders. In Unit 15C, Kachemak Bay east of a line from Point Pogibshi to Anchor Point, the special sea duck daily bag limit for residents and nonresidents is 2 per day, 4 in possession, for harlequin and long-tailed ducks, and 1 per day, 2 in possession, for eiders (king and common collectively). Sea ducks include scoters, common and king eiders, harlequin ducks, long-tailed ducks, and common and red-breasted mergansers. The season for Steller=s and spectacled eiders is closed.

(2) Dark geese include Canada and white-fronted geese. Light geese include snow geese and Ross' geese. Separate limits apply to brant. The season for emperor geese is closed Statewide.

(3) In Units 5 and 6, the taking of Canada geese is only permitted from September 28 through December 16. In the Middleton Island portion of Unit 6, the taking of Canada geese is by special permit only, with a maximum of 10 permits for the season and a daily bag and possession limit of 1. The season shall close if incidental harvest includes 5 dusky Canada geese. In Unit 6–C and on Hinchinbrook and Hawkins Islands in Unit 6–D, a special, permit-only Canada goose season may be offered. Hunters must have all harvested geese checked and classified to subspecies. The daily bag limit is 4 daily and 8 in possession. The Canada goose season will close in all of the permit areas if the total dusky goose harvest reaches 40.

(4) In Units 9, 10, 17, and 18, dark goose limits are 6 per day, 12 in possession.

(5) In Unit 17, the daily bag limit for sandhill cranes is 2 and the possession limit is 4.

Falconry: The total combined bag and possession limit for migratory game birds taken with the use of a falcon under a falconry permit is 3 per day, 6 in possession, and may not exceed a more restrictive limit for any species listed in this subsection.

Special Tundra Swan Season: In Units 17, 18, 22, and 23, there will be a tundra swan season from September 1 through October 31 with a season limit of 3 tundra swans per hunter. This season is by registration permit only; hunters will be issued 1 permit allowing the take of up to 3 tundra swans. Hunters will be required to file a harvest report after the season is completed. Up

to 500 permits may be issued in Unit 18; 300 permits each in Units 22 and 23; and 200 permits in Unit 17.

■ 4. Section 20.103, including the heading, is revised to read as follows:

§ 20.103 Seasons, limits, and shooting hours for doves and pigeons.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset except as otherwise noted. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920).

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

(a) *Doves.*

Note: Unless noted, the seasons listed below are for mourning and white-winged doves in the aggregate.

OTHER POPULATIONS			

	Season dates	Limits	
		Bag	Possession
Hawaii (4)	Nov. 3–Nov. 25 &	10	10
	Dec. 1–Dec. 23 &	10	10
	Jan. 5–Jan. 21	10	10

(1) In *Illinois,* shooting hours are sunrise to sunset.
(2) In *Texas,* the daily bag limit is either 15 mourning, white-winged, and white-tipped doves in the aggregate, of which no more than 2 may be white-tipped doves with a maximum 70-day season. Possession limits are twice the daily bag limit. During the special season in the Special White-winged Dove Area of the South Zone, the daily bag limit is 15 mourning, white-winged, and white-tipped doves in the aggregate, of which no more than 4 may be mourning doves and 2 may be white-tipped doves. Possession limits are twice the daily bag limit.
(3) In *Arizona,* during September 1 through 15, the daily bag limit is 10 mourning and white-winged doves in the aggregate, of which no more than 6 may be white-wing doves. During November 23 through January 6, the daily bag limit is 10 mourning doves. The possession limit is twice the daily bag limit.
(4) In *Hawaii,* the season is only open on the island of Hawaii. The daily bag and possession limits are 10 mourning doves, spotted doves and chestnut-bellied sandgrouse in the aggregate. Shooting hours are from one-half hour before sunrise through one-half hour after sunset. Hunting is permitted only on weekends and State holidays.

(b) *Band-tailed Pigeons.*

	Season dates	Limits	
		Bag	Possession
Arizona	Sept. 7–Sept. 30	5	10
California:			
North Zone	Sept. 15–Sept. 23	2	4
South Zone	Dec. 15–Dec. 23	2	4
Colorado	Sept. 1–Sept. 30	5	10
New Mexico (1):			
North Zone	Sept. 1–Sept. 20	5	10
South Zone	Oct. 1–Oct. 20	5	10
Oregon	Sept. 15–Sept. 23	2	4
Utah (2)	Sept. 1–Sept. 30	5	10
Washington	Sept. 15–Sept. 23	2	4

(1) In *New Mexico,* each band-tailed pigeon hunter must have a band-tailed pigeon hunting permit issued by the State.
(2) In *Utah,* each band-tailed pigeon hunter must have either a band-tailed pigeon hunting permit or a special bird permit stamp issued by the State.

■ 5. Section 20.104 is revised to read as follows:

§ 20.104 Seasons, limits, and shooting hours for rails, woodcock, and common snipe.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset except as otherwise noted. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920).

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

Note: States with deferred seasons will select those seasons at the same time they select waterfowl seasons in August. Consult late-season regulations for further information.

(1) The bag and possession limits for sora and Virginia rails apply singly or in the aggregate of these species.

(2) All bag and possession limits for clapper and king rails apply singly or in the aggregate of the two species and, unless otherwise specified, the limits are in addition to the limits on sora and Virginia rails in all States. In *Connecticut, Delaware, Maryland,* and *New Jersey,* the limits for clapper and king rails are 10 daily and 20 in possession.

(3) In *Connecticut,* the daily bag and possession limits may not contain more than 1 king rail.

(4) In *Maryland,* no more than 1 king rail may be taken per day.

(5) In *Massachusetts,* the sora rail limits are 5 daily and 5 in possession; the Virginia rail limits are 10 daily and 10 in possession.

(6) In *New Jersey,* the season for king rails is closed by State regulation.

(7) In *New York,* the rail daily bag and possession limits are 8 and 16, respectively. Seasons for sora and Virginia rails and common snipe are closed on Long Island.

(8) In *Pennsylvania,* the daily bag and possession limits for rails are 3 and 6, respectively.

(9) In *Rhode Island,* the sora and Virginia rails limits are 3 daily and 6 in possession, singly or in the aggregate; the clapper and king rail limits are 1 daily and 2 in possession, singly or in the aggregate; the common snipe limits are 5 daily and 10 in possession.

(10) In *Alabama,* the rail limits are 15 daily and 15 in possession, singly or in the aggregate.

(11) In *Illinois,* shooting hours are from sunrise to sunset.

(12) In *Indiana,* the sora rail limits are 25 daily and 25 in possession. The season on Virginia rails is closed.

(13) In *Iowa,* the limits for sora and Virginia rails are 12 daily and 24 in possession.

(14) Additional days occurring after September 30 will be published with the late season selections.
(15) In *Michigan,* the aggregate limits for sora and Virginia rails are 8 daily and 16 in possession.
(16) In *Nebraska* and *New Mexico,* the rail limits are 10 daily and 20 in possession.
(17) In *South Dakota,* the snipe limits are 5 daily and 15 in possession.

■ 6. Section 20.105 is revised to read as follows:

§ 20.105 Seasons, limits, and shooting hours for waterfowl, coots, and gallinules.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset, except as otherwise noted. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920).

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

Note: States with deferred seasons may select those seasons at the same time they select waterfowl seasons in August. Consult late-seasons regulations for further information.

(1) Shooting hours are one-half hour before sunrise to one-half hour after sunset.
(2) The use of shotguns capable of holding more than 3 shotshells is allowed.
(3) The use of electronic calls is allowed.
(4) In *North Carolina,* the use of unplugged guns and electronic calls is allowed in that area west of U.S. Highway 17 only.
(5) In *North Carolina,* shooting hours are one-half hour before sunrise to one-half hour after sunset in that area west of U.S. Highway 17 only.
(6) In *Pennsylvania,* shooting hours are one-half hour before sunrise to one-half hour after sunset from September 1 to September 14, September 16 to September 21, and September 23 to September 25. On September 15 and September 22, shooting hours are one-half hour before sunrise to sunset.
(7) In *Pennsylvania,* in the area south of SR 198 from the Ohio state line to intersection of SR 18, SR 18 south to SR 618, SR 618 south to U.S. Route 6, U.S. Route 6 east to U.S. Route 322/SR 18, U.S. Route 322/SR 18 west to intersection of SR 3013, SR 3013 south to the Crawford/Mercer County line, not including the Pymatuning State Park Reservoir and an area to extend 100 yards inland from the shoreline of the reservoir, excluding the area east of SR 3011 (Hartstown Road), the daily bag limit is one goose. The season is closed on State Game Lands 214.
(8) In *Pennsylvania,* in the area of Lancaster and Lebanon Counties north of the Pennsylvania Turnpike, east of SR 501 to SR 419, south of SR 419 to the Lebanon-Berks County line, west of the Lebanon-Berks County line and the Lancaster-Berks County line to SR 1053, west of SR 1053 to the Pennsylvania Turnpike I–76, the daily bag limit is 1 goose with a possession limit of 2 geese. On State Game Lands No. 46 (Middle Creek Wildlife Mgmt Area), the season is closed.
(9) In *Vermont,* in Addison County north of Route 125, the daily bag and possession limit is 2 and 4, respectively.
(10) In *Vermont,* the season in the Connecticut River Zone is the same as the New Hampshire Inland Zone season, set by New Hampshire.
(11) In *Virginia,* shooting hours are one-half hour before sunrise to one-half hour after sunset from September 1 to September 15, and one-half hour before sunrise to sunset from September 17 to September 25 in the area east of I–95 where the September teal season is open. Shooting hours are one-half hour before sunrise to one-half hour after sunset from September 1 to September 22, and one-half hour before sunrise to sunset from September 24 to September 25 in the area west of I–95.
(12) See State regulations for additional information and restrictions.
(13) In *Oregon,* the season is closed in the Southcoast Zone and the Klamath County Zone.

(e) *Regular Goose Seasons.*

Note: Bag and possession limits will conform to those set for the regular season. Additional season dates occurring after September 30 will be published with the late season selections.

North Zone	Sept. 16–Sept. 30
South Zone	Sept. 16–Sept. 30
Mississippi River Zone.	Sept. 22–Sept. 30

(f) *Youth Waterfowl Hunting Days.*

The following seasons are open only to youth hunters. Youth hunters must be accompanied into the field by an adult at least 18 years of age. This adult cannot duck hunt but may participate in other open seasons.

Definitions

Youth Hunters: Includes youths 15 years of age or younger.

The Atlantic Flyway: Includes Connecticut, Delaware, Florida, Georgia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, South Carolina, Vermont, Virginia, and West Virginia.

The Mississippi Flyway: Includes Alabama, Arkansas, Illinois, Indiana, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Ohio, Tennessee, and Wisconsin.

The Central Flyway: Includes Colorado (east of the Continental Divide), Kansas, Montana (Blaine, Carbon, Fergus, Judith Basin, Stillwater, Sweetgrass, Wheatland, and all counties east thereof), Nebraska, New Mexico (east of the Continental Divide except that the Jicarilla Apache Indian Reservation is in the Pacific Flyway), North Dakota, Oklahoma, South Dakota, Texas, and Wyoming (east of the Continental Divide).

The Pacific Flyway: Includes Arizona, California, Colorado (west of the Continental Divide), Idaho, Montana (including and to the west of Hill, Chouteau, Cascade, Meagher, and Park Counties), Nevada, New Mexico (the Jicarilla Apache Indian Reservation and west of the Continental Divide), Oregon, Utah, Washington, and Wyoming (west of the Continental Divide including the Great Divide Basin).

Note: Bag and possession limits will conform to those set for the regular season unless there is a special season already open (e.g., September Canada goose season), in which case, that season's daily bag limit will prevail.

Wyoming	Ducks, dark geese, mergansers, and coots	Sept. 15 & 16.

(1) In *Maryland,* the accompanying adult must be at least 21 years of age and possess a valid Maryland hunting license (or be exempt from the license requirement). This accompanying adult may not shoot or possess a firearm.
(2) In *New York,* the daily bag limit for Canada geese is 2.
(3) In *West Virginia,* the accompanying adult must be at least 21 years of age.
(4) In *Kansas,* the adult accompanying the youth must possess any licenses and/or stamps required by law for that individual to hunt waterfowl.
(5) In *Nebraska,* see State regulations for additional information on the daily bag limit.
(6) In *South Dakota,* the limit for Canada geese is 3, except in areas where the Special Early Canada goose season is open. In those areas, the limit is the same as for that special season.
(7) In *Oregon,* the goose season is closed for the youth hunt in the Northwest Special Permit Goose Zone and the Northwest General Zone.

■ 7. Section 20.106 is revised to read as follows:

§ 20.106 Seasons, limits, and shooting hours for sandhill cranes.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), shooting and hawking hours, and daily bag and possession limits on the species designated in this section are as follows:

Shooting and hawking hours are one-half hour before sunrise until sunset, except as otherwise noted. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920).

Federally authorized, State-issued permits are issued to individuals, and only the individual whose name and address appears on the permit at the time of issuance is authorized to take sandhill cranes at the level allowed by the permit, in accordance with provisions of both Federal and State regulations governing the hunting season. The permit must be carried by the permittee when exercising its provisions and must be presented to any law enforcement officer upon request. The permit is not transferable or assignable to another individual, and may not be sold, bartered, traded, or otherwise provided to another person. If the permit is altered or defaced in any way, the permit becomes invalid.

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

Note: States with deferred seasons may select those seasons at the same time they select waterfowl seasons in August. Consult late-season regulations for further information.

(1) Each person participating in the regular sandhill crane seasons must have a valid sandhill crane hunting permit and/or a State-issued Harvest Information Survey Program (HIP) certification for game bird hunting in their possession while hunting.
(2) In *Kansas,* shooting hours are from sunrise until sunset.
(3) In *Kansas,* each person desiring to hunt sandhill cranes is required to pass an annual, online sandhill crane identification examination.
(4) Hunting is by State permit only. See State regulations for further information.
(5) In *New Mexico,* in the Middle Rio Grande Valley Area, the season is only open for youth hunters on November 10. See State regulations for further details.

■ 8. Section 20.109 is revised to read as follows:

§ 20.109 Extended seasons, limits, and hours for taking migratory game birds by falconry.

Subject to the applicable provisions of the preceding sections of this part, areas open to hunting, respective open seasons (dates inclusive), hawking hours, and daily bag and possession limits for the species designated in this section are prescribed as follows:

Hawking hours are one-half hour before sunrise until sunset except as otherwise noted. Area descriptions were published in the July 20, 2012, **Federal Register** (77 FR 42920). For those extended seasons for ducks, mergansers, and coots, area descriptions were published in an August 17, 2012, **Federal Register** and will be published again in a late-September 2012, **Federal Register**.

CHECK STATE REGULATIONS FOR AREA DESCRIPTIONS AND ANY ADDITIONAL RESTRICTIONS.

Daily bag limit ..... 3 migratory birds, singly or in the aggregate.
Possession limit ..... 6 migratory birds, singly or in the aggregate.

These limits apply to falconry during both regular hunting seasons and extended falconry seasons—unless further restricted by State regulations. The falconry bag and possession limits are not in addition to regular season limits. Unless otherwise specified, extended falconry for ducks does not include sea ducks within the special sea duck areas. Only extended falconry seasons are shown below. Many States permit falconry during the gun seasons. Please consult State regulations for details.

For ducks, mergansers, coots, geese, and some moorhen seasons; additional season days occurring after September 30 will be published with the late-season selections. Some States have deferred selections. Consult late-season regulations for further information.

CUSTOMER SERVICE AND INFORMATION

ELECTRONIC RESEARCH

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: **www.fdsys.gov.**

Federal Register information and research tools, including Public Inspection List, indexes, and links to GPO Access are located at: **www.ofr.gov.**

E-mail

FEDREGTOC-L (Federal Register Table of Contents LISTSERV) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to **http://listserv.access.gpo.gov** and select *Online mailing list archives, FEDREGTOC-L, Join or leave the list (or change settings);* then follow the instructions.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to **http://listserv.gsa.gov/archives/publaws-l.html** and select *Join or leave the list (or change settings);* then follow the instructions.

FEDREGTOC-L and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: **fedreg.info@nara.gov**

The Federal Register staff cannot interpret specific documents or regulations.

Reminders. Effective January 1, 2009, the Reminders, including Rules Going Into Effect and Comments Due Next Week, no longer appear in the Reader Aids section of the Federal Register. This information can be found online at **http://www.regulations.gov.**

CFR Checklist. Effective January 1, 2009, the CFR Checklist no longer appears in the Federal Register. This information can be found online at **http://bookstore.gpo.gov/.**

FEDERAL REGISTER PAGES AND DATE, AUGUST

CFR PARTS AFFECTED DURING AUGUST

At the end of each month the Office of the Federal Register publishes separately a List of CFR Sections Affected (LSA), which lists parts and sections affected by documents published since the revision date of each title.

LIST OF PUBLIC LAWS

This is a continuing list of public bills from the current session of Congress which have become Federal laws. It may be used in conjunction with ''P L U S'' (Public Laws Update Service) on 202–741–6043. This list is also available online at *http://www.archives.gov/federal-register/laws*.

The text of laws is not published in the **Federal Register** but may be ordered in ''slip law'' (individual pamphlet) form from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402 (phone, 202–512–1808). The text will also be made available on the Internet from GPO's Federal Digital System (FDsys) at *http://www.gpo.gov/fdsys*. Some laws may not yet be available.

H.R. 1402/P.L. 112–170

To authorize the Architect of the Capitol to establish battery recharging stations for privately owned vehicles in parking areas under the jurisdiction of the House of Representatives at no net cost to the Federal Government. (Aug. 16, 2012; 126 Stat. 1303)

H.R. 3670/P.L. 112–171

To require the Transportation Security Administration to comply with the Uniformed Services Employment and Reemployment Rights Act. (Aug. 16, 2012; 126 Stat. 1306)

H.R. 4240/P.L. 112–172

Ambassador James R. Lilley and Congressman Stephen J. Solarz North Korea Human Rights Reauthorization Act of 2012 (Aug. 16, 2012; 126 Stat. 1307)

S. 3510/P.L. 112–173

To prevent harm to the national security or endangering the military officers and civilian employees to whom internet publication of certain information applies, and for other purposes. (Aug. 16, 2012; 126 Stat. 1310)

Last List August 16, 2012

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly enacted public laws. To subscribe, go to *http://listserv.gsa.gov/archives/publaws-l.html*

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
