Committee, a statutory Federal Advisory Committee body. Given the significant role that manufactured housing plays in providing affordable housing, HUD has determined that it should undertake a substantive review of all current and planned federal regulation of manufactured housing. This review is intended to ensure that HUD can more effectively meet its responsibilities to facilitate the availability of affordable manufactured homes and encourage innovation and cost-effective construction techniques for manufactured housing while continuing to protect consumers by ensuring quality, durable, safe and affordable manufactured homes.

In conducting this review, HUD believes that it would benefit from information and perspectives among state, local and tribal officials, experts in relevant disciplines, affected stakeholders in the private sector and the public as a whole. HUD is, therefore, requesting comment on all current and planned regulatory actions affecting manufactured housing. HUD specifically seeks comment on:

- Rules listed in its Unified Agenda of Regulatory and Deregulatory Actions regulations, including rules to update its Manufactured Home Construction and Safety Standards (FR–5739), and exempt Recreational Vehicles from its Manufactured Home Construction and Safety Standards and Procedural and Enforcement Regulations (FR–5787).
- How HUD should proceed with its Interpretative Bulletin that provides guidance for designing and installing manufactured home foundations in areas subject to freezing temperatures with seasonal ground freezing.
- The effectiveness of HUD’s on-site completion of construction regulations, its Subpart I notification and corrections procedures, and its Alternative Construction approval process, both overall and specifically in review of manufactured homes with a carpentry-ready design or any other similar design that would permit the construction of an add-on at the final home site, that is not structurally independent from the home’s structure, support and anchoring systems.

HUD does not anticipate moving forward with any manufactured housing program regulations pending completion of its review. HUD may make exceptions, however, on individual rules based on policy priorities or revised circumstances.

To assist in the formulation of comments, HUD encourages commenters to consider how HUD’s manufactured housing regulatory agenda may be streamlined to reduce or eliminate costs and overall burden while ensuring that HUD can continue to meet its statutory responsibilities under the Manufactured Home construction and Safety Standards Act of 1974 (42 U.S.C. 5401 et seq.), as amended.

Dated: January 8, 2018.

Dana T. Wade, General Deputy Assistant Secretary for Housing. [FR Doc. 2018–01276 Filed 1–25–18; 8:45 am]

BILLING CODE 4210–67–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 51, 60, and 63

RIN 2060–AS95

Revisions to Testing Regulations for Air Emission Sources

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: This action proposes corrections and updates to regulations for source testing of emissions. The proposed rule includes corrections to testing provisions that contain inaccuracies, updates to outdated procedures, and approved alternative procedures that provide testers enhanced flexibility. The revisions will improve the quality of data but will not impose new substantive requirements on source owners or operators.

DATES: Comments. Written comments must be received by March 27, 2018.

Public Hearing. The EPA will hold a public hearing on this rule if requested. Requests for a hearing must be made by February 5, 2018. Requests for a hearing should be made to Mrs. Lula H. Melton via email at melton.lula@epa.gov or by phone at (919) 541–2910. If a hearing is requested, it will be held on February 26, 2018 at EPA Headquarters, William Jefferson Clinton East Building, 1201 Constitution Avenue NW, Washington, DC 20004.

ADDITIONAL INFORMATION:

To assist in the formulation of comments, HUD encourages commenters to consider how HUD’s manufactured housing regulatory agenda may be streamlined to reduce or eliminate costs and overall burden while ensuring that HUD can continue to meet its statutory responsibilities under the Manufactured Home construction and Safety Standards Act of 1974 (42 U.S.C. 5401 et seq.), as amended.

Dated: January 8, 2018.

Dana T. Wade, General Deputy Assistant Secretary for Housing. [FR Doc. 2018–01276 Filed 1–25–18; 8:45 am]

J. National Technology Transfer and Advancement Act and 1 CFR Part 51
K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

I. General Information

A. Does this action apply to me?

The proposed amendments apply to industries that are subject to the current provisions of parts 51, 60, and 63. We did not list all of the specific affected industries or their North American Industry Classification System (NAICS) codes herein since there are many affected sources in numerous NAICS categories. If you have any questions regarding the applicability of this action to a particular entity, consult either the air permitting authority for the entity or your EPA Regional representative as listed in 40 CFR 63.13.

B. What action is the agency taking?

This action makes corrections and revisions to source test methods, performance specifications (PS), quality assurance/quality control (QA/QC) procedures, and testing regulations. The corrections and revisions consist primarily of typographical errors, updates to testing procedures, and the addition of alternative equipment and methods the Agency has deemed acceptable to use.

II. Background

The EPA catalogs errors and corrections, as well as necessary revisions to test methods, PS, QA/QC procedures, and associated regulations in 40 CFR parts 51, 60, and 63 and periodically updates and revises these provisions. The most recent updates and revisions were promulgated on August 30, 2016 (81 FR 59800). This proposed rule addresses necessary corrections and revisions identified subsequent to that final action, many of which were brought to our attention by regulated sources and end-users, such as environmental consultants and compliance professionals. These revisions will improve the quality of data obtained and give source testers the flexibility to use newly-approved alternative procedures.

III. Summary of Proposed Amendments

The following amendments are being proposed.

A. Method 201A of Appendix M of Part 51

In Method 201A, in section 12.5, the denominator of equation 24 would be corrected.

B. Method 204 of Appendix M of Part 51

In Method 204, in section 8.2, the statement correcting equation 204–2 would be corrected to “The NEAR must be ≤0.05.”

C. Method 205 of Appendix M of Part 51

In Method 205, section 2.1.1 would be revised to allow the use of National Institute of Standards and Technology (NIST)-traceable transfer standards to calibrate the gas dilution system because these standards are widely available and provide the accuracy necessary to perform the calibration. Section 2.1.1 would also be revised to require testers to report the results of the calibration of the dilution system to enable the regulatory authority to review this information.

D. General Provisions (Subpart A) of Part 60

In the General Provisions of part 60, section 60.17(h) would be revised to add American Society for Testing and Materials (ASTM) D6216–12 to the list of incorporations by reference and to re-number the remaining consensus standards that are incorporated by reference in alpha-numeric order.

E. Fossil-Fuel-Fired Steam Generators (Subpart D) Part 60

In subpart D, the allowed filter temperature in section 60.46(b)(2)(i) would be revised from 160 ± 14 ºC to 160 ± 5 ºC resulting in increased precision of the filterable PM measurements.

F. Electric Utility Steam Generating Units (Subpart Da) Part 60

In subpart Da, the allowed filter temperature in section 60.50Da (b)(1)(ii)(A) would be revised from 160 ± 14 ºC to 160 ± 5 ºC resulting in increased precision of the filterable PM measurements.

G. Industrial-Commercial-Institutional Steam Generating Units (Subpart Db) Part 60

In subpart Db, the allowed filter temperature in section 60.46(b)(d)(4) would be revised from 160 ± 14 ºC to 160 ± 5 ºC resulting in increased precision of the filterable PM measurements.
In Method 5, sections 2.0, 6.1.1.2, 6.1.1.6, the allowed filter temperature in section 60.293(f) would be revised from 120 ±14 °C to 120 ±5 °C resulting in increased precision of the filterable PM measurements.

I. Municipal Waste Combustors for Which Construction Is Commenced After December 20, 1989 and on Before September 20, 1994 (Subpart Ea) Part 60

In subpart Ea, the allowed filter temperature in section 60.58a(b)(3) would be revised from 160 ±14 °C to 160 ±5 °C resulting in increased precision of the filterable PM measurements.

J. Glass Manufacturing Plants (Subpart CC) Part 60

In subpart CC, the allowed filter temperature in section 60.293(f) would be revised from 120 ±14 °C to 120 ±5 °C resulting in increased precision of the filterable particulate matter (PM) measurements. The allowed filter temperature in section 60.296(d)(2) would be revised from 177 ±14 °C to 177 ±5 °C resulting in increased precision of the filterable PM measurements.

In subpart QQQQ, in Method 28WHH, in section 13.5.1, equation 8 would be corrected.

L. Method 2B of Appendix A–1 of Part 60

In Method 2B, in section 12.1, the definition of ambient carbon dioxide concentration would be revised because the global monthly mean (CO2) concentration varies over time. Also, a website link would be added to the definition.

M. Method 5 of Appendix A–3 of Part 60

The allowed filter temperature in Method 5, sections 2.0, 6.1.1.2, 6.1.1.6, 6.1.1.7, and 8.5 would be revised from 120 ±14 °C to 120 ±5 °C resulting in increased precision of the filterable PM measurements. Section 6.1.1.9 would be revised to allow the use of a single temperature sensor in lieu of two temperature sensors on the dry gas meter as allowed by Technical Information Document 19 (TID–19) and the approved broadly applicable alternative, ALT–117 (see https://www.epa.gov/emc).

N. Method 5B of Appendix A–3 of Part 60

The allowed filter temperature in Method 5B, sections 2.0, 6.1, and 8.2 would be revised from 160 ±14 °C to 160 ±5 °C resulting in increased precision of the filterable PM measurements. Section 11.0 would be revised to replace the reference to Method 5, section 11.0 with specific analytical procedures and to report the results using Figure 5B–1 for complete data review. Section 17.0 would be revised to delete the word “Reserved” from the title, and Figure 5B–1 (Analytical Data Sheet) would be added.

O. Method 5I of Appendix A–3 of Part 60

In Method 5I, sections 2.1 and 8.5.2.2 would be revised to tighten the allowed filter temperature from 120 ±14 °C to 120 ±5 °C resulting in increased precision of the filterable PM measurements.

P. Method 7 of Appendix A–4 of Part 60

In Method 7, sections 10.1.2 and 11.3 reference erroneous sections; the correct sections would be inserted.

Q. Method 8 of Appendix A–4 of Part 60

In Method 8, sections 6.1.1.1 through 6.1.1.4 would be renumbered to 6.1.1.2 through 6.1.1.5; a new section 6.1.1.1 would be added to clarify the requirements that apply to the probe nozzle; and Figure 8–1 (Sulfuric Acid Sampling Train) would be corrected.

R. Method 18 of Appendix A–6 of Part 60

In Method 18, in section 13.1, the erroneous paragraph (c) designation would be re-designated as (b).

S. Method 22 of Appendix A–7 of Part 60

In Method 22, sections 11.2.1 and 11.2.2 would be revised to allow digital photography to be used for a subset of the recordkeeping requirements. Section 11.2.3 would be added to allow digital photographic records. Note that ALT–109 (see https://www.epa.gov/emc) is the associated broadly applicable alternative that allows the use of digital photographs for specific recordkeeping requirements.

T. Method 26 of Appendix A–8 of Part 60

In Method 26, section 6.2.2 would be revised to allow the use of glass sample storage containers as an option to allow flexibility and to be consistent with Method 26A.

U. Method 26A of Appendix A–8 of Part 60

In Method 26A, section 6.2.1 would be revised to remove the language regarding sample storage containers. We have determined that high-density polyethylene is an acceptable material for sample storage containers in addition to the currently allowed glass. Therefore, we would allow both high-density polyethylene and glass in a new section 6.2.4.

V. Test Method 28WHH of Appendix A–8 of Part 60

In Test Method 28WHH, equation 8 in section 13.5.1 would be corrected.

W. Performance Specification 1 of Appendix B of Part 60

In Performance Specification 1, references to ASTM D6216–98 (in sections 2.1, 3.1, 6.1, 8.1(1), 8.1(3)(ii), 8.2(1), 8.2(2), 8.2(3), 9.0, 12.1, 13.1, 13.2, and 16.0 reference 8. will be replaced with ASTM D6216–12. Note: If the initial certification of the continuous opacity monitoring system (COMS) has already occurred using D6216–98, D6216–03, or D6216–07, it will not be necessary to recertify using D6216–12.

X. Performance Specification 2 of Appendix B of Part 60

In Performance Specification 2, section 13.2 would be replaced with a table that indicates the relative accuracy performance specifications.

Y. Performance Specification 3 of Appendix B of Part 60

In Performance Specification 3, the two sentences in section 12.0 that read, “Calculate the arithmetic difference between the RM and the CEMS output for each run. The average difference of the nine (or more) data sets constitute the RA.” would be deleted; these two sentences are no longer necessary since equations 3–1 and 3–2 would be moved from section 13.2 to section 12.0.

Z. Performance Specification 11 of Appendix B of Part 60

In Performance Specification 11, section 13.1, the word “average” erroneously exists in the second sentence and would be deleted.

AA. Performance Specification 15 of Appendix B of Part 60

In Performance Specification 15, section 13.0 would be added as “Method Performance (Reserved).”

BB. Performance Specification 18 of Appendix B of Part 60

In Performance Specification 18, in section 11.8.7, the last sentence would
be revised to clarify the duration of the drift check. In Table 1, the erroneous acronym “NO₂” would be replaced with “NO.” In the appendix of Performance Specification 18, the inadvertently omitted reserved section 12.0 would be added.

CC. Procedure 1 of Appendix F of Part 60

In Procedure 1, in section 5.1.2 (1), the sentence immediately following the table that reads, “Challenge the CEMS three times at each audit point, and use the average of the three responses in determining accuracy.” would be replaced with, “Inject each of the audit gases, three times each for a total of six injections. Inject the gases in such a manner that the entire CEMS is challenged. Do not inject the same gas concentration twice in succession.” In section 5.1.2 (3), the reference to EPA’s traceability protocol for gaseous calibration standards would be updated, and the language regarding the use of EPA Method 205 for dilution of audit gases would be clarified.

DD. General Provisions (Subpart A) of Part 63

Sections 63.7(g)(2), 63.7(g)(2)(v), and 63.8(g)(1)(i) of the General Provisions (subpart A) of part 63 would be revised to require the reporting of specific test data for continuous monitoring system performance evaluation tests and ongoing QA tests. These data elements would be required regardless of the format of the report, i.e., electronic or paper. These modifications will ensure that performance evaluation and quality assurance test reporting include all data necessary for the compliance authority to assess and assure the quality of the reported data and that the reported information describes and identifies the specific unit covered by the evaluation test report.

EE. Wool Fiberglass Manufacturing (Subpart NNN) Part 63

In subpart NNN, the allowed filter temperature in § 63.1385(a)(5) would be revised from 120 ±14 °C to 120 ±5 °C resulting in increased precision of the filterable PM measurements.

FF. Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters (Subpart DDDDD) Part 63

In Table 6 of subpart DDDDD, row 1.f. would be revised to allow the use of EPA SW–846–7471B (for liquid samples) in addition to EPA SW–846–7470A for measuring mercury to allow flexibility.

GG. Coal- and Oil-Fired Electric Utility Steam Generating Units (Subpart UUUUU) Part 63

In subpart UUUUU, the allowed filter temperature in § 63.10010(h)(7)(i)(1) would be revised from 160 ±14 °C to 160 ±5 °C resulting in increased precision of the filterable PM measurements. In Table 5, Method 5I would be allowed as a test method option because Method 5I is designed for low PM application.

HH. Method 303 of Appendix A of Part 63

In Method 303, section 12.4, equation 303–3 would be corrected by inserting “where y = ” in front of the equation.

II. Method 308 of Appendix A of Part 63

In Method 308, deionized distilled water would replace the aqueous n-proposal solution; the affected sections are 2.0, 7.2.2, 7.2.3.3, and 11.3.2. Section 7.2.2, which defines the aqueous n-proposal solution, would be removed. Section 8.1.2 would be revised to require a leak check prior to the sampling run (in addition to after the sampling run) for QA purposes; requiring a leak check prior to the sampling run would potentially save time and money. In section 9.1, methanol spike recovery check would be added as a QC measure in Table 9.1. In section 12.1, variables used in equations 308–4 and 308–5 would be added and section 12.5, which includes equations 308–4 and 308–5, would be added. In section 13.0, the title “Reserved” would be replaced with “Method Performance” and QA requirements would be added to be consistent with other methods.

JJ. Method 320 of Appendix A of Part 63

In section 8.2.2.4, the denominator in equation 2 would be corrected from P05 to P0. In section 9.2.3, the word “where” in the statement “Calculate the dilution ratio using the tracer gas as follows: where:” would be deleted. Also in section 9.2.3, “dir” on the definition of spike is inadvertently superscripted and would be subscripted.

KK. Method 323 of Appendix A of Part 63

In Method 323, section 12.9, the denominator in equation 323–8 would be corrected.

LL. Method 325A of Appendix A of Part 63

In Method 325A, section 8.2.1.3 would be revised to clarify that only one extra sampling site is required near known sources of volatile organic compounds (VOCs) when the source is within 50 meters of the boundary and the source is located between two monitors. The label under Figure 8.1 would be corrected from Refinery (20% angle) to Refinery (20° angle). Section 8.2.3.2 would be revised to include facilities with a monitoring perimeter length equal to 7,315 meters (24,000 feet). Section 8.2.3.3 would be added to provide clarification and an equivalent procedure in Option 2 (linear distance between sites) for sites locations that parallel section 8.2.2.2.4 in Option 1 (radial distance between sites).

MM. Method 325B of Appendix A of Part 63

In Method 325B, section 9.3.2 would be revised to correct an error in the number of field blank samples required for a sampling period and to provide consistency with the sample analysis required in Method 325B. In sections 9.13 and 11.3.2.5, the erroneous reference to section 10.6.3 would be corrected to 10.0. Also in section 11.3.2.5, the erroneous reference to section 10.9.5 would be corrected to 9.13. Section 12.2.2 would be revised to correct the calculation of target compound concentrations at standard conditions. Sections 12.2.3 and 12.2.4 would be deleted because the equations for target concentrations are incorrect. Table 17–1 would be revised to add inadvertently omitted QC criteria from section 9.3.3.

IV. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at http://www2.epa.gov/laws-regulations/laws-and-executive-orders.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a “significant regulatory action” under the terms of Executive Order (E.O.) 12866 (58 FR 51735, October 4, 1993) and is, therefore, not subject to review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011).
C. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the PRA. The amendments being proposed in this action to the test methods, performance specifications, and testing regulations do not substantively revise the existing information collection requirements but rather only make corrections and minor updates to existing testing methodology. In addition, the proposed amendments clarify performance testing requirements.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. An agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, has no net burden or otherwise has a positive economic effect on the small entities subject to the rule. This proposed rule will not impose emission measurement requirements beyond those specified in the current regulations, nor does it change any emission standard. We have, therefore, concluded that this action will have no net regulatory burden for all directly regulated small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175. This action would correct and update existing testing regulations. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of “covered regulatory action” in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act and 1 CFR Part 51

This action involves technical standards. The EPA proposes to use ASTM D6216–12 for continuous opacity monitors in Performance Specification 1. The ASTM D6216–12 standard covers the procedure for certifying continuous opacity monitors and includes design and performance specifications, test procedures, and QA requirements to ensure that continuous opacity monitors meet minimum design and calibration requirements, necessary in part, for accurate opacity monitoring measurements in regulatory environmental opacity monitoring applications subject to 10 percent or higher opacity standards.

The ASTM D6216–12 standard was developed and adopted by the American Society for Testing and Materials. The standard may be obtained from http://www.astm.org or from the ASTM at 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428–2959.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard. This action would correct and update existing testing regulations.

List of Subjects

40 CFR Part 51

Environmental protection, Air pollution control, Performance specifications, Test methods and procedures.

40 CFR Part 60

Environmental protection, Air pollution control, Incorporation by reference, Performance specifications, Test methods and procedures.

40 CFR Part 63

Environmental protection, Air pollution control, Performance specifications, Test methods and procedures.

E. Scott Pruitt,
 Administrator.

For the reasons stated in the preamble, the Environmental Protection Agency proposes to amend title 40, chapter I of the Code of Federal Regulations as follows:

PART 51—REQUIREMENTS FOR PREPARATION, ADOPTION, AND SUBMITTAL OF IMPLEMENTATION PLANS

1. The authority citation for part 51 continues to read as follows:

2. Amend appendix M to part 51 as follows:

[a. Revise section 12.5, equation 24, in Method 201A.]
[b. Revise the last sentence in section 8.2 in Method 204.]
[c. Revise section 2.1.1 in Method 205.]

The revisions read as follows:

Appendix M to Part 51—Recommended Test Methods for State Implementation Plans

Method 201A—Determination of PM

12.5 Equations. Use the following equations to complete the calculations required in this method.

Sampling Dwell Time at Each Point. N

the total number of traverse points. You must use the preliminary velocity traverse data.
Method 204—Criteria for and Verification of a Permanent or Temporary Total Enclosure

8.2 * * *

The NEAR must be ≤0.05.

Method 205—Verification of Gas Dilution Systems for Field Instrument Calibrations

2.1.1 The gas dilution system shall be recalibrated once per calendar year using NIST-traceable flow standards with an uncertainty ≤0.25 percent. You shall report the results of the calibration by the person or manufacturer who carried out the calibration whenever the dilution system is used, listing the date of the most recent calibration, the due date for the next calibration, calibration point, reference flow device (ID, S/N), and uncertainty.

Method 206—Verification of Gas Dilution Systems for Field Instrument Calibrations

2.1.1 The gas dilution system shall be recalibrated once per calendar year using NIST-traceable flow standards with an uncertainty ≤0.25 percent. You shall report the results of the calibration by the person or manufacturer who carried out the calibration whenever the dilution system is used, listing the date of the most recent calibration, the due date for the next calibration, calibration point, reference flow device (ID, S/N), and uncertainty.

PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

3. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

4. In § 60.17:
   a. Redesignate paragraphs (h)(177) through (h)(219) as (h)(178) through (h)(217).,
   b. Add new paragraph (h)(177).

The addition reads as follows:

§ 60.17 Incorporations by reference.

(h) * * *

Subpart D—Standards of Performance for Fossil-Fuel-Fired Steam Generators

5. Revise § 60.293(d)(2) to read as follows:

§ 60.293 Standards for particulate matter from glass melting furnace with modified-processes.

(f) Test methods and procedures as specified in § 60.296 shall be used to determine compliance with this section except that to determine compliance for any glass melting furnace using modified processes and fired with either a gaseous fuel or a liquid fuel containing less than 0.50 weight percent sulfur, Method 5 shall be used with the probe and filter holder heating system in the sampling train set to provide a gas temperature of 120 °C (248 °F).

Subpart E—Standards of Performance for Municipal Waste Combustors for Which Construction Is Commenced After December 20, 1989 and On or Before September 20, 1994

9. Revise § 60.58a(b)(3) to read as follows:

§ 60.58a Compliance and performance testing.

(b) * * *

(3) Method 5 shall be used for determining compliance with the particulate matter emission limit. The minimum sample volume shall be 1.7 cubic meters (60 cubic feet). The probe and filter holder heating systems in the sample train shall be set to provide a gas temperature of 160 °C (320 °F). An oxygen or carbon dioxide measurement shall be obtained simultaneously with each Method 5 run.

Subpart CC—Standards of Performance for Glass Manufacturing Plants

10. Revise § 60.293(f) to read as follows:

§ 60.293 Standards for particulate matter from glass melting furnace with modified-processes.

(f) Test methods and procedures as specified in § 60.296 shall be used to determine compliance with this section except that to determine compliance for any glass melting furnace using modified processes and fired with either a gaseous fuel or a liquid fuel containing less than 0.50 weight percent sulfur, Method 5 shall be used with the probe and filter holder heating system in the sampling train set to provide a gas temperature of 120 °C (248 °F).

Subpart Dc—Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units

8. Revise § 60.45c(a)(5) to read as follows:

§ 60.45c Compliance and performance test methods and procedures for particulate matter.

(a) * * *

(5) For Method 5 or 5B of appendix A of this part, the temperature of the sample gas in the probe and filter holder shall be monitored and maintained at 160 ± 5 °C (320 ± 9 °F).
Appendix A–1 to Part 60—Test to read as follows:

(d) Method 5 shall be used to determine the particulate matter concentration (Cₚ) and volumetric flow rate (Qᵥ) of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 0.90 dscm (31.8 dscf). The probe and filter holder heating system may be set to provide a gas temperature no greater than 177 ± 5°C (350 ± 9°F), except under the conditions specified in § 60.293(e).

12. Revise “(CO₂)” in section 12.1 in Method 2B of appendix A–1 to part 60 to read as follows:

Appendix A–1 to Part 60—Test Methods 1 Through 2F

Method 2B—Determination of Exhaust Gas Volume Flow Rate From Gasoline Vapor Incinerators

12.1 Nomenclature.

(CO₂)₀ = Ambient carbon dioxide concentration, ppm (if not measured during the test period, may be assumed to equal the global monthly mean CO₂ concentration posted at http://www.esrl.noaa.gov/gmd/ccgg/trends/global.html#global_data).

13. In appendix A–3 to part 60:

a. Revise sections 2.0, 6.1.1.2, 6.1.1.6, 6.1.1.7, 6.1.1.9, and 8.5 in Method 5.

b. Revise sections 2.0, 6.1.8, and 11.0 in Method 5B.

c. Add section 17.0 in Method 5B.

d. Revise sections 2.1 and 8.5.2.2 in Method 5I.

The revisions read as follows:

Appendix A–3 to Part 60—Test Methods 4 Through 5I

Method 5—Determination of Particulate Matter Emissions From Stationary Sources

2.0 Summary of Method. Particulate matter is withdrawn isokinetically from the source and collected on a glass fiber filter maintained at a temperature of 160 ± 5°C (320 ± 9°F). The collected sample is then heated in an oven at 160°C (320°F) for 6 hours to volatilize any condensed sulfuric acid that may have been collected, and the nonsulfuric acid particulate mass is determined gravimetrically.

6.1 Sample Collection.

The probe liner heating system and filter heating system must be capable of maintaining a sample gas temperature of 160 ± 5°C (320 ± 9°F).

8.2 Probe and Filter Temperatures.

Maintain the probe outlet and filter temperatures at 160 ± 5°C (320 ± 9°F). Note: After start-up of the sampling system, it may take several minutes to equilibrate the system and temperature reading to within the required temperature threshold.

11.0 Analytical Procedure

11.1 Record and report the data required on a sheet such as the one shown in Figure 5B–1.

11.2 Handle each sample container as follows:

11.2.1 Container No. 1. Leave the contents in the shipping container or transfer the filter and any loose PM from the sample container to a tared glass weighing dish. Oven dry the filter sample at a temperature of 160 ± 5°C (320 ± 9°F) for 6 hours. Cool in a desiccator for 2 hours, and weigh to constant weight. Report the results to the nearest 0.1 mg. For the purposes of this section, the term “constant weight” means a difference of no more than 0.15 mg or 1 percent of total weight less tare weight, whichever is greater, between two consecutive weighings, with no less than 6 hours of desiccation time between weighings.

11.2.2 Container No. 2. Note the level of liquid in the container, and confirm on the
11.2.3 Container No. 3. Weigh the spent silicon gel (or silicate gel plus impinger) to the nearest 0.5 g using a balance. This step may be conducted in the field.

11.2.4 Acetone Blank Container. Measure the acetone in this container either volumetrically or gravimetrically. Transfer the acetone to a tared 250 ml beaker, and evaporate to dryness at ambient temperature and pressure. Then oven dry the probe sample at a temperature of 160 ± 5 °C (320 ± 9 °F) for 6 hours. Cool in a desiccator for 2 hours, and weigh to constant weight. Report the results to the nearest 0.1 mg.

### Method 5I—Determination of Low Level Particulate Emissions From Stationary Sources

#### 2.1. Description

The system setup and operation is essentially identical to Method 5. Particulate is withdrawn isokinetically from the source and collected on a 47 mm glass fiber filter maintained at a temperature of 120 ± 5 °C (248 ± 9 °F) for 6 hours. Cool in a desiccator for 2 hours, and weigh to constant weight. Report the results to the nearest 0.1 mg.

#### 2.1.1.1 Probe Nozzle

Borosilicate or quartz glass with a sharp, tapered leading edge and coupled to the probe liner using a Teflon union. When the stack temperature exceeds 210 °C (410 °F), a leak-free ground glass fitting or other leak free, non-containing fitting must be used to couple the nozzle to the probe liner. It is also acceptable to use a one-piece glass nozzle/liner assembly. The angle of the taper shall be >30°, and the taper shall be on the outside to preserve a constant internal diameter. The probe nozzle shall be of the button-hook or elbow design, unless otherwise specified by

*Convert weight of water to volume by dividing total weight increase by density of water (1 g/ml).
6.1.1.2 Probe Liner. Borosilicate or quartz glass, with a heating system to prevent visible condensation during sampling. Do not use metal probe liners.

6.1.1.3 Filter Holder. Borosilicate glass, with a glass frit filter support and a silicone rubber gasket. Other gasket materials (e.g., Teflon or Viton) may be used, subject to the approval of the Administrator. The filter holder shall provide a positive seal against leakage from the outside or around the filter. The filter holder shall be placed between the first and second impingers. Do not heat the filter holder.

6.1.1.4 Impingers. Four, of the Greenburg-Smith design, as shown in Figure 8–1. The first and third impingers must have standard tips. The second and fourth impingers must be modified by replacing the insert with an approximately 13-mm (1⁄2-in.) ID glass tube, having an unconstricted tip located 13 mm (1⁄2 in.) from the bottom of the impinger. Similar collection systems, subject to the approval of the Administrator, may be used.

6.1.1.5 Temperature Sensor. Thermometer, or equivalent, to measure the temperature of the gas leaving the impinger train to within 1 °C (2 °F).

(b) Recovery. After developing an appropriate sampling and analytical system for the pollutants of interest, conduct the procedure in section 8.4. Conduct the appropriate recovery study in section 8.4 at each sampling point where the method is being applied. Submit the data and results of the recovery procedure with the reporting of results under section 8.3.

16. In appendix A–7 to part 60:
(a) Revise sections 11.2.1 and 11.2.2 in Method 22.
(b) Add section 11.2.3 in Method 22.
estimated wind speed, wind direction, and sky condition. Sketch the process unit being observed, and note the observer location relative to the source and the sun. Indicate the potential and actual emission points on the sketch. Alternatively, digital photography as described in Section 11.2.3 may be used for a subset of the recordkeeping requirements of this section.

11.2.2 Indoor Location. Record the following information on the field data sheet (Figure 22–2): Company name, industry, process unit, observer’s name, observer’s affiliation, and date. Record as appropriate the type, location, and intensity of lighting on the data sheet. Sketch the process unit being observed, and note the observer location relative to the source. Indicate the potential and actual fugitive emission points on the sketch. Alternatively, digital photography as described in Section 11.2.3 may be used for a subset of the recordkeeping requirements of this section.

11.2.3 Digital Photographic Records. Digital photographs, annotated or unaltered, may be used to record and report sky conditions, observer’s location relative to the source, observer’s location relative to the sun, process unit being observed, potential emission points and actual emission points for the requirements in Sections 11.2.1 and 11.2.2. The image must have the proper lighting, field of view and depth of field to properly distinguish the sky condition (if applicable), process unit, potential emission point and actual emission point. At least one digital photograph must be from the point of view of the observer. The photograph(s) representing the environmental conditions must be taken within reasonable time of the observation (i.e., 15 mins). Any photographs altered or annotated must be retained in an unaltered format for recordkeeping purposes.

17. In appendix A–8 to part 60:
   ■ a. Revise section 6.2.2 in Method 26.
   ■ b. Revise section 6.2.1 in Method 26A.
   ■ c. Add section 6.2.4 in Method 26A.
   ■ d. Revise equation 8 in section 13.3.1 in Test Method 28WHH.

The revisions read as follows:

Appendix A–8 to Part 60—Test Methods 26 Through 30B

Method 26—Determination of Hydrogen Halide and Halogen Emissions From Stationary Sources Non-Isokinetic Method

\[
\sigma_i = (62.56 + (-0.0003413 \times T_{3i}) + (-0.0006225 \times T_{3i}^2)) \times 0.1337, \text{ lbs/gal} \quad \text{Eq. 8}
\]
2. Conduct the verification procedures for performance specifications in section 7 of ASTM D6216–12.
3. Provide to the owner or operator, a report of the opacity monitor’s conformance to the design and performance specifications required in sections 6 and 7 of ASTM D6216–12 in accordance with the reporting requirements of section 9 in ASTM D6216–12.

9.0 What quality control measures are required by PS–1?
Opacity monitor manufacturers must initiate a quality program following the requirements of ASTM D6216–12, section 8. The quality program must include (1) a quality system and (2) a corrective action program.

13.1 Design Specifications. The opacity monitoring equipment must comply with the design specifications of ASTM D6216–12.

13.2 Manufacturer’s Performance Specifications. The opacity monitor must comply with the manufacturer’s performance specifications of ASTM D6216–12.

12.1 Desired Attenuator Values. Calculate the desired attenuator value corrected to the emission outlet pathlength as follows:

\[ OP_2 = 1 - \left(1 - \frac{L_1}{L_2}\right)^{\frac{L_1}{L_2}} \]  

Where:
- \( OP_1 \) = Nominal opacity value of required low-, mid-, or high-range calibration attenuators.
- \( OP_2 \) = Desired attenuator opacity value from ASTM D6216–12, section 7.5 at the opacity limit required by the applicable subpart.
- \( L_1 \) = Monitoring pathlength.
- \( L_2 \) = Emission outlet pathlength.

12.0 Calculations and Data Analysis
Summarize the results on a data sheet similar to that shown in Figure 2.2 of PS2.

13.2 CEMS Relative Accuracy Performance Specification. The RA of the CEMS must be no greater than 20.0 percent of the mean value of the reference method.
VerDate Sep<11>2014 19:24 Jan 25, 2018 Jkt 244001 PO 00000 Frm 00020 Fmt 4702 Sfmt 4702 E:\FR\FM\26JAP1.SGM 26JAP1

preparation of EPA Protocol Gases are described in Citation 1. Procedures for Assay and Certification of Gaseous edition of the EPA Traceability Protocol for Protocol Gases following the most recent Institute of Standards and Technology (NIST) have been certified by comparison to National (CRM’s) (See Citation 1) audit gases that have sample transport surfaces has stabilized. assure adsorption-desorption of the CEMS audit point for a sufficient period of time to cylinder when challenging the CEMS. Do not dilute gas from audit points 1 and 2. Do not dilute gas from audit cylinder when challenging the CEMS. The monitor should be challenged at each audit point for a sufficient period of time to assure adsorption-desorption of the CEMS sample transport surfaces has stabilized. 2 Gases for short path IP cell interference tests cannot be added above 100 percent stack equivalent concentration. Add these gases at the indicated percentages to make up the remaining cell volume. PS–18 Appendix A—Standard Addition Procedures 12.0 Reserved 19. Revise sections 5.1.2(1) and 5.1.2(3) in Procedure 1 of appendix F to part 60 to read as follows: Appendix F to Part 60—Quality Assurance Procedures Procedure 1—Quality Assurance Requirements for Gas Continuous Emission Monitoring Systems Used for Compliance Determination 5.1.2 Cylinder Gas Audit (CGA). If applicable, a CGA may be conducted in three of four calendar quarters, but in no more than three quarters in succession. To conduct a CGA: (1) Challenge the CEMS (both pollutant and diluent portions of the CEMS, if applicable) with an audit gas of known concentration at two points within the following ranges:

<table>
<thead>
<tr>
<th>Audit point</th>
<th>Pollutant monitors</th>
<th>Diluent monitors for—CO₂</th>
<th>O₂</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>20 to 30% of span value</td>

</table>

Inject each of the audit gases, three times each for a total of six injections. Inject the gases in such a manner that the entire CEMS is challenged. Do not inject the same gas concentration twice in succession. Use of separate audit gas cylinder for audit points 1 and 2. Do not dilute gas from audit cylinder when challenging the CEMS. The monitor should be challenged at each audit point for a sufficient period of time to assure adsorption-desorption of the CEMS sample transport surfaces has stabilized.

2 Gases for short path IP cell interference tests cannot be added above 100 percent stack equivalent concentration. Add these gases at the indicated percentages to make up the remaining cell volume.

Performance Specification 11—Specifications and Test Procedures for Particulate Matter Continuous Emission Monitoring Systems at Stationary Sources

13.1 What is the 7-day drift check performance specification? Your daily PM CEMS internal drift checks must demonstrate that the daily drift of your PM CEMS does not deviate from the value of the reference light, optical filter, Beta attenuation signal, or other technology-suitable reference standard by more than 2 percent of the response range. If your CEMS includes diluent and/or auxiliary monitors (for temperature, pressure, and/or moisture) that are employed as a necessary part of this performance specification, you must determine the calibration drift separately for each ancillary monitor in terms of its respective output (see the appropriate performance specification for the diluent CEMS specification). None of the calibration drifts may exceed their individual specification.

logarithmic average = e^y - 1

where \( y = \frac{\ln(X_1 + 1) + \ln(X_2 + 1) + \ldots + \ln(X_n + 1)}{A} \)

Method 305—Procedure for Determination of Methanol Emission From Stationary Sources

2.0 Summary of Method

A gas sample is extracted from the sampling point in the stack. The methanol is collected in deionized distilled water and adsorbed on silica gel. The sample is returned to the laboratory where the methanol in the water fraction is separated from other organic compounds with a gas chromatograph (GC) and is then measured by a flame ionization detector (FID). The fraction adsorbed on silica gel is extracted with deionized distilled water and is then separated and measured by GC/FID.

7.2.2.3 Methanol Standards for Adsorbent Tube Samples. Prepare a series of methanol standards by first pipetting 10 ml of the methanol working standard into a 100-ml volumetric flask and diluting the contents to exactly 100 ml with deionized distilled water. This standard will contain 10 \( \mu \)g/ml of methanol. Pipette 5, 15, and 25 ml of this standard, respectively, into four 50-ml volumetric flasks. Dilute each solution to 50 ml with deionized distilled water. These standards will have 1, 3, and 5 \( \mu \)g/ml of methanol, respectively. Transfer all four standards into 40-ml glass vials capped with Teflon®-lined septa and store under refrigeration. Discard any excess solution.

\[ E = \text{Mass emission rate of methanol, mg/hr} \]
\[ C = \text{Concentration of methanol in the front of the adsorbent tube, \( \mu \)g/ml} \]
\[ C_b = \text{Concentration of methanol in the back of the adsorbent tube, \( \mu \)g/ml} \]
\[ C_u = \text{Concentration of methanol in the impinger portion of the sample train, \( \mu \)g/ml} \]
\[ E = \text{Mass emission rate of methanol, \( \mu \)g/hr} \]
\[ m_f = \text{Total mass of compound measured in impinger and on adsorbent with spiked train (mg)} \]

\[ m_v = \frac{m_z}{V_s} - \frac{m_u}{V_d} \]

12.4 Average Duration of VE from Charging Operations. Use Equation 303–3 to calculate the daily 30-day rolling log average of seconds of visible emissions from the charging operation for each battery using these current day’s observations and the 29 previous valid daily sets of observations.

\[ T_{std} = \text{Standard absolute temperature, 293 degrees K (528} \, ^{\circ} \text{R)} \]
\[ V_{af} = \text{Volume of front half adsorbent sample, ml} \]
\[ V_{ab} = \text{Volume of back half adsorbent sample, ml} \]
\[ V_i = \text{Volume of impinger sample, ml} \]
\[ V_m = \text{Dry gas volume as measured by the DGM, corrected to standard conditions, dscm (dscf)} \]

\[ V_{m(\text{std})} = \text{Dry gas volume measured by the DGM, corrected to standard conditions, dry standard cubic meters (dscm), dry standard cubic feet (dscf)} \]

9.1 Miscellaneous Quality Control Measures. The following quality control measures are required:

<table>
<thead>
<tr>
<th>Section</th>
<th>Quality control measure</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1.2, 8.1.3, 10.1</td>
<td>Sampling equipment leak check and calibration</td>
<td>Ensures accurate measurement of sample volume.</td>
</tr>
<tr>
<td>10.2</td>
<td>GC calibration</td>
<td>Ensures precision of GC analysis.</td>
</tr>
<tr>
<td>13.0</td>
<td>Methanol spike recovery check</td>
<td>Verifies all methanol in stack gas is being captured in impinger/adsorbent tube setup.</td>
</tr>
</tbody>
</table>

11.3.2 Desorption of Samples. Add 3 ml of deionized distilled water to each of the stoppered vials and shake or vibrate the vials for 30 minutes.

12.5 Recovery Fraction (R)
13.0 Method Performance

Since a potential sample may contain a variety of compounds from various sources, a specific precision limit for the analysis of field samples is impractical. Precision in the range of 5 to 10 percent relative standard deviation (RSD) is typical for gas chromatographic techniques, but an experienced GC operator with a reliable instrument can readily achieve 5 percent RSD. For this method, the following combined GC/operator values are required.

(a) Precision. Triplicate analyses of calibration standards fall within 5 percent of their mean value.

(b) Recovery. After developing an appropriate sampling and analytical system for the pollutants of interest, conduct the following spike recovery procedure at each sampling point where the method is being applied.

i. Methanol Spike. Set up two identical sampling trains. Callocate the two sampling probes in the stack. The probes shall be placed in the same horizontal plane, where the first probe tip is 2.5 cm from the outside edge of the other. One of the sampling trains shall be designated the spiked train and the other the unspiked train. Spike methanol into the impinger, and onto the adsorbent tube in the spiked train prior to sampling. The total mass of methanol shall be 40 to 60 percent of the mass expected to be collected with the unspiked train. Sample the stack gas into the two trains simultaneously. Analyze the impingers and adsorbents from the two trains utilizing identical analytical procedures and instrumentation. Determine the fraction of spiked methanol recovered (R) by combining the amount recovered in the impinger and in the adsorbent tube, using the equations in section 12.5. Recovery values must fall in the range: 0.70 ≤ R ≤ 1.30. Report the R value in the test report.

\[
R = \frac{m_v \times v_s}{s}
\]

Equation 308-5

\[
DF = \frac{SF_{6(spk)}}{SF_{6(dir)}}
\]

Equation 3

\[
CS = DF \times Spike_{dir} + Unspike \times (1 - DF)
\]

Equation 4

\[
C_{form@15\%O_2} = C_{form} \times \frac{(20.9-15)}{(20.9-0_{2d})}
\]

Eq. 323-8

Method 320—Measurement of Vapor Phase Organic and Inorganic Emissions by Extractive Fourier Transform Infrared (FTIR) Spectroscopy

* * * * *

Method 323—Measurement of Formaldehyde Emissions From Natural Gas-Fired Stationary Sources—Acetyl Acetone Derivatization Method

* * * * *

12.9 Formaldehyde Concentration Corrected to 15% Oxygen

known source of VOCs. For example, in Figure 8.1, the facility added three additional monitors (i.e., light shaded sampler locations) and in Figure 8.2, the facility added two additional monitors to provide sufficient coverage of all area sources.

8.2.1.3 Extra samplers must be placed near known sources of VOCs if the potential emission source is within 50 meters (162 feet) of the boundary and the source location is between two monitors. Measure the distance (x) between the two monitors and place another monitor approximately halfway between (x/2 ± 10 percent) the two monitors. Only one extra sampler is required between two monitors to account for the...
Refinery (20° Angle)

Note: Shaded sources are within 50 meters of the property boundary and are located between two monitors. Additional coverage required by this method was accomplished by placing the monitors halfway between two existing monitors.

Figure 8.1. Facility with a Regular Shape Between 750 and 1,500 Acres in Area

9.3.2 Field blanks must be shipped to the monitoring site with the sampling tubes and must be stored at the sampling location throughout the monitoring exercise. The field blanks must be installed under a protective hood/cover at the sampling location, but the long-term storage caps must remain in place throughout the monitoring period (see Method 325A). The field blanks are then shipped back to the laboratory in the same container as the sampled tubes. Collect at least two field blank samples per sampling period to ensure sample integrity associated with shipment, collection, and storage.

9.13 Routine CCV at the Start of a Sequence. Run CCV before each sequence of analyses and after every tenth sample to ensure that the previous multi-level calibration (see Section 10.0) is still valid.

11.3.2.5 Whenever the thermal desorption—GC/MS analytical method is changed or major equipment maintenance is performed, you must conduct a new five-level calibration (see Section 10.0). System calibration remains valid as long as results from subsequent CCV are within 30 percent of the most recent 5-point calibration (see Section 9.13). Include relevant CCV data in the supporting information in the data report for each set of samples.

12.2.2 Determine the equivalent concentrations of compounds in atmospheres as follows. Correct target compound concentrations determined at the sampling site temperature and atmospheric pressure to standard conditions (25 °C and 760 mm mercury) using Equation 12.5.

\[ C_c = \frac{(m_{\text{meas}}) \times 10^6}{U_{\text{NTP}} \times \left[ \frac{t_{\text{ss}}}{298.15} \right]^2 \times t} \]

Where:
- \( m_{\text{meas}} \) = The mass of the compound as measured in the sorbent tube (ug).
- \( t \) = The exposure time (minutes).

**40 CFR Part 62**

[FR Doc. 2018–00470 Filed 1–25–18; 8:45 am]

BILLING CODE 6560–50–P

**ENFORCEMENT OF STATE REQUIREMENTS FOR EXISTING COMMERCIAL SOLID WASTE INCINERATION UNITS**

**AGENCY:** Environmental Protection Agency (EPA).

**ACTION:** Proposed rule.

**SUMMARY:** The Environmental Protection Agency (EPA) is proposing to approve a Clean Air Act (CAA) section 111(d)/129 plan (the “plan”) submitted by the Division of Air Quality of the North Dakota Department of Health (the “Department”) on June 12, 2014. The plan would allow for the implementation of emissions guidelines for existing commercial and industrial solid waste incineration (CISWI) units within the jurisdiction of the State of North Dakota. The plan creates new enforceable emissions limits and operating procedures for existing CISWI units within the State of North Dakota in accordance with the requirements established by the revised CISWI new source performance standards (NSPS) and emission guidelines (EG), promulgated by the EPA on March 21, 2011, with subsequent final amendments to the rule promulgated on February 7, 2013. This proposed plan approval rulemaking is being taken in accordance with the requirements of sections 111(d) and 129 of the CAA and the relevant parts and subparts of the Code of Federal Regulations (CFR).

**DATES:** Written comments must be received on or before February 26, 2018.

**ADDRESSES:** Submit your comments, identified by Docket ID No. EPA–R08–OAR–2017–0698 at http://www.regulations.gov. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from www.regulations.gov. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (i.e., on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit http://www2.epa.gov/dockets/commenting-epa-dockets.

**FOR FURTHER INFORMATION CONTACT:** Gregory Lohrke, Air Program, U.S. Environmental Protection Agency (EPA), Region 8, Mail Code 8P–AR, 1595 Wynkoop Street, Denver, Colorado.
