NOW, THEREFORE, I, GEORGE BUSH, President of the United States of America, do hereby proclaim July 19, 1990, as Flight Attendant Safety Professionals' Day. I urge the people of the United States to observe that day with appropriate ceremonies and activities designed to recognize the important role flight attendants play in enhancing the safety and convenience of our Nation's air transportation system.

IN WITNESS WHEREOF, I have hereunto set my hand this thirteenth day of July, in the year of our Lord nineteen hundred and ninety, and of the Independence of the United States of America the two hundred and fifteenth.

GEORGE BUSH

Proclamation 6158 of July 17, 1990

Decade of the Brain, 1990–1999

By the President of the United States of America
A Proclamation

The human brain, a 3-pound mass of interwoven nerve cells that controls our activity, is one of the most magnificent—and mysterious—wonders of creation. The seat of human intelligence, interpreter of senses, and controller of movement, this incredible organ continues to intrigue scientist and layman alike.

Over the years, our understanding of the brain—how it works, what goes wrong when it is injured or diseased—has increased dramatically. However, we still have much more to learn. The need for continued study of the brain is compelling: millions of Americans are affected each year by disorders of the brain ranging from neurogenetic diseases to degenerative disorders such as Alzheimer's, as well as stroke, schizophrenia, autism, and impairments of speech, language, and hearing.

Today, these individuals and their families are justifiably hopeful, for a new era of discovery is dawning in brain research. Powerful microscopes, major strides in the study of genetics, and advanced brain imaging devices are giving physicians and scientists ever greater insight into the brain. Neuroscientists are mapping the brain's biochemical circuitry, which may help produce more effective drugs for alleviating the suffering of those who have Alzheimer's or Parkinson's disease. By studying how the brain's cells and chemicals develop, interact, and communicate with the rest of the body, investigators are also developing improved treatments for people incapacitated by spinal cord injuries, depressive disorders, and epileptic seizures. Breakthroughs in molecular genetics show great promise of yielding methods to treat and prevent Huntington's disease, the muscular dystrophies, and other life-threatening disorders.

Research may also prove valuable in our war on drugs, as studies provide greater insight into how people become addicted to drugs and how drugs affect the brain. These studies may also help produce effective treatments for chemical dependency and help us to understand and prevent the harm done to the preborn children of pregnant women who abuse drugs and alcohol. Because there is a connection between the
body's nervous and immune systems, studies of the brain may also help enhance our understanding of Acquired Immune Deficiency Syndrome.

Many studies regarding the human brain have been planned and conducted by scientists at the National Institutes of Health, the National Institute of Mental Health, and other Federal research agencies. Augmenting Federal efforts are programs supported by private foundations and industry. The cooperation between these agencies and the multidisciplinary efforts of thousands of scientists and health care professionals provide powerful evidence of our Nation's determination to conquer brain disease.

To enhance public awareness of the benefits to be derived from brain research, the Congress, by House Joint Resolution 174, has designated the decade beginning January 1, 1990, as the "Decade of the Brain" and has authorized and requested the President to issue a proclamation in observance of this occasion.

NOW, THEREFORE, I, GEORGE BUSH, President of the United States of America, do hereby proclaim the decade beginning January 1, 1990, as the Decade of the Brain. I call upon all public officials and the people of the United States to observe that decade with appropriate programs, ceremonies, and activities.

IN WITNESS WHEREOF, I have hereunto set my hand this seventeenth day of July, in the year of our Lord nineteen hundred and ninety, and of the Independence of the United States of America the two hundred and fifteenth.

GEORGE BUSH

Proclamation 6159 of July 18, 1990

Rose Fitzgerald Kennedy Family Appreciation Day, 1990

By the President of the United States of America
A Proclamation

On July 22, 1990, Rose Fitzgerald Kennedy will celebrate her 100th birthday. It is fitting that, on this special occasion, we not only wish her much happiness, but also reflect upon the importance of an institution she has cherished and defended for years. That institution is the family.

In the inimitable shelter of family life, we gain a sense of identity and purpose. The love and knowledge passed from generation to generation provides us with a link to the past—and it gives us a stake in the future.

Through family life, our country's most cherished values and traditions are passed from one generation to the next. Indeed, as members of a family, we learn important lessons about love and commitment, duty and fidelity, and respect and concern for others. It is through our parents and other close relatives that most of us discover how great God's love for mankind must be, and it is through them that we learn His Commandments and the importance of obeying them. Because we carry
